APPENDIX B

NOTE OF A DISCUSSION WITH THE MINISTER OF HEALTH ON DECEMBER 9, 1954, ON THE PROVISION OF DRUGS FOR PRIVATE PATIENTS

Present: A. Brown, A. Talbot Rogers, D. P. Stevenson, and W. Hedgcock.

1. Dr. Rogers said that, in pursuing this question, the Committee did so with the full knowledge that its implementation would require an amendment of the Act and that this might not be possible at the present time. Dr. Rogers referred to the very considerable amount of feeling in the profession that the present state of affairs was inequitable. It seemed quite unnecessary to regard prescribing as an inseparable part of general medical services, and the profession had always been led to believe that patients would be free to use separately any part of the services which were provided under the Act. It was believed that it would not be difficult to devise satisfactory machinery which would prevent any abuse, and, in the opinion of the

Association, the fear that it might lead to two standards in general practice was quite unfounded. Whilst appreciating the present difficulties, the Committee would like to know what the Government's policy would be at a time when amending legislation became a practical proposition.

2. Dr. Brown amplified Dr. Rogers's statement, and said that when the Act was introduced the impression gained ground that patients would be able to take advantage of the Service either in part or in whole. Now it was found that the supply of drugs was tied up with treatment and that an amendment to the Act would be necessary to give effect to this part of the Association's policy. Dr. Brown said that he appreciated to the full the difficulties in the political field and the lack of time available for legislation at the moment. What his Committee, the Private Practice Committee, would like to know was whether the Government accepted the view that a private patient was entitled to drugs under the Service. Once that principle had been decided any administrative difficulties could be examined.

3. The Deputy Secretary said that there were four particular points which he would like to make. Two arose out of the recently published Report of the Cohen Committee on General Practice. Firstly, the suggestion that the proposal would introduce two standards in general practice had given rise to considerable resentment in the profession and, in his view, such a situation might well exist in reverse to-day when many private patients were unable to afford the drugs necessary for their treatment. Secondly, it had been stated that many doctors in private practice would be unwilling to accept the imposition of any necessary safeguards. The Association, which represented the whole of the profession, would be only too willing to discuss the introduction of measures to prevent abuse, and, indeed, some form of contract and some ultimate sanction, such as the removal of a licence to prescribe on Form E.C.10, had always been envisaged. The Association was not, of course, aware of the source of this statement, but, for its part, it recognized that if its point was met, the Association would be only too glad to devise adequate safeguards.

4. The third point concerned finance. Although time alone would show the cost of allowing private patients their drugs on Form E.C.10, it was quite possible that any increase in the drug bill which resulted would be offset, at any rate to some extent, by an increase in the amount of private practice, with a consequent reduction in the amount of public funds which went into the Central Pool.

5. There remained the political aspect, and it was here that it was hoped that the Minister would explain the Government's policy.

6. Mr. Macleod said that there had been no change either in the situation generally or in his own views on the subject. It had been suggested that there was a breach of faith on the part of the Government in not giving effect to a promise which was contained in an election manifesto.

7. This was not so. The pamphlet issued by the Conservative Party which had advocated this right for private patients had appeared in July, 1949. This pamphlet was in no way a form of election manifesto, and, indeed, the proposal had been dropped completely from the Party's electioneering programme which appeared some six months later. Again, in the 1951 election no mention of it had been made at all. The Conservative Party's reason for withdrawing from its original position was that it realized the impracticability of making any concession on the lines suggested when the full and mounting cost of the Health Service became apparent. As far as the Cohen Committee was concerned, the Parliamentary Secretary's reply in the House of Commons to the effect that the Cohen Committee was unanimous on this particular point was made in perfectly good faith. No minority report or anything of a similar nature had appeared when the report was published, and, if any members of the Cohen Committee had had any reservations, it would have been proper for them to have stated this when they were considering their report in its draft form.

8. From the Government's point of view the question raised three difficulties, those of legislation, finance, and

administration. The door was by no means shut. The proposal which was made in the 1949 leaflet was withdrawn purely because of the financial position of the National Health Service, and it had never been restored. He found himself in no position to give any undertaking of any sort that the Government would commit itself to allowing private patients to be supplied with drugs under the Service either at present or any future time. As far as the administrative difficulties were concerned, they were formidable but not insurmountable. He did not necessarily agree with the views of the Cohen Committee on this particular point, and, if the Government agreed to give private patients this right, then there was little doubt that any proposals would be discussed with the profession in advance.

9. In brief, Mr. Macleod said that the situation could be summarized—that the proposal was not repugnant to Conservative principles and that the door was by no means shut. He could, however, give no undertaking that the change either could or would take place.

10. The Minister agreed that his officials, in consultation with Dr. Stevenson, should formulate and agree a statement for publication which would set out the Government's view on the question.

APPENDIX C

REPORT OF THE SUBCOMMITTEE ON SERVICE COMMITTEES AND TRIBUNAL REGULATIONS

Preliminary

1. The Subcommittee was reappointed by the General Medical Services Committee at its meeting on July 22, 1954, with the following terms of reference and personnel:

Reference: That a Subcommittee be appointed to review the constitution and procedure of Medical Service Committees and to report with recommendations to the parent Committee.

Personnel: A. Talbot Rogers, B. Cardew, H. Guy Dain, F. Gray, R. C. Hamilton, Kate Harrower, D. F. Hutchinson, W. M. Knox, A. N. Mathias, F. A. Smorffitt, and H. H. D. Sutherland; together with three representatives of the dentists and one representative of the pharmacists when matters of common interest are under discussion.

Chairman

2. H. Guy Dain was appointed Chairman of the Subcommittee.

Revision of the Service Committees and Tribunal Regulations

3. During the past session the Subcommittee has continued its discussions with the Ministry of Health on the recommendations for the revision of the Service Committees and Tribunal Regulations which were approved by the Annual Conference in 1953. Representatives of the British Dental Association and the National Pharmaceutical Union have been present throughout the negotiations.

4. Unfortunately, there has been some delay in completing these discussions. In the first place, the Ministry had to consult the Executive Councils' Association on the changes proposed, and, secondly, the Committee was asked to consider a number of new proposals put forward by the Ministry itself. Nevertheless, agreement has now been reached on the majority of the points under discussion, and the Subcommittee is pleased to report that most of its own recommendations have been accepted by the Ministry and will be met either by a revision of the regulations or, where more appropriate, by the addition of further guiding paragraphs in the *Handbook on Service Committee Procedure*.

5. Only in a few instances has the Subcommittee decided, after discussion with the Ministry, not to pursue its original recommendations.

6. The stage has now been reached where drafts of amending regulations have been prepared and regulations will be made and laid before Parliament if the various steps proposed are approved by the G.M.S. Committee and the Conference.

7. A summary of the present position setting out the outcome of the negotiations to date is set out below:

I. Recommendations which have been Agreed with the Ministry of Health (Subject, in some instances, to Minor Modification)

Appointment of Chairman and Deputy Chairman

Recommendation A: That Regulation 3(3) should be modified so as to leave the field open to non-members of the executive council, it being understood that notwithstanding the wider field of selection envisaged, the person appointed should be acceptable to both parties represented on the Service Committee.

8. The Ministry has accepted the suggestion that the post of chairman of a Service Committee should be open to non-members of the executive council with a proviso, to which the Subcommittee has agreed, that he should not be a member of one of the professions concerned.

Position of an Interested Person who is a Member of the Service Committee

Recommendation B: That provision should be made in the regulations for a requirement that a member of a Service Committee who is an interested party in the matter under consideration shall be required to disclose his interest either to the Chairman before the meeting or at the commencement of the proceedings.

9. Although in broad agreement with the Subcommittee's suggestions, the Ministry held that failure to disclose any interest should not invalidate the proceedings of the Committee. The Subcommittee did not feel able to accept this position and maintained that, not only should members of Service Committees be required to disclose their interest prior to the meeting, but that a record of replies made should be included in the Minutes of the proceedings.

10. After further discussion, the Ministry suggested that the situation should be met by ensuring that the notices calling meetings of Service Committees refer in comprehensive terms to the duty of each member to disclose any interest which he may have in the case concerned.

11. This has been accepted as an equitable solution to the problem.

Deputy Chairman

Recommendation C: That consideration be given to the practicability of appointing a deputy chairman for a defined group of executive council areas adjacent to each other.

12. The Ministry felt difficulty in this suggestion as tending to divorce the deputy chairman from the actual proceedings of any one Service Committee. The Subcommittee made a somewhat modified proposal, that in a group of executive council areas the chairman of each Service Committee should act as deputy chairman for other committees in the group. The Executive Councils' Association is being consulted about arrangements on these lines.

Investigation by Service Committee

Recommendation D: (1) That the following proviso be inserted after Regulation 4(1):

"Provided that no such complaint shall be investigated as aforesaid unless made by a person for whose treatment the medical practitioner is responsible in respect of treatment afforded to him by such medical practitioner or person authorized by him in writing to make such complaint or his spouse or in the case of an infant his parent or guardian or in the case of a person unable to make such complaint owing to mental infirmity a close relative or in the case of a deceased person his personal representative(s), or in the case of the Ministry of National Insurance a responsible official of that Department."

(2) That the following be inserted in place of Regulation 4(3):

"Subject as hereinafter provided the Dental Service Committee shall investigate any complaint that a dental practitioner has failed to comply with the terms of service made by a person for whom the dental practitioner has undertaken or agreed to undertake treatment."

"Any complaint made under this regulation shall be made by the person for whom the dental practitioner has undertaken or agreed to undertake treatment; provided that on being satisfied that any such person is deceased or that he is unable

through age, infirmity or other reasonable cause himself to make the complaint the Committee may investigate a complaint made by some other person on his behalf."

13. Considerable discussion has taken place on this recommendation and the Ministry, at first, would not agree that the right of complaint should be limited in the way proposed. Subsequently, however, it was agreed that both the procedure and the regulations should be amended to indicate that, where the patient is able to express an opinion on his treatment, complaints should not be pursued except by his spouse or with his endorsement. Where the complaint has not been made by the patient or a properly authorized person, then the chairman of the executive council will have discretion to refer the case to the council for investigation under Regulation 4(5). The amendments which are being made in this instance largely give effect to the Subcommittee's original recommendation.

Procedure of Service Committee

Recommendation F: That the substance of the following paragraph of the *Handbook on Service Committee Procedure* should be incorporated in the regulations:

"7. Similarly if a practitioner's observations on alleged acts of omission or commission are sought by the executive council prior to possible reference of a case to a Service Committee under Regulation 4(5) the source from which the information has come should be indicated and also any provisions in the terms of service alleged to have been broken. If no term of service is affected the reason why the conduct of the practitioner is being investigated should be clearly set out."

14. It has been agreed that the matter should be specifically covered in the regulations.

Professional Adviser to Chairman

Recommendation G: That the Chairman of a Service Committee should be required to confer with a professional adviser who is not a member or a deputy member of the Service Committee but selected by the Service Committee from a panel nominated by the local professional committee, when deciding whether a statement made by a complainant discloses prima facie ground of complaint.

15. The Ministry is prepared to give executive councils strong advice on the subject in the *Handbook*, but does not think it appropriate to include specific provision to this end in the regulations.

16. The Subcommittee accepted this view.

Rules of Procedure—I(1)(a)

Recommendation H: That the Clerk should be required only to inform the complainant of the procedure which will be followed if a further statement is not received within seven days, namely, that the case will be brought before the Service Committee, which has power to dispense with the hearing.

17. The Subcommittee's recommendation, now accepted by the Ministry, was intended to overcome the wording of the rule which required the Clerk to invite the complainant to submit a further statement. Under the amendment now proposed, the complainant will merely be asked whether he wishes to submit a further statement within seven days.

Rules of Procedure—I(1)(b)

Recommendation I: That any communication from an executive council to a practitioner informing him that a complaint has been lodged against him by or on behalf of a patient, shall embody a clear warning that his reply will be produced at any inquiry which might follow and may there be used in evidence.

18. The Ministry has accepted this recommendation, and it will be dealt with by an appropriate amendment to the Rules of Procedure.

Rules of Procedure—I(1)(c)

Recommendation J: That the period of three days referred to in Rule 1(1)(c) be extended to seven days and a further requirement of the Clerk be added to ensure that copies of the documents are sent to the secretary of the local professional committee.

19. The Subcommittee's recommendation has been accepted and an appropriate amendment will be made to the Rules of Procedure.

Rules of Procedure—I(1)(h)

Recommendation L: That Rule 1(1)(h) be amended so as to make it obligatory to adjourn the committee if a new issue is admitted.

20. The Ministry could not accept this recommendation as it stood, but suggested strengthening the position of a respondent by laying on him the responsibility for asking that there should not be an adjournment, and giving the Chairman express discretion whether to adjourn the meeting. As a further measure, however, the Subcommittee sought an amendment to Rule 1(1)(h) to make it clear that whenever a new issue is brought in there should be an opportunity for the respondent to consult his professional representative (if present), during which time the case should stand adjourned.

21. The Ministry has agreed to amend the Rules of Procedure to this effect and, furthermore, has undertaken to include in the *Handbook* advice to the Chairman of the Service Committee that, if a new issue should arise when there is no professional representative available for consultation, the Chairman should advise the respondent to seek an adjournment and that the case should only be proceeded with if the respondent so requests in the face of the advice by the Chairman.

Report of Service Committee

Recommendation M: That the Rules of Procedure should be amended so that a Service Committee is not required to report in detail on those cases where there is no prima facie ground of complaint.

22. The Subcommittee has agreed that this recommendation could within the existing regulations be met by modifying the form of report which is used in these cases.

Reference to Previous Cases

Recommendation N: That an amendment be sought to Regulation 5(4) so as to ensure that reference to previous cases should be made only when failure to comply with the terms of service was found in those cases and is also found in the present case.

23. After very full discussion, the Ministry has accepted the position that previous convictions should only be taken into account after the Service Committee had found that the respondent had breached his terms of service. An appropriate amendment will be made to Regulation 5(4).

Representations of Executive Council to Tribunal

Recommendation O: That the words "any relevant findings" in Regulation 8 be amended to read "any relevant findings of fact."

24. This recommendation has been accepted.

Procedure on Appeal

Recommendation P: That in cases where the practitioner has been found not guilty of a breach of the terms of service and a patient then appeals against the decision of the executive council, the persons appointed to hear the oral representations shall include a medical or dental practitioner, as the case may be, selected from the panel of practitioners referred to in Regulation 11.

25. The Ministry has agreed to this proposal and the regulations are being amended accordingly.

Procedure on Withholding Money—Regulation 11(1)

Recommendation R: That Regulation 11(1) be amended to provide that the Minister should not be empowered to impose a fine following either a hearing by a Service Committee, or an appeal against the findings of a Service Committee, which results in a verdict favourable to a practitioner.

26. It has been agreed that the regulations should be suitably amended with regard to action following decisions of executive councils on Service Committee proceedings.

Procedure on Withholding Money—Regulation 11(6)

Recommendation S: That Regulation 11(6) be amended by

- (i) the addition of the words "so far as may be in rotation" after the word "Minister" in line 4;
- (ii) the insertion of the words "for that purpose" after the word "nominated" in line 6.

27. This suggestion has been accepted and the regulations are being amended accordingly.

Appeals—Dental Estimates Board

Recommendation T: (i) That Regulation 18(2) be amended by the addition of the following:

"The Minister may, on the application of any person desiring to appeal, extend the time for giving notice of appeal and may do so although the application is not made until after the expiration of one month from the date on which notice of the Board's decision was received."

(ii) That the following be substituted for Regulation 18(3):

"The Minister shall appoint two dental practitioners, of whom one shall be selected from a panel of dental practitioners who are or have been engaged in the provision of general dental services nominated for that purpose by organizations which are, in the Minister's opinion, representative of the dental profession. The practitioners so appointed shall hear the representations of the appellant and the Dental Estimates Board and determine the appeal."

28. This recommendation has been accepted in principle by the Ministry and the regulations have been re-drafted to meet the Subcommittee's wishes.

II. Recommendations which the Subcommittee has Decided not to Pursue

Time Limit for Making Complaints

29. In its report the Subcommittee indicated firstly that the period of six weeks normally allowed for a complaint to be lodged was unnecessarily long; secondly, that any application made to the Minister for permission to investigate a complaint should be supported by a majority vote of the members of the Service Committee; and, thirdly, that when the Minister was called upon to reach a decision on any application which was made for permission to consider a complaint which had been received after the time limit for making complaints had expired he should have the benefit of independent advice similar to that which is given by the Medical Advisory Committee constituted under Regulation 11(4). The Subcommittee therefore put forward the following detailed recommendations:

Recommendation E: (i) That the period of six weeks referred to in Regulation 4(4)(a) be reduced to four weeks;

(ii) That the period of two months referred to in 4(4)(c)(i) be reduced to six weeks;

(iii) That any application to the Minister for permission to investigate a complaint, notice of which is received more than six weeks after the event, should be supported by a majority vote of the members of the Service Committee, and that in the event of a decision to refer the case the Minister should, before reaching a decision, be advised by a committee having a similar constitution to that of the Medical Advisory Committee constituted under Regulation 11(4);

(iv) That the following be substituted for Regulation 4(4)(b):

"The person desiring to make a complaint under this regulation against a dental practitioner shall within six months after the completion of treatment, or within four weeks after the event which gave rise to the complaint, whichever is the sooner, give written notice to the clerk of the council stating the substance of the matter which it is desired to have investigated";

(v) That the following be substituted for Regulation 4(4)(c)(ii):

"(ii) in the case of a complaint against a dental practitioner the complaint is made within six months after the completion of the treatment or within six weeks after the said event, whichever is the sooner, or";

(vi) That Regulation 4(4)(c)(iv) be modified so as to make it clear that the practitioner's representations relate solely to the question of the departure from the time limit for making the complaint.

30. The Ministry pointed out that the various proposals contained in the Recommendation could well be interpreted as a curtailment of the rights of the patient and, as such, could not be accepted.

31. In particular, it did not feel that the period of six weeks allowed for making a complaint could properly be reduced. Partly to meet the Subcommittee's suggestions

and partly in pursuance of one of its own proposals, the Ministry suggested that the special provision relating to complaints made within two months might be replaced by giving the patient a right to appeal to the Minister against the decision of an executive council not to investigate a complaint made after the expiration of the six-week period.

32. The Subcommittee did not consider that a right of appeal by the complainant to the Minister against the refusal of an executive council to hear a complaint received out of time was necessary—particularly where the complaint was out of time due to misdirection.

33. As a result of further discussions, the Ministry agreed to withdraw its suggestion, and the appropriate paragraphs in the *Handbook on Service Committee Procedure* will be strengthened to bring to the notice of the executive council that permission should not normally be refused in these circumstances. The Subcommittee has not pressed its own recommendations.

34. In amending the regulations, the time-limits on reference under Regulation 4(5) have been applied more specifically to correspond with the periods stipulated in Regulations 4(4)(a) and (b).

Rules of Procedure—I(1)(f)

Recommendation K: That the words "such" and "as the Committee may think" be deleted from Rule 1(1)(f) so that it reads:

"Either party shall be entitled to be present at the hearing and to give and call evidence relevant to the matters at issue, and may put questions relevant to the matter in dispute to the other party or to any witness called by him, either directly, or, if the committee so direct, through the chairman of the committee. Subject as aforesaid, the procedure at the hearing shall be such as the committee may determine."

35. The Ministry's view was that, as the rule stands, the Service Committee has full discretion whether to admit evidence and that a very substantial protection exists in the practitioner's right of appeal to the Minister. In addition, the respondent has the right to demand an oral hearing if it is proposed to withhold money from his remuneration or impose a similar penalty, whilst the right of appeal is in terms wide enough to cover an appeal on the grounds of the admission of irrelevant evidence. Further in the case of an oral hearing, the case is heard *de novo* by way of a re-hearing.

36. The Subcommittee feels that, in view of the Ministry's assurances on this point, its original recommendation need not be pursued.

Appeal to the Courts

Recommendation Q: That the present appeals machinery be amended so as to provide that the person appointed under Section 42 of S.I. 507 (1948) to hear the appeal should be appointed by the Lord Chancellor, and should be a practising barrister or solicitor of not less than ten years' standing, not being a member of the staff of the Ministry of Health.

37. Following discussion, the Subcommittee received the following letter from the Ministry of Health on this point:

"We cannot accept this point on procedure on appeal from a decision of the National Health Service Tribunal. Such an appeal is heard in practice by a member of the legal staff of the Department, assisted by a practitioner selected from the appropriate panel, and it has been suggested that the Minister's officer should be replaced by a practising barrister or solicitor of not less than ten years' standing, not being a member of the staff of the Ministry, and appointed by the Lord Chancellor. The case will already, however, have been before the National Health Service Tribunal whose chairman must under the National Health Service Act, 1946, possess the qualifications now proposed for the person to hear an appeal. The appeal is not, under the Act, from one Tribunal to another, but from the Tribunal to the Minister, who can only decide to confirm or revoke a direction of the Tribunal that a practitioner's name be removed from the list: he has no jurisdiction where they have not directed removal.

"The function of the person hearing the appeal (who has been in practice, a barrister of not less than 20 years' standing) is to prepare, from the facts and contentions placed before him, a report which the Minister refers to the appropriate Advisory Committee for recommendations, which he considers, together with the report, before reaching his decision. It is, of course,

open to the Minister to seek any further advice which he may consider desirable on any point arising and if matters of law arose it would be open to him where he thought it necessary to seek the views of the law officers of the Crown.

"On this explanation of the Minister's functions and the way in which they are exercised he thinks it will be agreed that the appointment of a barrister or solicitor in the manner suggested would hardly be appropriate."

38. The Subcommittee is satisfied that, in the light of the Ministry's explanation, there is no necessity for seeking a revision of the appeals machinery.

Employment of Counsel

Recommendation U: That Regulations 12, 13, 14, 15, and 16 be amended so as to make it clear that a practitioner may be represented by counsel or other paid advocate, or may call witnesses.

39. On reflection, the Subcommittee agreed with the view expressed by the Ministry that the employment of counsel would be inappropriate in these cases.

Determination of Question of Whether Substance was a Drug

Recommendation V: That any question under Regulations 16 and 17 as to whether a substance ordered by a practitioner was a drug or not may only be investigated within a period of six months subsequent to the date of issue of the prescription, and that in the event of the practitioner appealing against the decision of the local medical committee the results of such appeal shall be notified to the practitioner within one month from the date of the appeal.

40. After a very full discussion, the Subcommittee accepted the view advanced by the Ministry, that the requirements of Regulations 16 and 17 with regard to the use of referees makes the imposition of statutory time limits inappropriate. It has therefore not proceeded with this recommendation.

Notices Under the Regulations

Recommendation W: That all documents required or authorized by the regulations to be sent to persons concerned with the hearing, should be sent by registered post.

41. The Ministry maintained that the acceptance of this recommendation would involve substantial expense and, in consequence, it could be considered only if strong evidence was forthcoming of defects in the present machinery.

42. The Subcommittee accepted this point of view and, although the matter will be carefully watched, it has not been pursued for the present.

III. Proposals Made by the Ministry of Health and Accepted by the Subcommittee

43. In the introductory paragraphs of this report, reference was made to a number of amendments which the Ministry itself wished to see incorporated in the revised regulations.

44. Although as a result of discussions between the Ministry and the Subcommittee a number of these proposals have not been pursued, in some instances the Subcommittee has accepted the Ministry's views that it would be desirable to alter the disciplinary machinery in the manner suggested. These matters are set out below, and, subject to the approval of the General Medical Services Committee and the Annual Conference, appropriate action will be taken to put them into effect.

Procedure With Regard to Frivolous or Vexatious Complaints

45. The Ministry originally proposed to amend the rules of procedure so as to make it clear that complaints which had gone so far that the observations of the practitioner or chemist had been obtained had ceased to be "frivolous" and should go to a hearing. The Subcommittee felt that this suggestion could not be justified and it put forward the alternative that the regulations should be so amended that the chairman could rule at any stage that the case was frivolous or vexatious, although if he approached the

respondent at all he should do so only after the complainant had seen any reply and had had a definite period in which to furnish any further observations, and after the chairman had considered any further observations which might be supplied by the complainant. This suggestion was accepted by the Ministry.

Procedure on Appeal

46. The Subcommittee accepted proposals that the regulations should be amended to say explicitly that the proceedings at an appeal to the Ministry shall be in private and to make clear that only a practitioner who appeals has a right to an oral hearing in the circumstances already determined. Under the present regulations it is arguable that a complainant on appeal has such a right if a recommendation has been made to withhold remuneration, and he wishes more drastic action to be taken.

Procedure on Withholding Money

47. The Subcommittee accepted a proposal by the Ministry that the procedure of making separate representations on a monetary withholding in addition to the right to appeal should apply only where the Ministry proposed to deduct a larger amount than that recommended, or when the quantum of the amount was not stated in the report of the Service Committee, as approved by the executive council. This suggestion involves an amendment of Regulation 7(1) to add to the notification to the parties of their right to appeal a notification to the practitioner or chemist of his right alternatively to make representations against a deduction recommended by the executive council, orally or in writing.

Appeal from the Dental Estimates Board

48. The Subcommittee has agreed to certain amendments in Regulation 18 in addition to those made on its own initiative (see Recommendation T). The persons hearing the appeal will have their powers clearly restricted to making an award which is permissible under the regulations; and provision will be made for any appeal, which involves a question whether a person is entitled to receive a particular type of service, to be dealt with by the Ministry outside this particular appeals machinery.

Constitution of Medical and Dental Advisory Committees

49. Regulation 11 provides for the constitution of these advisory committees, and each consists of three practitioners in the service of the Ministry of Health and three from outside. The Ministry pointed out that no express provision is made to meet the position where one of the members fails to arrive or has, for some reason, been so associated with the case referred to the committee that he may feel unable to take part in the committee's deliberations on the point.

50. The Subcommittee has agreed to the revision of this regulation so that the advisory committees can function when a quorum consisting of one practitioner from the Ministry, two practitioners from the panel, and the chairman, are present.

IV. Consequential Amendments to the Regulations

51. Inevitably, the various measures listed above have necessitated a number of consequential amendments to the regulations. The Subcommittee has examined these in considerable detail and, having taken legal advice, is satisfied that no objection can be taken to the additional amendments proposed.

V. Responsibility for the Acts and Omissions of Deputies

52. It will be remembered that the Conference last year passed the following resolution:

53. **Resolved:** That arrangements should be made whereby the general practitioner who appoints a deputy, locum, or assistant should not be liable for any breaches of the terms of service by the deputy, locum, or assistant.

53. Although this matter has been carefully considered by the Subcommittee and strong representations made to the Ministry, the latter does not feel able to agree that a principal's immunity for the acts and omissions of his deputies should extend to locums and assistants. As it has not been possible to pursue the point further, the Subcommittee has sought to secure an amendment to the regulations on the lines of the principles enunciated during the course of earlier discussions with the Defence Societies and set out in the Report to last year's Conference—namely, that where the deputy is also a principal on the medical list in any executive council area, whether as a partner or not, the deputy should be responsible for his own acts and omissions unless it can be shown that there is prima facie evidence that the principal himself had acted in breach of his terms of service.

54. Unfortunately, whilst the Ministry accepted these suggestions in principle, it felt that practical difficulties would arise should an executive council wish to take disciplinary proceedings against a deputy who was not on its own medical list. Cases where the deputy is not on the same list as the principal must be very rare and the Subcommittee has therefore agreed that, subject to this modification, the regulations should be amended on the lines of its own proposals.

APPENDIX D

REPORT OF THE SUBCOMMITTEE ON ASSISTANTS IN GENERAL PRACTICE

Preliminary

1. The Subcommittee was appointed by the General Medical Services Committee at its meeting on December 16, 1954, with the following terms of reference and personnel:

Reference: To investigate the matter of the employment of assistants, and to make recommendations.

Personnel: A. Beauchamp, A. Brown, B. Cardew, T. J. Hargest, J. A. Pridham, F. M. Rose, C. M. Scott, C. J. Swanson, S. Wand, together with the Chairman of the Committee, *ex officio*.

Subsequently, but prior to its first meeting, S. Wand withdrew from the Subcommittee.

Meetings

2. The Subcommittee has met on two occasions—January 11 and February 2, 1955.

Chairman

3. B. Cardew was appointed Chairman of the Subcommittee.

The Problem and its General Background

4. The Subcommittee at its first meeting considered a factual statement of the various attempts which had already been made to find a solution to the problem. The Assistants and Young Practitioners Subcommittee first considered the subject and submitted its original recommendations to the G.M.S. Committee in January, 1953, and the protracted nature of the discussions, and the widely divergent views expressed, make it clear that no solution on the lines previously considered is likely to find acceptance. The Subcommittee is equally clear, however, that some solution must be found if only to promote a happier understanding of the problems of principals and assistants alike.

Size of the Problem

5. Although it has not been possible to obtain a complete picture of the size of the problem, a good deal of information can be extracted from the Ministry of Health's Report for 1953. The figures in this Report show that the problem is probably not as extensive as had been imagined and that, if anything, it is tending to diminish. There were, in July, 1953, 1,596 assistants in England and Wales, of whom 724 were employed by partnerships and 872 by doctors in single-handed practice. Whilst the Ministry's report does not divide the number of partnerships employing assistants into cate-

gories by size of list, this data is available for single-handed practitioners, and the figures as at July 1, 1953, are set out below:

Size of Doctor's Lists	Assistants Employed
0-1,500	22
1,501-2,500	97
2,501-3,600	213
3,601 and over	540
	872

In July, 1952, the corresponding figures were:

Size of Doctor's Lists	Assistants Employed
0-1,500	16
1,501-2,500	96
2,501-3,600	149
3,601 and over	720
	981

6. Thus there has been a fall of 109 in the number of assistants employed by single-handed practitioners during a relatively short period—a period, moreover, where the full effect of the Working Party's proposals might not be apparent.

7. The Subcommittee has also noted that out of a total of 872 single-handed practitioners employing assistants only 238 have lists of 4,700 and over.

Possible Solutions

8. Recent attempts to reconcile the opposing viewpoints on this subject have been confined to a consideration of the size of the additional list of patients which a principal may have by virtue of employing an assistant. In the Subcommittee's view, the size of the list itself is but incidental to the real issues involved. The major question of principle is whether exception can properly be taken to one doctor employing another in circumstances which make it possible for him to derive financial advantage from so doing.

9. Those who oppose the present regulations claim that they inevitably lead to exploitation of assistants, whilst others, who see no justification in seeking any change in the existing allocation scheme, maintain that very little financial incentive exists for a principal to employ an assistant even when the full extra list of 2,000 patients has been attained.

10. The Subcommittee believes that both points of view are inconclusive, for a principal would be unlikely to consider the employment of an assistant unless there were good grounds for believing that the venture would be to his advantage in one way or another, and it does not necessarily follow that an assistant is exploited just because his principal derives some financial benefit from the arrangement.

11. Exploitation is much more likely to occur when the assistant is obliged to undertake more than a fair share of the practice work or is not paid a salary commensurate with the work he is asked to undertake. No reduction in the extra list could remedy cases of this nature.

12. On the general issue the Subcommittee holds the view that there is nothing improper or unethical in a principal enjoying a monetary reward in respect of the indefinite employment of an assistant, provided that the salary and allowances paid are commensurate with the responsibility and work undertaken and that the assistant has had no reason to believe that the appointment offered would lead to a partnership.

13. In the first place, the assistant is usually a man who is new to general practice and is learning his job preparatory to taking a full part as a principal in the Service, not necessarily in the practice to which he is first appointed as an assistant. Secondly, overall responsibility for all the patients rests with the principal. Thirdly, to make it economically impracticable to employ an assistant would react to the disadvantage of the small minority who prefer to remain as assistants and still further increase the difficulties which young men face on entry into general practice. The Subcommittee is convinced that it would be wrong to recommend any step which might limit the opportunities for young men to acquire a probationary period in general practice as assistants, and for all these reasons has decided that it cannot recommend any change in the figures at present laid down in the Allocation Scheme.

14. Having reached this conclusion the Subcommittee decided to consider other possible ways of meeting some of the criticisms which have been made, and has examined the problem under three separate headings, namely:

- (1) the "permanent" assistant;
- (2) the assistantship "with view";
- (3) admission to partnership.

(1) "The Assistant who has no wish to become a Principal"

15. Those who elect to remain assistants in general practice throughout their working lives do so of their own free will and usually for personal reasons. For such practitioners the remedy is clearly in their own hands if they feel that they are being unfairly treated. Insistence upon a written agreement setting out equitable terms of employment is the only possible safeguard, and, in the Subcommittee's view, any attempt to legislate further for this group is impracticable and undesirable.

(2) Assistantship "With a View"

16. It is in these circumstances that most complaints of unfair treatment arise. The principal who advertises successive posts "with a view" and then has a series of assistants, none of whom are taken into partnership, constitutes the real core of the problem. Here again, however, the Subcommittee holds that a formal agreement in the first instance will afford some safeguard to the assistant. Although similar advice has already been given elsewhere—notably in the Association's *Handbook*—there is no doubt that there is room for greater publicity, particularly among final-year students and the newly qualified. To this end the Subcommittee is convinced that further efforts should be made through the deans of medical schools to see that these elementary safeguards are impressed upon the young doctor about to start upon his career. It therefore recommends:

Recommendation: That further efforts should be made, through the deans of medical schools and honorary secretaries of local medical committees, to ensure that final-year students and newly qualified practitioners are fully informed of the importance of entering into a formal agreement when accepting a post as an assistant, either with or without a view.

17. It is however clear that even a formal agreement will provide no real safeguard against a principal determined not to take his assistant into partnership, and the Subcommittee has therefore examined the present N.H.S. regulations on the employment of assistants.

18. At present any principal must secure the consent of the executive council or, on appeal, the Medical Practices Committee, before he can employ an assistant for more than three months, and he is also required to notify the executive council of the name of each assistant engaged. In addition, the regulations do not debar an executive council, having once given consent to the employment of an assistant, from subsequently withdrawing that consent, and it is known that at least one executive council regularly reviews the position of principals to whom consent has been given on first application. Thus, although at present the executive council may not be aware whether an assistant is taken on "with a view," it will know of those cases in which a series of assistants have been engaged and where a partnership might reasonably have been expected to follow. In this way flagrant disregard of the principle of fair treatment could be an influencing factor when the executive council is deciding whether to renew its consent, and it would be appropriate for the local medical committee to take an active part in advising the executive council of those instances where it would be appropriate for them to intervene.

19. Apart from any question of an executive council's power to review the consent already given to employ an assistant, it is quite clear from Section 13(3) of Part IV of the General Medical Services Regulations, 1954, that a practitioner who has obtained consent to the employment of an assistant has no automatic right to increase his list up to the full maximum of 2,000 patients. This section of the regulations reads as follows:

Where a practitioner or partnership of practitioners employs one or more permanent assistants, the number of persons for

whose treatment the practitioner or practitioners may be responsible may, and, if the Minister so directs, shall, be increased to an extent allowed by the scheme, not exceeding 2,000 in respect of each assistant.

Thus, apart from withholding consent to employ an assistant, executive councils already have discretion to decide what additional number of patients a practitioner may have by virtue of the employment of an assistant.

20. A combination of these methods, whereby the assistant is from the start in no doubt as to whether or not he has a "view" and the executive council (advised by the local medical committee) is left in no doubt as to its powers either to review regularly the permission already given to employ an assistant or to modify the size of the additional list permitted, would, in the Subcommittee's opinion, provide all the safeguards which can reasonably be expected.

21. The Subcommittee therefore recommends:

Recommendation: That the Ministry of Health should be asked:

(i) to insert an additional section in paragraph 8 of the Terms of Service of General Practitioners so as to make it clear that local executive councils shall, in consultation with local medical committees, periodically review all cases in which consent has been given to the employment of an assistant;

(ii) by means of a circular letter to executive councils to point out that, whereas under the regulations the normal maximum additional list of patients permitted by virtue of the employment of an assistant is 2,000, local executive councils have power where, after consultation with local medical committees, they are satisfied that a reasonable case exists for so doing, either after due notice to withdraw their original consent to the employment of an assistant or modify the number of additional patients otherwise permitted under their allocation schemes.

Recommendation: That an appropriate letter be sent to local medical committees drawing their attention to the proposed arrangements, and offering general guidance upon the principles they should adopt when advising their local executive councils that in a particular instance it would be appropriate to withdraw the consent already given to the employment of an assistant, or to modify the size of list.

22. At present a principal who is refused consent to employ an assistant has a right of appeal to the Medical Practices Committee. The Subcommittee recommends that this right should continue and be extended to include those cases where, on review, the executive council has decided either to withdraw its consent or to modify the permitted number of additional patients.

23. The Subcommittee believes that there is one aspect of the first recommendation set out in Paragraph 21 above upon which the parent Committee would wish to have further guidance—namely, the interpretation to be placed upon the words "periodically review." After considerable thought the Subcommittee suggests that a period of two years would be both appropriate and reasonable.

(3) Admission to Partnership

24. The Subcommittee believes that there is another important factor which deters a principal from taking his assistant into partnership. Even where the principal is satisfied that the assistant is in all respects ready for partnership, and that there are good grounds for believing that the partnership will eventually be satisfactory from both the professional and the financial points of view, the fear of a considerable drop in income over the first few years is a serious deterrent to the principal.

25. The obvious solution would be the adoption of an earlier suggestion by the G.M.S. Committee that a general practitioner taking another into partnership should thereupon be entitled to at least some part of the compensation moneys due to him. Unfortunately, both the Government and the Cohen Committee have failed to support this proposal and the Subcommittee has therefore looked for other methods which could be carried into practice without undue difficulty at the present time.

26. One suggestion which it considers would give some definite incentive and, at the same time, mitigate to some extent any financial hardship on the part of the principal would be to evolve a system whereby a principal, on implementing a "view" offered to an assistant, would have the

right to claim payment on the basis of notional lists retrospectively to the date that the assistant was first engaged as "with a view to partnership." Clearly, some overall time limit would be necessary and a method of establishing a claim for retrospective payment evolved. As far as the former question is concerned, the Subcommittee suggests a period of one year. To establish a right to payment it proposes that the principal, upon taking an assistant, should, possibly by making a declaration on the form used for notifying the executive council of the appointment, register the "assistant's view" with the council. Retrospective payment to the principal on the basis of notional lists would then start to accrue for up to a maximum period of one year from the date upon which the view was first registered. It would be paid only in respect of the individual assistant registered as "with a view" and who was subsequently taken into partnership.

27. The Subcommittee wishes to make it clear that there would be no compulsion upon the principal to register any assistant at any particular time. The sole purpose of optional registration would be to qualify for the additional payment and no right would arise until the assistant was so registered.

28. The adoption of this proposal would require a revision of the distribution scheme and so necessitate amending regulations, but the Subcommittee is convinced that it would provide a real incentive to partnership practice. The Subcommittee therefore recommends:

Recommendation: That a principal implementing a "view" registered with the executive council should have the right to claim retrospective payment on the basis of notional lists for a period up to a maximum of one year.

Summary of Recommendations

That further efforts should be made, through the deans of medical schools and through honorary secretaries of local medical committees, to ensure that final-year students and newly qualified practitioners are fully informed of the importance of entering into a formal agreement when accepting a post as an assistant, either with or without a view.

That the Ministry of Health should be asked:

(i) to insert an additional section in paragraph 8 of the Terms of Service of General Practitioners so as to make it clear that local executive councils shall, in consultation with local medical committees, periodically review all cases in which consent has been given to the employment of an assistant;

(ii) by means of a circular letter to executive councils to point out that, whereas under the regulations the normal maximum additional list of patients permitted by virtue of the employment of an assistant is 2,000, local executive councils have power where, after consultation with local medical committees, they are satisfied that a reasonable case exists for so doing, either after due notice to withdraw their original consent to the employment of an assistant or modify the number of additional patients otherwise permitted under their allocation schemes.

That an appropriate letter be sent to local medical committees drawing their attention to the proposed arrangements, and offering general guidance upon the principles they should adopt when advising their local executive councils that in a particular instance it would be appropriate to withdraw the consent already given to the employment of an assistant, or to modify the size of list.

That a principal implementing a "view" registered with the executive council should have the right to claim retrospective payment on the basis of notional lists for a period up to a maximum of one year.

Questions Answered

Senior Registrar's Expenses

Q.—(1) As a full-time senior registrar am I entitled to an allowance in respect of the rent of my telephone, as I have to have one in order to be on call for the hospital? (2) As part of my duties includes the teaching of medical students, am I entitled to any allowance in respect of medical textbooks, journals, membership of the B.M.A., Royal Society of Medicine, etc.?

A.—The allowability of expenses incurred by individuals in connexion with their work for an employer is governed by the statutory Rule which Vaisey J. referred to in the case of *Lomax v. Newton* as "notoriously narrow and rigid." (1) In the case of *Hamerton v. Overy* the judge accepted the reasoning of Vaisey J. and refused to allow to an employee of a regional hospital board the expense incurred in maintaining a telephone in his home. No doubt the Inland Revenue would successfully rely on that decision in this case. (2) The same reasoning would apply to the question of technical books, etc.—i.e., the expense would not be regarded as incurred "wholly, exclusively, and necessarily in the performance of the duties," but rather as incurred to put the individual concerned into the position necessary to obtain the appointment and perform the duties.

Tax on Merit Award

Q.—During the present income-tax year I was allocated a merit award, back-dated to January 1, 1952. Can I claim that this year's payment be spread out over the past three income-tax years?

A.—The questioner should have no difficulty. It is thought that the Inland Revenue will take the same view as himself—i.e., that the amount of the award should be spread over the period from the date as from which the amount payable has been calculated—as was done, for instance, in the case of the Danckwerts awards.

Examination at Police Station

Q.—A patient on my list was taken into custody for being in charge of a car while under the influence of alcohol. He insisted upon sending for me late at night, which entailed my driving about eight miles and examining him and drafting out a report for the police. Am I allowed to send him an account, as the service does not appear to come within my service under the N.H.S.?

A.—In "The Recognition of Intoxication," the report of a special committee of the B.M.A., published in 1954, it is stated that:

"A driver of a motor vehicle who finds himself at a police station on the suspicion of being under the influence of alcohol is there either because he has been involved in a road accident or because the suspicions of the police have been aroused by his unusual behaviour while driving or by his apparently abnormal condition while in charge of a stationary vehicle. On arrival he is informed that a doctor will be called to examine him. He has the right to refuse examination and to request the police to call on his behalf a doctor of his own choice. In the latter case he must pay the doctor's fee himself, as this service is not provided free under the National Health Service."

If the doctor is called to advise only on his patient's sobriety, and in the course of examination no evidence is found of a mental or physical abnormality or pathological process to account for the patient's suspicious behaviour, there is no objection to charging a fee. If, however, the doctor's presence is requested on the ground that the patient considers that his state is due to a mental or physical condition other than that caused by alcohol or drugs or should such a condition be detected at examination, no fee should be charged.

With regard to the question of a report to the police, it seems necessary to quote again from the B.M.A. committee's report as follows:

"If the examination has been made at the request of the detained person, the doctor should tell him his conclusions if asked. He should not, however, disclose any information to the police unless his patient insists."

If a report is submitted to the police with the patient's consent, as it is not one of those reports or certificates which have to be issued free under the National Health Service, the doctor is not precluded from charging a fee.

Correspondence

Because of the present high cost of producing the Journal, and the great pressure on our space, correspondents are asked to keep their letters short.

Consultant and Specialist Staff in N.H.S.

SIR.—I would like to amplify the comments made by Dr. G. E. Adkins (*Supplement*, March 12, p. 79) in which he states that the chest service is the "Cinderella" of the Health Service. The chest service is only a small part of the hospital service, but in no other branch has there been more bitterness about grading, or about prospects of promotion out of the dead-end S.H.M.O. grade. The following facts, all taken from the tables published in the *Supplement* of February 26 (p. 66), should be known to all doctors, consultants, and general practitioners alike, as well as to the Ministry, the regional board administrators, and the general public.

Now, Sir, S.H.M.O.s in the chest service: (1) are greater in number than in any other branch, at 415, the next highest being mental health at 400 and anaesthetics at 315; (2) are virtually equal highest with infectious diseases (56%) in their proportion of the total of consultants and specialists, at 55%; the next highest is venereology at 46%; the mean of all groups is 26%; (3) have the third poorest chance of promotion during the next ten years, as shown by the ratio of those due to retire at age 65 to the total in the specialty, at 16% of the present total over ten years. Plastic surgery has pride of place at 7% (number of S.H.M.O.s equals 1), and thoracic surgery is second at 9% (number of S.H.M.O.s equals 2). The mean is 24%. The other branches sharing the 16% are neurosurgery (number of S.H.M.O.s equals 1), orthopaedic surgery (number of S.H.M.O.s equals 61), and radiotherapy (number of S.H.M.O.s equals 38). It is appreciated that it is not possible to say from the table what proportion of those due to retire are themselves S.H.M.O.s, but the figures show the trend. Thus the chest service S.H.M.O. comes in one of the first three places in each of the above disadvantageous groups, but in no case do the other two specialties in any group figure in the first three of either of the other two groups.

Need more be said? Is not action necessary?—I am, etc.,

Portsmouth.

J. D. LENDRUM.

Sessional Fees

SIR.—The British Medical Association insists that local authorities using the services of practitioners on a sessional basis should pay £2 5s. per session. Individual general practitioners appear to pay their colleagues one guinea per session when taking surgeries. It would appear equitable that a suitable standard fee should be agreed for both.—I am, etc.,

London, W.1.

W. S. PARKER.

Shortage of Hospitals

SIR.—I should like to support Dr. R. L. Kitching's remarks (*Supplement*, March 19, p. 115) on the subject of shortage of hospitals. One aspect of the problem has been insufficiently emphasized: Prior to 1948 it was broadly true to say that hospitals were primarily intended for persons of lower income levels. With the introduction of the N.H.S. these became available as a right to all members of the community. It is a matter for surprise that the state of chaos is not greater. We are told constantly that expenditure is in excess of "estimates," and therefore the money is not available. Truth to tell, the so-called "estimates" have been little better than guesswork and bear little relation to needs. With long waiting-lists of "cold" cases

and doctors having difficulty in obtaining admission for emergencies, the Ministry of Health has failed to meet requirements.

In spite of long waiting-lists, many hospitals are overcrowded to an extent which is a danger to health and adds greatly to the difficulties of the medical and nursing staffs. I suggest that this is a factor which should not be overlooked in discouraging recruits to the nursing profession. At one hospital with which I am associated, overcrowding is so serious that the General Nursing Council has drawn the attention of the committee to the fact that the efficient training of nurses is seriously affected; and yet, with a long waiting-list, improvement is impossible. I am, etc.,

Horley, Surrey.

T. W. PRESTON.

POINTS FROM LETTERS

"Dictated but not Read"

DR. SIDNEY BOCKNER (London, W.1) writes: Your correspondent who complains (*Supplement*, February 19, p. 59) of consultants whose letters finish with "Dictated but not read" clearly is unaware of the reason for this practice. If a consultant visits a hospital only once a week, he will not see the letters he has dictated after an out-patient clinic until a week later. It is better to send an immediate reply signed "Dictated but not read" than to delay the letter a whole week so that it may be read.

MR. E. H. RAINER (Chislehurst) writes: This expedient should, and surely is, only resorted to in cases where a consultant attends the hospital at infrequent intervals of a week or more. The purpose is to avoid delay in the dispatch of letters to practitioners. But shorthand typists are not infallible and mistakes, even serious ones, may be made in transcribing. A better method, surely, is to have one's letters sent on for correction and signature before dispatch.

B.M.A. LIBRARY

The Library service is available to all members of the Association resident in Great Britain and Northern Ireland (and by special arrangement to members of the Irish Medical Association). The only charge made is for postage of books. A copy of the Library Rules will be forwarded on application to the Librarian at B.M.A. House.

The following books have been added to the Library:

- Carling, Sir E. R., *et al.* (Editors): *British Practice in Radiotherapy*. 1955.
 Clifton, M. J. (Editor): *Handbook of Medical Treatment*. Fourth edition. 1954.
 Donald, L.: *Practical Obstetrical Problems*. 1955.
 Faust, E. C.: *Amoebiasis*. 1954.
 Hers, J. F. P.: *Histopathology of the Respiratory Tract in Human Influenza*. 1955.
 Institute of Biology: *Biology of Deserts*. Proceedings of a Symposium. 1954.

H.M. Forces Appointments

ROYAL NAVY

Surgeon Commander W. J. Cranley has retired.

ROYAL NAVAL VOLUNTEER RESERVE

Surgeon Lieutenants P. Millyard, I. D. Innes, T. S. Matheson, and R. P. C. MacDonald to be Surgeon Lieutenant-Commanders.

ROYAL ARMY MEDICAL CORPS

Lieutenant-Colonel C. R. Christian, having attained the age limit for retirement, has retired on retired pay.
Major F. J. Ingham to be Lieutenant-Colonel.
Major H. D. G. Hetherington has retired, receiving a gratuity.
Captain J. Lapper to be Major.

REGULAR ARMY RESERVE OF OFFICERS

ROYAL ARMY MEDICAL CORPS

Colonel E. G. Sibley, E.R.D., from Army Emergency Reserve of Officers, to be Colonel.
Lieutenant-Colonel J. G. E. Vachell, having attained the age limit of liability to recall, has ceased to belong to the R.A.R.O.
Captain (War Substantive Major) J. B. Lloyd, having attained the age limit of liability to recall, has ceased to belong to the R.A.R.O., and has been granted the honorary rank of Lieutenant-Colonel.

ARMY EMERGENCY RESERVE OF OFFICERS

ROYAL ARMY MEDICAL CORPS

Lieutenant-Colonels A. J. Webster, T.D., T. E. Jones-Davies, and A. H. Charles, T.D., have been granted the acting rank of Colonel.
Major (Acting Lieutenant-Colonel) H. K. Meller, M.B.E., T.D., to be Lieutenant-Colonel.
Major A. D. Bourne has been granted the acting rank of Colonel.
Major P. W. Kippax, R.A.R.O., to be Major, and has been granted the acting rank of Lieutenant-Colonel.
Major A. C. F. Green, from R.A.R.O., to be Major.
National Service List.—Captain (Acting Major) A. A. Sharp, from T.A. National Service List, to be Captain, retaining the acting rank of Major.
Captain A. M. Huntley, from Emergency Commission, to be Captain, and has been granted the acting rank of Major.

HER MAJESTY'S OVERSEA SERVICE

The following appointments have been announced: W. M. Daly, M.B., Ch.B., B.A.O., Medical Officer, Uganda; Constance E. Field, M.D., Paediatric Specialist, Singapore; E. W. R. Hackett, M.B., Ch.B., B.A.O., D.L.O., and M. A. Majekodunmi, M.D., M.R.C.P.I., D.C.H., Senior Specialists, Federation of

Nigeria; W. Serle, M.B., Ch.B., D.P.H., Principal Medical Officer, Southern Cameroons, Federation of Nigeria; L. E. Wynter-Wedderburn, M.B., Ch.B., M.R.C.P., D.C.H., Medical Specialist (Paediatrics), Jamaica; K. D. Young, M.R.C.S., L.R.C.P., Medical Superintendent, Hargeisa Group Hospital, Somaliland Protectorate; L. P. Younglao, M.B., B.Ch., B.A.O., M.P.H., Deputy Director of Medical Services, Trinidad; P. W. E. Downes, M.B., Ch.B., W. G. MacKintosh, M.B., Ch.B., and R. C. Short, M.B., Ch.B., Medical Officers, South Pacific Health Service, Fiji; P. K. Ganguli, M.B., D.M.R.D., Radiologist, Trinidad; T. G. Humby, M.R.C.S., L.R.C.P., Medical Superintendent, Barbados; A. E. MacKinnon, M.B., D.R.C.O.G., Medical Officer, Northern Region, Nigeria; W. A. W. Maney, F.R.C.S., Surgical Registrar (Orthopaedic), Singapore; C. C. Tredway, M.B., B.Ch., Medical Officer, Kenya; M. C. Latham, M.B., B.Ch., B.A.O., A. W. Tranter, M.B., B.S., D.C.H., I. H. Wyndell, M.B., B.S., Medical Officers, Tanganyika; M. A. Fawkes, M.B., B.Ch., Medical Officer of Health, Federation of Nigeria; B. E. C. Hopwood, M.R.C.S., L.R.C.P., Senior Medical Officer, Uganda; J. M. Liston, M.B., Ch.B., Director of Medical Services, Tanganyika; C. M. Ross, M.B., B.Ch., Specialist (Leprologist), Northern Region, Nigeria; W. A. dos Santos, M.B., B.Ch., D.Bact., Superintending Medical Officer (Specialist), Trinidad; J. C. Williams, L.R.C.P.&S.I., Medical Officer (Health), Jamaica; D. B. E. Hennessy, M.R.C.S., L.R.C.P., Resident Medical Officer, Kenya; A. B. P. H. Koch, M.D., Medical Officer, Gold Coast; M. K. Panikkar, M.R.C.S., L.R.C.P., District Medical Officer, Windward Islands; Elizabeth E. Johnson, M.R.C.S., L.R.C.P., D.T.M.&H., Medical Officer, Sierra Leone.

Diary of Central Meetings

APRIL

- 4 Mon. Armed Forces Committee, 2 p.m.
6 Wed. Assistants and Young Practitioners Subcommittee, G.M.S. Committee, 2 p.m.
13 Wed. Council, 10 a.m.
15 Fri. Joint Committee of the B.M.A. and Magistrates' Association, 10.15 a.m.
15 Fri. Compensation and Superannuation Committee, 2 p.m.
20 Wed. Conference of Advisory Councils on Occupational Health, 12 noon.
20 Wed. Registrars Group Executive Committee, 2 p.m.
21 Thurs. Trustees of the Dain Fund, 1 p.m.
25 Mon. Staff Side, General Whitley Council (at 14, Russell Square, London, W.C.), 10.30 a.m.
25 Mon. General Whitley Council (at 14, Russell Square, London, W.C.), 2.30 p.m.
27 Wed. Welsh Committee (at Raven Hotel, Shrewsbury), 2.15 p.m.
29 Fri. D.I.H./D.P.H. Subcommittee. Occupational Health Committee, 10.30 a.m.

Branch and Division Meetings to be Held

CLEVELAND DIVISION.—At Sparks Café Royal, Middlesbrough, Thursday, April 7, 8.30 p.m., meeting. Lecture by Professor C. H. Stuart-Harris: "Influenza."
COVENTRY DIVISION.—At Pilot Hotel, Burnaby Road, Radford, Coventry, Tuesday, April 5, 8 p.m., supper. Talk by a Ministry of Labour Representative: "Rehabilitation Centres." Films: (i) "Diseases of the Ear, Nose, and Throat"; (ii) "Daily Varicose Vein Clinic"; (iii) "Endocrinology of the Menstrual Cycle."
DUDLEY DIVISION.—At Board Room, Corbett Hospital, Stourbridge, Tuesday, April 5, 9 p.m., ordinary meeting.
EASTBOURNE DIVISION.—At Princess Alice Memorial Hospital, Eastbourne, Wednesday, April 6, 8.30 p.m., annual meeting.
HENDON DIVISION.—At Hendon Hall Hotel, London, N.W., Tuesday, April 5, 8.45 p.m., annual general meeting. Address by Dr. Robert Forbes: "Six Strange Cases."
HYDE DIVISION.—At Pack Horse Inn, Mottram, Wednesday, April 6, 8.30 p.m., clinical meeting. Film: "The Conjoined Twins of Kano," followed by a discussion.
METROPOLITAN COUNTIES BRANCH.—At B.M.A. House, Tavistock Square, London, W.C., Tuesday, May 3, 3 p.m., annual general meeting. President's address by Dr. R. Hale-White: "Patients, Politics, or Both?"
SOUTH WARWICKSHIRE DIVISION.—At Board Room, Warneford General Hospital, Leamington Spa, Tuesday, April 5, 8 p.m., meeting.
SWANSEA DIVISION.—At Neath General Hospital, Swansea, Thursday, April 7, clinical meeting.
TUNBRIDGE WELLS DIVISION.—At Pembury Hospital, near Tunbridge Wells, Tuesday, April 5, 8.30 p.m., clinical meeting.

Correction.—The new edition of the *National Formulary* will replace the 1952 *Formulary* on May 1, not April 1 as stated in paragraph 194 of the Annual Report of Council (*Supplement*, March 19, p. 81).

CONFERENCE OF HONORARY SECRETARIES

The annual Conference of Honorary Secretaries of B.M.A. Divisions and Branches was held in the Great Hall of B.M.A. House, London, on March 31. The chair was taken by Dr. J. E. MORRISON (Stirling Branch), and there was an unusually large attendance.

Welcome by Chairman of Council

Dr. E. A. GREGG, Chairman of Council, described the Conference as one of the most important gatherings in the Association year. The value of the work of the secretaries of the Divisions and Branches was fully recognized at Headquarters. If there was not a good secretary in an area there would not be a good Division. Reviewing the present state of affairs, Dr. Gregg said that the danger that most impressed him was the spirit of sectionalism creeping into the profession. There was only one body—the B.M.A.—which could properly claim to represent the profession in this country. There was no other body in which a doctor in a particular neighbourhood, by reason of his being a doctor, was able to associate himself with others engaged in the same work, who could discuss together, irrespective of what kind of doctors they were, matters of importance in promoting the medical and allied sciences and the honour and interests of the medical profession.

"Do set your faces against sectionalism every time you see it raising its stupid head. Woodrow Wilson once said that he disliked hyphenated Americans; I dislike hyphenated doctors. It is just as doctors that we meet together in the British Medical Association, whether in the Divisions and Branches or in the Representative Body. We do not want to have anything to do with any hierarchy of medicine. Let us do all we can to resist this tendency to sectionalism. Every secretary must try to draw together all the doctors in his area whatever the nature of their practice."

Turning to other matters, Dr. Gregg said that they had held recently in that building a meeting with representatives of the Press organizations, and he hoped it would be some satisfaction to those present to know that they had covered a good deal of ground and that further meetings would be held (see *Journal*, page 906). Finally, turning to the financial side of the Association's affairs, he said that very careful consideration had been given by the Council to the membership subscription, and it would be wrong of him to hold out an idea that within any short time the question of a reduction of the subscription would be regarded as possible.

The Division and its Country Members

Dr. J. E. CRANE (South-west Wales Division) opened a discussion on the Division and its country members, and described the reorganization of his own Division. They were told that the function of the Association was to foster the getting together of members and to provide a forum

for their discussions. But in a Division like his own, which was 50 miles in diameter, the usefulness of getting people to meet from over a wide area was not quite the same as it was in a town. Instead of looking at a Division from the point of view of size, they should regard it from the functional aspect—physiologically rather than anatomically. All their clinical activities were based on hospitals. The functional unit for a Division should be the area of the hospital, where consultants worked, and this usually more or less coincided with the executive council, the local medical committee, and the public health authority areas. If it was necessary for a Division to be larger than this area it should be in multiples of such functional units. In his own area the country doctor was the main member to be considered, and they had to see that the country member had his due share of activities. The greatest obstacle in South-west Wales was distance; the Division covered three agricultural counties. Communications were never easy, and in winter were hazardous. Attendance at meetings was problematical. He hoped he was alone in having the recurring nightmare of calling a Divisional meeting which was attended only by himself and the invited speaker. In his Division they had now decentralized their meetings. They had meetings in each of the three counties. They had reorganized the Division on the assumption that each functioning unit wanted to get together, and co-operation between members in the unit was the important thing. Carmarthen had an active medical society based on the hospital and working in close co-operation with the B.M.A. It had a 50% attendance at meetings. Pembrokeshire wanted a similar body to Carmarthen: the formation of a discussion group was considered, but they preferred to call themselves the Pembrokeshire Medical Society within the Division. There had been for years a certain rivalry between Divisions and medical societies, and in any clash the medical society had usually come off better. That was because it was a functional unit and commanded a loyalty which was stronger than that of a Division. The Pembrokeshire Medical Society which had been launched would discuss not only clinical but political matters so far as these affected their problems. The functional units were of a convenient size to be represented at the Annual Representative Meeting and to invite B.M.A. lecturers. Increased activity in the Division on these lines tended to unify the Division and to improve the work it did.

Dr. R. P. HENDRY (Rugby) asked whether it would not be convenient in a large and scattered Division to transform it into a Branch with perhaps four or five Divisions, or some other intermediate unit which might be called a group within the Branch. It was most important that members should have reasonable opportunity to get to meetings, and a journey of 50 miles was discouraging from that point of view.

Dr. DUDLEY IRELAND (Shropshire and Mid-Wales), who also came from a widely scattered district, said that there was one difficulty which Dr. Crane had not mentioned, that of getting speakers, other than the official B.M.A. lecturers, from outside the Division. A city Division had access to a wide choice of consultants. In his area the local medical society was in competition with the B.M.A. Division. The society was an old-established body, and the consultants went to that society, and to a large extent could not be got to attend general meetings of the Division in the absence of some special speaker. They were about to try the experiment of carrying the meetings round to different places in the Division.

Dr. J. C. G. MERCER (East and Mid-Lothian) said that his was another scattered Division spread over two counties. There was a medical society of old standing in East Lothian. A large number of members in his Division were consultants attached to the Edinburgh hospitals and living on the outskirts of Edinburgh, being only nominally in the Division and not interested in Divisional meetings at all. They were very much troubled with the sectionalization of the profession.

Formation of Local Groups

Dr. W. LIVINGSTONE (North Staffordshire) said that in his Division they had decided to form local groups. Geographically this local grouping rather suited them. This was Arnold Bennett's "Five Towns" area (six towns really), and it was hoped that each town would form its local group. The groups were not large, perhaps not consisting of more than 15 doctors, but a full attendance was reached, and the leader of each of the groups was a member of the local executive of the Division and also a member of the local medical committee. He also felt that when a Division was large it ought to have more than one secretary.

Dr. J. S. ROSS (East Hertfordshire) said that his Division stretched for 30 or 40 miles along the eastern side of the county. Over the years the Division had been built up in a way that had maintained the loyalty of its members, and he felt now that if they started lopping off pieces of it in order that they might more conveniently fit in with hospitals they were likely to break the loyalty to the Division and create more difficulties than they solved.

Dr. F. A. BELAM (Guildford) said that a large area was not always the reason for a small attendance. His own area was not unduly large, but a 10% attendance was about usual, in spite of special efforts. At clinical meetings at the hospital they did not get a representative attendance from the Division; they got only those around the hospital. They had now substituted a general practitioners' clinical meeting to which those who came brought cases or case notes.

Dr. J. G. WARNOCK (Tees-side Branch) said that his Branch was formed of four Divisions, with a total membership of 500. A scientific secretary had been appointed to each Division and to the Branch. This had resulted in better attendances at clinical meetings. The secret of success was to bring both consultants and general practitioners into what amounted to a clinical society.

Dr. F. V. ALLEN (Scarborough), from a small and scattered Division, averaging about 25 to a meeting, pleaded for more speakers from the centre, with payment of fares. The same plea was made by Dr. C. W. EVANS (Derbyshire). Dr. A. B. KETTLE (East Somerset) said that the country doctor would attend medico-political meetings if the business touched him, but not ordinary clinical meetings or lectures which he was able to get from other sources. Dr. G. P. MARSHALL (North-east Ulster) considered that what were wanted were not lectures, but lecture-demonstrations, the sort of thing they could get in teaching hospitals.

Dr. J. W. E. CORY (West Suffolk) said that in his Division they had managed to stimulate some interest by inviting representatives of ancillary professions to give lectures on subjects of common interest.

Dr. P. S. STEEN (South Essex) said that consultants at his local hospital at Romford were anxious to form a medical society. Many of the consultants lived outside the

Division and therefore did not receive notices of Division meetings. He thought that perhaps the Association tied itself too tightly in geographical limitations. Could not new members be asked which Division they would like to join instead of being required to join the Division in whose area they lived?

Dr. J. A. PRIDHAM (chairman of the Organization Committee), speaking on this last point, said that at the last Annual Representative Meeting a resolution was passed asking for an arrangement whereby any member could choose his Division if he lived outside the area. An appropriate alteration of the by-laws would be submitted to meet that difficulty. The procedure would be quite simple.

Mr. L. DOUGAL CALLANDER (Treasurer), taking up the point with regard to lecturers' expenses, said that the Division was allowed one B.M.A. lecture a year, for which a fee of 10 guineas and expenses were paid. The arrangements for all such lectures must be made at Headquarters. As for other lecturers or openers of discussions at clinical or scientific meetings, the travelling expenses of the person concerned might be paid by the Division out of the Association funds in its possession.

On a show of hands, a large majority of those present were against splitting Divisions into smaller groups.

The Division and the Young Practitioner

Dr. J. H. E. MOORE (Leeds) gave a report on what his Division did for the young practitioner. One custom, which had been established for three years, was a joint meeting of final-year students with members of the Division executive committee; an address on careers in medicine was given. In common with other university centres the Leeds Division has for some years past entertained the newly qualified doctors to lunch. This year it had gone further and had formed a Young Practitioners Group. Membership was limited to practitioners under the age of 35. It included men and women in every branch of medicine. He circulated the whole membership, inviting those under 35 to come forward, and he got 77 replies and 32 turned up at the meeting. A chairman and secretary of the group were elected and points for discussion were considered, the first of them being hospital admissions and health officers' problems. The group was very enthusiastic; he did not know what it was going to lead to, but he was very hopeful and any problems would be settled as they came along.

Dr. T. LODGE (Sheffield) said that in his Division a representative panel had been set up the members of which would give addresses to students or act as members of a "Brains Trust." He also suggested that young practitioners should be made aware of the financial facilities offered by the Medical Insurance Agency.

Dr. R. B. L. RIDGE (Metropolitan Counties Branch) said that his Branch ran a course of lectures for fifth-year students on a variety of subjects. A point was made of issuing a personal invitation, carrying the student's name. Dr. F. M. MACDONAGH (Grimsby) suggested that more might be done by the Divisions in seeing that the living conditions and hours of work of hospital residents were as good as possible.

Dr. J. A. PRIDHAM said that the Organization Committee had a subcommittee for students and the newly qualified. They had suggested to individual secretaries that they should co-opt one or two residents or young practitioners on to the divisional executive. The question of a survey of hospitals and perhaps of making a "black list" of those in which living conditions were not satisfactory had been considered.

Recruitment of New Members

Dr. PRIDHAM, as chairman of the Organization Committee, gave some of the latest membership figures. On the previous day the membership stood at 66,954. There had been a slight drop during 1954 in the United Kingdom membership. The percentage of membership in the United Kingdom to the total profession in 1953 was 72%, and in 1954 it was 71%. The percentage of membership in the working

profession (that is, excluding retired) was 80% in 1954 as compared with 81% a year ago.

Dr. A. MACRAE (Secretary of the Association) then spoke on the recruitment drive, giving a factual statement on the methods used for maintaining the membership of the Association. A recruiting circular was issued twice a year, in June and December. It had been the practice hitherto to send the same recruiting letter to all non-members, but he felt a little unhappy about that blunderbuss method. The person who had never been a member of the Association needed a rather different method of approach from one who had lapsed. He had therefore produced two forms of recruiting letter. Lapses, by the way, were in many cases not due to deliberate resignation, but to carelessness.

As for the results achieved by the two recruiting letters sent out last December, up to date there had been applications from 205 non-members and from 122 lapsed members who wanted to resume their membership, and applications were still coming in. The result achieved made the labour well worth while. As for the newly qualified, lists of names were sent to the Divisions every six months, and they liked to think that the honorary secretaries, when they got information about new people, took some steps to give them information. Various communications were sent from Headquarters to the newly qualified themselves, including leaflets about services available, and these if necessary were followed up two months later by a letter, and again after an interval by another letter. Once the newly qualified man had joined the Association he received a welcoming letter giving him the name and address of the local honorary secretary.

The Association Subscription

Dr. G. WARING TAYLOR (Leicestershire and Rutland) suggested that a year was a long time to allow a member to remain in arrears with his subscription. At the end of the year the member was confronted with a demand for the subscription for the year which had elapsed, and was also informed that the subscription for the coming year was due, and the requirement to pay 12 guineas might be rather a shock to him. He thought that the member in arrears might be approached earlier and informed that his cessation from membership would take place at some date during the year instead of at the end of it. His idea was that membership, including the sending of the *Journal*, should cease at the end of nine months instead of twelve.

After some discussion the conference gave its opinion that the period of grace should be six months instead of twelve. Dr. MACRAE said that he could not see that making the period six months instead of twelve would be any disadvantage from the administrative point of view.

Dr. R. P. HENDRY (Rugby) said that there was a bigger problem in these membership figures than had so far been stressed. In 1951 the net gain in the Association membership was 1,877, and in 1952 it was 1,841. Then came the raising of the subscription, and in 1953 there was a net decrease of 399, and in 1954 a derisory increase of 33. In other words in 1951-2 there was a net increase of 3,718, and in 1953-4 a net decrease of 366. That represented a very serious problem. Among other suggestions with regard to recruitment, he said that it would be useful if each Division had a little money available for hospitality for new members or non-members coming into the area.

Chairmanship of Conference

On a ballot, with four candidates, Dr. R. B. L. RIDGE, joint honorary secretary of the Metropolitan Counties Branch, was elected Chairman of the Conference of Honorary Secretaries, 1956.

On the motion of Dr. F. A. BELAM, a hearty vote of thanks was accorded to the Chairman of the day, Dr. J. E. MORRISON.

The Hon. Secretaries lunched at B.M.A. House as guests of the Council. Dr. J. COTTRELL proposed the health of the Chairman, Dr. MORRISON, who, in his reply, paid a tribute to the Headquarters staff, which was acknowledged by Dr. A. MACRAE, the Secretary of the Association.

CONSULTANTS AND SPECIALISTS

An all-day meeting of the Central Consultants and Specialists Committee was held on March 24. Dr. T. ROWLAND HILL presiding.

Consultant Organization

The question of holding an annual conference of representatives of hospital groups, after the pattern of the annual conference of local medical committees, was considered. Dr. D. F. HUTCHINSON pointed out that the latter conference was a policy-making body; the advantage of such a conference was that in any matter which arose with the Ministry or other body the backing of conference resolutions carried more weight than the opinion of a central committee. Mr. HOLMES SELLORS mentioned the possible dangers of policy-making by large bodies which were subject to emotional appeal.

It was agreed to refer the question to the regional committees with a view to ascertainment by them of the opinion of the hospital groups in their region.

Remuneration of Hospital Medical Staff

The CHAIRMAN drew the attention of the Committee to a number of resolutions adopted by the Representative Body in 1954, criticizing the Whitley agreement for the revision of hospital staff remuneration, and calling for further action to secure a more adequate implementation of the Spens Report. Dr. Rowland Hill reminded the Committee that at its last meeting it had accepted a suggestion from its executive that the time had come when some survey should be undertaken to find out what were the effects of the 1954 salary revision, and in the light of this information to decide what the reaction would be to any further claim based on the altered value of money. It had been suggested, added Dr. Rowland Hill, that the Spens Report was being abandoned because the Committee did not continue to press for a 100% increase in the Spens recommendations on the ground of the altered value of money. It was well known, however, that the Government had made the strongest appeals for restraint in the matter of remuneration. No one would deny that consultants had a strong claim, but it was a question whether it was not more in the interests of consultants to seek improvements in terms and conditions of service by making claims in various directions where they were most justified. It was for this reason that attention was being focused on such questions as the conditions of whole-time officers, S.H.M.O.s, etc.

Dr. Rowland Hill referred to certain criticisms at the recent meeting of the B.M.A. Council of the section of the draft annual report of Council under "Remuneration of Hospital Medical Staff," which was referred back. It was proposed that the Committee give power to the Chairman and Secretary to reword that section of the Annual Report of Council so as to clarify it, and this was agreed to.

The discussion ended with a vote of confidence in the Chairman.

Hospital Medical Staffing

Professor G. I. STRACHAN introduced the subject of hospital medical staffing. Various comments had been received from regional and group committees arising out of the report of the subcommittee. A resolution from the Newcastle Regional Committee and from the Psychological Medicine Group Committee had put into other words what his subcommittee had in mind.

The CHAIRMAN said that the revised report had been sent to the Joint Committee, not as a final document, but for assistance in discussion. There was broad agreement between the report and another by the Royal College of Physicians on junior staffing. Everyone desired to maintain the utmost elasticity. The Joint Committee would be meeting Ministry officials on this subject, and he had asked that the results of any discussion should be referred to their own Committee.

Scottish representatives on the Committee amplified a long statement which had been put in by the Central Consultants and Specialists Committee (Scotland). It was the Scottish view that for the present system of named salary grades there should be substituted a system of numbered scales or grades within the total range, from which would be selected the one appropriate to each appointment. Individual authorities would be free to employ such names as they wished for their appointments, the status of which would be indicated by the salary grade selected; also there should be an agreed ratio of the appointments to which the first three salary scales or grades would apply, and appointments in the second scale would be permanent staff appointments, and those in the third of limited tenure and renewable where the circumstances of the appointment made this desirable. Scotland also thought that the assumption that it was necessary in the interests of the service to have whole-time appointments of the present restrictive character should be examined.

Professor STRACHAN thought the Scottish proposals more complicated than those of his subcommittee.

Dr. R. M. FORRESTER, representing the Registrars Group, said that his own original minority report stood withdrawn, but he considered the report of the subcommittee not strong enough in certain directions. It left some aspects of hospital staffing undiscussed. Dr. T. F. MCCARTHY, the S.H.M.O. representative on the Committee, believed that the proposals were a substantial contribution to the solution of the problem, but everything depended on the spirit in which they were interpreted. He asked that it should not be forgotten that S.H.M.O.s would like to have a voice in all future discussions on the subject.

The Committee agreed, without dissent, to accept the revised report and authorized its representatives on the Joint Committee to enter with their colleagues into negotiation with the Ministry, always bearing in mind the principle laid down that responsibility for the treatment of hospital patients must remain in the hands of practitioners of consultant status, and that the first step to be taken, therefore, was to examine and review in every hospital the volume of work which should be undertaken only by consultants.

It was also agreed to pass on to the Joint Committee, without necessary endorsement, the various contributions to the discussion which had been made, particularly by the specialist groups. Thanks were expressed to Professor Strachan and his subcommittee for their hard work.

Remuneration of Medical Teachers

Mr. B. N. BROOKE, on behalf of the Full-time Non-professional Medical Teachers and Research Workers Group Committee of the Association, drew attention to the dissatisfaction with the new scales for university teachers which were announced by the Chancellor of the Exchequer in November last (*Supplement*, December 4, 1954, p. 213). He said that the discrepancy between the medical teacher and his colleague of equal status, and often with identical duties, in the hospital service was in many cases now greater than before. Under the old N.H.S. and university scales, introduced in 1949, a consultant in the hospital service at the minimum of his scale received about 13% more than a reader or senior lecturer in clinical subjects, also at the minimum of his scale. Under the new scales the difference was 20%. At higher points in the scales the discrepancy was wider, and at the maximum a consultant received nearly 30% more than a reader or senior lecturer. The new scales brought university medical staff approximately to the level occupied by hospital medical staff in 1949. For preclinical medical teachers the comparison was even more unfavourable. The financial disadvantage which attached to these discrepancies more than offset the vocational attraction of university work, and might have an adverse effect on recruitment.

It was agreed, on the Chairman's suggestion, to send these representations to the Joint Committee. The CHAIRMAN added that it had been thought well to obtain information

from the universities concerning the fees paid to part-time clinical teachers, and this information was placed before the Committee. The rates varied very considerably. It appeared that no increase was contemplated in any case. It was agreed to send this information also to the Joint Committee.

Investigation of Complaints

Dr. S. COCHRANE SHANKS, chairman of the Medico-Legal Subcommittee, reported that a meeting had been held with the Ministry for further discussion on the procedure for investigating complaints involving the personal conduct or professional competence of members of hospital medical staffs. With regard to competence, the subcommittee had reiterated its view that hospital authorities should be given more precise advice regarding the composition of committees of inquiry; these committees should be composed of medical and lay members in equal numbers, with an independent chairman. The Ministry had readily agreed to a substantial element of medical representation, so long as there was also some lay representation. Another matter concerned the reporting of accidents in hospitals. A revised draft of the circular from the Ministry regarding the procedure to be followed had been studied and in the main agreed upon.

Hospital Private Beds and Provident Schemes

Reference was made to the reported increase in the membership of provident schemes covering private treatment in hospitals. It was evident that there was a very large section of the public who were prepared to make this anticipatory provision to ensure private accommodation in sickness. Mr. KINDERSLEY urged the Committee to go further into this matter and endeavour to obtain complete information. This was agreed to.

Miscellaneous Business

It was agreed to resist a proposal from the Treasury that Government departments, such as the Ministry of Pensions, should pay S.H.M.O.s a lower scale of fees for professional specialist services than they paid consultants, a practice which must result to the disadvantage of both grades, tending to create a cheap form of specialist service.

Dr. H. D. CHALKE introduced the report of the Geriatrics Joint Subcommittee, describing it as a document which, while not telling the world anything particularly new, did lay emphasis where it was needed. The report was sent to the Council with the Committee's approval.

A regional committee wrote that the senior administrative medical officer of the region had issued a circular letter to all consultants and S.H.M.O.s asking that for one month a detailed check of hours be kept at each of the hospitals visited. The CHAIRMAN said that from the beginning of the service it was agreed that consultants should in no circumstances be exposed to the procedure of "clocking in," and the Ministry had always upheld that principle. He suggested that the report in this case be sent to the Ministry, but he reminded the Committee that sometimes these regional instructions were supposed by those who received them to be more rigid or to have a purpose other than was intended by those who issued them.

The rates of remuneration in respect of employment by the War Office of civilian consultants on a sessional basis were referred to the executive for consideration.

The report on the medical use of hypnotism came forward from the Psychological Medicine Group Committee and was approved for submission to the Council. The Group Committee asked that the Council be recommended to take the lead in furthering research on the subject of hypnotism, and to bring to the notice of suitable research foundations the need for such research. It was agreed to make the recommendation.

A letter was read from the Newcastle Regional Committee objecting to the Ministry's circular HM (54) 51, on medical arrangements for dealing with major accidents, on the chief

ground that many of the recommendations were impracticable. Reference had already been made to this circular by the Chairman of the Joint Committee when protesting to the Minister on the issue of circulars affecting medical staff without prior consultation with the profession. There had been no prior consultation in this case. It was agreed to forward the Newcastle objections to the Joint Committee.

A letter from the Medical Superintendents Society was received concerning the Bradbeer report on the internal administration of hospitals. It was agreed to defer consideration of the points raised until the report itself came to be discussed with the Ministry. The CHAIRMAN said that an undertaking had been given by the Under-Secretary of the Ministry that before any portion of the Bradbeer report was put into operation it would be discussed with the profession.

A letter from the Sheffield Regional Committee pointing out some difficulties with regard to skilled secretarial assistance in hospitals was referred to the Joint Committee and also to the Scottish Joint Committee for discussion with the departments.

The Consulting Pathologists Group had been considering the resolution of the Representative Body that arrangements should be made for a practitioner to have a necropsy performed by a consultant pathologist on any patient who was of particular clinical interest to the practitioner. The Group supported this, provided it was made clear that the appropriate place for such post-mortem examinations was the post-mortem department of the hospital to which the pathologist was attached, and the Committee concurred in this view.

RIISING COST OF HEALTH

ADDRESS BY SIR JOHN CHARLES

Sir John Charles, Chief Medical Officer of the Ministry of Health, addressed the West London Medico-Chirurgical Society recently on the rising costs of the National Health Service. He took the year 1949-50, the first complete year of the service, as the base-line. During the five years which had followed, the general medical services, the hospitals, and the pharmaceutical services had registered substantial increases in cost, whereas the cost of the general dental service and the supplementary ophthalmic service had decreased, though not to such an extent as to offset the increases in the other services.

Some Figures

The cost of running the hospitals in the five years under review had gone up by £64m., an increase of 32%. Medical salaries, including those of specialists, had risen by 27%; nursing salaries by about 37%, and all other salaries and wages by over 47%. Whole-time medical staff had increased by 19%, part-time medical appointments by 17%, whole-time nurses and midwives by 14%, and administrative and clerical staff by 12%. The number of hospital beds had risen during four years, 1949 to 1953, by rather more than 5.5%; the rate of occupancy at the end of the period, at 90%, was a little higher than it had been at the beginning, while the turnover—that is, the number of in-patients treated per annum per available bed—had increased from 6.5 to 7.5. The number of in-patients had risen from nearly 3 million in 1949 to over 3.5 million in 1953.

Sir John Charles spoke at some length on proper bed use. The main causes of uneconomical use were delay in filling vacant beds, the lag in starting diagnostic procedures and treatment, and procrastination in the discharge of patients. A good deal depended on the effectiveness of the arrangements for the treatment of patients after their hospital stay had ended and they had returned home.

Turning to the general medical services, he said that in July, 1953, there were nearly 19,000 practitioners practising as principals and providing general medical services for some 42,400,000 persons, giving each principal on the average a list of 2,330. The annual cost fluctuated around £51m.

The Drug Bill

In considering the cost of the pharmaceutical services, said Sir John Charles, they entered a region of great possibilities for improvement. The net expenditure upon this service, after deducting the revenue obtained from the charges levied since 1952, had risen from £31.5m. in 1949-50 to £42.2m. in 1954-5, a rise of nearly 34% in six years. The main reason for the increased cost was that the content of prescriptions had undergone modification. The most striking changes were in the proportions of mixtures and proprietary preparations. At the commencement of the service mixtures accounted for 34% of the total number of prescriptions and proprietary preparations for 16%. In 1953 the mixtures had dropped to 24% and the proprietary preparations had risen to 27%. As a result the overall gross cost of the pharmaceutical service—that is, the cost of prescriptions dispensed by chemists and the dispensing done by dispensing doctors—was now nearly as high as the cost of general medical services. The figures were: for the pharmaceutical service nearly £49m. (including £6m. from patients' payments); for general medical services, £53m.

The number of prescriptions issued each year was 220 million, being, on the average, over five prescriptions per annum for every individual enrolled in the service. At a cost of 4s. 2d. per prescription this amounted to over a pound a head in a year.

Is it Necessary?

Was all this expenditure really necessary? Was this medicinal appetite a healthy one? He believed that considerable economy was attainable without detriment to the patient. One direction might be by prescribing smaller quantities of drugs. It was seldom that the patient's condition during acute illness called for the administration of the same drug or mixture for any considerable time. Again, drugs remaining after the patient had died could not be returned to the pharmacy for reissue and were very often thrown away. The use of antibiotics was at first confined to hospitals where facilities existed for the ascertainment of bacterial sensitivity, and treatment with the antibiotic was kept under continuous bacteriological surveillance. These precautionary measures had tended to lapse, and antibiotics were frequently used in cases when less expensive drugs would be equally effective.

Apart from so-called proprietary substances for which there was no therapeutic equivalent and whose use in appropriate cases was beyond criticism, doubt might be expressed, along with the Cohen Committee, whether the average proprietary preparation had so much greater therapeutic value. He knew, however, that there were cases where the cost of the proprietary was no more than that of the standard.

Sir John Charles concluded his address by saying that, if the service was to realize its great potentialities, waste must be rigorously controlled, and he quoted Bacon: "It is no baseness for the greatest to descend and look into their own estate."

Sir John Charles's address will be published in full in the April issue of the *West London Medical Journal*.

GROUP PRACTICE LOANS

The Group Practice Loans Committee has advised the General Medical Services Committee that, owing to the rate at which applications are now coming in, and because the new money which comes into the fund in any one financial year is limited to £100,000 for Great Britain as a whole, future applicants may, if successful, find that there will be some delay before payment can actually be made. The Committee has decided that it will continue to consider all applications which are submitted to it, but it will, in giving its decision, inform doctors if there is likely to be any delay before money is available for payment.

S.H.M.O.s GROUP

The first meeting of the S.H.M.O.s Group Council, which was attended by representatives from every region in England and Wales and the Western and Northern Regions of Scotland, took place on March 21 at B.M.A. House. The members were welcomed by Dr. A. MACRAE, Secretary of the Association. G. WARING ROBINSON was appointed Chairman. The following have been appointed as the regional representatives on the Group Council: N. STRANG and A. T. G. EVANS (Newcastle); P. J. O'CALLAGHAN and J. A. DICK (Leeds); GWYN HOWELLS and G. WARING ROBINSON (Sheffield); C. B. V. WALKER and P. McCAULEY (East Anglia); L. H. ASHKEN and R. HOCHHAUSER (North-west Metropolitan); P. J. FEENY and W. DERWENT R. THOMPSON (North-east Metropolitan); J. D. LENDRUM and F. A. NASH (South-west Metropolitan); D. L. PUGH and T. REEVES (South-east Metropolitan); R. T. JAMES and J. A. RANKIN (Oxford); G. LOWE and J. C. McMASTER (South-western); G. M. L. JAMES and J. H. THOMAS (Wales); A. GORDON EVANS and F. E. GRIFFITHS (Birmingham); W. GRIFFEL and T. F. MCCARTHY (Manchester); W. D. GRAY and E. SNELL (Liverpool); A. A. DEWAR and J. F. SWAN (Western Scotland); R. W. BAXTER (Northern Scotland).

It was reported that, so far, about 450 S.H.M.O.s had applied to join the Group.

Hospital Medical Staffing

The report of the Medical Staffing Subcommittee of the Central Consultants and Specialists Committee was discussed and the following resolution passed for submission to the Central Consultants and Specialists Committee:

"That the S.H.M.O.s Group Council welcomes the amended proposals of the Medical Staffing Subcommittee, but wishes to emphasize (1) that the success of the scheme will depend entirely on the way in which it is interpreted; in the opinion of the Group Council it is essential that S.H.M.O.s, who form more than one-third of the consultant and specialist body, should have representation on all committees which may be concerned with the interpretation and implementation of the scheme; this will ensure that such committees have full information of the S.H.M.O. viewpoint and will be a token of the good faith of all concerned; and (2) that the position of S.H.M.O.s should be safeguarded so that no individual as a result of the implementation of the proposals suffers a loss of status or responsibility."

Organization of Group

It was proposed that nominations for future elections of the Group Council should be invited at regional meetings of S.H.M.O.s held each year between April and June, and that in the event of more than two nominations a postal ballot be held. Representatives should normally hold office for two years, the two representatives from each region to retire in alternate years, retiring members being eligible for re-election.

The present Group Council will continue in office until next year.

The Group Council appointed an executive committee of 12 members, including representatives of Scotland and Wales, with power to co-opt additional members if necessary for special purposes. The following members were appointed: S. F. LOGAN DAHNE, GWYN HOWELLS, G. LOWE, T. F. MCCARTHY, F. A. NASH, D. L. PUGH, T. REEVES, G. WARING ROBINSON, E. SNELL, J. F. SWAN, J. H. THOMAS, and W. J. WILSON.

Representation on Consultants and Specialists Committees

The question of representation of the Group on the Central Consultants and Specialists Committee was referred to the executive committee, and it was decided in the meantime to ask the Central Consultants and Specialists Committee to agree to the appointment of a second representative in addition to T. F. MCCARTHY.

It was also decided to ask the Central Consultants and Specialists Committee to recommend each regional con-

sultants and specialists committee to permit the appointment to it by local S.H.M.O.s of two direct representatives. Reciprocal arrangements for liaison with the Registrars Group were also approved.

Matters Referred to Executive Committee

Several items were referred to the executive committee for attention, including the question of collecting information on the nature and extent of consultant supervision, and a request from the Central Consultants and Specialists Committee for the views of the Group on proposals from the Treasury on fees for work carried out on behalf of Government departments.

A report was given to the Group Council on representations which were being made by the Staff Side of Whitley Committee B with the object of securing improvements in the remuneration of S.H.M.O.s.

The meeting concluded with a vote of thanks to W. J. WILSON for the valuable work which he had put in as Honorary Secretary of the Provisional Group; and also a vote of thanks to the Chairman.

HEALTH SERVICE ESTIMATES 1955-6

It is estimated¹ that an extra £22m. will be spent on the National Health Service, England and Wales, during 1955-6, making a total of £411m. Payments to hospitals will increase by nearly £20m. to £305m., an increase which includes an extra £460,000 in advances to hospital boards for capital account (total £10m.) and an increase of £19m. for advances for revenue account (total £285m.). The estimates for teaching hospitals and regional hospital boards expenditure are £40m. and £254½m. respectively.

General medical, dental, pharmaceutical, and supplementary ophthalmic services are expected to cost £133m., an increase of £3½m. Out of this £133m. it is estimated that payments to general practitioners will be nearly £55m., an increase of £2m., and the pharmaceutical service is expected to cost £42m. (after deducting £6m. for payments by patients), an increase of £24,000. The cost of the supplementary ophthalmic service will increase by £648,000 to £8m. (after deducting £5½m. for payments by patients). Compensation for the loss of right to sell medical practices is estimated at £2½m., a decrease of £56,000.

Scotland

The increase in expenditure on the National Health Service, Scotland, is estimated at £2m., making £52m. in all. The hospital estimates are increased by nearly £2m., advances to boards on revenue account being increased by £1½m. to a total of £35m. Advances to boards on capital account remain the same as for 1954-5—that is, £2m. Expenditure on general medical, dental, pharmaceutical, and supplementary ophthalmic services is estimated at £16m. (£407,000 increase), of which £7m. is for general medical services, £5m. for pharmaceutical services, and £760,000 for supplementary ophthalmic services (increases of £237,000, £30,000, and £40,000 respectively).

Other Items

It is estimated that £2,186,160 will be required for a grant in aid of the Medical Research Council and for a grant to the Council in respect of research schemes under conditional aid arrangements, an increase of £211,291 over the previous year. The estimate for the Polish Health Services under the Polish Resettlement Act, 1947, is £542,880 (a decrease of £21,320).

Subscription to the World Health Organization is increased by £40,950 to £384,900.

An annotation on the subject of the Health Service estimates appears on page 899 of the *Journal*.

MEDICAL VISITORS FROM OVERSEAS

B.M.A.'S HELP AND ADVICE

Nearly 200 guests accepted invitations to attend the B.M.A. Empire Medical Advisory Bureau's "at home" on March 29. Sir Arthur and Lady Porritt received the guests. During 1954 nine social functions were held by the Bureau and were attended by 1,154 overseas and 506 United Kingdom doctors and their wives. Five "at homes" were held in London, and two were held in Edinburgh, at the Association's Scottish House and at the Royal College of Physicians, Edinburgh.

The main aims of the Bureau are to welcome and provide a personal advisory service for practitioners from the Commonwealth countries, and to encourage them to turn to the Bureau for any help and advice they need during their stay in the United Kingdom.

Last year 1,235 new inquirers made contact with the Bureau, as compared with 1,108 during 1953. Of these, 1,158 came from the following Commonwealth countries abroad: South Africa (217), East Africa (10), West Africa (24), Australia (277), Canada (103), Ceylon (22), India (330), Malaya (17), Malta (3), New Zealand (48), Pakistan (43), Rhodesias (7), British West Indies (20), British Guiana (2), Borneo (1), Cyprus (10), Hong Kong (11), Mauritius (5), Sudan (5), Zanzibar (1), and two were unclassified. Among the 1,810 inquiries made during the year, 432 related to courses of instruction, diplomas, and examinations, and 443 to hospital appointments, part-time employment, and locums.

Finding accommodation for visitors in houses, flats, hostels, hotels, and boarding-houses is also an important part of the Bureau's work. Inquirers are encouraged to write about accommodation some months before arrival, and in 1954 294 doctors were helped in this way.

International Medical Visitors' Bureau

The International Medical Visitors' Bureau of the B.M.A., which offers a service similar to that of the Empire Medical Advisory Bureau, but to foreign doctors, was consulted by 314 new inquirers from 36 countries during 1954, compared with 320 from 33 countries during 1953. About 250 requests were also made for information about "holiday exchanges" by doctors or their families in the United Kingdom or in foreign countries. It is known that at least 40 such exchanges have been arranged as a result of contacts made after inquiry at the Bureau. The majority of inquirers during the past four years came from U.S.A. (92), South America (3), France (17), Germany (35), Austria (13), Netherlands (5), Denmark (3), Norway (5), Sweden (8), Switzerland (19), Italy (15), Israel (8), Iraq and the Near East (18), and Egypt (15). Many inquiries for help with accommodation were met.

Pamphlets describing the objects and facilities of the International Medical Visitors' Bureau (IMVB 10/5) and of the Empire Medical Advisory Bureau (EMAB 10/12) are available to inquirers and visitors of the Bureaux.

A report of the work of the two bureaux was published in the Annual Report of Council (*Supplement*, March 19, p. 105).

REMUNERATION OF MEDICAL OFFICERS
IN PUBLIC HEALTH SERVICE

The arbitration hearing by the Industrial Court of the dispute in Committee C of the Medical Whitley Council over the remuneration of medical officers in the Public Health Service took place on March 29 and 30. The Court will announce its decision in due course.

Mr. B. J. N. MACKENNA, Q.C., and Mr. S. B. R. COOKE, instructed by Messrs. Hempsons, appeared for the Staff Side.

Correspondence

Reform of the Association's Constitution

SIR,—Mr. N. Ross Smith's article (*Supplement*, March 26, p. 117) is a valuable contribution to the consideration of this important subject and merits the closest study. He is a man of wide experience, but, as with all of us, this experience is limited by his own environment. What he says by way of the need for reform may well be true of Bournemouth and suchlike areas, but I do not think that it will be accepted as a statement of fact in the more populous midlands and north.

He suggests that there is little importance for the Council being elected on a geographical basis. This presupposes that problems facing different parts of the profession are identical throughout the country, but this is not so, and when attending national executive meetings of various bodies in London I am often impressed by this fact. It would do great harm to the B.M.A. if members felt that their part of the country was not represented on the Council by somebody who knew local conditions and with whom they were in touch (or could be if they so desired). I can see no advantage in a Council constituted as suggested by Mr. Ross Smith. It would be a most retrograde step to allow Council to determine policy without reference to the general body of members.

So far as the Representative Body is concerned, I fail to see where the suggested annual conference of delegates is any improvement. Many of us feel that the case for the need to reform the Representative Body has not been proved, but, if it had, Mr. Ross Smith's idea does not appear to solve the present alleged difficulties. There is possibly more to be said for his suggestions about the scientific meeting. When it comes to local reorganization I think that local conditions vary so enormously that any reforms need to be most flexible and that what suits a compact area like Liverpool may be unsuitable to Hampshire, and vice versa. But, wherever the area's situation, I think that the local machinery needs strengthening and that it would be helpful to the strength of the organization if the secretaries could spend more time in the Divisions. In a compact area like Merseyside I believe that the Branch is fulfilling a useful co-ordinating function which could not be so well carried out in London. I speak as secretary of the Branch and past chairman of the Liverpool Division.

What Mr. Ross Smith sees as a weakness in the relationship between the B.M.A. and the autonomous bodies I see as a source of strength—namely, that non-members of the B.M.A. are willing to accept these bodies as their mouth-piece. It seems self-evident that under these circumstances these bodies can claim to represent the profession and not just the B.M.A. when speaking to authority. It is not desirable that there should be a closer integration of the autonomous organizations into the structure of the Association. Before we make radical alterations in our Constitution let us be convinced that what we are doing is really an improvement and is not going to be a cause of greater disunity. Attendances at B.M.A. meetings, though depressingly poor, are no worse than attendances at meetings of non-medical bodies, and are not likely to be increased by any of their suggested alterations.—I am, etc.,

Liverpool, 9.

V. COTTON-CORNWALL.

Dispensing Doctors

SIR,—With the introduction of form E.C.10(D) another bale of straw has been loaded on the back of that uncomplaining camel, the dispensing doctor. We are told that this form has been introduced "with the agreement of the profession" in order to simplify investigations into prescribing of items for which extra payment is allowed. Why must our masters insist on going to Birmingham by way of Beachy Head? How many of the members of our profession who so blithely agreed to this new imposition have

the slightest conception of the complexities of rural dispensing practice? Already we have our difficulties of delivery (where should we be without those stalwarts, the milkman and the postman?), the collection of shillings, forms E.C.57, and the list of "expensive" drugs. Many of us have patients in two counties, and most of us no doubt have a proportion of "prescribing" patients; it may therefore be necessary to carry round in the bag four separate pads of prescription forms as well as a list of who is and who is not on our dispensing list. The net result is certainly to bring closer the day we go to Paradise by way of Kensal Green.

Yet it could all be so simple. Over two years ago in a letter to the *Supplement* (September 20, 1952, p. 138) I gave the outlines of a scheme which would reduce paperwork to a minimum, simplify the investigation of prescribing costs, and abolish the manifest anomalies of the list of "expensive" drugs (for how many months did we supply methyltestosterone to our patients on the instructions of gynaecologists, at 1s. the tablet of 10 mg., before this drug finally achieved its place on the "expensive" list?). The essence of this scheme is that the dispensing capitation fee should be designed to cover (a) the labour of dispensing, and (b) the cost of containers; and a very fair figure would be 5s. per caput per annum. All drugs, cheap, expensive, proprietary, or official, should be supplied on indent, and the cost paid by the Ministry; let the Ministry haggle over its discount; after all, we are not in competition with the chemists—we provide a service in areas where they find it uneconomic to trade. I would suggest one further simplification: introduce a standard form E.C.10 valid throughout the country, instead of one for each county, but stamp the back with the doctor's name, as with certificates of incapacity. How simple this would make the task of investigators into prescribing costs; for dispensing patients, check the cost of indents against stocks held, adding in the capitation fee; for prescribing patients, collect and price the scripts legibly stamped with the doctor's name.

Who can possibly object to this scheme? Large-list firms who pay a dispenser and are paid on the basis of the Drug Tariff at present, can still pay their dispenser and not be out of pocket. The small-list single-handed dispensing doctor need no longer read up the appendix to E.C.N.151 in fear and trembling when his patient returns from out-patients with the encouraging advice of the consultant, "I am writing to your doctor to arrange your treatment," ringing in his ears. Indeed, this scheme might well bring home some of the responsibility for excessive prescribing costs to sources hitherto uninvestigated and inviolate.—I am, etc.,

Chieveley, Berks.

JOHN RICHARDS.

Certificate of Public Health

SIR,—I am very concerned about the action the Council proposes to take—that is, to discontinue the Certificate of Public Health (recommendation (a), appendix V, Annual Report of Council, *Supplement*, March 19, p. 111). I wonder if the chief purpose of the C.P.H. has been fully considered by the Public Health Committee. I strongly advocated the C.P.H. for the purpose of training the medical student in preventive medicine by making it one of the subjects for qualification in the "final." From my long association with G.P.s I am convinced that their attitude to preventive medicine will not change till this subject is given the same prominence in the curriculum as medicine, surgery, and obstetrics. I contend that the weakness of the National Health Service in prevention has led up to the excessive drug bill.

A point which does not seem to have been considered in framing the Diploma of Public Health course is the status of the medical officer of health. The M.O.H. is a specialist officer and he should be on the same footing as other specialists in the profession. I contend that this calls for a regrouping of the higher qualifications in public health and preventive medicine and placing them on the same level

as the qualifications of other specialists. The D.P.H. should be a doctorship (and not a diploma). A fellowship should be instituted for original research and new investigation in the public health field. This would place the M.O.H. in his rightful place as one of the consulting staff in teaching hospitals and in a professorship in the university staff.

As the administrative officer of his area the M.O.H. could be brought into closer touch with the profession by passing all certification under the National Health Service through the department of the medical officer of health for analysis and tabulation. This would give the M.O.H. fuller information on the state of health of his area. Further, as an administrator the M.O.H. should be represented on all local committees dealing with the profession.—I am, etc.,

Southport.

S. T. BEGGS.

Branch and Division Meetings to be Held

CAMBRIDGE AND HUNTINGDON DIVISION.—At Lecture Room, Addenbrooke's Hospital, Cambridge, Friday, April 15, 3 p.m., annual general meeting.

CHESTERFIELD DIVISION.—At Walton Sanatorium, Chesterfield, Friday, April 15, 8.45 p.m., meeting. Talk by Dr. A. W. D. Leishman: "Some Aspects of Hypertension."

DARTFORD DIVISION.—At Bexley Maternity Hospital, Thursday, April 14, 8.45 p.m., annual general meeting.

EAST KENT DIVISION.—At Chez Laurie Restaurant, Thanet Way, Herne Bay, Thursday, April 14, 7.30 p.m.; dinner, 8.45 p.m., Dr. H. Sterndale: "Toxaemia of Pregnancy."

GUILDFORD DIVISION.—At Royal Surrey County Hospital, Guildford, Thursday, April 14, 8.30 p.m., meeting. Lecture by Dr. R. Forbes: "Recent Developments in Medical Litigation."

HARROW DIVISION.—At Myllet Arms Hotel, Western Avenue, Perivale, Saturday, April 16, 8 for 8.30 p.m., dinner. Members and ladies and medical guests and ladies are invited.

KINGSTON-ON-THAMES DIVISION.—At Epsom District Hospital, Dorking Road, Epsom, Surrey, Tuesday, April 12, 7.45 p.m., clinical meeting.

LEWISHAM DIVISION.—At Lewisham General Hospital, High Street, Lewisham, S.E., Sunday, April 17, 10.45 a.m., clinical meeting.

MID-HERTS DIVISION.—At Wellington Court Clinic, Bricket Road, St. Albans, Friday, April 15, 8.45 p.m., meeting.

MONMOUTHSHIRE DIVISION.—At St. Mellon's County Club, Thursday, April 14, 7.30 for 8.15 p.m., dinner lecture meeting. Address by Mr. Dd. M. Lloyd, M.A. Members' wives are invited.

NORTH STAFFS DIVISION.—At Grand Hotel, Hanley, Tuesday, April 12, 8 p.m., supper meeting. Talk by Professor R. E. Tunbridge: "Rehabilitation."

ST. PANCRAS DIVISION.—At Committee Room A, B.M.A. House, Tavistock Square, London, W.C., Thursday, April 14, 8.30 p.m., meeting. Dr. R. T. Brain: "Some Dermatological Problems in Children" (illustrated by colour slides). Members of the City Division are invited.

SOUTH STAFFS DIVISION.—At Medical Lecture Hall, Royal Hospital, Wolverhampton, Friday, April 15, 8.30 p.m., annual general meeting.

SUTTON COLDFIELD DIVISION.—At Sutton Coldfield Hospital, Thursday, April 14, 9.15 p.m., annual general meeting. Short film by Dr. F. H. Milner, Ph.D., F.R.I.C.: "Allergy."

WEST DENBIGH AND FLINT DIVISION.—At Talardy Hotel, St. Asaph, Thursday, April 14, 8 p.m., annual general meeting.

WEST HERTS DIVISION.—(1) At West Herts Hospital (Physiotherapy Department), Hemel Hempstead, Tuesday, April 12, 8.30 p.m., general meeting, followed by a clinical meeting. (2) At Stanboroughs Hydro, Watford, Wednesday, April 13, 8.30 p.m., annual general meeting. Film: "Return to Action," followed by speaker from Ministry of Labour on same subject.

WESTMINSTER AND HOLBORN DIVISION.—At Holborn Town Hall, London, W.C., Thursday, April 14, 8 p.m., ordinary meeting.

A NEW HOUSING ESTATE PRACTICE IN RELATION TO ESTABLISHED PRACTICES

AN ANALYSIS AFTER TWO YEARS

BY

A. LILKER, M.D.

The problem of providing general medical services on new housing estates rarely fails to arouse a heated controversy, and the clash of conflicting interests often reverberates on the pages of the *Supplement*: its echo was even heard recently at a meeting of the G.M.C. (*Supplement*, December 11, 1954, p. 217). Long before the first house is roofed the local authority raises the question, and places the local medical committee in the invidious position of devising a solution which would satisfy the executive council and the population without incurring an accusation of favouritism or offending the legitimate interests of established practices.

The wisdom of creating and filling "vacancies" has been contested, and in many towns housing estates were provided with branch surgeries with or without a resident caretaker. The relative merits of independent practices and branch surgeries of established practices are still being debated, and it is hoped that our experience of two years on the Stockport main estate of 2,000 houses under construction will contribute to the solution of such problems elsewhere.

Growth of the Practice

The Stockport vacancy, advertised in the usual way, was filled by me 27 months ago, when I found about 350 houses built and occupied. To date (December, 1954) 700 houses are occupied, and the occupation rate is approximately 180 a year. At the end of my first four months (December, 1952) I had 250 patients on my list, a year later (December, 1953) 1,000, and now about 1,500.

In order to assess the extent and the rate of losses of individual Stockport practices as a result of transfer of patients to me, names preceding my own on 1,455 medical record cards (E.C.6) available were inspected and the patients classified.

On 33 cards the name of the previous doctor did not appear. First registrations accounted for 93 patients. (Many children up to 3 years of age, though having received attention from a previous doctor, were not registered.) In 160 cases the patients came from doctors outside the Stockport area. This leaves 1,169 patients coming from 33 main Stockport practices with 48 principals. The average loss per principal after 27 months is therefore 24 patients. As the average number of patients per principal in Stockport is about 2,500, this loss would represent 1%.

Further analysis shows:

13	principals	lost	1-10	patients
14	"	"	11-20	"
6	"	"	21-30	"
6	"	"	31-40	"
8	"	"	41-50	"
1	principal	"	85	"

For the purpose of this survey 18 practitioners, including 7 out of the 8 with losses between 41 and 50, employing five assistants, with lists ranging from 3,400 to 5,000 per principal, were kind enough to disclose to me the size of their lists.

Their losses per 1,000 patients approximately were:

5	principals	lost	5	patients
2	"	"	6	"
1	principal	"	7	"
4	principals	"	9	"
6	"	"	14	"

This gives an approximate average of 9 patients per 1,000 per principal.

A serial correlation test for randomness in this table shows a bias ($r=0.422$) in the movement of patients, undoubtedly to be found in the 14/1,000 group. All six principals practise in densely populated industrial areas, have big practices, and several of them encourage their patients to transfer. While statistically significant, this proportion remains unimportant from a practical point of view and would compare favourably with the usual movement of patients between practices over a similar period (27 months).

In the case of the single practitioner who lost 85 patients, an unusual factor, which need not be disclosed here, has now ceased to operate and his further losses are expected to be minimal.

Some Observations

I have noted, particularly during the last few months, a lower rate of transfers as related to the growth of the estate, after taking into account the decreasing proportion from houses occupied at the time of starting the practice. This is not necessarily connected with a personal factor, and can be easily explained by improved travelling and telephone facilities and therefore easier contact between the patient and his medical attendant in town. This tendency to retain one's doctor after removal is very marked: I estimate that about 50% of those who moved into their new homes three years ago have not re-registered. With the increase of the population of the estate this well-perceptible social trend is gaining force, and it can be predicted with reasonable accuracy that the average loss of established practices of 5 per 1,000 in the first calendar year, and 3.3 per 1,000 in the last, will be reduced to the negligible proportion of 2 or fewer patients per 1,000 in forthcoming years. Such losses represent only a fraction of the usual shift of patients in most industrial practices.

I have no doubt that this low proportion of losses will surprise many. I have asked several practitioners: "In your estimate, how many of your patients have transferred to me?" Invariably the estimated number was four or five times greater than the actual.

And here are a few other interesting and often unexpected observations arising out of this survey:

Healthy families show a greater tendency to transfer on changing their residence than those used to frequent medical attendance.

The rate of transfer in summer, when the incidence of illness is low, is significantly higher than in winter, and is at its lowest during a mild epidemic.

Patients advised by their doctor to transfer on account of distance are not any readier to do so than those whom their doctor is prepared to retain. Practitioners known to take great pains to retain their patients do not show any significant decrease of losses.

Two principals who employed me as an assistant for two years and one year respectively—and who kindly consented to my practising in their neighbourhood—sustained losses well within the average.

Hardly any psychosomatic or neurotic patients, usually so ready to change their doctor, came to me from council houses; in "compensation" I receive a fair share of them from practices in my immediate neighbourhood.

Summary

A practice on a new and easily accessible housing estate built up in over two years drew most of its 1,500 patients from 48 principals in 33 practices in a proportion ranging from 5 to 14 patients per 1,000 with an average of 9 per 1,000. The trend of transfers suggests that further losses of other practitioners are not likely to exceed an average of 2 per 1,000 a year.

The significance of this paper will be enhanced if it is recorded that, though a comparative stranger, I have received nothing but kindness, co-operation, and indulgence from most of my colleagues and every assistance from the Local Medical Committee, Stockport Executive Council, and Stockport Corporation.

REMUNERATION OF GENERAL PRACTITIONERS

DISTRIBUTION OF FINAL SETTLEMENT

Following discussions between the G.M.S. Committee and the Ministry of Health, it has at last been possible to determine the size of the Central Pool for the year 1952-3, and therefore the amount of the final settlement for that year.

The payments made during the financial year 1952-3 were based on the old distribution scheme, and at that time every effort was made to distribute the total pool, so far as it could be calculated, during the course of the year. Thus, as the G.M.S. Committee anticipated, the final settlement is very small, but the amount payable to individual doctors will be included in the June quarterly cheque.

The amount of the final settlement for the year 1953-4 is likely to be substantial, and it is hoped that payment will be made within the next 12 months.

ASSISTANTS AND YOUNG PRACTITIONERS SUBCOMMITTEE

FREEDOM OF OPINION

A meeting of the Assistants and Young Practitioners Subcommittee of the General Medical Services Committee was held at B.M.A. House on April 6. Dr. F. GRAY occupied the chair.

The first item on the agenda was the consideration of a letter published in the *Supplement* of March 26 (p. 126) under the heading, "Assistants in General Practice." Two of the six signatories of this letter, Dr. H. P. HILDITCH and Dr. L. RUSSELL, were members of the Subcommittee and also its representatives on the G.M.S. Committee. The letter had expressed views on the report of the G.M.S. Committee's Subcommittee on the employment of assistants, and these views, in the chairman's opinion, were inconsistent with the resolution welcoming the report passed by the Assistants and Young Practitioners Subcommittee at its last meeting (*Supplement*, March 5, p. 69).

Dr. GRAY said that the publication of this letter made it necessary that the Subcommittee should clarify its position.

Did it mean that the Subcommittee had changed its mind since its last meeting and wished to go back on its resolution? If so, the G.M.S. Committee would want to know. Dr. L. RUSSELL said that he and Dr. Hilditch—he felt he could speak for Dr. Hilditch, who was unable to be present—had no intention of involving the Subcommittee when they signed the letter. They were writing in a personal capacity and on behalf of another organization, and he thought that what was written had made that obvious.

After some discussion, in which it emerged that none disputed the right of any member of the Subcommittee publicly to express a personal view contrary to that held by the Subcommittee, provided it was made clear that it was a personal view and not that of the Subcommittee, a resolution was passed in the following terms:

"That the Subcommittee, in order to clarify any doubts which may have arisen as a result of the publication of the letter in question in the *British Medical Journal*, reaffirms its previous decision."

The Subcommittee also affirmed its confidence in Drs. Russell and Hilditch.

Change of Doctor

The Subcommittee considered a resolution by Dr. ELEANOR SAWDON that the procedure for change of doctor for a person who had not changed his address should be simplified. Dr. Sawdon thought that the present restrictions, and especially the 14-day waiting period, were cumbersome and irritating to patients, doctors, and executive councils. She proposed that a person should be able to change doctors by sending his medical card to the executive council together with a letter informing the council of his intention to transfer, and that the council should return the card with a transfer slip attached which would authorize immediate transfer. At present the earliest date on which transfer could take place was 14 days. Dr. Sawdon did not wish to disturb the existing arrangement by which a person can transfer immediately by getting his doctor's consent recorded on the medical card.

The majority of the Subcommittee were against any change in the 14-day interval, and the resolution was not agreed to.

SUPPLEMENTARY ANNUAL PAYMENTS

The Ministry of Health has sent a circular (E.C.L.17/55) to executive councils giving further guidance on certain points in the arrangements for supplementary annual payments to single-handed small-list practitioners. The arrangements for these payments were first set out in a previous circular (E.C.L.50/54) and were summarized in the *Supplement* (September 4, 1954, p. 107).

Doctors Over Sixty Years of Age

The intention of the supplementary annual payment scheme was that a doctor over 60 years of age should not be automatically eligible for a supplementary payment unless he had been conducting single-handed for the last ten years the practice in respect of which he was applying for a supplementary payment. To make this clear the Ministry is amending the first sentence of paragraph 5(a) of the original E.C.L. to read as follows: "He should be 60 years of age or over, have a list of at least 300 patients at the beginning of the quarter and have been in single-handed practice for the last ten years in the practice from which his application is made."

Where these conditions are not fully satisfied, but the practitioner was in practice in the area before April 1, 1953, the executive council, states the new circular, should refer the case to the central committee set up for the purpose for a formal decision. In other cases it is open to the practitioner to ask the council to refer his application to the central committee for a decision. It is also stated, to avoid any doubt, that a doctor who is in receipt of a hardship payment under the old arrangements is not eligible for a supplementary annual payment as well.

Resignation or Death after April 1, 1953

If a doctor satisfied the criteria for a supplementary annual payment on April 1, 1953, but has since resigned from the list or died, a supplementary annual payment should, on application, be granted up to the date when he ceased to be on the list.

Re-entry to the Scheme

A practitioner may lose his supplementary annual payment because his list falls below 300 or decreases by more than 10% over four consecutive quarters. The Ministry points out that where this happens, but the practitioner subsequently builds up his list again, he is eligible to reapply for a supplementary annual payment, which may be granted if the list has remained over 300 for four consecutive quarters, and, in the case of doctors under 60 years of age, has increased by at least 10% over those four quarters.

The Ministry also includes in the circular some information on the effect of dispensing payments on the calculation of income for purposes of hardship payments and initial practice allowances. The information in the circular will be sent shortly to all general practitioners in the Service in an executive council notice.

Northern Ireland News

NORTHERN IRELAND BRANCH CONFERENCE

A conference of chairmen, honorary secretaries, honorary treasurers, and representatives of Divisions of the Northern Ireland Branch was held on March 6 in the Grand Central Hotel, Belfast. Dr. L. S. POTTER, Assistant Secretary of the B.M.A., was also present. Dr. S. M. BOLTON, President of the Branch, took the chair.

A discussion took place on the membership of the Association, and Dr. POTTER said it stood at 65,829 at January 19. Sixty-five per cent. of the profession were Association members in Northern Ireland as compared with 70% in England. The Divisional figures were: Belfast 60%; County Armagh 73%; Fermanagh 66%; Londonderry 70%; North-East Ulster 70%; County Tyrone 60%; and West Down 56%. These figures showed that four Divisions were above average and three slightly below.

Recruitment

At the Conference of B.M.A. Honorary Secretaries in 1954 it had been suggested that a great deal could be done to recruit ex-members by personal approach by the honorary secretary of the Division or by a member of the divisional executive committee. Dr. POTTER stated that specimen draft letters had been sent to honorary secretaries of Divisions to send to non-members and ex-members, and the regional office would undertake to carry out the work involved. It was therefore only a question of asking the office to send out the letters.

Newly qualified practitioners were entitled to a reduced subscription for the first five years from the date of qualification. Every effort was made to welcome the newly qualified to the Association. The luncheons given by the Northern Ireland Branch Council to new medical graduates in July and December had proved very useful in obtaining new members. Dr. Potter pointed out that divisional secretaries should get in touch with new members in their Divisions, and particularly those attached to hospitals, and inform them of the Association's activities. The Constitution Committee in a recent questionnaire had inquired whether it was more desirable for the executive committee of a Division to elect members than for the Branch Council to do so. Dr. CHAPMAN, honorary secretary of the Belfast Division, thought that the Division should elect new members.

Attendance at Meetings

Dr. D. L. HEMMINGWAY, honorary secretary of the County Armagh Division, asked if there was any way in which divisional secretaries could encourage members to attend divisional meetings. He inquired if the *Journal* would consider publishing notes on the activities of the Northern Ireland Branch, and Dr. POTTER suggested that honorary secretaries should forward information about meetings, lectures, and social functions to the *Journal*.

Dr. WATSON, honorary secretary of the Tyrone Division, stated that in his area there were two active medical clubs which met once a month. These meetings were very popular and it was difficult to get members to attend B.M.A. meetings. It was suggested that the medical clubs might be asked to run a meeting in conjunction with the Division. Several members thought that light refreshments should be provided at B.M.A. meetings as it would give members an opportunity to talk informally.

Dr. H. J. CRONHELM, honorary secretary of the Branch, stressed the importance of keeping the Headquarters film library up to date, and Dr. POTTER assured the meeting that this was being done.

During a discussion on the divisional areas in Northern Ireland, Dr. W. J. C. HILL, honorary secretary of the North-East Ulster Division, spoke of the advantages of composing the Division on county lines. Dr. N. F. KELLY, of Belfast, said that members in the North-Down area, who were included in the Belfast Division, found it difficult to attend meetings. It was decided that the Branch Council should be requested to appoint a committee to consider the problem of the divisional areas, and where a member was on the fringe of two Divisions he should be given the choice of joining either.

Correspondence

Assistants in General Practice

SIR,—I read with interest the proposals of the General Practice Reform Association mentioned by Dr. H. P. Hilditch and his colleagues (*Supplement*, March 26, p. 126). The proposal to abolish assistants altogether would obviously create real unemployment, as well as abolishing the only sane way to embark on general practice. I suppose, however, the idea of reducing the maximum list to 2,000-2,500 is that out of these "clippings" enough practices would be created to absorb all those disgruntled assistants—an idea which a little plain arithmetic would quickly disprove.

As a principal I too would like to propose reforms, the chief being that assistants should think less about their grievances and more about whether they are really worth the generous salaries which are at present being offered. Replies to advertisements for locums throw a good deal of light on the mental attitude of many unestablished practitioners. Out of many replies few give any useful evidence of their experience or qualifications, most write only to inquire what salary, conditions, and "off-time" are offered.

The report of the Medical Practices Advisory Bureau in the same issue (p. 120) proves that very little real unemployment exists, but that vacancies in unattractive areas cannot be filled even if the salary is satisfactory. I am afraid the unestablished practitioners are still living in Cloud Cuckoo Land, in which they want the world handed them on a plate, and the sooner they snap out of their orgy of self-pity the better. Apparently disgruntled by the fact of being assistants, they are, however, unwilling to serve the apprenticeship of hard grinding work in unattractive areas which most principals have had to face before they attained their present enviable (?) position.—I am, etc.

London, E.2.

D. E. PEAKE.

SIR,—I feel very sorry indeed for the number of competent young doctors striving unsuccessfully to become principals in general practice. It is likely that in the course of

the next few years we may see a number of doctors with experience in hospitals and as assistants who are actually unemployed, or unable to find a post offering them remuneration sufficient to keep the wife and family they have not unnaturally acquired by this time.

One of the main reasons for this is so obvious that I am amazed that it has escaped official and frequent comment for so long. In order to take another doctor into partnership a principal has to offer him a minimum of £1,500 a year, without being able to charge him any capital sum to offset this very considerable loss of income. To find such a sum is particularly difficult for single-handed practitioners, who may even be put in the ludicrous situation of having to borrow money in order to pay it out to a partner. Moreover, there is the unwritten obligation to increase the new partner's share until within 6-10 years it becomes an equal one, or risk the vague but ever present charge of "hidden sale of goodwill." In many country districts sheer geography limits the chance of ever doubling the size of the practice, so that taking a partner may well mean that the principal will never again earn an income equal to his former one. It is surely this, rather than the other and less creditable reasons advanced, that blocks the way for so many young men.

The solution to the problem is a simple one. Compensation for the value of our practices was fixed on the 1946-8 incomes; it is a safe assumption that, when those of us who are young or middle-aged come to retire, this sum will bear very little relation to the true value of our practices. Indeed, in a great many cases the income from practices has greatly increased, even doubled, since 1948, and we shall be quite uncompensated for this increased value. Let the Minister allow principals to sell to incoming partners a share of their practice equivalent to not more than the increase in practice income since 1948, at an official rate, say one and a half years' purchase. This will solve the problem more quickly and with more fairness than a whole number of new restrictions and regulations limiting the freedom of action of doctors.—I am, etc.,

Theale, Berks.

H. S. SAMUEL.

CLAIRE WAND FUND

ESSAY COMPETITION

The Trustees of the Claire Wand Fund invite entries for an essay competition which the Fund is sponsoring during the present year on the following subject: "Postgraduate Education of Newly Qualified Doctors in Preparation for Entry into General Practice." The competition is open to any qualified medical practitioner. The prizes offered are: First prize 200 guineas; second prize 75 guineas. Certificates will also be presented to the first and second prizewinners; other special prizes and/or certificates may be awarded if the entries merit such a course.

Should the Trustees decide that no essay submitted is of sufficient merit, a particular prize will not be awarded. The decision of the Trustees will be final. It is a condition of entry for the competition that the copyright in any essay for which a prize or certificate is granted shall be the property of the Trustees. The first and second prizes will be presented at the Annual Conference Dinner in June, 1956. The competition will close on January 31, 1956.

Essays should be not less than 6,000 words and not more than 10,000 words in length. Each essay, which must be unsigned, must be typewritten or printed on one side of the paper only and accompanied by a note of the candidate's name and address.

Entry forms should be obtained from the Secretary, Claire Wand Fund, B.M.A. House, Tavistock Square, London, W.C.1, to whom all inquiries relative to the prizes should be addressed.

R. H. CURRER,
Secretary,
Claire Wand Fund.

Association Notices

AREA OF MOMBASA DIVISION OF KENYA
BRANCH

Notice is hereby given of a proposal by the Mombasa Division, endorsed by the Kenya Branch, to include within the area of the Division, which at present covers the Island of Mombasa, the Coast Province of the Colony and Protectorate of Kenya.

Any member affected by the proposal and objecting thereto is requested to write to the Secretary of the Association by May 31, stating the objection and the ground therefor.

A. MACRAE,

Secretary.

Diary of Central Meetings

APRIL

- 18 Mon. Registrars Group Executive Committee, 2 p.m.
(Date changed from April 20).
20 Wed. Conference of Advisory Councils on Occupational Health, 12 noon.
20 Wed. Committee on Homosexuality and Prostitution, 2 p.m.
20 Wed. Central Consultants and Specialists Executive, 2.15 p.m.
21 Thurs. G.M.S. Committee, 10.30 a.m.
21 Thurs. Trustees of the Dain Fund, 1 p.m.

Branch and Division Meetings to be Held

CROYDON DIVISION.—At the Greyhound, Croydon, Thursday, April 21, 7.30 for 8 p.m., annual dinner and dance.

DEWSBURY DIVISION.—At Board Room, General Hospital, Dewsbury, Friday, April 22, 8.30 p.m., meeting. Annual B.M.A. Lecture by Dr. R. E. Bonham-Carter: "Bronchospasm."

DUNDEE BRANCH.—At Department of Surgery, Queen's College, Dundee, Friday, April 22, 8.30 p.m., joint meeting with East of Scotland Faculty of College of General Practitioners; lecture by Professor A. Mair: "General Practice and Medical Education." Members of the Perth Branch are invited.

GREENWICH AND DEPTFORD DIVISION.—At St. Alfege's Hospital, Vanbrugh Hill, Greenwich, S.E., Wednesday, April 20, 8.30 p.m.; clinical meeting.

HOLLAND DIVISION.—At Johnson Hospital, Spalding, Friday, April 15, 9 p.m., annual meeting.

KENSINGTON AND HAMMERSMITH DIVISION.—At St. Charles's Hospital, Ladbroke Grove, London, W., Friday, April 22, 3.30 for 4 p.m., clinical meeting.

KESTIVEN DIVISION.—At Bristol Arms Hotel, Sleaford, Thursday, April 21, 7.15 for 7.45 p.m., meeting. Dr. Douglas French: "Opportunities for Research in General Practice."

METROPOLITAN COUNTIES BRANCH.—At B.M.A. House, Tavistock Square, London, W.C., Tuesday, May 3, 3 p.m., annual general meeting. President's Address by Dr. R. Hale-White: "Patients, Politics, or Both?"

NORTH-EAST ESSEX DIVISION.—At Nurses' Recreation Hut, Maternity Home, Lexden Road, Colchester, Wednesday, April 20, 8.15 p.m., meeting. Two films: (1) "The Four-minute Mile, an account of Roger Bannister's record-breaking mile"; and (2) "The General Practitioner and Rheumatic Disease."

NORTH-WEST WALES DIVISION.—At Royal Hotel, Caernarvon, Saturday, April 23, 7.30 p.m., annual meeting, followed by a dinner and social meeting. Medico-political discussion: "The National Health Service." Guest speakers, Mr. Goronwy O. Roberts, M.P., and Mr. Cledwyn Hughes, M.P. Ladies are invited to the dinner and discussion.

NORTH OF ENGLAND BRANCH.—At Royal Victoria Infirmary, Newcastle-upon-Tyne, Thursday, April 21, 7.15 p.m., a radio-logical evening.

OLDHAM DIVISION.—At Albion Club, Queen Street, Oldham, Monday, April 18, 9 p.m., meeting. Lecture by Dr. R. S. F. Schilling: "Industrial Pulmonary Diseases Caused by Vegetable Dusts—Particularly Byssinosis."

SCARBOROUGH DIVISION.—At Scarborough Hospital, Thursday, April 21, 8.30 p.m., general meeting.

SCUNTHORPE DIVISION.—At the Blue Bell Hotel, Scunthorpe, Thursday, April 21, 8 p.m., annual general meeting.

SOUTHAMPTON DIVISION.—At Royal South Hants Hospital, Southampton, Wednesday, April 20, 8.30 p.m., annual general meeting. Retiring Chairman's Address by Dr. W. L. M. Bigby: "Anaesthetic Risks."

SOUTH-EAST ESSEX DIVISION.—At Southend General Hospital, Friday, April 22, 8.30 p.m., annual general meeting.

TUNBRIDGE WELLS DIVISION.—At Kent and Sussex Hospital, Tunbridge Wells, Wednesday, April 20, 8.30 p.m., A.G.M.

WEST DENBIGH AND FLINT DIVISION.—At North Wales Hospital for Nervous and Mental Diseases, Denbigh, Tuesday, April 19, 2.30 p.m., clinical meeting.

WINCHESTER DIVISION.—At the Museum, Winchester College, Tuesday, April 19, 9 p.m., meeting. "Winchester Address" by the Rt. Hon. Lord Beveridge.

ANNUAL MEETING: TORONTO, JUNE 20-24

PRELIMINARY

Award of the Gold Medal

208. In South Australia there is a greatly honoured member of the Association, Sir Henry Simpson Newland, C.B.E., D.S.O., LL.D., M.S., F.R.C.S., F.A.C.S., F.R.A.C.S., who combines high professional distinction with a long and very notable record of service to the Association and the medical profession. Sir Henry is a Past President of the Royal Australasian College of Surgeons and of the Australian B.M.A. Federal Council. He has received the Gold Medal of the Federal Council. The latest honour conferred on him in his own country is the foundation of the Henry Simpson Newland Oration, which will be delivered for the first time in August this year during the Australasian Medical Congress (B.M.A.) in Sydney.

Many years ago the Representative Body elected Sir Henry a Vice-President of the Association. The Council has much pleasure in reporting that it has now decided to award him the highest honour that it can bestow, the Gold Medal of the Association for Distinguished Merit.

Dr. A. Talbot Rogers will represent the parent body at the Congress in Sydney next August, and it is hoped that on this occasion there may be an opportunity for him to present the Medal to Sir Henry on behalf of the Council.

Election of Vice-Presidents

209. For Sessions 1951-2 and 1952-3 the Representative Body elected overseas Presidents, one from the Medical

Association of South Africa (Dr. A. W. S. Sichel) and the other from the Irish Medical Association (Dr. P. T. O'Farrell). The Council considers that the services rendered by Dr. Sichel and Dr. O'Farrell fully warrant their being honoured by election to the office of Vice-President, and that this would also be a graceful compliment to their Associations. The Council has much pleasure in recommending:

Recommendation: That A. W. S. Sichel, LL.D., M.D. (Cape-town), be elected a Vice-President in recognition of his valuable services to the Association.

Recommendation: That P. T. O'Farrell, LL.D., M.D., F.R.C.P.I. (Dublin), be elected a Vice-President in recognition of his valuable services to the Association.

The War Memorial

210. The Council has decided to reproduce a photograph of the War Memorial in postcard form, with a short description of its symbolism. The postcard will shortly be available at Headquarters and at regional offices at the price of 6d.

Central Midwives Board

211. The constitution of the Central Midwives Board provides that it shall include six persons appointed by the Minister after consultation with such bodies as appear to him to be concerned, one of the six being a general practitioner. The Minister invited the Association to make a nomination and has appointed the Council's nominee, Dr. I. G. Innes (Hull).

Representatives at Conferences of Other Bodies*(Continuation of para. 8 of Annual Report)*

212. Mr. J. W. Tudor Thomas, the Immediate Past-President of the Association, has been appointed an official delegate of the Association at the Annual Meeting of the American Medical Association, to be held in Atlantic City in June. Mr. Tudor Thomas has been invited by the A.M.A. to take part in the proceedings at its Annual Meeting.

Professor Alex. Haddow, Director of the Chester Beatty Research Institute at the Royal Cancer Hospital, has accepted an invitation to take part in the Annual Meeting of the Medical Association of South Africa, and has been appointed as an official delegate from the B.M.A.

GENERAL MEDICAL SERVICES**Remuneration***(Continuation of para. 16 of Annual Report)**The Size of the Central Pool*

213. The further inquiry undertaken by the Board of Inland Revenue into practice expenses for application to the 1953-4 Pool has now been completed. The results are under consideration by the Committee in consultation with its expert advisers, and further discussions will take place with the Ministry so that the final settlement for that year can be determined.

The Committee has also received the Ministry's tentative proposals on possible methods of keeping the expense ratio up to date in those years when the Board of Inland Revenue is unable to undertake a full inquiry. The Committee is considering these proposals in consultation with its advisers.

The Danckwerts Award and the Small-List Practitioner

Since the issue of the original E.C.L. on the scheme of supplementary annual payments some doubt has arisen as to the circumstances in which a doctor can automatically qualify for one of these payments. Further instructions are now being sent to executive councils to clarify the situation, and the opportunity is also being taken of dealing with a number of other minor points arising from the scheme. The G.M.S. Committee hopes that, as a result, no small-list practitioner will be in any doubt as to his position under these arrangements.

The G.M.S. Committee was unable to accept the suggestion put forward by the Ministry that, in the case of applications for supplementary annual payments from general practitioners over the age of 75, the regional medical officer should visit the doctor concerned in order to be sure that the practitioner is, in fact, able to provide full general medical services. The Committee felt that this was a matter which could best be judged by the local medical committee in consultation with the practitioner's own local colleagues, but it has agreed that in cases of doubt it would be appropriate for a medical member of the Central Appeals Committee to interview the doctor in consultation with a member of the local medical committee or a near-by colleague. A circular letter setting out the arrangements which the Committee feels should be made in these circumstances has been sent to local medical committees.

Committee on General Practice of the Central Health Services Council*(Continuation of para. 20 of Annual Report)*

214. The G.M.S. Committee has prepared a document setting out the views of the Committee and of local medical committees on the various recommendations contained in the Report of the Committee on General Practice within the National Health Service, which was set up by the Central Health Services Council. This document will form the basis on which further discussions can take place with the Ministry on all aspects of the Cohen Report.

Group Practice*(Continuation of para. 19 of Annual Report)*

215. The Group Practice Loans Committee has advised the Council that, owing to the rate at which applications are now coming in and because the new money which comes into the fund in any one financial year is limited to £100,000 for Great Britain as a whole, future applicants may, if successful, find that there will be some delay before payment can actually be made. The Group Practice Loans Committee will continue to consider all applications which are submitted to it, but, when giving its decision, will inform doctors if there is likely to be any delay before the money is available for payment.

Assistants in General Practice

216. Early in 1953 the Assistants and Young Practitioners Subcommittee drew the G.M.S. Committee's attention to the difficulties which were being experienced by assistants in attaining principal status in the National Health Service. A number of suggestions for solving the difficulties have been put forward by the Subcommittee—directed in the main to a reduction of the additional list of patients allowed by virtue of the employment of an assistant. In the view of the G.M.S. Committee, however, none of the suggestions advanced would have successfully solved the main problem—that of the principal who advertises successive posts "with a view" and then has a series of assistants, none of whom is taken into partnership. The Committee therefore set up a special subcommittee to examine the problem and see what action could usefully be taken to meet the views advanced by the Assistants and Young Practitioners Subcommittee. This special Subcommittee has now completed its task and its report, which has the approval both of the G.M.S. Committee and of the Assistants and Young Practitioners Subcommittee, is being submitted to the Annual Conference. The Subcommittee's report is set out in Appendix VII.

Temporary Resident Fees

217. The G.M.S. Committee has continued to consider the difficulties which have arisen over the application of the criteria laid down for the purpose of deciding which cases should attract the lower temporary resident fee of 5s.

It will be remembered that executive councils, in consultation with local medical committees, are required to classify holiday camps and institutions into those in which it would be appropriate to pay the higher temporary resident fee of 17s., and those where the lower fee of 5s. would be more appropriate. The decision as to whether an institution is to be classified for the purposes of payment at the lower rate depends largely upon whether the doctor is in regular attendance and has facilities for seeing a number of patients at a fixed time and place.

The matter has been discussed with the Ministry of Health and, before making any radical alteration in the present scheme, the Committee decided to seek further information as to the size of the problem and the extent to which the lower rate of payment was being applied. Having considered the matter again in the light of the further information supplied by the Ministry, the Committee feels that a case does exist for giving local medical committees discretion to pay a fee for temporary residents which would modify the present somewhat rigid rates of payment. The matter is to be discussed with the Ministry on this basis.

Amendment of Service Committees and Tribunal Regulations*(Continuation of para. 26 of Annual Report)*

218. Negotiations have continued with the Ministry of Health on the recommendations made by the special Subcommittee which has been reviewing the Service Committees and Tribunal Regulations. The G.M.S. Committee

is pleased to report that agreement has now been reached on the various matters under discussion, and, subject to the approval of the Annual Conference, any necessary action, whether by means of amending regulations or otherwise, will be taken by the Ministry of Health.

Discount on Drugs

219. Negotiations have continued between the G.M.S. Committee, the National Pharmaceutical Union, and the Association of British Pharmaceutical Industry in an effort to secure an equitable rate of discount for dispensing doctors. The Committee has now been informed by the A.B.P.I. that it is prepared to recommend to its constituent members that manufacturers and wholesalers should increase to a material extent the professional discount allowed to N.H.S. dispensing doctors on ethical proprietary preparations. This offer is under consideration by the Rural Practices Subcommittee, since it is rural areas which are mainly concerned with this issue, and the Subcommittee's views will be reported to the Annual Conference and to the Representative Body in due course.

Employment of General Practitioners in Hospitals

220. The Representative Body last year expressed the view that there should be no reduction in the remuneration of general practitioners working in hospitals.

This matter has been considered by the G.M.S. Committee in consultation with the Staff Side of Committee "B" of the Medical Whitley Council.

The Council is glad to report that an attempt to lower the existing rates has been successfully resisted. The matter is, however, very much bound up with the investigation now being undertaken by the Central Consultants and Specialists Committee into the whole question of junior hospital staffing.

As soon as this investigation is completed it will be possible to fit general practitioners into the pattern proposed and at that point to consider the appropriate remuneration for the posts which they hold.

Representation of Regional Hospital Boards and Hospital Management Committees

221. At the Representative Meeting last year, several resolutions were passed, all aimed at securing more adequate representation of general practitioners at all levels of hospital administration.

This matter has been considered by the G.M.S. Committee, and in discussions with the Ministry every opportunity has been taken to stress the importance which the profession attaches to adequate general-practitioner representation. The G.M.S. Committee is watching the position carefully and will review the matter again when the results of the nominations for the next group of general-practitioner vacancies on regional hospital boards are available.

Rh Tests and Blood Grouping

222. Last year the Council was asked to ensure that when Rh tests and blood grouping are carried out a card should be supplied suitable for preservation by the patient. The G.M.S. Committee has now discussed this matter with the Ministry of Health and has been given to understand that group cards are normally given to all donors and antenatal patients throughout the country. There have apparently been difficulties in some areas and the Ministry has undertaken to give what help it can in these specific localities.

HOSPITAL AND CONSULTANT SERVICES**Remuneration of Hospital Medical Staff***(Continuation of para. 46 of Annual Report)*

223. The Council has considered the following Minutes of the A.R.M., 1954:

68. **Resolved:** That this meeting is dissatisfied with the recent consultant award, and the reasons given therefor.

70. **Resolved:** That this meeting deplores the inadequacy of the recent agreement reached on the remuneration of hospital medical staffs, and urges that steps be taken to reopen this matter immediately with a view to obtaining the implementation of the Spens Report as applied to consultants and specialists and obtaining adequate betterment. In the event of disagreement, the matter should be referred to arbitration.

71. **Resolved:** That a further attempt be made to make the present settlement retrospective to the date of commencement of negotiations.

90. **Resolved:** That the S.H.M.O. remuneration should be raised forthwith to approximate more nearly to that of consultant.

92. **Resolved:** That the value of the emoluments of house officers should remain at £100.

93. **Resolved:** That practitioners on the staffs of hospitals at present remunerated on G.P. 10(b) rates should also receive an increase in remuneration.

210. **Resolved:** That this meeting views with great concern any possible reduction in the remuneration of general practitioners working in hospitals.

The decisions of the Representative Body were conveyed, through the Central Consultants and Specialists Committee, to the Staff Side of Whitley Committee "B." The Staff Side has submitted claims to the Management Side:

(i) For a further increase in the remuneration of S.H.M.O.s;

(ii) for an increase in the remuneration of non-clinical medical superintendents;

(iii) for the payment of domiciliary consultation fees to members of hospital staffs holding whole-time contracts;

(iv) for an increase in the salary scales for regional hospital board headquarters medical staff to correspond with the increase given to hospital medical staff;

(v) for certain improvements in the emoluments of house officers.

In addition, the Staff Side is discussing with the Management Side the assessment of the residential emoluments of registrars. It has considered also the advisability of pressing for arbitration on the long-standing dispute concerning allowances for the professional expenses of whole-time officers, but has postponed a decision on this pending the outcome of the claim for the payment of domiciliary consultation fees.

The Staff Side considers it impracticable to press for retrospective payment of the increased salaries agreed upon last session, as the operative date was accepted as part of the agreement.

The discussions which led to the agreement of April, 1954, took no account of the remuneration of general practitioners under the provisions of paragraph 10(b) of the Terms and Conditions of Service, since this was the subject of separate negotiations which are still being conducted by the Staff Side of Committee "B" in consultation with the General Medical Services Committee.

As regards a further review of hospital medical remuneration in general, the Central Consultants and Specialists Committee proposes, as a first step, to conduct a comprehensive inquiry, with such expert aid as is necessary, into the present incomes of members of hospital medical staffs from all professional sources. It is hoped that this proposal will be endorsed by the Staff Side of Committee "B." The inquiry would show how the total professional income of hospital medical staffs has been affected by the various changes which have taken place since 1939, and its results would influence the decision as to what further claims might reasonably be made. The Council considers that this is a wise policy. It doubts whether further negotiations concerning the remuneration of hospital medical staff could be pursued effectively without supporting statistical evidence, such as is not available at the present time, as to the total incomes earned in this branch of the profession as compared with those earned in other branches. The Council therefore asks the Representative Body to await with patience the results of the proposed inquiry.

Hospital Medical Staffing*(Continuation of para. 47 of Annual Report)*

224. The revised report on hospital medical staffing, approved by the Central Consultants and Specialists Committee, is set out in Appendix VIII. This report modifies the original report on this subject in the light of the views expressed by the Representative Body, Regional Consultants and Specialists Committees, and other bodies.

The report, which has already received preliminary consideration by the Joint Consultants Committee, will be considered further by that Committee in conjunction with reports from other constituent bodies and from the Central Consultants and Specialists Committee (Scotland), and comments from the Special Group Committees regarding the application of general principles in different specialties. The Joint Committee will then be in a position to enter into discussions with the Ministry, and to report back to its constituent bodies in the light of the Ministry's reactions.

Remuneration of Medical Teachers*(Continuation of para. 58 of Annual Report)*

225. There is as yet little information as to the action being taken by different universities to revise the salary scales of their medical teaching staffs following the provision of additional moneys by Parliament for this purpose.

Except in the case of clinical professorial posts, however, the new ranges announced by the Chancellor of the Exchequer do no more than narrow the gap between the remuneration of medical teachers and hospital staff following the increase in salary given to the latter in 1954. They do nothing to remove the former discrepancy in remuneration in the two spheres, which in some cases is now greater than before.

For example, under the old scales a consultant in the hospital service at the minimum of his scale received 13% more than a reader or senior lecturer in clinical subjects of consultant status also at the minimum. Under the new scales the difference is 20%. At higher points in the respective scales this discrepancy is even wider, and a consultant on the maximum receives nearly 30% more than a reader or senior lecturer will receive at his new maximum.

The new scales bring university medical staff approximately to the level occupied by hospital medical staff in 1949. For example, the range for readers and senior lecturers is now £1,750-£2,400 (£2,750 for lecturers with special responsibility) and the consultant scale in the hospital service, fixed in 1949, was £1,700-£2,750.

The comparison for preclinical medical teachers is even more unfavourable, as their scales are lower than those of clinical teachers.

The scales announced by the Chancellor of the Exchequer are the maximal scales the universities may now adopt, and are not necessarily the scales they will in fact apply to their medical teaching staffs. The little evidence so far available indicates that salaries are likely to be revised on a less favourable basis than the ranges announced by the Chancellor of the Exchequer.

These discrepancies are a financial disadvantage which more than offsets the vocational attraction of university work and must therefore have an adverse effect on recruitment.

While clinical teachers have the remedy of applying for posts in the hospital service, preclinical teachers—for example, anatomists—may not be able to go back into clinical work. Furthermore, they are generally appointed at a late age, at least 27, so that their salary position for several years is well below that of non-medical colleagues.

The position is largely similar in the field of pure research. In this field, even at the highest levels, established and virtually irreplaceable medical workers are taking other types of post because of the higher rewards obtainable, and owing to the great difficulty of recruiting medical men to replace them more and more non-medical workers are being appointed for work which belongs strictly to medicine.

If the present anomalies are allowed to continue the academic and research fields will cease to attract their fair share of the best brains in medicine, and the authorities must decide whether this inevitable outcome is in the best interests of medicine and the nation.

There is no machinery available to the profession for negotiation with the universities, and previous approaches to the University Grants Committee and the Vice-Chancellors' Committee have proved fruitless.

The position is being brought to the notice of the Ministry with a request that it should use its influence in the matter.

Fees for Part-time Work for Government Departments*(Continuation of para. 62 of Annual Report)*

226. As stated in the Annual Report, the Treasury has recently introduced two scales of payment for specialist services undertaken for Government departments, one scale for consultants, and another, and lower, scale for S.H.M.O.s. It is considered that there is no justification for this discrimination and representations are being made to the Treasury accordingly.

Geriatric Units: Treatment and Rehabilitation of Chronic Disablement*(Continuation of para. 67 of Annual Report)*

227. The report of the Joint Subcommittee appointed to study the establishment of an integrated service for the treatment and rehabilitation of chronic disablement arising from age or illness is set out in Appendix IX.

The Council has approved the report in principle, and during the coming session will consider how best to secure its implementation.

Medical Use of Hypnotism*(Continuation of para. 206 of Annual Report)*

228. The report of the special subcommittee on hypnotism has now been approved by the Council and is set out in Appendix X.

The Council proposes to bring the report to the notice of suitable research foundations in the hope of fostering research on the lines indicated in the report.

Untoward Incidents in Hospital and Complaints Involving Medical Staff

229. It was reported to the Representative Body last year that agreement had been reached between the Ministry of Health and the medical defence organizations regarding the apportionment of damages in legal actions in which hospital authorities and members of their medical staffs were involved. During the past year discussions have taken place with the Ministry on the procedure to be adopted in reporting upon accidents or other untoward incidents in hospital, or in investigating complaints involving the personal conduct or professional competence of members of hospital medical staffs. A large measure of agreement on these questions has already been reached, and it is hoped that satisfactory arrangements will soon be made which will safeguard the interests of medical staffs.

Civilian Consultants Employed by the War Office

230. Representations are being made to the War Office for an increase in the fees payable to civilian consultants employed on a sessional or per case basis, to bring them into line with the revised scale of fees adopted by the Treasury for work done for Government departments.

REFORM OF THE NATIONAL HEALTH SERVICE

231. The Council has now considered reports from the Standing Committees concerned on action taken by them arising from the decisions of the S.R.M., of December, 1951, on the interim report of the Council on the Reform

of the National Health Service. Appropriate action has been taken with the departments concerned on a number of the recommendations and these matters have been dealt with in previous reports of the Council; others necessitate amending legislation.

ARBITRATION MACHINERY*(Continuation of para. 74 of Annual Report)*

232. The Council has made a careful study of the problems involved in giving effect to the resolution adopted by the Representative Body last year "that there should be the unilateral right to arbitration."

There are at least two ways by which this objective could be achieved: first, by seeking an amendment of the Industrial Disputes Order, 1951, which at present precludes the reporting of disputes by professional organizations which are not trade unions or arbitration on a case affecting only one officer; and, secondly, by seeking satisfactory arbitration arrangements as a "top tier" to the Whitley Council structure.

In pursuing the first of these alternatives the Council has reminded the Minister of Labour and National Service that during the war, when the Conditions of Employment and National Arbitration Order (1305) was introduced, and up to 1951, any professional organization, whether a trade union or not, had a right to refer a dispute to the Minister and through him to the National Arbitration Tribunal. This position was changed by the Industrial Disputes Order, 1951, and although the Council has repeatedly urged the Minister of Labour and National Service to amend the 1951 order by including professional associations, little progress has been made. The Minister's latest statement on the subject is in the following letter, sent to the Association in December, 1954:

"You wrote to me on 14th December asking about the amendment of the Industrial Disputes Order, 1951.

"I fully appreciate your Council's concern on this matter, and if I could give you a forecast of early action, I should be glad to do so, but I must in candour admit that I cannot hold out hopes of an early amendment of the Order."

On the second alternative, in spite of repeated representations by the Staff Side of the General Whitley Council, no progress has been made. The absence of an agreement on facilities for arbitration in the Whitley structure is a direct result of the refusal of the Management Side to agree (i) that there should be the right of unilateral reference; (ii) that any ruling by the court or arbitrator should be binding on both sides.

Faced with this unyielding attitude on the part of the Management Side of the General Whitley Council, the Chairman of Council sought an interview with the Minister of Health, and conveyed to him the very strong views held by the profession on this important issue. In recent correspondence, however, the Minister has stated his view that this very difficult matter must be thrashed out in the General Whitley Council.

During the course of these protracted negotiations the Council has given further consideration to the possible implications of the resolutions adopted by the Representative Body and has examined the attitudes towards arbitration of the three sections of the profession represented by the Constituent Committees of the Medical Whitley Council. These may be briefly summarized as follows:

General Practitioners

General practitioners, though represented on the Medical Whitley Council and the General Council, have never conducted their negotiations through Whitley machinery. Following the pattern adopted in the days of National Health Insurance, general practitioners have continued to negotiate directly with the Ministry of Health, and through the Danckwerts Adjudication secured a settlement which is generally believed to be more favourable than any which might have been obtained through Whitley procedure.

There is no disposition upon the part of general practitioners to modify this method.

Hospital Medical Staffs

Hospital medical staffs were advised to enter into permanent contracts based upon the Terms and Conditions of Service on the strength of the following assurances given by the Permanent Secretary of the Ministry in 1949:

(a) That no changes would be made in the Terms and Conditions of Service without discussions in the appropriate part of the Whitley machinery.

(b) That remuneration was regarded as a subject suitable for arbitration.

(c) That, save in exceptional circumstances and after the conciliation machinery of Whitley had been exhausted, issues of remuneration remaining in dispute would go either to arbitration or for inquiry and report by a Committee.

The Staff Side of Committee "B" of the Medical Whitley Council has been granted arbitration on a number of occasions and was offered a Committee of Inquiry during the recent dispute on consultant remuneration. It would be wrong to say that it is entirely satisfied with the way in which negotiations are conducted in the Whitley Council, but it does not feel that the unilateral right to arbitration would necessarily strengthen its position.

Public Health Service Medical Officers

In this field it is felt that there might be a possible advantage in attempting to secure the unilateral right of arbitration, though so far there has been no difficulty in securing arbitration by agreement.

After careful consideration of the whole position the Council is of the opinion that the profession would be well advised to rely, for the present, on *ad hoc* arbitration arrangements when disputes occur.

PUBLIC HEALTH**Remuneration in the Public Health Service***(Continuation of para. 87 of Annual Report)*

233. The case for a review of the remuneration of all grades of medical officers in the Public Health Service was heard in the Industrial Court on March 29 and 30. The Award of the Court is now awaited.

Aberdeen Corporation Order*(Continuation of para. 100 of Annual Report)*

234. The Council has been informed that the Aberdeen Corporation does not intend to proceed with Clause 25 of the draft provisional Aberdeen Corporation Order, against which the Association had petitioned on the ground that the medical officer of health would be precluded from exercising the right conferred by the Local Government (Scotland) Act, 1947, of appointing his own deputy. The Council has therefore withdrawn the Association's Petition.

FINANCE

235. The Balance Sheet and Income and Expenditure Account for the year 1954, as audited by Messrs. Price, Waterhouse and Co., appear as an Appendix to this Report (Appendix XI).

SCIENCE**Association Prizes and Scholarships***(Continuation of para. 145 of Annual Report)***Middlemore Prize**

236. "Allergy in Relation to Eye Disease" was the subject set for the 1955 Middlemore Prize Essay Competition. (The Middlemore Prize was established in 1880 to be awarded for the best essay or work on any subject which the Council might select from time to time in any department of ophthalmology.) The Prize for 1955, consisting of a certificate and a cheque for £50, has been awarded to Norman Ashton, of the Institute of Ophthalmology, London.

Provisionally Registered Practitioners' Prize

A Prize Essay Competition for Provisionally Registered Practitioners was introduced by the Council for 1955. The subject chosen for the competition was "A Discussion on the Influence of John Hunter on Medicine." The Prize of a

certificate and a cheque for £50 has been awarded to F. W. Jones, of Outwood, Wakefield.

It has been decided to make the Prize Essay Competition for Provisionally Registered Practitioners an annual event.

Medical Students' Prizes

The subject chosen for the 1955 Prize Essay Competition for Medical Students was "The Recreational Activities of a Medical Student." The Council has awarded the following prizes in this competition:

£30 and certificate—A. M. Nhonoli (Makerere Medical School, Uganda).

£25 and certificate—I. S. Begg (Edinburgh University).

£20 and certificate—M. G. Davey (Sydney University).

£15 and certificate—K. M. Parry (Bristol University).

£10 and certificate—J. Lutwama (Makerere Medical School).

£10 and certificate—W. S. Stephen (Bristol University).

£10 and certificate—Gabrielle M. O'Sullivan (Sydney University).

£5 and certificate—S. J. Steele (Middlesex Hospital Medical School).

Occupational Health Prize

The Council offered an Occupational Health Prize for 1955, consisting of a certificate and a cheque for the sum of £50, for the best essay on any occupational health subject submitted by a member of the Association engaged in this branch of medical practice. The Council reserved the right to make no award if no entry of a sufficiently high standard was received. Only four entries were submitted in this competition, and the Council decided not to award the prize for 1955, as it did not consider that any entry was of sufficient merit.

Association Research Scholarships

The following research scholarships, tenable for one year from October 1, 1955, have been awarded:

Ernest Hart Memorial Scholarship (£250).—Christopher Ounsted, Oxford, for research into the aetiology and outcome of behaviour disorders in epileptic children.

Walter Dixon Memorial Scholarship (£250) (Renewal).—G. W. Taylor, London, for research into the aetiology, pathology, and treatment of idiopathic lymphoedema.

Insole Memorial Scholarship (£250).—F. Lanceley, Liverpool, for research into the possibility of different strains of organism in trichomonad vaginitis.

Ordinary Research Scholarship (£200).—R. Kilpatrick, Sheffield, to study the excretion of adrenaline and noradrenaline in the urine following insulin hypoglycaemia in patients with hypertension and those who have had bilateral sympathectomy for hypertension.

P. J. Lawther, London, for research concerned with the investigation of the clinical effects of air pollution.

Anne G. Mullins, London, to follow up selected cases of haemoptysis without obvious cause, with a view to discovering an aetiology and prognosis.

M. W. Reece, Sheffield, for research into post-operative formation of a venous thrombosis and pulmonary embolism.

B.M.A. Lectures

(Continuation of para. 146 of Annual Report)

237. Since the preparation of the Council's Annual Report, a further seven B.M.A. Lectures have been arranged, making a total of 105 for the session 1954-5. The Council wishes to record its thanks to the following, who have kindly consented to give Lectures during the current session, in addition to those named in paragraph 146 of the Annual Report:

Dr. K. G. Bergin | Mr. Douglas Miller
Mr. I. Bourdillon | Dr. J. C. Sawle Thomas

ORGANIZATION

Affiliation of Ceylon Medical Association to B.M.A.

238. The Council has received from the Ceylon Medical Association, which is a Corporate Branch of the British Medical Association, the following resolution:

This Association resolves that the Ceylon Medical Association, incorporated Branch of the British Medical

Association, should be an independent body affiliated to the British Medical Association.

The necessary action is being taken under Article 16 to terminate the existing arrangement, after which it will be possible to proceed with consideration of the proposed affiliation.

MEDICAL BENEVOLENCE

239. The sum received during 1954 by the Charities Trust Fund of the Association for medical charities was £12,838, which is £149 less than that received during 1953. The following statement shows the amounts collected and distributed during the twelve months:

To	1954 £
Subscriptions and Donations collected for:	
(a) Distribution at the discretion of B.M.A. Charities Trust Fund	4,583
(b) Royal Medical Benevolent Fund	2,931
(c) Royal Medical Foundation of Epsom College	891
(d) Royal Medical Benevolent Fund Society of Ireland	65
(e) Sir Charles Hastings Fund	96
(f) Dain Fund	1,887
Bequests received and allocated to Medical Charities	2,096
Subscriptions and Donations in respect of 1955, paid in advance	289
	£12,838

By	1954 £
amounts distributed to:	
(a) Royal Medical Benevolent Fund:	
Earmarked contributions	2,931
From Charities Trust Fund	1,928
	4,859
(b) Royal Medical Foundation of Epsom College:	
Earmarked contributions	891
From Charities Trust Fund	2,465
	3,356
(c) Royal Medical Benevolent Fund Society of Ireland:	
Earmarked contributions	65
(d) Sir Charles Hastings and Christine Murrell Funds:	
Earmarked contributions	96
From Charities Trust Fund	1,278
	1,374
(e) Dain Fund:	
Earmarked contributions	1,887
From Charities Trust Fund	1,008
	2,895
Total distribution	12,549
Payments in advance carried forward	289
	£12,838

Other Benevolent Funds

240. The Council is gratified to learn of the continued support given to the Dain Fund and the Sir Charles Hastings Fund by members of the profession. The purpose of the Sir Charles Hastings Fund is to assist doctors who, through no fault of their own, are in financial difficulty of a purely temporary nature; the Dain Fund gives financial assistance for educational purposes to the sons and daughters of medical practitioners.

The Council has continued to co-operate with the other medical benevolent funds, keeping in close touch with the committees of the Royal Medical Benevolent Fund and the Royal Medical Foundation of Epsom College.

The Council is hopeful that members of the Association will continue their support and interest in the medical benevolent funds.

Epsom College Centenary Appeal

241. The Council wishes to draw the attention of all members to the Epsom College Centenary Appeal, to which it hopes they will give sympathetic consideration. Funds are urgently needed to carry on the day-to-day work of the College, and the Council has allocated £1,000 to this Appeal from the 1955 subscriptions to the Charities Trust Fund.

SCOTLAND

(Continuation of para. 181(b) of Annual Report)

Hospital Medical Staffing

242. The Central Consultants and Specialists Committee (Scotland) at their meeting on March 7 adopted a Com-

mentary on Hospital Staffing and the Remuneration of Hospital Doctors prepared by their own Medical Establishments Subcommittee. This has been forwarded to the Central Consultants and Specialists Committee in response to an invitation to comment on the revised report of their Medical Staffing Subcommittee (the Strachan Report). Reference is made to this commentary in the report of the meeting appearing in the *Supplement* to the *B.M.J.* of March 26, and the following is a summary of its proposals:

1. For the present system of named salary grades there should be substituted a system of numbered scales or grades within the total range, from which would be selected by approved procedure the one appropriate to each appointment. Individual hospital authorities would be free to employ such names as they wished for their appointments, the status of which would be indicated by the salary grade selected.

2. There should be an agreed ratio of the appointments to which the first three salary scales or grades would apply.

3. A necessary first step in the working out of this ratio is a comprehensive review of the present consultant establishment.

4. Appointments in the second salary scale or grade should be of indefinite tenure—that is, permanent staff appointments. Those in the third should be appointments of limited tenure and renewable where the circumstances of the appointment make this desirable.

5. The full appointments procedure as now applied to consultant appointments should be applied for all appointments within the first three salary scales or grades.

6. The assumption that it is necessary in the interests of the Service to have whole-time appointments of the present restrictive character should be examined.

E. A. GREGG,
Chairman of Council.

APPENDIX VII

REPORT OF THE SUBCOMMITTEE ON ASSISTANTS IN GENERAL PRACTICE

Preliminary

1. The Subcommittee was appointed by the General Medical Services Committee at its meeting on December 16, 1954, with the following terms of reference and personnel:

Reference: To investigate the matter of the employment of assistants, and to make recommendations.

Personnel: A. Beauchamp, A. Brown, B. Cardew, T. J. Hargest, J. A. Pridham, F. M. Rose, C. M. Scott, C. J. Swanson, S. Wand, together with the Chairman of the Committee, *ex officio*.

Subsequently, but prior to its first meeting, S. Wand withdrew from the Subcommittee.

Meetings

2. The Subcommittee has met on two occasions—January 11 and February 2, 1955.

Chairman

3. B. Cardew was appointed Chairman of the Subcommittee.

The Problem and its General Background

4. The Subcommittee at its first meeting considered a factual statement of the various attempts which had already been made to find a solution to the problem. The Assistants and Young Practitioners Subcommittee first considered the subject and submitted its original recommendations to the G.M.S. Committee in January, 1953, and the protracted nature of the discussions, and the widely divergent views expressed, make it clear that no solution on the lines previously considered is likely to find acceptance. The Subcommittee is equally clear, however, that some solution must be found if only to promote a happier understanding of the problems of principals and assistants alike.

Size of the Problem

5. Although it has not been possible to obtain a complete picture of the size of the problem, a good deal of information can be extracted from the Ministry of Health's Report for 1953. The figures in this Report show that the problem is probably not as extensive as had been imagined and that, if anything, it is tending to diminish. There were, in July, 1953, 1,596 assistants in England and Wales, of whom 724 were employed by partnerships and 872 by doctors in single-handed practice. Whilst the Ministry's report does not divide the number of partnerships employing assistants into categories by size of list, this data is available for single-handed practitioners, and the figures as at July 1, 1953, are set out below:

Size of Doctor's Lists	Assistants Employed
0-1,500	22
1,501-2,500	97
2,501-3,600	213
3,601 and over	540
	872

In July, 1952, the corresponding figures were:

Size of Doctor's Lists	Assistants Employed
0-1,500	16
1,501-2,500	96
2,501-3,600	149
3,601 and over	720
	981

6. Thus there has been a fall of 109 in the number of assistants employed by single-handed practitioners during a relatively short period—a period, moreover, where the full effect of the Working Party's proposals might not be apparent.

7. The Subcommittee has also noted that out of a total of 872 single-handed practitioners employing assistants only 238 have lists of 4,700 and over.

Possible Solutions

8. Recent attempts to reconcile the opposing viewpoints on this subject have been confined to a consideration of the size of the additional list of patients which a principal may have by virtue of employing an assistant. In the Subcommittee's view, the size of the list itself is but incidental to the real issues involved. The major question of principle is whether exception can properly be taken to one doctor employing another in circumstances which make it possible for him to derive financial advantage from so doing.

9. Those who oppose the present regulations claim that they inevitably lead to exploitation of assistants, whilst others, who see no justification in seeking any change in the existing allocation scheme, maintain that very little financial incentive exists for a principal to employ an assistant even when the full extra list of 2,000 patients has been attained.

10. The Subcommittee believes that both points of view are inconclusive, for a principal would be unlikely to consider the employment of an assistant unless there were good grounds for believing that the venture would be to his advantage in one way or another, and it does not necessarily follow that an assistant is exploited just because his principal derives some financial benefit from the arrangement.

11. Exploitation is much more likely to occur when the assistant is obliged to undertake more than a fair share of the practice work or is not paid a salary commensurate with the work he is asked to undertake. No reduction in the extra list could remedy cases of this nature.

12. On the general issue the Subcommittee holds the view that there is nothing improper or unethical in a principal enjoying a monetary reward in respect of the indefinite employment of an assistant, provided that the salary and allowances paid are commensurate with the responsibility and work undertaken and that the assistant has had no reason to believe that the appointment offered would lead to a partnership.

13. In the first place, the assistant is usually a man who is new to general practice and is learning his job preparatory to taking a full part as a principal in the Service, not

necessarily in the practice to which he is first appointed as an assistant. Secondly, overall responsibility for all the patients rests with the principal. Thirdly, to make it economically impracticable to employ an assistant would react to the disadvantage of the small minority who prefer to remain as assistants and still further increase the difficulties which young men face on entry into general practice. The Subcommittee is convinced that it would be wrong to recommend any step which might limit the opportunities for young men to acquire a probationary period in general practice as assistants, and for all these reasons has decided that it cannot recommend any change in the figures at present laid down in the Allocation Scheme.

14. Having reached this conclusion the Subcommittee decided to consider other possible ways of meeting some of the criticisms which have been made, and has examined the problem under three separate headings, namely :

- (1) the "permanent" assistant;
- (2) the assistantship "with a view";
- (3) admission to partnership.

(1) "The Assistant who has no wish to become a Principal"

15. Those who elect to remain assistants in general practice throughout their working lives do so of their own free will and usually for personal reasons. For such practitioners the remedy is clearly in their own hands if they feel that they are being unfairly treated. Insistence upon a written agreement setting out equitable terms of employment is the only possible safeguard, and, in the Subcommittee's view, any attempt to legislate further for this group is impracticable and undesirable.

(2) Assistantship "With a View"

16. It is in these circumstances that most complaints of unfair treatment arise. The principal who advertises successive posts "with a view" and then has a series of assistants, none of whom are taken into partnership, constitutes the real core of the problem. Here again, however, the Subcommittee holds that a formal agreement in the first instance will afford some safeguard to the assistant. Although similar advice has already been given elsewhere—notably in the Association's *Handbook*—there is no doubt that there is room for greater publicity, particularly among final-year students and the newly qualified. To this end the Subcommittee is convinced that further efforts should be made through the deans of medical schools to see that these elementary safeguards are impressed upon the young doctor about to start upon his career. It therefore recommends:

Recommendation: That further efforts should be made, through the deans of medical schools and honorary secretaries of local medical committees, to ensure that final-year students and newly qualified practitioners are fully informed of the importance of entering into a formal agreement when accepting a post as an assistant, either with or without a view.

17. It is however clear that even a formal agreement will provide no real safeguard against a principal determined not to take his assistant into partnership, and the Subcommittee has therefore examined the present N.H.S. regulations on the employment of assistants.

18. At present any principal must secure the consent of the executive council or, on appeal, the Medical Practices Committee before he can employ an assistant for more than three months, and he is also required to notify the executive council of the name of each assistant engaged. In addition, the regulations do not debar an executive council, having once given consent to the employment of an assistant, from subsequently withdrawing that consent, and it is known that at least one executive council regularly reviews the position of principals to whom consent has been given on first application. Thus, although at present the executive council may not be aware whether an assistant is taken on "with a view," it will know of those cases in which a series of assistants have been engaged and where a partnership might reasonably have been expected to follow. In this way flagrant disregard of the principle of fair treatment could be an

influencing factor when the executive council is deciding whether to renew its consent, and it would be appropriate for the local medical committee to take an active part in advising the executive council of those instances where it would be appropriate for them to intervene.

19. Apart from any question of an executive council's power to review the consent already given to employ an assistant, it is quite clear from Section 13(3) of Part IV of the General Medical Services Regulations, 1954, that a practitioner who has obtained consent to the employment of an assistant has no automatic right to increase his list up to the full maximum of 2,000 patients. This section of the regulations reads as follows :

Where a practitioner or partnership of practitioners employs one or more permanent assistants, the number of persons for whose treatment the practitioner or practitioners may be responsible may, and, if the Minister so directs, shall, be increased to an extent allowed by the scheme, not exceeding 2,000 in respect of each assistant.

Thus, apart from withholding consent to employ an assistant, executive councils already have discretion to decide what additional number of patients a practitioner may have by virtue of the employment of an assistant.

20. A combination of these methods, whereby the assistant is from the start in no doubt as to whether or not he has a "view" and the executive council (advised by the local medical committee) is left in no doubt as to its powers either to review regularly the permission already given to employ an assistant or to modify the size of the additional list permitted, would, in the Subcommittee's opinion, provide all the safeguards which can reasonably be expected.

21. The Subcommittee therefore recommends :

Recommendation: That the Ministry of Health should be asked:

(i) to insert an additional section in paragraph 8 of the Terms of Service of General Practitioners so as to make it clear that local executive councils shall, in consultation with local medical committees, periodically review all cases in which consent has been given to the employment of an assistant;

(ii) by means of a circular letter to executive councils to point out that, whereas under the regulations the normal maximum additional list of patients permitted by virtue of the employment of an assistant is 2,000, local executive councils have power where, after consultation with local medical committees, they are satisfied that a reasonable case exists for so doing, either after due notice to withdraw their original consent to the employment of an assistant or modify the number of additional patients otherwise permitted under their allocation schemes.

Recommendation: That an appropriate letter be sent to local medical committees drawing their attention to the proposed arrangements, and offering general guidance upon the principles they should adopt when advising their local executive councils that in a particular instance it would be appropriate to withdraw the consent already given to the employment of an assistant, or to modify the size of list.

22. At present a principal who is refused consent to employ an assistant has a right of appeal to the Medical Practices Committee. The Subcommittee recommends that this right should continue and be extended to include those cases where, on review, the executive council has decided either to withdraw its consent or to modify the permitted number of additional patients.

23. The Subcommittee believes that there is one aspect of the first recommendation set out in Paragraph 21 above upon which the parent Committee would wish to have further guidance—namely, the interpretation to be placed upon the words "periodically review." After considerable thought the Subcommittee suggests that a period of two years would be both appropriate and reasonable.

(3) Admission to Partnership

24. The Subcommittee believes that there is another important factor which deters a principal from taking his assistant into partnership. Even where the principal is satisfied that the assistant is in all respects ready for partnership, and that there are good grounds for believing that the

partnership will eventually be satisfactory from both the professional and the financial points of view, the fear of a considerable drop in income over the first few years is a serious deterrent to the principal.

25. The obvious solution would be the adoption of an earlier suggestion by the G.M.S. Committee that a general practitioner taking another into partnership should thereupon be entitled to at least some part of the compensation moneys due to him. Unfortunately, both the Government and the Cohen Committee have failed to support this proposal and the Subcommittee has therefore looked for other methods which could be carried into practice without undue difficulty at the present time.

26. One suggestion which it considers would give some definite incentive and, at the same time, mitigate to some extent any financial hardship on the part of the principal would be to evolve a system whereby a principal, on implementing a "view" offered to an assistant, would have the right to claim payment on the basis of notional lists retrospectively to the date that the assistant was first engaged as "with a view to partnership." Clearly, some overall time limit would be necessary and a method of establishing a claim for retrospective payment evolved. So far as the former question is concerned, the Subcommittee suggests a period of one year. To establish a right to payment it proposes that the principal, upon taking an assistant, should, possibly by making a declaration on the form used for notifying the executive council of the appointment, register the "assistant's view" with the council. Retrospective payment to the principal on the basis of notional lists would then start to accrue for up to a maximum period of one year from the date upon which the view was first registered. It would be paid only in respect of the individual assistant registered as "with a view" and who was subsequently taken into partnership.

27. The Subcommittee wishes to make it clear that there would be no compulsion upon the principal to register any assistant at any particular time. The sole purpose of optional registration would be to qualify for the additional payment and no right would arise until the assistant was so registered.

28. The adoption of this proposal would require a revision of the distribution scheme and so necessitate amending regulations, but the Subcommittee is convinced that it would provide a real incentive to partnership practice. The Subcommittee therefore recommends:

Recommendation: That a principal implementing a "view" registered with the executive council should have the right to claim retrospective payment on the basis of notional lists for a period up to a maximum of one year.

Summary of Recommendations

That further efforts should be made, through the deans of medical schools and through honorary secretaries of local medical committees, to ensure that final-year students and newly qualified practitioners are fully informed of the importance of entering into a formal agreement when accepting a post as an assistant, either with or without a view.

That the Ministry of Health should be asked:

(i) to insert an additional section in paragraph 8 of the Terms of Service of General Practitioners so as to make it clear that local executive councils shall, in consultation with local medical committees, periodically review all cases in which consent has been given to the employment of an assistant;

(ii) by means of a circular letter to executive councils to point out that, whereas under the regulations the normal maximum additional list of patients permitted by virtue of the employment of an assistant is 2,000, local executive councils have power where, after consultation with local medical committees, they are satisfied that a reasonable case exists for so doing, either after due notice to withdraw their original consent to the employment of an assistant or modify the number of additional patients otherwise permitted under their allocation schemes.

That an appropriate letter be sent to local medical committees drawing their attention to the proposed arrangements, and offering general guidance upon the principles they should adopt when advising their local executive councils

that in a particular instance it would be appropriate to withdraw the consent already given to the employment of an assistant, or to modify the size of list.

That a principal implementing a "view" registered with the executive council should have the right to claim retrospective payment on the basis of notional lists for a period up to a maximum of one year.

APPENDIX VIII

REVISED REPORT OF SPECIAL SUBCOMMITTEE
ON HOSPITAL MEDICAL STAFFING

INTRODUCTION

1. The Subcommittee was appointed by the Central Consultants and Specialists Committee in June, 1953, to inquire into the causes of the shortage of hospital (junior) medical staff, and to make recommendations for dealing with the problem. Professor Strachan was elected chairman of the Subcommittee.

2. At the time of its appointment the Ministry of Health had approached the Joint Consultants Committee for its advice upon this subject, and the Joint Committee—rather than appoint another subcommittee to study the problem—decided to await the deliberations of this Subcommittee. The Joint Committee accordingly made available to the Subcommittee a considerable amount of statistical and other information bearing on the subject, which had been furnished by the Ministry, and this has greatly facilitated the work of the Subcommittee.

REPORT

Size of the Problem

3. There is no doubt that the difficulty of recruiting junior medical staff to hospitals is one which has steadily increased since the beginning of the National Health Service. It was first noticed in connexion with house officer appointments, more particularly those in relatively isolated hospitals, and for a time was held in check by advancing the salary (as provided for under the Terms of Service) or by upgrading posts to S.H.O. This device no longer provides the solution. More recently the difficulty of recruitment has spread to registrars, and even to senior registrars. The staffing shortage has now become widespread and urgent.

4. The Subcommittee had before it the following information regarding the actual shortage:

	Establishment (December, 1952)	Posts Filled	Shortage
House officers	3,104	2,775	329
S.H.O.s	1,654	1,548	106
Registrars (May, 1953)	2,388	1,986	402
	7,146	6,309	837

5. This shortage of 837 did not of itself, however, give a real indication of the seriousness of the problem. Of the 3,100 house officer posts, 2,110 were approved by the licensing bodies for the pre-registration year, but the number of medical students qualifying in England and Wales each year was only approximately 1,800. The surplus from Scotland and Ireland was not likely to do more than meet the deficiency of 300 in approved posts. This meant that some 1,000 house officer and 1,650 senior house officer posts must be filled by fully registered practitioners.

6. It was also significant that a substantial number of unfilled vacancies were in the registrar grade. In 1950, when the Ministry first announced its intention to reduce the senior registrar and registrar establishments in order to relate them to the number of consultant vacancies, there were upwards of 1,400 in each of these two grades. The number of senior registrars has since been reduced to approximately 1,000, but in the same period the number of registrars has grown to nearly 2,000 and is still some 400 short of the number needed by the hospitals. This suggests that the problem is one which affects the whole of the medical staffing structure below the consultant, and not merely the lowest ranges.

Reasons for the Shortage

7. The causes of the shortage are complex, and to some extent interrelated, and it is necessary to appreciate them before seeking a remedy.

Increased Demand

8. Underlying the whole problem is the fact that in recent years the demand for medical staff in hospitals has increased enormously. This is due primarily to progress in medicine itself, but the demand has been intensified by the development of the services provided by many peripheral hospitals since the introduction of the National Health Service. This increased demand is not only for house officers, but also for more experienced practitioners.

Staffing Structure

9. With the inception of the National Health Service the system traditional in the teaching and ex-voluntary hospitals of making all posts below the consultant (or S.H.M.O.) short-term appointments was adopted also in the ex-municipal hospitals. Moreover, this system has been applied much more rigidly than hitherto even in the teaching and voluntary hospitals. Inevitably this makes a heavy demand on medical man-power which must be related to career prospects in the hospital service and in other forms of medical practice. One of the major questions with which the Subcommittee has been faced is whether the increased demand for hospital medical staff can continue to be met adequately by comparatively short-term appointments (which may not offer the prospect of a permanent career).

Relative Prospects in Teaching and Non-Teaching Hospitals

10. The figures supplied by the Ministry support the general impression that the shortage of medical staff is far greater in the non-teaching hospitals than in the teaching hospitals. There is in fact a definite falling off in recruitment in the non-teaching hospitals. This is believed to be partly due to the impression widely held among young practitioners that posts in non-teaching hospitals offer little prospect of eventual promotion to consultant rank. This problem, and the wider problem of prospects generally, the Subcommittee has had to consider.

Integration with General Practice

11. Another aspect of the problem is the almost complete breakdown of the old custom whereby a practitioner combined an appointment on the staff of his local hospital with a general practice. This has deprived the hospital service of a source of medical man-power which it can ill afford to lose.

National Service

12. An added difficulty is the introduction of national service, which leads to a break in the continuity of hospital employment.

General Comments upon the Problem**Demand and Distribution**

13. A significant feature of the problem is the fact that the number of practitioners qualifying each year is between 2,000 and 3,000 less than the number of house officer and senior house officer posts. These are and, in the opinion of the Subcommittee, must remain short-term posts. Any attempt to fill the gap by training additional doctors would speedily result in gross overcrowding of the profession. The problem must therefore be solved in other ways.

14. In a memorandum on the distribution of hospital junior staff the Ministry has drawn attention to the fact that between 1949 and 1952 there has been a greater increase in junior staff in non-teaching hospitals (taken as a whole) than in teaching hospitals. This the Subcommittee feels is due in large measure to the development of the non-teaching hospitals, which in many cases now participate in the teaching of graduates and undergraduates, and undertake a variety

of clinical work previously only carried out in the teaching hospitals. The Ministry also draws attention to the fact that, despite the substantial increase of junior staff in the non-teaching hospitals, the London teaching hospitals (and to a lesser degree the provincial teaching hospitals) still have a relatively higher proportion of junior staff than the non-teaching hospitals. The number of junior staff per 1,000 occupied beds in the teaching hospitals is three and a half times as large as in the non-teaching hospitals. Even allowing for the special needs of the teaching hospitals, a ratio of not more than 2:1 would seem to the Subcommittee to be more appropriate. The Subcommittee believes that the teaching hospitals have a disproportionate share of the available man-power.

15. The Ministry, while emphasizing that it does not consider that the numbers of junior staff are anywhere excessive, has suggested that it would be better for the Service as a whole that teaching hospitals and some of the better-staffed regional hospitals should suffer a slight reduction of staff rather than that the less-favoured regional hospitals should be allowed to become dangerously short of staff. For this reason it has suggested that there should be a 5-10% reduction in the junior staff of the teaching and better-staffed regional hospitals. While the Subcommittee sympathizes with the underlying motive, it feels that if this proposal were carried into effect before the defects in the present staffing structure are remedied the probable result would be a lowering of the staffing standard in the teaching hospitals without any compensating improvement in hospitals elsewhere. Some reduction in the total number of junior posts could probably be achieved, and a redistribution of posts as between teaching and non-teaching hospitals would undoubtedly assist if recruitment to the non-teaching hospitals could be assured. At the present juncture, however, the solution of the problem lies in removing the causes for the falling off in recruitment, particularly in the non-teaching hospitals, in providing inducements for young practitioners to continue in hospital employment for a longer period, and in utilizing to a far greater extent the part-time services of practitioners established in other forms of medical practice—for example, general practice or the public health service. When this has been done hospital authorities should be reminded of the need for economy in the use of medical man-power, and instructed to institute a searching review of their staffing needs.

Staffing Pattern, Prospects, and Recruitment

16. The Subcommittee is convinced by the experience of the past few years that the rigidity of the existing staffing structure, the apparent lack of equality in promotion prospects in different types of hospital, and the growth of the hospital service as a separate entity largely closed to practitioners in other forms of medical work, underlie most of the present difficulties.

17. In the past it was very much easier for a young practitioner to move freely from hospital to general practice, or vice versa, or to combine the two types of work. Moreover, a few years' experience in hospital was regarded as a sound basis for other forms of medical work, particularly in the case of a young practitioner who aspired to obtain a general practice or partnership in a town where there was the possibility of a hospital appointment. Nowadays, by the pressure of circumstances, the young practitioner feels compelled to choose his career at a fairly early stage, with consequent repercussions in the hospital service. If he intends to make his career in general practice there is no apparent advantage in spending time in hospital appointments, because the longer he does so the further he falls behind his competitors for general practice vacancies who have had experience in that sphere. Further, his hospital experience offers far less attraction to many a prospective principal or partner than it did in the days when it carried with it the probability of further hospital work which would enhance the value and prestige of the practice.

18. The break in continuity of hospital employment caused by national service also discourages the intending general

practitioner from devoting more than the minimum time to hospital appointments. Remuneration in the Services is appreciably higher than that of a house officer or senior house officer. Unless he is determined to seek a specialist career, and to make certain sacrifices in achieving his ambition, a man returning to civilian life at the age of 28 or 29 (in many cases with family responsibilities) is naturally reluctant to accept a substantial reduction in income, especially if doing so is unlikely to benefit his ultimate career.

19. If, on the other hand, a newly qualified practitioner intends to make his career in the hospital service he tends, if he can, to avoid appointments in non-teaching hospitals, and tries to "climb the ladder" within a teaching hospital. The recent policy—not universally practicable—of making senior registrar posts interchangeable between teaching and non-teaching hospitals has done little to alter this tendency, since there is a widespread impression that promotion to the senior registrar level is unlikely except through the teaching hospitals. The Subcommittee feels that there are sufficient grounds for this anxiety on the part of young practitioners, and this is supported by advertisements which have appeared for senior registrars, in which it is stated that preference will be given to candidates with experience as registrars in teaching hospitals.

20. In the nature of things it has probably always been the case that many of the most suitable candidates for consultant rank are those who are chosen for junior appointments in the teaching hospitals. The impression now, however, is that the number of consultant vacancies are so few, in comparison with the number of competitors, that the candidate from outside the teaching hospital has virtually no chance at all.

21. All these factors have an important bearing on the staffing structure. There is at the present time a consultant establishment in England and Wales of a little over 6,000, or, with S.H.M.O.s (the only other "career" grade), between 8,000 and 9,000. This, with provision for expansion within the hospital service and opportunities for consultant careers outside the National Health Service, provides the opportunity for promotion for approximately 200-250 men annually. Below this level there are some 7,500 junior medical staff the tenure of whose appointments varies between six months and four years.

22. Obviously the consultant establishment must be fixed in relation to the need for consultants and not to provide prospects for younger men. At the same time there is only one source of recruitment, and if the hospitals are to be staffed adequately the junior posts must either (a) offer reasonable prospects of a career wholly within the hospital service itself, or in combination with other medical work, or (b) be regarded as useful stepping-stones to other forms of practice.

23. Among the chief characteristics of the present staffing structure are its lack of security, and the rigidity of the training ladder, which takes little or no account of the varying time taken by individuals to achieve the necessary standard for consultant rank. The recent problems of the senior registrar system have probably been exceptional, but in the view of the Subcommittee any system is unsound under which an aspiring consultant may be discarded merely because the opportunity for promotion does not come within a limited specified period. This is a particular difficulty in the numerically small specialties; in these it is impossible to relate a limited period of training to the irregularly occurring consultant vacancies. Consultant vacancies may occur, say, two in one year, and none for a year or so; consequently there must be a "holding post" to take up the differential of production and absorption. In the past many suitable candidates have been content to serve in a subordinate capacity on their hospital staffs for quite long periods awaiting the chance for a vacancy on the honorary staff—and in the meantime have performed much of the medical work of the hospital.

24. Coupled with the lack of security is the question whether the present demand for medical staff can adequately be met by short-term appointments normally held on a

whole-time basis. The Subcommittee feels strongly that a system which includes permanent appointments or appointments of indefinite tenure is desirable and probably essential and that a greater use should be made of part-time staff.

PROPOSALS**Immediate Remedies**

25. The Subcommittee directed its attention in the first place to the possibility of finding some remedies capable of immediate application which might go some way towards easing the existing difficulties whilst a long-term plan could be evolved, discussed, and put into operation.

26. It considered the possibility of deferring the call up of young practitioners for national service until, say, 18 months or two years from qualification, in order that hospitals should not be deprived of their services immediately upon completion of their first two house appointments. After very careful consideration this possibility was discarded as an immediate remedy for the following reasons:

(a) The Subcommittee is informed that at the moment the needs of the Service Departments are such that a general deferment of call up could not be contemplated.

(b) General deferment of call up would not materially alleviate the present shortage of hospital junior staff owing to the fact that a high proportion—for example, between 45% and 55%—of newly qualified practitioners have already completed their national service.

There is evidence, however, that this state of affairs may be modified in the near future (from mid-1957 onwards) owing to the increasing number of men qualifying who will not have completed their national service. Deferment is therefore not ruled out as a means of amplifying house officer requirements.

27. The Subcommittee next considered the criticism that it would be impossible to attract young practitioners back into the hospital service after national service unless the remuneration they could expect approximated to that received in H.M. Forces. The suggestion was made that ex-Service practitioners should receive a salary higher than that normally attached to the post, but this would involve two rates of pay for the same post. The Subcommittee discarded this suggestion because it had envisaged that practitioners returning to the hospital service after military service would normally be appointed to posts above the house officer grade, and on the scale recommended later in this report.

28. One of the biggest obstacles in the way of inducing young practitioners to continue in resident appointments after marriage, or, more particularly, attracting practitioners back into the hospital service after their period of military training, is the inadequate provision of married quarters. Except in the mental hospital service very few hospitals offer married quarters for junior medical staff. Many practitioners return from the Services to civilian life as married men, often with young children, and in addition to the handicap of the expense of maintaining two homes on the salary of a junior hospital appointment they are naturally reluctant to be separated from their families.

The provision of married quarters is therefore a matter of pressing urgency, and it is doubtful whether hospital boards and committees are sufficiently aware of this. Unfortunately the standard of food and accommodation at present provided for resident staff is deplorably low in some hospitals and acts as a deterrent rather than an incentive. The erection of special accommodation presents obvious problems, but in many areas there is suitable existing property which could be adapted for the purpose without much difficulty. Moreover, the adoption of the university system of "approved" lodgings would probably go some way to meet the problem. The Subcommittee welcomes the recent circular issued by the Ministry encouraging hospital authorities to provide residential accommodation. Nothing should be allowed to stand in the way of such measures as are necessary in this direction to ensure the adequate staffing of hospitals.

29. Some of the routine clinical work of hospitals could well be done on a part-time basis by married women doctors who could spare the time from their domestic duties for regular sessions, and steps should be taken to encourage women doctors to come forward to do this work.

Long-term Solution

30. The Subcommittee considers that the policy of specifying a certain category of medical staff for the training of consultants, and of fixing hospital establishments wholly in relation to prospective consultant vacancies, is wrong, and should be abolished. The hospital medical establishment should depend upon the type and amount of medical work (including research and teaching) required to be done in the hospital and should be determined in consultation between hospital boards and their consultant staffs. At the same time it will be necessary to lay down the overall ratio between consultants and junior staff in order to secure that the balance between them is satisfactory on the one hand to secure a sufficient number of men aspiring to higher posts, and on the other to ensure that their prospects of promotion are reasonable.

31. *Responsibility for the treatment of hospital patients must remain in the hands of practitioners of consultant status. The first step to be taken, therefore, is to examine and review in every hospital the volume of work which should be undertaken only by consultants.* This having been determined, the consultant establishment should then be adjusted to accord with the requirements. It seems likely that such a review will support the opinion advanced for some years by the Joint Committee that redistribution of and increase in the consultant establishment is necessary. In no circumstances should the consultant establishment be such that consultant work is being regularly carried out by those who are not consultants. Whereas this principle should be everywhere applied, it should not exclude the occasional performance by those training or aspiring to be consultants of duties normally carried out by consultants, and under their general supervision.

32. In a hospital much of the clinical work is too responsible for house officers, but often does not require the personal services of a consultant, provided it is carried out under his responsibility.

33. The Subcommittee therefore suggests that there is still a need for an intermediate grade of hospital officer who shall bear responsibilities consistent with the performance of much of the regular medical, surgical, and other treatment which makes up the work of the hospital, while he is preparing for a consultant post. As hitherto these officers should be of such standing and experience as to be able to exercise supervision over the house officers.

34. Since 1948 a number of different grades of medical staff have in fact constituted such an intermediate grade—that is, senior house officers, registrars, senior registrars, J.H.M.O.s, and S.H.M.O.s. Some of these have had a special position; for instance, registrars, and senior registrars have been regarded more as trainees for consultant rank than as intermediate officers appointed to carry out the work of the hospital.

35. It is essential that in the future the partial restoration of an old principle should be sought; that is, that at all levels in the hospital, from house officer to consultant, appointment to a post should be for the purpose of carrying out the work of the hospital at that level. A man aspiring to be a consultant should in the course of his hospital work achieve the means of training himself to be a consultant—training, that is, by active experience of the work, it being always emphasized that his primary function is to carry out the work of the hospital.

36. The intermediate grade of medical staff should be wide and flexible. This grade will be the training ground for all those who aspire to consultant rank, and it is envisaged that the majority who remain in the hospital service long enough to reach the highest levels of this grade will ultimately achieve consultant status. In order to achieve this and to ensure adequate supervision the ratio between the numbers

in the consultant and intermediate grades in each specialty should be agreed between the Ministry and the profession. In considering this ratio the numbers of university staff should be taken into account. Further, arrangements should be made to ensure that such agreed ratio shall be put into operation by the Boards. A considerable proportion of hospital junior staff will, of course, eventually make their careers in some other field of medicine, but there will still remain a small number who fail to reach consultant rank yet who prefer hospital practice, and who, because of their training and experience, have a valuable contribution to make to the work of the hospital. It is essential that provision should be made for this small number of practitioners to make a permanent career in the hospital service.

37. The Subcommittee has had the greatest difficulty in finding suitable titles for the posts in the intermediate grade. It has considered, and discarded, such titles as intermediate hospital medical officer, senior medical officer, etc. Inasmuch as the medical staff in question will assist consultants in their work, the Subcommittee now proposes that they should be called junior medical (or surgical) assistant, medical (or surgical) assistant, and in the highest salary range senior medical (or surgical) assistant.

In order that the new grade shall meet the requirements the Subcommittee suggests that the overall range of salary should be from £800 to £2,200, but that this should be "broken down" into three broad ranges of £800–£1,000, £1,100–£1,400, and £1,500–£2,200. In the lowest scale appointment should be initially for a period of three years, with the opportunity of reappointment or renewal. Appointments in the middle range should be initially for four years and thereafter renewable for an indefinite tenure at £1,400 per annum. Posts in the highest range should be for an indefinite period. Provision should be made to allow of periods of leave—up to one year for research or higher study at home or abroad without loss of seniority or tenure.

38. The establishment at all levels should be fixed according to the needs of the hospital. It should clearly be understood, however, that in no circumstances should the appointment of medical (or surgical) assistants or senior medical (or surgical) assistants, even in the highest levels of the proposed salary range, be regarded as an effective substitute for the appointment of consultants. The former should carry out his work in association with the consultant, to whom he will be in a position of reference at all times, the consultant retaining the ultimate responsibility. Such appointments should not therefore be made where such supervision is impracticable.

39. Part-time appointments in this grade, and particularly in the upper reaches, should be encouraged. Such posts would provide general practitioners with an opportunity to practise a specialty under general consultant supervision, but with an appropriate degree of clinical responsibility. They could also be the stepping-stone for the general practitioner aspiring eventually to become a consultant. An extension of part-time appointments would also enable practitioners engaged in other spheres of medical work—for example, teaching, research, public health, industrial medicine, or private practice—to contribute to the needs of hospital staffing. Such contribution the Subcommittee would regard as valuable, not only from the point of view of the hospital service but in linking the hospital service and general practice to the benefit of all concerned, more particularly the patient.

40. The man who wishes to have further hospital experience before entering some other branch of medical practice would perhaps remain for three years or so and then take his departure, having gained very valuable experience and at the same time contributed usefully to the hospital service.

41. The man who wishes to become a consultant would, assuming that he had sufficient to commend him, be able to apply for such posts as were advertised at higher levels in this grade, and the time he takes to merit consultant status would depend largely upon himself. There would be no rigid time scale. For example, having done his house officer appointments he could achieve an appointment at £800 a year. After two or three years in such an appointment he

might apply for a post at £1,100 a year in his own or another hospital. During his three years he might have read for and acquired higher degrees and in various ways built up a reputation as a potential consultant. By this means he might well be appointed to a more senior post, which he would hold for a year or two, always looking out for a consultant vacancy for which he might apply. Thus, the introduction of this long grade would not preclude an able man from taking such short cuts to consultant appointment as the necessary length of training will allow and his talents enable him to take. On the other hand, it would provide for the practitioner who took rather longer to reach consultant standard and ensure that he was not "discarded" solely by the passage of time.

42. It is probable that the teaching hospitals will prefer in general to retain the system of short-term appointments, and the Subcommittee sees no reason why this should not be done within the staffing structure recommended. Indeed, the Subcommittee strongly recommends that posts of junior medical (or surgical) assistant or medical (or surgical) assistant in teaching hospitals should be limited in tenure to four years, and not normally be renewable. This would encourage intermediate medical staff at teaching hospitals to seek other posts in the intermediate grade in the non-teaching hospitals while awaiting promotion. It would also provide an opportunity for a greater number of men to hold teaching hospital appointments, and in these ways secure that aspirants for consultant appointments had the fullest opportunity of experience in both teaching and non-teaching hospitals. The number of intermediate posts in teaching hospitals should also be so limited in number as to ensure that the intermediate officers in non-teaching hospitals have a reasonable opportunity of competing successfully for consultant posts. It is envisaged that the posts of senior medical (or surgical) assistant, which would be the normal channel of promotion to consultant, would not be held at teaching hospitals.

43. All existing S.H.M.O.s should be redistributed between the consultant establishment and the new senior medical (or surgical) assistant establishment, according to their qualifications and experience.

Senior registrars and registrars should be redistributed within the various levels of the intermediate grade.

44. The foregoing proposals are summarized below:

A. The medical staffing of hospitals should be based upon the following five salary grades:

- (i) House officer £425 to £525;
- (ii) Junior medical (or surgical) assistant £800 by £100 to £1,000;
- (iii) Medical (or surgical) assistant £1,100 by £100 to £1,400;
- (iv) Senior medical (or surgical) assistant £1,500 by £100 to £2,200;
- (v) Consultant £2,100 to £3,100.

B. The appointment of medical (or surgical) assistant should initially be for a term of four years, and thereafter on an indefinite basis, except in teaching hospitals, where the appointment should be determined after four years and not normally be renewable.

C. Posts of medical or surgical assistant or senior medical (or surgical) assistant, and especially the latter, should be whole- or part-time according to the needs of the Service and the preference of the officer.

APPENDIX IX

REPORT OF THE GERIATRICS JOINT SUBCOMMITTEE

The Committee and the Terms of Reference

In July, 1953, the Representative Body of the British Medical Association adopted the following resolution:

That this meeting, realizing the pressing need for co-ordination of the various authorities caring for the aged, recommends the Minister to consider the establishment of geriatric units for that purpose, under the guidance of an experienced physician.

Consideration was given to this resolution by the Consultants and General Practitioners Liaison Committee. On their recommendation a Joint Subcommittee, consisting of representatives of the Central Consultants and Specialists, General Medical Services, and Public Health Committees was appointed with the following terms of reference:

To give further study to the question of the establishment of an integrated service for the treatment and rehabilitation of chronic disablement arising from age or illness.

In carrying out the terms of reference the Subcommittee has had constantly before it the views expressed in the previous report issued by the Association, and has taken into consideration other recent reports on the subject. It has concentrated its efforts upon seeking out and pointing out those features of the services for the treatment and rehabilitation of chronic disablement in the elderly which seem to require urgent and close attention and improvement, and which if put into effect would quickly and substantially increase the facilities available for this purpose. In concentrating on this approach, it is realized that there are other features of the service which may appear to have received rather scant attention. This is not to be interpreted as meaning that the Subcommittee disapproves of or considers unimportant certain other features which have already been dealt with fully in the previous report.

Members of the Subcommittee.—H. D. Chalke, London (Chairman); P. C. P. Cloake, Birmingham (resigned, June 1954); J. Fenton, London; W. G. Harding, London; R. Jones, Ipswich; C. F. R. Killick, Williton, Somerset; K. S. Maurice-Smith, Ely; D. H. Mills, Lymington, Kent; Llywelyn Roberts, Sheffield; A. Talbot Rogers, Bromley; M. Sorsby, London; D. Wilson, Bognor Regis.

Co-opted Members.—Lord Amulree, London; R. N. Curnow, Truro; Trevor H. Howell, London; H. L. Glyn Hughes, London; R. Crosbie Walsh, London.

Observers.—C. A. Boucher, London; E. B. Brooke, Southampton.

During its deliberations the Subcommittee had the benefit of the views of representatives of the Medical Society for the Care of the Elderly.

Preamble

The growing demands of an ageing population and the economic position of the country require that measures to meet the needs of the elderly and infirm must rest firmly upon certain broad principles.

Temporary sickness, permanent disability, and social needs are common to all age groups, the needs of the elderly differing only in degree. The particular problems of the elderly call for special measures when, on account of infirmity and not of age, independence has to give way to dependence upon others.

Because of the natural desire to remain at home, national economic necessity, and the occasional ill-effects of uprooting, it should be a basic principle that the care of the elderly should be centred on the home and the general practitioner. The aim should always be to make any admission to hospital a temporary interlude only. To this end, adequate domiciliary services of many kinds must be easily available, and the general practitioner must be able to command immediate support from the hospital and welfare services when the need arises.

Patients requiring admission to hospital should be admitted irrespective of age and assessed and treated in a general hospital until discharged or found to be in need only of long-term nursing care.

There must be liaison at local level in order to ensure effective co-ordination of existing services. In each group or area there should be someone to whom general practitioners can turn and in whose hands rests the responsibility for deciding the temporary and permanent disposal of all the elderly sick and infirm.

I. INTRODUCTION

1. A Joint Subcommittee was set up by the Central Consultants and Specialists, General Medical Services, and Public Health Committees of the Association to consider

the establishment of an integrated service for the treatment and rehabilitation of chronic disablement arising from age or illness. The Subcommittee, whilst fully aware of the problems relating to disabled persons of all age groups, decided that the urgency occasioned by the increasing magnitude and complexity of the problem of the aged warranted prior consideration of their needs.

2. This report therefore deals with the elderly only and the Committee suggests that a further report be prepared covering the wider problem of the care and treatment of disabled persons generally.

3. In 1947 the Association published a report entitled "The Care and Treatment of the Elderly and Infirm." In short, a co-ordinated geriatric service was recommended, based on geriatric departments in selected general hospitals. A supplement to the Report issued at a later date under the title "The Right Patient in the Right Bed" underlined the need for the provision of accommodation under various headings so that the old and infirm should not occupy beds in a general hospital for extended periods. The value of out-patient facilities for elderly patients was stressed as an important method of relieving the pressure on hospital beds.

4. At an early stage in its deliberations the Subcommittee realized that the recommendations of the above-mentioned reports were not being implemented as fully as was hoped. There is, however, a definite trend towards and awareness of the need to achieve "the right patient in the right bed." The sum of hospital, halfway house, and residential accommodation has increased and is increasing, and at the same time a certain amount of necessary redistribution of both beds and patients has taken place.

5. In arriving at its recommendations the Subcommittee has taken into consideration the replies received in response to extensive inquiries of a number of practitioners working in the field—general practitioners, consultants, medical officers of health, as well as welfare authorities in many parts of the country. These show that there are considerable differences in various parts of the country in the extent and efficiency of the services available for elderly and infirm persons, although there is little co-ordinated statistical information on the subject. There is a need for a nationwide survey which would bring to light the various schemes in operation, and would help those authorities planning for the future to provide an efficient and co-ordinated service.

6. The approach to the problem that was suggested and accepted by the Subcommittee was the urgent need to do more than merely provide institutional accommodation for the elderly and infirm. It seemed of prime importance that, given adequate hospital services, steps should be taken to prevent as many as possible from needing them, and that means should be recommended that might delay the need for admission in every individual case. The underlying principle should be that where admission proves to be necessary the stay in hospital should be regarded as a transient phase and discharge should be anticipated.

Need for Early Application of Services

7. It follows that there is a responsibility resting upon all those in touch with the elderly to make known as early as possible the need for help, so that the available services may be utilized to enable elderly people to remain in their own homes. There is no clearly defined statutory obligation on any person or body to maintain contact with elderly people and make known their needs. Co-ordination between the local statutory and voluntary services should clearly be in the hands of the medical officer of health and his staff. Some of the ways in which this can be achieved are indicated in the report of the British Medical Association on the "General Practitioner and the Health Visitor" (Sub-Appendix I).

Responsibility of Relatives

8. The Subcommittee has considered the general attitude of relatives to their responsibilities for the care of the elderly and chronic sick. Although relatives should (and in the majority of cases do to the best of their powers)

accept their responsibilities, yet at the present time this may involve real difficulties, particularly of finance and accommodation. The prime responsibility for the care and welfare of the elderly must, however, be fairly placed upon the relatives, who should ensure that the services of statutory and voluntary bodies are called in where necessary.

Public Responsibility

9. Local authorities should bring to the notice of the public the increasing complexity of the problem of the ageing population and should educate them in the part they must play, at the same time acquainting them with the local facilities available.

10. The Subcommittee has been impressed by an account of a scheme carried out in connexion with the physical medicine department of a large provincial hospital. By close local liaison with clergy and others a lively interest in old people has been stimulated and has resulted in practical co-operation (see Sub-Appendix II).

II. ACCOMMODATION

11. All community planning should take into account the natural desire of the majority of the aged to continue to live at home as long as possible and to do so in the district in which they have spent most of their lives.

12. It may well be that one of the easiest and most effective ways of achieving these ends is to arrange that the redistribution of accommodation in accordance with the family's need should take place earlier than is customary at present—that is, when the children have grown up and have left the parental home. If the parents (at that time by no means old) move into more compact, more easily run, and more accessible accommodation then the need for special old people's accommodation would be less. The move would take place at a time at which people are still reasonably adaptable. It is not suggested that housing authorities should have power to remove people in this way, but medical officers of health should encourage housing authorities and individuals to consider this possibility.

13. A number of authorities provide special housing facilities for elderly people. Much more could be done through redistribution and adaptation of existing accommodation while other accommodation is being erected. Suitable accommodation should be provided on housing estates so that the residents, when they become elderly, may have young and active neighbours who can assist them in time of need. Alternatively there should be a resident warden to give help as required. Where young people wish to take elderly parents to live with them housing authorities should be sympathetic and allot them suitable accommodation.

14. Accommodation for the elderly may be provided in the following ways: (a) Suitable houses, flats, and bungalows, with necessary adaptations to furniture and fittings, for the ambulant able to look after themselves, and with the necessary domiciliary services for those able to remain at home but needing occasional nursing and/or semi-skilled help. (b) Residential accommodation under Part III of the National Assistance Act for those in need of care and attention which is not otherwise available to them. (c) Homes for the frail ambulant needing the attention of semi-skilled staff and occasional nursing in sick-bay accommodation. (d) Hospital beds for those requiring frequent medical attention and skilled nursing.

Private Homes

15. The Subcommittee would encourage the extended use of charitable and private homes for elderly people of limited private means. To ensure the maintenance of the required standard, the procedure for the registration of private homes should be reviewed by county and county borough councils in order that adequate inspection may take place before registration, and that regular visits may be made subsequently. Although authorized under Section

39 of the National Assistance Act, 1948, it appears that visits after registration are not universally carried out.

16. There is a group of elderly people able and willing to pay something towards maintenance in voluntary or private homes, and the possibility of subsidizing such homes from public funds in order to balance payments made by individuals should be explored. A recent survey has shown that out of 500 elderly persons on a hospital waiting-list (many of whom were in private nursing-homes), 7% later had to be admitted to hospital because of financial considerations. The above suggestion would enable more beds to become available and would prevent hospital beds being used where not entirely necessary on medical grounds.

Foster Homes

17. The frail ambulant (and perhaps some of the ambulant) might be accommodated by a scheme of fostering. There may be families prepared to take into their homes a moderately active old person. The difficulties of such a scheme are recognized—increasing frailty, the necessity for careful selection of homes, and the need for subsequent supervision—but arrangements of this nature are already working satisfactorily in certain areas.

Structural Alterations and Appliances

18. Whatever form of housing is provided, valuable results, both to the individual old person and to those trying to solve the general problem, will accrue from efforts to make the accommodation more easily manageable by its elderly occupant. More attention should be paid by local authorities to the need for structural modifications in the home, whether in new construction or by adaptation of existing accommodation, to meet the requirements of the aged. These include the provision of ramps, and sheds for housing of invalid chairs, the erection of hand-rails and steps, and suitable alterations to lighting, heating, and cooking systems.

19. At the present time there is a division of responsibility for the supply of appropriate appliances and gadgets, and for making alterations to household equipment for the elderly. Broadly speaking, alterations to the house, including structural alterations and the provision of hand-rails, may be undertaken by the welfare authority. Gadgets enabling the elderly with a persistent disability to live more easily are usually made in the local hospital workshop, or they are provided by the welfare authority. Nursing appliances for those sick at home are supplied on loan by the local health authority, often by arrangement with the British Red Cross Society or with a hospital. There is room for simplification and extension of these arrangements.

Old People's Clubs

20. Finally, it is essential to ward off senility and incapacity by interesting the aged in their surroundings, and to combat loneliness and any tendency towards the hermit attitude. The value of old people's clubs is particularly stressed. Apart from being social centres they provide a means of enabling those responsible for voluntary and statutory services to keep in touch with the elderly. Many of these clubs provide ancillary services such as chiropody, and arrange transport for those who would otherwise be housebound. They also serve as centres for a meals service. If a club is closely linked to an old people's home it enables the ambulant residents to share the facilities and to maintain outside interests longer than might otherwise be the case.

III. THE PLACE OF THE GENERAL PRACTITIONER

21. It is important that the services available for elderly people should be supplied with the least possible delay to those in need of help; early notification is therefore essential. The family doctor, having in most cases the closest knowledge of the condition, circumstances, and needs of an old person, should be kept informed of all the local

authority and other services on which he can call. The Subcommittee recommends that local health authorities should publish a brochure giving these details. It should be in pocket size and should be circulated to every general practitioner in the area, as well as to others concerned with the care and welfare of the elderly. In addition, the general practitioner will find the services of the health visitor useful in dealing with the social needs of the patient, meeting their needs and bringing the necessary agencies into action.

Domiciliary Services: Visiting

22. Most local health authorities make some provision for visiting of the aged infirm, and generally much essential assistance is given by voluntary organizations. Whilst the health visitor is statutorily the field worker who visits the family, including its aged members, there is much scope for voluntary effort in the way of friendly visits to lonely old people. Voluntary workers should of course be told to whom they should turn in case of need—the family doctor, the health visitor, clergy, and so on. Where staffing permits health visitors do try to make regular visits to the aged infirm known to the authority. It is the opinion of the Subcommittee that visiting should be left for local arrangement and agreement, but it is essential to have machinery by which all elderly people requiring attention come to be visited by some responsible person so that there is no delay in notifying the need for and obtaining other services when required. Such early visiting is considered by the Subcommittee to be of the utmost importance in the prevention of the need for admission to or of long stay in hospital.

23. In some areas, local co-operation is achieved through case committees representative of the health and social services in the area, including voluntary organizations. This provides a means of assessing the requirements of individuals and arranging for them to be met.

Home-nursing and Domestic Help

Recruitment of Nursing Staff

24. The inquiries made suggest that although the home nursing service would probably be adequate if the establishment posts were filled, in most areas nursing staffs are below strength. Efforts to keep elderly people in their own homes will make even greater demands on the home nursing service, and establishments should be reviewed in the light of the needs of the elderly sick and infirm. It is recommended that a greater number of male nurses should be recruited to these services. In addition, a proportion of both male and female State Enrolled Assistant Nurses should be employed for duties within their scope under the supervision of State Registered Nurses.

25. It is reported that some housing committees are unwilling to make concessions for nursing staff. This adds to the difficulty of procuring and maintaining an adequate nursing service. In order to ensure satisfactory recruitment of male nurses as well as other nurses, they should be given priority in the allocation of housing accommodation; where necessary, local housing committees should consider the purchase of property for renting to nursing staffs.

Linen Supply

26. Local health authorities are entitled to keep a store of linen which district nurses may issue on loan for the use of elderly people. This is an essential service.

Night Patrol Service

27. The Subcommittee has considered the possible value of a night patrol service in urban areas. Its use would be limited and would depend to a large extent on the amount of responsibility accepted by families, but there must be a number of areas in which there are sufficient old people living alone who would benefit from one or more visits during the night from a patrolling home help. In these areas the establishment of a service of this type appears to be warranted.

Sitter-up Service

28. Other elderly people might require a sitter-up for the night, although where this service is available the demand is not reported to be great. It might well be that if such services, where established, were better known to general practitioners there would be increased call upon them. The best use of night sitters is probably on a temporary basis when they can give periods of rest to relatives on one or two nights per week or for short holidays. Hospital beds might well be saved in this way. Where there are no relatives available and the requirement is for a permanent night sitter the case should be regarded as one for institutional accommodation.

29. Friends and neighbours often undertake this duty and they make a valuable contribution to the problem, but it is unlikely that an adequate or consistent service will be maintained solely on a voluntary basis. It is suggested, therefore, that the provision of such a service should at any rate be partly the responsibility of the local health authority, supplemented by such volunteers as are prepared to help.

Home Help Service

30. The home help service can be an important factor in avoiding admission to hospital, institution, or a home. It may play a major part in delaying the onset of senility or complete incapacity, by relieving patients of the more arduous tasks beyond their capacity, by ensuring that they get proper nourishment, and by enabling them to carry on in an atmosphere free from the more telling cares of running a household. The employment of male home helps is an essential part of an efficient home help service.

31. Figures from the Ministry of Health Annual Reports show that whereas the number of whole-time home helps has declined somewhat since 1949, there has been a large increase in the number of part-time home helps, and consequently in the number of hours of service available. This accounts for the steady annual increase in the number of cases attended. Although the home help system appears to be operating satisfactorily, it is, as yet, far from adequate in many places, and problems of recruitment are variable. Periodic half-day meetings at which talks are given by officers of the public health department are of value in raising the standard of home help efficiency; they may also help recruitment. Conditions of service should be so adjusted as to ensure adequate recruitment and maintenance of a high standard of service.

Teaching How to Manage the Home

32. There may be in some cases scope for one of the team, preferably the health visitor, to familiarize old persons with the easier ways of doing certain things in the home, so that with the aid of a few mechanical modifications they may become independent once again. This could go a long way in overcoming the bleak forebodings that must occupy the minds of old people when they realize they can no longer manage as they did formerly.

Meals

33. One of the great needs for old people living alone is a meals service. Clinicians are agreed as to the occurrence of malnutrition; this is hardly surprising when the old person has let himself or herself slip into the habit of taking the easier course of avoiding food preparation and existing very largely upon tea and bread-and-butter. There is little doubt that the provision of a well-cooked nourishing meal daily, or even two or three times a week, would improve the state of nutrition and maintain the strength of many elderly persons so that they may the longer look after themselves.

"Meals on Wheels"

34. A meals-on-wheels service should be organized in all areas. At present this can only be accomplished through voluntary organizations, who arrange and operate the ser-

vice, and who receive grants from local authorities under the provisions of Section 31 of the National Assistance Act, 1948. Whilst such arrangements exist in a number of areas, nevertheless the service can hardly be considered adequate even for present needs, and it is seldom that a meal is provided every day. The school meals service is available in many places, and arrangements for the joint use of this service might well be the best way of providing for the elderly. Meals might often have to be delivered to individual houses. This could be arranged from a local centre. In some places a communal meal could be provided for ambulant old people in a village hall or other accommodation used by old people's clubs. (This already happens in some areas.)

"Invalid Kitchens"

35. The "invalid kitchens" service is another means whereby adequate meals may be available to those who are sick. This service, which is at present restricted to the London area, where it is administered by a voluntary organization receiving a grant from the county council, should be extended.

36. Attention is drawn to one important aspect of any mobile meals service—namely, the value of the regular contact between the deliverers of the meals and the individual old people. The same applies when a home help attends and is able to cook for the elderly person.

IV. PREVENTIVE AND RECUPERATIVE SERVICES

37. Early recognition and treatment of eye, ear, dental, and other defects can do much to stave off the establishment of severe and irreversible disabilities. Owing to their gradual onset, with consequent adaptation by the patient to the defect, elderly patients often present themselves for treatment too late. The onset of these defects can be detected early in some cases by those who visit the elderly in either a voluntary or statutory capacity. If these visitors are aware of the possibilities of treatment, it is likely that much hardship and disability among elderly people will be prevented. The booklet suggested in paragraph 21 should be the source of information.

Ophthalmic Services

38. There is a high incidence of cataract and glaucoma in the aged. This is reflected in the fact that, of the newly registered as blind, some 70% are over the age of 70. Over 80% of those registered as blind from cataract have had no treatment and a smaller, although still considerable, percentage of those blind from glaucoma have likewise had no treatment. Some method whereby treatment is more readily sought by patients or is more readily available to them appears to be needed. It is recommended that routine examination by an ophthalmologist should be part of the services given to elderly patients. It is further recommended that the advice given by the Ministry that blind certification should normally be only on the authority of an ophthalmologist of consultant status should be implemented as fully as possible. Examination by a consultant may well lead to more applicants for blind registration taking advantage of the facilities available for treatment.

Holidays and Convalescence

39. At present local health authorities may grant recuperative holidays, but not convalescence, to old people recovering from an acute illness, but not all do this. A "recuperative holiday" is defined as a rest after illness when no regular nursing and medical care is required, and a charge can be made according to the means of the individual. Convalescence is arranged by a hospital as an extension of hospital treatment when the person is in need of regular medical and nursing care, and no charge is made. In their capacity as welfare authorities, local authorities may facilitate the taking of holidays by handicapped persons and defray any expenses. The schemes for this are covered by

the National Assistance Act and are subject to the approval of the Ministry of Health, as outlined in their circular 32/51. Many Old People's Welfare Associations (which receive grants from local authorities under the provisions of the National Assistance Act) have established holiday schemes for old people. This practice may well be extended.

Special Types of Holiday Home

40. Greater use should be made of the powers which local health authorities already possess in order to cater for old people with special disabilities (blindness, diabetes) who require a special type of holiday home accommodation.

Chiropody

41. Many investigators have drawn attention to the inadequacy of the chiropody arrangements for old people. Surveys of the housebound elderly in receipt of home help have shown that about 10% were in need of chiropody but were not receiving it. It has been estimated that foot defects play a significant part in the restriction of normal activity in about a quarter of the older population. The lack of treatment of foot conditions which can be remedied or ameliorated by chiropody is in many cases the sole reason why old persons are confined to the house. Whilst there is danger in over-emphasizing the necessity for chiropody at the expense of other essential services, the evidence suggests that an extension of this service is desirable. The present position is that, whilst the relatively few local authority schemes in operation before July 5, 1948, may continue, they may not be extended, neither can new ones be established. Many voluntary organizations in receipt of local authority grants are providing chiropody for old people (this is particularly valuable when available at an old people's club), but this only partly offsets the lack of adequate provision by hospital and local health authorities. The Subcommittee recommends that general practitioners should be able to refer their patients direct to hospital chiropody clinics.

Laundry Service

42. Statutory provision should be made for expenditure by local sanitary authorities when necessary on a laundry service for soiled linen. Some authorities already provide such a service for the incontinent. In a few cases facilities at a laundry attached to a hospital group are made available for the use of the local sanitary authority. This practice, which could usefully be extended, is an example of the need to establish the strongest links between the local authorities and the hospitals in this matter of caring for old people. In some areas a laundry allowance is payable (under the National Assistance Act), so that old people make their own arrangements for the actual work of laundering to be done.

V. THE PLACE OF THE HOSPITAL

43. The term "chronic sick" has become misleading. Patients requiring hospital care must be admitted to a hospital where full facilities for assessment and treatment are available. They may need to remain there for a short or a long period, but whilst active treatment is necessary there they should remain. A number of these patients will be left with a final disability which may require simple nursing care only, in accommodation which must remain under the control of the general hospital.

Hospital Geriatric Units

44. Hospital units have an important place in the treatment and rehabilitation of the aged sick, and they have carried out pioneer work in this field. The Minister of Health has stated recently that in England and Wales there are now 59 geriatric units for active treatment. These account for 20,500 of the total beds (53,871) normally available for the chronic sick.

45. These units, together with various departments of general hospitals, should, as well as providing active treatment, serve as assessment units to which elderly people may be admitted and from which they may be later transferred to other appropriate accommodation (e.g., general hospital, long-stay hospital, Part III accommodation, or home), thus releasing beds for other admissions. After a short stay some patients will be able to return home and receive further help and treatment through the domiciliary services.

46. Close association with the general practitioner, the local health and welfare authorities, and voluntary services is imperative. It is recommended that the medical staff of the unit should include local general practitioners appointed as paid clinical assistants or in some other capacity. It is essential that an adequate number of social workers should be available to work in association with geriatric units. The health visitor is an invaluable member of the team, for her activities in connexion with the home and the family unit enable her to provide essential information; if her services are utilized to the full, home visiting by hospital almoners (which is not recommended) becomes unnecessary. It is reported that in one area a health visitor has been seconded for duties in connexion with a geriatric unit, the hospital management committee concerned sharing her salary. Arrangements such as this make for co-ordination and smooth running of the services already in existence.

47. The physician in charge of the unit should not necessarily be confined to duties within the unit, but might also act as adviser on the medical problems of old age to a hospital area—i.e., to a hospital management committee group or groups.

48. Whilst the extension of special geriatric units is advocated by many, others favour the treatment of the elderly in general wards. There is a place for hospital facilities of both types provided that they are closely linked with the services concerned with the home and home life.

Medical Education and Nursing Training

49. One important aspect of the unit attached to a teaching hospital is the part it plays in the training of doctors and nurses, and, for this reason, a geriatric unit should be attached to every teaching hospital. Although treatment of the elderly need not be looked upon as an additional specialty, it is advantageous, both for treatment and for teaching purposes, to assemble a number of patients with similar complaints. It is recommended that medical education should ensure that all doctors entering practice are aware of the importance of active treatment of the elderly; in this way a number will become sufficiently interested to devote part of their time to a study of the medical problems of elderly people. Similarly, the training of all nursing staffs must include reference to the care and treatment of elderly people, and arrangements should be made for a few months' duty in this sphere of hospital life.

50. Facilities for postgraduate training and experience should also be made available both for medical practitioners and for nurses.

Admissions to Hospital

51. Whatever arrangements are made locally for admission to hospitals, the procedure should not be a rigid one. If there is no vacancy at a hospital in a particular area, the use of any available beds in an adjoining area should be possible.

Ancillary Services

52. An extension of ancillary services (physiotherapy, occupational therapy, and chiropody) will, in the first place, entail a certain financial outlay, but experience has already shown that, by reducing the length of stay of some patients, an eventual economy will result and a higher turnover be effected and maintained.

VI. THE PLACE OF THE WELFARE HOME

53. There is a continuing need for residential accommodation for aged people who are unable any longer to live in

their homes. The Subcommittee welcomes the increased provision of small welfare homes in recent years, many of them so sited and administered that the old people may feel that they remain part of the community. Such homes, for reasons of staffing alone, can only accommodate reasonably fit old people. There will remain the need for larger homes for the infirm who require more care and attention, quite apart from the necessity for "intermediate" beds in long-stay annexes of hospitals where full nursing facilities need not be provided.

54. To serve the large number of "borderline" cases the establishment of joint-user institutions to be used together by regional hospital boards and welfare authorities is often advantageous; this avoids the unnecessary stress to the old people of moving into unfamiliar surroundings, and also eases staffing problems.

55. Even where such joint-user institutions cannot be set up—at any rate in the near future—closer linkage between the staffs of geriatric units and welfare homes is to be encouraged. In a later section we refer to the appointment of a consultant for the purpose of co-ordinating the services. Similarly, in the field of nursing the joint employment of skilled staff should and could be developed. An example would be daily visits to welfare homes by a male nurse from the geriatric unit to give bladder wash-outs.

56. Many elderly people are still being cared for by their relatives, and some authorities make arrangements for them to be admitted to welfare homes or long-stay annexes for short periods in order to relieve the relatives. This is a commendable practice and should be taken into account when planning joint-user institutions or other establishments. The admission of a patient in these circumstances will often prevent a prolonged period in a hospital or welfare home, because the relatives will be more willing to continue the care of the elderly persons with these occasional breaks and the aid of domiciliary services.

VII. ADMINISTRATION

57. In the present circumstances the provision of services for the elderly and infirm are not and cannot be under one authority. Hospitals, local authorities (with all their departments and services), and general practitioners are deeply concerned, as also are voluntary organizations.

Liaison

58. Apart from contact between officers themselves, there are plans in some areas to effect liaison between the public health medical officers, welfare officers, hospital service, and voluntary organizations, either through a joint committee or through regular conferences. The practice of appointing the medical officer of health as honorary medical adviser to the local old people's welfare association is most advantageous. He, together with a senior health visitor and district nurse, should serve on the committee. This is quite a common practice, but there should also be consultant and general-practitioner representatives. A further link may also be effected between voluntary and statutory bodies by arrangements for the attendance of health visitors at old people's clubs, to give advice and talks.

Liaison Committees

59. The formation of a liaison committee, representing all statutory and voluntary interests, is an essential means of achieving the best arrangements. Such a committee can correlate existing services; can determine weak points requiring special attention; can make united recommendations to the constituent bodies; and will, in short, be able to consider the whole chronic sick (geriatric or otherwise) problem of any given area as a comprehensive whole.

Local Health and Welfare Services

60. The operation of the National Assistance Act is, in the majority of cases, in the hands of the Welfare Department. In a minority the services are administered by the Health

Department. The social and the medical factors, especially prevention, must be considered as one, and the services that can be rendered to elderly people by these two departments are so closely interlocked that, in the view of the Subcommittee, they should be under the same administrative head—i.e., the medical officer of health.

61. It is clear, however, that the best results will be obtained, and the least frustration be experienced on the part of all concerned, when the establishment of a closely co-ordinated service is, by gradual development, brought to fruition.

Co-ordination Through a Practitioner Appointed for the Purpose

Need for Correct Allocation of Beds

62. Much has been said about the need for more hospital beds for accommodating the aged sick, but the evidence obtained suggests that there is a great deal of unnecessary hospital admission owing to the failure of the social services to make home conditions satisfactory. Another cause is the lack of Part III and "intermediate" accommodation. Much of the Part III accommodation of welfare authorities is occupied by aged persons, but, in general, there is far too little linkage in the allocation of this accommodation with that in general hospitals and long-stay annexes. It is therefore advocated that the practitioner who assesses priorities for admission to hospital beds for the assessment and treatment of the elderly should advise, through the medical officer of health, on admission on medical grounds to Part III accommodation. (This, of course, would in no way affect the responsibilities of the medical officer of health for compulsory removal under Section 47 of the National Assistance Act, 1948.)

Joint Appointments

63. The Subcommittee has taken note of the arrangements in one county whereby the county council shares the services of a consultant with the regional hospital board. Difficulty was being experienced locally (as it is in so many areas) in classifying patients as "chronic sick" or "frail ambulant," which decision determines whether they become the responsibility of the regional hospital board or the welfare authority.

64. The consultant who acts for a board and for a major local authority can, without delay, direct the patient to the right services, deciding whether or not admission to hospital for overhaul or assessment is necessary, and working in close conjunction with the general practitioner and the medical officer of health in regard to domiciliary services. Co-ordination on these lines is needed everywhere. The best machinery for achieving it would depend on local circumstances. This question as it affects rural areas is discussed in paragraph 90.

VIII. LEGISLATION

65. The legislation which concerns older persons, either directly or indirectly, has been considered carefully by the Subcommittee. It is not recommended that there should be any new legislation to deal with the problems of an ageing population, but rather that the provisions of existing Acts should be used to greater advantage. For example, greater encouragement should be given to local health authorities to submit proposals to the Minister under Section 28 of the National Health Service Act, 1946, with particular reference to the supply of meals. This would be a form of preventive service in that physical deterioration would be prevented.

66. Local authorities under Section 31 of the National Assistance Act, 1948, may "make contributions to the funds of any voluntary organization whose activities consist in or include the provision of recreation or meals for old people." It is suggested that this section might be extended and widened to include direct participation by sanitary authorities in these matters, and to embrace activities other than meals and recreation.

67. Some doubt exists as to the legality of using the Public Health Act, 1936 (Section 84), or the Public Health (London) Act, 1936 (Section 122), for the setting up of a laundry service for old persons in particular need of one—for example, the incontinent. A decision should be made on this important matter.

68. Wider use should be made of the Physical Training and Recreation Act, 1937, in providing employment and holiday schemes for the elderly, and in equipping old people's clubs.

IX. MENTAL HEALTH

69. The provision for the aged mentally infirm is a major problem. At the present time the general practitioner finds it extremely difficult to deal with the borderline patient who cannot and should not be certified, and who, at the same time, is hardly suitable for admission into the welfare home of the local authority. Many old persons would not need to be certified if suitable accommodation of a simpler nature was available. If this could be obtained it would enable more patients to benefit from the specialized treatment available at mental hospitals.

70. There should be greater differentiation between senile dementia and mental sickness, and steps should be taken to ensure that the admission of elderly people to mental hospitals is restricted to those who are mentally sick. Long-stay annexes should be attached to general hospitals rather than to mental hospitals.

71. Increased facilities for preventive psychiatry and for observation would enable recovery to take place in some cases and would thus reduce the number of admissions. The preventive approach could be applied in the observation wards of geriatric units, which would render considerable assistance to mental hospitals, both in this way and by facilitating early admission. Mental confusional cases could be sent as acute cases to geriatric units, for in many instances all that is required before they are able to return home is medical treatment. Senile confusional subjects and demented should also be admitted to geriatric units for assessment. Assessment may show whether the patient is in need of active treatment as provided in a mental hospital, or of admission to a long-stay annexe, or is able to return home or to be admitted to Part III accommodation (some of which should be specially adapted and staffed for such cases). Those returning home might benefit from supervision by local health authority mental health services, or by mobile psychiatric teams. This form of preventive psychiatry has been introduced in Amsterdam with excellent results.

72. It appears that there is very little system in operation for the follow-up of senile patients discharged from mental hospitals. It seems desirable that there should be someone who should act as mental health visitor to these patients after their discharge. In one area, the duly authorized officer undertakes this duty, and this practice might well be adopted elsewhere.

73. Replies to inquiries made by the Subcommittee have indicated that additional Part III accommodation is urgently required to accommodate correctly many patients at present in mental hospitals.

X. RESEARCH

74. Medical knowledge about the specific problems of senescence is still limited and the infirmities which come with old age are imperfectly understood. There is wide scope for more research in this field, not only in geriatric units and long-stay hospitals but also in general practice. This latter is probably the most important, for in general practice the onset of symptoms of infirmity due to old age can be seen early and studied. Every encouragement should be given to research in this field as it is likely to produce valuable results. There is a need for the provision of adequate facilities for pathological investigation and research.

75. Side by side with research into medical problems should be carried out research into the social aspects of

old age. In all spheres of life medical and social factors are closely allied, but there is little doubt that in the problems associated with the elderly these factors have outstanding importance.

XI. EMPLOYMENT

76. It is most important that the termination of the employment of an individual should be related to the "biological factor" rather than to the "chronological factor." It follows that the policy of automatic retirement is unrealistic and uneconomic. When an individual should cease work cannot be satisfactorily stated in terms of years. Although a modification of duties or a transfer to lighter work may be necessary it is clear that employment encourages the maintenance of the general health. The Subcommittee has heard with pleasure the fact that certain employing authorities are putting into practice the recommendations made by the National Advisory Council to the Ministry of Labour in its report on the "Employment of Older Men and Women," published in October, 1953. Furthermore, in a recent circular (No. 69 54, October, 1954) the Minister of Housing and Local Government draws attention to this report, and asks to be informed of the results of the reviews made by local authorities in the light of the report.

77. There is very little provision for the employment of elderly people in special employment schemes. It is believed that one of the best means of maintaining the health of elderly people is to keep them occupied, either in light employment or, when it is necessary to give up work, through handicrafts or other occupational and diversional activities. It is therefore suggested that statutory and voluntary bodies should be encouraged to provide occupational and diversional facilities. The question of transport to the centres providing these facilities should also be considered.

XII. EXAMINATION DURING HEALTH

78. The question of the routine medical examination of older people has been considered. The advantages of this are the early detection, and in many cases the amelioration, of disabilities, including eye, ear, dental, or other defects, which, if untreated, might make the patient house-bound and bedridden prematurely. The general practitioner has the first responsibility in this matter, but his work can be assisted greatly by the health visitor, who, with her knowledge of the families in her district, can advise the old person to consult the family doctor early; she can also save the practitioner's time by visiting homes of old people on his list and informing him when she considers a visit to be advisable. Routine medical examination in health is also an essential part of research into the problems of ageing.

79. The establishment of more "Examination in Health" clinics either in local health authority or in hospital premises is worthy of careful consideration. The former is probably more advantageous, provided chiropody and physiotherapy facilities can be made available and the services of an experienced physician are obtained.

XIII. THE RURAL ASPECT

80. Although much of this report relates to rural as well as other areas, the Subcommittee felt it important to include some particular reference to the problem in rural areas.

Domiciliary Services

81. In rural areas, too, the domiciliary services must be strengthened to ensure that patients are not admitted to hospital unnecessarily. As in urban areas, the cost of better organized domiciliary services needs to be looked at in the light of the diminished strain on the hospital services which would result, and the increased demands on the local authority purse. In view of the special implications in rural areas it appears that there may be a case for a central grant.

Home Help Service

82. There are special recruitment problems in rural areas in respect of the home help and night-sitter services. Although it is likely that help of this nature will in many cases be carried out in rural areas on a voluntary basis (often by friends or neighbours), steps should be taken to ensure that an adequate service is available. This may mean that modification of the conditions of service will be necessary.

Ancillary Services

83. Apart from the general necessity for an extension of ancillary services, there is a special problem in rural areas which could largely be met by the extension of peripheral physiotherapy services to cover those patients who, in the opinion of the consultant, could best be treated near their own homes. The Subcommittee was much impressed by a report of the work done by the department of physical medicine of a large provincial hospital. A brief account of the work carried out is contained in Sub-Appendix II.

Admissions to Hospitals

84. Whereas in urban and industrial areas long-stay hospitals and general hospitals are often only a mile or two apart, in rural areas long-stay hospitals may be at distances ranging from 10 to 100 miles, or even more, from a major general hospital with full facilities for investigation.

85. In rural areas, therefore, the Subcommittee suggests that where direct admission to a general hospital (or active geriatric department, or local or general-practitioner hospital) is not practicable, admissions to long-stay hospitals are best arranged: (a) Direct with the long-stay hospitals concerned. (b) Through the hospital management committee bed bureau, or similar organization. (c) Direct from a general hospital.

86. By one or other of these methods telephone calls, especially long-distance ones, are reduced to a minimum, time is saved, and local knowledge is made available. Furthermore, where removal from home surroundings is essential for elderly patients with, say, vascular or cerebral emergencies, the shorter the journey to hospital the less prejudiced are their chances of survival.

87. Notwithstanding the above considerations, there should be no system which restricts the admission of a patient to a particular area. Any such rigidity should be capable of modification to permit the use of beds in an adjoining area when necessary.

88. When the more urgent symptoms have subsided, arrangements should permit of any of these patients—if further investigation is required—being transferred for this purpose for, say, seven to fourteen days in a general hospital. If the original bed in the long-stay hospital is kept available (but not necessarily empty) the patient can be returned to it immediately investigations are completed, thereby ensuring that the general hospital bed is not "blocked" for an indefinite period with a chronic sick case.

Assessment of Priority

89. It is obvious that when a long-stay hospital admits from an extensive area—for example, a hospital management committee area or areas—the question of priority of admission must arise. Cases admitted direct from a general hospital have already been investigated and full clinical notes are available. These can be passed on via the hospital almoner when a patient is taken on to a long-stay hospital waiting-list. With patients being admitted from their own homes, the general practitioner has made a diagnosis, which may or may not be the final one, but in addition he is fully cognizant of the social environment of the case.

90. The Subcommittee recommends, therefore, that for rural long-stay hospitals the medical officer in charge of the hospital should assess cases for admission. He will be in the favourable position of knowing his local colleagues, the types of home from which patients will come, and will,

at the same time, be in frequent touch with his other colleagues on the staff of the general hospital or hospitals in the locality. He will also be fully familiar with the resources of his own hospital. His appointment may be with a regional hospital board or with the local health authority, or a joint one.

91. The appointment of lay admissions officers is not recommended. Their necessarily different approach to the problem of the chronic sick, whether aged or otherwise, may result in strained feelings between them and the medical practitioners.

Liaison Committees

92. Present weaknesses are probably due to the fact that a number of responsible authorities are involved with the care of the elderly and infirm, with a resulting division of both responsibility and authority. In rural areas, in particular, the establishment of liaison committees, as advocated in paragraph 59, is an important step towards a satisfactory service.

XIV. SUMMARY OF RECOMMENDATIONS

Recommendation 1.—In dealing with the problem of the elderly in its many aspects, the overriding basic principle should be—that whenever possible every elderly person shall remain in his or her own home as long as possible; and that all necessary ancillary services shall to this end be fully provided. (Preamble.)

Recommendation 2.—Suitable accommodation for the elderly should be erected either on housing estates or in a group with accommodation available for a warden (para. 13).

Recommendation 3.—Registration of private homes should be followed up by regular inspection in all cases (para. 15).

Recommendation 4.—The possibility of welfare authorities making full use of private establishments for the care of the elderly, and the possibility of boarding-out arrangements in private houses, should be further explored (paras. 16, 17).

Recommendation 5.—Where practicable, greater attention should be paid to the making of adaptations to existing accommodation to assist the elderly in their own homes—for example, by altering the height of kitchen equipment, the provision of handrails, etc. (paras. 18, 19).

Recommendation 6.—Local health authorities should issue periodically, for the use of those concerned with the care and welfare of elderly people, a brochure (in pocket size) giving details of all services available for elderly people in the area (para. 21).

Recommendation 7.—Greater use should be made of the health visitor as a member of the domiciliary team (paras. 21, 46, 78).

Recommendation 8.—(a) Every possible step should be taken to fill the establishment of district nurses, and the establishment should be reviewed in the light of the requirements of the elderly sick and infirm (para. 24). (b) In all areas it would be helpful for the nursing duties to be so arranged as to allow the employment of a proportion of State Enrolled Assistant Nurses on duties within their accepted scope. Authorities should also be encouraged to employ male nurses and male S.E.A.N.s in greater numbers (para. 24). (c) Male nurses, as well as others, should be given priority in the allocation of housing accommodation (para. 25).

Recommendation 9.—There should be a substantial expansion of the home help service, including male staff (paras. 30, 31).

Recommendation 10.—Adequate arrangements should be made in all areas to provide meals for elderly people (paras. 34, 35).

Recommendation 11.—(a) Routine examination by an ophthalmologist should be part of the service given to elderly patients (para. 38). (b) The advice given by the

Ministry of Health that blind certification should normally be only on the authority of an ophthalmologist of consultant status should be implemented as fully as possible (para. 38).

Recommendation 12.—There should be an extension of the chiropody services for elderly people (para. 41).

Recommendation 13.—Provision should be made in all areas for a laundry service for the incontinent (para. 42).

Recommendation 14.—Geriatric units, where established, should be in the care of a consultant, with adequate medical staff, including local general practitioners (paras. 46–48).

Recommendation 15.—(a) Every teaching hospital should have a unit concerned with the treatment of elderly people (para. 49). (b) Undergraduate medical education and nursing training should include instruction in the care and treatment of the elderly and there should be facilities for post-graduate study (paras. 49, 50).

Recommendation 16.—The rigidity of the admissions system which restricts the admission of a patient to a particular area should be modified to permit the use of beds in an adjoining area when necessary (paras. 51, 87).

Recommendation 17.—There should be an increase in Part III accommodation to meet present and future needs (paras. 53, 62, 73).

Recommendation 18.—(a) There should be greater co-ordination of the local health authority and welfare authority services for the elderly. This should be effected either by amalgamation or by unified administrative control, under the medical officer of health (para. 60). (b) (i) A practitioner, to whom cases from general practice would be referred, should be responsible for the assessment of priorities for admission of the elderly to hospital beds, and should advise through the medical officer of health on admission on medical grounds to Part III accommodation. The practitioner would be appointed jointly by the local authority and the regional hospital board (paras. 62–64). (ii) In rural areas, assessment of priority for admission to long-stay hospitals should be the responsibility of the medical officer in charge of the hospital (para. 90). (c) Area liaison committees, representing all statutory and voluntary interests, should be established throughout the country (paras. 59, 92).

Recommendation 19.—There should be increased facilities for preventive psychiatry, as well as additional observation wards and hospital accommodation for the mentally ill (paras. 69–71).

Recommendation 20.—Practitioners should be encouraged to undertake research into the medical and social problems associated with old age, and should be afforded adequate facilities for the purpose (paras. 74, 75).

Recommendation 21.—(a) The present general policy of retirement on reaching a specific age must be reconsidered (para. 76). (b) Special employment schemes should be introduced for those no longer able to undertake full work (para. 77).

SUB-APPENDIX I: THE GENERAL PRACTITIONER AND THE HEALTH VISITOR (B.M.A. REPORT, 1954)

The need for the closest co-operation between general practitioners and health visitors is fully accepted by the Association, and in conjunction with the Society of Medical Officers of Health detailed consideration has been given to the most effective means of securing this co-operation.

It is appreciated that in many areas reasonably satisfactory arrangements already exist with resultant benefit to all concerned, but it is apparent that in other areas the necessary degree of co-operation has yet to be attained.

It is the view of both bodies that harmonious relations can be established if good will and interest are shown by all concerned and if the following principles are accepted:

1. Co-operation between general practitioners and the medical officer of health and his staff regarding the health, care, treatment, and aftercare of all patients is essential.

2. The local health authority has certain statutory obligations regarding the health of the community, and the health visitor who is employed by the local health authority is under the direction of the medical officer of health. This, however, in no way prevents the health visitor from working closely with the general practitioner and under his guidance in the care of individual patients.

3. Direct consultations should take place between general practitioners and health visitors with a view to the exchange of information regarding individual patients.

4. The general practitioner is primarily responsible for the health of the individual and the family, while the health and welfare of the family in relation to the community is a responsibility of the medical officer of health and his staff. The close association of all concerned, as members of one team, is of vital importance if these responsibilities are to be adequately fulfilled.

The Association and the Society realize that to a great extent the question of co-operation is a local problem and the means by which such co-operation can be obtained are for local consideration and arrangement. It is strongly recommended that urgent consideration be given to this matter in all areas. It is only in this way that the general practitioners, medical officers of health, and health visitors can work in partnership towards that co-operation which will ensure efficient and all-embracing care for the patient, whatever his age or state of health.

APPENDIX TO SUB-APPENDIX I

The following suggestions of some of the ways by which greater co-operation between general practitioners and health visitors could be better understood and improved may be helpful:

1. In the first place discussions to this end should take place between the medical officer of health of the local health authority, together with senior members of his staff, and representatives of the B.M.A. Branch or Division and the local medical committee.

This is essential, for the detailed arrangements will vary, not only between local health authorities but in different parts—that is, rural and urban—of a local health authority.

Agreement on the principle of co-operation at this level should ensure full implementation elsewhere.

2. Close personal contact and exchange of information between individual general practitioners and health visitors is essential. In this way both parties will understand and appreciate the other's duties and responsibilities.

In rural areas where the one individual is home nurse, midwife, and health visitor, there is usually that understanding between her and her general-practitioner colleagues. In urban areas, particularly in the large towns and cities, and where in most cases the health visitor does not act as home nurse or midwife, general practitioners do not know personally the health visitors working in the area.

3. Complaints have been made by general practitioners that at times contradictory advice is given to patients by health visitors. It is clear that this must be avoided, and here close consultation and co-operation between general practitioners and health visitors is essential.

4. In addition to their statutory duties, health visitors are available, at the discretion of the medical officer of health, for visiting patients when requested by general practitioners. Full consultation between the parties will result in efficient and economic use of health visitors.

5. Many general practitioners are unaware of the many facilities which can be made available for their patients through the local authority health and welfare services. Some medical officers of health regularly circulate all general practitioners in their area with detailed information, and it is strongly recommended that this should be done in all areas. It can be of great value to the general practitioner to know what assistance can be provided by his local authority. The full use of health visitors would tend to obviate repeated visits on the part of the general practitioner and would facilitate his work by securing rapid assistance through the local authority.

In all these ways the health visitor can supplement the service of the general practitioner, and by working in partnership they can weld together both the clinical and preventive aspects of the service, within the existing arrangements under Parts III and IV of the National Health Service Act.

6. In certain areas a health visitor has been allocated by the medical officer of health to work with a group of general practitioners. This has proved to be a satisfactory arrangement, but its practicability depends on local circumstances. It is recommended that this arrangement could well be extended wherever possible.

SUB-APPENDIX II: DEPARTMENT OF PHYSICAL MEDICINE, ROYAL HAMPSHIRE COUNTY HOSPITAL, WINCHESTER

As stated in the report (paras. 10 and 83) the Director of the Department of Physical Medicine at the Royal Hampshire County Hospital has, by close liaison with parish priests and others, been able to stimulate an interest in old people. This has resulted in practical co-operation. Voluntary helpers have amongst other things assisted with cleaning, cooking, and gardening, have made adjustments to furniture or equipment in the homes of the elderly so that they may manage more easily, and have also helped when it has been advisable to move bedroom furniture to the ground floor. Patients are, of course, admitted to hospital where necessary, but with co-operation between the parish and the hospital this is often avoided.

The hospital runs a mobile physical medicine team and has three vans which visit village centres on various days in the week to give treatment. All patients are seen at the main hospital every few weeks so as to make certain that the treatment they are receiving is satisfactory and is still required. The main department and 10 peripheral centres are staffed by 20 physiotherapists. The mobile service was set up and the department re-equipped seven years ago. At the same time a hot pool was installed at the main hospital. It is particularly useful for patients who have been bedfast for long periods, and who are able to regain a certain amount of movement in the pool.

In addition, there is at the main hospital a demonstration kitchen and bedroom with specially designed furniture and equipment for the disabled. This was built because it was realized how important it is that elderly people should be taught and encouraged to use these special aids before having them in their own homes.

APPENDIX X

MEDICAL USE OF HYPNOTISM

Report of a Subcommittee appointed by the Psychological Medicine Group Committee of the British Medical Association

Appointment of Subcommittee

1. The Subcommittee was appointed in November, 1953, by the Psychological Medicine Group Committee of the British Medical Association, its terms of reference being as follows:

To consider the uses of hypnotism, its relation to medical practice in the present day, the advisability of giving encouragement to research into its nature and application, and the lines upon which such research might be organized.

2. The Subcommittee consisted of Professor T. Ferguson Rodger (chairman), Dr. E. A. Bennet, Professor Alexander Kennedy, and Dr. S. Noy Scott (representing the Science Committee of the B.M.A.).

Work of Subcommittee

3. The Subcommittee held 10 meetings at which evidence, both oral and written, was received.

4. The following questions were put in advance to those who were invited to give evidence:

- Is hypnosis a useful method of treatment?
- What safeguards are indicated in the use of hypnosis?
- How should hypnosis be taught?
- Does the medical hypnotist need special qualifications?

5. The Subcommittee wishes to record its appreciation of the assistance given by those who provided memoranda, or other written observations, or who attended meetings to give oral evidence—namely, Dr. G. J. Ambrose, Dr. G. E. Badman, Sir Russell Brain, Bt., P.R.C.P., Mr. G. H. Buckley, F.R.C.S., Dr. G. W. T. H. Fleming, Dr. H. W. Gordon, Mr. E. Dudley Grasby, M.R.C.O.G., Dr. A. A. Mason, Dr. G. F. Newbold, Dr. S. J. Van Pelt, Mr. E. E. Wookey, L.D.S. R.C.S., and Professor O. L. Zangwill.

6. The Subcommittee is also greatly indebted to Drs. W. R. Bion, N. G. Harris, W. Moodie, and E. B. Strauss, who attended a meeting of the Subcommittee and assisted in the final stages of the formulation of this report.

7. Members of the Subcommittee have studied much of the literature on hypnotism, and Sub-Appendix C gives a short list of selected works which provide a general introduction to the subject and a guide to the literature.

The Subcommittee has also considered certain recent publications by practising hypnotists and has formed the opinion that they fail to do justice to the complexity of the subject.

The Subcommittee is firmly of the opinion that publications which convey to the layman the impression that hypnotism is a panacea cannot be discouraged too strongly.

Need for a Statement on the Present Status of Hypnotism

8. Having considered the report of the Committee appointed by the Council of the B.M.A. in 1892 "to

investigate the nature of the phenomena of hypnotism, its value as a therapeutic agent, and the propriety of using it" (Sub-Appendix A), the Subcommittee, while substantially in agreement with the views then expressed, considers that the results of further study of the subject and the advances in and changes of attitude towards psychological treatment in general during the last 60 years justify the formulation of an up-to-date statement. This statement will therefore be concerned with the nature and uses of hypnotism, its relation to medical science and to psychological medicine in particular, the proper attitude of the medical profession towards the inevitable popular interest which it creates, its place in the medical curriculum, and the advisability of making a fuller knowledge of its phenomena and uses available to those training for certain specialties.

According to the available evidence, hypnotism in one form or another was known and used as a means of healing, mainly in a religious setting, by the major ancient civilizations. This has remained true through the Christian era, and the phenomena of hypnotism have been interpreted in accordance with the ideas of the time and locality, whether animistic, occultist, religious, physiological, or psychological. Its induction and practical control were well understood long before the present period in which the treatment of mental disorder has become part of the province of medical science. Since the time of its therapeutic use by Mesmer hypnotism has been of great importance to the growth of modern psychotherapy. Its subsequent development as a means of treatment within the framework of the Hippocratic tradition by Charcot, Bernheim, Liébeault, and many others, and the work of serious investigators of the calibre of Braid, Elliotson, Janet, Forel, Breuer, and Freud laid the foundation for present-day ideas of unconscious motivation and psychotherapeutic method.

The remarkable and striking nature of the phenomena induced in hypnotism and the fact that no satisfactory unifying hypothesis has yet been evolved to account for them, and the ease with which they may be induced, has led on the one hand to exploitation in the hands of charlatans and on the other to an intense public curiosity which scientific inquiry is still unable fully to satisfy. In the past hundred years this has given rise to a situation in many countries in which it has been felt necessary to hold commissions of inquiry to consider means of regulating the use of hypnotism. In some cases these inquiries have led to laws being passed, usually to fall into disuse later. The committee set up by the Paris Academy of Sciences in 1826 deliberated for five years and came to conclusions which in the opinion of the Subcommittee showed remarkable foresight and are mainly applicable to-day (see Sub-Appendix B for extracts from report), and this also applies to the report of the British Medical Association in 1892. It is evident, therefore, that hypnotism and the problem of its therapeutic and its improper uses is a subject which achieves prominence in cycles in those countries in which there is a regard for the advance of medical science and for public safety. The passing of the Hypnotism Act of 1952 marks such a cycle. It is therefore appropriate that the medical profession, some of whose members may have formed only tentative judgments on hypnotism, should make its attitude clear.

9. When hypnotism was first practised in this country official medical and scientific bodies expressed scepticism and open hostility to those who drew attention to it and its clinical applications. This attitude still influences medical opinion to a certain extent. It has no doubt been intensified, possibly with justification, by the use of hypnotism as a public entertainment and by excessive claims made for it by persons with little knowledge of morbid psychology who are unaware of the possibilities of other methods of treatment and of the limitations of hypnotism.

The Subcommittee is satisfied after consideration of the available evidence that hypnotism is of value and may be the treatment of choice in some cases of so-called psychosomatic disorder and psychoneurosis. It may also be of value for revealing unrecognized motives and conflicts in

such conditions. As a method of treatment, in the opinion of the Subcommittee it has proved its ability to remove symptoms and to alter morbid habits of thought and behaviour.

The Subcommittee therefore regards hypnotism as a proper subject for inquiry by the tried methods of medical research.

10. The striking nature of some of the immediate effects of hypnotism is such that medical men with knowledge of the subject may be invited to give information other than through the scientific and technical journals. The Subcommittee is agreed that the customary refusal of medical practitioners to publicize their work should be maintained, and that doctors do disservice to medicine and to themselves by making communications upon hypnotism to the lay press in a manner inconsistent with medical tradition and ethics. At the same time the very proper reticence of the medical profession towards the subject may well have led to uncertainty on the part of the public as to the attitude of medical men, and for this reason an authoritative statement is offered.

What is Hypnotism?

11. The following definition appears in the Hypnotism Act, 1952:

"Hypnotism" includes hypnotism, mesmerism, and any similar act or process which produces or is intended to produce in any person any form of induced sleep or trance in which the susceptibility of the mind of that person to suggestion or direction is increased or intended to be increased but does not include hypnotism, mesmerism, or any such similar act or process which is self-induced.

This definition is necessarily concerned with the purpose of the Act, which is to regulate the demonstration of hypnotic phenomena as a form of public entertainment, and the Subcommittee considers that a more comprehensive statement is desirable.

12. Although a great deal of information is now available about the manifestations of hypnotism and the physiological changes which accompany them, an exact definition is impracticable. The hypnotic state may, however, be described as follows:

A temporary condition of altered attention in the subject which may be induced by another person and in which a variety of phenomena may appear spontaneously or in response to verbal or other stimuli. These phenomena include alterations in consciousness and memory, increased susceptibility to suggestion, and the production in the subject of responses and ideas unfamiliar to him in his usual state of mind. Further, phenomena such as anaesthesia, paralysis and rigidity of muscles, and vasomotor changes can be produced and removed in the hypnotic state.

13. There is a wide range of hypnotic manifestations which are by no means confined to the so-called trance.

If all types of phenomena are taken into account it may be stated that the majority of people can be hypnotized but in only a minority is it possible to induce a deep trance in a single session.

Importance to Psychiatry and General Medicine

14. While, as has been stated (paragraph 9), hypnotism is of value in the treatment of so-called psychosomatic disorder and psychoneurosis some enthusiastic supporters of this form of treatment fail to enumerate the contraindications, and give the impression that it constitutes an approach which should replace all other forms of psychiatric treatment. In the opinion of the Subcommittee this view is mistaken. Like other remedies hypnotism has its indications and contraindications, and considerable knowledge and expert judgment are required to decide when hypnotism is likely to help the patient, and whether it should be used by itself or as a complement to other methods of psychotherapy.

For these reasons the Subcommittee is of the opinion that hypnotism should not be regarded as a specialty independent of psychological medicine.

15. In addition to the treatment of psychiatric disabilities, there is a place for hypnotism in the production of anaesthesia or analgesia for surgical and dental operations, and in suitable subjects it is an effective method of relieving pain in childbirth without altering the normal course of labour. It has been claimed that the shock of operative procedures can be mitigated when these are carried out under deep hypnosis, but further research is desirable. The amount of work necessary to prepare a patient to undergo surgical operation under hypnotism limits its usefulness.

Dangers of Hypnotism—Ethical Aspects

16. The dangers of hypnotism have been exaggerated in some quarters. The Subcommittee is convinced, however, that they do exist, especially when it is used without proper consideration on persons predisposed, constitutionally or by the effects of disease, to severe psychoneurotic reactions or antisocial behaviour. The commission of crimes involving even danger to life is not entirely to be ruled out.

17. Hypnotism may involve the rapid or immediate development of a relationship between hypnotist and subject of the same order and intensity as is produced more slowly in the course of psychotherapy. The trained psychotherapist must be aware of this relationship as part of the therapeutic process and must recognize its potentiality for harm and be able to deal with it. The application of the hypnotic technique without such knowledge and experience provides no control of the powerful emotions which may be released. For this reason the Subcommittee considers that harm can be done by the application of hypnotism in unsuitable subjects, particularly when it is used by persons indifferent to the well-being of the subject or ignorant of the morbid complications of the hypnotic state. It is recommended, therefore, that the use of hypnotism in the treatment of physical and psychological disorders should be confined to persons subscribing to the recognized ethical code which governs the relation of doctor and patient. This would not preclude its use by a suitably trained psychologist or medical auxiliary of whose competence the medical practitioner was personally satisfied, and who would carry out, under medical direction, the treatment of patients selected by the physician.

Place in Medical Education

18. It is recommended that a description of hypnotism and its therapeutic possibilities, limitations, and dangers should be given to medical undergraduates during their psychiatric course.

19. Instruction in the clinical use of hypnotism should be given to all medical postgraduates training as specialists in psychological medicine and possibly, say, to trainee anaesthetists and obstetricians, so that they will understand its indications and practical applications. The Subcommittee holds that no special "gift" is required to induce it: there are various techniques of equal efficacy.

Need for Research

20. As its work progressed the Subcommittee became convinced of the need for further research into hypnotism. Medical men have hesitated to take a serious interest in a procedure which is so unlike the orthodox methods of medical science. Nevertheless, it is thought that since hypnotism can achieve good results in certain cases, and since present theories as to its nature and mode of action are speculative, it constitutes a challenge to medical science.

21. The Subcommittee wishes to draw attention to the fact that, although a very considerable amount of satisfactory research work is on record, investigations must necessarily continue until the problems of the hypnotic state have been solved and the best means of its application to bodily and mental disorder have been worked out.

It regards hypnotism as a proper subject for scientific inquiry. The main fields which might particularly engage the attention of serious medical research workers are thought to be as follows:

(1) Continuation of neurophysiological and psychological observations on hypnotism induced under controlled conditions, to explore its relation to consciousness, attention, the formation and extinction of conditioned responses, the communication between different parts of the central nervous mechanism, and conditions which favour its easy induction.

(2) Controlled observation of its therapeutic effects in functional nervous disorders. It is possible that the relative simplicity and brevity of hypnotic techniques provide a form of psychological treatment the result of which could more easily be subjected to statistical analysis.

(3) The investigation of somatic disorders in the aetiology of which psychological factors are thought to play a major part. Profound and easily measurable changes of physiological function can be induced under hypnotism, and thus it offers a means of direct observation of psychosomatic relations.

(4) Since hypnotism very readily produces an intense relationship between patient and doctor it provides a means of research into the general problem of the patient-doctor relationship.

Further, because of the relative brevity of treatment with hypnotism, such research may contribute to a solution of the problem created by the very large number of people requiring psychotherapy, and this possibility should be explored in the clinical field.

(5) The investigation of the relation of hypnotism and similar states to non-medical methods of treatment, including healing through religious agencies.

22. Since research of this kind requires co-ordination of laboratory, clinical, and other studies it might best be organized through university departments and research foundations.

SUB-APPENDIX A

Statement of 1892 by a Committee appointed by the Council of the B.M.A. to investigate the nature of the phenomena of hypnotism; its value as a therapeutic agent; and the propriety of using it.

The Committee, having completed such investigation of hypnotism as time has permitted, have to report that they have satisfied themselves of the genuineness of the hypnotic state. No phenomena which have come under their observation, however, lend support to the theory of "animal magnetism."

Test experiments which have been carried out by members of the Committee have shown that this condition is attended by mental and physical phenomena, and that these differ widely in different cases.

Among the mental phenomena are altered consciousness, temporary limitation of will power, increased receptivity of suggestion from without, sometimes to the extent of producing passing delusions, illusions, and hallucinations, and exalted condition of the attention, and post-hypnotic suggestions.

Among the physical phenomena are vascular changes (such as flushing of the face and altered pulse rate), deepening of the respirations, increased frequency of deglutition, slight muscular tremors, inability to control suggested movements, altered muscular sense, anaesthesia, modified power of muscular contraction, catalepsy, and rigidity, often intense. It must, however, be understood that all these mental and physical phenomena are rarely present in any one case. The Committee take this opportunity of pointing out that the term hypnotism is somewhat misleading, inasmuch as sleep, as ordinarily understood, is not necessarily present.

The Committee are of opinion that as a therapeutic agent hypnotism is frequently effective in relieving pain, procuring sleep, and alleviating many functional ailments. As to its permanent efficacy in the treatment of drunkenness, the evidence before the Committee is encouraging, but not conclusive.

Dangers in the use of hypnotism may arise from want of knowledge, carelessness, or intentional abuse, or from the too continuous repetition of suggestions in unsuitable cases.

The Committee are of opinion that when used for therapeutic purposes its employment should be confined to qualified medical men, and that under no circumstances should female patients be hypnotized except in the presence of a relative or a person of their own sex.

In conclusion, the Committee desire to express their strong disapprobation of public exhibitions of hypnotic phenomena, and hope that some legal restriction will be placed upon them.

F. NEEDHAM,

Chairman.

T. OUTTERSON WOOD,

Honorary Secretary.

SUB-APPENDIX B

Extracts from the report on the experiments in animal magnetism made by a committee of the medical section of the French Royal Academy of Sciences.

(This committee was appointed in 1826 and made its report at the meetings of June 21 and 28, 1831. An adverse report on animal magnetism had been made by the Royal Society of Medicine and by the French Academy of Sciences. This report was not unanimous, and in the light of later observations it was decided to appoint a new committee. This was to have had Laennec as its rapporteur, but he was taken ill and his place was taken by Husson. A series of experiments were made under conditions of rigorous control. The committee was unanimous in its conclusions, from which the following are extracted.)

"We have related with impartiality that which we have observed with distrust. . . . Far from setting limits to this part of physiological science, we hope, on the contrary, that a new field has been opened up to it. Considered as a cause of certain physiological phenomena, or as a therapeutic method, magnetism should be admitted within the sphere of the medical sciences, and, consequently, physicians only should practise it, or superintend its use, as in the northern countries."

In presenting its report to the Académie des Sciences, the committee said:

"Indeed, we dare not flatter ourselves with the hope of having you participate entirely in our conviction of the reality of the phenomena which we have observed, and which you have neither seen nor studied along with us. We do not demand of you a blind belief of all that we have reported. We conceive that a great proportion of these facts are of a nature so extraordinary that you will not be able to accord them full belief. Perhaps we ourselves might have manifested a similar incredulity if our places were reversed, and you had come to announce the same facts and conclusions to us, and we were in the position of never having seen or had the opportunity of studying anything of the same kind."

British Medical Association

PROCEEDINGS OF COUNCIL

A meeting of the Council of the Association, the last before the Annual Representative Meeting, was held at Headquarters on April 13, with Dr. E. A. GREGG, Chairman of Council, in the chair.

In view of the fact that the Annual Meeting is not being held in this country this year, so that the usual ceremonial presentation of prizes cannot take place, the PRESIDENT (Sir John McNee), during a break in the Council proceedings, presented such of the prizes as had already been awarded. The prize-winners were: Professor N. B. CAPON (Liverpool), the Sir Dawson Williams Prize; Dr. A. F. ROGERS (Bristol) and Dr. J. K. WILSON (Liverpool), the Katherine Bishop Harman Prize; Dr. C. A. H. WATTS (Ibstock, Leicestershire), the Sir Charles Hastings Clinical Prize, and Dr. D. S. McLAREN (London), the Charles Oliver Hawthorne Clinical Prize.

Personal

The deaths of the following former members of Council were announced: Dr. C. J. A. WOODSIDE (Belfast), Surgeon Rear Admiral O. D. BROWNFIELD (Petersfield), and Dr. J. C. PEARCE (Diss). The Chairman was authorized to send letters of condolence to the relatives.

Dr. A. V. KELYNACK, Assistant Secretary, was heartily welcomed on her return after a lengthy illness.

The Council tendered its congratulations to the Rt. Hon. CHARLES HILL, M.P., former Secretary of the Association, on his appointment as Postmaster-General.

It was reported that Professor BRYAN MCFARLAND had accepted the Council's invitation to represent the Association at the Annual Meeting of the Medical Association of South Africa in Pretoria in October. It was also reported that Professor ALEXANDER HADDOW, director of the Chester Beatty Research Institute, was taking part in the same meeting, and the Council nominated him as a second official delegate.

It was stated that Mr. TUDOR THOMAS, Immediate Past President, would be attending the American Medical Association meeting in Atlantic City next June, and it was resolved to ask the American Medical Association to receive him as an official delegate.

It was reported that the Chairman had put forward the name of Dr. C. A. H. WATTS, Sir Charles Hastings Clinical Prizewinner, for a vacancy on the Standing Mental Health Advisory Committee, the Minister having expressed a wish to appoint a general practitioner.

The Council considered the method of preparing the Association's evidence to the Departmental Committee, under the chairmanship of the Rt. Hon. Henry Willink, on manpower in the medical profession. It was decided to set up a small steering committee similar to that appointed to co-ordinate the evidence for the Guillebaud Committee. Dr. ANNIS GILLIE was anxious that the outlook of women students should be considered, and Dr. D. F. HUTCHINSON urged the claims of the Medical Recruitment Committee to representation. The CHAIRMAN, in whose hands the appointment of the committee was left, said that these and other points would be taken into consideration.

Public Relations

Dr. H. G. DAIN, as chairman of the Public Relations Committee, brought forward a memorandum prepared by the committee for use at an appropriate time as the foundation of the Association's case for the continued existence of private beds in National Health Service hospitals. After discussion the memorandum was approved.

A report on Press representation at the Annual Representative Meeting was also before the Council from the Public Relations Committee. The arguments for and against invit-

ing the Press were set out, and the view was taken in the report that the arguments for admitting the Press outweighed the arguments on the other side.

Dr. O. C. CARTER drew attention to one passage in the report in which it was stated that at its present level of general public appeal the scientific part of the Annual Meeting did not deserve much newspaper space. The Association was a body of high academic and scientific standing, but the impression might arise that it was a kind of trade union concerned primarily with questions of remuneration.

Dr. A. V. RUSSELL said that it was important to increase the interest of the scientific side of the Annual Meeting. Dr. I. D. GRANT said that the Annual Representative Meeting was, after all, the parliament of the profession. Moreover, as to the scientific side he thought that at the last two Annual Meetings the plenary scientific sessions had been of great value and had attracted much Press publicity.

The report was approved.

General Medical Services

Dr. TALBOT ROGERS, in presenting the report of the General Medical Services Committee, said that a detailed study had now been made of the report of the Committee on General Practice (the Cohen Committee), set up by the Central Health Services Council. His Committee had been struck by the "somewhat negative" nature of the report. Matters of major policy with which the Committee was in agreement had already been discussed with the Ministry, and other questions would inevitably be raised sooner or later in routine meetings. As regards four major issues—namely, drugs for private patients, the obstetric list, the machinery for filling practice vacancies, and stock orders—opportunity had already been taken to press the Association's views.

Dr. Rogers drew special attention to the work of the special subcommittee under the chairmanship of Dr. Dain which had been reviewing Service Committee and Tribunal regulations. Agreement had been reached on the various matters under discussion and, subject to the approval of the Annual Conference, any necessary action, whether by amending regulations or otherwise, would be taken by the Ministry. Three years of careful work had been put into this by the subcommittee, and a very large number of constructive amendments had been put forward, most of which had been accepted.

The Council warmly endorsed Dr. Rogers's congratulations to Dr. Dain on the work of his subcommittee.

The Ban on Heroin

Dr. R. HALE-WHITE referred to the fact that the Government had decided to implement the recommendation of the Economic and Social Council of United Nations regarding the manufacture and use of heroin. It had had the effrontery to ban heroin in this country without making any approach to the medical profession.

Mr. LAWRENCE ABEL spoke to the same effect, and urged that this matter should be taken up by the General Medical Services Committee with the Ministry.

The CHAIRMAN said that this came about as a result of international pressure. It was from its world-wide aspect that the problem was brought to them. Dr. S. WAND said that as a member of the Medical Advisory Committee concerned he came to this subject feeling that the ban was uncalled for; but having heard the arguments and knowing from his personal experience that there were drugs which replaced heroin very adequately, he was persuaded that if this country stayed out of the international agreement it would intensify a grave international problem. During the last six or eight years a number of pain-relieving drugs had been introduced which led to the lessened use of heroin.

It was agreed that an approach on the subject should be made to the Government as to the present position with regard to heroin, and that the Government should be informed of the opinions expressed on the subject.

Medical Use of Hypnotism

Dr. ROWLAND HILL, Chairman of the Central Consultants and Specialists Committee, presented a report on the "Medical Use of Hypnotism," prepared by a subcommittee appointed by the Psychological Medicine Group Committee. The report appears as an appendix to the Supplementary Report of Council at page 190. Professor T. FERGUSON RODGER, chairman of the Subcommittee, was invited to give an outline of the report. He said that as long ago as 1892 a statement had been put forward by a committee appointed by the Council of the Association to investigate the phenomena of hypnotism, its value as a therapeutic agent, and the propriety of using it. The subject had often been before the public, and, of course, it had been the happy hunting ground of the charlatan. The present report attempted a definition of hypnotism, touched on its importance to psychiatry and general medicine, and its place in medical education, stressed its dangers and the ethical aspects of its use, and set out the main fields which might particularly engage the attention of serious research workers.

On the motion of Dr. ROWLAND HILL the report was approved, and it was agreed that a lead should be taken in furthering research on the subject of hypnotism, and that the need for such research on the lines indicated in the report should be brought to the notice of universities and research foundations. Mr. LAWRENCE ABEL hoped that the research would not proceed on entirely academic or psychiatric lines, but that the general practitioner would be in some way integrated with it.

Professor Ferguson Rodger and his subcommittee were warmly thanked for their work.

Geriatrics

Dr. ROWLAND HILL moved approval of a report of the Geriatrics Joint Subcommittee. He explained that the subcommittee was appointed by the Liaison Subcommittee of the General Medical Services, Central Consultants and Specialists, and Public Health Committees to consider how the establishment of a co-ordinated geriatric service could best be achieved. The report appears as an appendix to the Supplementary Report of Council at page 181.

Dr. H. D. CHALKE, chairman of the subcommittee, said that this was a comprehensive report. It was felt that the problem of chronic sickness could not be separated from that of old age. The subcommittee, which embraced members of different branches of the profession, had noted the earlier report entitled "The Care and Treatment of the Elderly and Infirm," published by the Association in 1947, but they were soon aware that the recommendations of that report had not been implemented as fully as they might have been. The present report conveyed nothing new, but the main point was that they had emphasized or reiterated that the whole problem of the aged was centred on the home. Another point was that so many agencies were appointed for the care of old people that it was felt that a central co-ordinating medical authority should be set up. In starting its work the subcommittee had tried to find the extent of the problem, and sent out a large number of questionnaires, but this was found to be statistically impossible. In some parts of the country the services were adequate and in others grossly inadequate.

Dr. FRANK GRAY moved the reference back. He considered that this was not a report which could possibly be approved in its present form. It was an unfortunate result of liaison among different bodies. No advance had been made on the earlier Association report in 1947; in fact they had gone back on it. The old report began with a classification of the elderly, but the present subcommittee had blurred that classification. It stated at one point that the main responsibility must be with the relatives, yet the rest of the report ignored the relatives and proceeded as if there were no such people. There were, broadly speaking, two classes of hospital accommodation for the reception

of the elderly—the modern geriatric unit and the "dump," in which latter they had no treatment and were left to lie in bed.

What the report had to say about the place of the general practitioner (Dr. Gray continued) was unsatisfactory. He "should be kept informed of all the local authority and other services on which he can call." He was, apparently, given no other role. There was just another reference in the preamble: "In each group or area there should be someone to whom general practitioners can turn." The bulk of the report seemed to be composed of the enumeration of local health authority services.

An assumption in the report was that, although life might be lengthened, the average health over the age of 60 would remain exactly the same. That was an assumption which should not be accepted. Again, the report stated that the termination of an individual's employment should be related to the biological rather than to the chronological factor, and that the policy of automatic retirement was unrealistic and uneconomic. With that he agreed, but it would be immediately pointed out that there was an automatic age for retirement of members of the B.M.A. staff. A distinction should be made between those who were merely elderly and those who had associated illness or disability. The subcommittee seemed to have no conception of preventive medicine.

Dr. W. E. DORNAN seconded the reference back. The great trouble, not emphasized enough in this report, was that some geriatric institutions, though essentially first rate in their conception and organization, completely lacked sufficient numbers of trained nursing staff to apply the ordinary methods of treatment.

Dr. R. G. GIBSON said that this was one of the best reports he had ever read. It did not take anything away from the general practitioner. He drew attention to what was said in the report about routine medical examination of older people in which the general practitioner would have first responsibility. Dr. H. M. GOLDING said that if all the recommendations in this report were implemented the old people he looked after would be much better off. Mr. S. F. L. DAHNE said that the report laid the emphasis in the right place. Dr. A. BARKER hoped the report would be accepted.

Dr. MARY ESSELMONT, while not supporting all Dr. Gray's criticisms, hoped that the report would be referred back. It did not seem to go much further than the report issued eight years ago. Economic factors were not sufficiently stressed. Dr. J. A. PRIDHAM liked the report, but wished that more emphasis had been given to the home help service, which was hardly mentioned at all. Dr. J. C. ARTHUR said that the heart of the problem was that in very many cases the relatives were not prepared to take up the responsibility, and that ought to be emphasized a little more. Dr. W. WOOLLEY and other members spoke in appreciation of the report.

Dr. CHALKE said that Dr. Gray had indulged in armchair criticism. This report did not concern every person over 60 or 65. It referred only to the relatively small percentage who were in need of care and in whom relatives were not interested. With regard to the criticism that the role of the general practitioner was not sufficiently emphasized, his own fear was that it was being emphasized too much. The question of employment of the elderly had been dealt with in a recent Government publication, and the subcommittee had not considered it necessary to go into it at length.

The amendment to refer back was lost, and the report was approved.

Hospital Medical Staffs

Dr. ROWLAND HILL reported on various matters which had been before the Central Consultants and Specialists Committee (*Supplement*, April 9, p. 159). In dealing with the remuneration of hospital medical staff, he said that his committee had reiterated its recommendation that a survey of current hospital medical staff income from all professional sources should, with such expert aid as was necessary, be undertaken. The recommendation would be placed

before the Staff Side of Whitley Committee "B" in April, and the results of the survey when complete should be an influencing factor in any further action to be taken in connexion with overall remuneration in relation to falling values of money.

The revised report of the subcommittee on hospital medical staffing under Professor Strachan's able chairmanship had been considered by the Joint Committee, and a large measure of agreement had been reached. Before any changes in structure of hospital medical staff were put into effect a review of establishments would take place in order to ascertain what consultant expansion was necessary. The Royal College of Physicians had prepared a report on junior hospital staffing. The policies were fundamentally in agreement, though differing in detail.

Dr. R. P. LISTON expressed some disquiet concerning the position of the Representative Body, which, it seemed to him, might be presented with a *fait accompli*. Dr. HILL replied that he did not think any question would be ripe for decision by the time of the Annual Representative Meeting this year. The point he was anxious to make was that the body which would be ultimately responsible for reaching agreement with the Government on this matter was the Joint Consultants Committee. The Central Committee had told the Joint Committee that before any decisions were reached with the Government there must be a reference back to the constituent bodies on this particular issue. The position was one which called for understanding and co-operation.

Dr. J. A. PRIDHAM said that a very important point of principle was involved. The Representative Body was the voice of the British Medical Association, and he would like it emphasized that any resolutions by that body would have the most careful consideration before any action was taken with the Government.

Mr. LAWRENCE ABEL said that he sympathized with this point of view, and he could assure the Council that although the report of the Strachan subcommittee had been accepted in principle there was no immediate likelihood of any final commitment by any body or collection of bodies, and that any resolutions of the Representative Body would be taken most fully into account. A compromise might have to be reached eventually, but everything was being done in the most democratic way, and in this field the hospital staffs needed the help of the general practitioner and of the Association as a whole.

Dr. ROWLAND HILL endorsed Mr. Abel's remarks. He agreed fully on the importance of discussion in the Representative Body.

Dr. WAND drew attention to the statement in the report that a number of points remained open for discussion, and that it would now be left to the Joint Committee to enter into preliminary discussions with the Ministry on agreed principles. It seemed to him that no matter what action was taken by the Representative Body it might not relate to those points remaining open for discussion.

Mr. ABEL said that there was unanimous agreement that before any changes in the structure of hospital medical staffing were brought into effect a review of establishments must take place. That was the first step and nothing could possibly follow until that was done.

Dr. HUTCHINSON said that it was made quite clear in the Central Committee that this document was sent to the Joint Committee for discussion only, not for agreement with the Government, and that the report must come back to the Central Committee.

Dr. ROWLAND HILL said that Dr. Hutchinson's interpretation of the position was the correct one. Nothing would be agreed between the Joint Committee and the Ministry without previous reference back to the constituent bodies.

The discussion on this subject then dropped. Other matters of report brought forward by Dr. Rowland Hill were set out in the report of the meeting of the Committee (*Supplement*, April 9, p. 159).

It was stated that the Central Committee was making representations to the War Office regarding fees payable

to civilian consultants employed on a sessional basis, and was also reviewing the terms and conditions of service of whole-time consultants employed by the War Office.

Remuneration of Medical Officers of Health

Dr. H. D. CHALKE, in the absence of the chairman of the Public Health Committee, presented a report of the business at its last meeting. He reported that on March 29 and 30 the case for a review of the remuneration of all grades of medical officers in the Public Health Service was heard in the Industrial Court. The staff case was very ably presented by counsel, Mr. B. J. M. MacKenna, Q.C., and Mr. S. B. R. Cooke, instructed by Messrs. Hempons. The award of the Court was now awaited.

Gold Medal of the Association

A proposition was before the Council to award the Gold Medical of the Association to Sir HENRY SIMPSON NEWLAND, Past President of the Royal Australasian College of Surgeons and of the Australian B.M.A. Federal Council, and a Vice-President of the B.M.A. since 1932.

Mr. MYLES FORMBY, representative on the Council of certain of the Australian Branches, said that he knew that this proposal would be warmly welcomed in Australia. He was sure it would be a most popular award.

The motion, formally proposed by the CHAIRMAN OF COUNCIL, that the Gold Medal of the Association be awarded to Sir Henry Newland, was, as required by the regulations, voted on by ballot, and was approved.

The Council agreed to recommend to the Representative Body that Dr. A. W. S. SICHEL, of Capetown, President of the Association in 1951-2, and Dr. P. T. O'FARRELL, President in 1952-3, be elected Vice-Presidents in recognition of their valuable services.

Other Business

On the proposition of Dr. J. A. L. VAUGHAN JONES, chairman of the Occupational Health Committee, it was agreed that the constitution of the Committee on Medical Education be altered to include a nominee of the Association of Industrial Medical Officers. He said that his committee was anxious that occupational health interests should be adequately represented. His colleague, Dr. H. Alexander, was one of the members of the new committee, but it was considered that it would be advantageous if the Association of Industrial Medical Officers were represented directly in the same way as the Society of Medical Officers of Health. Other matters in the report of the Occupational Health Committee were set out in the account of its meeting (*Supplement*, March 26, p. 122).

Dr. H. H. D. SUTHERLAND, chairman of the Amending Acts Committee, again brought forward the question of the implementation of the decisions of the Special Representative Meeting of December, 1951. The suggestion had been made that before any decision as to future action be reached the recommendations passed in 1951 should be reviewed by the Council. He moved that the Council should take action at the appropriate time on the resolutions passed by the Special Representative Meeting and should keep the Representative Body informed of all actions taken or proposed. Dr. DAIN pointed out that this resolution was unnecessary. What it asked for was exactly what the Council was sent there to do. The motion was not carried.

Dr. J. G. HAMILTON reported for the Committee which is considering remuneration policy. A good deal of information had been collected and the help of an eminent statistician had been obtained. The Committee would be meeting again in May to consider the implications of these figures.

Dr. Hamilton also reported for the Scottish Committee. Here the chief matter concerned the advice given to a regional hospital board by the Department of Health that special leave with pay should not be granted to members of hospital staff to enable them to attend meetings of the Scottish Committee. Apparently the Department regarded

Scottish News

CO-OPERATION IN THE HEALTH SERVICE

CONFERENCE AT PEEBLES

[FROM A SPECIAL CORRESPONDENT]

Under the auspices of the Royal Institute of Public Administration a two-day conference on the health services was held at Peebles on April 1 and 2. This, the third such conference, was the first in Scotland, and about 220 delegates from local authorities, hospital authorities, executive councils, and interested voluntary bodies attended. Sir CHARLES CUNNINGHAM, Secretary of the Scottish Home Department and chairman of the Edinburgh Group of the Institute, welcomed the delegates.

Dr. MAY BAIRD, chairman of the North-eastern Regional Hospital Board and convener of the Health and Welfare Committee of Aberdeen Corporation, was chairman of the conference. The theme was "working together," and she suggested most advantage would accrue from discussions directed to improving the present administrative set-up rather than suggesting radical alterations which were not practicable.

The Personal Touch

Sir HUMPHREY BROWN LINDSAY, chairman of the South-eastern Regional Hospital Board, in his address entitled "The General Theme," dealt with the ways in which the activities of the different branches might best be co-ordinated. Such co-ordination, he considered, depended essentially upon the personal and friendly co-operation between those working the service, at whatever level. In his experience formal co-ordinating committees had not been very effective. He felt that *ad hoc* committees, called together to deal with a specific subject, for which members could be specially chosen were better. As a member of the Scottish Health Services Council, Sir Humphrey felt that it was too remote from the field of action to be as useful as it might be.

Sir Humphrey referred to the control and treatment of tuberculosis, where it now seemed that results were being obtained, and he considered that this illustrated the close co-operation possible between local authorities, hospitals, and general practitioners. The general impression was that in the maternity services more could be done to ensure continuity of care in the antenatal, confinement, and post-natal periods. While emphasizing that there was no room for complacency, Sir Humphrey did suggest to the delegates that the achievements of the Health Service were worthy of recognition.

Provost Mrs. M. EWART, of Hamilton, queried the use of regional hospital boards—a view which found no support amongst other delegates.

Speaking as a general practitioner, Dr. J. O. McDONAGH, Perth, president of the Scottish Association of Executive Councils, thought that basically the organization was sound, but they should not be afraid to be critical. He considered that there was at present automatic co-operation between the three branches and a little overlapping caused no harm. He did not think that co-ordinating committees were necessary. They had no executive functions, and that was their weakness. If there had to be co-ordinating committees they should be formed for specific purposes and be dissolved when they had done their job. A surfeit of committees would choke the service quicker than anything. Dr. McDonagh said that general practitioners should have cottage hospitals available to them.

Most speakers were critical of the formal co-ordinating committee. Common membership of the different bodies automatically encouraged co-ordination, and personal contacts were of vital importance. All speakers stressed the key position of the general practitioner, which he derived from his knowledge of the patient and the branches of medicine.

the concession, which was granted to the Central Consultants and Specialists Committee (Scotland), as in relation to the National Health Service work of a particular committee, and did not consider that the Scottish Committee fulfilled the criterion. The matter was to be taken up with the Department.

On the report of the Journal Committee, Dr. HAMILTON mentioned that requests had come from Istanbul for permission to translate into Turkish the volumes in the Refresher Course series, and from Argentina to translate into Spanish the third volume of "Any Questions?" The Committee had agreed in principle.

Dr. O. C. CARTER, in presenting the report of the Family Doctor Committee, said that there was some difficulty about applying to *Family Doctor* staff the grades and scales which worked quite well from the point of view of B.M.A. clerical staff, but bore little relation to the normal practice in commercial publishing. The Council agreed that in future all appointments to the staff of the *Family Doctor* should be independent of B.M.A. grades and salary scales, and should be made, within the approved budget, in terms appropriate to corresponding commercial publishing levels.

The Treasurer (Mr. L. DOUGAL CALLANDER), in a brief statement on the financial position of the Association, mentioned that the issue of the application for the 1955 membership subscriptions was completed at a later date than in the previous year, and consequently the amount collected in advance was considerably less in 1954 than in the corresponding period of 1953. Nevertheless, the 1955 subscriptions received by February 28 exceeded the figure for the corresponding date in 1954.

It was announced that the Ceylon Medical Association, which was a corporate Branch of the Association, desired to alter its status and to become an independent body affiliated to the B.M.A. The Council passed a formal resolution to enable this to be done.

The report of the Armed Forces Committee, presented by Major-General J. C. A. DOWSE, described the proposed arrangements for the extension of the B.M.A. lecture scheme to enable large groups of Service medical officers at selected establishments in the United Kingdom to apply for one lecture annually.

The recommendations of the Science Committee, brought forward by Dr. NOY SCOTT, were concerned wholly with the awards in the essay competitions and research scholarships. The high standard of the essays in the Medical Students Prize Essay Competition, in which eight prizes and certificates were awarded, was mentioned.

Dr. H. M. GOLDING, for the Charities Committee, said that the amount of both earmarked and unearmarked subscriptions in 1955 was greater than in 1954. Recommendations for the allocation to medical charities of the unearmarked subscriptions were agreed to.

A report was made on the first meeting of the Medical Education Committee, of which Sir Lionel Whitby is the chairman. Four subcommittees had been appointed in fields corresponding to those of the four sections of the First World Conference. The subcommittees would report to the full committee towards the end of the year.

A similar programme-of-work report was made on behalf of the Constitution Committee. It was stated that it would be some little time before it was in a position to make recommendations.

The Council, which had met at 10 a.m., completed its business at 5.15 p.m.

CHILDREN'S SPECTACLE FRAMES

A circular to executive councils and ophthalmic services committees (E.C.L.15/55) states that the Minister, on the advice of his Standing Ophthalmic Advisory Committee, has decided to make frames No. C.521 and C.525 available to all applicants whatever their age. The charges authorized by the National Health Service Act, 1951, will continue to apply when these frames are chosen.

Mental Health Services

Dr. JOHN JARDINE, chairman of the General Board of Control, spoke of mental health. He emphasized the changed medical and social outlook on mental disease. He laid stress on the value of the voluntary organizations. The family doctor must play an increasingly important part in the prevention of mental illness and in securing early treatment. Local authority officials, mental welfare officers, health visitors, probation officers and the like could all play a part. Many speakers referred to the unsatisfactory state of mental hospitals, and it was refreshing to hear the physician-superintendent of Craig Dunain Hospital, Inverness, Dr. M. M. WHITTER, describe how much could be done by inculcating a humane attitude in all grades of staff and what could be done by simple measures to brighten up unsuitable buildings.

Delegates from local authorities were much concerned about the difficulties arising from mental cases being retained in local authority institutes owing to the shortage of hospital beds. It was thought that more use could be made of the method of boarding out mental cases.

The Care of the Aged

The third session was devoted to a paper on the "Care of Old People." Dr. TAYLOR BROWN, consultant physician for geriatrics in the Eastern Region, gave an interesting account of the provision for geriatrics in this region. He emphasized that it had been possible to develop a co-ordinated scheme, the main aim of which was to keep old people in their own homes where possible.

Day-to-day matters of difficulty were "ironed out" by the co-operation of the different officials. An effective co-ordinating committee representing the different interests in the area had been established. Dr. Taylor Brown said that the function of the hospital should be essentially to rehabilitate and enable people to return to their normal life, although he admitted that many beds would have to continue to be used for persons in their terminal days who required more than simple nursing.

The general trend of the discussion which followed was that there was already developing a very adequate co-operation between the three branches of the Health Service in this field; and the shift of the emphasis to domiciliary provision rather than institutional provision was considered a sound one. The need for auxiliary medical services, especially chiropody and physiotherapy in the patient's own home, was fully recognized.

Conclusion

The CHAIRMAN, in summing up the conference, said that criticism had been constructive. The general impression was that most delegates felt the existing administrative set-up could be made to work effectively and much had been accomplished. It was significant that no satisfactory alternative to the present system had been put forward. Much of the discussion was focused on the relative position of the general practitioner and local health authority services. There was a unanimous opinion that both were needed and were complementary to each other, but that the exact field covered by each must depend on circumstances.

HEALTH SERVICES IN SCOTLAND**INCREASE IN WORK**

The statement that demands on the curative services continue at a high level and show no signs of abating is made in the *Reports of the Department of Health for Scotland and the Scottish Health Services Council, 1954*.¹ In spite of indications of improvement in the national health and improvements in housing and environmental conditions generally, the volume of visits to hospitals and doctors and

¹ H.M. Stationery Office, 4s. 6d.

the extent of the drug bill show no improvement to speak of, but rather the reverse. The number of patients in hospital (on the basis of discharges) was 30% higher in 1953-4 than in 1949-50. During those four years outpatient attendances have increased by one-third, and in 1954 numbered nearly seven million. As for drugs, prescriptions dispensed in the pharmaceutical service numbered just under 21 million, an increase of 454,000 over the 1953 figure. Many factors, it is said, may have contributed to this result; the most optimistic is that people are learning to seek early medical advice. A healthier nation, but a more health- or disease-conscious one.

General Medical Services

The total number of doctors employed in the National Health Service in Scotland—in hospitals, by local authorities, in general practice—was 5,350, an increase during the year of 178. In the general medical services under the Act 2,558 principals were taking part, 1,513 of them in partnership, and 251 assistants were employed. The number of complaints against doctors investigated by executive councils was 27, and in 10 of these the doctor was found to be in breach of his terms of service. The health centres at Sighthill, Edinburgh, which has just completed its first year, and at Stranraer, which is newly opening, are stated to be experimental only, and it is not proposed at present to build any further centres of similar type.

Prescribing statistics show a wide variation in average cost per patient between doctors working in different executive council areas. For prescriptions dispensed in December, 1953, the highest average cost per patient was 2s. 4d. in Glasgow and Dumbarton, and the lowest 1s. 5d. in Inverness, against a national average of 2s. 1d. The average cost of each prescription in Scotland was 5s. 5d., a penny more than the year before. There did not seem to be as marked a seasonal incidence in prescriptions as might be expected. The number issued in September was 1,646,000, and in February 1,809,000.

Local Authority Services

The local health authority services in Scotland report substantial increases in the number of B.C.G. vaccinations. Primary injections against diphtheria numbered 83,200, about the same as in 1953. A major activity in the school medical service in some areas is the treatment of minor ailments. In Edinburgh during the year over 12,000 cases of this kind were treated. The majority were bruises and the like, but a good proportion were diseases of the skin (impetigo appears to be on the increase in Scotland), as well as diseases of the eye and ear.

The total number of domiciliary births was 28,886 (28,600 in 1953), and the number of births in which a doctor and midwife were engaged under the arrangements of the N.H.S. was 27,514, as compared with 954 in which a midwife only was engaged.

Hospital and Specialist Services

The annual running costs of hospital and specialist services increased from £24.6m. in 1949-50 to £30.2m. in 1953-4. A large part of this is represented by higher salaries and wages, but it is reported that there has also been a significant increase in volume of treatment and standard of care. The total number of consultants at the end of last year was 827, of whom 394 were part-time and 433 whole-time. This is an increase of 59 on the year, almost wholly among the whole-time. Senior hospital medical officers numbered 337, of whom 100 were part-time and 237 whole-time, a decrease in total of 23. The total number of posts in hospitals approved for the purpose of the pre-registration year for newly qualified doctors increased by 30 to 589. It is mentioned that in some areas and in certain types of hospital a shortage of house-officers continued throughout the year. Consequently, on the whole, newly qualified doctors found little difficulty in obtaining pre-registration posts. The employment of general

practitioners in hospitals has been the subject of discussion, but progress has been somewhat slow.

In the Northern Region there is a joint training scheme under which senior house officers, engaged for a period of two years, are attached in rotation to various units in hospitals, and are also allocated to general practitioners in Inverness and district for periods of training in all aspects of general practice. Of the first four senior house officers who completed their training under this scheme, three took up appointments in general practice, while the fourth remained in the hospital service. In certain specialties, particularly tuberculosis and psychiatry, the regional boards have found it necessary to create new consultant posts to cope with the increased work associated with the development of the service.

Geriatric services are being developed in several localities, but little has been done to increase the accommodation for mental cases. The cost of maintaining a patient in a Scottish hospital last year was 23s. 6d. a day, but this is the average over a wide range, from 44s. 1d. in maternity hospitals to 12s. 7d. in mental deficiency institutions.

The report of the Scottish Health Services Council is largely occupied with two matters. One is the staffing of mental deficiency institutions. Here the problem is not at present acute, but the council recommends that greater emphasis should be placed in the General Nursing Council syllabus on practical training in occupational and games therapy. The other is the role of the assistant nurse in the National Health Service. Here the council makes a number of recommendations concerning training, enrolment, and employment. One of them is that the present requirement of one year in chronic sick nursing should be reduced to six months, and that the training should be more broadly based.

The number of doctors in Scotland engaged in family practice, or on executive council lists, is 2,528, according to a census carried out on January 1, 1954, reported by Dr. W. Robertson in *Health Bulletin*, April, 1955. They have 4,895,054 people, or 96% of the population, on their lists. Though the average distribution of patients is 1.936 per doctor, the ratio varies widely with the geographical region. The lowest numbers are in the north, the minimum being in Sutherland with 1.096 persons per practitioner, and the highest are in the west, where the highest Scottish figure, 2.372, is found for Lanark; and Dumbarton, Renfrew, Ayr, Stirling, and Clackmannan—a joint return—are also above the national average. The ratio in the four principal cities is Aberdeen 2.138, Dundee 1.971, Glasgow 1.920, and Edinburgh 1.706. The census also examined the length of the postgraduate life of Scotland's doctors, and 20 years was found to be the average time since the gaining of first medical qualifications. Only 14 doctors, 0.6% of the total in practice, qualified in the last century, and only 3.3% qualified in 1950 or later. Glasgow University has provided 44.2% of Scotland's family doctors, Edinburgh 22.5%, the Colleges 13%, Aberdeen 11.4%, and St. Andrews 5.3%. Only 1.9% initially took English qualifications.

HOSPITALITY

A Swedish doctor, living on the west coast of Sweden north of Gothenburg, who has four boys aged 4, 12, 13, and 14 and a girl aged 10, would like to arrange a holiday exchange in the summer for his eldest son with one or perhaps two children, aged 10-15, of a British doctor. Would anyone interested please communicate with Brigadier H. A. Sandiford, International Medical Visitors' Bureau, B.M.A. House, Tavistock Square, London, W.C.1.

Occasional requests are received from Continental doctors who would like to arrange for their children to stay with medical families in Britain as paying guests, particularly during the summer vacation. At present about six requests from French doctors (including one living in French Morocco) are outstanding. Would anyone interested please communicate with Brigadier H. A. Sandiford, International Medical Visitors' Bureau, B.M.A. House, Tavistock Square, London, W.C.1.

FUTURE NUMBER OF DOCTORS

The Ministry of Health has announced that the committee set up by the Minister of Health and the Secretary of State for Scotland, under the chairmanship of Mr. Henry Willink, to estimate the future number of medical practitioners and the appropriate intake of medical students (see *Journal*, February 26, p. 548), is now ready to receive evidence.

Invitations are being sent to selected organizations, but the committee will also consider written evidence from other sources. Any person or organization wishing to submit views should send them in writing to the committee's secretary, Mr. Phillip Muston, Ministry of Health, Savile Row, London, W.1.

MIDDLE EAST BRANCH

The Middle East Branch of the B.M.A. held its fifth annual meeting in Damascus from March 14 to 16, 1955. Doctors from Syria, the Lebanon, Jordan, Iraq, and the Gulf attended the meeting. Dr. W. M. FORD ROBERTSON was elected president, and Dr. E. H. R. ALTOUNYAN honorary secretary and treasurer for the year 1955-6.

The opening address of the scientific discussions was given by the Minister of Health for Syria, and the following papers were read: "Modern Methods in the Diagnosis and Treatment of Epilepsy" (Sir Charles Symonds, London); "Emphysematous Gastritis" (M. W. Sawwaf); "Pulmonary Resection in the Treatment of Tuberculosis" (J. L. Wilson); "Industrial Medicine in Iraq" (A. M. Critchley); "Medical Treatment of Hypertension" (M. A. Khiami); "Surgical Treatment of Hypertension" (Abdus Sattar Adi); "A New Prosthetic for the Head of the Femur" (H. Fruchaud); "The Physiology of the Duodenum" (K. Roberts); "Maternal and Child Welfare Throughout Arab History" (F. Zaim); "Twenty-five Years' Medical and Surgical Practice in the Euphrates Valley" (A. M. Bertsch); "Modern Aspects of the Treatment of Fractures" (G. Perkins, London); "Diaphragmatic Hernia" (P. Ponthus); "Tuberculosis Control Among Refugees in Syria" (J. Puyet); "Treatment of Cerebral Palsy" (H. Pirker); "Bronchiectasis" (A. F. Mouchantat); "Obstetrical Advances in Kuwait" (N. L. Owen); "Surgical Treatment of Pulmonary Hydatid Disease" (J. G. Sournia); "Tonsillectomy in Children" (I. S. Ayoub); "Congenital Pyloric Stenosis" (Abdul Ghani Al-Kathemi); "Some Notes on the Medical History of Aleppo" (A. Poche); "Medical Ethics" (E. H. R. Altounyan). Professor Carleton Coon gave a lecture on anthropology.

On March 14 Sir John and Lady Gardener held a reception at the British Embassy for all doctors and their wives attending the meeting. The annual dinner of the Branch was held at the Orient Club on March 16. A special air excursion to Palmyra was organized on March 17.

FILM LIBRARY

The following additions have been made to the B.M.A. film library.

Pancreatic Secretion.—Presented by Imperial Chemical Industries Ltd. Colour, sound, 34 minutes. 1954.

Venepuncture in General Practice.—By S. L. Drummond-Jackson. Colour, sound, 16½ minutes. 1954.

Taking a Swab.—By Nucleus Films Ltd. Black and white, silent, 10 minutes. 1950.

TRADE UNION MEMBERSHIP

The following is a list of local authorities which are understood to require employees to be members of a trade union or other organization:

Metropolitan Borough Councils.—Fulham, Southwark.

Non-County Borough Councils.—Crewe.

Urban District Councils.—Houghton-le-Spring.

ELECTION OF COUNCIL, 1955-6

The following are the results of the election for members of Council in those Groups where there were contests:

Group 12 (Divisions of Metropolitan Counties)

Branch in Middlesex	
D. F. Hutchinson (London, W.C.1)	407 Elected
J. B. Wrathall Rowe (Harrow)	376 Elected
Angus Weston (Greenford, Middlesex)	331
No. of voting papers issued	2,020
No. returned	614
Spoiled papers	3

Group 15 (Hampstead, St. Pancras, and Westminster and Holborn Divisions)

Frank Gray (London, W.C.1)	90
J. L. McCallum (London, W.C.1)	128 Elected
No. of voting papers issued	939
No. returned	218
Spoiled papers	2

Public Health Service

C. O. S. Blyth Brooke (London, E.C.1)	216
H. D. Chalke (London, N.W.4)	408 Elected
J. B. Tilley (Newcastle-upon-Tyne)	516 Elected
No. of voting papers issued	1,783
No. returned	606
Spoiled papers	2

A. MACRAE,
Secretary.

5 Thurs.	Rural Practices Subcommittee, G.M.S. Committee, 2 p.m.

Branch and Division Meetings to be Held

BIRKENHEAD AND WIRRAL DIVISION.—At Arrowe Park Hotel, Birkenhead, Saturday, April 23, 9 p.m., meeting. Lecture by Mr. W. W. Davey: "Is Your Gastrectomy Really Necessary?"

BLACKBURN DIVISION.—At White Bull Hotel, Church Street, Blackburn, Tuesday, April 26, 8.15 p.m., annual general meeting.

BOURNEMOUTH DIVISION.—At Royal Victoria Hospital, Bournemouth, Friday, April 29, 8.15 p.m., meeting. Address by Dr. Macdonald Critchley: "The Body Image." (Illustrated with lantern slides.)

BRADFORD DIVISION.—At Bradford Royal Infirmary, Wednesday, April 27, 8.15 p.m., meeting. Address by Mr. G. A. Craig: "Home or Hospital."

CAMBERWELL DIVISION.—At Dulwich Hospital, East Dulwich Grove, S.E., Tuesday, April 26, 8.45 p.m., annual general meeting. Address by Dr. F. E. Camps: "Investigation of Crimes of Violence in America and England." Visitors are invited.

CARDIFF DIVISION.—At Pathology Lecture Theatre, Welsh National School of Medicine, Royal Infirmary, Cardiff, Wednesday, April 27, 8.15 p.m., meeting. Address by Dr. Eric Waddington: "Leg Ulcers." Members may bring medical guests.

CITY DIVISION.—At Hackney Hospital (G5 Ward), Homerton High Street, London, E., Wednesday, April 27, 2 p.m., film meeting.

DERBY DIVISION.—At Derbyshire Royal Infirmary, Thursday, April 28, at 8.30 p.m., annual meeting.

EAST DENBIGH AND FLINT DIVISION.—(1) At Chester, Thursday, April 28, 7.30 p.m., annual dinner. (2) At Mold, Sunday, May 1, 3 p.m., annual meeting.

EAST HERTS DIVISION.—At Hertford County Hospital, Thursday, April 28, 8.30 p.m., annual general meeting.

EAST KENT DIVISION.—At Chez Laurie Restaurant, Thanet Way, Herne Bay, Thursday, April 28, 7.30 p.m., dinner; 8.45 p.m., special and annual general meeting.

ENFIELD AND POTTERS BAR DIVISION.—At St. Michael's Hospital, Chase Side Crescent, Enfield, Friday, April 29, 8.15 for 8.30 p.m., fifth annual meeting.

FURNESS DIVISION.—At Duke of Edinburgh Hotel, Barrow-in-Furness, Tuesday, April 26, 8 p.m., annual general meeting.

GLASGOW DIVISION.—At Glasgow Regional Office, 234, St. Vincent Street, Glasgow, Wednesday, April 27, 8.30 p.m., meeting.

GREENWICH AND DEPTFORD DIVISION.—At Miller General Hospital, Greenwich High Road, London, S.E., Wednesday, April 27, 8.30 p.m., annual general meeting.

GUILDFORD DIVISION.—At Royal Surrey County Hospital, Guildford, Saturday, April 30, 7 to 9 p.m., sherry party. Ladies are invited.

HENDON DIVISION.—(1) At Hendon Hall Hotel, London, N.W., Wednesday, April 27, 8.45 p.m., annual general medico-political meeting. (2) At Colindale Hospital, Colindale Avenue, London, N.W., Saturday, April 30, 2.30 p.m., meeting. Demonstration by Dr. W. E. Snell.

LANCASTER DIVISION.—(1) At Moor Hospital, Lancaster, Saturday, April 23, 8 p.m., meeting. B.M.A. lecture by Dr. W. N. Pickles: "Epidemiology in General Practice." Lay friends of members are invited. (2) At Midland Hotel, Morecambe, Thursday, April 28, 8.30 p.m., annual general meeting.

METROPOLITAN COUNTIES BRANCH.—At B.M.A. House, Tavistock Square, London, W.C., Tuesday, May 3, 3 p.m., annual general meeting. President's Address by Dr. R. Hale-White: "Patients, Politics, or Both?"

PERTH BRANCH.—At Murray Royal Hospital, Perth, Thursday, April 28, 8 p.m., meeting. B.M.A. Lecture by Dr. Douglas Miller: "Common Obstetric Injuries and their Sequelae." Members from neighbouring Branches are invited.

REIGATE DIVISION.—At Dorking General Hospital, Horsham Road, Dorking, Surrey, Tuesday, April 26, 8.30 p.m., clinical meeting on "Tuberculosis."

SHEFFIELD DIVISION.—At Royal Victoria Hotel (Assembly Room), Friday, April 29, 8.30 p.m., meeting.

SOUTH BEDFORDSHIRE DIVISION.—At Luton and Dunstable Hospital (in the Board Room), Friday, April 29, 9 p.m., meeting. Dr. Clifford E. Allen: "Homosexuality and Sexual Abnormalities."

STOCKTON DIVISION.—At Stockton and Thornaby Hospital, Monday, April 25, 8.30 p.m., meeting. Lecture by Mr. F. J. Burke: "Modern Aspect of Gynaecology."

TOWER HAMLETS DIVISION.—At St. Andrew's Hospital, Devons Road, Bow, E., Friday, April 29, 3 p.m., clinical meeting. Dr. W. R. Bett: "The General Practitioner and Medical Writing."

WANDSWORTH DIVISION.—At South London Hospital for Women and Children, South Side, Clapham Common, London, S.W., Sunday, April 24, 9.30 a.m., clinical meeting.

WEMBLEY DIVISION.—At Wembley Hospital, Tuesday, April 26, 9 p.m., annual general meeting.

WEST DERBYSHIRE DIVISION.—At Smedley's Hydro, Wednesday, April 27, 8.30 p.m., joint meeting with West Derbyshire Medical Society. Annual B.M.A. lecture by Professor John Glaister: "The Ruxton Case." A general discussion will follow.

WESTMINSTER AND HOLBORN DIVISION.—At Westminster City Chambers, Thursday, April 28, 8 p.m., ordinary meeting.

WILLESDEN DIVISION.—At Willesden General Hospital, Harlesden Road, N.W. (Department of Physical Medicine), Friday, April 22, 9 p.m., annual general meeting.

WINCHESTER DIVISION.—At Royal Hampshire County Hospital, Wednesday, April 27, 8.45 p.m., general meeting.

ANNUAL REPRESENTATIVE MEETING, LONDON, JUNE 1-4

PROVISIONAL TIME-TABLE

Tuesday, May 31	Friday, June 3 (continued)
8.30 to 10.30 p.m.—Cocktail Party (by invitation of the Metropolitan Counties Branch), Royal College of Surgeons, Lincolns Inn Fields, W.C.2.	10.00 a.m.—Annual Representative Meeting resumes. 1.00 p.m.—L. Small private fork luncheon parties, followed by visits to places of interest around London.
9.00 a.m.—Annual Representative Meeting Inquiry Office opens—Committee Room A.	7.30 p.m.—Welsh Dinner, Royal College of Surgeons, W.C.1. Ticket £1 10s. (excluding wines).
9.00 a.m.—Ladies' Club opens—Hastings Room.	7.30 p.m.—Glasgow Graduates' Dinner, Bush House Restaurant, Aldwych, W.C.2. Ticket £1 10s. (excluding wines but including cocktails).
10.00 a.m.—Annual Representative Meeting begins—Great Hall.	7.45 p.m.—Edinburgh Graduates' Dinner, Savoy Hotel, W.C.2. Ticket (excluding wines) £1 11s. 6d.
a.m.—L. Visits to Houses of Parliament, S.W.1 (time to be announced later).	
7.00 for 7.30 p.m.—*Dinner, followed by a dance, for members of the Representative Body and their ladies, at the Dorchester Hotel, W.1. Single ticket £1 18s. 6d. (including cocktails but not wines).	
Thursday, June 2	Saturday, June 4
9.00 a.m.—Annual Representative Meeting Inquiry Office open.	9.30 a.m.—Annual Representative Meeting resumes.
9.00 a.m.—L. Whole day coach and river excursion to Henley-on-Thames, visiting Runnymede and Windsor. Lunch and tea on launch. Inclusive ticket £1 2s. (starting from and returning to B.M.A. House).	12.30 p.m.—Annual General Meeting and Extraordinary General Meeting—Great Hall.
9.30 a.m.—Annual Representative Meeting resumes.	At conclusion of A.R.M.—Council Meeting—Council Chamber.
9.30 a.m.—Ladies' Club open.	3.00 p.m.—Overseas Conference (open to all overseas representatives)—Committee Room C.
9.45 for 1.00 p.m.—Overseas Luncheon, Hotel Russell, W.C.1.	
5.30 p.m.—"At Home" for overseas representatives, given by the Empire Medical Advisory Bureau.	
9.40 p.m.—Ceremony of the Keys at the Tower of London (limited to 50). Tickets obtainable at Ladies' Club.	
Friday, June 3	
9.00 a.m.—Annual Representative Meeting Inquiry Office open.	
9.00 a.m.—Council Meeting—Council Chamber.	
9.30 a.m.—Ladies' Club open.	

KEY

*Evening Dress (Tails or Dinner Jacket).
 L. Events arranged for ladies accompanying members of Representative Body.

WELSH DINNER

The Welsh Dinner will be held at the Royal College of Surgeons, Lincolns Inn Fields, London, W.C.2, on Friday, June 3. All Welsh representatives, Welsh graduates, and others with Welsh associations, accompanied by their ladies, will be welcome at this dinner.

Tickets will be 30s. per head (exclusive of wines), and those wishing to attend are asked to apply, with remittance, to Dr. S. J. Hadfield, B.M.A. House, Tavistock Square, London, W.C.1.

GENERAL MEDICAL SERVICES COMMITTEE REMUNERATION AND PRACTICE EXPENSES

An all-day meeting of the General Medical Services Committee was held on April 21, with Dr. A. TALBOT ROGERS in the chair. It was announced that, owing to the General Election, the Minister of Health would not be able to address the Annual Conference of Local Medical Committees on May 19. For the same reason the meeting of the Committee fixed for May 26 was cancelled.

A message was sent to Dr. T. McDONALD, who is not standing for re-election to the Committee, thanking him for his services.

A report by Professor R. G. D. ALLEN commenting on the Ministry's proposals for estimating the practice expense ratio in subsequent years when the Board of Inland Revenue was unable to undertake another factual inquiry was placed before the Committee. The Ministry in its original letter suggested methods by which the expense factor might be kept up to date. In its opinion the only way in which an analysis could be made was to ask, by way of a questionnaire, the doctors who had been included in the Inland Revenue's figures for 1952-3 to supply information about the make-up of their professional expenses for the later year.

Dr. D. F. HUTCHINSON considered that a questionnaire of this kind would be an unfortunate thing from the point of view of intra-professional relations. He still hoped that the Ministry might bring pressure to bear upon the Board of Inland Revenue to undertake yearly inquiries.

The CHAIRMAN pointed out that the Board of Inland Revenue had always been extremely impartial in this matter, and its unwillingness to undertake further inquiries was solely due to pressure in its offices. There was certainly no wish on the part of anyone to unload on to certain doctors the duty of reporting on unnecessary items of expenditure, and he believed that in the Ministry's proposed questionnaire there were questions the answers to which would not be relevant to future payments.

Dr. J. C. ARTHUR suggested that any doctor who employed an accountant could without difficulty get out a sufficient analysis. A compromise might be reached on the basis of a much less detailed "breakdown" than the Ministry had suggested in its draft questionnaire.

It was agreed that representatives of the Committee should discuss the matter with the Committee's advisers and report back.

Dentists' Remuneration

Mr. L. EVEREST, the member of the Committee representing the dentists, gave a brief account of the arrangements which had been made concerning dentists' remuneration. During the last three years the profession had asked that the amount of the cut of 10% in their remuneration, made in 1950, should be restored, and the Minister had now accepted their proposals and was withdrawing the 10% cut at an early date, but he held the right to alter the figures in unforeseen circumstances. It was estimated that the restoration would cost the country about £4m. and would give an average increase of £400 a year gross to each practitioner. The Representative Board of the British Dental Association had accepted the proposals. Mr. Everest reminded the Committee that the average expense ratio in the dental profession was 53%.

The Willink Committee

The CHAIRMAN stated that the Council of the Association had accepted the suggestion that the preparation of evidence for the Willink Committee on the admission of students to medical schools should follow the course adopted in the case of the Guillebaud Committee.

The Committee took a ballot as the result of which nine of their members were appointed to prepare evidence from the general-practitioner point of view.

Maternity Medical Services

Dr. D. P. STEVENSON (Deputy Secretary) reported on a visit he had paid to the Portway Hospital in connexion with

the general-practitioner maternity services in the Weymouth area. He had met the chairman and other members of the hospital management committee. The points elicited were that the allocation of a dozen beds to general practitioners would not affect the status of the hospital as a training school for midwives. Secondly, much play had been made of the fact that if general-practitioner patients were admitted there would be difficulty in obtaining nursing staff; but this matter was gone into, and it was found that one pupil midwife would have to be replaced by a trained midwife. Dr. Stevenson had been asked to submit a memorandum to the committee of management, and had done so, and the result was awaited. Dr. PRIDHAM spoke appreciatively of Dr. Stevenson's visit, and the appreciation was endorsed by the Committee.

Dr. D. P. WILLIAMS made a report on the outcome of his interview with the chairman of the Flintshire and Denbighshire Local Medical Committee on the standards of surgery and waiting-room accommodation.

Other Business

The minutes of the meeting of the General Medical Services Subcommittee (Scotland) of March 8 were received.

Dr. CATHERINE HARROWER said that the Ministry's attention had been drawn to an anomaly whereby a doctor contracting to provide full maternity medical services received only seven guineas whereas two doctors who each contracted to undertake only Part I or Part II services separately received in total fees amounting to eight guineas. The reply of the Ministry on this point was that it was not thought that the reason for this arrangement had ever been stated, but probably the reason why the two parts added up to more than the whole was that when a doctor contracted only for Part I or Part II it was considered that he was likely to have a little more trouble in respect of the particular part than in the normal case.

It was agreed to discuss at the next meeting with the Ministry the need for some clarification concerning a proposed amendment dealing with partnership lists. This had been the subject of previous communications with the Ministry, which was prepared to agree to an amendment that where a partnership continued to employ an assistant the additional list of patients allowed in consequence would not be affected by the necessity for bringing the partnership lists within the maximum permitted by the allocation scheme. The Ministry felt it should be made clear that, where a practitioner or partnership of practitioners employed one or more permanent assistants, the number of persons on the list might be increased to the extent which the allocation scheme allowed.

It was reported that the London Executive Council had passed a resolution calling for the help of the General Medical Services Committee in pressing for a more effective system of registration in order to avoid inflation of lists. The General Medical Services Committee expressed its gratification that the London Executive Council should have asked the Committee for its assistance, especially as it was asking for what was in line with the Committee's own policy.

A question concerning the entitlement of doctors, improving their surgery accommodation, to draw upon any sum held to their credit on account of compensation was referred to the Compensation Subcommittee. A resolution to this effect had been passed by the Hertfordshire Executive Council and submitted to the Management Committee of the Executive Councils Association.

Discussion arose on a letter from the Ministry concerning the position of deputy chairmen of service committees and the possibility of arrangements by which chairmen of service committees of one executive council should be deputy chairmen of service committees of adjacent councils. The recent report of the subcommittee on service committee and tribunal procedure, under Dr. Dain's chairmanship, had put forward certain decided views regarding the position and functions of deputy chairmen, and it was agreed that a letter setting forth the views of the Committee should be sent to the Ministry.

The "National Formulary"

Dr. A. B. DAVIES presented a copy of the new edition—the third—of the *National Formulary*, which replaces the 1952 edition and is operative from May of this year. Dr. Davies and the other members associated with him in this work were warmly thanked by the Committee.

CLASSIFICATION OF PROPRIETARY MEDICINES

The Ministry of Health and the Department of Health for Scotland announce the following additions to the lists of proprietary medicines classified by the Standing Joint Committee on the Classification of Proprietary Preparations dated November, 1954, which were circulated to doctors in the National Health Service.

Additions to Category 1.—"Antrenyl" tablets, "calcium disodium versenate" injection, "carbo-resin," "convenil" (Hommel), "diparcol" injection, "elarine chloride pulvules," "imferon" injection, "lergine" tablets, liver extract crude (Lilly) injection, "merbentyl" tablets, "monodral" tablets, parathyroid hormone (Pabryn), "wyovin" tablets.

Additions to Category 5.—"Antibacsyn" injection, "antibacsyn" oral, British bee venom for desensitization, "cholinvel," hesperidin tablets V.L., inositol tablets V.L., "pabavel" tablets, pantothenic acid tablets V.L., "secretin-mebiol."

Additions to Category 6.—"Bisposod," "cremalgin," "digesto" laxative tablets (Sumner), "hepa-desicol," "heparglandol-B" injection, linctus cocerlanus (Legat), "lextron pulvules," "lextron ferrous pulvules," linctus cocerlanus & codein (Legat), "moldomia" drops, "moldomia" elixir, "moldomia" tablets, "okasa gold," "okasa silver," sodium oleate compound tablets (Gale Baiss), "tetraglandin pulverette," "vitaphos" tonic.

Deletions from Category 6.—The following preparations have been transferred to categories 2, 3, or 4: "ung. renaglandin," "ung. renaglandin" anaesthetic, "visiblin."

CO-OPERATION BETWEEN DOCTORS AND CLERGY

The Association's committee which is preparing evidence for the Archbishops' Commission on Divine Healing and Co-operation with the Clergy has been asked by the Secretary of the Commission for the following information about groups of doctors and ministers meeting together from time to time in various localities: (1) What is the total membership of the group? (2) What is the average attendance? (3) How often does the group meet? (4) Who are its members? How many? (5) How many? (6) How many? (7) How many? (8) How many? (9) How many? (10) How many? (11) How many? (12) How many? (13) How many? (14) How many? (15) How many? (16) How many? (17) How many? (18) How many? (19) How many? (20) How many? (21) How many? (22) How many? (23) How many? extended to old people not actually in hospital? He thought that they might. Lord Beveridge also thought that there should be means for making certain that, as old people living alone failed gradually, their failing was discovered before it became a tragedy.

The whole problem was one for the next thirty to fifty years. The distortion of the age structure would pass, said Lord Beveridge, but that was all the more reason for making sure that it caused no needless suffering while it lasted.

Dr. R. G. GIBSON (Winchester) thanked Lord Beveridge on behalf of the large and appreciative audience. Dr. Gibson referred to the B.M.A.'s concern for the welfare of the elderly and to its recently published report (*Supplement*, April 23, p. 181) on the establishment of a service for the treatment and rehabilitation of chronic disablement arising from age or illness.

Questions Answered

Correspondents should give their names and addresses (not for publication) and include all relevant details in their questions, which should be typed. We publish here a selection of those questions and answers which seem to be of general interest.

Surgery Repairs and Rebuilding

Q.—The accommodation of my practice is in need of very extensive repair. Is it true that if I rebuild my surgery I can expect no income-tax relief, but that if I spend an equal sum on repairing an old surgery it would be allowed?

A.—The Revenue authorities take the view that while the cost of repairing a building used for business or professional purposes is allowable the demolition and reconstruction of a building is not allowable, even to the extent that such action may have rendered unnecessary expenditure on repairs. In other words, the construction of a new building is a matter of capital expenditure, different essentially from repairing the building, and the law does not enable the notional cost of the latter to be regarded as included in the former type of expenditure. It is not known whether there has been any legal judgment of a court in this country on that specific point, but it was discussed and decided in favour of the Revenue in an Irish case, and though, of course, that judgment would not govern the views of an English court the same grounds and reasoning would apply. It is assumed from the questioner's letter that the surgery is a separate structure. If it were part of the main premises, or, because of its situation, design, etc., could be so regarded, it would be possible to argue that the replacement of a part of the premises—i.e., the surgery—was in effect only a repair of the whole. A simple analogy would be the re-soling of a pair of boots.

Registrar Working at Two Hospitals

Q.—Can I claim income-tax relief on the purchase price of a car and its maintenance when, as surgical registrar, I work at a hospital some miles from the main hospital of the group? For the first six months I shall be resident in the hospital, but doing out-patient sessions in the main hospital. For the next eighteen months I shall be non-resident and on call for emergencies. Are any other expenses—e.g., telephone, subscriptions, etc.—allowable for income-tax purposes?

A.—It is assumed that for the period during which the questioner is required to attend two hospitals he will receive a cash allowance intended to meet such expense as may be necessary for the travel between the main hospital and the outlying hospital. The question therefore relates to the cost of travel between residence and one of the two hospitals. In so far as that expense is not met by the cash allowance no deduction for income-tax purposes is due. That results from the statutory Rule under Schedule E that

to be allowable expenses must have been incurred "wholly, exclusively, and necessarily in the performance of the duties." The High Court has held in a series of cases that the cost of travel between residence and the place where the duties are performed is not incurred "in the performance of the duties." The decisions apply also to such expenses as maintenance of telephone, subscriptions to medical societies, etc.

Car Purchase before Entering Practice

Q.—I am considering purchasing a car in May for personal use until I enter general practice in October. Will I be able to claim any income-tax relief in October when I start in practice?

A.—It is assumed that the questioner will be practising on his own account or in partnership and not as an assistant. The allowance is made from the assessment on the profits of the practice and is calculated as follows: (a) initial allowance at 20% of the cost, and (b) annual allowance—for the first year of the allowance on cost and thereafter on the written-down value—at 25%. The first financial year for which the allowances will be due is the year for which the amount of the assessment is determined by the profits of the practice year in which the car is first used in the practice. If—as apparently in this case—the car is purchased before it is taken into the use of the practice, the "cost" referred to above must be calculated at the written-down value as at the date it is applied to that use. For instance, if the car is purchased for, say, £800 on May 1, 1955, and is taken into practice use on October 1, 1955 (five months after purchase), the commencing value, it is considered, should be taken as £800—5/12 of 25% of £800 = £83—that is, £717.

Examinations for National Service Medical Boards

Q.—I examine and report on three or four young men referred by National Service medical boards every week. Some cases require very detailed examination and reports, and may lead to major surgery. What statutory obligation is there for consultants to do this type of work, and why is no payment made?

A.—Examination and report in hospital of young men referred by National Service medical boards is a service coming within the hospital and specialist service under Section 3 of the National Health Service Act, 1949. Consequently it must be regarded as part of the contract of a consultant. Such work should be taken into account in assessing a consultant's work. Where major surgery or other treatment is required, this, of course, will also come under the ordinary hospital and specialist services.

Prize for Medical Thesis

Q.—Is a sum of money awarded to me as a prize for a medical thesis liable to taxation? I am a full-time hospital officer, and the work was done in my own time and at my own expense.

A.—It is assumed that the prize was not awarded by the authority by which the questioner is employed. If it was, other considerations might apply. The general charging section of Schedule D brings into liability to tax "annual profits or gains," and an isolated receipt of this kind, which has no reference to payment for a fraction of a year, or indeed for any period whatever, is thought to be outside the scope of the tax.

Hospital in-patients under the National Health Service are regarded as being maintained free of charge for National Insurance purposes. In a memorandum to hospital authorities (H.M. (55) 31) the Ministry states that unless a patient is paying the whole cost of the services provided (other than the cost of treatment) the rate of National Insurance benefit payable to him is liable to reduction, after the first eight weeks in hospital, by 15s. a week if he has no dependants, and by 7s. 6d. a week if he has dependants.

Correspondence

Because of the present high cost of producing the Journal, and the great pressure on our space, correspondents are asked to keep their letters short.

Patients of a Vacant Practice

SIR.—In the report of the G.M.S. Committee (*Supplement*, April 2, p. 129), paragraphs 85 and 86, one reads of "other doctors in the vicinity who have been temporarily looking after the practice" and of "the obligation of the acting practitioner to hold the practice together for the appointed successor." May we have some clarification of this concept? Upon whom, precisely, does the obligation rest? By whom, precisely, has it been imposed? We no longer own the goodwill of practices. We have "lists" of patients and we are under contract with the Ministry, subject to severe pains and penalties, to render them as good medical service as may be reasonably expected of us. Where can one find in our terms of service reference to any obligation to ensure that these lists are transferred whole and complete to the contractual care of anyone else?

In days gone by we bought the goodwill of our practices, using our own or borrowed money for the purpose. Which of us with any claim to common sense imagined that the purchase money guaranteed us the full income of our predecessor? Why should the nominee of a local executive council be in a very much more privileged position than the youngster who had "bought a practice"? The Minister can bring in regulations to "freeze" any list, thereby setting at naught "the right of the patient to select his own doctor," but I can think of no reason why we should be expected to undertake this odious task on his behalf.

Lest it be thought that I have any large axe to grind in this matter, I may be permitted to mention that I am the oldest practitioner, with one exception, within a radius of more than a dozen miles. I write because I am one of those who believe that "1984" is very much nearer than most are able to see or willing to admit. Any interference with the freedom of the patients of a vacant list or with the colleagues of the practitioner who has left it vacant is in my submission a typical big-brotherism.—I am, etc.,

Launceston, Cornwall.

DONALD M. O'CONNOR.

Ship Surgeons

SIR.—Having only just arrived back in Britain this is the first opportunity I have had of seeing some of the correspondence provoked by my letter (*Supplement*, February 5, p. 43) on ship surgeons. If it is not too late now I should like to make a few points.

The boon to Australian postgraduates of a free passage to the United Kingdom is irrelevant to the argument from the logical viewpoint, seeing that the point at issue is the principle of employing "casual labour." However, I should like to mention that the Australian house-surgeon just qualified earns £A1,100 a year (£880 sterling), compared to the £2 a week I earned thus in Dublin—and I find it difficult to believe that they cannot save £100 (fare P. & O. tourist out-of-season £96, emigrant ship cheapest fare £76). Uniform involves the psychology of dress, which is slowly being recognized; a ship surgeon dressed like a passenger will be hard put to think of himself as other than a passenger.

The top-line shipping companies prefer the permanent surgeon, as application will prove; it is only certain companies that are prepared to employ the "non-uniformed holiday trippers," despite Dr. G. L. Alexander's assertion (*Supplement*, February 19, p. 58); and also he underestimates the problem of cheap gin. Again, the top-line companies gladly give their regulars three months' leave for refresher courses periodically. Dr. D. McLaren (p. 58) falls back on the *argumentum ad hominem* fallacy and refers the term "holiday tripper" back on the regular, so does not aid his own argument; he also accrues to himself

the right to assess the value of different branches of medicine, and Dr. W. H. Wolfenden (p. 58) thinks of the surgeon's job in terms solely of dispensary hours—in which many surgeons would agree with him. All three letters rebound back to the point that I have been trying to make—that is, that the surgeon is not at present a respected member of the ship's company. The difference of opinion seems rather to be regarding whether he should be or not. Shipping lines who are interested in the welfare of their crews know that "the best value they can get for their money" is the regular man who regards himself as a member of the Merchant Service and is proud of it.

Finally, if there is a rising tide of medical unemployment perhaps Dr. Alexander would be glad to know that Hong Kong, Singapore and Malaya, Sarawak and Borneo, Australia, etc., are crying out for doctors and offer good salaries.—I am, etc.,

Folkestone.

M. DILLON.

Assistants in General Practice

SIR.—Although I also am a principal, the attitude of Dr. D. E. Peake (*Supplement*, April 16, p. 167) towards the under-dogs of our profession, the unestablished practitioners, struck me as deplorable. I would like to support the proposals of the General Practice Reform Association for abolishing assistants. Whatever the assistant's salary, to hold a fellow doctor in a subject position—his livelihood subject to his principal's pleasure—longer than is necessary for the ascertainment of whether or not he is a suitable partner, constitutes exploitation and should not be allowed. Such practices degrade our profession to a trade and doctors to medical tradesmen.—I am, etc.,

Wallasey, Cheshire.

LENNOX JOHNSTON.

Compensation for Loss of Goodwill

SIR.—I think the time is now opportune for general practitioners to take concerted action re the above. A Liberal M.P. has recently termed National Savings schemes (voluntary) a colossal swindle. I wonder what he would have to say about compensation for goodwill of practices (compulsory). For every £2,000 involved £3,000 would scarcely be adequate compensation at the moment, because of inflationary tendencies countenanced by the Government.

The National Health Service should be prepared to take a realistic view of the position and increase compensation figures by 50%, or restore to the practitioner the right of sale or purchase of goodwill. The same right would restore many of the valuable privileges he has lost, not least a choice of freedom of locality in which to practise with due regard to personal and family requirements. The same privilege would help younger aspirants to principalships to achieve their aim.—I am, etc.,

Fraserburgh.

J. MACLEOD.

Inspection Invited

SIR.—I have recently had built here a house consisting of a waiting-room, a consulting-room, a separate examination room, patients' toilet, and garage on the ground floor, and living accommodation on the first floor; all in an external building area of 30 by 33 ft. (9 by 10 m.). To achieve a suitable design was not as simple as might be imagined, even with the greatest co-operation of an excellent architect. I should therefore be happy to allow any member who is contemplating building a similar property to inspect the house and plans, in case such may be of assistance.—I am, etc.,

325, Baring Road,
Grove Park, London, S.E.12.

GEOFFREY HARRIS.

In a circular to hospital authorities (H.M. (55) 11) the Minister of Health calls attention to the advisory service on hospital domestic management provided by the Ministry. He recommends boards and committees to consult the advisers freely on matters connected with organization, training, and efficient use of domestic and ancillary staff.

Association Notices

AFFILIATION OF CEYLON MEDICAL ASSOCIATION
TO BRITISH MEDICAL ASSOCIATION

In accordance with Article 16 of the Articles of the B.M.A., the Council gives notice to all concerned that it is proposed, as from December 31, 1955, to discontinue the Ceylon Medical Association as a Corporate Branch of the British Medical Association in order that steps may be taken to affiliate the Ceylon Medical Association to the British Medical Association.

ANNUAL GENERAL MEETING

Notice is hereby given that the Annual General Meeting of the Association will be held in the British Medical Association House, Tavistock Square, London, W.C.1, on Saturday, June 4, 1955, at 12.30 p.m. Business: (1) Minutes of last meeting held on July 5, 1954; (2) Balance Sheet and Income and Expenditure Account for the year ending December 31, 1954; (3) appointment of auditors.

EXTRAORDINARY GENERAL MEETING

Notice is hereby given that an Extraordinary General Meeting of the Association will be held in the British Medical Association House, Tavistock Square, London, W.C.1, on Saturday, June 4, 1955, at 12.30 p.m. or as soon thereafter as the Annual General Meeting of the Association shall be terminated, when the following resolution will be proposed as a special resolution:

RESOLUTION

That Articles 5, 6, 10, and 18 be altered in the following manner:

- (1) By altering Article 5 as follows: After "Each Branch" add "of the Association not in Great Britain or Ireland."
- (2) By altering Article 6 as follows: After "1st January, 1938," delete "but so that this proviso" and add "Provided further that the Regulations and By-laws may provide that any member admitted to membership before the 31st December next occurring after the date of the grant to him of a qualifying diploma within the meaning of the Medical Acts may compound his subscriptions for such period as may be prescribed by the payment of a lump sum but so that each of the foregoing provisos."
- (3) By altering Article 10(c) as follows: After "or (vi)" add "in the case of an Associate on the 31st day of December next following after he shall have ceased to reside within the area of the Branch by which he was elected or (vii)."
- (4) By altering Article 18 as follows: At the beginning insert "Subject as hereinafter provided." After the words "Corporate Group and of no other" insert "Provided Always that any member whose address as registered for the time being in the Register of Members of the Association is within Great Britain or Northern Ireland who has become a member of a Division other than that in which he resides in manner provided by the By-laws shall be an ordinary member of such first mentioned Division and of no other."

By order of the Council.

A. MACRAE,
Secretary.

Branch and Division Meetings to be Held

- ALDERSHOT AND FARNHAM DIVISION.**—At Northfield Hospital, Aldershot (lately the Civil Isolation Hospital), Friday, April 29, 8.30 p.m., meeting. Talk by Chief Constable of Hampshire on medico-legal subjects.
- BROMLEY DIVISION.**—At Bell Hotel, Bromley, Wednesday, May 4, 8 p.m., meeting. Lecture discussion on marriage guidance work introduced by Mr. J. Brayshaw (General Secretary, National Marriage Guidance Council).
- DORSET DIVISION.**—At the Clinic, Glyde Path Road, Dorchester, Monday, May 2, 8.30 p.m., meeting.
- EASTBOURNE DIVISION.**—At Burlington Hotel, Saturday, May 7, 7.15 for 7.45 p.m., annual dinner and dance. Members may bring guests.
- FINCHLEY DIVISION.**—At Finchley Memorial Hospital, Granville Road, N. Finchley, N., Tuesday, May 3, 8.30 for 9 p.m., annual general meeting.
- HARROW DIVISION.**—At Rayners Hotel, Rayners Lane, Harrow, Monday, May 2, 8.30 p.m., business meeting.
- HOLLAND DIVISION.**—At the Bridge Hotel, Sutton Bridge, Saturday, April 30, 7.15 for 7.45 p.m., meeting preceded by supper. B.M.A. lecture by Mr. A. Lawrence Abel: "Common Diseases of the Rectum and Anal Canal." Followed by coloured films.
- ISLE OF WIGHT DIVISION.**—At Unity Hall, Newport, Tuesday, May 3, 3.30 p.m., annual general meeting.
- LAMBETH AND SOUTHWARK DIVISION.**—(1) At Lambeth Hospital, Brook Drive, Kennington Road, S.E., Monday, May 2, 8.30 p.m., annual general meeting. (2) At Belgrave Hospital for Children, Clapham Road, S.W., Tuesday, May 3, 2.30 p.m., clinical meeting.
- LEICESTERSHIRE AND RUTLAND BRANCH.**—At the King's Head Hotel, Loughborough, Wednesday, May 4, 7.45 p.m., buffet supper.
- LEWISHAM DIVISION.**—At Lewisham General Hospital, High Street, Lewisham, S.E., Friday, May 6, 8.30 p.m., annual general meeting.
- MANCHESTER DIVISION.**—At the Fallowfield Hotel, Wilbraham Road, Manchester, Tuesday, May 3, 8.30 p.m., A.G.M.
- METROPOLITAN COUNTIES BRANCH.**—At B.M.A. House, Tavistock Square, London, W.C., Tuesday, May 3, 3 p.m., annual general meeting. President's address by Dr. R. Hale-White: "Patients, Politics, or Both?"
- MID-HERTS DIVISION.**—At Wellington Court Clinic, Brickett Road, St. Albans, Friday, May 6, 8.45 p.m., annual general meeting.
- ST. PANCRAS DIVISION.**—At Committee Room C, B.M.A. House, Tavistock Square, London, W.C., Monday, May 2, 8.30 p.m., annual general meeting.
- SCUNTHORPE DIVISION.**—At Scunthorpe and District War Memorial Hospital, Sunday, May 8, 10 a.m., clinical meeting.
- SOUTH WALES AND MONMOUTHSHIRE BRANCH.**—At East Glamorgan Hospital, Church Village, near Pontypridd, Glam., Thursday, May 5, 3 p.m., joint clinical meeting with North Glamorgan and Brecknock Division.
- SOUTH-WEST WALES DIVISION.**—At St. David's Hospital, Carmarthen, Sunday, May 1, 3 p.m., annual meeting.
- STIRLING BRANCH.**—At Bellsdyke Mental Hospital, Larbert, Sunday, May 1, 3 p.m., annual general meeting.
- TROWBRIDGE DIVISION.**—At the Angel Hotel, Chippenham, Sunday, May 1, 11 a.m., annual general meeting.
- WAKEFIELD DIVISION.**—At Clayton Hospital, Wakefield, Thursday, May 5, 8 p.m., meeting. Annual B.M.A. lecture by Dr. J. D. Allan Gray: "The Clinical Application of Antibiotics."
- WEST HERTS DIVISION.**—At Mount Vernon Hospital, Northwood (in the Plastic Surgery Centre), Friday, May 6, 8.30 p.m., general meeting.
- WEST SOMERSET DIVISION.**—At Musgrove Park Hospital, Taunton, Tuesday, May 3, 8 p.m., annual general meeting.

Meetings of Branches and Divisions

BLACKPOOL AND FYLDE DIVISION

A meeting was held on March 9, when Dr. Macdonald Critchley delivered the B.M.A. lecture for the year. Dr. T. S. Blackledge was in the chair and 51 members were present. Dr. Critchley spoke on "The Body Image," and his lecture was illustrated by lantern slides.

CHELSEA AND FULHAM DIVISION

A general meeting was held at the Cheyne Hospital, Chelsea, on March 25. Dr. G. Rosemont was in the chair. Dr. Dunham spoke on research among spastic children, and was followed by Mrs. Collis and Dr. Ian Anderson.

THE LAW ON MENTAL ILLNESS AND MENTAL DEFICIENCY

ASSOCIATION'S EVIDENCE TO ROYAL COMMISSION

As announced in the Annual Report of the Council of the B.M.A. (*Supplement*, March 19, p. 108) the Association has submitted a memorandum of evidence to the Royal Commission on the Law Relating to Mental Illness. The memorandum was drawn up at the Council's request by the Association's Psychological Medicine Group Committee, which was augmented for the purpose by co-opted representatives of the Central Consultants and Specialists Committee, the General Medical Services Committee, and the Public Health Committee, a nominee of the Royal Medico-Psychological Association, and a legal expert on mental law and procedure (Mr. C. F. Penton).

The Chairman of the evidence committee was Dr. N. H. M. Burke. The Psychological Medicine Group Committee members were: Dr. A. Harris, Dr. P. K. McCowan, Dr. Doris M. Odum, Dr. J. D. W. Pearce, Professor T. Ferguson Rodger, Dr. J. C. Sawle Thomas, and Dr. J. Valentine. The co-opted members were: Dr. M. J. Brookes, Dr. H. M. Cohen, Dr. W. H. Patterson, Mr. C. F. Penton, Dr. S. Wand, and Dr. Elspeth M. Warwick.

Oral evidence was given before the Royal Commission on April 27 by the following members of the Committee: Drs. Burke, Cohen, Brookes, Odum, and Wand.

In preparing its memorandum the Committee was in close liaison with the Royal Medico-Psychological Association, a practice which has been followed on previous occasions when the two Associations have been invited to give evidence on matters relating to psychological medicine. The Committee found a very considerable measure of agreement with the R.M.P.A., and the memorandum therefore varies very little from that already submitted by the latter body. Such variations as were made were due to the wider outlook resulting from the presence on the B.M.A. Committee of the co-opted members.

The Association's memorandum of evidence recommends a new and comprehensive Mental Health Act to cover the whole psychiatric field, with parts for mental illness, mental deficiency and psychopathy.

Mental Illness

The main aim in the treatment of mental illness should be that the voluntary and temporary methods of admission to hospital should be those of usual choice, and that admission by judicial order should be reserved for the comparatively few for whom it is unavoidable. The introduction of voluntary admissions in the Mental Treatment Act (1930)

had been an unqualified success, and some 80% of all admissions were now in this category.

The Association's evidence recommended that the formalities should be reduced for both admission and discharge.

Though the provision under the Act of 1930 (section 5) for temporary treatment without certification had not been used as much as was hoped and expected, 23 years' experience had shown that admission to mental hospital without judicial intervention was practicable and also acceptable to public opinion.

Temporary Admissions

The Association has recommended that all patients should now normally be admitted to hospitals on a temporary status except for those who are admitted on a voluntary basis or those who require emergency procedure. Application for admission should be made by a relative or by a mental welfare officer, and should be accompanied by two medical recommendations.

In order to ensure that as many as possible should receive all their treatment under the temporary category, the Association has advised that admission should be for six months and that it should be extendible, under safeguards, for up to two years. Before this time most recoverable patients will have got well, and the stigma of certification will have been avoided.

The temporary category should provide a suitable umbrella for many of the senile patients whose disposal at present caused anxiety, and should enable their mental illness or decay to be treated without certification.

The judicial reception order, the Association considers, should be used only for those who have been tried as temporary patients and have failed to recover. The order should have force for one year, and should be renewable by the Board of Control for suitable periods on presentation of special reports and certificates from the hospital.

Immediate Supervision

Under the existing Act there are several different procedures, of which section 20 and section 11 provide the chief, by which a patient, where necessary, can be removed under immediate supervision.

The Association has recommended that a single unified procedure should be used. The mental welfare officer, the Association thinks, should have power to remove a patient in need of immediate care to a hospital (general or mental)

which has been designated for the purpose. The order should cover three days and be extendible to 21 days by the order of the medical superintendent of the mental hospital or the medical officer in charge of the observation ward, as the case might be.

Mental Deficiency

Part Two of the memorandum of evidence dealt with mental deficiency and discussed the varied aspects and causation of arrested or incomplete development of the mind.

Social inadequacy was regarded as the criterion for bringing into operation the measures of special care provided by the law, and it was immaterial whether the inadequacy was associated with a lack of intelligence or with an emotional or adaptive defect.

The present terminology, the Committee thought, was disturbing to the relatives and should be modified. The classes of idiot, imbecile, and feeble-minded, for instance, were unnecessary except, perhaps, for clinical use and should cease to appear in any legal document, while the class of moral defective had already been discarded in common practice.

Treatment

Treatment within the community should be developed, especially by increase of occupation centres and of home training. There should be power to make attendance at centres compulsory, and the management should be in the hands of the education authority.

There should be two kinds of hostel, and many more were needed of the kind which extended the work of the hospital by providing a stage towards licence and discharge. The local health authority should have hostels for patients not needing full hospital treatment. Where convenient it should be possible for the former hostel to receive voluntary patients from the local authority hostel, and for the latter hostel to take some on licence from the hospital, a useful field for co-operation.

The Association's memorandum recommends that the main method of entry to care for the higher-grade patient who is over 16 and can appreciate what is involved should be by a voluntary procedure, and for those under 16, and those over 16 whose understanding is inadequate for voluntary entry, there should be a revised method of placement.

No judicial order was involved in this procedure and the Association hoped that many patients would fall into this uncertified group. Judicial order should be reserved for those whose admission to care was necessary but had not been arranged by the voluntary or placing methods, or those whose claim for discharge was barred by the medical officer.

In place of the old list of conditions which render a patient "subject to be dealt with" there should be evidence showing clearly that admission to in-patient care or to guardianship was essential in the interest of the patient or for the protection of the public.

Under section 8 of the present Act a court may make an order. The memorandum suggested a further, and less drastic, power whereby the court may refer the case for such action as the local authority might think suitable.

The memorandum advised that there should be an extra visit at the third year, but saw no value in the visit at the age of 21 years. The parents should have the right of being present or represented at each visit and of presenting an independent psychiatric report, and the visitors should be able to discharge at any visit, but only on the advice of the medical officer.

Except for this method, the power of discharge should continue to be vested in the Board of Control.

The Justice

Dealing with the certification of a defective the memorandum stated that "the intervention of a Justice is essential for the reassurance of the relatives and the public, the protection of the medical practitioner and other officials concerned, and the public assertion of the principle of the liberty of the subject."

Among the safeguards proposed for the temporary patient who is detained in a mental hospital without order, it was suggested that he should have the right of an interview, within four weeks of admission, with a judicial authority who was not connected with the management of the hospital. This magistrate would either endorse the form of application for admission or could recommend to the hospital management committee a reconsideration of the case.

Psychopathy

The evidence dealt next with forms of mental abnormality which were difficult to classify or to relate to the more accepted and definite forms of mental illness or defect, but which influenced behaviour adversely and might produce family unhappiness, anti-social conduct, or even gross delinquency.

Such conditions were loosely called psychopathic, and it was clear to the Association that facilities were needed for voluntary treatment of those psychopaths who would accept it and for compulsory control where it was necessary for the protection of others.

The memorandum discussed the possibilities of treatment in prison, as advocated by the East-Hubert report of 1939, and under the measure of compulsion introduced by section 4 of the Criminal Justice Act of 1948. Both methods suffered, in the Association's opinion, from the limitation of the time available for treatment.

The memorandum suggested that the court should be given power to order admission to an appropriate institution. The order should be made only on the basis of two medical recommendations and for a limited period, but there should be the possibility of extension after reconsideration by visiting justices or by a special visiting board. This was put forward to meet the difficulty of the unpopular indeterminate sentence.

The psychopath who was not a delinquent but was a serious disrupter of family happiness presented a special problem and the memorandum proposed that a form of petition should be allowed from the relatives, the probation officer, or the duly authorized officer. This should be accompanied by a full statement of the facts and by two medical recommendations. Of these, one should preferably be by the family doctor, and the other by a psychiatric specialist. The court, if satisfied of the strength of this evidence, would order further examination by an independent specialist, and would then be able to order admission to a suitable institution. For these cases the court should be of a kind, such as a juvenile court, which could hear cases in private.

The allocation of these psychopathic patients should be by an elastic method designed to fit the individual into the appropriate institution, and should be done on the advice of such a person as the regional psychiatrist, who had comprehensive knowledge of the facilities which were available and an understanding of the patient's needs.

The Board of Control

Much anxiety had been caused to the Association by the recommendations of the Ministry of Health, which seemed to reduce the status and functions of the Board of Control and to weaken its powers, or distribute them to others.

The Association's opinion was put strongly that "the continued existence of the Board, substantially in its present form, is in the interests of the patients, the hospitals, and the public... it should be maintained in a position of complete independence as a central authority whose reports would have the value attaching to those of an impartial inspectorate."

It had already been stated in the evidence that special legislation was necessary to regulate conditions for the treatment of patients with mental diseases, and this very fact required that the hospitals for these patients "shall be inspected and reported upon by persons empowered to report and to criticize solely from this point of view, uninfluenced by any consideration of departmental policy."

It was recommended that the admission documents and the continuation certificates should continue to be scrutinized by the Board, as this was the only way to achieve uniformity in standard.

Further, the Board should be strengthened in number and maintained in professional quality so that its members might have more time for inspections and reports, and time also to visit any case which may seem to call for inquiry.

THE ADOLESCENT IN INDUSTRY

JOINT CONFERENCE OF ADVISORY COUNCILS ON OCCUPATIONAL HEALTH

The second Joint Conference of Advisory Councils on Occupational Health was held at B.M.A. House, London, on April 20. Mr. C. F. GOTHARD (Burton-on-Trent) presided, and was supported by Dr. I. D. GRANT (Chairman of the Representative Body of the Association) and Dr. J. A. L. VAUGHAN JONES (Chairman of the B.M.A.'s Occupational Health Committee). In addition to representatives of the councils and members of the Occupational Health Committee, there were present observers from the Ministries of Health and of Labour and National Service, the Society of Medical Officers of Health, the Royal College of Nursing, the Association of British Chambers of Commerce, the British Employers Confederation, the Trades Union Congress, and various industrial welfare organizations.

Dr. I. D. GRANT, in welcoming the conference, said that the British Medical Association was really its godparent, for the Representative Body had passed a resolution recommending the setting up of advisory councils in the various areas, and the first to be set up, at Dr. Vaughan Jones's instigation, was at Leeds. The Minister of Labour had set up an Industrial Health Advisory Council on which the British Medical Association was represented. The full co-operation of the Association could be assured in every endeavour to improve the working conditions of the people of this country.

Learners not Earners

Dr. A. W. RIDDOLLS (York) moved a composite resolution:

That there is a need for improvement in the liaison between education and industry, and that the interests of the nation are best served when its young people are primarily regarded not as "earnings" but as "learners."

He said that the best person to deal with the young person entering industry was not necessarily the foreman or charge hand, but someone particularly fitted to deal with and understand young people. The adolescent had two great needs: to belong to and be accepted by a group, and to acquire personal adequacy and self-confidence. The change from school to industry should be made a more gradual process, and some responsibility should be taken not only by the employing authority but by the school. Each local education authority should have a psychologist on its staff to give guidance to children before leaving school as to the vocation for which they were suited, and in each senior school one teacher should be careers master or mistress. Children in their last year at school might be given part-time work to see if they liked the employment and to introduce them into industry.

Mr. H. RAMSDEN (York), in seconding, said that in some industries new entrants were pitchforked into piece-work, which was detrimental to their health. Too many parents were concerned only with the amount of money that the children could bring home.

Dr. VAUGHAN JONES said that the parents' responsibility must be emphasized. The fact that young people change from job to job was sometimes an evidence, not of drift, but of real individuality. There was not nearly enough liaison between the school medical service and the factory doctor.

Dr. M. E. M. HERFORD said that the factory doctor was in an exceptionally favourable position to help young people when they entered or changed employment. A great many firms were unaware of their statutory duty to notify the factory doctor of the taking on of young people. In Slough, with which he was acquainted, the young people changed jobs very frequently, but not 10% could be described as drifters. Those who were not apprentices had little to attract them unless the conditions of work were particularly good, but if the lad found someone who had a genuine interest in him he was likely to make a good start.

Mr. F. H. MARTIN (Wolverhampton) spoke as a teacher. In Wolverhampton they had done quite a lot in forming a liaison between industry and education. It was recommended that some teachers should visit the factories, and people training in factory supervision should go into the schools. Mr. Martin made the point that nowadays the more intelligent children go to grammar schools and a number who previously went into industry no longer do so.

Mr. E. A. LEWIS (Association of British Chambers of Commerce) said that the careers master's job was one that ought to be very greatly developed. The grammar school gave such a master a great deal more scope than the secondary modern school. The liaison between employers and schools was a very thorny problem, but the resistance really came neither from the employers nor the schools, but from the pupils who wanted to earn as much as possible as quickly as possible and for as little as possible.

The resolution was carried.

Vocational Guidance

Another composite resolution by York declared that young persons entering industry should be given vocational guidance; that in this connexion a more comprehensive use should be made of all medical records by the health services of the country; that schemes of induction and encouragement of initiative should be provided; that there should be co-operation between parents and teachers initially, and between doctors, welfare workers, trade union officials, and employers in stimulating a sense of responsibility among adolescents entering industry; that it is primarily the responsibility of parents, assisted by teachers, the Church, youth leaders, and other agencies, to inculcate the right attitudes towards work; that more use should be made of the youth employment service, and that the service itself should make more use of the advice of general practitioners regarding the choice of suitable vocations, particularly in the case of physically handicapped children.

Mr. A. MACDONALD, in moving, said that it would be of value if school medical records could be passed on to the factory surgeon, to which would be added the records of his own yearly examination until the adolescent was 18, and then the whole be sent to the family doctor.

Mr. W. B. SIMPSON (Wandsworth) said that the youth employment service was doing an excellent job, but parents should be stimulated to take more interest in their children entering industry.

Dr. H. ALEXANDER (Wandsworth) said that in Wandsworth occupational guidance had been the subject of special talks to juveniles, but it was disappointing that at school-leaving interviews only 50% or fewer of the parents took the trouble to attend. He added that the general practitioner was in a position to know more about the family and social background than any other member of the team concerned, and should be able to give valuable information which the youth employment service could use.

Mr. S. J. BATCHELDER (Leeds) reminded the conference of the great number of small firms which were not able to provide facilities. One point to be remembered was that in these days very many of the mothers worked in the factory and thus knew something of the industrial conditions which their children would encounter.

Dr. R. C. SCOTT (Burton-on-Trent) could not agree that the school medical officer was the best man to do the job of

the appointed factory surgeon. It was the general practitioner who had and must have some definite knowledge of industry.

Dr. VAUGHAN JONES spoke of the responsibility of the churches, as well as of the parents, to take an interest in this matter. He did not accept the criticism that juveniles of the working classes were to any greater extent than any other groups in the community out to get as much and give as little as possible.

The composite resolution was carried, as was a further resolution by York urging that no undue emphasis should be placed on the problems confronting young people leaving school and entering industry. The mover said that it must not be forgotten that, while adolescence gave rise to difficulties, it also brought out admirable qualities of idealism and service.

On another resolution, "That the immediate supervisor of young people at their place of work should be a person of understanding who appreciated the problems of adolescence," some objection was raised to the word "immediate," and the phrase was altered to "the individual responsible for young people at their place of work," etc., and in that form was carried.

Another resolution, from Southampton, proposed to urge the Government to implement fully those recommendations of the Gowers Report which dealt with the employment of juveniles. Mr. A. E. GREGORY, in moving, referred particularly to the juveniles in some trades who were required to begin work at a very early hour in the morning and to continue for many hours during the day.

Many members of the Conference said that they had not had the opportunity of studying the Gowers Report, and after a short discussion the resolution was referred back to the Occupational Health Advisory Council for consideration and report to the next Conference.

The Conference concluded with votes of thanks to the Chairman, to Dr. Vaughan Jones and the Occupational Health Committee, and to the British Medical Association for acting as hosts, including luncheon hospitality.

Mr. F. H. Martin, of Wolverhampton, was appointed chairman for next year's conference.

REMUNERATION OF MEDICAL OFFICERS IN PUBLIC HEALTH SERVICE

INDUSTRIAL COURT AWARD

The Industrial Court has announced its arbitration award on the dispute in Committee C of the Medical Whitley Council over the Staff Side's claim for a revision of the salary scales of medical officers employed by local authorities. The award is largely in favour of the Management Side, and the doctors affected by it number approximately 2,000. Details of the present commencing salary ranges,

the Staff Side claim, and the Management Side offer are set out in the table at the foot of this page.

Both sides to the dispute were agreed that, when the award was made in respect of the categories of medical officers named in the table, they would be able to agree on the salaries of the remaining categories of medical officers—that is, deputy medical officers of health, holders of mixed appointments and combined appointments, and divisional medical officers—and also on the method of assimilation to the new scales.

The Award

The award is announced in the following terms: "The Court, having given careful consideration to the evidence and submissions of the parties, find and so award that, with effect from January 1, 1955, the salary scales for medical officers of health, senior medical officers and medical officers in departments (assistant medical officers) shall be as follows:

MEDICAL OFFICERS OF HEALTH			
Population Group	Commencing Salary	Increments	
Not exceeding	Between		
75,000 ..	£1,625 and £1,830	4 × £52 10s.	
100,000 ..	£1,730 and £2,040	5 × £51 10s.	
150,000 ..	£1,940 and £2,250	5 × £51 10s.	
250,000 ..	£2,150 and £2,450	2 × £100	
		1 × £50	
400,000 ..	£2,400 and £2,700	2 × £100	
		1 × £50	
600,000 ..	£2,500 and £2,900	3 × £100	
Over 600,000	At discretion	At discretion	

SENIOR MEDICAL OFFICERS

£1,415 × £50—£1,765 × £65—£1,830.

MEDICAL OFFICERS IN DEPARTMENTS (ASSISTANT MEDICAL OFFICERS)

£975 × £50—£1,375.

"The Court find against the proposal of the Management Side for the introduction, in the case of Scotland, of a salary scale for a medical officer of health with a population group not exceeding 60,000 and award accordingly.—(Signed) JOHN FORSTER, President, G. MAURICE HANN, KENNETH SCOTT."

A Matter of Principle

The Staff Side, as part of its case, claimed that medical officers' salaries should be related to remuneration in other branches of the profession, whereas the Management Side's offer linked medical salaries in the local authority service to those of the local authority hierarchy as a whole. Although the Court has not made a specific pronouncement of its views on this matter of principle (to which the Staff Side attached great importance), comparison of the award with the Management Side's offer before arbitration (see table) shows that the figures are substantially the same.

1. Medical Officers of Health

Population Group not Exceeding	Present Time		Staff Side Claim		Management Side Offer	
	Commencing Salary Between	Increments	Commencing Salary Between	Increments	Commencing Salary Between	Increments
60,000*	—	—	—	—	£1,520 and £1,730	4 × £52 10s.
75,000 ..	£1,450 and £1,650	4 × £50	£1,850 and £2,050	4 × £50	£1,625 .. £1,830	4 × £52 10s.
100,000 ..	£1,550 .. £1,850	5 × £50	£1,950 .. £2,250	5 × £50	£1,730 .. £2,040	5 × £51 10s.
150,000 ..	£1,750 .. £2,050	5 × £50	£2,150 .. £2,450	6 × £50	£1,940 .. £2,250	5 × £51 10s.
250,000 ..	£1,950 .. £2,250	2 × £100	£2,350 .. £2,650	2 × £50	£2,150 .. £2,450	2 × £100
		1 × £50				1 × £50
400,000 ..	£2,200 .. £2,500	2 × £100	£2,600 .. £2,900	4 × £100	£2,400 .. £2,700	2 × £100
		1 × £50				1 × £50

Over 600,000	At discretion	At discretion	At discretion	At discretion	At discretion	At discretion
2. Senior Medical Officers £1,250, by 8 increments of £50, to £1,650			£1,550, by 8 increments of £50, to £1,950		£1,415, by 7 increments of £50, and 1 of £65, to £1,830	
3. Medical Officers in Departments (Assistant Medical Officers) £950, by 7 increments of £50, to £1,300			£950, by 10 increments of £50, to £1,450		£975, by 8 increments of £50, to £1,375	

* Applicable to Scotland only. † Scale offered by Management Side at the hearing.

British Medical Association, Canadian Medical Association, and Ontario Medical Association

JOINT ANNUAL MEETING—TORONTO, JUNE 20-24, 1955

President-Elect: THOMAS CLARENCE ROUTLEY, C.B.E., LL.D., M.D., F.R.C.P.(C.).

PROGRAMME

The 123rd Annual Meeting of the British Medical Association will be held in Toronto from Monday, June 20, to Friday, June 24, inclusive, as a joint meeting with the Canadian Medical Association and the Ontario Medical Association.

Those members arriving by the *Saxonia* will be the guests in Montreal of the local doctors on Thursday, June 16. Members arriving in Montreal by the *Empress of France* will similarly be entertained on Friday, June 17.

Members in Toronto on the afternoon of Friday, June 17, are to be the guests of Lady Eaton at a reception and supper at Eaton Hall Farm, King, Ontario.

Preceding the Meeting, there will be a Civic Reception on the evening of Saturday, June 18, and Religious Services on the afternoon of Sunday, June 19.

The British Medical Association Adjourned Annual General Meeting and President's Address will take place at 8 p.m. on Monday, June 20, followed by the President's Reception, at the Royal York Hotel. The Annual Dinner of the Ontario Medical Association is arranged for Tuesday, June 21, at 7 p.m., and is to be followed by Square Dancing. The Annual General Meeting of the Canadian Medical Association will be held on the evening of Wednesday, June 22, in the same place, and will be followed by a reception.

The Annual Dinner of the British Medical Association will be held in the Royal York Hotel on Thursday, June 23, at 7.30 p.m.

The C.M.A. is arranging luncheons each day of the meeting except Friday. At the luncheon on Monday Sir Henry Dale is to be presented with the Medal of Honour of the Canadian Pharmaceutical Manufacturers Association.

An all-day visit to Niagara Falls has been arranged for Friday, June 24, and various special functions have been planned for the ladies accompanying members.

Members of the Association and their ladies are invited to attend all the above functions (except the C.M.A. luncheons, which are for members only).

Information on arrangements for currency, travel, and accommodation may be obtained from the Secretary, B.M.A. House, Tavistock Square, London, W.C.1.

DRESS

Evening Dress (Tails or Dinner Jacket) with Decorations (Miniatures) will be worn at the evening functions on June 20, 22, and 23. Members have been advised that, as many will be travelling by air to Canada and their luggage accordingly limited, a dinner jacket will be quite adequate for all formal occasions.

Informal Dress will be worn at the evening functions on June 17, 18, 19, and 21.

Academic Dress will not be worn (except by those taking an official part in the Religious Services and B.M.A. Adjourned Annual General Meeting) owing to luggage restrictions and the difficulty of hiring robes in Canada.

REGISTRATION

Registration for B.M.A. members and ladies will take place before the meeting in the Royal York Hotel, commencing at 7.30 a.m. on Friday, June 17, continuing on Saturday, June 18. The main registration office opens at the Royal York Hotel on Monday, June 20. Members arriving by air at Malton Airport should take the airport

bus to the Royal York Hotel; those travelling by train will arrive at the Union Station, which is immediately opposite the Royal York Hotel.

CHRISTIAN MEDICAL FELLOWSHIP ANNUAL BREAKFAST

The Annual Breakfast of the Christian Medical Fellowship will be held in the Royal York Hotel from 7.45 to 8.45 a.m. on Thursday, June 23. The Chairman will be Dr. T. C. Routley, and the speaker Dr. John R. Brobeck, Ph.D., Professor of Physiology, University of Pennsylvania. Those intending to be present are asked to notify the local secretary, Dr. I. H. Erb, 299, St. Clair Avenue West, Toronto, 7.

DINNER OF THE MAIMONIDES MEDICAL SOCIETY OF ONTARIO

There will be a dinner of the newly formed Maimonides Medical Society of Ontario on the evening of Wednesday, June 22, at the Royal York Hotel. (Membership is open to all Jewish physicians qualified to practise in Ontario.) Special guests will be the Jewish doctors and their wives who will be attending the Meeting from overseas. Advance information of intention to be present should be sent to Dr. A. Leventhal, 425, Palmerston Boulevard, Toronto.

SCIENTIFIC MEETINGS

Scientific meetings will be held daily from June 20 to 24, beginning each day with Round Table Conferences from 9 to 10.15 a.m., followed by Plenary or General Sessions from 10.30 a.m. to 12.15 p.m. The Scientific Sections will be held daily from 2 to 5 p.m., and there will be a Panel Discussion on the National Health Service on June 22 at 3 p.m. A Scientific Exhibition will be held in conjunction with the Joint Meeting, in addition to a Pharmaceutical Exhibition.

Details of the scientific meetings, all of which will be held in the Royal York Hotel (unless otherwise stated), are given below.

SCIENTIFIC PROGRAMME

Monday, June 20

Round Table Conferences

9 to 10.15 a.m.—(a) The Management of Prostatic Obstruction. *Chairman*: Dr. C. L. GOSSE,* Halifax. (b) Pain. *Chairman*: Dr. FRANK TURNBULL,* Vancouver. (c) The Role of the General Practitioner in the Diagnosis and Treatment of Glaucoma. *Chairman*: Dr. A. J. ELLIOT,* Toronto. (d) The Problem of the Anaemias. *Chairman*: Dr. E. S. MILLS,* Montreal.

Plenary Session

10.30 a.m. to 12.15 p.m.—The Present Status of Chemotherapy of Bacterial Infections. *Chairman and Opening Speaker*: Professor L. P. GARROD, London. *Speakers*: Dr. T. E. ROY,* Toronto; Professor J. W. CROFTON, Edinburgh; Dr. K. J. R. WIGHTMAN,* Toronto. (*Official Reporter*: Professor R. CRICKSHANK.)

Tuesday, June 21

Round Table Conferences

9 to 10.15 a.m.—(a) Surgery of the Lungs. *Chairman*: Dr. R. M. JANES,* Toronto. (b) Is Prenatal Care Worth

Canadian speakers are denoted by an asterisk ().

While? *Chairman:* Dr. ELINOR F. E. BLACK,* Winnipeg. (c) The Prevention and Treatment of Poliomyelitis. *Chairman:* Dr. C. E. VAN ROOYEN,* Toronto. (d) Alcoholism in Industry. *Chairman:* Dr. W. HARVEY CRUICKSHANK,* Montreal.

General Session

10.30 a.m. to 12.15 p.m.—(1) The Blackader Lecture—Professor STANLEY GRAHAM, Glasgow. The Changing Pattern of Paediatrics. (2) Sir GEOFFREY JEFFERSON, Manchester. Variations on a Neurological Theme. (3) Dr. R. M. B. MACKENNA, London. The Art of Dermatology.

Wednesday, June 22

Round Table Conferences

9 to 10.15 a.m.—(a) The Management of Coronary Thrombosis. *Chairman:* Dr. HAROLD SEGALL,* Montreal. (b) Deafness. *Chairman:* Dr. W. J. McNALLY,* Montreal. (c) The Management of Rheumatoid Arthritis. *Chairman:* Dr. WALLACE GRAHAM,* Toronto. (d) The Recognition and Management of Depressive Reactions. *Chairman:* Dr. R. O. JONES,* Halifax.

Plenary Session

10.30 a.m. to 12.15 p.m.—The Clinical Application of Physiology to Medicine and Surgery. *Chairman and Opening Speaker:* Professor Sir HENRY COHEN, Liverpool. *Speakers:* Dr. JOSEPH DOUPE,* Winnipeg; Sir HENRY DALE, London; Dr. J. S. L. BROWNE,* Montreal. (*Official Reporter:* Dr. F. PRESCOTT.)

Panel on National Health Service

3 p.m.—*Chairman:* Dr. R. W. RICHARDSON,* Winnipeg. (1) Dr. E. A. GREGG, London. Background of the Service. (2) Dr. A. TALBOT ROGERS, Bromley. The Family Doctor Service. (3) Dr. T. ROWLAND HILL, London. The Hospital Service. (4) Dr. S. C. GAWNE, Preston. The Public Health Service. (*Official Reporter:* Dr. A. TALBOT ROGERS.)

Thursday, June 23

Round Table Conferences

9 to 10.15 a.m.—(a) The Management of Bronchial Asthma. *Chairman:* Dr. BRAM ROSE,* Montreal. (b) The Care of Premature Infants. *Chairman:* Dr. J. F. McCREARY,* Vancouver. (c) Anaesthesia for the Aged Patient. *Chairman:* Dr. HAROLD GRIFFITH,* Montreal. (d) Problems in Dermatology. *Chairman:* Dr. GEORGE S. WILLIAMSON,* Ottawa.

General Session

10.30 a.m. to 12.15 p.m.—(1) Professor Sir ROBERT MACINTOSH, Oxford. A Plea for Simplicity in Anaesthesia. (2) Professor DUGALD BAIRD, Aberdeen. Caesarean Section, Its Use in Difficult Labour in Primigravidae. (3) Dr. WILLIAM PICKLES, Aysgarth, Yorks. The General Practitioner and the Laboratory.

Friday, June 24

Round Table Conferences

9 to 10.15 a.m.—(a) The Value of Mass Radiography. *Chairman:* Dr. G. C. BRINK,* Toronto. (b) The Treatment of Burns. *Chairman:* Dr. S. D. GORDON,* Toronto. (c) Lumbar Pain. *Chairman:* Dr. R. I. HARRIS,* Toronto. (d) Rehabilitation Following Industrial Injury. *Chairman:* Dr. BRUCE YOUNG,* Toronto.

General Session

10.30 a.m. to 12.15 p.m.—(1) The Gordon Richards Memorial Lecture—Mr. J. RALSTON PATERSON, Manchester. Why do Cancer Patients Delay? (2) Sir HENEAGE OGILVIE, London. What Not to Do in Gall-bladder Surgery. (3) Dr. DESMOND CURRAN, London. The Place of Psychology and Psychiatry in Medical Education.

SECTIONAL MEETINGS

ANAESTHESIA

President: Professor Sir ROBERT MACINTOSH (Oxford). *Vice-Presidents:* Dr. GEORGES COUSINEAU* (Montreal). Dr. B. C. LEECH* (Regina), Dr. G. S. W. ORGANE (London), Dr. H. J. SHIELDS* (Toronto). *Hon. Secretary:* Dr. R. A. GORDON* (Toronto). *Official Reporter:* Dr. F. PRESCOTT.

Sessions

(Banting Institute Lecture Room)

Wednesday, June 22

2 to 5 p.m.—(1) Dr. C. LANGTON HEWER (London). Physiology and Complications of the Trendelenburg Position. (2) Dr. H. R. GRIFFITH* (Montreal). Whither Now in Anaesthesia? (3) Dr. A. R. HUNTER (Manchester). Antidotes to Curarizing Drugs. (4) Dr. LEON LONGTIN* (Montreal). A New Technique of Intubation for the Prevention of Contralateral Infection During Lung Surgery. (5) Quiz Session. *Moderator:* Dr. B. C. LEECH* (Regina).

Thursday, June 23

2 to 5 p.m.—(1) Dr. D. A. BUXTON HOPKIN (London). Chlorpromazine. (2) Dr. H. J. SHIELDS* (Toronto). History of Anaesthesia in Canada. (3) Dr. RONALD JARMAN (London). The Anaesthetic and the Anaesthetist. (4) Dr. FERNANDO HUDON* (Quebec). Considerations on Recovery Rooms. (5) Dr. R. W. COPE (London). Anaesthesia for Children and the Newborn. (6) Dr. PHILIP R. BROMAGE (Emsworth). Spirometry in the Assessment of Analgesia after Abdominal Surgery.

CHILD HEALTH

President: Professor A. A. MONCRIEFF (London). *Vice-Presidents:* Dr. ALAN G. BROWN* (Toronto), Professor W. F. GAISFORD (Manchester), Dr. ALTON GOLDBLOOM* (Montreal), Dr. D. B. LEITCH* (Edmonton). *Hon. Secretary:* Dr. A. L. CHUTE* (Toronto). *Official Reporters:* Dr. D. V. HUBBLE (June 21); Professor WILFRID GAISFORD (June 22).

Sessions

(Hospital for Sick Children)

Tuesday, June 21

2 to 5 p.m.—*Some Problems of the Neonatal Period:*—(1) Dr. MARY CROSSE (Birmingham). Dr. JEAN WEBB* (Ottawa). Vital Statistics—Causes of Neonatal Mortality and Morbidity. (2) Professor W. S. CRAIG (Leeds). Anoxia and Respiratory Failure. (3) Dr. PETER SPOHN* (Vancouver). Retrolental Fibroplasia. (4) Dr. BRUCE CHOWN* (Winnipeg). Erythroblastosis. (5) Dr. WM. DONOHUE* (Toronto). Causes of Death in Prematurity. (6) Professor ALAN MONCRIEFF (London). Congenital Malformations, Causation and Prevention. (7) Mr. DENIS BROWNE (London). Congenital Malformations, Surgery.

Wednesday, June 22

2 to 5 p.m.—(A) *Problems of Gastro-enteritis:*—(1) Dr. FRANCES PRESSICK* (Montreal). Bacteriology. (2) Dr. B. E. SCHLESINGER (London). Drugs and Antibiotics. (3) Dr. W. W. PAYNE (London). Fluid and Electrolyte Balance. (B) *Respiratory Diseases:*—(1) Professor W. F. GAISFORD (Manchester). Experiences with B.C.G. (2) Dr. GLADYS BOYD* (Toronto). Bronchiectasis.

DERMATOLOGY

President: Dr. R. M. B. MACKENNA (London). *Vice-Presidents:* Dr. D. E. H. CLEVELAND* (Vancouver), Dr. EMILE GAUMOND* (Quebec), Dr. E. J. TROW, sen.* (Toronto), Dr. D. I. WILLIAMS (London). *Hon. Secretary:* Dr. RAYMOND C. SMITH* (Toronto). *Official Reporter:* Dr. R. MASON BOLAM.

Sessions

(Tudor Rooms 4 and 5)

Wednesday, June 22

2 to 5 p.m.—(1) Further Studies on the Pathogenesis of Rosacea, by Drs. BARNEY USHER* and GORDON YOUNG* (both of Montreal). (2) The Whitfield Tradition in Modern Therapy, by Dr. D. I. WILLIAMS (London). (3) Ringworm of the Scalp (this paper will be presented by Dr. BRITAIN SAUNDERS* (Toronto), but as a co-operative effort by the staff of the Hospital for Sick Children: NORMAN WRONG,* STUART ROGERS,* CHARLES HAIR,* and Dr. RAYMOND C. SMITH.* (4) Acute Skin Diseases in General Practice, by Dr. R. MASON BOLAM (Newcastle-upon-Tyne).

Thursday, June 23

2 to 5 p.m.—Clinical session at Toronto General Hospital presented by the Section of Dermatology, Academy of Medicine, Toronto.

GENERAL PRACTICE

President: Dr. IAN D. GRANT (Glasgow). *Vice-Presidents:* Dr. J. HOWARD BLACK* (Vancouver), Dr. C. L. GASS* (Tatamagouche, N.S.), Dr. F. M. ROSE (Preston), Dr. MURRAY STALKER* (Ormskirk, P.Q.). *Hon. Secretary:* Dr. H. G. HALL* (Toronto). *Official Reporter:* Dr. A. TALBOT ROGERS.

Sessions

(Tudor Rooms 1-5)

Monday, June 20

2 to 5 p.m.—Symposium:—The Management of Abortion in General Practice. *Moderator:* Dr. JOHN MANN* (Toronto). *Participants:* Mr. J. R. NICHOLSON-LAILEY (Taunton), Dr. MARY ESSLEMONT (Aberdeen), Dr. JOSLYN ROGERS* (Toronto).

Thursday, June 23

2 to 5 p.m.—(1) Dr. IAN D. GRANT (Glasgow). Problems in the Management of the Aged. (2) Dr. ALISTAIR McCONE (Glasgow). Let me see your Tongue: Why? (3) Dr. F. M. ROSE (Preston). Problems of Hypertension in General Practice. (4) Dr. HAROLD F. ROBERTSON* (Toronto). Occluding Arterial Lesions of the Leg. (5) Dr. J. A. McDONALD* (Gloucester). Subject to be announced.

MEDICINE

President: Professor Sir HENRY COHEN (Liverpool). *Vice-Presidents:* Dr. E. R. CULLINAN (London), Dr. R. F. FARQUHARSON* (Toronto), Dr. R. B. KERR* (Vancouver), Dr. WALTER DE M. SCRIVER* (Montreal). *Hon. Secretary:* Dr. R. C. DICKSON* (Toronto). *Official Reporters:* Dr. D. A. LONG (June 20 and 22), Dr. D. V. HUBBLE (June 23).

Sessions

(Concert Hall)

Monday, June 20

2 to 5 p.m.—(1) (a) Dr. H. GARFIELD KELLY* (Kingston). The Mechanism of Heart Failure. (b) Dr. STEPHEN WHITTAKER (Warwick). The Treatment of Heart Failure. (2) Dr. PAUL DAVID* (Montreal). Indications for and Results of Mitral Valvulotomy. (3) Dr. HUGH STANSFIELD* (Vancouver). Electrocardiographic Patterns in Atypical Acute Coronary Occlusion. (4) Dr. KENNETH HARRIS (London). Clinical Aspects of Atypical Coronary Disease. (5) Dr. WILLIAM EVANS (London). Treatment of Cardiac Infarction—Immediate and Late.

Wednesday, June 22

2 to 5 p.m.—(1) Dr. E. R. CULLINAN (London). The Essential Nature, Effects, and Treatment of Simple Obesity. (2) The Sprue Syndrome: (a) Professor A. C. FRAZER (Birmingham). Idiopathic Steatorrhea. (b) Dr. DOUGLAS CAMERON* (Montreal). Secondary Steatorrhea. (3) Dr. A. W. BAGNALL* (Vancouver). Post-Menopausal Osteoporosis. (4) Dr. GUY E. JORON* (Montreal). Diagnosis and Treatment of Acute Pyelonephritis in Diabetes Mellitus.

Thursday, June 23

2 to 5 p.m.—(1) Dr. DAVID A. LONG (London). The Aetiology of Rheumatic Fever. (2) (a) Dr. E. C. WARNER (London). The Nature of the Physiological Disturbance in Chronic Pulmonary Emphysema. (b) Dr. T. H. AARON* (Edmonton). The Modern Treatment of Chronic Pulmonary Emphysema. (3) Dr. WILLIAM J. MORSE* (Boston). Investigation of the Haemorrhagic Diatheses. (4) Dr. JOHN P. GEMMELL* (Winnipeg). Choice of Treatment in Hyperthyroidism.

NEUROLOGY

President: Sir GEOFFREY JEFFERSON (Manchester). *Vice-Presidents:* Dr. GILBERT L. ADAMSON* (Winnipeg), Dr. WILDER G. PENFIELD* (Montreal), Dr. W. RITCHIE RUSSELL (Oxford), Dr. FRANK A. TURNBULL* (Vancouver). *Hon. Secretary:* Dr. J. ALLAN WALTERS* (Toronto). *Official Reporter:* Dr. W. RITCHIE RUSSELL.

Sessions

(Best Institute)

Monday, June 20

2 to 5 p.m.—(1) Dr. HUGH GARLAND (Leeds). Diabetic Neuropathy. (2) Sir CHARLES SYMONDS (London). Cough Headache—A Benign Syndrome. (3) Dr. E. H. BOTTERELL* (Toronto). Hypothermia in Cerebral Vascular Surgery. (4) Dr. W. M. LOUGHEED* (Toronto). Hypothermia for Neurological Surgery: Evaluation of the Method. (5) Dr. W. RITCHIE RUSSELL (Oxford). Observations on Interstitial Neuritis. (6) Dr. T. ROWLAND HILL (London). Some Problems of Peripheral Neuropathy.

Wednesday, June 22

2 to 5 p.m.—(1) Mr. D. W. C. NORTHFIELD (London). The Results of Treatment of Cervical Spondylosis with Neurological Manifestations. (2) Sir GEOFFREY JEFFERSON (Manchester). The Integration of Coma. (3) Dr. WILDER PENFIELD* (Montreal). The Results of Cortical Excision in the Treatment of Focal Epilepsy. (4) Dr. DOUGLAS McALPINE (London). Some Observations on the Diagnosis and Treatment of Multiple Sclerosis.

OBSTETRICS AND GYNAECOLOGY

President: Professor DUGALD BAIRD (Aberdeen). *Vice-Presidents:* Dr. D. M. LOW* (Toronto), Mr. JOHN PEEL (London), Dr. W. P. TEW* (London, Ont.), Dr. J. ROSS VANT* (Edmonton). *Hon. Secretary:* Dr. R. B. MEIKLEJOHN* (Toronto). *Official Reporter:* Mr. S. BENDER.

Sessions

(Concert Hall, June 21; P.D.R.10, June 23)

Tuesday, June 21

2 to 5 p.m.—(1) Dr. DOUGLAS FREW* (Edmonton). What is Adequate Prenatal Care To-day? (2) Mr. S. BENDER (Chester). Fertility after Tubal Pregnancy. (3) Dr. F. L. JOHNSON* (Hamilton). The Management of Breech Presentations. (4) Mr. JOHN PEEL (London). The Management of the Diabetic Patient in Pregnancy. (5) Dr. OTTO SCHMIDT* (Winnipeg). Induction of Labour—Its Use and Abuse.

Thursday, June 23

2 to 5 p.m.—(1) Dr. CARL TUPPER* (Halifax). The Management of Spontaneous Abortion—A Combined Approach. (2) Mr. MALCOLM DONALDSON (London) and Dr. PAUL LATOUR* (Montreal). The Early Diagnosis of Cancer of the Cervix. (3) Miss GLADYS HILL (London). Functional Bleeding. (4) Professor DAVID STEWART (Jamaica). Treatment of Suppression of Urine Following Eclampsia.

OCCUPATIONAL MEDICINE

President: Dr. J. M. ROGAN (London).
Vice-Presidents: Dr. J. G. CUNNINGHAM* (Toronto), Dr. J. J. O'DWYER (London), Dr. H. GRAHAM ROSS* (Montreal), Dr. W. G. SAUNDERS* (Vancouver).
Hon. Secretary: Dr. J. H. BAILLIE* (Toronto).

Sessions

(P.D.R. 7, June 21; Bell Telephone Building, June 23)

Tuesday, June 21

2 to 5 p.m.—(1) Dr. A. H. SELLERS* (Toronto). The Procuring of Comparable Industrial Medical Statistics. (2) Dr. J. E. GOODWIN* (Toronto). Indicating in Advance a Susceptibility to Noise. (3) Dr. IAN URQUHART* (Toronto). Problems of Resuscitation in Industry. (4) Dr. J. H. BAILLIE* (Toronto). Some Considerations of Sickness Absenteeism in a Non-hazardous Industry. (5) Dr. J. J. O'DWYER (London). The Contribution of the Doctor to the Management Team.

Thursday, June 23

2 to 5 p.m.—(1) Dr. JOHN ROGAN (London). The Health of the British Coal-miner. (2) Dr. R. APPLEFORD* (Oakville). The Detection of Diabetes on Preplacement Blood Examinations. (3) Dr. C. G. SHAVER* (St. Catharines). Silicon Carbide as an Industrial Hazard. (4) Dr. S. D. MCCLEAN (London). Some Aspects of Health in the Oil Industry. (5) Surgeon Commander F. P. ELLIS, R.N. (Washington). Environmental Health in the Royal Navy. The Changing Scene.

OPHTHALMOLOGY

President: Mr. J. W. TUDOR THOMAS (Cardiff).
Vice-Presidents: Mr. J. H. DOGGART (London), Dr. NORMAN L. ELVIN* (Winnipeg), Dr. R. T. HAYES* (St. John, N.B.), Dr. KENNETH B. JOHNSTON* (Montreal).
Hon. Secretary: Dr. CLEMENT MCCULLOCH* (Toronto).
Official Reporter: Mr. J. H. DOGGART.

Session

(P.D.R. 7)

Monday, June 20

2 to 5 p.m.—(1) Mr. JAMES H. DOGGART (London). Vessels of the Ocular Fundus as a Guide to Prognosis. (2) Mr. J. W. TUDOR THOMAS (Cardiff). On Advising a Corneal Graft. (3) Dr. I. LLOYD JOHNSTONE (Worcester). The Operative Treatment of Abducens Palsy. (4) Dr. CHARLES DYSON* (London). Chordomata of Ocular Interest. (5) Dr. HOWARD REED* (Winnipeg). Some Observations on the Results of Cataract Extraction. (6) Dr. C. D. BAIRD* (Chatham). Diseases of the Meibomian Glands.

ORTHOPAEDIC SURGERY

President: Mr. PHILIP WILES (London).
Vice-Presidents: Mr. H. JACKSON BURROWS (London), Dr. J. CALIXTE FAVREAU* (Montreal), Dr. ALEXANDER GIBSON* (Winnipeg), Dr. R. I. HARRIS* (Toronto).
Hon. Secretary: Dr. HERBERT M. COLEMAN* (Toronto).
Official Reporter: Mr. H. JACKSON BURROWS.

Sessions

(Academy of Medicine)

Wednesday, June 22

2 to 5 p.m.—(1) Mr. H. JACKSON BURROWS (London). Replacement of Bone by Internal Prostheses. (2) Dr. J. BATEMAN* (Toronto). Management of Acute Nerve Injuries. (3) Dr. J. M. JAMES* (Rochester). Peripheral Vascular Surgery from the Standpoint of the Orthopaedic Surgeon. (4) Mr. J. P. JACKSON (London). Results of Chemotherapy in Bone and Joint Tuberculosis. (5) Dr. GEORGE PENNAL* (Toronto). The Thomas Splint. (6) Mr. H. H. LANGSTON (Winchester). A Plea for a Rational Outlook on the Internal Fixation of Fractures. (7) Dr. A. JOUSSE* (Toronto) (*chairman*). Symposium on Traumatic Paraplegia.

Thursday, June 23

2 to 5 p.m.—(1) Mr. PHILIP WILES (London). The Aetiology of Postural Defects. (2) Mr. DENIS BROWNE (London). The Causation of Certain Congenital Deformities and Their Treatment by Controlled Movement. (3) Dr. L. P. ROY* (Quebec). Bone Tumours. (4) Dr. F. P. PATTERSON* (Vancouver). Complications of External Pin Fixation in Orthopaedic Surgery. (5) Dr. G. L. BURKE* (Vancouver). Some Observations on the Feet and Legs in Childhood. (6) Dr. A. A. BUTLER* (Montreal). The Surgical Management of Osteoarthritis of the Knee-Joint. (9) Dr. J. N. SWANSON* (Toronto). Some Orthopaedic Problems Connected with Gouty Arthritis.

OTOLARYNGOLOGY

President: Mr. V. E. NEGUS (London).
Vice-Presidents: Mr. T. E. CAWTHORNE (London), Dr. G. M. T. HAZEN* (Saskatoon), Dr. D. M. MACRAE* (Halifax, N.S.), Dr. G. E. TREMBLE* (Montreal).
Hon. Secretary: Dr. H. W. D. MCCART* (Toronto).
Official Reporter: Mr. R. G. MACBETH.

Sessions

(P.D.R. 10)

Tuesday, June 21

2 to 5 p.m.—(1) Dr. DAVID H. BALLON* (Montreal). Review of Foreign Body Endoscopy Over a Period of Thirty years. (2) Dr. R. E. GREENWAY* (London). Results of Cobalt Therapy in Malignancies of the Nose and Throat. (3) Dr. J. A. SULLIVAN* (Toronto). Clinical Testing of Vertigo. (4) Mr. VICTOR NEGUS (London). Air Conditioning Mechanism of the Nose.

Wednesday, June 22

2 to 5 p.m.—(1) Mr. TERENCE CAWTHORNE (London). Facial Palsy. (2) Mr. RONALD MACBETH (Oxford). The Treatment of Oesophageal Varices in Portal Hypertension by Means of Sclerosing Injections. (3) Dr. EDWARD TREMBLE* (Montreal). A Few Highlights Concerning Respiratory Cilia. (4) Dr. HOWARD MCCART* (Toronto). Parotid Tumours.

PREVENTIVE MEDICINE

President: Professor L. P. GARROD (London).
Vice-Presidents: Dr. G. D. W. CAMERON* (Ottawa), Dr. ROBERT DEFRIES* (Toronto), Dr. S. C. GAWNE (Preston), Dr. LEONARD A. MILLER* (St. John's, Newfoundland).
Hon. Secretary: Dr. L. A. PEQUEGNAT* (Toronto).
Official Reporter: Professor R. CRUICKSHANK.

Sessions

(Hall B)

Monday, June 20

2 to 5 p.m.—(1) (a) Professor R. CRUICKSHANK (London). The Epidemiology of Upper Respiratory Tract Infections. (b) Dr. G. DEMPSTER* (Toronto). Acute Respiratory Disease. (c) Dr. ELIZABETH CHANT ROBERTSON* (Toronto). Ultra-violet Radiation in the Control of Respiratory Disease. (2) *Occasional Paper.*—Dr. JOHN GARDINER* (Toronto). The Heart Registry.

Wednesday, June 22

2.30 to 5 p.m.—(1) Dr. H. J. PARISH (London). Combined Prophylactics. (2) Dr. A. R. FOLEY* (Quebec) and Dr. JAMES M. MATHER* (Vancouver). Combined Immunization from the Viewpoint of the User in the Field. (3) Dr. P. J. MOLONEY* (Toronto). Antigenic and Immunological Aspects of Combined Immunization.

PSYCHIATRY

President: Professor AUBREY J. LEWIS (London).
Vice-Presidents: Dr. R. O. JONES* (Halifax, N.S.), Dr. D. G. McKERRACHER* (Regina), Dr. W. C. M. SCOTT* (Montreal), Dr. ALDWYN B. STOKES* (Toronto).
Hon. Secretary: Dr. A. M. DOYLE* (Toronto).
Official Reporter: Dr. DESMOND CURRAN.

Session on Suicide

(Hall B)

Tuesday, June 21

2 to 5 p.m.—(1) Professor AUBREY LEWIS (London). Statistical Aspects of Suicide. (2) Dr. A. E. MOLL* (Montreal). The Psychopathology of Suicide. (3) Dr. G. C. SISLER* (Winnipeg). The Treatment of Suicidal Attempts. (4) Dr. E. STENGEL (London). The Social Significance of the Suicidal Attempt.

Session on Basic Sciences in Psychiatry

Thursday, June 23

2 to 5 p.m.—(1) Dr. WM. C. GIBSON* (Vancouver). Physiology. (2) Dr. JOHN W. LOVETT DOUST* (Toronto). Psychology. (3) Dr. W. C. M. SCOTT* (Montreal). Psychobiology. (4) Dr. DENIS LEIGH (London). The Contribution of Neuro-anatomy and Neuro-pathology to Psychiatry.

RADIOLOGY

President: Mr. J. RALSTON PATERSON (Manchester).
Vice-Presidents: Dr. E. A. PETRIE* (St. John, N.B.), Dr. A. C. SINGLETON* (Toronto), Dr. ETHLYN TRAPP* (Vancouver), Dr. JOHN WILKIE (Sheffield).
Hon. Secretary: Dr. M. M. R. HALL* (Toronto).
Official Reporter: Dr. EDITH PATERSON.

Sessions

(Tudor Rooms 1-3, June 22; P.D.R. 9, June 23)

Wednesday, June 22

2 to 5 p.m.—*Diagnosis*—(1) Dr. L. R. HARNICK* (Toronto). Diodrast Arthrography of the Knee, and Surgical Correlation. (2) Dr. R. A. MACPHERSON* (Winnipeg). Ulceration of the Duodenal Bulb without Deformity—A Clinical-Radiological Correlation. (3) Dr. J. WILKIE (Sheffield). Intracranial Calcifications. (4) Dr. GUILLAUME GILL* (Montreal). Ureteral Block and Kidney Function. (5) Dr. D. G. WOLLIN* (Toronto). Experimental Rupture of Transverse Ligament of the Atlas.

Thursday, June 23

2 to 5 p.m.—*Therapy*—(1) Dr. ETHLYN TRAPP* (Vancouver). Treatment of Carcinoma of the Body of the Uterus. (2) Dr. JEAN BOUCHARD* (Montreal). Subject to be announced later. (3) Dr. EDITH PATERSON (Manchester).

Treatment of the Leukaemias. (4) Dr. RONALD BURR* (Kingston, Ont.). Intracavity Irradiation of Carcinoma of the Bladder. (5) Dr. OWEN MILLAR* (Toronto). The Use of Radioactive Gold in Malignant Effusion.

SURGERY

President: Mr. A. LAWRENCE ABEL (London).
Vice-Presidents: Dr. C. W. BURNS* (Winnipeg), Dr. R. M. JAMES* (Toronto), Dr. W. J. P. MACMILLAN* (Charlottetown, P.E.I.), Mr. T. HOLMES SELLORS (London).
Hon. Secretary: Dr. BURNS PLEWES* (Toronto).
Official Reporter: Mr. R. S. MURLEY.

Sessions

(Roof Garden)

Monday, June 20

2 to 5 p.m.—*Symposium on Abdominal Surgery*—Mr. IAN FRASER (Belfast). Some Problems of the Small Intestine. Mr. L. R. BROSTER (London). Intersexuality. Mr. A. DICKSON WRIGHT (London). Intestinal Obstruction. Mr. C. PATRICK SAMES (Bath). Obstructions at the Lower End of the Common Bile Duct. Mr. A. LAWRENCE ABEL (London). Treatment of Ulcerative Colitis by Total Colectomy and Ileo-Rectal Anastomosis. *Short Paper*—Dr. W. BIGELOW* (Toronto). Effects of Hypothermia on Risks of Surgery.

Tuesday, June 21

2 to 5 p.m.—*Symposium on Cancer*—Mr. R. W. RAVEN (London). The Present Position of the Treatment of Cancer of the Oesophagus. Mr. D. N. MATTHEWS (London). Pharyngeal Reconstruction after Excision for Cancer. Mr. R. S. MURLEY (London). The Assessment of Results in Breast Cancer. Mr. MICHAEL HARMER (London). Bilateral Adrenalectomy in Breast Cancer. *Symposium on Cardiovascular Diseases*—Dr. DOS SANTOS (Lisbon). Arterial Surgery. Mr. T. HOLMES SELLORS (London). Intracardiac Surgery. Dr. ED. GAGNON* (Heart Surgery). Professor A. M. BOYD (Manchester). Vasodilator Drugs in Obliterative Arterial Disease. Mr. R. E. HORTON (Bristol). The Use of Grafts in Arterial Disease of the Lower Limb.

UROLOGY

President: Mr. H. P. WINSBURY-WHITE (London).
Vice-Presidents: Mr. A. W. BADENOCH (London), Dr. PAUL BOURGEOIS* (Montreal), Dr. GORDON N. ELLIS* (Edmonton), Dr. J. C. MCCLELLAND* (Toronto).
Hon. Secretary: Dr. CHARLES J. ROBSON* (Toronto).
Official Reporter: Mr. R. S. MURLEY.

Session

(P.D.R. 8)

Wednesday, June 22

2 to 5 p.m.—(1) Mr. H. P. WINSBURY-WHITE (London). Early Signs of Bladder-neck Disease. (2) Dr. JOHN K. LATHIMER (New York). The Role of the General Practitioner in the Treatment of Genito-urinary Tuberculosis. (3) Mr. LESLIE N. PYRAH (Leeds). The Use of the Ileum in Genito-urinary Surgery. (4) Mr. A. W. BADENOCH (London). Haematuria. (5) Dr. THOMAS RUSSELL* (Toronto). Urinary Tract Infections. (6) Mr. NOEL ADENEY (Bournemouth). Vesical Neoplasms—A Provincial Surgeon's Bogy.

SCIENTIFIC EXHIBITION

Exhibits and Exhibitors

Dr. G. M. WYANT* Controlled Hypotension in General Surgery.
Dr. E. A. LEW* Prognostic Value of Life Insurance Mortality Investigations.
Group Captain D. G. M. NELSON* Personal Survival Equipment and Test Equipment.

Dr. DONALD MACRAE.* Bony Abnormalities at the Cranio-vertebral Junction of Neurological Importance.

Dr. K. A. BAIRD.* Sensitivity to Products of Bacteria—Practice and Theory.

Dr. HAMILTON BAXTER.* Team-work in the Rehabilitation of Cleft-palate Patients.

Dr. COLIN C. FERGUSON.* Surgical Emergencies in the Newborn.

Dr. W. L. DONOHUE.* Foetal and Neonatal Morbidity and Mortality.

Mr. F. W. ROWSE.* Canada's National Public Health Services.

Dr. R. D. DEFRIES.* Preparation of Poliomyelitis Vaccine (Salk).

Dr. EVAN V. SHUTE.* The Effect of Alpha Tocopherol on Peripheral Vascular Conditions and Burns.

Mr. MICHAEL HARMER. Cancer of the Breast.

Dr. WALLACE TROUP.* Cardiovascular-Renal Mortality in Western Countries.

Dr. A. J. RHODES.* Isolation of Poliomyelitis and Other Viruses by Tissue Culture.

GENERAL TIME-TABLE

L.—Events primarily arranged for Ladies.
U.—Events for all Members and Ladies accompanying them
*—Evening Dress.
†—Decorations.

Friday, June 17

5.30 p.m.—U. Buses leave Royal York Hotel for reception and supper given by Lady Eaton at Eaton Hall Farm, King, Ontario.

Saturday, June 18

8.00 p.m.—U. Civic reception and musicale, Royal York Hotel.

Sunday, June 19

3.00 p.m.—Protestant Service, St. James's Cathedral.

3.00 p.m.—Roman Catholic Service, St. Michael's Cathedral.

U. Private supper parties by Toronto hostesses for all visitors.

Monday, June 20

3.00 p.m.—L. Fashion Show and Tea—Georgian Room, T. Eaton Co.

8.00 p.m.—U*†. B.M.A. Adjourned Annual General Meeting and President's Address—Royal York Hotel.
U*†. President's Reception. Dancing.

Tuesday, June 21

3.00 p.m.—L. Garden Tea, Hart House, University of Toronto.

7.00 p.m.—U. Annual Dinner, Ontario Medical Association (informal dress), followed by Square Dancing—Royal York Hotel.

Wednesday, June 22

12.30 p.m.—L. Ladies' Lunch—Stoddleigh Restaurant, Exhibition Park, Toronto.

Dinner, Maimonides Medical Society of Ontario, Royal York Hotel.

8.00 p.m.—U*†. C.M.A. Annual General Meeting—Royal York Hotel.

10.00 p.m.—U*†. Reception—Dancing.

Thursday, June 23

7.45 a.m.—Annual Breakfast of the Christian Medical Fellowship, Royal York Hotel.

11.00 a.m.—L. Buses leave Royal York Hotel for Garden Tour and Luncheon at Oakville, Ontario.

7.30 p.m.—U*†. Annual Dinner, B.M.A.—Royal York Hotel.

Friday, June 24

9.30 a.m.—U. Buses leave Royal York Hotel for excursion to Niagara Falls, arranged by the Hydro-Electric Power Commission of Ontario. Luncheon stop at the Mountain Sanatorium, Hamilton. Sightseeing at Niagara. Tea at Niagara Falls Club, by courtesy of the Niagara Falls Medical Society. 7.45 p.m., Dinner. Return to Toronto by 11 p.m.

CONSULTANTS AND SPECIALISTS

OPTION FOR WHOLE- OR PART-TIME SERVICE

The Joint Consultants Committees have had recent discussions with the Ministry of Health and the Department of Health for Scotland about whole-time and maximum part-time service for consultants in the National Health Service, and the following is an agreed statement of the position.

It is recognized that some consultants, while prepared to devote substantially the whole of their time to hospital work and to give it priority on all occasions, would prefer a maximum part-time to a whole-time contract. Ever since 1948 it has been the Ministry's view that, subject always to the needs of the hospital service, employing boards should in this matter take into account the circumstances and preferences of the consultants concerned. While there has been no previous statement on this point as regards Scotland, the practice in that country has been similar.

Where a new appointment is being made this means that, except where the board decides that the needs of the hospital service (considered in conjunction with those of the local health services, where the consultant is to undertake duties on behalf of a local authority) demand a whole-time appointment, the competition should be thrown open to all applicants who are prepared to give substantially the whole of their time to the post, whether they prefer a whole-time or a maximum part-time contract. In such a case the successful candidate should not be asked to state his preference until after he has been selected for appointment.

Similarly, if a consultant who is already employed in a whole-time post wishes to transfer to a maximum part-time contract, or *vice versa*, the board should, before reaching a decision, take his circumstances and preferences into account, again subject to the overriding needs of the hospital service.

This statement does not, of course, deal with the many cases where the services of a consultant are needed in the aggregate for only a limited volume of work, and where therefore a part-time appointment would in all cases be appropriate.

MEDICAL WHITLEY COUNCIL COMMITTEE B

MANAGEMENT SIDE'S "NO" TO CLAIMS

A meeting of Committee B of the Medical Whitley Council was held on Tuesday, April 26, and some outstanding problems affecting hospital medical staffs were discussed.

Remuneration of S.H.M.O.s

A claim had been lodged by the Staff Side for an immediate increase in the remuneration of S.H.M.O.s to restore the overlap between the maximum of the S.H.M.O. and the minimum of the consultant salary scales which existed before the agreed revision of hospital medical staff remuneration in April last year. The Management Side did not agree that the present circumstances were in any way different from those when the agreement was reached last year, and rejected the claim.

The Staff Side will consider the position at its next meeting.

Locum Rates for Consultants and S.H.M.O.s

Although the Management Side agreed to increase the locum rates for junior medical staffs (*Supplement*, March 19, p. 91) it has so far refused to agree to any increase for locums of consultant and S.H.M.O. status. The Staff Side claimed that the existing rates for consultant and S.H.M.O. locums should be increased proportionately to the increases granted to permanent staff, but the Management Side maintained that the existing rates were generous and that there was no case for an increase.

Matters Still Under Discussion

Discussions are still continuing in Whitley Committee B on the Staff Side's claim that whole-time consultants should be paid for domiciliary consultations. Likewise the questions of remuneration of medical superintendents and the board and lodging charges for resident staff have not yet been resolved. The Management Side hopes to deal with the Staff Side's claim for an increase in the remuneration of administrative medical officers of regional hospital boards at the next meeting in July.

DOCTOR'S FAILURE TO PERMIT SURGERY INSPECTION

FINE RECOMMENDED

The London Executive Council has made representations to the Minister of Health that 30 gns. should be withheld from the remuneration of a doctor who failed to permit inspection of his surgery and waiting-room.

In February the chairman of the Council, at the request of the local medical committee, gave authority for the practitioner's surgery to be inspected. The practitioner agreed, but subsequently notified the Council that the date arranged was inconvenient and suggested another date, which however, was not convenient to one of the visitors. The Council again wrote to the doctor on February 15, stating that the visit would be made on March 11, but on March 6 the doctor sent a letter to the Council stating that this date was not convenient as certain decorations had not been completed, and suggested deferring the visit until the middle of May.

The Council replied on March 7 that the repeated alteration of arrangements was troublesome and that it had not asked that the surgery should be redecorated prior to inspection. The duty of the officers was to report on the present condition of the premises, and any information about redecoration, etc., would be included in the report.

Reference to Service Committee

On March 11 the doctor was notified that it had been decided to refer the matter to the Medical Service Committee for investigation unless he could indicate several days during the following fortnight on which the surgery could be inspected.

The doctor made no reply to this, and registered letters regarding the meeting of the Medical Service Committee were returned through the post office. A further, unregistered, letter notifying him of the date and time of the meeting was sent prior to the meeting. The practitioner failed to attend before the Committee.

Terms of Service Flouted

In its report to the Executive Council, the Committee stated that it was of the opinion that the practitioner had shown a complete disregard of the obligations into which he entered when he applied to join the medical list and accepted the terms of service. It was unable to consider his conduct in the matter as anything less than a deliberate flouting of the terms of service.

The practitioner has the right of appeal against the recommendations of the Executive Council.

A report of the General Benefits Committee of the London Executive Council states that two medical practitioners practising in partnership in London have a combined list of 828 in excess of the permitted maximum. The committee has decided that payment for these patients for the three months ended March 31 should not be allowed, and the practitioners have been advised that the Council will take action to limit their lists in accordance with the regulations if the services of a full-time assistant have not been secured by May 6.

N.O.T.B.A. ANNUAL MEETING

The formation of area committees was approved at the sixth Annual General Meeting of the National Ophthalmic Treatment Board Association, which was held at B.M.A. House on Friday, April 1. The meeting also discussed ways and means of combating the growth of unregistered medical eye-centres. It was considered that this was an undesirable development owing to the lack of supervision which could be exercised over these centres by a body such as the N.O.T.B.A.

Questions Answered

Vaccination of Hospital Staff

Q.—*I am a casualty officer and house-surgeon, and carry out vaccination both of domestic and of nursing staff as required by the hospital. Am I entitled to claim a vaccination fee from the local health authority?*

A.—Vaccination of members of hospital staffs is regarded as part of the duties assigned to the officer under his contract. Consequently, the officer cannot receive a fee for this work. With regard to the payment of a fee for notification to the local health authority, an officer would be entitled to this only where the authority required such a notification and had specifically asked for notification of each individual case. For example, the passing of information to a local health authority merely giving the vaccination state of the staff of the hospital would not entitle an officer to a fee.

General Practitioner Course

Q.—*I have for several years attended a G.P. course on psychotherapy in general practice. The fee is 5 guineas per term. On some occasions the fees were paid by the post-graduate education people centrally to the clinic. I find that the inspector of taxes refuses to accept it as a deductible item on the basis that it is a capital cost. What is your opinion, and have I any redress?*

A.—The question of whether the cost of attending a course in a professional subject should be regarded as a current allowable expense or an outlay of capital is sometimes difficult to decide. Basically it depends on whether attendance at the course is for the purpose of (a) maintaining the individual's standard of professional competence, or (b) of adding to his status and the extent of his professional qualifications. The crux of the difficulty is that the constant advance of technical knowledge demands an increase in the individual's own knowledge if his or her professional standard is to be maintained. A point in favour of the questioner's claim is that the course is for the assistance of general practitioners. The claim can be pressed by lodging an appeal either to the district commissioners or to the special commissioners of income tax. On the facts stated, the questioner would seem to have a reasonable chance of success at a personal hearing.

Policy Maturing Abroad

Q.—*Shall I be liable for U.K. income tax on the proceeds of a paid-up endowment policy which I bought in Kenya from a colonial service pension which will soon be mature in E. Africa, and which I desire to receive in the United Kingdom?*

A.—The proceeds resulting from the maturing of a life insurance policy are essentially "capital" in their nature, and are not liable to British income tax.

The visit of Dr. E. Grey-Turner, Assistant Secretary, to West Africa (*Supplement*, February 5, p. 39) which was to have taken place in March was unavoidably postponed.

EXCHANGE OF STUDENT NURSES

TRAINING LINK BETWEEN GENERAL AND
MENTAL HOSPITALS

Hospital authorities in England and Wales have been asked by the Minister of Health to promote schemes wherever possible for the interchange of student nurses between general and mental hospitals. In the Minister's view this step will help to improve the quality of the mental nurse's training, introduce a valuable element into the training of general nurses, and have a beneficial effect in breaking down the isolation from which many mental hospitals still suffer.

The General Nursing Council has agreed that for student mental nurses a six-months secondment to a general hospital would be satisfactory for that part of the syllabus dealing with bodily diseases. The council is also willing to consider proposals for the secondment of student general nurses to mental hospitals for part of their training.

Appointments to Senior Posts

The Minister also announces an important change in the qualifications required for appointment to the most senior posts in mental hospitals. Formerly promotion to matron or deputy matron in mental and mental deficiency hospitals was limited to applicants who had trained in both mental and general nursing. The Central Health Services Council has expressed the view that this requirement is a deterrent to recruitment in the mental nursing field, and the hospital authorities are now advised that they should not regard candidates for the senior posts as ineligible solely because they do not possess the double qualification, if they are otherwise suitable.

FUNCTIONS OF THE MEDICAL OFFICER
OF HEALTH

The Society of Medical Officers of Health has recently published a booklet¹ on the functions of the medical officer of health. The operation of the National Health Service and National Assistance Acts, quite apart from the changes in medical administration, has resulted in increased attention being paid to the amount of sickness among the people and the increasingly heavy cost of remedial measures. The introduction to the booklet states: "Special skills needed for applying means of prevention do not seem to be well understood, and the tendency remains to concentrate upon perfecting and extending methods of treating specific diseases rather than upon measures for raising the standard of community health as a whole, whereby much of the sickness could be avoided."

The Society believes that, by strengthening the means of prevention available to-day, the amount of ill-health could be reduced within a reasonably short period.

Guardian and Adviser

The booklet gives an account, in broad general principles, of what, in the Society's view, should be—and in many progressive authorities are—the functions of the medical officer of health.

Part I develops the theme that the medical officer of health should be the guardian of the community health. An appeal is made for a recognition of the integrity of the subject of community health in place of the past and present tendency to split it up into watertight sections. It is pointed out that this does not in any sense entail or demand a return to past administrative structures. On the contrary, the medical officer of health is concerned much more with the application of principles governing his work than with forms of

¹ *The Functions of the Medical Officer of Health*, 1955. Society of Medical Officers of Health, London. Price 1s. 6d.
² *Memorandum on the Duties of Medical Officers of Health*, 1925. Ministry of Health, London.

government. Looking to the future, he is confident that these principles can be successfully applied and that he can be accorded a sufficient place of authority whether the administrative structure of the health service is united into a single whole or divided into separate parts, whether it remains under local government or central government.

The services for which the medical officer of health should be executive responsible are set out in Part II, and under each heading a few of the main controversial points are discussed with the object of defining the boundaries of the community health services.

Part III emphasizes the need for the medical officer of health to be placed in a position to advise on the medical aspects of other services, of which he need not be in executive control, where these affect the community health. Part IV states his overall duty to have regard for all circumstances which may adversely affect the community health of his area. According to the Ministry's memorandum,² quoted by the Society, the general duty of a medical officer of health is "to acquire an accurate knowledge of the influences, social, environmental, and industrial, which may operate prejudicially to health in the area, and of the agencies, official and unofficial, whose help can be invoked in amelioration of such influences."

Correspondence

Because of the present high cost of producing the Journal, and the great pressure on our space, correspondents are asked to keep their letters short.

Rewards for Skill

SIR.—The question of reward for skill is going to be the main problem of our welfare State in the coming decade. Ever since unskilled labour won its great victory in the dock strike of 1889 the "differential reward" between skilled and unskilled work, which had in many trades been fixed by the craft guilds in the Middle Ages, has been growing smaller. Indeed, in some trades it is now possible for the unskilled workman, on overtime, to earn more than his skilled companion.

The medical profession has, in part, solved this problem by the extraordinary method of merit awards, whereby a cabal of master-craftsmen have privy access to State funds for the reward of their fellow specialists. As the problem of "differentials" becomes more acute in other professions and skilled trades, this precedent of medical merit awards is certain to be quoted. The vision of each skilled trade drawing a secret fund from the Treasury would be a fine nightmare for any Chancellor of the Exchequer. I am sure, however, that the recent rail dispute would have been solved most expeditiously if secret merit awards could have been given to the drivers of the "Flying Scotsman" and the "Bristolian."—I am, etc.,

Wells.

Maternity Record Card

SIR.—I was most interested to see Dr. R. Owen's obstetric record card (*Supplement*, April 23, p. 203). Since he asks for other practitioners' suggestions, I venture to enclose a copy of the card which I have been using for the past 18 months. This has hitherto been duplicated on pasteboard, as I have delayed ordering printed cards until finally satisfied that the best use was being made of available space. The card is of the same size as the Form E.C.6 (continuation record sheet). The rather large amount of space devoted to the confinement was intended to allow for the collection of information for a statistical study at some future date.

I feel that Dr. Owen's section for the post-natal examination is an improvement on my own, which has proved rather cumbersome. On the other hand, my sections "General Health" and "Obstetric History" are rather more adaptable than his "P.O.B.H.," "P. Med. H.," and "Examn. Gen."

Entry into Practice

SIR.—Knowing how much justifiable pride the British Medical Association takes in helping its members and others into general practice by the agency of the Medical Practices Advisory Bureau, I was surprised to note that the Bureau publicized in its report (*Supplement*, March 26, p. 120) the instance of two principals who asked for introductions for assistants without a view. In the first, after 140 introductions, "the post still remains vacant for lack of applicants," and in the second, after 200 introductions, only two inquiries were received. The Bureau gives this as a "convincing answer to the statement that doctors cannot get posts in general practice." I communicated with a member of the Assistants and Young Practitioners Subcommittee and asked for an explanation. He told me he had inquired into these practices, the localities, and the remunerations offered, and in the opinion of his Subcommittee the conditions of these practices were so unattractive that no young man was likely to consider them.

I note, too, that in the report it is stated that "the number [of doctors] out of work involuntarily is rather less than 5% and that this percentage is not increasing." Would it be possible for me to be informed how that 5% is computed, and whether unemployment amongst members is divided into casual and permanent, and what is the criterion of permanency in months? I recall that this is not the first time that the Medical Practices Advisory Bureau has quoted a practice where an assistant could not be obtained though the practice was widely circularized to counter the case that there is unemployment amongst doctors.

It is my opinion as a member of the British Medical Association that it is one thing for a great organization loyally to try to help its members and at the same time loyally to try to work out a scheme whose defects are apparent to many, always excluding those who administer it, and another thing to cover up the grave difficulties of entry into practice. Surely the British Medical Association could use its powerful influence to press for greater freedom for members of the medical profession and easier entry into practice. Many of us would feel happier if the British Medical Association did not "play down" these difficulties.—I am, etc.,

GEORGE ROSSDALE,

Honorary Treasurer,

The Fellowship for Freedom in Medicine.

London, W 1.

Government Department Salaries

SIR.—I see that the Civil Service Commissioners are advertising a number of medical vacancies in several Government departments in the *Journal* of April 23 (advertisement page 40). In these advertisements the London salary scales are given, and it is stated that salaries are "slightly lower" outside London. I think that your readers should know that in some areas of the country, when a London salary of £1,577 or more is appropriate, the provincial salary may be as much as £100 less than the London rate. In my opinion a difference of £100 is rather more than "slightly lower."—I am, etc.,

"PROVINCIAL."

Mothers who had arranged to have their baby at home, but who are admitted to hospital for an emergency confinement and return home within a few days, will in future become eligible for a home confinement grant under the National Insurance (Maternity Benefit and Miscellaneous Provisions) Amendment Regulations, 1955, which apply to confinements taking place on or after April 6. The £3 grant is being increased to £4 from May 16, 1955.

GENERAL MEDICAL SERVICES COMMITTEE

ELECTION OF DIRECT REPRESENTATIVES, 1955-6

The following direct representatives upon the General Medical Services Committee have been elected unopposed for the Groups mentioned:

- Group A1**
Dr. J. T. Baldwin (Milton Bridge, Midlothian).
- Group A2**
Dr. C. J. Swanson (Aberfeldy, Perthshire).
- Group A3**
Dr. W. M. Knox (Glasgow).
- Group A4**
Dr. R. C. Hamilton (Kilmarnock).
- Group C**
Dr. H. F. Hollis (Leeds).
Dr. H. Thorp (Tadmorden).
- Group E**
Dr. Miles Parkes (Crewe).
- Group F**
Dr. T. J. Hargest (Clydach, Swansea).
Dr. G. P. Williams (Holyhead).
- Group H**
Dr. A. B. Davies (Walsall).
- Group I**
Dr. F. A. Smoritt (Southam, Warwicks).
- Group K**
Dr. R. W. McConnel (Wendover, Bucks).
- Group L**
Dr. S. Noy Scott (Plympton).
- Group M**
Dr. K. S. Maurice-Smith (Ely).
- Group N**
Dr. H. S. Howie Wood (Isle of Wight).
- Group O**
Dr. D. F. Whitaker (Guildford).
- Group P**
Dr. R. Green (Hurstpierpoint, Sussex).
- Group Q**
Dr. A. Talbot Rogers (Bromley, Kent).
- Group R**
Dr. D. F. Hutchinson (Middlesex).
Dr. A. N. Mathias (Cricklewood, N.W.2).
- Group S**
Dr. H. N. Rose (Ilford, Essex).
Dr. C. M. Scott (New Barnet).
- Group T**
Dr. M. Sorsby (London, E.5).
Dr. H. H. D. Sutherland (London, W.10).
- Group U**
To be notified.
- In the contested Groups—namely, B, D, G, and J—the results were as follows:
- Group B**
Dr. T. S. Blaiklock (Morpeth). *Elected.*
Dr. F. Lishman (Crook, Co. Durham). *Elected.*
Dr. F. J. Stevenson (Carlisle).
- Group D**
Dr. F. S. Catto (Manchester). *Elected.*
Dr. A. Campbell (Accrington). *Elected.*
Dr. P. J. Gibbons (Liverpool). *Elected.*
Dr. I. M. Dove (Blackpool).
- Group G**
Dr. E. W. Goodwin (Leicester). *Elected.*
Dr. A. S. Wilson (Gosberton). *Elected.*
Dr. A. D. Stoker (Winster).
- Group J**
Dr. C. F. R. Killick (Williton, Somerset). *Elected.*
Dr. W. B. S. Crawford (Bath).

Dangerous Drugs Act: Withdrawal of Authority

The Home Office announces that Dr. Ian Fleming Macleod (Stirling) is no longer authorized to be in possession of or to prescribe those drugs to which the Dangerous Drugs Regulations apply.

Branch and Division Meetings to be Held

- BURNLEY DIVISION.—At Lecture Room, Reedly Hall Nurses' Training School, Friday, May 6, 8.30 p.m., A.G.M.
- BURTON-ON-TRENT DIVISION.—At Stanhope Arms Hotel, Bretby, Burton-on-Trent, Tuesday, May 10, 7.45 p.m., A.G.M.
- CROYDON DIVISION.—At 43, Wellesley Road, Croydon, Tuesday, May 10, 8.30 p.m., annual general meeting followed by films: "Some Aspects of Accessible Cancers": (1) Breast; (2) Rectum.
- EAST KENT DIVISION.—At Chez Laurie Restaurant, Thanet Way, Herne Bay, Thursday, May 12, 7.30 p.m., dinner; 8.45 p.m., discourse and demonstration by Dr. Quentin F. Evans: "Holger Nielsen Method of Artificial Respiration"; discussion to be opened by Dr. D. M. Lyon: "General Practitioner and the Health Visitor."
- GUILDFORD DIVISION.—At Royal Surrey County Hospital, Guildford, Thursday, May 12, 8.30 p.m., general practitioner's clinical meeting.
- HENDON DIVISION.—At Hendon Hall Hotel, London, N.W., Thursday, May 12, 7.30 for 8 p.m., annual dinner. Guests of honour, Mr. and Mrs. Dickson Wright.
- KENSINGTON AND HAMMERSMITH DIVISION.—At St. Charles's Hospital, Ladbroke Grove, London, W., Friday, May 13, 3.30 for 4 p.m., clinical meeting.
- KESTEVEN DIVISION.—At Nurses' Recreation Hall, Grantham and Kesteven General Hospital, Sunday, May 8, 11 a.m., meeting.
- KINGSTON-ON-THAMES DIVISION.—At Nurses' Home, Kingston Hospital, Tuesday, May 10, 8 p.m., annual general meeting.
- NORTH MIDDLESEX DIVISION.—At North Middlesex Hospital (in the Committee Room), Silver Street, Edmonton, N., Tuesday, May 10, 8.45 p.m., meeting. Annual B.M.A. Lecture by Professor M. L. Rosenheim: "The Management of Hypertension." Members of the Enfield and Potters Bar Division are invited.
- NORWICH DIVISION.—At Museum, Norfolk and Norwich Hospital, Wednesday, May 11, 8.30 p.m., meeting. Lecture by Mr. H. P. Whiteside, F.P.S.: "The National Formulary 1955." Members of the Norwich Branch of the Pharmaceutical Society are invited.
- PADDINGTON DIVISION.—At Royal National Throat, Nose, and Ear Hospital, Gray's Inn Road, London, W.C., Friday, May 13, 3.30 p.m., clinical meeting and discussion. Mr. A. R. Dingley: "Tonsillectomy in Children and Adults."
- SOUTH-WEST WALES DIVISION.—At Ashburnham Hotel, Thursday, May 12, 7.15 p.m., social meeting for members and their wives. Cocktail party.
- WANDSWORTH DIVISION.—At St. James' Hospital, Sarsfield Road, Balham, S.W., Wednesday, May 11, 2 p.m., clinical meeting. Medical friends are welcome. All members of the Camberwell, Lambeth and Southwark, and Chelsea and Fulham Divisions are invited.

S.H.M.O. Meeting

There will be a meeting of the Senior Hospital Medical Officers in the North-east Metropolitan Region on Tuesday, May 10, at 8 p.m. at B.M.A. House (Committee Room C), Tavistock Square, London, W.C.

PRESIDENTIAL ADDRESS TO
METROPOLITAN COUNTIES BRANCH
DR. HALE-WHITE ON MEDICO-POLITICAL
APATHY

The 97th annual general meeting of the Metropolitan Counties Branch was held at B.M.A. House on May 3, when Dr. R. HALE-WHITE was invested with the badge of office as President of the Branch for 1955-6, and proceeded to deliver what was afterwards described as a forthright address under the title "Patients, Politics, or Both?"

Dr. Hale-White's address was a plea that every member of the profession should take his share in medical politics, although, of course, his service to his patients remained his primary duty. The alternative, which would not bear serious examination, was to engage a few men well versed in the ramifications of the National Health Service and pay them handsomely to man the ground where medicine and politics coalesced, while behind the picket thus formed doctors got on with their own medical work in peace.

He proceeded to give the meeting some idea of the muddled state of the National Health Service as he saw it. For example, it was said that many doctors were over-worked, yet it was difficult for a young man to enter the Service and even more difficult for an ageing doctor to ease off. It was exceedingly hard for a doctor to do what he would wish for his patients, and in most cases practically impossible for him to follow them through an illness in hospital. But he would never say that the National Health Service could not have been worse. It would have been much worse but for those despised committees and sub-committees, those 50 B.M.A. Council meetings and 10 Representative Meetings during the last seven years. If these bodies had not done their work the bringing in of a whole-time salaried service would have been an almost automatic development within a short time of the Act coming into force. Regulations and directions relating to what a doctor might or might not do would have descended on the profession like confetti. The general practitioner might easily have been told by a Government department upon what signs and symptoms he could reach a certain diagnosis and what action to take when the diagnosis was reached. The general practitioner would have been written off as a mere "filterer" or as a "thermometer officer."

The Real Fighters

Fortunately there were a few members of the Association who had reached an eminent position in the medico-political

field. Dr. Hale-White said that he was not one of those who carp at the efforts of their representatives to seek improvements in the Service by the necessary route of consultation with the Ministry.

"Rather do our troubles lie at the other end," he said. "The British Medical Association is at present considering its own constitution to see if it can improve itself in any way to fit in with modern conditions. But, even as it is, the Association is quite a good medico-political weapon. There is only one thing really wrong with it and that is its members. The lack of communal interest is unbelievable. The number who take the opportunity of attending meetings at which policy has its birth reaches only about 10% in such a large number of instances as to make one despair of the profession's interest in its own survival. Even when it comes to electing people to relatively important positions, such as members of Council, the great mass are quite uninterested. Indeed, I doubt if the percentage of members who realize the way in which the Council is elected amounts to double figures. There are 40 seats on the Council elected by Regions, so in the last four years there have been 160 possibilities of electoral contests: there have actually been 15, and when there is a contest the number who vote is pathetically small. I cannot believe that apathy has not a great part to play in this situation. I am the first to admit that a leavening of age and experience is essential in the Council, but double or treble the competition to be a member would be an excellent thing."

It was often heard that doctors, busy at their practice all day, had not time for committee work. The Association did not want people who were not busy, because otherwise its affairs would get into the hands of indifferent doctors. The Association must be controlled by those whose practical ability as doctors made them busy and successful, men who could not find the time without some sacrifice. Personal and financial sacrifice was inevitable, and he was appalled by the enormous number of doctors who were not prepared to make any sacrifice. Those who did not lift a finger to help the Association in its policy or in its fight were debarred by their own inertia from any right to criticize the Association for its achievement or lack of it.

A Democratic Structure

The Association's structure, Dr. Hale-White continued, was ideal for anyone who held an opinion, constructive or destructive. He had only to attend a divisional meeting and "say his piece." If he was supported, a motion would go to the Annual Representative Meeting, and before long he would find that his idea had become the policy of the Association. But this seldom happened: there was rarely any infusion of new ideas by new people. The Association's affairs were left in the hands of a few hard-working souls—willing horses—whose efforts were largely wasted because there was not enough backing behind them.

It was a common supposition that medicine and the National Health Service were synonymous. This was quite untrue. So far the country had been spared a State monopoly in medicine, which was the undoubted target of those who introduced the N.H.S. Though not yet flourishing enough to be safe, private practice was with us. For this, every patient and every doctor should say, "Thank goodness," not because private practitioners were necessarily better than their colleagues in the Service, but because, for as long as there were two systems in healthy competition, complete disaster could not overwhelm medicine in this country, and the principle of free choice was still left to the public. But medico-political indolence was equally rife among private practitioners. They must not congratulate themselves that they were outside the scope of medico-politics. Were not pay-beds an acknowledged party-political pawn?

The most helpful contribution towards keeping private practice alive had been made by two or three provident associations, one of which during the last four years had increased its membership from 60,000 to 200,000. There must now be more than half a million people entitled to a very large proportion of the cost of hospital and specialist treatment through the enterprise of these associations and the independent spirit of the individuals who paid the premiums.

The Need for Political Awareness

Having entitled his address "Patients, Politics, or Both?" Dr. Hale-White said that he came down heavily in favour of "Both."

"I look upon it as a doctor's duty to take a personal part in medico-politics. . . . The happy conditions in which a doctor could devote his whole mind to his patients and to medical reading are unfortunately gone—and gone for ever so far as I can see. If he is to serve his patients truly it is as important that a doctor shall devote a part of his time to medico-politics as it is that he shall keep himself up to date with medical literature. . . . We should always be 'at the ready' if we value what is left of our freedom."

Being "at the ready" enhanced the ability to recognize political clichés for the rubbish they were. If the profession found itself in a sudden crisis, some of the "ostriches" might pull their heads out of the sand and be quite impressed by such phrases as "administratively impracticable," or "retrograde step," or "putting the clock back." Politicians assumed, without the slightest evidence or reason, that every step they took was a step in the right direction. It followed, therefore, that every retrograde step was wrong. Real progress was not so easy. It did not consist in discarding all the old in favour of the new. It was achieved most surely by keeping the best of the old and adding the best of the new, and only discarding things when their uselessness or inferiority was proved up to the hilt, in which event they must be discarded, however old or however new.

Standard of Medical Practice Going Down

Dr. Hale-White went on to express the view that the standard of medical practice in this country was going down and would continue to go down unless far-reaching changes were made. "Any downward slope, however slight, gets to the bottom in the end." Those who were worried about the future of medicine in this country should not hesitate to say so. Censure of the National Health Service would be much greater were it not for indolence and cowardice. Tinkering with the Service was not sufficient; it was the whole pattern of the thing that was wrong, and not the personnel. If, as he believed, there was a really large body in the profession that was genuinely satisfied that the public were not getting the "best service that the country can afford"—to quote the words of the manifesto of one of the political parties—the first thing to do was to say so, and the next was to map out a better system, in which a whole-time salaried service as an alternative should not even be considered as a "starter."

But this needed a great awakening of medico-political consciousness. If there were a vital interest among 90%

instead of only 10% of its members there would be no limit to what the Association could achieve. In 1951 a Special Representative Meeting was held in which many resolutions were passed calling for amendments in the Service. How many members of the Association cared what, if anything, had happened to those resolutions of 3½ years ago? And if nothing much had happened, whose was the fault? It was largely the fault of those members who did not care, for if they had cared a great deal more would have happened. If an accusation of inertia or procrastination could be made against the centre, it was nothing to the charge of indifference and shortsightedness that could be made against the periphery—and by "periphery" he meant the individual members who in their thousands never attended a meeting or lifted a finger to help. Somehow they must be awakened to a sense of their personal responsibility for the welfare of medicine in this country.

A vote of thanks to Dr. Hale-White, proposed by Dr. Frank Gray, was very warmly accorded, also a vote of thanks to Dr. D. F. Hutchinson, the retiring President. Dr. Alistair French was unanimously chosen as President-elect for 1955-6, and Dr. Annis Gillie Treasurer.

M.C.B. HOSPITALITY FUND

The Metropolitan Counties Branch Council thanks those who have already contributed to its hospitality fund. A good start has been made, but more money is still needed. Donations are not being acknowledged individually, as this would add to the administrative costs, but anyone wishing to know if his contribution has been received should ring Euston 2111, ext. 5.

VALUATION FOR RATING ACT, 1953

EFFECT ON DOCTORS' PREMISES

The General Medical Services Committee has considered the possible effects upon the rating valuation of doctors' premises of the Valuation for Rating Act, 1953. The Act applies to England and Wales only. It appears that in some cases the Act can result in a considerable increase in the rating valuation of premises used by general practitioners as, *inter alia*, the residential and professional aspects can be valued separately in order to arrive at a valuation for the premises as a whole.

The Committee draws the attention of general practitioners to the following effects of the Act:

(1) In cases where the professional premises are also used as part of the ordinary residential accommodation the whole house is normally to be valued on a 1939 basis.

(2) If specially constructed surgery premises are added to residential accommodation, general practitioners will not only be adding to their rates in the ordinary course of events, but also the added premises will be rated on a different and higher basis than the residential accommodation.

(3) If separate accommodation is not added to the existing premises, but certain rooms are adapted specifically for the purposes of the practice, then much the same position will apply as in (2)—that is, the professional section of the existing accommodation will then be assessed at a higher rate than hitherto.

(4) If, however, the house is divided into two—namely, one part used for professional purposes and the other part as an ordinary dwelling-house, by the doctor himself, or an assistant, or a caretaker—then (a) the benefit of a valuation on a 1939 basis which can be secured if the professional premises are also used as part of the residential accommodation will be lost, and (b) if the value of the part of the premises used as residential accommodation is not less than one-tenth of the whole, the benefit of valuation on the 1939 basis for any part of the premises will be lost.

PART-TIME CONSULTANTS AND INCOME TAX

DISCUSSION AT SOMERSET HOUSE

A deputation from the Council of the British Medical Association, consisting of the Treasurer (Mr. L. Dougal Callander) and the Chairman of the Central Consultants and Specialists Committee (Dr. T. Rowland Hill), visited Somerset House on April 6 to discuss the position of part-time consultants in relation to the method of assessment to income tax of their income from hospital appointments in the National Health Service. The deputation was received by representatives of the Board of Inland Revenue.

Dr. Rowland Hill began by explaining the position of the B.M.A. as being by far the largest representative organization of the medical profession in this country. He pointed out that it represented, in particular, some 6,000 to 7,000 consultants working in the National Health Service, the great majority on a part-time basis.

Change in Assessment Procedure

Dr. Rowland Hill went on to say that the Association was seriously disturbed about the recent change in procedure which had resulted in the hospital income of many part-time consultants being assessed to income tax under Schedule E. He said that the Association had consulted the highest legal authority on the subject, Mr. Millard Tucker, Q.C., who had stated that, in his opinion, this practice was wrong. In the light of his advice the Association, with the co-operation of certain other professional organizations, had decided to finance four test cases and was prepared to carry these cases, if necessary, right up to the House of Lords. Two of these cases were already before the special commissioners; in the other two cases the assessments of the local inspectors of taxes were still awaited.

Dr. Rowland Hill explained, however, that the deputation had not come as amateur lawyers to argue about the legal aspects of the matter. They had deliberately decided not to bring with them any legal representative. They had come as doctors to explain their views on the professional implications of the change from Schedule D to Schedule E assessment.

The Implications

The medical profession had feared that the N.H.S. might prove the first step towards the introduction of a whole-time salaried service—a form of service to which both general practitioners and consultants were strongly opposed. After much discussion with the Minister of Health of the time, the profession obtained an agreement in 1948 when the Minister promised an amending Act (placed on the Statute Book in 1949) to provide that the profession would not be converted into a whole-time salaried service unless—should Parliament so decide—by further legislation.

Ever since the inception of the N.H.S. it had been the policy of the Ministry of Health as well as the policy of the profession that—except in a small minority of cases in which the needs of the hospital service made whole-time appointments necessary—consultants should be allowed part-time contracts. Consultants favoured this arrangement because they were anxious to maintain their status as practitioners of a profession and to avoid becoming salaried servants of employing bodies.

It was possible, however, that by indirect and insidious methods the status of consultants might suffer a change of the very character that the N.H.S. (Amendment) Act of 1949 was designed to prevent. It was for this reason that disquiet was felt about the proposed Schedule E assessment, which was the form of assessment applied to employees but not to practitioners of a profession.

Dr. Rowland Hill pointed out that the N.H.S. had been in operation for nearly seven years, during which time the pre-existing method of income-tax assessment—under Schedule D—had continued to be applied to part-time con-

sultants. He said that the deputation would welcome an explanation of why it was thought necessary at this stage to disturb the traditional arrangement. He explained the partnership between the B.M.A. and the Royal Colleges, and said (on his, Dr. Rowland Hill's, own responsibility) that the deputation might be regarded as expressing the views of the Colleges, which were fully in accord with those of the Association.

Relative Earnings

In reply the representatives of the Inland Revenue said that, although the N.H.S. had been in existence for some time, they had only gradually become aware of the fact that in many cases it seemed to be bringing about a fundamental change in the relative weight of hospital and private work and in the relative earnings from the two activities. It had come to their notice also that the methods used by inspectors of taxes in assessing the income of part-time consultants were varying and inconsistent. It was for this reason that they had thought it desirable to issue some guidance, based on the principles enunciated in the case of *Davies v. Braithwaite* (Tax Cases, Vol. XVIII, page 198). There was no question of their having made any special "drive" in the case of the part-time consultant. Their interest had been, not in the amount of the tax collected, but solely in the desirability of uniform administration of the law as they understood it. Briefly, the position was that a part-time appointment was within Schedule E unless the consultant was engaged primarily in private practice and any hospital appointments were merely incidental thereto. All the facts of a particular case must be considered, but, speaking generally, they would find it difficult to agree that a consultant was engaged primarily in private practice unless he devoted to it more than half his time and unless the net income from the private practice exceeded the income from the hospital appointments.

In reply to a question, the representatives of the Inland Revenue agreed that their view of the position was based on the assumption that the hospital work of the part-time consultant in the N.H.S. was an "employment" for the purposes of the Income Tax Acts. They considered that the part-time consultant was employed under a contract of service which gave rise to the legal relationship of master and servant, and they thought that this view derived some support from decisions in the courts (including the Scottish courts) in cases concerned with the responsibility of a hospital for the negligence of its staff.

Two Assurances

They gave, however, two important assurances. First, they stated that, where a consultant suffered hardship through having to pay the second instalment of Schedule D tax on the income of the preceding year while the tax for the current year was being deducted from his hospital income under P.A.Y.E., the collector could be asked to agree to some reasonable latitude in payment. Secondly, they said that, where the admissible expenses of private practice exceeded the income from private practice, tax on the resultant loss could be allowed by repayment against tax on the other income of the consultant, including his hospital income if that income was assessed under Schedule E. They pointed out also that there was an advantage in being assessed under Schedule E, since this obviated the embarrassment of having to continue making heavy tax payments after retirement on a much reduced income.

The deputation pointed out that the position of a consultant was liable to change in respect of the proportion of his total professional income which was earned in private practice. At the outset of his career the income from this source might be negligible, but in the course of time it might become very substantial. Questioned about the extent of private practice at the present time, the deputation stated that a very considerable amount of private consultant practice still remained—though its distribution throughout the country was patchy—and that in the last year or two it had shown a tendency to increase.

In reply to questions Dr. Rowland Hill explained that, apart from consultants, S.H.M.O.s were the only members of hospital medical staffs affected by the changed method of assessment, and he gave a description of the domiciliary consultation arrangements, making it clear that, in general, part-time consultants were not obliged to undertake this work as a part of their hospital contracts. The general practitioner called in the consultant of his choice exactly as he would in private practice, and the consultant regarded the consultation as essentially of the nature of private practice, although the fee did not come out of the patient's pocket.

Test Cases

The deputation stated that it would obviously be convenient for the four test cases to be considered together and that the B.M.A. solicitors were anxious to have the co-operation of the Revenue in expediting the outstanding assessments so that the four cases could be taken concurrently. The representatives of the Revenue replied that of course they would co-operate in the manner suggested, but they could not say, until they had seen the cases, whether they were sufficiently typical to be regarded by the Revenue as test cases. They asked whether the four cases had been specially chosen, and it was explained that the solicitors had selected them from a larger number and had submitted them to Mr. Millard Tucker, who had approved them as suitable for the purpose.

The representatives of the Revenue said that, although they had been informed from various quarters that test appeals were to be taken, they had received no official information about them. They would like to receive full details of the four cases, and they would be very glad if they could also be given a sight of Mr. Millard Tucker's opinion.

Dr. Rowland Hill undertook to pass on these requests to the solicitors, and asked whether the Inland Revenue, while not undoing anything already done, would feel disposed, pending the results of the test cases, to hold their hand as regards the extension of the Schedule E method of assessment to additional consultants. The representatives of the Revenue doubted whether they could agree to this, but promised to consider the suggestion in the light of Mr. Millard Tucker's opinion, if this was made available to them.

MEDICAL PRACTICES COMMITTEE

AMENDMENT OF CLASSIFICATION OF AREAS

The following areas have been classified by the Medical Practices Committee (March 8 to April 30, 1955) as "designated":

Worcestershire.—Oldbury.

Preston.—Whole of County Borough.

The following areas as "intermediate":

Bedfordshire.—Luton.

Essex.—Basildon New Town (Billericay U.D.).

Kent and Canterbury.—Borough of Erith.

London.—Borough of Lambeth: Prince's and Oval Wards.

Northamptonshire.—Burton Latimer and Finedon.

Nottingham County and City.—Carlton and Netherfield.

Staffordshire.—Urban District of Kidsgrove.

Warwickshire.—Parishes of Barford, Cubbington, Radford Semele, Stoneleigh and Whitnash (rest of Warwick Rural District to remain classified as "restricted").

Worcestershire.—Kidderminster.

Barrow-in-Furness.—Whole of County Borough.

Derby.—Whole of County Borough.

Ipswich.—Whole of County Borough.

Southend-on-Sea.—Shoeburyness.

Glamorganshire.—Urban District of Ogmore and Garw (except Nantymoel).

Monmouthshire and Newport.—Urban District of Bedwelty.

The following areas as "restricted":

Cornwall.—Saltash.

Dorsetshire.—Sherborne and District.

Surrey.—Urban District of Dorking.

Glamorganshire.—Llanharen (Cowbridge Rural District).

IMPROPER ISSUE OF FORMS E.C.10

200-GUINEA FINE RECOMMENDED

The Norwich Executive Council at its meeting on April 27 decided, on the recommendation of its Medical Services Committee, to make representations to the Minister that the sum of 200 guineas be withheld from the remuneration of Dr. "A." The following is the report on the case by the Medical Services Committee to the Executive Council.

Committee's Report

"The Committee met on April 1, 1955, to investigate whether a doctor (hereinafter referred to as Dr. 'A') whose name is included in the Council's medical list had failed to comply with the Terms of Service of medical practitioners by

"(a) issuing or allowing to be issued on January 22, 1954, to a Mrs. 'X' a prescription form (E.C.10) which had been made out by another doctor (hereinafter referred to as Dr. 'B') but signed by Dr. 'A' when the name of Mrs. 'X' was not included in the list of persons registered with him,

"(b) issuing prescription forms (E.C.10) on February 26, April 26, May 11, and July 8, 1954, to a Mr. 'Y' when the name of Mr. 'Y' was not included in the list of persons registered with him,

"(c) issuing or allowing to be issued from January 1, 1954, to September 30, 1954, to persons included in his list a total of 305 prescription forms (E.C.10) which had been made out by Dr. 'B' but signed by Dr. 'A'."

"The matters for investigation had been referred to the Committee by the Finance and General Purposes Committee of the Executive Council under Regulation 4 (5) of the National Health Service (Service Committees and Tribunal) Regulations.

"The Medical Service Committee felt it necessary at the outset of this report to make it clear that, although the statement of matters to be investigated mentioned that prescription forms had been made out by a Dr. 'B,' those forms were not in fact signed by him and therefore the conduct of Dr. 'B' was not the subject of question, even though from the facts mentioned hereinafter it may appear that Dr. 'B' was also involved. The Committee also felt it necessary, for the full understanding of the matter, to state that Dr. 'B,' while under contract with the Executive Council is only under contract to provide general medical services in a limited field. Also Dr. 'B' is not a specialist as defined in Regulations made under the National Health Service Act.

"Dr. 'A' together with Dr. 'B' appeared before the Committee. The Secretary of the Local Medical Committee was also present. The Committee received the evidence of Dr. 'A' and also allowed Dr. 'B' to give evidence, as well as assist Dr. 'A.' The Committee also had before it documents put in evidence by the Finance and General Purposes Committee, copies of which had been circulated to Dr. 'A,' Dr. 'B,' and members of the Committee 11 days before the hearing.

"The facts as found by the Committee from the aforementioned evidence and from such admissions as were made by Dr. 'A' and Dr. 'B' during the course of the hearing were as follows:

1. Case of Mrs. "X"

"On January 22, 1954, a prescription form E.C.10 was issued to Mrs. 'X.' The name and address of Mrs. 'X,' the prescription details, and the date had been written on the form by Dr. 'B.' The signature on the form was, however, that of Dr. 'A.' At the time of issue of the form the name of Mrs. 'X' was not included in the list of persons registered with Dr. 'A' under the National Health Service; in fact her name was not included in any doctors' National Health Service list.

"The form was given by Dr. 'B' to Mrs. 'X' when he was treating her as a private patient. It was one of a number which had been signed in blank state by Dr. 'A' and which had been given to Dr. 'B' with Dr. 'A's' permission to use in any cases where persons in need of drugs and appliances, who, although consulting Dr. 'B' as their private doctor, were registered on the National Health Service list of Dr. 'A.' Dr. 'B' was not a deputy of Dr. 'A' when he saw Mrs. 'X.'

"In answer to a written inquiry by the Finance and General Purposes Committee Dr. 'A' had stated that Mrs. 'X' was a private patient, but at the hearing, Dr. 'A' stated that both he and Mrs. 'X' were under the impression that she was registered on his (Dr. 'A's') National Health Service list.

"At this stage it must be stated that both Dr. 'A' and Dr. 'B' submitted that the circumstances in the case of Mrs. 'X' were closely related to those of the issues of the 305 prescription forms which also formed part of the matters for investigation, and, while the Committee dealt with the case of Mrs. 'X' as a separate item, the explanations of Dr. 'A' and Dr. 'B' of the arrangements existing between the two doctors have, to avoid duplication, been left until later in this report.

"Returning to the case of Mrs. 'X,' Dr. 'A' agreed that he did not see Mrs. 'X' on January 22, 1954, nor had he seen her professionally for some time. He also agreed she was not under treatment by him on that date. He was fully aware that private patients are not entitled to have their drugs under the National Health Service, although he thought they became so entitled under the arrangements he and Dr. 'B' had evolved.

2. Case of Mr. "Y"

"On February 26, 1954, April 26, 1954, May 11, 1954, and July 8, 1954, Dr. 'A' issued prescription forms (E.C.10) to a Mr. 'Y.' At no time had the name of Mr. 'Y' been included in the list of persons registered with Dr. 'A' under the National Health Service.

"Mr. 'Y,' according to Dr. 'A,' had been a private patient of his for some time, but recently he had given up charging him fees. He (Dr. 'A') believed that he had confused Mr. 'Y' with another person of similar name and age, whose name was included in his National Health Service list and whose illness was coincidentally running astonishingly parallel to that of Mr. 'Y.' He also believed that the prescription forms (even though the drugs ordered were different on each occasion) were issued as the result of telephone requests from Mr. 'Y,' because he had no record, in his day book, of visits or attendances on the material dates, nor any note of charging fees to Mr. 'Y' for service on those dates.

"Dr. 'A' agreed he had not accepted or agreed to accept Mr. 'Y' for treatment under the National Health Service and that he was not entitled to issue National Health Service prescription forms to him.

3. Issue of 305 Prescription Forms

"From January 1, 1954, to September 30, 1954, 305 National Health Service prescription forms (E.C.10) which had been issued to persons registered on the list of Dr. 'A' were made out (name and address of patients, prescription details, and date) by Dr. 'B' but signed in the hand of Dr. 'A.' These forms were signed, in blank state, by Dr. 'A,' who gave them to Dr. 'B' for the purpose of their being used for persons who, although consulting Dr. 'B' as a private doctor and on a fee-paying basis, were, however, registered on Dr. 'A's' National Health Service list, and these forms were, in fact, used in that way.

"At the time of the issue of these forms the patients were not seen by Dr. 'A,' nor were they treated by him even though he was available to give, and responsible for, their treatment under the National Health Service had they wished him to provide such treatment. Neither were they receiving their treatment from Dr. 'B' as a deputy to Dr. 'A.' They were in fact receiving their treatment as private patients of Dr. 'B.'

"The explanations of Dr. 'A' and Dr. 'B' to the foregoing were that, whilst they are not in partnership nor financially associated, their practices are closely connected. Many of Dr. 'B's' private patients are registered on the National Health Service list of Dr. 'A.' Dr. 'B' stated that he encouraged his private patients to register with Dr. 'A' so that such patients could call on a National Health Service doctor whenever they required one and at the same time be free to consult their private doctor. According to both Dr. 'A' and Dr. 'B' they have in the course of time got to know many of the patients of each other.

"They thought that, although the patients who were registered on Dr. 'A's' National Health Service list were receiving their treatment from Dr. 'B' as a private doctor, so long as the forms were signed by Dr. 'A' he was thus making himself responsible for their treatment even though he was not seeing the patients when the forms were issued. According to Dr. 'A' and Dr. 'B' this arrangement was formulated by them in the early days of the National Health

Service and they had been carrying it on ever since, thinking that it was within the Regulations, even though they knew private patients were not entitled to drugs and appliances under the Service.

"According to Dr. 'B' he had never asked any other general medical practitioner to enter into such an arrangement with him, neither had any offer come from any other practitioner who may have had private patients of Dr. 'B' registered with him under the National Health Service.

"Finally, both Dr. 'A' and Dr. 'B' submitted that their arrangements for this method of prescribing had been done openly and in good faith, in the belief that they were acting within the Regulations. Since the whole matter had been questioned they had taken expert legal advice and found that their actions were in fact transgressing the Regulations. They submitted that their transgression was the result of a genuine case of mistaken interpretation of the Regulations. They offered their apologies and asked the Committee to believe that they had tried to act in the spirit of the National Health Service and to give their patients the best service they could. They also gave their assurances that they would do their best in the future to keep strictly within both the spirit and the letter of the Regulations.

Committee's Recommendations

"From the foregoing the Committee were unanimously of the opinion that Dr. 'A' had failed to comply with Clause 7 (10) of his Terms of Service in that the prescription forms E.C.10 referred to in (1), (2), and (3) of this report were improperly issued.

"In the opinion of the Committee the arrangements between Dr. 'A' and Dr. 'B' had been designed to obtain drugs and appliances through the National Health Service for the private patients of Dr. 'B,' and, in view of the publicity which had been given in both the medical and lay press almost continuously from the inception of the National Health Service that private patients are not entitled to their drugs and appliances from the Service, the Committee felt they could not reasonably be expected to accept the final submissions of Dr. 'A' and Dr. 'B,' and considered that this breach of the Terms of Service by Dr. 'A' was a very serious one.

"The Committee unanimously agreed to recommend to the Executive Council that representations be made to the Minister of Health that, owing to Dr. 'A's' failure to comply with his Terms of Service, the sum of 200 guineas be withheld from his (Dr. 'A's') remuneration."

The practitioner has the right of appeal against the recommendations of the Executive Council.

The Terms of Service

The following are the relevant clauses of the Terms of Service.

Clause 7 (10) of the Terms of Service provides that "the forms (E.C.10) provided shall not be used for persons other than the patients who are under treatment by him."

Clause 1 of the Terms of Service interprets "patient" as meaning a person for whose treatment a practitioner is responsible under his Terms of Service.

The Terms of Service provide that all treatment shall be given by a practitioner personally, except where he is prevented by reason of other professional duties, temporary absence from home, or other reasonable cause.

WELSH DINNER

The Welsh Dinner will be held at the Royal College of Surgeons, Lincoln's Inn Fields, London, W.C.2, on Friday, June 3. All Welsh representatives, Welsh graduates, and others with Welsh associations, accompanied by their ladies, will be welcome at this dinner.

Tickets will be 30s. per head (exclusive of wines), and those wishing to attend are asked to apply, with remittance, to Dr. S. J. Hadfield, B.M.A. House, Tavistock Square, London, W.C.1.

Northern Ireland News

REPORT ON BRANCH COUNCIL'S WORK

The Honorary Secretary of the Northern Ireland Branch Council, Dr. H. J. CRONHELM, has furnished a report on the work of the Branch during the session 1954-5. The Branch Council held eleven meetings during the year.

Negotiations were carried on with the Ministry of Health and Local Government regarding the setting up of appeals machinery for Northern Ireland. The Branch Council turned down Ministry proposals submitted by the Northern Ireland Hospitals Authority regarding the composition of an appeals advisory council. A reply is awaited from the Ministry, and meanwhile the Branch Council has made it clear that it would not accept any committee upon which the medical profession was not adequately represented.

Among matters discussed at regular meetings during the year with representatives of the Northern Ireland Hospitals Authority was the alleged misuse of the domiciliary visits scheme, and the Branch Council was not in favour of the Association taking part in disciplinary measures against those alleged to be responsible for the misuse. The Authority agreed to consider setting up a committee similar to the Central Medical Committee to investigate these cases. The Northern Ireland Hospitals Authority proposed to introduce a new grade of assistant physician and assistant surgeon to the hospital service. The Association could not accept the immediate introduction of this grade, which must wait until the findings of the Strachan Committee had been made known to the Council of the Association. Also discussed with the Authority were the inspection of ophthalmic medical practitioners' premises, radiological services in the mid-Antrim area, and delay in country areas of patients being seen by an orthopaedic surgeon.

Minister's Committee of Inquiry

The Branch Council was invited to give evidence at the Committee of Inquiry set up by the Minister of Health and Local Government to investigate questions of principle relating to the health services in Northern Ireland. In August, 1954, at an interview with the Committee the following members represented the Association: Dr. R. Marshall, President-elect of the Branch; Dr. H. J. Cronhelm, Honorary Secretary; Mr. G. D. F. McFadden, Chairman of the Consultants and Specialists Group; Dr. N. S. Dickson, Chairman of the G.M.S. Committee (N.I.); Dr. J. Bleakley, Honorary Secretary of the G.M.S. Committee (N.I.); Dr. J. B. McKinney, public health section; Dr. R. N. Beck, Honorary Secretary of the Registrars' Group; and Dr. S. L. W. Erskine, Honorary Secretary of the Tuberculosis and Diseases of the Chest Group. They discussed with the Committee the setting up of appeals machinery for the medical profession in Northern Ireland, alteration of the constitution of the Northern Ireland Tuberculosis Authority so that one-third of the total members should be medical and one-half of these chest physicians of the Authority, and the suggestion that there should be one health and welfare committee responsible for all public health and welfare services, or alternatively that the children's services should be administered by the Health Committee and not the Welfare Committee. They also discussed many other matters, including the inadequacy in certain areas of the Hospital Authority's Ophthalmic and E.N.T. Services. The publication of the report of the Committee of Inquiry is still awaited.

Other Activities

Replies to a questionnaire issued to general practitioners by the Northern Ireland Hospitals Authority dealing with the hospital and specialist services were considered by representatives of the Branch Council and a special *ad hoc* com-

mittee of the Authority. The admission and discharge of patients from hospital, general practitioners working in hospitals, and radiological and pathological examinations in hospital were discussed.

At the invitation of the Northern Ireland Hospitals Authority the Branch Council nominated Dr. W. H. Hood to the Authority's subcommittee on old people and chronic sick.

The Branch Council gave two graduates' luncheons during the year, which resulted in 82 graduates becoming members of the Association. The Presidential Dinner was held on February 10, 1955, and the Branch entertained His Excellency the Governor of Northern Ireland and Lady Wakehurst, and the President of the Association and Lady McNee.

A conference of Honorary Secretaries, Chairmen, and Representatives of the Divisions of the Association in Northern Ireland was held on March 6, 1955. Dr. L. S. Potter from Headquarters attended, and the meeting discussed the membership of the Association and methods for increasing it, and problems in connexion with the running of Divisions.

Dr. S. M. Bolton gave the Presidential Address for the year at the Pharmaceutical Society of Northern Ireland, Belfast, on May 5.

Sir Alexander Fleming Memorial Service

A memorial service for the late Sir Alexander Fleming, arranged by the Branch, was held in the parish church of St. Mary's, Belfast, on April 24. Representatives of the Queen's University, hospital services, and the Royal College of Nursing attended, together with the officers of the Branch and a large congregation.

Scottish News

NEW SCOTTISH HEALTH CENTRE

The Stranraer Health Centre, the second one to be built in Scotland, and the first to adjoin an existing hospital, was opened on May 6 by Mr. H. R. Smith, Secretary, Department of Health for Scotland.

The L-shaped building was designed and built by the Department of Health for Scotland after consultation with the Western Regional Hospital Board, and it incorporates an extension to the Garrick Hospital. Five consulting suites for the five family doctors practising in Stranraer (who have a total of 13,200 patients on their N.H.S. lists) form one wing. In the other wing the local health authority will have three rooms and a dental workshop, and will share four rooms with the Garrick Hospital board of management. The hospital has in addition a changing-room, a plaster room, and a suite for the x-ray unit.

The cost of the centre is about £33,000, of which about £12,000 will be contributed by the hospital authority for its accommodation.

The Industrial Diseases Subcommittee of the Industrial Injuries Advisory Council is to review the provision made for byssinosis under the National Insurance (Industrial Injuries) Acts. Professor Sir Arnold Plant is chairman of the Subcommittee and of the Advisory Council. The Acts provide insurance cover against byssinosis for persons who have been employed at some time since July 5, 1948, and for at least 20 years in all, "in any occupation in any room where any process up to and including the carding process is performed in factories in which the spinning or manipulation of raw or waste cotton is carried on." Because of the difficulty of distinguishing byssinosis from bronchitis and emphysema of non-occupational origin, benefit is not available unless the person concerned has died from byssinosis or is more than 50% disabled by it, probably permanently. Persons and organizations interested in any aspect of the provision made under the Acts are invited to submit written evidence to the Secretary, Industrial Injuries Advisory Council, 10, John Adam Street, London, W.C.2, as soon as possible and not after June 6, 1955. An explanatory memorandum can be obtained on request.

Correspondence

Because of the present high cost of producing the Journal, and the great pressure on our space, correspondents are asked to keep their letters short.

Entry into Practice

SIR.—Dr. George Rossdale quotes (*Supplement*, May 7, p. 223) a member of the Assistants and Young Practitioners Subcommittee as saying that "in the opinion of his Subcommittee the conditions of these practices were so unattractive that no young man was likely to consider them." The Subcommittee has neither considered nor expressed an opinion on any individual practice, and Dr. Rossdale's statement, therefore, is completely inaccurate.—I am, etc.,

F. GRAY,

Chairman, Assistants and Young
Practitioners Subcommittee

Hospital Medical Staffing

SIR.—The report of the Special Subcommittee on Hospital Medical Staffing (*Supplement*, April 23, p. 177) contains a great deal of sound sense and prepares the way for beneficial and long-overdue reforms in the system of hospital staffing. However, it does not appear to offer a solution to the present serious shortage of house officers.

First, it is apparent that the salaries of these posts are irrationally and unjustly low, and that the report recommends the maintenance of this injustice. On comparing the situations of other new graduates, we find that the scientist (chemist, physicist) entering industry after a three-year course can expect roughly £550-£650 per annum, a graduate teacher £582 (£612 for a good honours degree) for 27½ hours' teaching time weekly. There is therefore a strong case on moral grounds alone for an increase for house-officer grades. Secondly, if the number of students is not to be increased (a measure which would "speedily result in overcrowding of the profession," to quote the report), registered practitioners must be encouraged to fill the gap. That they are not doing so is probably due to the very low salary, under which a married man who took such a post might suffer actual hardship. There might therefore have to be a differential rate as at present—the equitable minima envisaged would be £550-£600 for the pre-registration graduate, £600 × £100-£800 for the registered practitioner. It is clear that the alternative of obtaining part-time services of general practitioners would be impracticable at this grade.

In conclusion, we wish to express our regret that it has fallen to us as students to point out the financial injustices suffered by junior hospital medical staff.—We are, etc.,

Assistants in General Practice

SIR.—What a relief it was to see Dr. D. E. Peake's letter (*Supplement*, April 16, p. 167). Surely it is time that it was made manifest to all and sundry that in no profession can success be guaranteed. My partners and I have had ample experience of locums and assistants over some 20 years. The fact that since 1948 we have established two young men as full and equal partners in our practice should be evidence that we do not seek to profit at the expense of assistants. There will always be those who are not suited to be principals—just as there have been, and will always be, registrars who are not capable of sustaining consultant rank.

Before 1948 there was the small band of "failed principals" (or consultants) which railed at the financing com-

panies because they insisted on some contribution towards security before investing capital in assisting a young (or not so young) aspirant to become a principal. What about the modern exploitation of principals by assistants and locums? Twenty guineas a week, but no night calls or midwifery—or if out at night the cancellation of morning surgery to ensure a compensating long "lie in." Dr. Lennox Johnston (*Supplement*, April 30, p. 209) must be very naive if he really believes that the average assistant would tolerate "exploitation," as he describes it. The unfortunate lone practitioner who suffers any extended period of ill-health must be wellnigh ruined by the charges of his locums and the loss of patients resulting from their inadequacy. No doubt there are unpleasant types established in practice—but how many? what percentage? One has had the unusual locum who has really proved worth the fees paid.—I am, etc.,

J. L. FAULL.

Geriatrics

SIR.—The Geriatrics Joint Subcommittee has set itself a formidable task in trying to set out in a brief report (Appendix IX to Supplementary Report of Council (*Supplement*, April 23, p. 181)) all that is being done and all that might be done for the prevention and treatment of disease in the aged. In spite of all that has been written in this and previous reports on the desirability of keeping old people in their homes, the fact remains that there is a large number of old people in need of hospital or institutional care and for whom no beds are available. There are the frail elderly without relatives who must depend on neighbours for help; there are the acutely ill whose numbers are subject to violent seasonal fluctuation, but above all there is that pathetic group of old people suffering from varying degrees of mental deterioration who just cannot be fitted into home life and against whom the doors of every institution are barred.

The local authority have the necessary powers to expand their accommodation, but their resources are controlled by the Treasury above and the popular vote below. The loyal official of the local authority tends to reject as many applicants for Part III accommodation as he can. The mental health department of the regional hospital boards are hard pressed for accommodation and reserve their beds where possible for the treatment of young remediables. Furthermore, it could be argued that it is most undesirable for an old person to end his life in a mental hospital under the stigma of certification. Finally there is the chronic hospital which has taken over the beds but not the responsibilities of the old workhouse. We all know, or think we know, the defects of the workhouse system and why it had to disappear. The conscious rectitude of Bumble has gone, but it has been replaced by the frigid efficiency of the geriatric unit. The success of the unit is measured by turnover of beds. We can prevent beds from "sitting up" by controlling admissions. You admit what you know you can "rehabilitate" and discharge just as the acute hospitals do. So you keep up "turnover," get "the right patient in the right bed," and live up to current slogans.

The problem is not solved by pious exhortations to the relatives to look after their aged folk. A schoolmaster pays 9 guineas a week to keep his father in a nursing-home. The old man wanders during the day and is restless at night. Once he knocked over an electric fire. A secretary has lost her job—and her job meant a lot to her—because she had to stay at home to look after her mother. A harbour pilot who is kept awake at night by a restless mother-in-law goes drowsy on the bridge at a time when the most intense mental concentration is required. All three cases have been considered unsuitable for admission to hospital or hostel.

Arguments based on moral principles and economic necessity have been advanced in this and previous reports to show that an increase in hospital accommodation for old people is unnecessary or undesirable. Such arguments do

not convince the family doctor or the relatives of patients in the category I have described. Do we really increase the sum total of human happiness when we improve our "turnover" by discharging a cantankerous old patient to his unwilling relatives? The fact is that these difficult old people form only a small fraction—less than 1%—of the total aged population. I believe they are more expensive to maintain outside of hospital than within. In a recent case the patient in his home had the district nurse call twice daily, a session of home help, a daughter home from work, alternate daily visits from the doctor, not to mention additional extramural services from the local authority and voluntary organizations. On economic grounds alone I suggest we should have a surplus of institutional beds to accommodate these elderly patients and so relieve their relatives for productive work in industry. Not only would this allow us to give a better service from the humanitarian point of view but it would give us room for classification, research, and better treatment in the hospitals.

Might I make one more practical suggestion? The Subcommittee recognizes the existence of malnutrition in old people who live alone. Occasionally we see a case of scurvy, and recently I have seen a case of frank pellagra. Such cases are rare and do not necessarily signify a severe degree of widespread malnutrition in this age group. All the same I think there is enough malnutrition to justify cheaper milk and fruit juices for old people. It would not cost much to offer the same concessions already granted to infants and expectant mothers.—I am, etc.,

Bristol.

WILLIAM HUGHES.

H.M. Forces Appointments

ROYAL NAVY

Surgeon Commanders T. F. Miles, L. R. Norsworthy, and T. W. Froggatt, O.B.E., have retired.
Surgeon Lieutenants P. J. Preston and J. S. P. Rawlins to be Surgeon Lieutenant-Commanders.
G. O. C. Davies-Webb has been granted a Short Service Commission in the rank of Surgeon Lieutenant-Commander.

ROYAL NAVAL VOLUNTEER RESERVE

Surgeon Lieutenant W. A. Wilson to be Surgeon Lieutenant-Commander.

ARMY

Colonel W. J. Robertson, late R.A.M.C., has retired on retired pay.

ROYAL ARMY MEDICAL CORPS

Lieutenant-Colonel J. B. Bunting, O.B.E., has retired, receiving a gratuity, and has been granted the honorary rank of Colonel.
Lieutenant-Colonel J. J. O'Connell, O.B.E., has retired on retired pay, and has been granted the honorary rank of Colonel.
Lieutenant-Colonel J. C. Babbage, M.B.E., has retired.
Majors A. L. J. Webb, D. B. Jagger, M.B.E., and R. A. R. Topping to be Lieutenant-Colonels.
Major H. R. Vincent has retired, receiving a gratuity, and has been granted the honorary rank of Lieutenant-Colonel.
Captain P. M. Bretland to be Major.

HER MAJESTY'S OVERSEA SERVICE

The following appointments have been announced: G. C. Butler, M.B., B.Ch., Senior Medical Officer, Sleeping Sickness Service, Northern Region, Nigeria; H. D. Chambers, M.D., Senior Medical Officer, Jamaica; P. I. Franks, M.R.C.S., L.R.C.P., D.O.M.S., Specialist Officer (Ophthalmologist), Federation of Malaya; S. Mawson, Chief Mental Hospital Superintendent, Gold Coast; Jean K. Ritchie, B.M., B.Ch., M.R.C.P., D.M.R.T., Radiologist, Singapore; J. R. Currie, M.R.C.S., L.R.C.P., Pathologist, Sierra Leone; O. C. Fung, F.R.C.S., Medical Officer, Grade B, Trinidad; D. J. Jones, M.B., B.Ch., Medical Officer, Federation of Nigeria; W. Scheurer, M.D., Medical Officer, Gold Coast; M. O. Thomas, L.R.C.P.&S.I., Medical Officer, Sierra Leone.

Correction.—In the Section of Neurology in the programme of the Joint Annual Meeting, Toronto, June, 1955 (*Supplement*, May 7, p. 217), "Sir Charles Symonds (London). Cough Headache—A Benign Syndrome" should be deleted, as Sir Charles Symonds is unable to attend the Annual Meeting.

Branch and Division Meetings to be Held

BARNSELY DIVISION.—At Queen's Hotel, Barnsley, Monday, May 16, 8.30 p.m., annual general meeting.

BIRMINGHAM DIVISION.—At Chadwick Manor, Knowle, Friday, May 20, 8 p.m., annual dinner dance.

BRISTOL DIVISION.—At Main Physics Lecture Theatre, Royal Fort, Wednesday, May 18, 8.30 p.m., annual general meeting.

DEWSBURY DIVISION.—At the Three Nuns Inn, Cooper Bridge, Mirfield, Tuesday, May 17, 7.45 for 8.15 p.m., annual dinner.

EAST HERTS DIVISION.—At Cranborne Rooms, Red Lion Hotel, Hatfield, Friday, May 20, 9 p.m. to 1.30 a.m., supper dance.

HERTFORDSHIRE BRANCH.—At the Old Fold Manor Golf Club, Hadley, Barnet, Thursday, May 19, 8.45 p.m., annual general meeting. B.M.A. Lecture by Dr. F. E. Camps: "Forensic Medicine, Past, Present, and Future." Members of the legal profession are invited.

HOLLAND DIVISION.—At White Hart Hotel, Boston, Saturday, May 14, 7.15 for 7.45 p.m., supper; 9 p.m., address by Dr. S. Wand: "Observations on the National Health Service Retrospective and Prospective."

KENSINGTON AND HAMMERSMITH DIVISION.—At St. Mary Abbots Hospital, Marloes Road, Kensington, W., Tuesday, May 17, 8.30 p.m., annual general meeting.

LINCOLN DIVISION.—At County Hospital, Lincoln, Thursday, May 19, 8.30 p.m., annual general meeting.

MACCLESFIELD AND EAST CHESHIRE DIVISION.—At Macclesfield Arms Hotel, Macclesfield, Friday, May 20, 8.30 p.m., A.G.M.

ROCHDALE DIVISION.—At Kingsway Hotel, Rochdale, Monday, May 16, 8.30 p.m., annual general meeting.

SHROPSHIRE AND MID-WALES BRANCH.—At 49, Church Street, Wellington, Thursday, May 19, 8.30 p.m., meeting of Clinical and Pathological Section. Paper by Mr. G. K. Rose: "Symptoms Arising from Cervical Spondylosis."

SOUTH ESSEX DIVISION.—At Oldchurch Hospital (in the Nurses' Lecture Room), Romford, Friday, May 20, 9 p.m., meeting. Lecture by Dr. R. S. Bruce Pearson: "Asthma."

SOUTH MIDDLESEX DIVISION.—At the Anchor Hotel, Shepperton, Wednesday, May 18, 9 p.m., meeting. Address by Dr. W. N. Pickles: "Research in General Practice." Members of the Guildford, Kingston-on-Thames, and West Middlesex Divisions are invited.

SOUTH-WEST ESSEX DIVISION.—At New Out-patients Department, Connaught Hospital, Orford Road, Walthamstow, E., Wednesday, May 18, 8.30 p.m., annual general meeting.

STOCKPORT DIVISION.—At Physiotherapy Department, Stockport Infirmary, Tuesday, May 17, 8.30 p.m., demonstration by Stockport Branch of Chartered Society of Physiotherapy of modern forms of physiotherapy. Members of the Stockport Division, B.M.A., have been invited.

WEST SUSSEX DIVISION.—(1) At Southlands Hospital, Shoreham-by-Sea, Thursday, May 19, 2.30 p.m., clinical meeting. (2) At 2, Longfellow Road, Worthing, Sunday, May 22, 4 p.m., annual general meeting.

A HEALTH CENTRE IN THE ARMY

BY

M. C. WINTER, M.B., Ch.B.

Captain, R.A.M.C.

AND

J. A. FLEMING, M.B., B.S., D.Obst.R.C.O.G.

Captain, R.A.M.C.

We are presenting a description of an Army Medical Centre in the Canal Zone of Egypt which is being conducted along the lines of a health centre. We think that it may be of interest as an example of how the various health services may be co-ordinated and provided from a single centre at a financial cost no greater than if they were provided separately.

The centre was developed with three objectives: (1) giving the patients a better and more comprehensive health service; (2) studying the advantages of a health centre as compared with a medical centre; and (3) training medical officers for subsequent general practice.

Type of Practice

At the time of writing the centre provides medical attention for 2,600 people, composed of 2,350 Service personnel and wives, children, and servants and about 250 locally engaged civilians and families.

The type of practice might be compared to that on a housing estate in England. The patients live in three main villages, although, in addition, about 450 people live in outlying quarters. The medical centre itself is situated in the largest of the three villages, which houses 1,400 people.

The number of attendances per patient per year at this centre is similar to that in civilian general practice in England, although we do rather more than twice the number of visits. This statement is based on figures given by Taylor (1954). Our figures for the twelve-months period ending in June, 1954, are: attendances, 3.70 per patient per year; visits 2.71 per patient per year. In addition to these figures there are a further 1.26 attendances per patient per year for inoculations, vaccinations, and school medical examinations.

Staff

There are two doctors, one of whom is part-time, as he spends approximately one-third of his time as medical officer

to a near-by Women's Royal Army Corps battalion. In addition there are two S.S.A.F.A. (Soldiers', Sailors', and Airmen's Families Association) nursing sisters, one of whom is also part-time, as she spends approximately half her time attending clinics in near-by garrisons. There are also two Q.A.R.A.N.C. (Queen Alexandra's Royal Army Nursing Corps) nursing orderlies; these are nurse trainees, who are posted from the near-by military hospital for periods of three months for experience in a clinic. Finally, there are voluntary workers who help at the centre at various times in capacities that will be mentioned later in the paper.

This is an apparently generous staff to deal with the number of patients judged by civilian standards of general practice in the United Kingdom; however, they are providing the additional services mentioned and are working under subtropical conditions.

Buildings and Furnishings

The buildings were originally substandard married quarters, and, without alteration, they have been adapted for use as a medical centre. The main building is single-storied and contains five rooms—combined reception room and office, waiting-room, consulting-room with an examination lobby, treatment room, and the medical officers' quarters. In a separate building are lavatories, a bathroom, a washing-up scullery, and store-rooms. The lay-out is by no means perfect, the main criticism being that the treatment room lies between the waiting-room and the consulting-room, so that patients have to walk along a verandah from the waiting-room to see the doctor in the consulting-room. Immediately adjacent to the centre is the garrison families welfare centre, run by a voluntary committee and staffed by voluntary workers under the general direction of S.S.A.F.A. This welfare centre is open twice a week during the antenatal and child welfare clinics for the sale of baby foods, chemists' goods, various other domestic articles, and light refreshments.

The combined reception room and office contains the receptionist's desk and record card file, a separate table with a typewriter, and a filing cabinet for administrative documents. There are also cupboards for linen and cleaning materials. In the waiting-room are twelve chairs and four occasional tables. Eight toddlers' wicker chairs and two matching wicker tables are a recent acquisition. The three built-in cupboards in this room are used for storing medicines not in immediate use. The treatment room contains an instrument cupboard and instrument table, an electric sterilizer, a refrigerator, a dressing trolley, a urine-test table, an examination couch, weighing scales, shelves for

medicines in use, a lock-up dangerous-drugs cupboard, and two cupboards for medicines and medicine bottles. The examination lobby contains an examination couch and instrument table; it is separated by curtains from the main consulting-room; a permanent hard-wood partition is shortly to be erected. The toddlers' chairs and tables, pictures, and flower vases have all been supplied through S.S.A.F.A.

Services Provided

Surgeries and Visits.—Morning surgeries are held each weekday; on two mornings a week, when the child welfare and antenatal clinics are held, the surgeries take a shortened form and are intended for emergencies only. Evening surgeries are held on five days a week and visits are done in the usual way. Patients are received by a nurse-receptionist, who extracts their record cards from an alphabetical file. Each patient in turn is taken in to the doctor. The consultation over, the patient returns to the waiting-room and a prescription is given to the nurse in the treatment room, who calls in the patient and carries out the treatment or dispenses the medicines prescribed.

Consultant Services.—Once a week the senior physician and the senior surgeon of the command each visit the centre, and the medical officers are able to ask patients to attend at these times and see them with the consultant. This system gives us the advantage of being able to discuss each case on the spot with the consultant. The patients like it better because it saves them the journey to the hospital, and it also helps to relieve any congestion that may occur in the hospital out-patient department. Any x-ray or other special investigations that the medical officers think may be necessary are done beforehand; if the consultant requires further investigations, these are done subsequently at an appointed time at the hospital. In addition, consultant advice in the various specialties is available at the hospital.

Child Welfare.—A weekly child welfare clinic is held for children under 5 years of age. The S.S.A.F.A. sisters see all the mothers and give advice on general management and feeding. If the sister or the mother so desires, they are then seen by the doctor. All infants on their first attendance are routinely seen and examined by the doctor. The babies are weighed by voluntary helpers. If any child is absent from the clinic on account of the mother's illness or for some other reason which may not be apparent, the S.S.A.F.A. sister calls to see the family. Mothers are encouraged as much as possible to bring their children to the clinic. A crèche is run on a private basis by an officer's wife in the main village. We find this of particular value as a means of looking after children if their mother is in hospital or ill at home.

Maternity Services.—A consultant obstetrician holds a weekly ante- and post-natal clinic at the centre. All confinements are conducted in hospital.

School Health.—There are three schools in the main village, with a total of some 700 pupils. The primary school takes children from 5 to 8 years of age, the junior from 8 to 11 years, and the secondary over 11 years. The medical officers do monthly hygiene and epidemiology visits to the school premises and also carry out regular medical examinations of each pupil every three years. Starting during the next school term, it is intended that the S.S.A.F.A. sisters will give health lectures to the children at school.

Health Visiting and Home Nursing.—The S.S.A.F.A. sisters spend a large part of their time health-visiting. Every new family arriving in the garrison is visited within the first week or two, when advice about health matters is given; periodic visits are also made subsequently. They also carry out any domiciliary treatment, such as the giving of injections, and home nursing.

Epidemiology.—Monthly inspections of communal kitchens and dining-rooms are made by the medical officers. If it is thought that an epidemic of any disease is threatening, a specialist in Army health is called in for consultation.

Inoculations and Vaccinations.—A weekly clinic is held for the purpose of keeping the families up to date with their various inoculations and vaccinations; between twenty and thirty inoculations and vaccinations, mainly T.A.B. and smallpox, are done at each clinic; a voluntary worker helps at this clinic. The technique used for mass inoculations is that described by Fleming and Ogilvie (1951); each syringe is loaded with a single dose of the prophylactic and the injection given; after the injection the needle is held in hot oil (about 120° C.) for 10 seconds with the syringe plunger depressed; another single dose is then drawn up and a further injection given. For all injections dry sterilized or autoclaved syringes are used; a supply of these is obtained daily on a one-for-one basis from the parent military hospital, which maintains a central syringe service similar to that described by Colquhoun (1954).

Dispensing.—Most medicines are dispensed direct from the medical centre. Stock mixtures and drugs are obtained monthly from the hospital; any drugs that are required that are not in stock can be obtained in a matter of hours from the hospital dispensary.

Dressings.—A "no-touch" technique and individual dressing packets are used for dressings. A kidney-shaped basin containing two gallipots and two pairs of dressing forceps, covered by a matching inverted kidney basin, is the apparatus used; while one set is in use a duplicate set is sterilized. Each individual dressing packet contains a square of gauze, a square of lint, and a piece of cotton-wool, wrapped together in plain paper; about a hundred of these packets are packed in a dressing drum and autoclaved at the hospital. A freshly sterilized kidney basin and its contents and a new dressing packet are used for each dressing. As a further measure of asepsis, elbow-operated hot- and cold-water taps and a foot-operated soiled dressing-bin have been installed.

Dental Service.—There is no dental surgery at the moment, but it is hoped that it will be possible to build and equip one in the future. Dental treatment at present is given at an Army dental centre, which is situated about a mile from our centre.

Physiotherapy, Radiology, and Pathology.—To carry the idea of a health centre to its logical conclusion these services should also be provided; it is, however, not considered justifiable to install expensive apparatus in a building which is serving only some 2,600 patients; the medical officers have these services available to them on request at the military hospital, which is only about two miles from the centre.

Discussion

This centre has been developed as an experiment to see how far the various branches of the medical services can be co-ordinated into a harmoniously working whole operating from one building, giving the patient a better service with a minimum of financial expenditure. It is also intended as a training-ground for medical officers for subsequent general practice in civilian life.

The layout of the rooms is not ideal. Owing to the smallness of the building there is at the moment only one consulting-room, and because of the shortage of transport the doctors have to share a car. Each doctor has a week "in" doing surgeries and a week "out" doing visits; in this way a patient does not know which doctor is going to attend him and there must be a loss of continuity, which is overcome to some extent by keeping adequate records and by a free interchange of views about patients between the doctors. It is hoped that some of these defects may be remedied by another car becoming available and by converting part of the medical officers' quarters into an additional consulting and examination room.

The cost of converting the building has been negligible. The building and equipping of a dental surgery and another consulting-room will be the most expensive items encountered. Apart from surgery furniture and small articles of

diagnostic equipment and surgical instruments, it has not been necessary to spend money on costly apparatus.

We have the great advantage of close liaison with the hospital, which does the dispensing and autoclaving and provides the consultant and special diagnostic services.

We believe that similar centres to the one described here are working in Malaya and in the Aldershot Command.

We would like to thank Major-General W. A. D. Drummond, F.R.C.S., Director of Medical Services, Middle East Land Forces, for the suggestion to write this paper, for his helpful advice in its preparation, and for permission for it to be published.

CHILD WELFARE CENTRES

PRESENT AND FUTURE NEEDS

The Maternity and Child Welfare Group of the Society of Medical Officers of Health has been considering the future of child welfare centres. The following is an abridged version of a memorandum prepared by the group.*

The purpose of this memorandum is to consider the needs of the mother and child of to-day, the part played by the child welfare centre in meeting these needs, and any necessary modification or extension of the traditional welfare centre pattern.

Although more general information and advice is available nowadays through the radio, television, and the Press, most mothers still need expert instruction in child care and welcome an opportunity to obtain individual advice and reassurance. Certain aspects of child health requiring particular attention to-day are mentioned below in relation to the work of child welfare centres.

Mental and Emotional Development.—Some at least of the great volume of mental ill-health has its origin in psychic trauma in childhood, often in the earliest years. Herein lies an opportunity for preventive work in the child welfare centres. Toddlers' clinics offer special opportunities for the study of behaviour difficulties in their early phases. To enable the clinics to play a greater part in preventive psychiatry a closer association is needed between the child welfare services and the psychiatric services for children.

Prevention of Respiratory Disease.—This is now a matter of far more urgency than the prevention of alimentary disorders—formerly the most pressing problem of child health work. The part played by the child welfare centre in the prevention of such disease lies in education and medical supervision. While most of the respiratory infections originate at home, the child welfare centre itself may not be blameless. More attention must be paid to the warmth and ventilation of the rooms and the prevention of overcrowding. Unnecessarily frequent attendances of young babies should be discouraged, and for them more emphasis should be placed on home visiting than on clinic attendance.

Prophylaxis of Infectious Diseases.—Infectious disease is still one of the major causes of mortality and morbidity in early childhood, although well-established prophylactic measures are available. The memorandum discusses in particular the prevention of tuberculosis, whooping-cough, diphtheria, and smallpox. Everything should be done to make it easy for mothers to have their children immunized and vaccinated, and the use of the child welfare clinic for this purpose has obvious advantages.

Prevention of Accidents.—Accidents (including poisoning) are the most frequent cause of death in children between 1 and 5 years of age, and the proportion of accidental

*Published in full in *Public Health*, 1955, 68, 51.

deaths rises with each year of age. While the most effective work may be done in the home, where the family doctor, the health visitor, and the sanitary inspector can point out the dangers, these warnings can be dramatically supplemented by group teaching at the welfare centre, especially if illustrated by local statistics and incidents.

Detection of "Defects" and Care of Handicapped Children.—The value of regular medical examination throughout the pre-school years cannot be too strongly emphasized. If it reveals the need for treatment, this should be arranged in association with the family doctor, with whom the health visitor will co-operate in any subsequent medical and social care. It is a statutory duty of the local education authority to ascertain the presence of handicapped children over the age of 2 years. In the case of children under 5 years it must rely on the health services to find these children. Recent advances in treatment emphasize the need for the early recognition of certain conditions, notably deafness (with consequent speech defect), spasticity, and congenital disease of the heart. The memorandum also stresses the importance of giving sound advice to the parents when children are found to be suffering from defects in the skeletal system, squint, or dental caries. Many conditions requiring postural re-education can be dealt with at the child welfare centre, and unnecessary separation of the young handicapped child from his mother should be avoided.

Medico-social Needs of Special Groups.—Approximately 7% of live births are premature, and the neonatal mortality of these infants is nine times as great as the general neonatal mortality. Though the maternity and child welfare services as a whole have a responsibility in influencing the incidence of prematurity and the neonatal death rate, the child welfare centre is concerned with those who survive. There is a special need for regular assessment of their physical and mental development, and for constant guidance and encouragement to the mother. The care of children who are illegitimate, "deprived," neglected, or members of "problem families" is also important, since they are likely to form the resistant "hard core" of child mortality, morbidity, and maladjustment. The clinic medical officer should know of all such children in the area and act as the leader of the local authority team, in consultation with the family doctor and with other local services. Every endeavour should be made to promote the attendance of these families at a welfare centre, where the contact with other mothers and with standards of care otherwise unknown can have far-reaching effects.

Meeting the Present Needs

Within the immediate sphere of the health services there are four principal lines of attack by which the standard of child health can be raised: (1) education of parents and the general public in child care; (2) regular medical supervision of every child's health and development; (3) treatment of illness and abnormality; and (4) medical and medico-social research. The prime function of the child welfare centre is to develop as fully as possible the first two of these methods.

EDUCATION IN CHILD CARE

McNeill, in the Fleming Memorial Lecture (*British Medical Journal*, 1954, 1, 533), stated that the aim of the child welfare service is "to reduce to a minimum the number of infant and child deaths, and to raise to a maximum the quality in the survivors," and strongly emphasized "a single method of achieving it by the education of mothers." Individual teaching has always been given by the health visitor in the home and by the health visitor and medical officer in the welfare centre. Now is the time to extend the practice and methods of group education. A useful technique for the clinic medical officer is to discuss a common problem with small groups of mothers and to

answer their questions, and there are many other methods of catching the interest of small audiences. Reading matter should be used sparingly and must be linked to the individual child or subject under discussion. Indiscriminate use of leaflets is valueless and wasteful.

Teaching in the welfare centre must be supported by a central organization in the health department. Those responsible for the specialist services, such as the chief dental officer and consultant psychiatrist, should take their part in the planning, and it is an advantage if other members of the health services—for example, general practitioners, nurses, midwives, and oral hygienists—are invited to join in the health education programme.

THE MEDICAL CONSULTATION

The objects of the medical consultation at a welfare centre are: (1) to provide a periodic assessment of the child's mental, emotional, and physical development, and (2) to help and reassure the mother in dealing with problems as they arise. In the earliest weeks supervision should be mainly by home visiting. Unless there is a special reason it is probably better for babies not to be brought to a welfare centre before they are 4 to 6 weeks old. At the first visit the child should be referred to the doctor for a thorough medical examination, which, if the child has not already been under medical supervision, may provide the first opportunity to detect congenital defects and conditions arising from birth trauma. Thereafter, as a minimum, the child should be medically examined at 6 months, 1 year, and 18 months old, and then near the subsequent birthdays. In addition, the prophylactic procedures already mentioned form an essential part of the medical supervision and provide further opportunities for consultation with the doctor.

Far too little attention has been given in the past to children beyond the age of infancy. To encourage mothers to obtain regular medical supervision of their children between 1 and 5 years old a system of appointments, either at ordinary child welfare sessions or at special toddlers' sessions, is strongly recommended—for example, "birthday appointments." If treatment is needed it should be arranged by, or in association with, the family doctor, but the whole purpose of regular supervision is to obviate the need for treatment arising.

Periodic medical supervision does not conflict with the care given by the family doctor during illness: it may well be undertaken by the family doctor himself if he can spare time and do it separately from his other work.

The Future of Welfare Centres

At the majority of hospitals there can be little time for educational work and no opportunity at all for routine supervision. Nevertheless co-operation between the hospital and child health service can give a greater appreciation of the social background of ill-health and can be instrumental in bringing the preventive and educational services to bear in just those cases where they may be most needed.

The general practitioner also has many opportunities. He has a responsibility for the health of every child on his list and often teaches some of the essentials of child care to those parents who consult him about their children during illness. It is probable that, at present, only a minority of general practitioners will have the time or the inclination to undertake regular medical supervision and sustained teaching of child care for more than a small proportion of the infants and young children on their lists. A recent inquiry in one area showed that of the children between 1 and 2 years old attending a welfare centre more than half had been seen by the family doctor only once since birth, and a considerable number had never been seen by him at all. This would probably be a common experience, but with the increasing emphasis on child health in the medical curriculum more general practitioners will feel equipped to give the equivalent of a clinic service to the children on their lists.

THE CHILD WELFARE CENTRE

It is neither possible nor desirable to delineate uniform standards for the future. At present the arrangements for clinic work should emphasize regular medical examination of all children up to the age of 5 years, prophylaxis against infectious disease, and the constant education of parents in child care. Dental services should be regarded as an integral part of child welfare work, and other services, such as child guidance and physiotherapy, should be readily available.

The premises should be easy of access to mothers. Integration of the child health services will be facilitated if the larger clinics are located close to or in the same building as the school clinic and the dental, physiotherapy, and child guidance departments. The establishment of health centres will favour this integration. Though elaborate equipment is unnecessary, the premises must be bright and welcoming and suitable for the work.

The keeping of accurate records is important and research should be encouraged.

THE STAFF

All doctors undertaking child welfare clinic work should have special training or experience in child health and disease, in preventive medicine, and preferably also in the methods of medico-social research; previous experience in general practice is also of great value. They should not work in isolation, but should guide the general work of the centre and share in the planning and execution of the health education programme. They should keep in close personal touch with paediatricians and general practitioners, and with colleagues on the administrative staff of the health department. In areas employing more than a few doctors, a senior medical officer should be responsible for co-ordinating the work of the clinic medical officers and for planning and developing the maternity and child welfare service in relation to local circumstances.

Where the doctor in charge of the child welfare clinic is a whole-time medical officer he should also be the school medical officer and, wherever possible, do other public health field work.

Every nurse undertaking advisory work in the clinics should have the health visitor's certificate. She also should play a part in the school health service and be in touch with practitioners in the area.

In addition to postgraduate training to prepare them for their special work, the staff should have frequent opportunities to keep abreast of recent developments through in-service training. It would be an advantage for all health departments to be in close touch with a university department of child health, so that the local authority services can be linked with the medical teaching centres on a regional basis and, with them, can arrange courses for doctors, nurses, and other staff, offering practical and theoretical instruction on recent advances in appropriate subjects.

It is concluded that the child welfare centre, with a wider approach to its task, with a well-trained staff, and adequate premises, must be the principal focus of the preventive medical and educational work that is unrelentingly needed to raise the standard of the health of young children.

The Interdepartmental Committee, under the chairmanship of Sir Arnold McNair, which has been set up by the Minister of Health and the Secretary of State for Scotland to ascertain the reasons for the lack of candidates for training as dentists (*Journal*, April 16, p. 979), has now held its first meeting and is ready to receive evidence.

Persons or organizations wishing to give evidence should, in the first instance, communicate in writing with the Secretary of the Committee, Mr. T. C. L. Nicole, at the Ministry of Health, Savile Row, London, W.1.

British Medical Association

AGENDA OF ANNUAL REPRESENTATIVE MEETING, JUNE 1, 2, 3, AND 4, 1955, IN THE GREAT HALL, B.M.A. HOUSE, TAVISTOCK SQUARE, LONDON, W.C.1

CHAIRMAN: Dr. I. D. GRANT, Glasgow

PRELIMINARY BUSINESS

Items 1 to 7 relate to preliminary business.

REPORT OF AGENDA COMMITTEE

Grouping of Motions and Amendments: Order of Business

8. The Committee has arranged certain Motions and Amendments which cover substantially the same ground in groups and has selected in each group one Motion or Amendment (marked with an asterisk*) on which it proposes that discussion should take place. The Representatives of the constituencies concerned have been informed of these proposals in accordance with Standing Order 21 (iii).

The Committee recommends:

Recommendation: (1) That the business under "Overseas" be taken at 11.0 a.m. on Friday, June 3:

(2) That "Other motions by Divisions," if not previously dealt with, be considered as the first business on Saturday, June 4, after the Official Vote of Thanks:

(3) That, with these exceptions, the order of the business be as set out in the Agenda.

STANDING ORDERS

9. **Motion** by the Chairman: That the Standing Orders (Doc. A.R.M. 5) as circulated with this Agenda be adopted as the Standing Orders of the Meeting.

PRELIMINARY

10. **Motion** by the Chairman of Council on behalf of the Council: That the Annual and Supplementary Reports of Council under "Preliminary" (Doc. A.R.M. 2, paras. 1-15, and Doc. A.R.M. 3, paras. 208-12) be received.

The President, 1955-6

11. **Motion** by the Chairman of Council: That in the absence of the President during the session 1955-6, Sir John McNee, who will then be the Immediate Past-President, be invited to act for the President on all appropriate occasions.

The President, 1956-7

12. **Motion** by the Chairman of Council: That Alexander H. Hall, O.B.E., M.D., Hove, be elected President of the Association for session 1956-7.

Election of Vice-Presidents

13. **Motion** by the Chairman of Council: That A. W. S. Sichel, LL.D., M.D. (Capetown), be elected a Vice-President in recognition of his valuable services to the Association.

14. **Motion** by the Chairman of Council: That P. T. O'Farrell, LL.D., M.D., F.R.C.P.I. (Dublin), be elected a Vice-President in recognition of his valuable services to the Association.

Representative of the Medical Branch of the Royal Navy on the Council

15. **Motion** by the Chairman of Council: That Surgeon Rear-Admiral James Hamilton, C.B., C.B.E., Q.H.S., be elected as the representative of the Medical Branch, Royal Navy, on the Council for the period 1955-8.

Remainder of Report under "Preliminary"

16. **Motion** by the Chairman of Council: That the remainder of the Annual and Supplementary Reports of Council under "Preliminary" be approved.

"BRITISH MEDICAL JOURNAL"

17. **Motion** by the Chairman of the Journal Committee on behalf of the Council: That the Annual Report of Council under "British Medical Journal" (Doc. A.R.M. 2, para. 128) be received.

18. **Motion** by the Chairman of the Journal Committee: That the Annual Report of Council under "British Medical Journal" be approved.

"FAMILY DOCTOR"

19. **Motion** by the Chairman of the Family Doctor Committee on behalf of the Council: That the Annual Report of Council under "Family Doctor" (Doc. A.R.M. 2, para. 129) be received.

20. **Motion** by the Chairman of the Family Doctor Committee: That the Annual Report of Council under "Family Doctor" be approved.

FINANCE

21. **Motion** by the Treasurer on behalf of the Council: That the Annual and Supplementary Reports of Council under "Finance" (Docs. A.R.M. 2, paras. 130-6, and A.R.M. 3, para. 235) and Appendix XI and the Financial Statement for the year ending December 31, 1954 (Doc. A.R.M. 3A), be received.

Membership Subscription

22. **Motion** by the Treasurer: That para. 136 of the Annual Report of Council be approved.

23. **Amendment** by NORTH-WEST WALES: That para. 136 of the Annual Report of Council be referred back to the Council for further consideration with a view to reduction of the standard rate of annual subscription to £4 4s.

24. **Motion** by EAST AND MID-LOTHIAN: That there appear to be anomalies in the rates of subscription payable and that the reduced rate should be payable by medical administrators; and that the Council should be asked to consider this matter.

25. **Motion** by GATESHEAD: That the Council be instructed to consider the proposal that in those cases where members' subscriptions are not chargeable against income tax some compensatory adjustment should be made in them.

26. **Motion** by MID-ESSEX: That the Council be instructed to consider the proposal that until the income-tax authorities make an allowance of the B.M.A. subscription to all doctors in their assessments, those not getting such an allowance should pay a subscription of four guineas instead of six guineas.

27. **Motion** by DUNDEE: That this Meeting requests Council to consider the formulation of a sliding scale of annual subscriptions so that those members having the use of B.M.A. House or of a Regional office should pay at a higher rate than those unable to make use of such facilities.

28. **Motion** by ISLE OF WIGHT: That the Council be instructed to consider the proposal that the annual subscription to the British Medical Association be reduced by excluding the *British Medical Journal* as a free issue, making it instead an optional extra. The *Supplement* to the *B.M.J.* to continue as a general issue to all members.

Remainder of Report under "Finance"

29. **Motion** by the Treasurer: That the remainder of the Annual and Supplementary Reports of Council under "Finance" be approved.

Hospitality Fund

30. **Motion** by DUNDEE: That this Meeting requests Council to examine the question of setting up a hospitality fund within the Association to enable visitors from abroad to be accommodated and entertained at Association expense.

GENERAL MEDICAL SERVICES

31. **Motion** by the Chairman of the General Medical Services Committee on behalf of the Council: That the Annual and Supplementary Reports of Council under "General Medical Services" (Docs. A.R.M. 2, paras 16-37, and Doc. A.R.M. 3, paras 213-22), the Report of a Discussion with the Minister of Health on December 9, 1954, on the Provision of Drugs for Private Patients (Appendix II), and the report of the Subcommittee on Assistants in General Practice (Appendix VII) be received.

Remuneration

32. **Motion** by the Chairman of the General Medical Services Committee: That paras. 16 and 213 of the Annual and Supplementary Reports of Council be approved.

33. **Amendment** by NEWCASTLE-UPON-TYNE: That the Association rejects any attempts to assess income from private practice in assessing the global sum payable to general practitioners.

34. **Amendment** by GATESHEAD: That if £2,000,000 was an approximately correct figure for the income of general practitioners from private practice at the time of the Danckwerts Award, it is too high now.

*35. **Motion** by NORTH GLAMORGAN AND BRECKNOCK: That, in view of the ever increasing cost of living, the Minister should be approached with a view to obtaining a corresponding increase in the remuneration of general practitioners.

36. **Motion** by EAST HERTFORDSHIRE: That in view of the considerable increase in the cost of living since 1950, a corresponding increase in the Central Pool should now be made.

37. **Motion** by NORTH MIDDLESEX: That this Meeting expresses dissatisfaction with the present capitation fee.

38. **Motion** by NEWCASTLE-UPON-TYNE: That Council be instructed to review the present level of remuneration in the profession in view of the continuously rising cost of living and the consequent fall in the real value of the Danckwerts award.

39. **Motion** by SOUTH-EAST ESSEX: That this Meeting instructs the Council to press for, and open negotiations to obtain, the full betterment rate as laid down in the judgment of Mr. Justice Danckwerts, instead of the percentage which he then awarded.

Group Practice

40. **Motion** by the Chairman of the General Medical Services Committee: That paras. 19 and 215 of the Annual and Supplementary Reports of Council be approved.

41. **Amendment** by SOUTHAMPTON: That this Meeting is concerned with the policy of the Association in regard to group practice, and, having regard for the full implications of this policy, suggests that the Council give this matter further consideration.

Drugs for Private Patients

*42. **Motion** by MID-CHESHIRE: That this Meeting considers that the British Medical Association should continue to press for the supply of drugs and appliances under the National Health Service to private patients.

43. **Motion** by BATH: That the Council be asked to continue to press for the provision of free drugs for private patients.

44. **Motion** by HARROW: That this Meeting instructs Council to bring influence to bear on the new Government from every possible source in order to convince it of the just entitlement of private patients to receive their medications by means of Form E.C.10.

45. **Motion** by WESTMINSTER AND HOLBORN: That the A.R.M. requests Council to press the new Administration to take immediate steps to allow the issue of medicines on E.C.10 forms to private patients.

46. **Motion** by HEXHAM: That this Meeting is dissatisfied with the principle that private patients should be debarred from obtaining drugs under the National Health Service, and considers that pressure should be continued to remove this anomaly.

47. **Motion** by BRIGHTON AND MID-SUSSEX: That this Representative Body notes with regret the contents of Appendix II of the Annual Report of Council and reaffirms its conviction that the opinions of the Cohen Committee on this matter are unacceptable. It deprecates the total absence of reference to the interests of the patient in Appendix II and considers that private patients have an equal right to free medicine and that this right should be granted.

48. **Motion** by GUILDFORD: That this Meeting regrets that no minority report in favour of the supply of drugs for private patients was issued by the Cohen Committee, and instructs the Council to make inquiries of individual private practitioners concerned to find out how many would be prepared to accept suitable safeguards.

Prescribing of Proprietary Preparations

49. **Motion** by EAST KENT: That when an executive council becomes aware that a new preparation is being prescribed which does not appear to be a drug forming part of the pharmaceutical services provided under the Act, it shall immediately circularize all general practitioners on its list informing them of the fact; that no general practitioner shall be liable to be surcharged for prescribing such a preparation until such time as the aforesaid notice shall be circulated, and that attention should be drawn to excessive delay in notifying general practitioners of unacceptable prescribing.

Economy in Prescribing

50. **Motion** by NORTH MIDDLESEX: That in view of the widespread disquiet in the medical profession, full information be published on the present definition of excessive prescribing, and also how the penalties to which doctors are liable are defined.

Surgery and Waiting-Room Accommodation

51. **Motion** by HEXHAM: That representations should be made to the Inland Revenue authorities that capital expenditure involved in bringing surgery accommodation up to modern requirements should be subject to income-tax relief.

General Practitioner Refresher Courses

52. **Motion** by the Chairman of the General Medical Services Committee: That para. 28 of the Annual Report of Council be approved.

53. **Amendment** by DORSET: That this Meeting considers that the grant which is made towards the expenses of engaging a locum during the period that a general practitioner is attending a postgraduate course should be twenty guineas per week.

54. **Motion** by MID-CHESHIRE: That this Meeting considers that general practitioners should receive mileage fees for attendance at refresher courses.

General Practitioners and Institutional Midwifery

55. **Motion** by STRATFORD: That every general-practitioner obstetrician who desires it should have access to maternity beds at his local maternity hospital.

Trainee General Practitioners

56. **Motion** by SOUTH-EAST ESSEX: That the Trainee Practitioner Scheme supported by public funds is unnecessary and extravagant and we would welcome its abolition.

Dental Anaesthetics

57. **Motion** by CITY OF ABERDEEN: That this Meeting considers that the fee for the administration of a dental anaesthetic by a medical practitioner should depend not upon the number of teeth to be extracted but upon the degree of care, skill, and responsibility involved.

Dental Haemorrhages

58. **Motion** by GATESHEAD: That the principle of payment for arrest of dental haemorrhage should apply universally to haemorrhages following extractions at local authority clinics.

59. **Motion** by SOUTH ESSEX: That this Meeting considers that claims for the treatment of dental haemorrhage should not be submitted to the dentist concerned but should go direct to the executive council.

60. **Motion** by BISHOP AUCKLAND: That the Council be asked to explore with representatives of the dental profession the possibility of the formation of local dental rotas on a 24 hours' basis to deal with emergencies, and that the requisite information be given to both doctors and patients.

National Insurance Contributions

61. **Motion** by the Chairman of the General Medical Services Committee: That para. 35 of the Annual Report of Council be approved.

62. **Amendment** by RUGBY AND SOUTH WARWICKSHIRE: That this Meeting has difficulty in accepting the contention of the Ministry of National Insurance that implementation of Minute 240 of the A.R.M., 1954, "would completely upset the actuarial basis of the National Insurance Scheme" and refers the matter back for further information and consideration.

(Minute 240 of the A.R.M., 1954, reads:

PROPOSED by RUGBY AND SOUTH WARWICKSHIRE: That this Meeting considers that the present practice of requiring a full week's national insurance contribution for any portion of a week, for which a person (not otherwise exempt) is certified as fit for work, is unfair not only to the contributors but also to the doctors, since it at times jeopardizes the doctor-patient relationship. This meeting therefore urges Council, in the interests of common justice, to raise this matter with the Ministry, notwithstanding the slight administrative problem which the adoption of the proposed alteration might involve.

RESOLVED: That the matter be referred to the Council.)

Assistants in General Practice

63. **Motion** by the Chairman of the General Medical Services Committee: That para. 216 of the Supplementary Report of Council and the Report of the Subcommittee on Assistants in General Practice set out in Appendix VII be approved.

64. **Amendment** by BIRMINGHAM: That in the recommendation contained in para. 16 of the Report of the Subcommittee on Assistants in General Practice the words—honorary secretaries of B.M.A. Divisions—be inserted after

—deans of medical schools; and that "honorary"—with regard to secretaries of the local medical committees be deleted.

The recommendation would then read:

"That further efforts should be made, through the deans of medical schools, honorary secretaries of B.M.A. Divisions, and secretaries of local medical committees, to ensure that final-year students and newly qualified practitioners are fully informed of the importance of entering into a formal agreement when accepting a post as an assistant, either with or without view."

Employment of General Practitioners in Hospitals

65. **Motion** by STRATFORD: That the Association reaffirms its policy to press for the provision of more beds under general-practitioner care and for diagnostic facilities for the general practitioner, where these are not already available.

Remainder of Report under "General Medical Services"

66. **Motion** by the Chairman of the General Medical Services Committee: That the remainder of the Annual and Supplementary Reports of Council under "General Medical Services" be approved.

General Practitioners and Hospitals

67. **Motion** by MID-CHESHIRE: That this Meeting considers that further and more urgent consideration should be given to bring the hospitals and general practitioner closer together.

Monthly Payments

*68. **Motion** by NEWCASTLE-UPON-TYNE: That doctors in the National Health Service be paid monthly by right without having to make application.

69. **Motion** by DUNDEE: That this Meeting is disappointed that no satisfactory solution has been arrived at with the Ministry whereby monthly payments may be received on application as a matter of right and without any plea of hardship being given.

Reclassification of Closed Areas

70. **Motion** by SOUTH-WEST WALES: That, in view of the fact that areas which had been closed since the start of the National Health Service have recently been reclassified and declared intermediate despite no change in the ratio of doctors to patients, this Meeting instructs the Council to keep a close watch on the activities of the Medical Practices Committee and to take action to safeguard the interests of the Association's members.

Obstetric List

71. **Motion** by GATESHEAD: That in view of the wide variation, in different executive council areas, of criteria for admission to the obstetric list, it is more than ever desirable that this list be abolished.

Differential Fee for Midwifery

72. **Motion** by HEXHAM: That the principle of a differential fee for midwifery is highly undesirable, and that the lower fee of five guineas should be abolished. It is suggested that a newly qualified practitioner should produce evidence of adequate experience under supervision before undertaking unaided midwifery.

Domiciliary Obstetric Scheme

73. **Motion** by GLASGOW: That this Meeting recommends to the Representative Body that the services of a specialist anaesthetist should be available to the general practitioner in obstetric cases under the domiciliary scheme.

Intermediate Certificates

74. **Motion** by BUCKINGHAMSHIRE: That an intermediate certificate of incapacity covering a period of up to four weeks be allowed after an initial certificate covering the first week.

Insulin Pack

75. **Motion** by SOUTH SHIELDS: That this Meeting considers that the terms (c.c. or ml.) on the insulin pack should correspond with the terms (c.c. or ml.) on the insulin syringe.

Advertising Methods of Pharmaceutical Industry

76. **Motion** by ST. PANCRAS: That the Council be asked to take note of the irritation and inconvenience caused to general practitioners by the advertising methods of the pharmaceutical industry as a whole, and that they should inquire into the problem and confer with representatives of the industry to alleviate it.

COMPENSATION AND SUPERANNUATION

77. **Motion** by the Chairman of the Compensation and Superannuation Committee on behalf of the Council: That the Annual Report of Council under "Compensation and Superannuation" (Doc. A.R.M. 2, paras. 38-44) be received.

Compensation

78. **Motion** by the Chairman of the Compensation and Superannuation Committee: That para. 38 of the Annual Report of Council be approved.

*79. **Amendment** by HENDON: That the Representative Body reaffirms its decision (Min. 163, A.R.M., 1951) that compensation for practices should be paid forthwith.

(Min. 163 was as follows:

Resolved: That, in view of the grave inflation that the country is confronted with at the present time, steps be taken to represent to the Minister the need for the payment of compensation forthwith.)

80. **Amendment** by NEWCASTLE-UPON-TYNE: That we continue to press strenuously for payment of compensation for practices.

*81. **Amendment** by HALIFAX: That this Meeting considers that the Minister should now pay compensation in full for medical practices, and that, until this compensation is paid, the rate of interest should be raised to an adequate level.

82. **Amendment** by LEEDS: That the Minister of Health be requested to pay forthwith the outstanding sums of compensation due to general practitioners; and that, in the event of the Minister being unwilling to pay the outstanding sums of compensation forthwith, a request be made to the Minister for an increase in the rate of interest thereon.

83. **Amendment** by DUNDEE: That this Meeting requests Council to open negotiations with the Ministry to consider raising the percentage of interest paid on compensation in view of the present financial position—for example, the bank rate.

*84. **Amendment** by GATESHEAD: That doctors wishing to incur capital expenditure on new or improved surgery premises should be able to obtain an advance payment of compensation.

85. **Amendment** by HUDDERSFIELD: That, in view of the recent demand for improvement to surgery premises, the compensation at present held by the Ministry (until death or retirement) should be made available for this purpose.

*86. **Amendment** by SHEFFIELD: That this A.R.M. is of the opinion that a principal who relinquishes a proportion of his patients by taking a partner should be entitled to claim immediate payment of an appropriate proportion of his compensation.

87. **Amendment** by BLYTH AND MORPETH: That the A.R.M. reaffirms the recommendation of the General Medical Services Committee that a practitioner on taking another into partnership should thereupon be entitled to at least a part of the compensation moneys due to him.

Assessment of Pension of Practitioners

88. **Motion** by GATESHEAD: That parity of assessment of pension with salaried officers will be obtained only if practitioners are allowed to opt, at the time of their retirement, for the system most advantageous in their particular case.

Remainder of Report under "Compensation and Superannuation"

89. **Motion** by the Chairman of the Compensation and Superannuation Committee: That the remainder of the Annual Report of Council under "Compensation and Superannuation" be approved.

Superannuation Payments on Sessional Fees

90. **Motion** by WILLESSEN: That Council be requested to explore the possibility of superannuation payments being made on sessional fees paid by Government departments to part-time medical officers.

MEDICAL BENEVOLENCE

91. **Motion** by the Chairman of the Charities Committee on behalf of the Council: That the Supplementary Report of Council under "Medical Benevolence" (Doc. A.R.M. 3, paras. 239-41) be received.

92. **Motion** by the Chairman of the Charities Committee: That the Supplementary Report of Council under "Medical Benevolence" be approved.

PRIVATE PRACTICE

93. **Motion** by the Chairman of the Private Practice Committee on behalf of the Council: That the Annual Report of Council under "Private Practice" (Doc. A.R.M. 2, paras. 109-27) be received.

Remuneration of Local Treasury Medical Officers

*94. **Motion** by GATESHEAD: That the fees for practitioners acting as regional medical officers for the Treasury should be £2 2s. for a full examination and £1 1s. for a short report.

95. **Motion** by EAST HERTFORDSHIRE: That the fees payable by the Treasury Medical Service for full medical examination should be increased to an amount similar to that payable for a life insurance examination.

96. **Motion** by WORCESTER AND BROMSGROVE: That this Meeting considers the fee of 25s. per examination and report paid to Treasury medical officers is inadequate and should be brought into line with the fees for life insurance examinations at present paid.

Remainder of Report under "Private Practice"

97. **Motion** by the Chairman of the Private Practice Committee: That the remainder of the Annual Report of Council under "Private Practice" be approved.

Duration Certificates

98. **Motion** by BISHOP AUCKLAND: That a medical certificate should not be required by an insurance company in the case of a deceased person not previously examined for life insurance.

(The decision of the A.R.M., 1937, reaffirmed in 1949, on this matter is:

Min. 74. **Resolved:** That the Representative Body is of the opinion that where any medical certificate is required by an insurance company in the case of a deceased person

not previously examined for life insurance such certificate should be obtained direct from the medical practitioner of the deceased; that it should not be furnished without the previous consent of the nearest available competent relative; and that a fee should be paid by the insurance companies for any such certificate.

A motion before the Representative Body in 1953 that a practitioner should never comply with a request for a "duration" certificate, was referred to the Council; and the view of the Council that there was no reason to depart from existing policy as laid down in 1937 and 1949 was endorsed by the Representative Body, 1954.)

Fees for Emergency Treatment under Road Traffic Act

99. **Motion** by DERBY: That this Meeting is of the opinion that the time is now appropriate for an upward revision of the 12s. 6d. fee and 6d. mileage for emergency treatment under the Road Traffic Act, 1934.

Families of Service Personnel Proceeding Abroad

100. **Motion** by BELFAST: That this Meeting considers that where medical services are provided on the requirement of Service departments for the families of Service personnel proceeding abroad the fees payable are inadequate and should be raised to a minimum of:

	£	s.	d.
Examination for fitness to reside abroad ..	1	5	0
Examination for fitness to travel ..	..	10	6
Vaccination ..	..	10	6
Inoculations ..	..	(each) 10	6

Report on Ministry of Pensions Form M.P.A.O. 38

101. **Motion** by BELFAST: That this Meeting considers that the fee of 5s. paid for a medical report on Form M.P.A.O. 38 for submission to the Ministry of Pensions is inadequate and requests that representations be made for its increase to a minimum of £1 1s.

OCCUPATIONAL HEALTH

102. **Motion** by the Chairman of the Occupational Health Committee on behalf of the Council: That the Annual Report of Council under "Occupational Health" (Doc. A.R.M. 2, paras. 75-86), and Statement on the Definitions, Qualifications, and Remuneration of Industrial Medical Officers (Appendix III), and the Terms of Service for Industrial Medical Officers (Appendix IV) be received.

Remuneration of Industrial Medical Officers

103. **Motion** by the Chairman of the Occupational Health Committee: That the following recommendation of the Council be adopted:

That the revised Statement on the Remuneration of Industrial Medical Officers set out in Appendix III of the Annual Report of Council be approved.

Duties and Ethical Rules for Industrial Medical Officers

104. **Motion** by the Chairman of the Occupational Health Committee: That para. 83 of the Annual Report of Council be approved.

105. **Amendment** by RUGBY AND SOUTH WARWICKSHIRE: That this Meeting urges Council to circulate among all non-members of the Association a copy of "The Duties and Ethical Rules for Industrial Medical Officers."

Remainder of Report under "Occupational Health"

106. **Motion** by the Chairman of the Occupational Health Committee: That the remainder of the Annual Report of Council under "Occupational Health" be approved.

MEDICAL ETHICS

107. **Motion** by the Chairman of the Central Ethical Committee on behalf of the Council: That the Annual Report of Council under "Medical Ethics" (Doc. A.R.M. 2, paras. 103-8) be received.

Loan of Hospital Records to Government Departments

108. **Motion** by the Chairman of the Central Ethical Committee: That the following recommendation of the Council be adopted:—

That the following statement on the loan of hospital records to Government departments be approved:

(a) That medical records be lent to the medical officers employed by Government departments only when written consent has been given by or on behalf of the patient.

(b) That the form of consent signed by or on behalf of the patient should include a statement that the patient agrees to his hospital records being made available to the medical board in order to assist them to consider and assess claims.

(c) That, wherever practicable, and particularly where disclosure of information may have an adverse psychological effect upon the patient, the practitioner who compiled the record or, if he is not available, one nominated by the hospital authority for the purpose, should be consulted on the wisdom of disclosing to the patient all of the confidential information contained therein, and should take the opportunity of reviewing the notes before they leave the hospital.

109. **Motion** by WORCESTER AND BROMSGROVE: That the statement that the patient agrees to his hospital records being made available to a medical board should not be requested or demanded until the need for the loan of such records arises.

Professional Secrecy

110. **Motion** by SOUTH ESSEX: That this Meeting considers the exchange of medical details concerning patients should take place only between doctors, and deplores the increasing tendency to exchange confidential medical details direct with lay persons.

Remainder of Report under "Medical Ethics"

111. **Motion** by the Chairman of the Central Ethical Committee: That the remainder of the Annual Report of Council under "Medical Ethics" be approved.

PUBLIC HEALTH

112. **Motion** by the Chairman of the Public Health Committee on behalf of the Council: That the Annual and Supplementary Reports of Council under "Public Health" (Docs. A.R.M. 2, paras. 87-101, and A.R.M. 3, paras. 233-34), and the Rules for D.P.H. Courses (Appendix V) be received.

Remuneration in the Public Health Service

113. **Motion** by GATESHEAD: That in view of the dangers presented to the medical profession by the low levels of remuneration in the salaried medical services of the State and local authorities, steps be taken urgently by the Association to bring the remuneration of medical personnel in these services to a level comparable to that of the rest of the profession engaged in hospital and general practice.

Remuneration of Divisional Medical Officers, London County Council

114. **Motion** by GREENWICH AND DEPTFORD: That this A.R.M. recommends that the salary of divisional medical officers of the London County Council be raised forthwith and be in accordance with the scales for medical officers of health—that is, in relation to the population served.

Fees for Part-time Work for Local Authorities

115. **Motion** by EAST KENT: That, consequent on the rise in salary of public health medical officers, the scale of fees for part-time sessional work with local authorities should be increased immediately.

School Health Service

116. **Motion** by WORCESTER AND BROMSGROVE: That the Council take all possible steps to ensure that the arrangements set out in para. 94, (a) and (b), be universally adopted throughout the country.

Milk

117. **Motion** by ISLE OF WIGHT: That this Meeting is in favour of the transfer of the responsibility for clean milk production from the Ministry of Agriculture and Fisheries to the local sanitary authority.

Remainder of Report under "Public Health"

118. **Motion** by the Chairman of the Public Health Committee: That the remainder of the Annual and Supplementary Reports of Council under "Public Health" be approved.

Notification of Infectious Diseases

119. **Motion** by DARTFORD: That this Meeting is of the opinion that a review of the legislation concerning the notification of infectious diseases should be carried out by the Association with a view to making recommendations to the Ministry regarding the form of revision, which is long overdue.

Diesel Oil

120. **Motion** by GUILDFORD: That this Meeting of the Representative Body urges the Council of the B.M.A. to draw the attention of transport authorities to the possible dangers of fumes from diesel engines; to the remarkable coincidence between the increased use of diesel fuel for transport and the rise of mortality from lung cancer and other respiratory diseases; and views with alarm the forthcoming replacement, in London, of 1,800 electric trolley buses by diesel-engined vehicles.

ARBITRATION MACHINERY

121. **Motion** by the Chairman of the Committee *re* Arbitration Machinery on behalf of the Council: That the Annual and Supplementary Reports of Council under "Arbitration Machinery" (Docs. A.R.M. 2, para. 74, and A.R.M. 3, para. 232) be received.

122. **Motion** by the Chairman of the Committee *re* Arbitration Machinery: That the Annual and Supplementary Reports of Council under "Arbitration Machinery" be approved.

123. **Motion** by WESTMINSTER AND HOLBORN: That the Council should examine the possibility of getting some form of arbitration for the profession alone, and press that the arbitration tribunal should be comprised of personnel permanently appointed, independent and mutually agreed.

SCIENCE

124. **Motion** by the Chairman of the Science Committee on behalf of the Council: That the Annual and Supplementary Reports of Council under "Science" (Docs. A.R.M. 2, paras. 141-7, and A.R.M. 3, paras. 236-7) be received.

Crash Helmets

125. **Motion** by MARYLEBONE: That this Meeting again stresses the life-saving value of crash helmets when worn by motor-cyclists.

126. **Motion** by ABERDEEN AND KINCARDINE COUNTIES: That this Meeting considers that the wearing of a crash helmet should be compulsory to all users of a motor-cycle, and asks the Council to take all possible action to achieve this end.

127. **Motion** by GREENWICH AND DEPTFORD: That this A.R.M. recommends that all forms of protective clothing, including crash helmets, should be free of purchase tax.

128. **Motion** by RUGBY AND SOUTH WARWICKSHIRE: That this Meeting considers that crash helmets are a valuable

protection for motor-cyclists, and urges Council to appoint a deputation to seek a personal meeting with the Chancellor of the Exchequer to stress this point and to press for the abolition of purchase tax on crash helmets, and similar protective clothing, such as firemen's and policemen's helmets.

Postage on Library Books

129. **Motion** by the Chairman of the Science Committee: That para. 144 of the Annual Report of Council be approved.

130. **Amendment** by NORTH-WEST WALES: That the first 10s. of the charge for postage on books from the B.M.A. Library should be a charge on the annual subscription.

B.M.A. Lectures

131. **Motion** by READING: That Divisions should have the option of applying for an additional B.M.A. lecture, at the discretion of the divisional executive committee.

Remainder of Report under "Science"

132. **Motion** by the Chairman of the Science Committee: That the remainder of the Annual and Supplementary Reports of Council under "Science" be approved.

Heroin

*133. **Motion** by ABERDEEN AND KINCARDINE COUNTIES: That this Meeting protests against the threatened withdrawal of that most excellent sedative heroin, which is of inestimable value in so many conditions, and recommends that it should still be manufactured in this country for use by medical practitioners but not exported.

134. **Motion** by LANCASTER: That this Meeting requests Council to protest against the order prohibiting the import or manufacture of heroin in this country.

135. **Motion** by WINCHESTER: That in view of the great value of heroin in medical practice, this Meeting congratulates Council on approaching the Government concerning the action which has recently been taken to ban this drug. This Meeting instructs Council to ensure that in future no drug be prohibited without full discussion with representative practising members of the profession in this country.

136. **Motion** by MARYLEBONE: That this Meeting deplores the action of the Government in banning the manufacture and the use of heroin for medical purposes without prior consultation with the representatives of the medical profession.

137. **Motion** by BLYTH AND MORPETH: That the A.R.M. resents the method by which decisions are taken concerning the banning of certain drugs, and feels that before each change is made the profession at large should be consulted and given the opportunity of expressing its views.

138. **Motion** by GLASGOW: That whilst appreciating that good reasons may exist for the prohibition of the export of heroin, this Meeting is not satisfied that there is proof of addiction to the drug in this country and considers that the prohibition of the importation and manufacture of heroin will deprive patients of a drug which has been of proved therapeutic value for many years.

HOSPITAL AND CONSULTANT SERVICES

139. **Motion** by the Chairman of the Central Consultants and Specialists Committee on behalf of the Council: That the Annual and Supplementary Reports of Council under "Hospital and Consultant Services" (Docs. A.R.M. 2, paras. 45-72, and A.R.M. 3, paras. 223-30), the Revised Report of the Special Subcommittee on Hospital Medical Staffing (Appendix VIII), the Report of the Geriatrics Joint Subcommittee (Appendix IX), and the Report on the Medical Use of Hypnotism—by a Subcommittee of the Psychological Medicine Group Committee (Appendix X) be received.

Negotiating Machinery

140. **Motion** by the Chairman of the Central Consultants and Specialists Committee: That para. 45 of the Annual Report of Council be approved.

141. **Amendment** by MARYLEBONE: That this Meeting strongly recommends to the Council that in all negotiations with the Ministry of Health on matters of hospital medical staffing professional legal and financial advisers shall be consulted before final decisions are reached.

142. **Amendment** by MARYLEBONE: That this Meeting instructs the Council to consider the desirability of advising the Staff Side to withdraw from Committee B of the Whitley Medical Council, in view of the fact that this negotiating machinery is not working satisfactorily.

143. **Motion** by DORSET: That the Representative Body requests Council to review the relationship of the Central Consultants and Specialists Committee to the Joint Committee.

Remuneration of Hospital Medical Staff

144. **Motion** by the Chairman of the Central Consultants and Specialists Committee: That paras. 46 and 223 of the Annual and Supplementary Reports of Council be approved.

145. **Amendment** by MANCHESTER: That this Meeting deplores the fact that the instructions to Council contained in Minute 70 (Annual Representative Meeting, 1954) have not been carried out, and demands that the Council do so forthwith.

(Minute 70 of the A.R.M., 1954, reads:

RESOLVED: That this Meeting deplores the inadequacy of the recent agreement reached on the remuneration of hospital medical staffs, and urges that steps be taken to reopen this matter immediately, with a view to obtaining the implementation of the Spens Report as applied to consultants and specialists and obtaining adequate betterment. In the event of disagreement, the matter should be referred to arbitration.)

146. **Amendment** by DERBY: That this Meeting expresses dissatisfaction with the results so far obtained for whole-time consultants and specialists, and urges that renewed efforts be made on their behalf.

*147. **Motion** by SHEFFIELD: That, pending the full implementation of the Strachan proposals and irrespective of the claim at present before Whitley Committee B, the maximum of the S.H.M.O. salary scale should be increased to 80% of the consultant maximum.

148. **Motion** by LIVERPOOL: That this Meeting recommends that the S.H.M.O. maximum rate of remuneration be raised to 80% of the consultant maximum.

149. **Motion** by DORSET: That this Meeting considers that the sum of money available for distribution for merit awards should be used to raise S.H.M.O.s to consultant status.

150. **Motion** by DORSET: That this Meeting considers that the shortage of hospital house officers is due to underpayment, and that their remuneration should be brought into line with that of newly appointed National Service medical officers.

151. **Motion** by NEWCASTLE-UPON-TYNE: That the remuneration of general practitioners doing sessional work in hospitals be increased.

Hospital Medical Staffing

152. **Motion** by the Chairman of the Central Consultants and Specialists Committee: That paras. 47 and 224 of the Annual Report of Council, and the Revised Report on Hospital Medical Staffing (Appendix VII) be approved.

153. **Amendment** by MARYLEBONE: That this Meeting instructs the Council that a survey of consultant establishments is essential before decisions are taken on any changes in hospital medical staffing. Review should be undertaken

by representatives appointed by the Ministry and by the Joint Consultants Committee. Any review committee so appointed should include representatives of the Consultants and Specialists Committee of the region concerned.

154. **Motion** by LEICESTERSHIRE AND RUTLAND: That there should be a maximum expansion of the consultant establishment so as to provide a service adequate for the needs of the country in accordance with the expressed policy of the Central Consultants and Specialists and Joint Committees.

155. **Motion** by SHEFFIELD: That there should be an expansion of the consultant establishment in the hospital services, particularly in those specialties in which the present ratio of consultants to S.H.M.O.s is low.

156. **Motion** by READING: That this Meeting takes note of the need for expansion of the consultant grade, but considers that any such expansion should absorb existing S.H.M.O.s who are already doing consultant work.

157. **Motion** by LEICESTERSHIRE AND RUTLAND: That all grades of medical staff who will be vitally affected should have representation on all committees dealing with the preliminary review of hospital staffing, and on all later committees concerned with putting the report into effect.

158. **Motion** by DARTFORD: That this Meeting draws attention to the position of doctors graded as S.H.M.O.s in the hospital service who, despite the fact they have been engaged in consultant work, are now faced with the prospect of being down-graded, and considers that the Council should be requested to treat this problem as a matter of priority and that the B.M.A. should do everything to ensure that S.H.M.O.s at present unfairly and inappropriately graded should be graded as consultants as soon as possible.

159. **Motion** by LIVERPOOL: That this Meeting believes that, in the event of the reforming of the structure of hospital medical staffing, the grade immediately below that of consultant should be linked with the consultant grade and be regarded as part of the senior medical staff.

S.H.M.O. Appointments

160. **Motion** by LIVERPOOL: That this Meeting reiterates the resolution passed last year by the A.R.M.: "That no further S.H.M.O. posts be established and that existing posts should be subject to biennial review with a view to up-grading." (Min. 121.)

161. **Motion** by READING: That all existing S.H.M.O. posts should be subjected to a review by an independent central committee with a view to upgrading.

Internal Administration of Hospitals

162. **Motion** by the Chairman of the Central Consultants and Specialists Committee: That para. 54 of the Annual Report of Council be approved.

163. **Amendment** by LIVERPOOL: (a) That this Meeting, believing everything concerning the patient must be of importance to the clinician in charge, and that, therefore, the lay and ancillary services must be subordinate to the medical, considers that the recommendation of equal tripartite administration by the Bradbeer Committee on Internal Administration of Hospitals is not in the interest of the patient (Bradbeer Report, paras. 20-21);

(b) That this Meeting affirms that under no circumstances shall the medical and nursing personnel of hospitals be under the control of lay administrators (para. 67);

(c) That this Meeting affirms that it should be obligatory for the hospital management committee to consult with the representatives of the senior medical and dental staff (para. 67);

(d) That this Meeting welcomes the recommendation in para. 72 of the report that, when medical administrators are appointed, they should be of consultant status with clinical responsibility. It considers that paras. 77-8 are unworkable;

(e) That this Meeting deplores the suggested down-grading of deputy medical administrators, when such are considered desirable, to an R.M.O./R.S.O. grade (para. 81);

(f) That this Meeting reaffirms its belief that it is in the interest of the patient to maintain the close link that at present exists between the medical and nursing professions.

NOTE:—The following are extracts from the Bradbeer Report:

Para. 20. "Hospital administration can be sub-divided into: (a) medical administration; (b) nursing administration; and (c) lay, or business, administration. . . . It is amply clear that the borderlines between the three parts cannot be sharply defined . . . but we are fully persuaded that the conception of partnership between the three parts of the whole administration should be regarded as fundamental."

Para. 21. "Partnership is the important word. None of the three parts can do without either of the others, each has its own set of functions which it is better adapted to perform than the others, and none should regard itself as superior to the others."

Para. 22. "Nevertheless there is one important qualification of the tripartite principle which must be set down at once. We have no doubt whatever—and this view was expressed by several of the bodies who gave evidence before us—that for the efficient administration of the hospitals it controls the governing body must have one officer to whom it can look for securing that its policy is carried out in all hospitals in the group and for co-ordinating and reviewing all group activities. That is to say, at group level—and this includes 'groups' consisting of a single hospital—there must be one chief administrative officer."

Para. 65. "The medical committee system needs strengthening, both at hospital and group level. . . . Every hospital should, in our opinion, have a medical staff committee."

Para. 66. "In all cases the medical staff committee will be constituted by the medical staff themselves, not appointed by the governing body of the hospital. It should be a self-generated committee existing in its own right, not a subcommittee of the group medical advisory committee."

Para. 67. "The Ministry has recently issued a memorandum on medical committees in hospitals and hospital groups, which contains the following examples of matters within the sphere of interest of medical committees at both levels. . . . The list is not intended to be exhaustive but to illustrate the wide field within which committees can, and already often do, give regular and valuable help to hospital authorities."

Para. 72. "The medical administrator must be a consultant in active clinical practice. . . . Generally, we do not think he should be required to, or should, give more than a reasonable proportion of his time to administration. . . . Medical administrative work at this level should be paid on the same basis as other clinical work."

Para. 77. "We are convinced that the best way of filling the post is to select one from among the consultant staff of the hospital (which would include any consultant newly appointed to fill a clinical vacancy). We recommend that the medical administrator should be selected jointly by representatives of the medical staff committee and of the hospital management committee, with one or more representatives from the regional board who could put the board's point of view from the clinical angle. The formal appointment as medical administrator would then be made by the hospital management committee and any necessary adjustment in the consultant's contract made by the board. If the consultant selected finds it necessary to reduce the amount of his clinical work, there should be no reduction in the sessions provided for in his contract with the board—this follows from what we have said in paragraph 72. The alternative would be for him to do the same amount of clinical work with an increase in his total sessions."

Para. 78. "Exceptionally—and most of us think it would be exceptional—it may happen in a large hospital desiring a medical administrator of the kind we contemplate that not one of the existing consultants is able or willing to take on the work even for a limited time. In this case we think that the regional hospital board should be asked for their help. We cannot but believe that the board, the medical staff committee, and the hospital management committee will be able between them to resolve the difficulty. In the last resort there may be no alternative but to wait for a clinical vacancy and then for the regional board, after consultation with the medical staff committee and the hospital management committee, to advertise the clinical appointment definitely linked with the medical administrative duties. But because of the medical administrator's special functions it is important that both the hospital management committee and the medical staff whose colleague he is to be should have a larger say in his appointment than they have for consultant posts at present. Under the Act and regulations, the management committee is already represented on the advisory appointments committee for consultants, but we are not convinced that the strength of their representation is sufficient for

the purpose of filling medical administrator posts. We recommend, therefore, that the representation of the hospital management committee, both lay and medical, should be augmented for these appointments. We recognize that this recommendation, if accepted, would involve an amendment of the regulations, but we think that amendment would be justified."

Para. 81. "In order, therefore, to help meet the needs of medical administration and to attract young men into this field of work, we recommend the recognition, in non-teaching hospitals only, of a new R.M.O. or R.S.O. grade covering salary ranges between the lowest registrar salary and the highest point in the S.H.M.O. grade. Whilst it is not suggested that such appointments would be necessary in all general hospitals, the new grade (in addition to its clinical value) would be useful in hospitals where the consultants find it difficult to take on much administrative, on top of clinical, work. It should, we suggest, be divided into salary ranges in accordance with the size and type of hospitals. In each case the appointment might be for four years, subject to one year in the first instance, and should be made by regional boards in close consultation with hospital management committee and the medical staff committees concerned."

164. **Amendment** by EAST KENT: That a medical superintendent should be appointed to each general hospital where there is no such appointment, by election from existing senior medical staff by the group medical advisory committee, in consultation with the medical staff committee, and that the tenure of office should be for periods of three years.

165. **Motion** by LIVERPOOL: That this Meeting recommends that all medical boards and all medical advisory committees in hospitals should become statutory bodies within the framework of the National Health Service.

Review of Consultant Organization

166. **Motion** by WORCESTER AND BROMSGROVE: That the A.R.M. be informed what stage the deliberations mentioned in the Report of Council, para. 59, have reached.

Geriatric Units: Treatment and Rehabilitation of Chronic Disablement

167. **Motion** by the Chairman of the Central Consultants and Specialists Committee: That paras. 67 and 227 of the Annual and Supplementary Reports of Council and the Report of the Geriatrics Joint Subcommittee on the Treatment and Rehabilitation of Chronic Disablement, set out in Appendix IX, be approved.

168. **Amendment** by WORCESTER AND BROMSGROVE: That recommendation 17 of the Report be amended to read: "There should be an increase in Part III accommodation to meet present and future needs, particularly with regard to the provision of an increased proportion of single rooms."

169. **Motion** by HEXHAM: That the inadequacy of local authority accommodation under Part III of the National Assistance Act is embarrassing to both general practitioner and hospital services.

170. **Motion** by MID-CHESHIRE: That this Meeting recommends that stress be put on the need for more accommodation for the aged, in addition to supporting the appointment of assessing officers.

171. **Motion** by BATH: That the Council should be asked to make representation to the Government to produce homes for old people, accommodating a sufficient number in each to be an economical proposition; thereby relieving hospital beds for geriatric cases.

172. **Motion** by GREENWICH AND DEPTFORD: That this A.R.M. recommends that the Minister be urged to provide wherever necessary geriatric and chronic sick hospital facilities, and further suggests that the Minister urges closer co-operation between hospital and local government authorities.

173. **Motion** by WANDSWORTH: That age should not act as a bar to admission to hospital.

174. **Motion** by MID-CHESHIRE: That the Association should consider propaganda to arouse the public conscience on the need for people to accept the responsibility for their aged relatives, except where hospital treatment is essential.

Remainder of Report under "Hospital and Consultant Services"

175. **Motion** by the Chairman of the Central Consultants and Specialists Committee: That the remainder of the Annual and Supplementary Reports of Council under "Hospital and Consultant Services" be approved.

Representation of Whole-time Consultants and Specialists on Central Consultants and Specialists Committee

176. **Motion** by DERBY: That this Meeting proposes that there should be a higher proportion of whole-time consultants and specialists on the Central Consultants and Specialists Committee.

Private Beds

177. **Motion** by BATH: That in view of the fact that membership of the various provident schemes is increasing the Minister should be asked to arrange that more private beds should be available in hospitals.

Domiciliary Psychiatric Service in Wales

178. **Motion** by CARDIFF: That this Meeting presses for the institution of a domiciliary psychiatric service in Wales.

Study Leave

179. **Motion** by STIRLING: That this Meeting is of opinion that the Ministry should be asked to state its policy in respect of "study leave" and to reinforce its instructions to regional hospital boards to make study leave available to hospital officers.

ESTATES

180. **Motion** by the Chairman of the Estates Committee on behalf of the Council: That the Annual Report of Council under "Estates" (Doc. A.R.M. 2, paras. 137-40) be received.

181. **Motion** by the Chairman of the Estates Committee: That the Annual Report of Council under "Estates" be approved.

PUBLIC RELATIONS

182. **Motion** by the Chairman of the Public Relations Committee on behalf of the Council: That the Annual Report of Council under "Public Relations" (Doc. A.R.M. 2, paras. 148-52) be received.

183. **Motion** by the Chairman of the Public Relations Committee: That the Annual Report of Council under "Public Relations" be approved.

ARMED FORCES

184. **Motion** by the Chairman of the Armed Forces Committee on behalf of the Council: That the Annual Report of Council under "Armed Forces" (Doc. A.R.M. 2, paras. 153-4) be received.

185. **Motion** by the Chairman of the Armed Forces Committee: That the Annual Report of Council under "Armed Forces" be approved.

ORGANIZATION

186. **Motion** by the Chairman of the Organization Committee on behalf of the Council: That the Annual and Supplementary Reports of Council under "Organization" (Docs. A.R.M. 2, paras. 155-69, and A.R.M. 3, para. 238) and proposals for amendments of Articles and By-laws (Appendix VI) be received.

Membership

187. **Motion** by RUGBY AND SOUTH WARWICKSHIRE: (1) That the net fall in membership of 366 over the years 1953 and 1954 contrasts unfavourably with the net increase of 3,718 in the years 1951 and 1952—this should be considered as a challenge, not a catastrophe. (2) That a small committee or subcommittee should be set up forthwith to consider this particular problem, seeking causes and suggesting remedies.

The Newly Qualified Practitioner: Pre-registration Posts

188. **Motion** by WESTMINSTER AND HOLBORN: That the Council should examine the availability of pre-registration posts in hospitals and report to the next A.R.M. (1956).

Autonomous Bodies

189. **Motion** by the Chairman of the Organization Committee: That the following recommendation of the Council be adopted:

That the autonomous powers of the General Medical Services Committee and the Central Consultants and Specialists Committee be renewed in respect of the year 1955-6.

That the Representative Body looks to these Committees to ensure (1) that no action be taken by either which may prejudice the interests of another part of the profession without full prior consultation with the appropriate interests, and (2) that their autonomous powers will be used so as to expedite and not delay the work of the Association.

190. **Amendment** by CITY OF EDINBURGH: That the word "affect" be substituted for the word "prejudice" in the recommendation.

Associates

191. **Motion** by the Chairman of the Organization Committee: That the following recommendation of the Council be adopted:

That in view of the provision under By-law 12 for the election of Complimentary Members of Divisions and Branches, the election of Associates be restricted to overseas Branches.

Amendments of Articles and By-laws

192. **Motion** by the Chairman of the Organization Committee: That the following recommendation of the Council be adopted:

That the Articles and By-laws of the Association be altered in the manner shown in Appendix VI to the Annual Report of Council, and that the Council be instructed to submit the amendments of the Articles concerned to an Extraordinary General Meeting of the Association.

193. **Motion** by RUGBY AND SOUTH WARWICKSHIRE: That if a motion adopted by the A.R.M. requires, for its implementation, an alteration to the Articles and/or By-laws, a draft of the proposed alterations should be forwarded to the sponsoring body for comment before publication. After publication thereof in the Annual Report of Council, it should be possible for any Division to move an amendment thereto which, if carried after due notice, would not delay implementation for a further year.

Remainder of Report under "Organization"

194. **Motion** by the Chairman of the Organization Committee: That the remainder of the Annual and Supplementary Reports of Council under "Organization" be approved.

CONSTITUTION OF THE ASSOCIATION

195. **Motion** by the Chairman of the Constitution Committee on behalf of the Council: That the Annual Report of Council under "Constitution of the Association" (Doc. A.R.M. 2, para. 170) be received.

196. **Motion** by the Chairman of the Constitution Committee: That the Annual Report of Council under "Constitution of the Association" be approved.

197. **Motion** by BATH: That in view of the fact that the medical profession is now divided into three sections, each organized as an autonomous body, the whole constitution of the B.M.A. should be revised to fit the requirements of

the present time; and that the Council of the Association should essentially be formed from the autonomous bodies, so that it can speak for the profession as a whole.

District Liaison Committees

198. **Motion** by CRY: That this Meeting considers that liaison committees organized on a district basis under the National Health Service, and consisting of members representing general practice, hospitals, and public health work, should be commended to all Divisions of the Association.

Divisions and Branch Functions

199. **Motion** by BUCKINGHAMSHIRE: That in the opinion of this Meeting, provided the Divisions in the Branch agree, each Division should be able to take on the functions of that Branch individually; and that the matter be referred to the Council for consideration.

Time Limits for Speeches

200. **Motion** by MID-CHESHIRE: That in order to expedite the work of the A.R.M. and yet allow further discussion of important matters, the time limit for speeches in the future should be reduced on all except specified motions and resolutions.

Delegation and Co-option

201. **Motion** by MID-CHESHIRE: That in order to relieve the burden of the Council and also to stimulate interest in the periphery, wider use should be made of delegation and co-option.

Combining of Annual Scientific and Representative Meetings

202. **Motion** by MARYLEBONE: That this Meeting asks the Council to investigate the possibility of combining the Scientific Meeting and the Annual Representative Meeting so that all members of the Association may have the opportunity of taking part in both the scientific and the medico-political activities of the Association.

Resident Medical Secretaries to Association Regional Offices

203. **Motion** by GLASGOW: That this Meeting recommends for the consideration of Council the appointment of resident medical secretaries to the regional offices in the larger cities throughout the United Kingdom, on the same lines as the successful Glasgow regional office. By such means, there would be decentralization of the Association's activities and a more efficient personal service would be made available to members in each area.

REFORM OF THE NATIONAL HEALTH SERVICE

204. **Motion** by the Chairman of the Amending Acts Committee on behalf of the Council: That the Annual and Supplementary Reports of Council under "Reform of the National Health Service" (Docs. A.R.M. 2, para. 73, and A.R.M. 3, para. 231) be received.

205. **Motion** by MARYLEBONE: That this Meeting desires further information on "the appropriate action taken with the Departments concerned on a number of the recommendations" passed by the Special Representative Meeting, December, 1951, and on the recommendations which necessitate amending legislation.

206. **Motion** by the Chairman of the Amending Acts Committee: That the Annual and Supplementary Reports of Council under "Reform of the National Health Service" be approved.

National Health Service and Politics

207. **Motion** by HARROW: That it is undesirable and detrimental to the interests of the health of the nation for the facilities and services of the National Health Service to be the means of gaining political capital, and the Council of the B.M.A. is requested to take such action as will cause the Health Service to be removed from the political arena.

REMUNERATION POLICY

208. **Motion** by the Chairman of the Committee *re* Remuneration Policy on behalf of the Council: That the Annual Report of Council under "Remuneration Policy" (Doc. A.R.M. 2, para. 102) be received.

209. **Motion** by the Chairman of the Committee *re* Remuneration Policy: That the Annual Report of Council under "Remuneration Policy" be approved.

SCOTLAND

210. **Motion** by the Chairman of the Scottish Committee on behalf of the Council: That the Annual and Supplementary Reports of Council under "Scotland" (Docs. A.R.M. 2, paras. 171-81, and A.R.M. 3, para. 242) be received.

211. **Motion** by the Chairman of the Scottish Committee: That the Annual and Supplementary Reports of Council under "Scotland" be approved.

WALES

212. **Motion** by the Chairman of the Welsh Committee on behalf of the Council: That the Annual Report of Council under "Wales" (Doc. A.R.M. 2, para. 182) be received.

213. **Motion** by the Chairman of the Welsh Committee: That the Annual Report of Council under "Wales" be approved.

OVERSEAS

214. **Motion** by the Chairman of the Overseas Committee on behalf of the Council: That the Annual Report of Council under "Overseas" (Doc. A.R.M. 2, paras. 183-6) be received.

215. **Motion** by the Chairman of the Overseas Committee: That the Annual Report of Council under "Overseas" be approved.

EMPIRE MEDICAL ADVISORY BUREAU

216. **Motion** by the Chairman of the Committee of Management of the Empire Medical Advisory Bureau on behalf of the Council: That the Annual Report of Council under "Empire Medical Advisory Bureau" (Doc. A.R.M. 2, para. 187) be received.

217. **Motion** by the Chairman of the Committee of Management of the Empire Medical Advisory Bureau: That the Annual Report of Council under "Empire Medical Advisory Bureau" be approved.

INTERNATIONAL MEDICAL VISITORS' BUREAU

218. **Motion** by the Chairman of the Committee of Management of the International Medical Visitors' Bureau on behalf of the Council: That the Annual Report of Council under "International Medical Visitors' Bureau" (Doc. A.R.M. 2, para. 188) be received.

219. **Motion** by the Chairman of the Committee of Management of the International Medical Visitors' Bureau: That the Annual Report of Council under "International Medical Visitors' Bureau" be approved.

MEDICAL FILMS

220. **Motion** by the Chairman of the Film Committee on behalf of the Council: That the Annual Report of Council under "Medical Films" (Doc. A.R.M. 2, para. 189) be received.

221. **Motion** by the Chairman of the Film Committee: That the Annual Report of Council under "Medical Films" be approved.

INTERNATIONAL RELATIONS

222. **Motion** by the Chairman of the International Relations Committee on behalf of the Council: That the Annual Report of Council under "International Relations" (Doc. A.R.M. 2, paras. 190-2) be received.

223. **Motion** by the Chairman of the International Relations Committee: That the Annual Report of Council under "International Relations" be approved.

OTHER ASSOCIATION ACTIVITIES

224. **Motion** by the Chairman of Council: That the Annual Report of Council under "Other Association Activities" (Doc. A.R.M. 2, paras. 193-207) be received.

Catering

225. **Motion** by the Chairman of Council: That para. 197 of the Annual Report of Council be approved.

226. **Amendment** by WINCHESTER: That it is, in the view of this Body, essential to improve the social amenities at Headquarters; and, to this end, this Meeting instructs Council to install a bar in the Hastings Room, with appropriate attendants during normal licensing hours.

227. **Amendment** by WINCHESTER: That Council be instructed to improve the quality of the catering and service in the dining-room.

Mental Illness

228. **Motion** by WANDSWORTH: That in acute mental illness the procedure required in order to obtain effective treatment and supervision is not satisfactory, and that Council be asked to examine and report on the problem.

Remainder of Report under "Other Association Activities"

229. **Motion** by the Chairman of Council: That the remainder of the Annual Report of Council under "Other Association Activities" be approved.

OTHER MOTIONS BY DIVISIONS

Whole-time State Salaried Medical Service

*230. **Motion** by MARYLEBONE: That this Meeting, representative of all branches of the profession, expresses its strong opposition to a full-time State salaried service, and reaffirms the resolution passed in May, 1946, in July, 1953, and again in July, 1954: "The medical profession is, in the public interest, opposed to any form of service which leads directly or indirectly to the profession as a whole becoming full-time salaried servants of the State or local authorities."

231. **Motion** by SOUTH STAFFORDSHIRE: That this Meeting reaffirms its opposition to any form of whole-time State salaried medical service.

Spens Reports

232. **Motion** by MARYLEBONE: That this Meeting reaffirms that the Spens Reports still remain the basis and yardstick in all negotiations on remuneration of doctors in every branch of the National Health Service.

Goodwill

233. **Motion** by HARROW: That this Meeting wishes to register a protest to the fact that such an important matter as the "goodwill issue" was debated by Council for a second time before the A.R.M. of 1954 and the previous decision rescinded after suspension of standing orders without previous notice of the motion being given to members of Council.

Annual Report of Council

234. **Motion** by SOUTH STAFFORDSHIRE: That Council be instructed to include in their Annual Report each year a list of resolutions affecting policy passed by the previous A.R.M. and the action which has been taken on each.

235. **Motion** by HARROW: That this Meeting instructs Council to include in its Annual Report a section tabulating the instructions received from the previous year's Representative Meeting and the action taken in each case.

ELECTIONS

236. **Elect**: Chairman; Deputy Chairman; 10 Members of Council by R.B. as a whole; 2 members of Council by Representatives of Scottish Constituencies; 1 member of Council by Representatives of Constituencies in Wales (including Monmouthshire); and members of Standing Committees and of A.R.M. Agenda Committee.

MINUTES

237. **Motion**: That the Chairman be empowered, on behalf of the Meeting, provisionally to approve the Minutes of this Meeting.

238. Any other business.

DISTINCTION AWARDS TO CLINICAL TEACHERS

STATEMENT BY JOINT CONSULTANTS COMMITTEE

In the terms and conditions of service for hospital medical staff, introduced in 1949, provision was made for the payment of distinction awards to university clinical teachers holding honorary contracts in respect of their hospital work. Thus, the holder of a whole-time clinical teaching post was to receive the whole of any award made, and a part-time teacher the same proportion of the award as his university salary bore to the salary he would have received if his post had been a whole-time one.

After giving the matter a great deal of thought the Ministry came to the conclusion that it was illogical that a clinical teacher, whose contribution to the National Health Service might be comparatively small, should receive the whole of a distinction award simply because he was a whole-time member of a university teaching staff. On the contrary, it felt that the distinction award should bear some relation to the amount of time devoted to the hospital service.

Accordingly, the Ministry approached the Joint Consultants Committee on the matter, and, when advising hospital boards, in 1951, upon the arrangements to be made for the payment of distinction awards to clinical teachers, instructed that they should be notified that the basis of apportionment was provisional and subject to review.

Discussions with Ministry

The Joint Committee and the Ministry thereupon entered into detailed discussion of the problem, in the course of which the Joint Committee consulted representatives of clinical professors, and the Ministry consulted the University Grants Committee and the Committee of Vice-Chancellors.

The view which the Joint Committee conveyed to the Ministry was that, while it was anxious to avoid real anomalies, there were important considerations that should not be lost sight of in applying distinction awards to whole-time clinical teachers. For example, the Committee thought that it would be quite wrong to assume that the contribution of a clinical teacher to the National Health Service should be measured solely on the basis of the time actually spent in hospital. Moreover, it would ultimately be detrimental to the Service if, in seeking a solution to possible anomalies in the payment of distinction awards, anything was done which would have the effect of attracting the best candidates away from an academic career.

As a basis for discussion the Joint Committee therefore suggested (a) that the holders of whole-time clinical teaching posts responsible for a "substantial" amount of clinical work related to the National Health Service should receive the whole of the award, except where they were entitled to engage in private practice and retain the fees accruing therefrom; in these exceptional cases the teacher should be

treated in the same way as a part-time consultant and be paid a fraction of the award directly related to the amount of time devoted to clinical responsibility under the National Health Service; and (b) that in the case of holders of whole-time teaching posts responsible for a "less substantial" amount of clinical work the award should be apportioned in relation to the time devoted to the National Health Service; this, the Committee urged, might in some instances appropriately be assessed as full-time, and in all cases should take account not only of the actual clinical work but of the responsibilities assumed, and of the less easily assessed value to the Service of being constantly on hand for the giving of advice, which contribution to the National Health Service should be liberally assessed.

Agreement

The Ministry accepted this approach to the problem, but felt that it would be necessary to define "substantial" and "less substantial" more precisely in order to determine which teachers should continue to receive the full award, and to work out a basis for apportioning awards in other cases.

To this the Joint Committee agreed, and eventually the formula for applying distinction awards to clinical teachers recently announced was agreed in Committee B of the Medical Whitley Council.

Boards were advised by the Ministry that, before determining the amount of the award in accordance with the formula, the time spent on clinical work by the teacher should be assessed not at a nominal figure, such as might appear in the teacher's honorary contract, but by reference to the average amount of time he might properly be said to spend on such work in actual practice. Moreover, "clinical" work was defined in fairly wide terms, including research related to the diagnosis or treatment of individual patients.

The new arrangements have been notified to hospital boards, and through them to clinical teachers holding honorary contracts to whom distinction awards have been made. It is understood, however, that already difficulty has been experienced in arriving at a fair assessment of the time given by clinical teachers to hospital work, and the Joint Committee wishes to remind any clinical teachers who may be affected by these new arrangements that they should in the first place endeavour to reach agreement with their employing authority on whether the whole award, or what proportion of it, would be appropriate in their case. Where agreement is not possible, the Joint Committee wishes to remind those concerned of the Ministry's instruction that in cases of difficulty boards may refer to the Ministry for guidance. In any case the Joint Committee itself would be very pleased to advise in individual cases.

TRADE UNION MEMBERSHIP

The following is a list of local authorities which are understood to require employees to be members of a trade union or other organization:

Metropolitan Borough Councils.—Fulham, Southwark.
Non-County Borough Councils.—Crewe.
Urban District Councils.—Houghton-le-Spring.

The following amendments to the *National Formulary, 1955*, have been issued: Page 15, line 24: for "sodium carbonate" read "exsiccated sodium carbonate"; Page 27, lines 14 to 19: amend to: "The usual dose [of chloramphenicol] for adults is 2 to 3 grammes, daily, in divided doses at six-hourly intervals. Children should receive 50 to 75 milligrams per kilogram of body weight, daily, in divided doses. The total dose for adults should not exceed 26 grammes; for children it should not exceed 100 milligrams per kilogram (2.2 lb.) of body weight for seven days"; Page 107, lines 24 to 26: amend to: "When mist. alumin. hydrox. et bellad. is prescribed, mist. alumin. hydrox. containing tincture of belladonna, 7½ m. in each dose, shall be dispensed. Dose: One teaspoonful, suitably diluted."

PRIVATE PRACTICE COMMITTEE

A meeting of the Private Practice Committee of the Association, under the chairmanship of Dr. ALEXANDER BROWN, was held on May 4.

Dr. T. L. SCOTT, honorary secretary of the Medical Officers of Schools Association, attended for a discussion on a matter which had previously occupied the Committee, the practice of boarding schools to place all their pupils on the list of the school medical officer, treatment being given under the National Health Service. Some members of the Committee had felt that an important point of principle was involved here, and that parents should have freedom of choice, not only to select a doctor for their children at school, but also to decide whether treatment should be under the National Health Service or given privately. Dr. Scott said that his association felt that any alteration of the present arrangements whereby all pupils were on the list of the school medical officer would be impracticable. Moreover, it would be psychologically bad for the individual pupil to be isolated from the rest of his community so far as medical treatment was concerned, and might deprive him of the nursing and sanatorium facilities which boarding schools provided.

In discussion it was pointed out that the choice had really been made before the pupil entered the school, and that "freedom of choice" must be modified in these circumstances. Dr. O. C. CARTER contended that although it might be administratively convenient to have all the pupils in one school under one doctor it did cut across the principle of private practice. Dr. L. W. BATTEN pointed out the hardship on the child or the parent who had no confidence in the school doctor. Others, however, argued that the free choice lay in the choice of the school, which included the medical officer. One member said that Dr. Scott had referred to the psychological effect on the isolated child who was receiving treatment in a different way from the rest of the school, and asked why he should be considered as isolated. Under different arrangements, might there not be many parents who would choose to have their children treated privately? Dr. SCOTT replied that requests to that effect had been very rare.

The Committee came to the conclusion that, although this special position cut across the principle of private practice, the headmaster, while the children were at boarding school, was in the position of parent, and had the right to choose a doctor for his pupils just as he chose a teacher for them, and that it would be undesirable to alter existing practice.

Payment of Admiralty Surgeons

The Committee also received a practitioner who had protested against the new scheme of payment for Admiralty surgeons and agents who were also in contract with the N.H.S. He said that in his case the new rate—a temporary resident fee plus mileage—worked out at a financial disadvantage. Some members of the Committee suggested that Admiralty surgeons were not really in a different position from other practitioners in regard to the treatment of Service personnel on leave as temporary residents, but it was agreed to take up with the Admiralty the special points which had been brought forward.

At a previous meeting the Committee had agreed to recommend that practitioners engaged predominantly in private practice should be asked whether they wished to prescribe for private patients on Form E.C.10, and would agree to any reasonable safeguards against wrongful prescribing. This was in connexion with the question of the provision of drugs for private patients. When the recommendation came before Council, however, it was withdrawn on the request of the Chairman of the General Medical Services Committee, and that Committee subsequently asked that it should be amended by the substitution of the word "solely" for "predominantly." After some discussion the amendment proposed by the General Medical Services Committee was accepted.

The Committee had before it a report that some 15 nominations had been made by Divisions in England in connexion with the selection at the Annual Representative Meeting of six candidates for the support of the Association in the election to the General Medical Council in April, 1956. A member drew attention to the fact that the direct representatives on the General Medical Council were the only representatives of general practice on that body, the other members being academic representatives and so forth, practically all of them specialists or teachers. Direct representation was therefore the only port of entry for general practitioners, and that was a point to be borne in mind in deciding on nominations.

The question of revising previous agreements on fees for medical examinations and reports in the light of the recent increase in the fee for the ordinary form of life assurance was considered. A document setting out the details of fees agreed by the Committee since the war was put in, and it was agreed to remit the examination to a small subcommittee headed by the Chairman.

Hire Purchase Control Order

It was reported that representations had been made to the Board of Trade seeking a special concession, similar to that made under the previous Order, to enable young doctors entering practice to purchase their initial car over a period extending to three years. It was reported that the Board of Trade had indicated that no general relaxation of this kind could be entertained, and that the type of concession sought must be reserved for dealing with quite exceptional individual emergencies.

Candidates for Teachers' Training Colleges

The Ministry of Education is to be asked to agree to the completion by the candidate's own doctor of medical reports required for admission to teachers' training colleges.

Representations for an increase in fees are to be made to the New Zealand Government for the examination reports required by emigrants, and to the Services departments for certificates of inoculation of families proceeding overseas.

TIME IN COURT

At the 1954 Representative Meeting in Glasgow a resolution from Swansea was debated (*Supplement*, July 10, 1954, p. 13) calling on the Association to approach the Lord Chancellor's Department to seek drastic changes for the better in the present methods of calling and hearing medical witnesses. This resolution, which was referred to Council, had arisen as the result of a case in which it was stated that a single-handed general practitioner had been required to spend four days away from his practice, his evidence being taken only on the fourth day.

Recently a deputation from the Medical Witnesses Subcommittee of the Private Practice Committee met representatives of the Lord Chancellor's Office at the House of Lords, and the difficulties of doctors attending court were discussed. A number of cases were quoted. Stress was laid on the shortness of the notice given to attend court and the consequent difficulties in making deputizing arrangements. Assurance was received that the points raised, and the suggestions made for relief of the difficulties, would be put before the Lord Chancellor. In addition, an undertaking was received that the Department would be prepared to look into any case brought to the notice of the Association where serious and apparently unnecessary hardship had been caused to medical witnesses.

Dr. S. A. Forbes has retired from the chairmanship of the Croydon Executive Council. At a meeting of the Council tributes were paid to Dr. Forbes's work over a long period for Croydon's Health Services, and a presentation was made to him and Mrs. Forbes.

THE DAIN FUND

REPORT OF THE TRUSTEES, 1954-5

This report covers the period April 21, 1954, to April 20, 1955, during which many requests for advice and help have been received. It has been possible for the Fund to continue the grants for the school year 1954-5 to three old applicants and in addition to assist eight new cases. The continuing grants involve an expenditure of £191. Satisfactory reports have been received on the progress of these children from the schools and universities at which they are studying.

Grants to meet sudden financial emergencies were made in connexion with three of the new cases:

Case 1.—A doctor's widow applied for help towards the school fees of one of her three children in order that he might remain at his present school until he sat for the Epsom College entrance and scholarship examination.

Case 2.—A young newly qualified doctor asked for assistance towards his daughter's school fees during his pre-registration year.

Case 3.—An elderly doctor, who had retired from practice owing to ill health, was finding great difficulty in maintaining his son during his final year of music study. The Trustees were able to ensure that the boy's studies would not be interrupted.

The grants allowed in these emergencies amounted to £145. Details of the other new applicants are given below:

Case 4.—The son of a deceased doctor asked for help with his university fees. He had embarked on a three-year course of training with a view to taking up teaching. He is also being assisted by the Royal Medical Benevolent Fund, and it is hoped that, after his first year, the local education authority will be prepared to make a grant available to him.

Case 5.—A doctor's widow made application for assistance for her two children, both training for the medical profession. The younger child holds a scholarship to the medical school and is in receipt of a Ministry grant.

Case 6.—A doctor's widow made application for help towards the medical school fees of one of her sons. A younger boy, still at school, is in receipt of a bursary and his fees are at present fully met.

Case 7.—A doctor's widow asked for help to maintain her son at university, where he is training to be a doctor.

Case 8.—A doctor's widow applied for assistance towards the school fees of one of her two daughters. It was possible, in co-operation with the local medical committee, to make arrangements for this child.

The grants allowed in these cases amounted to a total sum of £594. It is likely that some of these applicants will need assistance over a number of years.

This report shows the importance of the work of the Dain Fund, a total of £930 having been given in grants during the past year.

The support of many individuals and committees is greatly appreciated by the Trustees. As the Fund relies almost entirely on this support the Trustees are particularly grateful to those local medical committees who so generously give regular contributions. It is hoped that other committees will follow their example and that members of the profession will give real and practical help to the Fund by completing a form of covenant for seven years or by sending a donation to the Secretary.

The Trustees wish to acknowledge the help and co-operation of the Royal Medical Benevolent Fund, the Royal Medical Foundation of Epsom College, and certain local medical committees for their share in the responsibility of some of the cases assisted during the year.

H. GUY DAIN,
Chairman of the Trustees.

If draft regulations submitted to the National Insurance Committee are approved, people will be able to draw their benefit in any country in the world. At present National Insurance retirement pensions, widows' benefits, or guardian's allowance can be paid to people resident abroad only if they are living in the Commonwealth or in the Republic of Ireland.

HEALTH SERVICES IN NORTHERN IRELAND

In June of last year the Minister of Health and Local Government in Northern Ireland (Dame Dehra Parker) appointed a committee to look into the health services of the province. Its terms of reference were restricted to matters mainly local in character, falling outside those of the Guillebaud Committee which are common to both Northern Ireland and Great Britain, but inevitably there has been some overlapping. The chairman of the committee was Mr. H. G. TANNER, for seven years chairman of the South-western Regional Hospital Board, Bristol, and the other members were Sir GEORGE HENDERSON, lately Permanent Secretary of the Department of Health for Scotland, and Mr. J. V. S. MILLS, formerly Chief Crown Solicitor for Northern Ireland. The committee, to which the Northern Ireland Branch of the British Medical Association, along with many other bodies, gave evidence,¹ has now reported.²

The administrative structure of the National Health Service in Northern Ireland differs from that of Great Britain in that the powers are placed in the hands of nominated bodies which cannot readily be called to parliamentary account. The principal body is the Hospitals Authority, which provides hospital and specialist services throughout the province, and whose members are appointed by the Minister with the proviso that not fewer than one-third must be medical practitioners, and not less than one-fourth must be appointed in consultation with management committees. The other principal body is the General Health Services Board, which arranges for the provision of general medical and other services and controls the admission of doctors to the medical list. Its members are again appointed by the Minister with certain provisos.

Criticisms of the Service

There has been some parliamentary criticism of the service, but except on one point—a constitutional one—this does not seem to have been directed to any laxity or maladministration. The Hospitals Authority has indeed an impressive record of achievement. During the seven years of its existence the number of hospital beds has increased by 10%, laboratories have been built or enlarged, and x-ray departments provided. Admissions to hospitals in 1953 were 40% higher than in the year before the health service was instituted, and out-patient attendances have increased by 77%.

"The general picture," says the report of the committee, "is of vigorous and continuous growth. . . . In a field where true comparisons are difficult to make, we venture the opinion that the Northern Ireland record of progress in the last few years will bear examination against the record of any other area of the United Kingdom."

Nevertheless, the committee has a sheaf of recommendations to present. The chief of these is that the Hospitals Authority and the General Health Services Board should become agents of the Ministry. It is with the Ministry and not with nominated bodies that responsibility at the highest level for finance and policy should rest. At present the status of these bodies is equivocal. If the recommendation is carried out these authorities will be in the same position in respect to the Ministry as the regional hospital boards in Great Britain.

The committee goes on to make certain detailed recommendations: that the number of members of the Hospitals Authority should be 20 or 24 instead of a possible 37; that only one-fourth and not one-third should be doctors; that the terms of office of members should be reduced from five years to three; and that, both on the Hospitals Authority and on hospital management committees, members who have served for two consecutive terms should be ineligible for reappointment for twelve months. It is also felt that the

hospitals should be in fewer groups; at present 36 hospital management committees control 67 hospitals. A more equitable distribution of hospital endowments is suggested, not a strict pooling, but some redistribution whereby each management committee may have a reasonable fund at its disposal. At present, to take an extreme case, a general teaching hospital has several hundred thousand pounds' worth of endowments under its control, while a hospital of similar size, though not strictly of comparable type, has virtually no endowment funds.

Consultant Appointments

It is recommended that, while hospital management committees should be consulted about consultant appointments, the Authority should not be required to consult hospital or medical staffs committees; any consultation of the latter should be by the management committee. Contracts held by consultants and specialists should be reviewed at regular intervals. Facilities should be afforded to consultants and specialists to keep abreast of the latest developments of medical knowledge by attending teaching hospitals in Belfast. Distinction awards should not be made by the Authority—a practice which might lead to the suspicion of nepotism or corruption, though the committee is careful to say that the integrity of the present awards committee is beyond reproach. It favours distinctions being granted through a central committee having jurisdiction over the whole of the United Kingdom, to which Northern Ireland advisers could be attached.

General Practice

With regard to the General Health Services Board, whose functions are primarily regulatory and offer less scope for the determination of policies with important financial implications, the committee nevertheless recommends that, like the Hospitals Authority, it should become the agent of the Ministry, the size of its membership be reduced, and the proportion of its lay membership be increased. Part-time appointments of general practitioners to hospitals should be encouraged, and opportunities given to hospital doctors to engage in part-time general practice. The young graduate in the early stages of his career should not be confronted with the formal choice of a career in hospital or in general practice.

The committee has examined the possibilities of some alternative method of payment for general practitioners, such as a basic salary combined with a smaller capitation fee or payment on a fee-for-service basis, but neither commends itself. The first would be an uneasy compromise, and the second would create more difficulties than it solved. Nor does it suggest any change in the present limits of maximum permitted lists.

Some criticism has been made of the General Health Services Board on the ground that it has not so far established a health centre in the province; recently it has been more attracted by the idea of encouraging group practice. The committee thinks it would be desirable if the Board were, in collaboration with the professions concerned, to establish a small centre as a pilot scheme. Experiments in group practice could proceed simultaneously.

Prescribing and Certification

High prescribing costs are troublesome in Northern Ireland as elsewhere. Prescribing costs there are higher than the average for England or Scotland. Figures for individual, areal, and provincial costs are to be issued quarterly to practitioners, and it is hoped in this way to elicit their co-operation. Consultants cannot escape responsibility. They frequently call for the prescription of most expensive drugs on a lavish scale. One consultant is mentioned as prescribing 11 different items for a single patient.

An even more serious indictment concerns lax certification. Doctors interviewed by the Ministry invariably say

that they would lose their patients if they adopted more rigorous standards. One practitioner said that he never refused a certificate. The committee thinks that the practice of interviewing doctors whose certification appears to be lax should be continued, and the possibility of disciplinary action under the regulations should not be dismissed. A concerted effort should be made to bring home to general practitioners the necessity for a higher standard of certification, and it is suggested that the British Medical Association would be prepared to co-operate with the Ministry in this respect.

The committee concludes on an appreciative note. Given the spirit of subordinating local interests to the common good, it sees no reason "why the health services of Northern Ireland, an area small enough to simplify the task of co-operation at all levels, should not be among the most efficient and effective in the United Kingdom."

THE HOSPITAL, THE G.P., AND THE DISTRICT NURSING SERVICE

The Queen's Institute of District Nursing held a meeting at Church House, Westminster, on May 12, when the subject of discussion was the link between the hospital, the general practitioner, and the district nursing service. In the discussion, to which hospital almoners and district nursing superintendents contributed, the general-practitioner point of view was put forward by Dr. G. O. BARBER, of Great Dunmow, Essex.

Dr. Barber said that the link between the general practitioner and the nursing service was a close one, but the link between the hospital, the general practitioner, and the nursing service was tenuous and non-existent. His personal experience of district nurses was confined to rural areas, where the nurse was in the same position in relation to the general practitioner as the house staff of a hospital in relation to the consultant. She knew what was going on in the village, the general set-up and the social background, much better than the practitioner did, and it was from the district nurse that he obtained much useful information about the anxieties and difficulties in the homes of his patients. There were six district nurses in his neighbourhood, Dr. Barber said, and he met every one of them at least once a week. He worked with them nearly as closely as a doctor in a hospital worked with the nurses there, and he felt that this happy relationship should be extended into the towns so far as possible. The difficulty in the towns was that a district nurse might cover an area where there were as many as sixty doctors, and she could hardly keep in touch with all of them.

Teaching the Student

Until he had started in general practice in Essex, about two years after he had qualified, he had not known even of the existence of district nurses, but this lack of knowledge on the part of medical students and young house-surgeons was now realized and was being remedied. Until recently medical students had not been taught anything about general practice and the way in which it differed from hospital work, but now, during their time in hospital, they were being sent out to general practitioners, so that they could see a little of the work that was done by general practitioners, the treatment that they gave to their patients, and the kind of relationship which they had with their patients. The general practitioners to whom the students were sent should also introduce them to the workers in the other health services, including the district nurse and the health visitor.

Dr. Stephen Taylor, in his book entitled *Good General Practice*, had devoted a chapter to the work of the district nurse, which he regarded as of great importance, and he referred to the very great variations that existed in different parts of the country. Dr. Taylor had said that in some

districts the hospital, the general practitioner, and the district nurse worked closely together, whereas in other districts the general practitioner was hardly conscious of the existence of the district nurse and did not want her help.

The health visitor also should be a member of the team, and the link should be extended to her. It was only recently that she had been encouraged to get into contact with the local general practitioners, but unless she did so she would not be of as much help to the patient or to the health service as a whole as she might be. She could be of particular help in the case of problem families.

Getting Together

To the district nurse he would say: "Get to know your general practitioners. Push past any little difficulties there may be, particularly with the young ones, and sometimes with the old-established ones." To the general practitioner he would say: "The important thing is to get to know your district nurses." To the health visitor he would say: "Get to know your general practitioners. Show them that you want to help them." To the teacher in the hospital he would say: "Learn something about general practice before you set up to teach young students to be general practitioners, and if you start scratching the surface of general practice you will come across the district nurse straight away."

He would like, in conclusion, to describe a way in which an attempt was made to carry this out in the little place in Essex where he practised. For many years now it had been the custom for a bus-load of medical students to come there from hospital one afternoon in the summer, and he and his wife invited them to an afternoon party, to which they invited also the other doctors in the neighbourhood and their wives, the dispensers and the secretaries, the district nurses with their bags, the health visitors, the local medical officer of health, the assistant medical officer of health, the duly authorized officer, and others. After the medical students had been introduced to them in the garden, the different sections of workers went to different rooms in the house, and the students spent about half an hour in each room. The district nurses had a large room to themselves, where they spread out all their equipment. The students returned to London with a different idea about general practice and about the subject which would play such a large part in their future lives—the link between the hospital, the general practitioner, and the district nursing service.

HEALTH SERVICE FRAUDS IN SCOTLAND

In his report in the summarized accounts (published as a White Paper, H.M.S.O.) for the year ended March 31, 1954, of the Scottish regional hospital boards, boards of management, executive councils, and Dental Estimates Board, the Comptroller and Auditor General, Sir Frank Tribe, refers to two cases of fraud. One case concerned a hospital board of management and the other an executive council. According to a report in the *Scotsman*, Sir Frank Tribe said that both frauds—one involving the sum of £5,919 and the other £8,309—were made possible by failures "to observe normal rules and safeguards in the conduct of financial transactions."

In the board of management fraud the loss was owing to misappropriation of cash receipts by a cashier over a period of more than two years. The other case occurred through the defalcations of the former clerk and finance officer to an executive council over a period of four years from 1949. Both men received prison sentences. In the executive council case members of the council had signed incomplete or blank cheques.

Health Service authorities in Scotland have been informed that in no circumstances are cheques to be signed unless they are complete in every respect and are supported by documentary evidence enabling the signatories to verify that the payments to be made are fully approved and in order.

CENTRAL CONSULTANTS AND SPECIALISTS

An all-day meeting of the Central Consultants and Specialists Committee was held on May 12, with Dr. T. ROWLAND HILL in the chair.

Proposed Conference of Hospital Medical Staffs

The CHAIRMAN reported that at the request of the Committee the Executive had considered the advantages and disadvantages of holding a representative annual conference of hospital medical staffs. Such a conference would enable problems affecting hospitals and consultants services to be ventilated on a national scale, and there were other obvious advantages. The difficulty lay in arranging a representative conference which was not unwieldy. There were 500 management committees throughout the country, and even one representative sent up from each group hospital medical advisory committee would produce a conference unreasonably large. Nevertheless it was thought that the advantages outweighed the disadvantages.

Mr. C. E. KINDERSLEY pointed out that there already existed regional committees which, coming together, might well form the basis for any conference designed to elicit consultant opinion, and he suggested that the regions should discuss this matter before any new organization was evolved.

Dr. D. F. HUTCHINSON said that on the side of general medical services the annual conference of representatives of local medical committees had proved very valuable; but, in reply to a suggestion that one of the possible advantages ascribed to a consultants' conference was that it would enable the forces of publicity to be marshalled in support of consultants' interests, he stated that the press had always been excluded from the conference of local medical committees.

It was agreed that before proceeding further with the idea, which was generally favoured, the views of the regional committees should be sought.

Waiting-time in Out-patients

It was reported that a questionnaire on waiting-time in out-patients was to be sent to all hospital group committees. It was the view of the Committee that the questionnaire would be useful from the point of view of ascertaining the correlation between the number of patients and the number of nursing and lay staff in attendance. Professor STRACHAN pointed out that one factor often overlooked was the number of patients who turned up at the hospital without any appointment.

Civilian Consultants Employed by War Office

The CHAIRMAN said that the terms and conditions of civilian consultants employed by the War Office were being examined. The Armed Forces Committee of the Association had submitted proposals for improvement in remuneration and conditions of service of serving officers, and it was agreed that consultations should take place on the subject between representatives of the Consultants Committee and of the Armed Forces Committee.

Hospital Medical Staffing

The CHAIRMAN gave a report on the consideration given by the Joint Committee to the revised report of the Medical Staffing Committee and the comments made upon it. Preliminary discussions had been opened with officers of the Ministry.

It had been made clear to the Ministry that the Joint Committee had in mind a survey of consultant establishments initiated at the periphery, the results of which should be collated at regional level and submitted to a central committee on which the profession would be represented.

Outline for Whole-time and Part-time Service

The Ministry and the Joint Committee had agreed to a statement to be published in the medical press on the

question of option for whole-time and for maximum part-time service for consultants in the National Health Service.

Mr. HOLMES SELLORS said that this statement was an advance on anything which had been said before. Hitherto they had had oral statements; now they had it in black and white. Mr. LAWRENCE ABEL referred to the indefiniteness of whole-time employment. Did it mean that the whole-time consultant was to do no medical work outside his prescribed 38½ hours a week? One whole-time consultant on the Committee stated that one of his colleagues—also a whole-timer—had recently been working 60 hours a week. Mr. LAWRENCE ABEL thereupon asked why their colleagues should be allowed to do double time without being properly paid for it. It was also pointed out that part-time consultants were frequently putting in far more than the prescribed time, some surgeons operating for six or eight hours in what was called one session.

Remuneration of S.H.M.O.s

The representative of the S.H.M.O. Group Executive Committee brought forward a resolution of his Group expressing grave dissatisfaction at the rejection by the Management Side of the Staff Side's claims for an increase in the salaries of S.H.M.O.s (*Supplement*, May 7, p. 220) and for remuneration in accordance with the consultant scale of all S.H.M.O.s occupying posts established as consultant or which would, for the purpose of replacement, be so regarded.

He said that at the meeting of his Group extreme dissatisfaction was expressed at the refusal of this reasonable claim, and it was urged that both matters be pressed to arbitration at the earliest possible moment. The differential award last year had occasioned a good deal of bitterness, but they had been led to believe that the justice of their claim would still be recognized. It was difficult for the rank and file S.H.M.O.s not to feel that they had suffered a further decline in status. It was not solely a question of the inequity of the award of April, 1954, from the point of view of cost of living or the Spens report; the S.H.M.O. was now one of the most poorly paid grades in medicine, and the rejection of so modest a claim was a bad omen for other claims, especially those put forward in the Strachan report.

Mr. NICHOLSON-LAILEY, Dr. PETER EDWARDS, and other members of the Committee supported this protest, and it was agreed to pursue these matters with the Management Side. The S.H.M.O. Group Council also asked for permission to appoint a second representative on the Central Committee, which, the single representative said, would be of great assistance in putting forward their point of view.

After some discussion, however, it was felt inadvisable to add to the number of seats on the Committee. On another point concerning S.H.M.O. representation on regional committees, the CHAIRMAN pointed out that the organization subcommittee of their own Committee was studying the problem. It was agreed to ask the subcommittee to look into both proposals concerning S.H.M.O. representation.

Mileage Allowances

Detailed statements on the estimated cost per mile of running and maintenance of cars, obtained from the Automobile Association and the Royal Automobile Club, were remitted to the Executive for examination and comparison with the present mileage allowances paid to hospital staff.

Part-time Consultants' Income Tax

A report was laid before the Committee of a meeting between representatives of the Association, headed by the Chairman of the Committee (Dr. Rowland Hill), and of the Board of Inland Revenue on the question of assessment of part-time consultants for income tax. (The report appeared in the *Supplement* on May 14, p. 227.) Dr. Rowland Hill was congratulated by the Committee on the way in which he had presented the case.

It was pointed out that it might help to allay the anxieties of consultants if attention were drawn to the significant point that Somerset House agreed explicitly that any man who was running his private practice at a loss could set off his loss against his hospital salary. This document might well be brought to the attention of local inspectors of taxes. Another point was that the officials of Somerset House expressed themselves ready to co-operate in the test cases. It was made clear that the report was an agreed one between the officials of Somerset House and themselves.

Correspondence

The Problem of the Aged

SIR.—The mis-statements attributed to Lord Beveridge in his Winchester Address (*Supplement*, April 30, p. 207) cannot be allowed to pass. Table I shows his figures for the age distribution in Great Britain together with those from the Registrar-General's *Quarterly Return for England and Wales* adjusted to Great Britain by the addition of one-ninth for Scotland.

TABLE I.—Age Distribution, Great Britain, in Millions

Age Group	1951 B.	1953 R.-G.	1973 R.-G.	1979 B.	1983 R.-G.
0-14	6.0	11.0	10.3	5.5	10.4
Men 15-64, women 15-59	22.0	31.4	31.9	24.0	31.6
Men 65 and over, women 60 and over	6.8	6.9	9.2	9.5	9.8
Total	34.8	49.3	51.4	39.0	51.8

B., Lord Beveridge; R.-G., Registrar-General.

It will be seen that Lord Beveridge credits the country with little more than one-half of the children and only about two-thirds of the workers actually existing. Table II shows that Lord Beveridge is equally at fault in his estimate of the number of workers per pensioner.

TABLE II.—No. of Workers per Pensioner

	1951	1953	1973	1979	1983
B.	3.25	4.6	3.7	2.5	3.3
R.-G.					

Apart from these inaccuracies Lord Beveridge makes two cardinal blunders. In the first place, he says that the problem of the aged "arose through the dramatic decline of birth rates in Britain 75 years ago, changing the age structure of our population in this century." Between 1891 and 1931 the number of births fell by about one-third. Suppose this change had taken place suddenly in 1892, that the number of births had since remained unchanged at the lower figure (as indeed it did) and there was no change in mortality. The resulting age distribution would have been as shown in Table III.

TABLE III

Age Group	1891		1921		1951		1981		1983 Projected by R.-G.	
	No.	%	No.	%	No.	%	No.	%	No.	%
0-14	10.4	35.0	7.0	29.7	7.0	34.0	7.0	35.0	9.4	20.1
M 15-64, F 15-59	17.4	58.7	14.7	62.3	11.7	57.0	11.6	58.7	28.6	61.0
M 65 and over, F 60 and over	1.9	6.3	1.9	8.0	1.9	9.0	1.3	6.3	8.8	18.9
Total	29.7		23.5		20.6		19.8		46.8	

Figures in millions.

By 1921 pensioners, unchanged in number, would have risen from 6.3 to 8.0 through the decline in those aged 0-30. By 1951 the percentage of pensioners would have risen still further to 9.0 because all the workers as well as

the children would have suffered a one-third loss. By 1981 the pensioners would themselves have become involved in the one-third loss, so that the original age distribution would have been restored. A drastic reduction in births therefore has only a transient effect on the percentage of pensioners.

I have assumed that after 1891 the number of births remained constant at the lower figure. Actually this could not have happened. For the reduction in children would in course of time have led to a reduction in parents, and this in turn to a further reduction in children. A fall in the birth rate acting alone must continue until the race is extinguished.

The fall in the birth rate was accompanied by a more momentous event, a rise in the expectation of life. This brings us to Lord Beveridge's second blunder, his statement that "the whole problem was one for the next 30 to 50 years. The distortion of the age structure would pass." But how can it pass? The whole aim, or at least the chief aim, of the Welfare State is to increase the expectation of life, to convert the triangular age-pyramid into a rectangle, so that everyone lives to 80 or 90. Comparison of 1891 and the projection for 1983 (Table III) shows how far we are moving in this direction. An aged population is a permanent feature of civilized society. Nothing could prevent it except wholesale slaughter of the aged. The sooner everyone understands this the better. It is astonishing that Lord Beveridge appears to have such an imperfect comprehension of the consequence of policies which he has done so much to further.—I am, etc.,

Chesham.

FERANGCON ROBERTS.

Anonymity in Broadcasting

SIR.—Professor L. J. WITTS has expressed the opinion that "it is contrary to the public interest that responsible medical men should be prohibited from speaking or appearing in person in sound and visual broadcasting" (*Supplement*, January 8, p. 12). Dr. F. H. TYLER, of Birmingham, believes that "no other profession has attempted to impose such a ridiculous restriction on the presentation to the public of the views and personalities of its members . . . broadcasting provides unrivalled opportunities for the doctor as a health educator which are vitiated by anonymity" (*Supplement*, January 22, p. 23).

In paragraph 105 of this year's Report of Council it is stated that "the Council has under review the question of the publicity arising when medical practitioners take part in radio and television programmes or contribute to the Press" (*Supplement*, March 19, p. 95). The question is undoubtedly one of the first importance to the life of the profession and should be carefully considered from different points of view by the Representative Body. May I suggest that the Agenda Committee could help by arranging for the report of the Central Ethical Committee to be discussed at a much earlier stage in the proceedings of the forthcoming A.R.M.? I endeavoured to express a dissentient view when the report of the Central Ethical Committee was being considered at Cardiff in 1953. It was most difficult: many members had left for home and others on the platform and in the body of the hall had their eyes on the clock. On that occasion I did submit that anonymous views and statements by professional men were most undesirable. Indeed, Sir, the serious disadvantages of anonymity may well outweigh those of improper publicity.—I am, etc.,

West Clandon, Surrey.

C. P. WALLACE.

Remuneration of Public Health Medical Officers

SIR.—There will be profound disappointment at the award of the Industrial Court (*Supplement*, May 7, p. 214), which leaves public health medical officers still the worst-paid branch of the profession. I cannot agree with your annotator (*Journal*, p. 1142) that the "long-term effect . . . is difficult to foresee." I should have thought it was all too obvious that the long-term effect will be to discourage

the recruitment of able and ambitious men to preventive medicine. The most disturbing feature of the award, however, is not the meagre increases granted but the fact that local authorities are still given discretion in fixing salary scales within a range determined by population. I understand the Association has not yet finished fighting the more clamant injustices which followed the earlier award, and medical officers of county boroughs, health resorts, and similar areas with special claims can have but little confidence that they will receive adequate recognition for their additional responsibilities.

The employers' argument that the earlier award (No. 2285) showed that the Court accepted the principle of parity with other local government officers is refuted by the fact that the minimum commencing salaries for medical officers were fixed at a higher point than those of comparable local government officers. This principle has been adhered to in the present award, although it can be rendered nugatory by the employing authority giving the medical officer of health a smaller increment above his minimum than the other officers receive above their respective minima, and thus equalizing the salary scales of the various officers.

What is the next step? It is gratifying, if surprising, to read that "both sides to the dispute were agreed that . . . they would be able to agree on the salaries of the remaining categories of medical officers." Under Award No. 2321 deputy medical officers at present receive a commencing salary which is 66½% of the minimum of the scale adopted for the medical officer of health and the same increments. Other deputy local government officers, however, are remunerated in accordance with a series of scales recommended by the Joint Negotiating Committee for Chief Officers of Local Authorities in 1952, and revised in January, 1955. Some, if not all, authorities have placed these deputies on salary scales which represent a significantly lower fraction than 66½% of the relevant chief officer's salary, and carry lower increments.

In 1951 the Staff Side claimed, unsuccessfully, that a deputy medical officer of health should receive 75% of the medical officer of health's commencing salary. There will undoubtedly be an attempt now to secure the application of the J.N.C. scales to deputy medical officers of health. It should be made abundantly clear that anything less favourable than the 66½% ratio awarded by the Court in 1951 will be wholly unacceptable. May I end on a note of thanks to our representatives? We are not sufficiently numerous to be politically important and have voluntarily renounced the right to strike. I hope there will be no disposition to blame our negotiators for the unsuccessful outcome of their efforts. I should, perhaps, make it clear that my remarks are of general application and are not intended to anticipate the decision of any individual authority.—I am, etc.,

Thorpe Bay.

J. C. PRESTON.

Branch and Division Meetings to be Held

BATH, BRISTOL, AND SOMERSET BRANCH.—At Grand Atlantic Hotel, Weston-super-Mare, Saturday, May 21, 8.30 p.m., meeting. B.M.A. Lecture by Dr. Ffrangcon Roberts: "Are Doctors Necessary?" Members' wives are invited, and any lay persons who may be interested are welcome.

BELFAST DIVISION.—At Rooms of the Pharmaceutical Society of Northern Ireland, 73, University Street, Belfast, Tuesday, May 24, 8.30 p.m., annual meeting.

BRADFORD DIVISION.—At Medical Societies' Room, Bradford Royal Infirmary, Wednesday, May 25, 8.15 p.m., A.G.M.

CARDIFF DIVISION.—At Miners' Rehabilitation Centre, Talygar, Wednesday, May 25, (1) 3 p.m., demonstration of work carried out at the Hospital; (2) 5 p.m., annual general meeting.

CHELSEA AND FULHAM DIVISION.—At Fulham Town Hall, London, S.W., Friday, May 27, 9 p.m., annual general meeting.

CITY DIVISION.—(1) At Mildmay Mission Hospital, Austin Street, Bethnal Green, London, E., Tuesday, May 24, 8.30 p.m., clinical meeting. (2) At Hackney Hospital (G5 Ward), Homerton High Street, London, E., Wednesday, May 25, 2 p.m., film meeting.

DORSET DIVISION.—At Askers Roadhouse, near Bridport, Monday, May 23, 8.30 p.m., meeting.

EASTBOURNE DIVISION.—At Princess Alice Memorial Hospital, Eastbourne, Tuesday, May 24, 8.30 p.m., meeting.

GLASGOW AND WEST OF SCOTLAND BRANCH.—At Belvidere Infectious Diseases Hospital, Glasgow, Wednesday, May 25, 3 p.m., annual general meeting, followed by visits to, and inspection of, the new Tuberculosis Clinic, the new Admission Unit, and the Poliomyelitis Unit, with a demonstration of positive pressure respirator.

HASTINGS DIVISION.—At Royal East Sussex Hospital, Hastings, Tuesday, May 24, 8.15 p.m., annual general meeting.

HUDDERSFIELD DIVISION.—At Huddersfield Royal Infirmary, Tuesday, May 24, 8.15 p.m., general meeting.

KENSINGTON AND HAMMERSMITH DIVISION.—At St. Charles's Hospital, Ladbroke Grove, London, W., Friday, May 27, 3.30 for 4 p.m., clinical meeting.

MID-HERTS DIVISION.—At Mid-Herts Wing, St. Albans City Hospital, Friday, May 27, 8.15 p.m., clinical meeting.

NORTHERN IRELAND BRANCH.—At Musson House, Royal Victoria Hospital, Grosvenor Road, Belfast, Thursday, May 26, (1) 2.30 p.m., clinical meeting; (2) 4 p.m., annual meeting.

NORTH LANCASHIRE AND WESTMORLAND BRANCH.—At Reedy Hall Nurses' Training School, Burnley, Thursday, May 26, 12 noon for 12.30 p.m., lunch at invitation of Burnley Division, followed by sixth annual meeting of the Branch.

NORTH STAFFS DIVISION.—At Pathological Laboratory, North Staffordshire Royal Infirmary, Stoke-on-Trent, Tuesday, May 24, 8 p.m., meeting.

NORTH WALES BRANCH.—At Wynnstay Arms Hotel, Wrexham, Thursday, May 26, 3 p.m., annual meeting. Presidential Address by Dr. A. Wesley Hill: "Old Cures."

NUNEATON AND TAMWORTH DIVISION.—At Gymnasium, Manor Hospital, Nuneaton, Thursday, May 26, 9 p.m., A.G.M.

OXFORD DIVISION.—At Maternity Department Lecture Theatre, Radcliffe Infirmary, Oxford, Wednesday, May 25, 8.15 p.m., meeting. Dr. R. Bodley Scott: "The Doctor in Contemporary Fiction."

REIGATE DIVISION.—At Redhill County Hospital, Tuesday, May 24, 8.30 p.m., annual general meeting.

SHROPSHIRE AND MID-WALES BRANCH.—At Board Room, Royal Salop Infirmary, Shrewsbury, Thursday, May 26, 8.30 p.m., general meeting, followed by film: "Relief of Pain in Child-birth."

SOUTHAMPTON DIVISION.—At Royal South Hants Hospital, Southampton, Wednesday, May 25, 8.30 p.m., extraordinary general meeting.

SOUTH MIDDLESEX DIVISION.—At Anchor Hotel, Shepperton, Monday, May 23, 8.45 p.m., general Divisional meeting.

SOUTH STAFFS DIVISION.—At Medical Lecture Hall, Royal Hospital, Wolverhampton, Tuesday, May 24, 8.30 p.m., meeting.

TOWER HAMLETS DIVISION.—At Mile End Hospital, Bancroft Road, E., Friday, May 27, 3 p.m., clinical meeting. Group laboratory demonstration.

TUNBRIDGE WELLS DIVISION.—At Kent and Sussex Hospital, Tunbridge Wells, Wednesday, May 25, 8.30 p.m., meeting.

WEST SUFFOLK DIVISION.—At Everards Hotel, Thursday, May 24, 8.30 p.m., meeting.

WOOLWICH DIVISION.—At Eltham and Mottingham Hospital, London, S.E., Tuesday, May 24, 8.30 p.m., annual general meeting. Talk by Dr. Gerald Slot: "Virus Diseases in Children."

ANNUAL CONFERENCE OF REPRESENTATIVES OF LOCAL MEDICAL COMMITTEES

The Annual Conference of Representatives of Local Medical Committees was held in the Great Hall of the British Medical Association House, London, on Thursday, May 19. Practically all the areas in Great Britain and Northern Ireland were represented. The Chairman of the Conference was Dr. A. BEAUCHAMP (Birmingham), who was supported by Dr. A. TALBOT ROGERS (Chairman of the General Medical Services Committee). There were 144 motions and amendments on the agenda, the great majority of which arose out of the annual report of the Committee, published in the *Supplement* of April 2, 1955.

Statement by Chairman of Committee

Dr. TALBOT ROGERS, in moving the reception of the report, referred to the setting up of the Government committee on the admission of students to medical schools. From the point of view of the G.M.S. Committee a Working Party would have been preferable, but they had reason for congratulation in that the Government committee included two general practitioners, Dr. J. T. Baldwin and Dr. A. B. Davies, who were familiar with the problems of general practice.

A number of important subcommittees had been at work during the year, and one which merited special commendation was that which had concerned itself with Services Committees and Tribunals regulations. It had done three years of very intricate and specialized work under the chairmanship of Dr. H. G. Dain. This subcommittee had worked together with representatives of the dental and pharmaceutical professions, who were equally concerned in the problem, and who had given great assistance. Another subcommittee, under the chairmanship of Dr. B. Cardew, was concerned with the position of assistants in general practice.

In the matter of prescriptions, the old system of estimating areal averages was being resumed. It was only partial so far, and they were not certain that the sampling system gave as good a picture as they would like. They were investigating with the Ministry the manner in which these figures were compiled.

A question on which no progress could be recorded was that of the supply to private patients of drugs and appliances under the N.H.S. It was a matter to be pursued as soon as the right opportunity arose. A matter which had been carried to finality was the method of remuneration on account of Service personnel on leave. These personnel were to be treated as temporary residents by doctors in the

N.H.S., and it had been possible at the same time to protect doctors who were in private practice and not in the service. In this matter the General Medical Services and the Private Practice Committees had acted together.

In previous speeches to the Conference it had been necessary for him to call attention to the fact that some political pressure had been exercised concerning the adequacy of surgery and waiting-room accommodation. At the beginning of the past session this matter became of more immediate importance and it was learned that the Government felt they were not in a position to answer critics, and that the only way of getting a proper assessment was by official inspection. The Committee felt that this matter was one that could be more effectively dealt with by the doctors themselves, and representations were made to the Ministry. The Government agreed to the representations, and arrangements were made for a nation-wide inspection under local medical committee auspices. Most of this had now been done. He himself had taken part in it and had been pleasantly surprised at the reception he had had from doctors with whom he had discussed possible improvements and their appreciation that this was being carried out by their colleagues and not by officials of the department. (Applause.)

Remuneration

Dr. TALBOT ROGERS proceeded to present the section of the Annual Report on remuneration. The question of the assessment of the full amount of remuneration due to the doctor had been a rather more complicated matter since the Danckwerts award. Before then the doctors were being paid from a fixed pool varied only in respect of the number of patients under care. One of the most important things which resulted from the Danckwerts inquiry was the recognition of the fact that the central pool needed to be varied in direct ratio to the number of doctors employed in the service. The main factors in assessing how much money there was to share were four: (1) the number of doctors in the service; (2) the practice expense ratio; (3) professional receipts from other sources, and (4) earnings of N.H.S. doctors in private practice. In so far as receipts from private practice were concerned, his Committee maintained that nothing short of a complete survey would be really valid. In view of the fact that such a survey was not at present possible they had taken the attitude that it would be better to continue to accept the compromise figure proposed by Mr. Justice Danckwerts—namely, £2m.

The practice expense ratio was difficult to work out. On visiting the Ministry rather more than a year ago the officials there claimed that the proper ratio for 1952-3 was 32.23%, but it was pointed out that this was the result only of a sample inquiry and that the right must be reserved to discuss adjustments to the figure which came out of the inquiry. The officials did shift their figure to 32.30, which might not seem much, but it did mean that they were prepared to make adjustments. The Committee felt that in the following year doctors' expenses had gone up, and the Inland Revenue agreed to undertake a further inquiry. The figure of 33.36 was reached, and this was eventually rounded up to 33.40, which meant a global increase of about £650,000.

The amounts paid out of the Central pool by way of capitation fees, loadings, temporary resident fees, emergency and anaesthetic fees, initial practice allowances, hardship payments and supplementary annual payments under the old distribution scheme in 1952-3, and the corresponding amounts for the first two years under the new distribution scheme were approximately as follows: 1952-3 £49m., 1953-4 £50½m., and 1954-5 £51m.

In addition there were the final settlements to come for each of these years. So far as was known, these amounted in 1952-3 to £50,000 approximately, and in 1953-4 to £1,400,000 approximately. It was hoped that this money would be available in December of this year.

He had said that there had been great difficulty in getting out the practice expense ratio. The Committee was anxious that there should be as little further delay as possible. During the previous week there had been discussions with the Ministry on this matter. It became clear that for some time to come the Inland Revenue could not carry out any further inquiry, and after discussion it had been agreed to do without another sample inquiry for the next four years. They had got an agreement that year by year, as a result of discussion between the representatives of the Committee and the Ministry, any alterations to modify the position which had led to the acceptance of 33.40 as a round figure would be taken into account.

The aim would be to get the first final settlement paid out by the end of June, 1955, and there was no reason why doctors should not be paid year after year at the end of June, thereby cutting out what had been a quite appreciable time lag. He thought that a very satisfactory settlement had been reached in the final settlement for 1953-4. (Applause.)

Following Dr. Talbot Rogers's statement, a motion in the name of Southampton that in view of the increased cost of living the whole question of remuneration should be reconsidered was withdrawn, and a motion by Gateshead that in view of the continued diminution in the amount of private practice the figure of £2m., as representing receipts from this source, if correct at the time of the Danckwerts award, was too high now, was taken as a reference for consideration by the Committee.

Supplementary Annual Payments

Dr. P. D. CROSBIE (Middlesex) urged that eligibility for supplementary annual payments should be modified so that the period of ten years in single-handed practice in one area, as laid down in the official circular on the subject, might not be required—in other words, the period might be spent as a principal in two or more practices, provided that each such practice conformed with the criteria. The fact that a man had moved his practice during those ten years should not be a bar to supplementary annual payment.

Dr. A. S. RUSSELL (Wolverhampton), in supporting the motion, said that he believed that discretion could be exercised in cases where hardship appeared to obtain, and it was possible for appeals to be made to a central committee.

On the suggestion of Dr. D. F. WHITAKER (G.M.S. Committee) the matter was referred for consideration by the Committee, and was so accepted by Dr. TALBOT ROGERS, who said that there were genuine cases which needed reconsideration under this scheme.

Back Debits and Back Credits

Dr. W. M. EVANS (Middlesex) asked the Conference to pronounce in favour of the abolition of the present system of awarding back debits and back credits. When this system was started it was expected that credits and debits would eliminate themselves on a knock-for-knock basis, but in Middlesex at least this had by no means proved to be the case. The question had been the most acrimonious topic that had arisen between the executive council and the practitioners. It was doing more to cause friction than any other single thing. Someone would raise the question of inflation, but he was told that actually there was little risk of this.

Dr. J. C. ARTHUR (Gateshead) said that if a motion to abolish back debits and back credits were carried it would rule out a motion which he had put down, that an ex-Service man who presented himself for treatment more than six months after demobilization, not having been on the list of any other doctor during this time, should be regarded as a "back credit" to the date of demobilization. He thought that this would be a perfectly simple way of dealing with a vexed problem.

Dr. TALBOT ROGERS said that the matter was not quite so simple as Dr. Arthur had suggested. It involved a not inconsiderable amount of calculation and checking. On the general question he could well believe that the back debits throughout the country were probably more than the back credits. His committee would see to it that there was no falling off in the efforts made through the Service departments to get demobilized men to have their names put on a doctor's list at the earliest possible moment.

Representatives from Glasgow and from Perth and Kinross also advocated the abolition of back debits and back credits.

Dr. FRANK GRAY (London) said that this was purely an administrative matter. An extraordinary number of people came to him and complained because they had been treating people and could not get credits for them. Having decided only last year to continue the system as a reasonable compromise, he thought the Conference should allow it to go on and not take a hasty decision.

Dr. W. M. EVANS urged again that the whole system be abolished. It did make a financial difference to individual doctors. In Middlesex the back debits outnumbered the back credits by two to one.

By a show of hands the Conference pronounced itself in favour of the abolition of the system.

Dr. L. V. BROADHEAD (Barnsley) moved that practitioners should in all cases—irrespective of any plea of hardship—be paid monthly instead of quarterly. He was supported by Dr. N. NELSON (Dundee), who pointed out that monthly payments were usual in comparable professions and services, and that consultants and registrars were paid monthly.

Dr. TALBOT ROGERS hoped the Conference would not press this. It would mean more work at the centre. Moreover, it was not difficult for any doctor who really did require payment monthly to obtain it. If there were any areas where the doctors who wanted payment monthly were not getting a fair interpretation of the regulations, the Deputy Secretary would be glad to hear of them.

In reply to an expression of dissatisfaction from Dundee, that in view of the opinion given at the last Conference no approach had been made to the Secretary of State for Scotland that monthly payment should be made without any previous plea of hardship, Dr. C. J. SWANSON, chairman of the G.M.S. Subcommittee (Scotland), said that as regards remuneration Scotland would never try to get a "fast one" over their colleagues south of the border.

The proposal that monthly payments instead of quarterly payments be made was lost.

Temporary Resident Fees

Dr. B. HALFPENNY (Kent and Canterbury) moved that it be a reference to the Committee to discuss with the Ministry a revised scale of fees of 5s., 8s. 6d., and 17s. for

temporary residents in relevant cases under the distribution scheme, the amount of the fee to be at the discretion of the executive council in consultation with the local medical committee. He said that there were certain cases, mainly surgical ones, which were discharged early from hospitals to convalescent homes and which required considerably more care than could be appropriately represented by a 5s. fee. The need for differentiation was apparent.

Dr. J. V. LOPE (Surrey) said that the 5s. fee was not adequate for the work done in many cases. Dr. F. M. ROSE (Preston) felt that the introduction of an intermediate fee (8s. 6d.) would only complicate matters and make things worse. Strong pressure would be brought to bear that the minimum fee should never be paid.

Dr. TALBOT ROGERS said that the present rigid method whereby there were only two recognized fees did give rise to anomalies in some parts of the country, especially Kent, which perhaps had more temporary residents than any other area. He suggested that Dr. Halfpenny's motion should be taken as a reference to the Committee to be discussed along with suggestions from other quarters.

This was agreed to.

Mileage Payments

Dr. J. E. DARLOW (Lincolnshire, Holland) had a motion expressing profound dissatisfaction with the Mileage Committee set up by the Minister of Health under the Distribution Scheme and requesting the Committee to take appropriate action to speed up its report. For the last five years they had been hoping that some report from the Mileage Committee would come up.

Dr. A. M. MAIDEN (Lincoln) said that they were expecting a revision of the mileage scheme at an early date. Many of them felt that the whole question should be referred back to local medical committees. It was obviously difficult to get agreement on a standard scheme in view of the differentiation of areas.

Dr. C. F. R. KILLICK (Chairman of the Rural Practices Subcommittee) said that the Mileage Committee was a Government committee, and, like all Government committees, it did not work very quickly. In fact it had had a rough passage. Before it had got far in its deliberations it was interrupted by the Danckwerts inquiry. Since then it had been faced with the discovery of the troubles of the present scheme and the way to correct them. Every suggestion that had been made had had to be checked up by the Ministry to find out what effect it would have on the profession as a whole, and that meant delay. At the last meeting of the committee the Ministry did put forward a scheme, and he (Dr. Killick) was the only one who voted against it; he did so simply because he considered the scheme not fair to the profession. It was no better—perhaps even worse—than the scheme they had to-day.

The Lincolnshire motion was carried.

Group Practice Loans

Dr. D. F. HUTCHINSON (Chairman of the Group Practice Loans Committee) said that up to May 4 the actual number of applications for loans for group practice totalled 152 in England and Wales: Scotland had its own share of the fund and its own committee to administer it. The total amount applied for in England and Wales was £526,905, and the amount of money they had available up to now was considerably less than half this. Of the 152 applications 69 had been rejected solely because they did not come within the agreed definition of a group practice. Some eight applications had been withdrawn; in five which had been approved, the applicants subsequently decided that they did not want the loan, and up to now 47 applications, involving £204,000, had been approved. The amounts had been determined and would be paid out as soon as legal arrangements were complete. A further six applications had been approved in principle, but the actual amount was not settled, and some 14 others were being investigated. The average amount asked for was £3,500; the highest £13,000, and

there had been one or two as low as £200. In each case before approval was given the practice was visited. The committee had been very conscious that it was doctors' money they were using and they tried to use it in the best way to encourage group practice. Presently they would be getting small amounts coming back: in the current financial year these returns were expected to be £7,000.

In reply to the Southampton representative, Dr. Hutchinson said that he saw no reason why a balance sheet should not be produced every year; it would have to be agreed by the Ministry.

The Medical Practices Committee

Dr. J. E. ELLIOTT (Buckinghamshire), on the section of the report relating to classification of areas, moved that a local medical committee should automatically be afforded an opportunity of placing its problems personally before the Medical Practices Committee if a difference of opinion existed between two bodies or if there was an intention to change the classification of an area. He stressed the word "automatically."

Dr. ANNIS GILLIE (London) said that a great deal of time was spent in ensuring that for this purpose the doctor was located in the centre of his practice area, not necessarily the area in which he resided, which might be as much as 10 miles away.

Dr. TALBOT ROGERS said that in all their work throughout there had never been any difficulty in access to the Medical Practices Committee, and they were glad to feel that on that committee there were four valued members of that Conference. Whenever a local medical committee wished to make representations there was no difficulty about it being heard. Any question of "automatic" consultation would mean delay.

The Buckinghamshire motion was referred to the G.M.S. Committee.

A late motion by Cardiganshire deprecating reclassification of areas in that county was carried.

A motion by Norfolk, supported by Lancashire, requested the Committee to continue discussions with the Ministry, pressing for an amendment of the General Medical and Pharmaceutical Services Regulations, 1954, to provide that actual appointments to general practice vacancies should be made by the executive councils in consultation with local medical committees, subject to right of appeal to the Medical Practices Committee only. The mover said that it was impossible for the Medical Practices Committee to understand the local conditions.

Dr. J. A. PRIDHAM spoke as a member of the Conference, not primarily as a member of the Medical Practices Committee. The latter committee itself had never taken any steps to oppose what was actually the policy of the Conference as set out in the present motion. This matter should be put in its proper perspective. In 1953 there were 1,382 admissions to the list in England and Wales. Most of these people came in by succession, partnership, ordinary application, and so on, and there were only 132 advertised vacancies. Among these 132 any disagreement with the executive council occurred only in seven. There was no large field of disagreement. The executive councils scrutinized every application, and only in a negligible number of cases did any difficulty arise.

The Norfolk motion, which the Chairman declared to be already the policy of the Conference, was carried.

Dr. C. W. MARSHALL (Devon and Exeter) asked the Conference to express the view that where possible six months' notice should be required of the retiring doctor. Dr. TALBOT ROGERS thought it would be unwise for the Conference to come to any decision on this matter, which should be thrashed out carefully in the Committee. It was agreed that it be referred to the Committee.

Dr. L. DAVIES (Flintshire and Denbighshire) urged that there be no further delay in introducing methods of "freezing" or other form of vacant practice protection. His area was exercised about this matter because of what could

happen before a successful applicant was able to take up a practice vacancy. Dr. TALBOT ROGERS said that a subcommittee had been set up to look into this matter, which was fraught with difficulties, some of them ethical. It would not be easy to find a solution satisfactory to everybody.

Reinstatement of Ex-Service Personnel

Dr. J. C. ARTHUR (Gateshead) moved that continued attention be given to the question of the reinstatement of Services personnel on doctors' lists. Dr. TALBOT ROGERS said that the Committee was keeping matters of this nature continually under its surveillance, and he was prepared to accept the motion as an instruction.

Dr. G. PURDY (Leicestershire and Rutland) moved that the Conference was dissatisfied with the decision of the Committee not to pursue the suggestion that Services personnel be automatically registered on doctors' lists on discharge, and urged that the whole matter be reopened in consultation with the Executive Councils Association.

The Leicestershire and Rutland amendment was put to the Conference three times in view of the fewness of the hands that were held up either way, but it was at length declared carried.

Dr. C. D. MEADOWCRAFT (Middlesex) moved that the following words be printed in large letters on the top of the appropriate section of the demobilization leaflet, "You will not be restored to the list of your civilian doctor until you have presented this form to him," and this was carried.

Examination of Inflation

Dr. M. SORSBY (London) moved:

That this Conference notes with grave concern that the present system of registration does not prevent inflation, and is of opinion that (1) a central registry on an alphabetical basis would make for greater efficiency, and (2) a joint meeting of all interested parties should be convened immediately to decide the best means of establishing an alphabetical register.

He said that in London they were becoming very concerned about difficulties regarding inflation. Among the several causes of inflation was the failure on the part of the patient to provide a number by which he could be identified. Another fruitful cause was migration. They had got into the position that nothing could prevent inflation unless they got the support of the Ministry. In London the figure now stood at 99.7% on doctors' lists, and before the end of this quarter they might expect that there would be more people on doctors' lists than the estimated population. In two counties adjacent to London the figure for January was 98% plus. It was becoming a very serious matter.

Dr. F. E. GOULD (Birmingham) said that on January 1 in his city 99.69% of the population were on doctors' lists, which meant that out of 1,118,500 people, only 3,000 were private patients.

Dr. TALBOT ROGERS said that the Ministry was just as much concerned as themselves. They could not have another "purge." The only way of stopping it was by having an alphabetical index.

The motion was carried.

Prescribing and Dispensing

Dr. J. E. DARLOW (Lincolnshire: Holland) moved that the Committee ask the Minister to notify consultants that they should not request general practitioners to prescribe substances which general practitioners were not allowed to prescribe as drugs on E.C.10.

Dr. FRANK GRAY (London) moved as an amendment that instead of the Minister the request be made to the Central Consultants and Specialists Committee. This matter arose out of a perfectly genuine misunderstanding, because consultants might in certain circumstances prescribe these substances themselves and were unaware of the limitations imposed on general practitioners in this respect. There was no need to bring the Minister into a domestic matter between two sections of the profession.

The amendment was accepted by the proposer of the motion, and in that form the motion was carried.

Dr. G. O. S. REID (Kent and Canterbury) moved that prescriptions of dispensing practitioners should be submitted monthly for pricing and accounts paid monthly. Dr. C. F. R. KILLICK said that if any doctor was in difficulty about these payments he had only to make application. Dr. A. D. STOKER (Derbyshire) said that in his area doctors had to wait five months for payment, whereas chemists had to wait only one month.

The motion was carried, as was a further motion from the same proposer affirming that it should not be necessary for a dispensing practitioner to make an application for an advance payment which, if there were any delay in pricing, could be recovered by the executive council from other moneys due to him.

The Banning of Heroin

Aberdeen and Kincardine moved a resolution of protest against the discontinuance of the use of heroin in the treatment of suitable cases.

This motion was on the point of being agreed to without discussion, when Dr. TALBOT ROGERS, after saying that he felt as strongly as anyone on the subject, suggested that the Conference should first hear the point of view of the Medical Advisory Committee of the Central Health Services Council.

Dr. WAND said that it was stated that the profession had not been consulted, but in 1946-7 when the new service was formed the strongest possible representations were made to the Minister that there should be a Medical Advisory Committee, with doctors from every branch of medical practice appointed on the nomination of interested bodies, of which the British Medical Association was one. Since 1948 the Council had been asked for nominations to be considered by the Minister, and he was one of those who had been appointed. It was before this committee that there came the suggestion that heroin should be discontinued. He went to the committee with the firm opinion that a general practitioner should not have a drug taken from him which he wanted quite properly to use. But he learned that the problem of heroin addiction throughout the world and possibly in this country was a very grave one, only to be solved by international action. Such action had been taken by some of the countries in the Commonwealth and by the United States. From his own experience he could not but agree that there were adequate substitutes. He had not used heroin for a considerable time and he had found no need for it. Ours was a great country, a country to which others looked for a lead. Were they as medical men prepared to allow heroin addiction as a world problem to go unchallenged? He was persuaded by that sort of argument not to oppose the prohibition of heroin.

On a show of hands the resolution of protest was carried.

Restrictions on Appliances

Dr. A. D. STOKER (Derbyshire) asked that the Ministry be pressed to make appliances as freely prescribable, under the National Health Service, as drugs. He said that practitioners were allowed to prescribe almost any drug, however exotic, but with appliances the practitioner was at the mercy of any clerk in a pricing bureau. He was faced with a very restricted list. Dr. TALBOT ROGERS opposed the motion: they must draw the line somewhere. The motion was lost. A better fate, however, attended another motion by Berkshire, that the Committee press the Ministry to make appliances more freely prescribable under the National Health Service, and Dr. TALBOT ROGERS said they would be glad to receive from local medical committees suggestions as to the type of appliance they had in mind.

A motion by Wiltshire asked that, when a new drug was released to general practitioners and might be prescribed on E.C.10, it should, if considered to be an expensive drug, be placed on the specially expensive list for dispensing doctors on the same date.

Dr. KILLICK said that they were most anxious that dispensing doctors should not be in a worse position than their colleagues, but each item added to the expensive drugs list was a charge on the central pool, and therefore they would like to have control themselves of what went on the expensive drugs list.

The motion was lost.

A number of motions dealing with prescriptions and dispensing were referred to the Committee for consideration. One of them related to the case of dispensing doctors whose practices were in the area of more than one executive council, and it was urged that they should be allowed to write all prescriptions on form E.C.10 (D).

The following motion by Devon and Exeter was carried apparently without dissent:

That in view of the Minister's statement that the provision of drugs for private patients is not repugnant in principle, this Conference expresses the hope that further consideration may be given to this matter with a view to its early implementation.

Discount on Drugs

Dr. C. F. R. KILLICK (chairman of the Rural Practices Subcommittee) made a statement on the meetings which had taken place with representatives of the pharmaceutical industry. The matter at issue was that, while retail chemists could get from the manufacturing chemists discounts of up to 33%, dispensing doctors up to now had been able to get only 10%. At the last meeting they had to tell the chemists that at this Conference they would have to advise doctors who did dispensing to make their own individual arrangements with the manufacturers as to the rate of discount. A letter had since been received stating that the chemists were prepared to allow the doctors half the rate of discount they themselves obtained, and a further statement had now been made that they would be prepared to offer 15% discount on all proprietary medicines. He suggested that the matter be referred back again to the Rural Practices Subcommittee to take a final decision as to whether this 15% discount should be accepted. His feeling was that the offer of the pharmaceutical industry should be refused.

Dr. TALBOT ROGERS said that this was a matter which must be settled by the Rural Practices Subcommittee, and a report would be made to the next Conference.

Dr. A. BROWN (Cambridge) said that it was quite wrong to suppose that the dispensing doctor was not carrying the same risk as the chemist. About nine months ago they took stock of the drugs in his practice—a partnership of four—and the total stock carried at that time came to £1,000. After further discussion the Conference decided not to accept the offer of 15% on all proprietaries.

Surgery and Waiting-room Accommodation

Dr. E. V. KUENSSBERG (Edinburgh) moved:

That this Conference recognizes it to be necessary under a National Service that regulations should provide for the inspection of a doctor's premises where there is reason to believe that these may be inadequate, but deploring the Government's decision to institute a general survey and views with concern the implications of this decision and directs that this motion be brought to the notice of the Minister of Health and the Secretary of State for Scotland.

He supposed that in due course they would be required to exhibit a licence in the surgery to the effect that they had been annually inspected and perhaps graded in one of a number of classes! He begged the Conference not to allow the present inspection to become a precedent. It was regarded by many practitioners as a grave intrusion into their professional privacy, particularly when their own homes were used for professional purposes. It was, of course, a different matter if premises were inspected after a definite complaint.

Dr. P. J. GIBBONS (Liverpool) supported this motion. The inspection was an unjustifiable intrusion. The patient and the doctor had hitherto been the two people concerned,

and the patient had always been at liberty to initiate a complaint, but now a new element was introduced in the shape of the local medical committee.

Dr. TALBOT ROGERS said that there was no doubt there would have been a general inspection of surgeries, whatever the Committee had done, in view of the general impression in Parliament that accommodation was very often inadequate.

Dr. KUENSSBERG said that the Edinburgh motion was directed to the future and not to the past.

The motion was lost.

Service Committees and Tribunal Regulations

Dr. H. G. DAIN (chairman of the subcommittee on Service Committees and Tribunal Regulations), in moving approval of this part of the report (Appendix C), said that the subcommittee had been sitting for three years or more. Valuable suggestions had been forthcoming from many local medical committees, and a great measure of agreement with the Ministry had been obtained, and he thought they had achieved fair play for both doctor and patient.

Mr. G. PURDY (Leicestershire and Rutland) had a motion deploring the decision of the subcommittee not to pursue the recommendation concerning a principal's responsibility for the acts and omissions of his deputy.

Dr. M. J. CUTLER (Hastings) said that the Conference should not be put off by the statement in the report that it had not been possible to pursue this matter further.

Dr. DAIN said they had got the position established that a deputy who was properly ascertained to be such by the executive council and who was a principal on the same list would be responsible for his actions while acting as a deputy. It had been pointed out to them that there would be practically no cases where the principal and the deputy were not both on the same list. An assistant could not be on the list of the executive council, and if he was not on the list he would not be responsible to that body.

The Leicestershire and Rutland amendment which recommended the reference back of the paragraphs of the appendix concerning the responsibility for the acts and omissions of deputies was carried.

Dr. W. G. LOVE (Derbyshire) moved that no decision by a medical service committee should constitute a verdict against a doctor unless it was reached by at least a two-thirds majority of the members.

Dr. F. E. GOULD (Birmingham) opposed the motion and said that he was satisfied that doctors got a very fair hearing.

Dr. DAIN said that his experience of medical service committees was that there was never any difficulty about voting. To lay down a requirement that there must be a particular majority on a body of six was being fantastically meticulous.

The motion was lost.

Dr. DAIN, referring to the Leicestershire and Rutland amendment which had been carried, said that the reference back of these paragraphs flew right in the face of one of their established principles, that assistants should not go on the lists of executive councils. The Committee could not do as the Conference requested unless the Conference was prepared to reverse its decision and to put assistants and locumtenents in the same position as principals. This was a matter of such importance, involving the rescinding of a previous decision, which could not be done without notice, that the matter would have to be put off for another year. The Ministry had not been able to agree that a principal's immunity for the acts and omissions of his deputies should extend to locumtenents and assistants, and as it had not been possible to pursue the point further it had been agreed that where the deputy was also a principal on the medical list he should be responsible for his own acts and omissions.

The CHAIRMAN at this point introduced Dr. W. M. PICKLES, President of the College of General Practitioners, who was a visitor to the Conference. Dr. Pickles said that his proper place was in the gallery, but he welcomed the

opportunity of saying how much the College of General Practitioners appreciated the help and encouragement it had received from the British Medical Association.

Maternity Medical Services

Dr. CATHERINE HARROWER introduced the part of the report concerning maternity medical services, and specially drew attention to what had been done to secure smooth working of arrangements in all areas for ante- and post-natal care.

A motion by West Suffolk calling for a revision of fees for maternity medical services was referred to the Committee, and other motions concerning the calculation of mileage in maternity cases and of the apportionment of fees when these had to be divided between two doctors were carried. A motion by Bath was also carried, that regional hospital boards be asked to ensure that expectant mothers who may be confined in hospital on social or medical grounds have the opportunity of being attended by their own general practitioner, subject only to the requirements of training centres for students and midwives.

Dr. H. SOUTHWORTH (Blackburn) moved:

That this Conference (a) deplores the peremptory method employed in closing the Springfield Maternity Home in Blackburn, whereby a lay person acted in utter disregard of representations made by local doctors and of the condition of their patients; (b) hereby affirms its decision to resist any interference in clinical matters by lay persons, whether they be executives or members of a public body; and (c) instructs the General Medical Services Committee to make the strongest representations to the Minister of Health to ensure that such methods of closure or similar conduct will not be repeated in future.

He said that he would not repeat the history of the Blackburn episode, which was now familiar. The closure occurred despite the protests of two executive councils and two local medical committees. No doctor was asked his consent to the removal of the patients, and the evacuation was carried out under lay instruction.

Other Lancashire representatives spoke with similar indignation.

Dr. TALBOT ROGERS said that the G.M.S. Committee was wholeheartedly with Lancashire in this matter. They must make sure that there was no repetition of it, and the Committee would be glad to know in advance of any projected action of the kind in any area. He added that Dr. A. Campbell, of Accrington, who was to have spoken on this subject, had been prevented from attending the Conference by illness, and their good wishes for a speedy recovery would go out to him.

The Blackburn motion was carried unanimously.

A motion by Middlesex calling for the Committee to press for a more positive attitude with regard to general-practitioner hospitals and for the taking of more active steps with the Minister was taken as a reference to the Committee.

Two motions by Hertfordshire concerned with the improvement of diagnostic and ancillary facilities for general practitioners were agreed to without discussion.

Employment of General Practitioners in Hospital

Dr. J. C. ARTHUR (Gateshead) moved that appointments for general practitioners in hospitals as clinical assistants should be for a period of six months, and should not be renewable if other practitioners were able and willing to take the appointment. They were all in favour, he said, of the employment of general practitioners in hospital, but care should be taken to see that the arrangements were equitable for those concerned.

Dr. TALBOT ROGERS said that he disliked laying down rules to which there could be no exception. In this case a distinction should be made between two types of clinical assistantships—one in which the doctor became attached to a particular department of the hospital in order to get post-graduate experience, and the other in which he was actually a member of a team dealing with a specialty. In the former case a rotation of six months might be advisable; in the

latter there might also be a review from time to time, but to pin it down to six months would be a mistake.

The motion was lost.

Assistants in General Practice

Dr. BASIL CARDEW introduced the report of the subcommittee (Appendix D) which was set up during the year to investigate the matter of the employment of assistants. He said that since September, 1952, this question had been under discussion, and various schemes had been put forward by the Assistants and Young Practitioners Subcommittee. The General Medical Services Committee had never committed itself to the view that abuses of various kinds in the employment of assistants were widespread. Nevertheless, some individual cases of abuse did occur, and it was the Committee's duty always to be conscious of the rights of minorities. The various proposals put forward by the Assistants Subcommittee were mainly directed to restricting the number of patients which a principal could have on his list by virtue of his employment of an assistant, but the parent committee did not find itself able to accept any of the suggestions. It thereupon set up another subcommittee of its own members to find a solution, and it was the report of this subcommittee which was now before the Conference.

The subcommittee felt that there was no advantage whatever in looking at the size of the list; it proceeded to examine the underlying problem of cases of exploitation and came to its first recommendation:

(1) That further efforts should be made, through the deans of medical schools, and through honorary secretaries of local medical committees, to ensure that final-year students and newly qualified practitioners are fully informed of the importance of entering into a formal agreement when accepting a post as an assistant, either with or without a view.

The subcommittee then looked at the regulations to see whether executive councils had the power to go into the whole question of the employment of particular assistants in their area, and it found that they had already the power to limit the size of the extra list. What was not so clear was the power of refusal. The first proposed solution was to throw the whole thing back on to local medical committees and grant them the power, and in fact the duty, of looking at all assistantships in their areas at intervals to see whether the employment of an assistant was fully justified. This brought him to their second recommendation:

(2) That the Ministry of Health should be asked:

(i) To insert an additional section in paragraph 8 of the Terms of Service of General Practitioners so as to make it clear that local executive councils shall, in consultation with local medical committees, periodically review all cases in which consent has been given to the employment of an assistant;

(ii) By means of a circular letter to executive councils to point out that, whereas under the regulations the normal maximum additional list of patients permitted by virtue of the employment of an assistant is 2,000, local executive councils have power, where after consultation with local medical committees they are satisfied that a reasonable case exists for so doing, either after due notice to withdraw their original consent to the employment of an assistant or modify the number of additional patients otherwise permitted under their allocation schemes.

The intention was that in all material respects the local medical committee should be the body which would look at each case and bring forward a recommendation to the executive council. The local medical committee would need to have some guidance as to general principles, and some uniformity throughout the country was desirable. This was the import of their third recommendation:

(3) That an appropriate letter be sent to local medical committees, drawing their attention to the proposed arrangements, and offering general guidance upon the principles they should adopt when advising their local executive councils that in a particular instance it would be appropriate to withdraw the consent already given to the employment of an assistant, or to modify the size of list.

It was felt that that would ensure that there was no gross exploitation. But one thing more was necessary, and that was to give some help to the individual principal who hesitated to bring an assistant into partnership. It was felt that the fourth recommendation would constitute a real inducement:

(4) That a principal implementing a "view" registered with the executive council should have a right to claim retrospective payment on the basis of notional lists for a period up to a maximum of one year.

These recommendations had been accepted *nem. con.* by the General Medical Services Committee, and the Assistants and Young Practitioners Subcommittee had welcomed them as a first step.

Dr. J. C. ARTHUR moved that a practitioner be required, within six months of engaging an assistant, to notify the executive council, who should inform the assistant, whether he was employing the assistant "with a view" or not. The assistant should know whether or not, within a certain time, he had the prospect of a partnership.

Dr. CARDEW asked the Conference to reject this motion. It was quite clear that no Government would so alter the terms of service as to require a principal under contract with his executive council to declare any such intention. But, what was more serious, no executive council could ever be required in law to enter into communication with an assistant with whom it had no contractual relationship and inform him of a certain eventuality.

The Gateshead motion was lost.

Dr. H. H. D. SUTHERLAND (London) raised an objection to the last of the four recommendations brought forward by Dr. Cardew. If there was formal agreement under the first and second recommendations, the inducement offered in the fourth might be interpreted as something like a bribe, and he thought it was important to take legal advice on the subject before accepting it.

Opposition to the fourth recommendation was also voiced by Dr. W. W. HUDSON (Oxford) and Dr. H. G. ST. M. REES (West Suffolk), who considered the recommendation dangerous. Dr. F. M. ROSE (Preston) said that it was not a bribe, it was merely an inducement.

Dr. CARDEW said that if it was a bribe it was not more of a bribe than the notional list in a partnership. He did not think there was anything inequitable or in the way of abuse here, and he asked the Conference to express general agreement with the principle, subject to legal opinion.

The Conference adopted recommendations (1), (2), and (3) set out in Dr. Cardew's speech, but recommendation (4), that a principal implementing a "view" registered with the executive council should have the right to claim retrospective payment on the basis of notional lists for a period up to one year, was rejected on a show of hands.

Other Matters Arising from Report

The Conference rejected an amendment by Surrey to refer back the paragraphs dealing with post-mortem arrangements, with particular reference to the facilities available to local practitioners, but a motion by Derby was carried, recommending further attempts to ensure that where a post-mortem examination had been carried out in any circumstances a report should be sent to the practitioner concerned. Another motion by Kent and Canterbury concerning the information to be given by the coroner to the general practitioner was accepted as a reference to the Committee.

A motion by Derby was agreed to expressing dissatisfaction with the reply of the Minister that it was impracticable to give automatic information where a patient was rejected by a Medical Board as unfit for National Service, and calling for further pressure to be exerted on the Minister to arrange for appropriate information to be conveyed to the patient's doctor in cases where the patient's consent had been obtained.

The question of the charging of a fee for a report requested by a patient's employer came forward. It was the view of the Committee that when only a brief statement as

to the patient's fitness or unfitness for work was required, and it was in the patient's own interests that it should be given, no fee should be charged. Surrey carried a motion protesting against this suggestion, although Dr. H. D. CHALKE had explained that all that was asked for was a note from one doctor to another giving some slight information about the case.

An amendment by Manchester was also carried declaring that no distinction should be made between cases where a report was required in the patient's own interests and those in which reports were required by an employer for administrative convenience; in both cases the practitioner was fully justified in charging a fee.

On the motion of London, para. 207 of the report, concerning the method of selection of doctors for private practice appointments, was referred back for further consideration.

Miscellaneous Motions

This concluded the matters arising from the annual report. A number of miscellaneous motions remained on the agenda. Norfolk asked for an increase in the rate of interest on the compensation moneys due to general practitioners. This was referred to the Committee for consideration. Dr. A. N. MATHIAS said that it would require legislation, and this would be difficult, but the Committee would see what it could do and report next year. Two other motions concerning compensation were also referred to the Committee.

Dr. L. F. EVANS (Bolton) moved "That it is not ethical for a practitioner to treat, as a private patient, a person on the N.H.S. list of a neighbouring practitioner without informing the latter of his action." Dr. NOY SCOTT asked that the words "whilst still under treatment" should be inserted. It was only whilst the patient was under treatment that the practice was ethically wrong. Dr. EVANS quoted the ethical rules, which read, "Where a patient is under the care of . . ." and said that he interpreted "care" as meaning being on a practitioner's list. The motion was lost.

Cardiff wanted it made possible for those practitioners who opted out of the superannuation scheme in 1948 to enter it now if they so desired. Dr. MATHIAS said that this seemed to be an attempt to make the best of both worlds, but, if the Conference desired, the Committee would look into the matter.

Dr. L. V. BROADHEAD (Barnsley) said that during the last eighteen months the practice of referring patients to chest consultants by the Ministry of National Insurance for a report as to fitness for work without the knowledge of the patient's own practitioner had increased. He moved a protesting motion, which was carried.

An Ipswich resolution, asking that it be outside the range of general medical services to issue certificates of incapacity for conditions of less than 72 hours' duration which do not ordinarily require medical attention, was described by Dr. TALBOT ROGERS as badly phrased, but he promised that the Committee would consider what he thought was the meaning behind it.

Finally the Conference agreed to a motion by London expressing grave disquiet at the amount of communicable disease discovered in immigrants in this country, and recommending that the Government should make arrangements for adequate medical examination of all intending immigrants before passing the necessary papers for transport. Dr. F. GRAY said that this was brought forward with a view to safeguarding the public health of citizens of the United Kingdom from the risk of certain communicable diseases, such as syphilis and tuberculosis.

Trust Funds

Dr. CATHERINE HARROWER (treasurer) presented the income and expenditure account and the balance sheet of the National Insurance Defence Trust and the General Medical Services Defence Trust, and these were approved. She said that 55 areas had fulfilled—in some cases more than fulfilled—their quota of payment.

Dr. H. G. DAIN reported on the Dain Fund. He said that 20 years ago when a magnificent present was made to him, and he turned it over for the education of doctors' children, he had no idea of the magnitude to which the work would extend. The trustees at a recent meeting made grants during the next academic year amounting to over £1,000. They had never failed to get the money to meet most of the claims they received. Many local medical committees had subscribed, and the reason why some had not subscribed was often because they were helping cases in their own areas. It was agreed on the motion of Dr. F. E. GOULD (Birmingham) that the General Medical Services Committee should be asked to invite regular subscriptions to the Dain Fund from local medical committees.

Dr. S. WAND presented the report of the Claire Wand Fund, the capital of which now amounted to about £13,000. The Trustees had continued to examine ideas which would enable them to achieve their aim of establishing the Fund as a means of enhancing the status of general practice. One proposal was that the Fund should be used as a means of suitably rewarding any practitioner who had made some outstanding contribution which had resulted in raising the status of that branch of the profession. An essay competition on the postgraduate education of newly qualified doctors was now under way. An investigation which was proceeding under a grant from the Fund was into the aetiology and treatment of fibrositis on cases seen in general practice.

Elections

Dr. A. BEAUCHAMP was re-elected unopposed as Chairman of the Conference, and the following were the six members elected by the Conference to the General Medical Services Committee: Dr. J. C. ARTHUR, Dr. A. BROWN, Dr. I. G. INNES, Dr. J. A. PRIDHAM, Dr. F. M. ROSE, and Dr. S. WAND.

On the motion of Dr. J. M. LEES (Walsall), the Joint Formulary Committee was congratulated on the results of its intensive work culminating in the publication of the *National Formulary, 1955*, which had been received with great satisfaction.

Dr. A. G. CHAMBERLAIN (Dorset) moved to place on record the appreciation of the Conference of the excellent and continued work of all members of the General Medical Services Committee, and this was carried with applause, as was a vote of thanks to the Chairman for his conduct of the business of the day.

The Conference went on from 10 a.m. to 6.45 p.m., and afterwards, under the chairmanship of Dr. Beauchamp, the representatives dined together at the Dorchester Hotel.

The Conference Dinner was held at the Dorchester Hotel. Dr. A. Beauchamp presided, and the members of the General Medical Services Committee and officers of the Association were guests. Other guests included Dr. W. E. Dorman, Chairman of the Medical Practices Committee; Mr. A. Shanks, President of the Executive Councils Association of England and Wales; Dr. J. O. McDonagh, Chairman of the Scottish Association of Executive Councils; Dr. W. N. Pickles, President of the College of General Practitioners; Dr. G. F. Abercrombie, Chairman of the Council, and Dr. J. H. Hunt, Honorary Secretary of the College of General Practitioners. Dr. H. W. Donovan (Birmingham) proposed the toast of the G.M.S. Committee in a speech happily blended with humour and wisdom, to which Dr. Talbot Rogers replied. Dr. Rogers paid tribute to the work of the headquarters staff of the Committee. The toast of the Chairman of the Conference was proposed by Dr. A. B. Davies and replied to by Dr. Beauchamp.

The collection for the Dain Fund taken after the Dinner realized a record figure of £206.

After more than 25 years as honorary secretary of the Glasgow Division of the B.M.A., Dr. J. Inglis Cameron has resigned his office.

NATIONAL HEALTH SERVICE ACCOUNTS

In England and Wales at December 31, 1953, 2,175 (or 33.9% of the total of 6,412) full- and part-time consultants were in receipt of distinction awards, says Sir Frank Tribe, comptroller and auditor general, in his report on the summarized Health Service Accounts for England and Wales for the year 1953-4 (H.M.S.O., price 2s.). Two years previously 34% of the 5,885 consultants were receiving awards. The spread of distinction awards between whole-time and part-time consultants is not known.

Theft and Fraud

Losses by theft or fraud which had to be written off in the accounts for the years 1948-9 to 1953-4 amounted to £37,051. Sir Frank referred to the "laxity of financial control and absence of elementary safeguards" which had made such a figure possible. The Treasury too, he said, has "also commented on the inadequacy of the disciplinary action taken by the authorities against officers whose negligence had contributed to the losses." He illustrated his point by referring to a case in which £5,535 in cash was stolen from a locked steel cupboard whose keys had been left overnight on the top of a cupboard in an adjoining hut which had not been locked. Notified of this, the Treasury had asked the Ministry of Health in February, 1952, to take disciplinary action against those responsible. "As it was difficult to imagine a greater degree of negligence," the Treasury suggested that the person primarily responsible should be dismissed. During May the Ministry told the authority of this recommendation, but by then the authority had already decided that the three officers found negligent should be deprived of certain salary increases for six months, so the Ministry had to inform the Treasury that it had now to regard the case as closed as "it would have been constitutionally improper for them to have interfered with the exercise of the authority's discretion." While the Treasury approved the write-off of the loss in May, 1953, it made it known that it was disturbed "by the apparent inability of the Ministry to make its influence more effectively felt in bodies to whom it had delegated so much responsibility." The actual deductions from salaries were not made until October, 1954, after Sir Frank's officers had visited the hospital concerned in July.

Claims for Damages

The 1,100 (approximate) claims for damages made by patients—this figure is for claims against hospital authorities only, not including those against general practitioners—in the year under review cost the National Health Service £159,047. From July, 1948, to March, 1949, with 180 cases £7,560 was spent. Sir Frank pointed out that by a judgment in 1951 hospitals were responsible for the surgeons and doctors on their permanent staff—a responsibility which a further judgment in 1954 extended to cover the whole staff, resident or visiting. To prevent the conflicting interests of doctor and hospital prejudicing the case for the defence, the Ministry came to an agreement in 1954 that the doctor and hospital would collaborate, any damages proportioned as they agreed, or, failing agreement, they would pay in equal shares.

Cost of Maintenance

An examination of the total, inclusive cost of keeping a patient in hospital for a week during 1953-4 is given by J. M. K. Hawton, accounting officer. A general patient in a general teaching hospital may cost as much as £31 4s. 1d. per week, a maternity case £26 11s. 2d., an orthopaedic case £32 11s. 9d. The cost of hospitals run by management committees may be slightly less: here the figures would be £20 7s. 3d., £19 10s. 4d., and £13 12s. 7d. Against the running charges of bedding, crockery, cleaning, etc., and the standing charges of wages, maintenance of building, etc., the hospital has only the direct credit received from staff rent, etc., trading services, and other direct receipts, which are valued at an average of 9d.

ANONYMITY IN BROADCASTING

BY

L. J. WITTS, M.D., F.R.C.P.

Nuffield Professor of Clinical Medicine, Oxford

A letter I wrote to the *Supplement* (January 8, p. 12), arguing against the Central Ethical Committee's insistence on anonymity in broadcasting, was meant as a challenging shot, but the Old Guard reserved its fire. However, in a letter to *The Times* dated February 28, 1955, Dr. Robert Forbes wrote as follows:

"A doctor is ethically bound to refuse to allow his name and cases to be published abroad in such a manner that his professional reputation and status is deliberately promoted to the detriment of his colleagues, of whom some may be equally efficient or possessed of greater skill and knowledge. It was for this reason that the British Medical Association requested the British Broadcasting Corporation to ensure that medical practitioners when discussing medical subjects on the radio should speak or appear anonymously."

Dr. Forbes completely misrepresents the conditions and purposes of broadcasting. Scripts are censored by the B.B.C., and anything savouring of personal advertisement would stand small chance of getting through. Medical men are not invited to broadcast at the expense of their colleagues but for the education of the public. Doctors are trained in medical schools, whose main source of income is the State, and they subsequently work in the National Health Service or other public services. It is therefore essential that the public should be well informed about medicine. Two of the main channels of information are sound radio and television, and to get into vital communication with the audience the message must be personal whenever possible.

For the ordinary listener a talk without a name is like an egg without salt, and in this the listener is right. We should not wish him to take a patent medicine because it is advertised in the newspapers as "recommended by a Harley Street physician." Why, then, should we expect him to pay attention to a broadcast or television programme which is similarly advertised as "by a physician"? The public is entitled to know that it is Dr. T. F. Fox, Editor of the *Lancet*, who is telling them about a medical visit to Russia, Lord Horder who is talking about the medical aspects of cremation, or Dr. L. J. Wits, Nuffield Professor of Medicine, who is describing an attack of fibrositis. The name and description of the broadcaster should be published in the same form as they would appear at the head of an article in the *British Medical Journal*.

"Fame is the Spur"

Broadcasting and television are time-consuming and tiring, and for anyone already earning an average medical income the financial reward after payment of tax, though agreeable, is not a powerful incentive. There are two main reasons why I should wish to broadcast. The first is the fun of doing it, of being allowed to use this expensive and persuasive piece of machinery. The second is the desire to achieve success in the medium. "Fame is the spur that the clear spirit doth raise." If this last incentive is removed the game is not worth the candle. To get a good audience for a radio programme one must have not only good material but also a reputation. If medical broadcasters are to attract an audience comparable with that of Lord Russell, they will only do so by making themselves known to the listener through a number of interesting broadcasts under their own names.

I have several times broadcast under my own name, and, though I have received both abuse and requests for advice, I do not remember being asked to see a patient in consequence. Moreover, as Dr. F. H. Tyrer pointed out (*Supplement*, January 22, p. 23), less than half the profession is now in private practice and able to gain financially from publicity. It would be interesting, therefore, to learn what

evidence the Central Ethical Committee has that broadcasting has been used to obtain patients for doctors or to promote their own professional advantage. I am rather afraid that the ban is merely a symptom of a tendency which is prevalent throughout British life at the present time, a tendency to say that what everyone cannot have no one shall have. Every patient cannot have a pay-bed in hospital, therefore there shall be no pay-beds in hospital. Every medical practitioner cannot broadcast, therefore no doctor shall broadcast under his own name. Envy is a vice under whatever name it is disguised, whether social justice or professional ethics, and it is numbered among the seven deadly sins.

The American Way

The Americans seem to manage this thing better than we do, despite the fact that their radio is commercial. Far from being discouraged, personal broadcasting is actively encouraged by the American Medical Association, and the names of medical speakers are published in their journal. It is frankly realized that tact and discretion are necessary and that there may be circumstances in which it may be better for a broadcaster to use a pseudonym. A number of American medical societies which put out programmes have adopted rules about anyone appearing more than once in a session or making a use of television that might be construed as improper by the usual ethical standards. It is to be hoped that some of these points will be borne in mind if the matter is discussed by the Representative Body, for insistence on the anonymity of practitioners appearing in B.B.C. programmes is likely to have a restrictive effect on broadcasting by the medically qualified and to militate against the ideal of an educated democracy.

Scottish News

GENERAL MEDICAL SERVICES SUBCOMMITTEE (SCOTLAND)

A meeting of the General Medical Services Subcommittee (Scotland) was held on April 28, with Dr. C. J. SWANSON in the chair.

It was reported that the Scottish Committee had appointed Dr. H. B. MUIR, Auchtermuchty, Fife, as a representative to the Subcommittee to fill a vacancy which had arisen.

Grants for Training of Assistants

A motion by Dr. P. W. PHILIP, of Huntly, seconded by Dr. C. HARROWER, that the payment of the allowance of £150 per annum to trainers under the trainee general practitioner scheme be abolished, was discussed. In view of the discussions recently started with the Department of Health on possible developments in connexion with the trainee scheme, the motion was withdrawn.

Service Personnel on Leave

It was reported that the position with regard to Service men on leave had now been brought into line with that in England and Wales. If they are more than two miles from the nearest Service hospital or unit at which a Service medical officer is posted for duty, Service men on leave may be accepted and treated as temporary residents under the National Health Service arrangements.

Highlands and Islands Practitioners Subcommittee

It was reported that the Highlands and Islands Practitioners Subcommittee had been concerned about the substantial expense involved, in some cases, by patients having to attend hospitals. It was appreciated that machinery did exist whereby reimbursement could be made under certain circumstances, but the Subcommittee felt that consideration

might be given to a return to the original scheme whereby the necessary expenses could be met from National Health Service funds. After discussion it was decided to refer this matter to the Joint Committee of the General Medical Services Subcommittee, and the Consultants and Specialists Committee (Scotland) for examination.

On the matter of doctors' houses in the Highlands and Islands, it was reported that the Highlands and Islands Practitioners Subcommittee proposed to give evidence to the Highlands and Islands Standing Advisory Committee of the Scottish Health Services Council on practitioners' houses in the more remote areas.

Maternity Services Subcommittee

Dr. HARROWER stated that the revision of the Maternity Services Record Card (Form E.C. 24R) had now been completed. The Subcommittee has agreed to the Department of Health's suggestion that doctors should be asked to submit their maternity medical services claims as soon as possible after the completion of treatment, and certainly within three months.

Local Authority Surgery Accommodation

Communications from the Scottish Committee and from the Scottish Association of Executive Councils on the possibility of consulting accommodation being provided in certain areas by local authorities were discussed, and in view of the major importance of the subject the matter was remitted to the Chairman's Subcommittee for detailed consideration.

The Subcommittee considered the Department of Health's proposals for the exchange of practices and approved in principle the new procedure. The essential change was the provision for an appeal to the Scottish Medical Practices Committee by a practitioner when an executive council has declined to agree to the exchange.

GLASGOW MEDICAL GRADUATES DINNER

A Reunion Dinner of Glasgow medical graduates and their ladies has been arranged for Friday, June 3, at Bush House Restaurant, Aldwych, London, W.C.2, at 7.30 for 8 p.m. The price of the dinner, including an aperitif, is 30s. per head. Applications for tickets, which should be accompanied by a remittance, should be addressed to Dr. A. M. Maiden, B.M.A. House, Tavistock Square, London, W.C.1. Any Glasgow medical graduates and their ladies who would like to be present will be welcomed.

CENTRAL HEALTH SERVICES COUNCIL AND STANDING ADVISORY COMMITTEES

MEMBERSHIP CHANGES

The Minister of Health has appointed or reappointed the following medical and dental members to the Central Health Services Council and Standing Advisory Committees for the period ending March 31, 1958.

Central Health Services Council.—Sir Stanford Cade (London), new member; Professor Sir Henry Cohen (Liverpool); Professor A. J. Lewis (London); Dr. W. P. H. Sheldon (London); Dr. S. Wand (Birmingham), new member; Mr. T. Hindle (Blackburn), new member.

Standing Medical Advisory Committee.—Sir Stanford Cade (London), new member; Professor Sir Henry Cohen (Liverpool); Professor A. J. Lewis (London); Dr. H. M. C. Macaulay (London); Dr. W. P. H. Sheldon (London); Dr. Stanley Thomas (East Ham, London), new member; Dr. S. Wand (Birmingham).

Standing Dental Advisory Committee.—Mr. M. Beverley Burton (Abergavenny), new member; Mr. T. Hindle (Blackburn); Professor M. A. Rushton (London); Mr. R. W. Swiss (Harrow), new member; Professor F. C. Wilkinson (London).

Standing Ophthalmic Advisory Committee.—Dr. M. Critchley (London); Mr. O. G. Morgan (London).

Standing Maternity and Midwifery Advisory Committee.—Professor W. C. W. Nixon (London), new member.

Standing Mental Health Advisory Committee.—Dr. N. H. M. Burke (Wimbledon); Dr. T. M. Cuthbert (Middlesbrough), new member; Professor A. J. Lewis (London); Dr. C. A. H. Watts (Ibstock), new member; Dr. D. J. Williams (London).

Standing Tuberculosis Advisory Committee.—Dr. P. M. D'Arcy Hart (London); Dr. P. Kerley (London).

Standing Cancer and Radiotherapy Advisory Committee.—Sir Stanford Cade (London); Sir Ernest Rock Carling (London); Professor Sir Henry Cohen (Liverpool); Professor Sir Charles Dodds (London); Professor J. S. Mitchell (Cambridge); Mr. V. E. Negus (London); Sir Clement Price Thomas (London), new, until March 31, 1957.

Correspondence

Because of the present high cost of producing the Journal, and the great pressure on our space, correspondents are asked to keep their letters short.

Part-time Consultants and Income Tax

SIR.—The discussion of this problem reported in the *Supplement* of May 14 (p. 227) is disturbing to those who wish to make the best of our present Health Service. It concerns mainly those part-time consultants who will become liable to pay something like two years' tax in one. There are probably quite a lot of them, and it is difficult to believe they will not quite often be embarrassed by this extra demand, which must amount, at the least, to several hundred pounds. The trouble is that this money is taken from them while they are still in the Service. They are bound to be affected by it, and so, to quite an extent, is their value to the Service.

A whole-time service has undoubted attractions. There is no doubt, however, that our present severely restricted finances produce such delays and limitations that if every consultant in the country were whole-time the apparatus used in the Service, the mutual professional contacts made, the membership of societies and attendances at meetings, and the subscriptions to journals, would all be reduced. Part-time consultants who want these things pay for them when some whole-time consultants cannot, because in effect the part-timer is subsidized by the State. He gets the apparatus he wants quickly, the surroundings where he works and thinks best; he improves his standards and attempts original work, to quite an extent out of his own pocket, aided with this indirect subsidy.

If this subsidy is in part withdrawn by imposing an extra financial charge for one or more years, it seems to me that much of this voluntary activity is very likely to be restricted. The charge will, of course, fall on a number of men with families to educate. These are also the younger men, from whom most energy and originality are to be expected, to whom the loss of a few hundred pounds will be a serious matter. It is no great help to them or their children, and none at all to the Health Service, to give them back the money when they are 65, grandparents, and have no entry to hospitals anyway. When they are young enough to want to spend money in the Service, and have the chance, it is taken from them.

The scales are also loaded against the more able. A man with a Merit Award is more liable to a change of schedule. It is unlikely that his income from private practice will increase automatically at the same rate as his income from the Service. Thus, among the particular sufferers will be the energetic and original, the parents of the next generation, and the consultant leaders. They will need to reduce their pretty certainly closely balanced expenditure still further. Their professional work, their contributions to medical science, the education of their children, will all be jeopardized sufficiently to disturb their peace of mind more than a little. Few measures could seem less necessary, or more detrimental to the welfare of the Service and to the public interest.—I am, etc.,

Hove.

W. A. BOURNE.

Remuneration of S.H.M.O.s

SIR.—The widespread indignation amongst many of my S.H.M.O. colleagues at the recent rejection (*Supplement*, May 7, p. 220) by the Management Side of Committee B of the Medical Whitley Council of the claim for an increased remuneration for S.H.M.O.s has prompted me to write this letter. It is hoped that by enlisting the sympathy of our colleagues in all branches of medicine we may endeavour to prevent yet another injustice from being perpetrated on this already unjustly treated group of the profession.

A considerable amount of dissatisfaction has existed about the treatment of S.H.M.O.s since the National Health Service came into being. Had the Spens Report been properly implemented many of us would have been graded as consultants and remunerated as such. There was no mention of the S.H.M.O. grade in the Spens Report, and the grade was introduced without the consent of the profession. The system by which specialists were graded as S.H.M.O.s resulted in gross injustice to many, since there was no uniform set of criteria in use by the different grading committees, and one's chances of suitable grading were infinitely better in some regions than in others.

S.H.M.O. remuneration was fixed at a scale which overlapped the lower range of consultant salary, but which was even then considered to be too low for many specialists whose qualifications, experience, and duties resembled very closely those of their consultant colleagues. It was hoped that the award of 1954 would bring S.H.M.O. remuneration more into line with that of consultants. Instead, the gap between the two grades was increased and the remuneration of the most experienced S.H.M.O. no longer overlapped that of the newly fledged consultant. Our negotiators recognized that S.H.M.O.s had been unfairly dealt with and a special claim was lodged on their behalf to try to restore the position which had existed prior to 1954, even although this was already an unsatisfactory one. It is this claim that the Management Side has rejected. Their motives for doing so can only be surmised. It is certainly not due to any lack of cause for the claim. It is to be hoped that the Staff Side will now ask that the dispute should be submitted to arbitration and that if this does not have a satisfactory result the full resources of the B.M.A. will be brought to bear to help to rectify the unjust way S.H.M.O.s have been treated.—I am, etc.,

Meols, Cheshire.

E. SNELL.

Ship Surgeons

SIR.—May I correct Dr. M. Dillon's statement (*Supplement*, April 30, p. 209) about remuneration of Australian house-surgeons before too much damage is done? The usual rate of pay in most general hospitals is in the region of £A.500 per annum, increasing by £A.100 per annum for the next two or three years. Certainly there are a few Australian hospitals which have posts with a salary of approximately £A.1,100 per annum, but these posts are not available to the newly qualified doctor. The majority of these posts are in tuberculosis sanatoria, mental hospitals, or repatriation hospitals, and special qualifications are usually necessary. They are also available in the more outlying areas, as in parts of Queensland. While £A.500 per annum is a princely sum compared with £2 per week, so is £2 per week compared with nothing—as was the case some years back at the Royal Melbourne Hospital. Salaries of the present level have only been paid for about three years. The exception has been chosen and quoted as the rule.

Dr. Dillon states that he is mainly concerned about casual labour and implies that casual labour is of a lower standard than permanent labour. This must therefore apply to house-physician and surgeon posts. These posts are only held for six months or so, and are really casual posts. I feel sure Dr. Dillon would not wish to dispense with these posts. Also, the shipping companies appear to be quite satisfied with casual labour. Dr. Dillon seems very anxious that the ship surgeon should primarily be a sailor ("employ-

ment of amateurs"). A doctor, wherever he is, is primarily a doctor, and, whether he be in the Merchant Navy, missionary service, public health department, or anywhere else, this fact should always be borne in mind. Even at sea one must still attend sick people—usually very few. It is hard to understand why anyone would make only one or two voyages with cheap gin as the main object, as is suggested.—I am, etc.,

Chertsey, Surrey.

D. McLAREN.

Compensation for Loss of Goodwill

SIR.—I heartily corroborate the word "swindle," as used by Dr. J. Macleod (*Supplement*, April 30, p. 209) in connexion with our impounded compensation. My surgery and waiting-room accommodation, in my own opinion, could do with enlargement and improvement, although it passed a recent inspection as to fitness. The estimated cost of alteration involved an expenditure of less than £800, and this I felt would be an excellent way to spend some of my compensation. A request for an advance was emphatically turned down, although help and advice were given to me from the local B.M.A. office.

Eight hundred pounds not at the moment being readily available from other sources, and I having no wish to land myself with debt, the attractive improvements in my working, and the patients' waiting, conditions will have to remain in abeyance.—I am, etc.,

Birmingham, 31.

JOHN H. SHANN.

Entry into Practice

SIR.—With reference to Dr. F. Gray's letter (*Supplement*, May 14, p. 231) may I, through you, state that the medical man to whom I referred in my letter in the *Supplement* of May 7 (p. 223) is no longer a member of Dr. Gray's committee, the Assistants and Young Practitioners Subcommittee, but a member of the former Unestablished Practitioners Group (now called the General Practice Reform Association). In my letter to the *Supplement* I referred to the Assistants and Young Practitioners Group, but the Editor amended my letter to read "Assistants and Young Practitioners Subcommittee" without advising me. This misunderstanding led Dr. Gray to assert that my statement is "completely inaccurate," but this is unacceptable, as the main contention of my letter still stands.—I am, etc.,

London, W.1.

GEORGE ROSSDALE.

Civil Service Medical Officers

SIR.—After reading the advertisements for medical officer posts in the Civil Service published in the *Journal* of April 23 (advertisement p. 40) I must own to a feeling of bewilderment, not untainted by cynicism, at a certain aspect of the wording of these advertisements. In each one the same phrase is repeated with a glib assurance inviting doctors to apply for the glittering prize of a promotion-studded career in the Civil Service, with the bland statement that there are "promotion prospects."

Now this is interesting indeed, but it is just not good enough, for we in the Civil Service know that it is not so, or is so unlikely that it is impossibly remote. Perhaps, though, we have not yet been informed of those rich rewards for our years of service, or could it be that they are only applicable to new entrants? We shall all be most happy to hear of these promotion prospects, for the battle of complementation is one which we have been fighting for many years with little success.

The nearest approach to increasing the number of senior posts was arrived at by the despised and rejected Howitt Committee, which in its report advised personal promotion to the holder of a post which would not normally apply to the subsequent holder of the post, a form of grace and favour preferment which is not only distasteful but open to many forms of abuse by both sides.

I feel that this should all be made clear to applicants for posts as medical officers in the Civil Service, and also the

widely held view that for all practical purposes there will not be any promotion, except on retirement and death grounds, for many years to come. No doubt the red herring of the Royal Commission and its recommendations will be dangled before the applicant's eyes, but he has only to read the Treasury views of medical officers and their claims as given to the Royal Commission for this rosy dream to fade. My apologies for a pseudonym, but it is, I am afraid, necessary for the usual reasons.—I am, etc.,
CIVIL SERVANT DOCTOR.

H.M. Forces Appointments

ARMY

Colonel T. I. Dun, D.S.O., M.C., late R.A.M.C., has retired on retired pay, and has been granted the honorary rank of Brigadier. Colonels L. Handy, G. T. Gimlette, and T. B. H. Tabuteau, O.B.E., late R.A.M.C., have retired on retired pay.

ROYAL ARMY MEDICAL CORPS

Lieutenant-Colonel J. M. Savege has retired on retired pay, and has been granted the honorary rank of Colonel. Captains H. S. Gavourin, R. O. J. Fry, H. F. McElligott, F. R. D. Minett, W. G. Miln, M.B.E., K. H. Fraser, and P. C. Barry to be Majors.

Short Service Commission.—Captain J. B. Spearman to be Major.

REGULAR ARMY RESERVE OF OFFICERS

ROYAL ARMY MEDICAL CORPS

Captain P. V. MacGarry, having attained the age limit of liability to recall, has ceased to belong to the R.A.R.O. and has been granted the honorary rank of Major.

Class III.—Major M. S. Howe, M.C., from Active List, Short Service Commission, to be Major. Captain (Honorary Major) R. B. Crombie, from R.A.R.O., to be Captain (Honorary Major).

ARMY EMERGENCY RESERVE OF OFFICERS

ROYAL ARMY MEDICAL CORPS

Lieutenant-Colonel C. Berens, T.D., from T.A., to be Lieutenant-Colonel.

Major J. G. A. Gilruth, from T.A., to be Major.

TERRITORIAL ARMY

Lieutenant-Colonel (Acting Colonel) J. A. Dudgeon, M.C., T.D., R.A.M.C., to be Colonel.

ROYAL ARMY MEDICAL CORPS

Lieutenant-Colonels N. C. Oswald, T.D., and V. K. Drennan, T.D., have been granted the acting rank of Colonel.

Major (Acting Lieutenant-Colonel) R. Lamb has relinquished the acting rank of Lieutenant-Colonel.

Majors T. G. Cameron, M.C., C. T. A. Burgess, O.B.E., C. H. Imrie, and J. L. D. Roberts have been granted the acting rank of Lieutenant-Colonel.

Major T. I. Palmer, R.A.R.O., to be Major.
Honorary Major J. V. L. Farquhar, formerly R.A.R.O., to be Major.

Captain (Acting Lieutenant-Colonel) R. B. McConnell to be Major.

Captain (Acting Major) J. H. Garson has been granted the acting rank of Lieutenant-Colonel.

Captains (Acting Majors) D. E. Sharvill, R. B. Raffle, B. J. Harries, and A. C. P. D. Thomson to be Majors.

Captain (Acting Major) J. C. Campbell has relinquished his commission.

Captains E. R. Cole and J. A. Paterson to be Majors.

Captains P. W. S. Gray, S. Myers, N. T. Nicol, R. J. Howat, T. D. A. Gray, A. Ross, J. B. Walter, R. H. Freeman, and J. H. Parry have been granted the acting rank of Major.

Lieutenant S. E. J. Smith, T.D., has been granted the acting rank of Major.

HER MAJESTY'S OVERSEA SERVICE

The following appointments have been announced: A. A. Alderice, M.B., B.S., M.R.C.P., A. J. Boase, F.R.C.S., D.O.M.S., and H. C. Trowell, M.D., F.R.C.P., Senior Specialists, Uganda; G. H. K. Gentle, M.R.C.S., L.R.C.P., Superintending Medical Officer (Specialist), V.D. Division, Trinidad; J. R. Harries, M.B., B.S., M.R.C.P., Medical Specialist, Kenya; J. C. Baird, M.B., Medical Officer, Northern Region, Nigeria; W. L. H. L. Bell, M.R.C.S., L.R.C.P., and S. P. Maurer, M.B., B.Ch., Health Officer, Federation of Malaya; L. B. G. Bennett, M.B., B.Ch., Surgeon, St. Lucia; A. J. Coello, M.D., D.P.H., Medical Officer, Grade A, Physician, Trinidad; E. P. Hamblett, M.B., Ch.B., D.C.H., District Medical Officer, Dominica; Margaret M. R. O'Garra, M.B., B.S., District Medical Officer, Antigua.

Branch and Division Meetings to be Held

BOURNEMOUTH DIVISION.—At Board Room, Royal Victoria Hospital, Boscombe, Friday, May 27, 8.15 p.m., meeting. Address by Dr. A. C. Crooke: "The Influence of the Endocrines in Carcinoma."

ENFIELD AND POTTERS BAR DIVISION.—Saturday, June 4, summer social meeting, 6.45 p.m., reception; 7.15 p.m., visit to the House of Lords and the House of Commons; 8 p.m., dinner at the House of Commons. Guests of the Division: The Rt. Hon. Iain Macleod, Dr. E. A. Gregg, and Lord Webb-Johnson. Members' ladies and their medical guests are invited.

MID-HERTS DIVISION.—At Ashwell House, Verulam Road, St. Albans, Friday, June 3, 8.30 p.m., meeting. Annual B.M.A. Lecture by Dr. Ffrangcon Roberts: "The Influence of Medicine on Civilization," illustrated by slides.

MONMOUTHSHIRE DIVISION.—At St. Mellon's County Club, Friday, May 27, 8.30 p.m. to 2 a.m., summer dance.

PADDINGTON DIVISION.—At Royal National Throat, Nose, and Ear Hospital, Gray's Inn Road, London, W.C., Friday, June 3, 3.30 p.m., clinical meeting and discussion. Mr. N. Asherson: "Intra-cranial Complications of Ear and Sinus Disease."

SALISBURY DIVISION.—At the Roundabout, Little Durnford, near Salisbury, Tuesday, May 31, 8.15 p.m., A.G.M.

SOUTH MIDDLESEX DIVISION.—At Great Fosters, Egham, Wednesday, June 1, 8 p.m., cocktail party to be held jointly with local division of the British Dental Association.

SOUTH STAFFS DIVISION.—Thursday, June 2, 2.30 p.m., tour of Stuart Crystal Glass Works, Wordsley. Members' wives are invited.

SWANSEA DIVISION.—At Swansea Hospital, Thursday, June 2, annual meeting.

WEMBLEY DIVISION.—At Wembley Hospital (in the Gymnasium), Fairview Avenue, High Road, Wembley, Tuesday, May 31, 9 p.m., meeting. Symposium: "The Value of Surgical Treatment in Congenital Heart Diseases." Speakers, Dr. I. M. Anderson and Mr. C. E. Drew. To be illustrated with films and pictures. Members from surrounding Divisions are invited.

WILLESDEN DIVISION.—Wednesday, June 1, visit to Ovaltine Factory at King's Langley, Herts. Assemble 1.15 p.m. at Willesden General Hospital. Members and their ladies or other guest, and health visitor staff, are invited.

Meetings of Branches and Divisions

DORSET DIVISION

A meeting of the Division was held on March 14. Dr. C. Hollins was in the chair, and 21 members were present.

Dr. A. S. Hall gave a lecture on "The Differential Diagnosis of Eruptions of the Extremities." The meeting instructed the secretary to write to the county medical officer of health to ask if he would make known to parents that their own doctors were able to undertake the immunization of children against diphtheria, pertussis, and tetanus. Parents were often unaware of this and thought that immunization could be carried out only at local authority clinics.

GENERAL MEDICAL COUNCIL

190th SESSION

The 190th session of the General Medical Council opened at 44, Hallam Street, London, on May 24, with Sir DAVID CAMPBELL in the chair.

Dr. KENNETH COWAN was introduced as Crown Nominee for Scotland in succession to Sir Andrew Davidson. Dr. Cowan, who is Chief Medical Officer for the Department of Health for Scotland, was welcomed by the President and took his seat.

Notice was intimated of the reappointment of the following members, each of them for a term of five years: Professor E. R. BOLAND, representing the University of London; Sir HENRY COHEN, Crown Nominee; Professor W. J. TULLOCH, representing the University of St. Andrews; and Dr. ANDREW ALISON, representing the Royal Faculty of Physicians and Surgeons of Glasgow. Sir CECIL WAKELEY's reappointment as representative of the Royal College of Surgeons of England for the period March 8 to July 31, 1955, was also intimated.

Sir SYDNEY SMITH was re-elected Chairman of Business and Dr. G. A. CLARK was elected co-treasurer in place of Sir Cecil Wakeley, who ceases to be a member of the Council after July 31.

The Council proceeded to the election of the Executive and Dental Executive Committees, the Finance Committee, the Pharmacopoeia Committee, the Medical Disciplinary Committee, and the Dental Education and Examination Committee.

PRESIDENT'S ADDRESS

Sir DAVID CAMPBELL delivered his address from the Chair. He referred to the death early this year of the Council's former colleague, Sir Henry Wade, and paid tribute to his 10 years of service as the representative of the Royal College of Surgeons of Edinburgh, and particularly to his work for medical education. The President also recorded the regret of the Council at the death of Dr. Hampshire, whose 21-year occupancy of the office of Secretary to the Pharmacopoeia Commission saw the *British Pharmacopoeia* achieve an excellence which was respected throughout the world. The President also deplored the death of Dr. Harry Rae, for many years head of the Department of Public Health in Aberdeen University, and medical officer of health for the city and county of Aberdeen and a visitor of medical schools and examinations in public health for the General Medical Council.

Sir David Campbell referred to the retirement from the Council of Sir Andrew Davidson, and commended his work as chairman of the Special Committee set up in 1953 to revise the Rules of Courses of Study and Examinations for Diplomas in Public Health. He regretted the resignation from the Pharmacopoeia Commission of Professor Linstead, and congratulated him on his appointment as Rector of the Imperial College of Science and Technology.

Medical Colleges in India

The President said that the Government of India had for some time been engaged in a programme to secure a large increase in the number of qualified medical practitioners. This was being done by creating new medical colleges or by upgrading to university standard institutions which previously trained licentiates. Some of the new or upgraded medical colleges had been affiliated to universities which had for many years granted medical degrees. Others had been affiliated to or incorporated in new universities, or in universities which previously had no medical faculty. The standard of these new medical colleges was supervised by the Medical Council of India, who arranged for the inspection of the teaching at the colleges and of the examinations of the universities, under powers similar to those possessed by this Council.

Last May the Executive Committee had granted recognition for the purpose of registration in this country to the degrees of four Indian Universities which the Medical Council of India had recently recognized. Since then the Medical Council of India had notified the G.M.C. that they had recognized a number of further Indian qualifications, and had requested that their recognition in this country might in turn be considered. As a result, the Executive Committee in February decided to recognize the degrees of the University of Bihar in respect of the Darbhanga Medical College, the degrees of the University of Poona in respect of the B.J. Medical College, Poona, the degrees of the University of Utkal in respect of the S.C.B. Medical College, and the degrees of the University of Gujarat in respect of the B.J. Medical College, Ahmedabad. It also decided to extend the recognition of the degrees of the University of Agra, which was granted last year in respect of the Agra Medical College, to include persons who had undergone a course of study and been examined at the Gajra Raja Medical College, Gwalior.

Correctness of the "Medical Register"

One of the duties imposed by the Medical Acts upon the registrars of the General and Branch Councils is to keep the *Register* correct. But Sir David pointed out that, no matter with what diligence the registrars pursued their task, a successful result must depend to a large extent on the co-operation of the profession in keeping the Council informed of changes in their address.

The Acts authorized the registrars to write to any registered medical practitioner at his registered address to inquire whether he had ceased to practise or had changed his residence. If no answer was returned to this letter within six months, it became lawful to erase the name of the practitioner from the *Register*. In view of the great importance to the public of keeping the *Register* correct, it was the practice of the Council to direct that this power should be exercised. Since 1951, when the process was resumed, letters had been sent to approximately 50,000 practitioners. The

sections of the *Register* which had thereby been covered comprised those practitioners registered in the United Kingdom list whose names began with the letters A to N inclusive, and the whole of the Commonwealth and Foreign Lists. In one year one-third, and in no year less than one-sixth, of the practitioners to whom such letters were sent failed to reply and thereby rendered themselves liable to erasure from the *Register*. In spite of considerable efforts by the registrars, 2,659 could not be traced and their names were eventually erased. The fact that 309 names had been restored to the *Register* during the past four years after erasure under these provisions, including 146 in 1954, indicated that a proportion of those erased were still in practice.

Recommendations as to the Medical Curriculum

Sir David Campbell emphasized that the duty of the Council was to see that the courses of study and the tests of professional fitness actually applied by the examining bodies were "sufficient"—that is, the tests must ensure that those who passed them possessed, in the words of the Act of 1886, "the knowledge and skill requisite for the sufficient practice of medicine, surgery, and midwifery."

From the sixties of the last century onwards the Council had issued public statements, roughly at intervals of ten years, of the subjects in which students should be instructed and examined, the order in which the subjects should be taken, the period to be covered by the curriculum and its main subdivisions, and the general scope of the examinations. These statements were recommendations.

It might be, however, that with the passage of the years the recommendations had acquired the force of regulations, and thus had come to have a restrictive effect on the diversity, freedom, and responsibilities of universities and medical schools. That, in the President's view, was the fundamental problem which the Council would have to try to solve in its consideration of the amendment of its recommendations of 1947. They would also have to consider how far the introduction of the compulsory year of residence in hospital would affect the recommendations.

The "British Pharmacopoeia"

Dr. H. G. DAIN, chairman of the Pharmacopoeia Committee, presented its report.

The Commission had agreed that the apothecaries system of measurement should be eliminated from the *British Pharmacopoeia* and that the metric system should take its place. The Commission felt, however, that reasonable notice should be given of the intention to use the metric system only, and that it would be premature to make the change as early as 1958, when the next edition of the *Pharmacopoeia* will be published. The earliest appropriate date for the change appeared to be the year in which the following edition was due for publication, namely, 1963.

Study and Examinations for the D.P.H.

Dr. R. M. F. PICKEN, chairman of the Special Committee on Public Health, said that the Committee had invited, as a first step in considering the revision of the current rules on courses of study and examinations for the D.P.H., the views of a number of bodies and persons who were concerned with the training of candidates or were interested in public health administration. In general the Committee had found a consensus of opinion that no substantial amendment in the subject-matter prescribed in the existing rules was required. Criticism was made, however, on two grounds of the Certificate in Public Health. It was stated that little advantage was taken by practitioners of the provision enabling them to obtain a certificate. In the great majority of centres practitioners who had obtained the certificate proceeded normally to study for the diploma. In these circumstances the Committee felt that there could be little justification for the retention in the rules of specific provision for a separate Certificate in Public Health.

These recommendations were agreed to by the Council.

A report of the Medical Disciplinary Committee will appear in the Supplement next week.

RESEARCH IN GENERAL PRACTICE DR. W. N. PICKLES AT SOUTH MIDDLESEX DIVISION MEETING

Dr. W. N. PICKLES, President of the College of General Practitioners, gave an address on "Research in General Practice" to the South Middlesex Division of the B.M.A. on May 18. Members of the Guildford, Kingston, and West Middlesex Divisions of the B.M.A. were present by invitation. Dr. C. D. MEADOWCROFT was in the chair.

A Great Trio

Dr. Pickles chose a trio of "the greatest of our general practitioners" to build up his story. Starting with Edward Jenner—"A man who unhurriedly followed up a country belief and patiently waited to confirm it"—Dr. Pickles went on to William Budd, who, as a boy of 12 when Jenner died in 1823, "was being brought up in the traditions of medical practice in the family home at North Tawton in Devon." The speaker referred to Budd's *Typhoid Fever* as "one of the treasures of the epidemiologist, and his cold reasoning is a pattern for all those who essay to study the natural history of disease."

Budd was first a country practitioner, and of himself he wrote: "Having been born and brought up in the village. I was personally acquainted with every inhabitant of it, and being, as a medical practitioner, in almost exclusive possession of the field, nearly everyone who fell ill, not only in the village itself but over a large area around it, came immediately under my care." He later became a consulting physician in Bristol, where the idea that phthisis was a self-propagated zymotic disease and that all the leading phenomena of its distribution might be explained by supposing that it was disseminated through society by specific germs contained in the tuberculous matter cast off by persons already suffering from the disease, first came into his mind. It was his earlier experience in general practice. Dr. Pickles felt, that inspired Budd in his later work.

Of James Mackenzie (later Sir James) the speaker said that every young doctor should read the life of this lovable man. It shows how he began to take notes of all his patients and then decided to narrow it down to those whose signs and symptoms were connected with the heart; and that was where general practice came in—there was continuity. He was waiting to see what would happen to men, women, and children who showed these symptoms, and he was able to wait "as we in general practice are able to wait." Dr. Pickles quoted a story which illustrated Mackenzie's attitude very clearly: "A surgeon at the Edinburgh Royal was hesitating to perform a major operation on a rather decrepit elderly woman, and when he heard Mackenzie was in the city he asked for his advice. Mackenzie arrived without any of his paraphernalia—not even a stethoscope—felt the pulse, inquired where she lived, and, learning it was on the top story of a well-known tenement block and that she regularly went up and down, decided that she would stand the operation well, and she did."

Recording and Observing

Following humbly in the steps of James Mackenzie, Dr. Pickles said he believed that the keeping of records was essential, if not the basis of all good clinical work. "Let these notes be brief and let them be legible." Old-fashioned people like himself looked upon careless illegible handwriting as a form of bad manners, and notes written in this fashion were worthless and a source of irritation often to those who wrote them. He told young doctors to choose a fine pen and to take time over the procedure.

In research, said Dr. Pickles, the outlook of the country doctor was largely epidemiological in its widest sense. If he were to find a proportion of his young women patients victims of enlargement of the thyroid gland it would be fitting in him to inquire into local conditions and find out if there were anything in these which might contribute to the knowledge of its causation. There were problems of

heredity which were readily available: the hereditary nature of skin diseases such as psoriasis, for example, as well as the more obviously hereditary diseases, Friedreich's ataxia and conditions such as polydactyly.

Dr. Pickles spoke of a remarkable rheumatic family which he had had under his care during his years of practice. He had found it possible to work out a family tree which showed that out of 53 traceable descendants of a man, himself a victim, who died before his time, 23 had had rheumatic fever or showed unmistakable signs of valvular heart disease. The causation of rheumatic fever was very rightly one of the important objects of research at the present time, and, as environmental influence, dietary influence, and other factors were bound to loom large, it was as well to remember the existence of such families.

Writers of textbooks on infectious disease were handicapped by lack of definite information and were often bound to give approximations, say, on the length of the incubation period and the duration of infectiousness. Yet this information lay within the grasp of the country doctor, if he were interested and if he would give his mind to it. In country places that short and only possible exposure which alone gives this accurate information could often be traced, in a way that was well-nigh impossible in a town with the varied experiences of the town dweller. Dr. Pickles gave two instances of how he had obtained this information in a measles epidemic.

The Mind Prepared

In conclusion Dr. Pickles said: "We country doctors particularly should realize how great are our opportunities, and how much better and more interesting would be our lives if the lead which lies near to hand were assiduously followed. Work of this sort in the field is a possibility in itself, but its value is greatly increased if the practitioner is able to form a close liaison with the director of a laboratory, a man he knows and not just an impersonal bureau. This liaison is now possible in my own and many other districts and will be possible to all in the future."

"Research is not a matter of gusts of inspiration, but the results of patient observation undertaken so often with no sense of self-advancement. 'In the fields of observation chance favours only the mind which is prepared'—so wrote Pasteur. May those of us in general practice see that our minds are thus prepared."

A vote of thanks to Dr. Pickles was proposed by Dr. MORTIMER O'SULLIVAN, and Dr. W. A. LETHAM seconded.

REGISTRARS AND HOSPITAL MEDICAL STAFFING

MEETING OF REGISTRARS GROUP COUNCIL

A meeting of the Registrars Group Council was held at B.M.A. Headquarters on May 20. Dr. J. N. WALTON, a former chairman of the Group, who has recently returned following the completion of an overseas appointment, was invited to the chair. It was intimated that Dr. R. M. FORRESTER, who has represented the Group on the Central Consultants and Specialists Committee, was resigning on accepting a lectureship appointment, and warm thanks were tendered to him for his services.

The report of the Executive Committee for the session 1954-5 was approved, and this report will be circulated to regional registrars groups.

The principal matter for discussion was the revised report on hospital medical staffing prepared by the subcommittee, under the chairmanship of Professor G. I. Strachan, of the Central Consultants and Specialists Committee, and published in the *Supplement* of April 23 (p. 177). It was stated that this revised report had gone forward to the Joint Consultants Committee, together with statements by regional committees and special groups, including their own group.

The Minority Report

The CHAIRMAN said that much disapproval of the Strachan report had been expressed by registrars, and he wished to stress the difficult position in which Dr. Forrester, the one registrar on the Strachan subcommittee, had been placed. When his minority report came to be discussed in the Central Committee there were people who said in effect that the tail must not be allowed to wag the dog, and it was clear that there was no chance of acceptance of the report, so that he had no alternative but to withdraw it and devote himself to obtaining the best possible modifications of the hospital staffing structure. Since then the revised report had gone forward to the Ministry, not as the policy of the Central Consultants Committee of the B.M.A., but as a basis for discussion, and with it the views of other bodies, including a brief report from their own Group.

Dr. Forrester had explained that he had felt it necessary to withdraw the minority report because to have maintained it would have resulted in acrimonious discussion without the registrars being able to speak at the stage of future negotiations. It would also have held up discussions between the Ministry and the Joint Consultants Committee, and the former had been pressing hard for such discussions now for over a year. Whether it was regarded as a strategic retreat or a precipitate surrender, at least it had been agreed that a ratio should be established between those in training appointments and those in jobs not recognized as such, so that the position was ended whereby numbers of people were being taken in at one end and piled up at the other. The Joint Consultants Committee had now started to negotiate with the Ministry on a number of points. One of these which he found difficulty in understanding was that a minimum establishment of assistants in all specialties should be agreed to ensure that there would be sufficient practitioners in training to fill vacancies in the consultant establishment. That apparently went through unchallenged at the last meeting of the Central Consultants Committee. He did not quite know what was meant by "assistant," and it seemed to him that they had got the position upside down. The Chairman said that the Group Council would draw the attention of the chairman of the Central Committee to this ambiguous statement, and state their view that the governing word should be "maximum" rather than "minimum."

Three Points

The Chairman went on to say that many proposals were before the Council from regional registrars groups, most of them adverse to the Strachan report. It would not be profitable to discuss these individually but rather to concentrate on certain points. The Executive had set out three of these, the first being the interpolation of national service in a professional career. The continuing necessity for this service must be accepted, but the question of deferment and of inducement to return to hospital after service needed urgent attention. The Ministry had sent a circular to regional boards indicating the necessity for the provision of married quarters where required, but not drawing any attention to salary scale on completion of national service.

The question of house officers and their payment before and after their national service arose, with the difficulty of people doing the same job being paid at different rates. A representative suggested that this might be justified by the larger experience of the man coming out of national service, but Dr. FORRESTER pointed out that the Strachan subcommittee had envisaged that men after military service would normally be appointed to posts above the house-officer grade, though there was nothing in the report to say that this should be done.

The next question considered was the move from hospital to general practice. Attention was drawn to the scheme of rotating internships already initiated in the Oxford Region (see *Supplement*, January 29, p. 30). It was the strong feeling that any move to make doctors spend a longer time in hospital before entering general practice should work by inducement rather than by compulsion.

The CHAIRMAN said that the integration of hospital and general-practitioner service was one of the most important aspects of the whole problem. It must be made attractive to a man who intended to go into general practice to spend a further period in hospital after his national service. An important point was that many posts in the senior grade were to be part-time posts, and thus it should be possible for a man to go into general practice but work part-time in hospital.

Expansion of Consultant Service

The third question considered was the need for expansion of the consultant service. One further argument brought forward for such expansion was that the poor prospects of promotion from posts of the senior registrar type were acting as a deterrent to recruitment at all levels, and the ratio of senior registrars to consultant posts must be adjusted to involve a reduction in the number of the former and an increase in the latter.

The Chairman said that the increase in the number of consultant posts was not simply to find work for senior registrars but to carry on the work of the hospitals efficiently; it was necessary also because the present ratio of senior registrars to consultant posts was totally wrong, so that many senior registrars were doing consultant work. He suggested that the point be made that all senior registrars and S.H.M.O.s now serving should be redistributed in that grade or in the consultants grade according to their experience. The senior registrar who was regraded must be safeguarded perhaps by doing away with the gap between the surgical assistant and the senior surgical assistant. Dr. FORRESTER said that the redistribution envisaged was not so much of registrar personnel as of registrar posts, though this, of course, would necessarily entail in many cases a redistribution of individuals.

Various suggestions were made from the body of the meeting. The feeling was that without an increase in the number of consultant posts the whole of the suggestions would come to nothing. The CHAIRMAN said that the suggestions had all been noted and would be considered by the Executive in preparing a memorandum.

S.H.M.O.s GROUP EXECUTIVE COMMITTEE

CRITERIA FOR REGRADING S.H.M.O.s

The Senior Hospital Medical Officers Group Executive Committee of the S.H.M.O.s Group of the B.M.A. held its first meeting on May 3. G. WARING ROBINSON was appointed Chairman. It was reported that the membership of the Group had risen to 640.

Following the Group Council's consideration of the report of the Hospital Medical Staffing Subcommittee (the Strachan Committee) of the Central Consultants and Specialists Committee (see *Supplement*, April 9, page 162), the Committee discussed the criteria for redistributing existing S.H.M.O.s between the consultant grade and any new senior assistant grade which may be introduced.

Four Categories for Promotion

The Committee suggested that four categories of S.H.M.O.s should be distributed into the consultant establishment:

- (1) Those who were doing specialist work before the appointed day (July 5, 1948) and who subsequently accepted employment in the hospital service under the National Health Service Act in the same specialty.
- (2) Those who had held for a period of five years an appointment (or appointments) in the S.H.M.O. grade which has involved a large measure of personal responsibility in a hospital ward, out-patient clinic, special department, or specialist unit—for example, mass radiography, blood transfusion.
- (3) Those who had at least seven years' experience in the specialty (as senior registrars or S.H.M.O.s) and had held an appointment (or appointments) as S.H.M.O.s for a period of three years which had involved a large measure of personal responsibility in a hospital ward, out-patient clinic, special department, or specialist unit—for example, mass radiography, blood transfusion.

- (4) Those who had held an appointment as S.H.M.O. for at least two years and who held a major higher qualification (M.R.C.P., F.R.C.S., or M.R.C.O.G.).

Other Categories

S.H.M.O.s not in the above categories should, in the Committee's opinion, be given individual consideration with regard not only to academic qualifications but also to the length and nature of their experience and to their standing amongst their colleagues, and, where appropriate, they should be absorbed into the consultant establishment.

There should be safeguards for existing S.H.M.O.s who, as a result of being placed in the senior assistant grade, would suffer a lowering of status or responsibility or remuneration.

Senior hospital medical officers (whole-time) are defined in the terms and conditions of service as "Senior officers, age 32 or over, performing clinical duties, who are not of consultant status but are not registrars."

The Committee thinks that, for the purpose of these criteria, the definition should include part-time officers provided they spend a minimum of three sessions weekly in the hospital service.

These criteria are intended to be used for existing S.H.M.O.s only, since the abolition of the grade would entitle them to special consideration. They are not intended to apply to the future appointment of consultants from intermediate grades.

The Strachan Report recommended that only a small number should make their permanent career in the hospital service in a grade below that of consultant, and the S.H.M.O. Executive Committee believes it to be essential, therefore, that a large number of existing S.H.M.O.s should be redistributed into the consultant grade, and only a small minority into any new intermediate grade.

CENTRAL HEALTH SERVICES COUNCIL REPORT

The Central Health Services Council for England and Wales (chairman, Sir Frederick Messer) has made its report¹ to the Minister of Health on its proceedings, and on those of its standing advisory committees, for the year ending December 31, 1954. Much of the work reviewed has already been the subject of separate reports—for instance, the Report on General Practice Within the Health Service² (the Cohen Committee) and the Report on the Internal Administration of Hospitals³ (the Bradbeer Committee).

Thanking the members of the Council and advisory committees for their work, the Minister of Health writes in his introductory statement to the Council's report: "I am conscious that the collective advice I have been given is derived from the personal, unbiased contributions of each individual member, and, especially on questions which may be the subject of current controversy, these cannot always be entirely easy to make."

Nursing Assistants in Mental and Mental Deficiency Hospitals

In the early part of the year both the Standing Mental Health Advisory Committee and the Standing Nursing Advisory Committee considered the supply of nurses for mental and mental deficiency hospitals. The Standing Nursing Advisory Committee thought that there was a place in such hospitals for "a statutory grade of enrolled assistant nurse for whom there would be a roll distinct from the existing roll of assistant nurses." The Mental Health

¹ Central Health Services Council. Report for the Year Ended December 31, 1954. H.M.S.O., London.

² Central Health Services Council. Report of the Committee on General Practice within the National Health Service, 1954. H.M.S.O., London.

³ Central Health Services Council. Report of the Committee on the Internal Administration of Hospitals, 1954. H.M.S.O., London.

Committee took the opposite view. The two committees agreed that it would be necessary to employ two categories of nursing staff in this field for a considerable time ahead, but could get no further than recommending a full inquiry into the whole question.

The Council therefore appointed a working party of representatives of the two Standing Advisory Committees, under the chairmanship of Sir Henry Cohen. They produced a unanimous report which the Council accepted. The Working Party found no fundamental differences between the two sides in principles to govern a short-term policy. It agreed that there was an urgent need in both types of hospital which could be filled by nursing assistants appropriately experienced and supervised. There was a great deal in favour of a statutory roll of assistant mental nurses, especially regarding status, but legislation would be needed. Meanwhile, to achieve the best standard of work, the nursing assistant should undergo a training course for which a "practical proficiency" certificate should be awarded. The Working Party suggested that this short-term proposal should be given a three-year trial.

Medical Care of Epileptics

The Standing Medical Advisory Committee considered, among other things, the medical care of epileptics. A considerable proportion of patients, especially those with major epilepsy, could now be made fit to take their place in the normal working community. The Committee thought, therefore, that the medical services available to the epileptic should be reviewed.

In the medical field the immediate needs of epileptics appeared to be: (1) adequate facilities for advice on diagnosis and treatment; (2) some beds set aside for short-term stabilization and assessment; (3) long-term institutional accommodation for rehabilitation of more difficult cases and those unfit for life in the community; (4) adequate after-care and resettlement facilities. Problems arose under each of these headings—for instance, on (1), was there sufficient medical manpower, particularly at consultant level, and, if not, how could the position be improved? On (2), how many beds were likely to be required and could they be provided on a regional basis? How long would stabilization and assessment take? On (3), would the future intake to epileptic colonies be reduced if intensive treatment were available immediately on diagnosis? What was the prospect of mental deterioration if fits were not completely controlled? How far was psychopathy a symptom of epilepsy and how far was it due to faulty handling, particularly in the early stages?

The Medical Committee decided to set up a subcommittee with the following terms of reference: "To review arrangements for the care of the epileptic and to make recommendations."

The Ban on Heroin

The Minister referred to the Medical Advisory Committee three resolutions adopted by the Economic and Social Council of the United Nations, urging Governments to prohibit diacetylmorphine (heroin) and ketobemidone, and to discontinue cannabis, as used in medical preparations. The Medical Committee had advised in 1950 that it would be justifiable to prohibit heroin in this country if international agreement were reached to prohibit its manufacture and sale. Arrangements for prohibition were in fact now being made. Of the two other drugs, ketobemidone was not manufactured in this country, and cannabis, which had not appeared in the *British Pharmacopoeia* since 1914, had practically no recognized use.

The Committee advised the Minister that in its view it would be right to accept the resolutions of the Economic and Social Council of the United Nations relating to ketobemidone and cannabis.

Dental Manpower

The Standing Dental Advisory Committee examined the evidence on the number of dentists likely to be available in

future years in relation to the demand likely to be made upon their services. The Teviot Committee, reporting in February, 1946, had observed that "it was not possible to say with any accuracy how many dentists it would ultimately be desirable to have practising in this country. . . . Nevertheless, we can say with confidence that up to a total of about 20,000 in active practice there is no likelihood of securing entrants more quickly than they are needed."

In the light of the later information available to it, the Committee saw no reason to amend this appraisal. There was likely, however, to be a continuing increase in demand for provision of treatment in the Health Service. The Committee noted that, of the 15,000 dentists now on the *Register* who were practising, some 40% were aged over 55, so that in the next ten years retirement would be at a very high rate. The Teviot Committee estimated that, to reach the total of 20,000 practising dentists in Great Britain within 20 years, entry to the *Register* would have to be raised to 800 a year. Allowing for 10% wastage, some 900 new dental students were therefore needed each year. A peak of about 650 new students in dental schools in Great Britain was reached in the immediate post-war years, but there had been a fall to 470 in 1953.

The Committee concluded that unless some action was taken there would be an acute shortage of dentists in the near future.

The Minister has set up an interdepartmental committee (the McNair Committee) to ascertain the reasons for the lack of candidates of suitable quality for training as dentists and indicate possible directions in which remedies might be sought (see *Supplement*, May 21, p. 236).

PRACTICE COMPENSATION AUCTIONED

On May 26 in a City of London sale-room there took place what is believed to be the first public auction of a doctor's compensation for the loss of the right, under the provisions of the National Health Service Act, to sell the goodwill of his practice. The notice of sale described "Lot 1" as "The medical practice compensation amounting to £4,089, payable on the death of a medical practitioner, a gentleman aged 57, or on his retirement from the National Health Service, whichever event first happens." The interest of 24% per annum payable on the capital was included in the sale.

At the outset the vendor's solicitor read a letter from the Ministry of Health which said that it had no objection to the selling or assigning of practice compensation and the interest thereon. With any doubts thus dispelled, and after it was made clear that there was no retiring age for general practitioners in the N.H.S., the sale proceeded. An opening bid of £2,500 was briskly raised by hundreds to £3,200 and then to £3,250, beyond which none was prepared to go. As this exceeded the reserve, the hammer fell and the lot was sold.

TRANSFER OF L.C.C. HEALTH SERVICES

OPPOSITION BY LONDON EXECUTIVE COUNCIL

The London County Council has been seeking views on the possibility of returning to metropolitan borough councils certain of the personal health services, including maternity and child welfare, vaccination, day nurseries, and foot clinics, and of the sharing of powers for the provision of domestic help and health visitors (see *Supplement*, March 5, p. 70).

The London Executive Council at its meeting on May 26 agreed with the London Local Medical Committee that to hand back the present efficiently administered personal health services to the borough councils "would not be in the best interests of the population of London" and "would be highly undesirable."

Correspondence

Patients, Politics, or Both?

SIR.—A report on the presidential address delivered to the Metropolitan Counties Branch of the B.M.A. by Dr. R. Hale-White appeared in the *Supplement* of May 14 (p. 225). It was described as a forthright address, as indeed it was, and, as it was considered that the views expressed deserved publicity, it should be open to equally forthright comment.

May I say at the outset that I wholeheartedly agree with many of Dr. Hale-White's statements? I, too, am sure that the standard of medicine is going down, and will continue to go down. I, too, am sure that tinkering with the Service is not enough, but when I am told that the muddle we are in, and the worse muddle we are drifting into, is because of my apathy and the indifference of many like me, I have not sufficient sense of humour to laugh at the joke.

Does Dr. Hale-White forget completely the dynamic short-lived surge of leadership just before July, 1948? Has he forgotten that there then was neither apathy nor indifference at the periphery? In case he has, may I remind him that we were told by our elected representatives, by members and the Chairman of Council, by the Presidents of the Royal Colleges, that we had won all the essential points in the battle of will and wits with the then Minister of Health, and that we should enter the Health Service and ourselves smooth off its roughnesses and lack of proper finish. Many of us at the periphery were utterly dumb-founded at this startling inexplicable volte-face. I was told at a Divisional meeting that the doubts I felt were quite unjustified, my expression of fears that we were being led gently into a gilded (?) cage were most smoothly dismissed. Yet all this seemed to come about because, on that one occasion, the Minister was polite to the demure deputation from the B.M.A. and by simple tactics persuaded our ingenuous spokesmen to believe a number of noncommittal assurances which were worth precisely nothing.

I doubt if many at the periphery have ever quite got over that episode, and what have we seen since? Long-drawn-out talks with inconclusive endings, evasive answers, delaying tactics, in fact all the tricks employed by those who have succeeded in dividing and ruling. What seems to me as bad as this ineffectual negotiation is the acquiescence, by the very committees which Dr. Hale-White claims are fighting on our behalf, to the increasing number of obstacles which the Ministry of Health is putting in the way of good doctoring.

Why, in the name of sanity, was it agreed that I should be ordered to write my prescriptions on either a white or a green coloured form, when all my prescriptions are priced and my dispensary is in effect the same as a chemist's shop? Why on earth agree that I must have a knowledge of the technicalities of haberdashery? Imagine accepting and, I am told, helping to devise that utterly absurd pantomime of sticking stamps on a sheet of paper when paying over the taxes we have been made to collect. Who would ever have believed that I would be placed in the invidious position of asking for shillings from my old friends, some of whom subscribe to the widespread belief that the whole National Insurance contribution as well as these shillings form a part of my income? There have been occasions when I have gone out late at night, taking dressings with me, and in response to my request for "the Government shilling" I have been asked to accept two, as it was so good of me to come out so late!

Enough of examples, of which there are many more. As things are at present there is no way of countering the insidious changes that are taking place, more particularly when some of our medical brethren are acquiring a liking for bureaucracy. Many of us at the periphery are very much awake "to a sense of personal responsibility for the welfare of medicine in this country," and we feel, not apathy, indifference, and lack of interest, but an intense sense of

frustration, which grows with every added burden that our own representatives allow to be loaded on to our shoulders. The whole profession, with a few exceptions, is in the same drifting boat, and idealism, wisdom, and enthusiasm among that ship's crew cannot make up for bad navigation, complacency, and lack of directions from those on the bridge.—I am, etc.,

Ilminster, Somerset.

HUGH CARTWRIGHT.

Entry into Practice

SIR.—Dr. F. Gray, chairman of the Assistants and Young Practitioners Subcommittee (*Supplement*, May 14, p. 231), refutes a statement made by Dr. George Rosedale (*Supplement*, May 7, p. 223) regarding the two assistantships which could not be filled owing to a lack of applicants. Regrettably, he does not comment further. These two posts were quoted by Dr. L. S. Potter, medical director of the Medical Practices Advisory Bureau (*Supplement*, March 26, p. 120), as a "convincing answer to the statement that doctors cannot get posts in general practice." Such generalization from specific instances may surely give rise to erroneous conclusions.

There is undeniably a widespread belief amongst young practitioners that there is a shortage of assistantship posts compared with the number of available doctors, having due regard to reasonable demands by potential applicants for certain standards of employment. In the presence of such divergent views on the opportunities for obtaining such a post, many young practitioners would welcome a survey to determine, as accurately as possible, the involuntary unemployment rate in the profession and the average number of applicants for assistantship posts. Dr. Gray's Committee might appropriately investigate such vacancies as those quoted by Dr. Potter, with a view to assessing whether the sole deterrent is, in fact, an unattractive area.—I am, etc.,

London, N.W.2.

G. H. ISAAC.

*. We understand that the Medical Practices Advisory Bureau is carrying out a survey similar to the one referred to and that the figures will be published shortly.—ED., B.M.J.

Employment on Return from the Tropics

SIR.—With reference to Dr. E. R. Blay's letter (*Supplement*, April 23, p. 202) a return to the United Kingdom must usually be borne in mind by doctors who go to the Tropics, but if their home of origin was Northern Ireland they will find the door closed to them on their return, as before an appointment can be obtained there the previous five years must have been spent in the United Kingdom. Moreover, as regards the public health service in the Imperial Province, they will also find that the upward age limit is 45 years, and that even for a clinical post the applicant must hold the Diploma in Public Health.

Such restrictive regulations do not, of course, obtain in England, and, although the Northern Ireland Government makes much play of being constitutionally a part of the United Kingdom, the Northern Ireland Branch of the British Medical Association appears cheerfully to condone this state of affairs. Yet the great majority of medical graduates whose homes are in Northern Ireland seek employment outside the country, and some, of course, go to the Tropics. Indeed, practice in the Gold Coast particularly has been recommended by the Association's official representative from Belfast who recently visited that country.—I am, etc.,

Canterbury.

C. J. MACQUILLAN.

TRADE UNION MEMBERSHIP

The following is a list of local authorities which are understood to require employees to be members of a trade union or other organization:

Metropolitan Borough Councils.—Fulham, Southwark.

Non-County Borough Councils.—Crewe.

Urban District Councils.—Houghton-le-Spring.

British Medical Association

ANNUAL REPRESENTATIVE MEETING, LONDON, 1955

The Annual Representative Meeting was held in the Great Hall of B.M.A. House, London, from Wednesday, June 1, to Saturday, June 4. The chair was taken by Dr. I. D. GRANT (Glasgow). In addition to the 212 constituencies in Great Britain and Northern Ireland, 20 overseas constituencies were represented. The total number of acting and deputy acting representatives on the list was 430.

On the main agenda there were 238 motions and amendments. Almost all the business arose out of the Annual and Supplementary Reports of Council, which were published in the *Supplements* of March 19 and April 23 respectively.

The meeting opened at 10 a.m. The CHAIRMAN commented on the "wonderful attendance" of representatives notwithstanding the railway strike.

THE WORK OF THE ASSOCIATION

The CHAIRMAN OF COUNCIL (Dr. E. A. Gregg), in presenting the Annual and Supplementary Reports, said that the Council had accomplished a great deal of useful work in a session unusually short owing to the necessity of holding the Annual Representative Meeting before the Scientific Meeting in Toronto.

During the session death had taken many highly esteemed members of the Association. Perhaps it might not be invidious to mention two for whom the Representative Body had special regard and affection—Dr. J. B. Miller, a former Chairman of this Meeting, and Dr. Alfred Cox, who was Medical Secretary for 20 years.

Expanding requirements in respect of accommodation for the Annual Meeting had made it increasingly difficult to find centres which could provide all the necessary facilities, and it was with regret that the Council had felt obliged to decline invitations received from Belfast, Bristol, and Oxford. Next year they would go to Brighton, and it would be his pleasure to recommend for election to the office of President a general practitioner in that locality, the first general practitioner to be selected for the office since it was held by Dr. Thomas Fraser, of Aberdeen, in session 1939-40.

More than 250 members of the Association were about to attend the Joint Meeting with the Canadian Medical Association in Toronto. Their Canadian colleagues were preparing hospitality on an unexampled scale.

The Annual Report recorded a delightful gift to the Association by a member of Council, Mr. D. S. Pracy. Mr. A. M. A. Moore, who resigned the Treasurership a year ago, was now about to present a beautiful badge to be worn by the holder of that office. Mr. Moore would make the presentation at the Annual General Meeting.

There were two long and animated debates in the Representative Body in Glasgow last July. The first was on the proposed restoration of the right to buy and sell the goodwill of general medical practices—which, at least for the

time being, had ceased to be a live issue. The second was on the new salary scales for hospital medical staffs which came into operation in April, 1954, as a result of an agreement concluded in Committee B of the Medical Whitley Council. In this field there was, as yet, little progress to report, although a number of fresh claims made by the Staff Side of Committee B were under consideration. It was regrettable that the new salary claim made on behalf of the senior hospital medical officers had not found immediate acceptance. The Representative Body would be sorry to learn that, because of an illness from which they hoped he would speedily recover, Dr. T. Rowland Hill could not attend the meeting to explain the present situation. In his absence the task would be in the hands of Mr. J. R. Nicholson-Lailey.

No less important than the problem of remuneration was that of the structure of hospital medical staffing. The discussion of this difficult problem between the Health Departments and the Joint Consultants Committees was still at a preliminary stage, but, whatever solution might ultimately be found acceptable, much credit was due to the Association for the initiative it had taken in the matter and for the laborious and constructive work carried out by the special subcommittee under the chairmanship of Professor G. I. Strachan.

An attempt to negotiate improved salary scales for medical officers employed by local authorities had not been completely successful. The most disappointing feature of the recent award of the Industrial Court was the apparent acceptance by the Court of the contention, strongly resisted by the Staff Side of Whitley Committee C, that the remuneration of public health medical officers should be related, not to that of other branches of the medical profession, but to that of other professional officers in the employment of the local authorities. This disturbing position would receive careful study by the Council during the coming session.

Finally, from much other material on which he would have liked to comment if time permitted, he selected the problem of the Government's decision to prohibit the manufacture, export, and import of heroin. It was right that the Association should guard jealously the clinical freedom of the doctor, and when the Council looked at this problem last December it expressed the view that, while it was the duty of the Government to legislate against misuse of heroin, the medical profession should not be deprived of this drug or any other drug that was of use in the treatment of patients.

The Presidency

On the motion of the CHAIRMAN OF COUNCIL, it was agreed that in the absence of the President (in Canada) during the session 1955-6 Sir John McNee, who would be the immediate Past President, be invited to act for the President on all appropriate occasions.

It was also agreed on the motion of the CHAIRMAN OF COUNCIL that Dr. Alexander H. Hall, O.B.E., M.D., of Hove, be elected President of the Association for the session 1956-7.

Dr. ALEXANDER HALL, who was received with cheers, acknowledged his election, which he, as "a humble general practitioner," felt to be an expression by his Division of their belief in the importance of the part which the general practitioner played in the structure of the country's medical services.

Election of Vice-Presidents

The CHAIRMAN OF COUNCIL moved that Dr. A. W. S. Sichel, of Capetown, and Dr. P. T. J. O'Farrell, of Dublin, be elected Vice-Presidents in recognition of their valuable services to the Association. Dr. Sichel was President in 1951-2 and Dr. O'Farrell in 1952-3.

This was agreed with applause.

"BRITISH MEDICAL JOURNAL"

Dr. J. G. M. HAMILTON (Chairman of the Journal Committee) presented the Annual Report under "British Medical Journal." So largely did medical political affairs bulk in the activities of the Association that its efforts in connexion with the promotion of medical and allied sciences—the first of its primary objectives—tended to be lost sight of. The accusation sometimes advanced that the Association was little more than a "medical trade union" was palpably refuted by the fact that the journal department was now a publishing house of considerable magnitude with an annual turnover approaching £500,000—a very notable contribution towards the furtherance of the Association's first objective.

Overseas readership had steadily increased in the last 10 years. The *Journal* was read in virtually every country in the world.

The 14 special journals had in 1954 shown a steady rise in circulation in respect of each one.

Every effort would be made, said Dr. Hamilton, to ensure that the *British Medical Journal* reached its readers during the present railway strike. Deliveries would doubtless be delayed, but the department relied with assurance on the understanding and forbearance of members. He explained that the reduction in size was due to the necessity of keeping postal packages below 8 oz. in weight.

Dr. B. HIRSH (Manchester) complained that a large portion of the contents of the *Journal* was uninteresting to general practitioners. He said that the section which interested them most was the *Supplement* correspondence, and asked why it was restricted to about three letters per week on general-practitioner subjects.

Dr. HAMILTON replied that, while criticism of the *Journal* was healthy, it ought to be based on some knowledge both of the subject-matter of the criticism itself and of the clear objectives which the Editor and his assistants were obliged to follow.

It had been found as a result of a recent estimate that about 85% of the letters received were published either in the *Journal* or in the *Supplement*. The amount of space devoted to correspondence had to be determined by a variety of factors, including the nature of the other editorial matter which it was necessary to include. The technical job of making up such a journal, because of the manifold character of the Association's activities, was a very difficult one, but it lay in the hands of one who could justifiably be regarded as the most notable and distinguished medical editor in the world to-day.

About two-thirds of the *Journal's* readership, he reminded Dr. Hirsh, comprised members of the Association who were not general practitioners. It was the Editor's task to provide "something for everyone" and certainly not "everything for someone." Medical scientist and medical specialist readers had also to be catered for, and their interests were not the same as those of the general practitioners.

The report under "Journal" was approved.

"FAMILY DOCTOR"

Dr. O. C. CARTER (Chairman of the Family Doctor Committee) presented the Annual Report under "Family

Doctor." Four years ago, he said, the publication had been in a very frail state; its survival had been problematical. The Representative Body had wisely decided to give it a further chance, and last year it had been produced at no cost to the Association and had provided a small surplus.

"We are building up a large business asset for the Association which has a very considerable capital value," he said. This had been achieved by ploughing back a good deal of the money it had earned. The volume of editorial work had increased considerably over the past year and *Family Doctor* was now more and more widely accepted, approved, and quoted. An assistant medical editor was now needed.

A modest surplus for this year had been budgeted for, despite increased costs. It was intended to develop the magazine's interests by increasing its circulation; its size was to be increased from 64 to 90 pages. The publication of *Family Doctor* pamphlets was to be widened.

At December last year the value of advertising space booked in advance for 1955 had been about equal to the total advertising revenue of 1954. For the first new half-year the revenue had exceeded that of last year's corresponding period by £14,000, despite the fact that advertising copy had been subjected to an even finer screening than before. This year's February, March, and April numbers had been completely sold out. Dr. Carter paid a tribute to the work of the Editor, Dr. Flack, the assistant editor, Miss Ward, and to the business manager, Mr. Edsall.

Dr. C. P. WALLACE (Guildford) deprecated the possibility of *Family Doctor* being regarded primarily as a business asset for the improvement of capital value and thought that attention should be paid to its objects.

Dr. CARTER said it had never been the publication's object merely to make money; its purpose was to give public education and information on healthy living—the reason why its earnings had been ploughed back in order to improve it as a publication and to make it more widely known.

The report under "Family Doctor" was approved.

Dr. W. WOOLLEY moved and Dr. H. M. GOLDING (Bristol) seconded:

That this meeting warmly congratulates the Editor and staff of *Family Doctor* on their fine achievement this year.

This was carried with applause.

ASSOCIATION FINANCE

The TREASURER (Mr. L. Dougal Callander) presented the Financial Statement for the year 1954. At the close of 1953 the Association had had substantial debts to liquidate before the finances could be stabilized. By practising every economy, and particularly by careful budgeting, stabilization had been achieved and by the end of 1954 the Association was out of debt. (Applause.) The seeming paradox of last year's subscriptions being slightly less though membership was slightly higher was due to a greater number of overseas applications, where the subscription was at a smaller rate. Current membership figures were appreciably up. The increased total expenditure for 1954 had been anticipated. Several new and important committees had been set up, including a Constitution Committee. Capitation grants had cost a little more because the balances in the Branches and Divisions had been used up. One of last year's greatest reductions had arisen from the small amount having to be paid on interest on loans.

Current liabilities had been reduced from £192,000 to £164,000. "The picture is a pleasing one," said Mr. Callander, "but, as your Treasurer, I must ask this meeting of representatives to be very cautious in making any decisions which might reduce the income of the Association at present. We can only carry on with a reasonable balance from the income we have at the present moment. We must have a reserve." The past year should be regarded as a period of stabilization; the Association must now consolidate its position so as to be able to weather any unforeseen financial crisis. If the position which the Association had reached in the eyes of the Commonwealth and the world was to be retained emissaries must be sent abroad and paid for, while emissaries from other countries must be received

here. Income from members' subscriptions was just sufficient to deal with the running costs of the Association as at present constituted.

Reduction of the subscription was not at the present moment a practicable proposition; in fact, it would be thoroughly bad finance. As soon as he felt such a step to be justified, he would be the first to advise the Council accordingly.

Mr. Callander ended by thanking the staff of the Association for their help and co-operation and paid a tribute to the work of Mr. Giles, the Financial Comptroller.

Membership Subscription

Several motions were on the order paper pressing for a reduction of membership subscription or its modification for certain classes of members. North-west Wales moved that the relevant paragraph in the Annual Report be referred back with a view to reduction of the standard rate of annual subscription to four guineas. Dr. L. W. JONES (North-west Wales) said that the increase from four to six guineas was made so that the additional income could be devoted to debt redemption, and after three years sufficient should have been subscribed for this purpose and to set some aside to reserve. Also, a subscription reduction would be offset by a greatly increased membership.

Dr. ANGUS WESTON (Council) asked that the motion be rejected. A lower income would mean a lowering of the standard of all the Association's activities.

Dr. J. C. KNOX (Tyneside) pointed out that the accounts disclosed a lowering of subscription income for the first time, and wondered whether this was due to the increased subscription.

Dr. O. C. CARTER (Bournemouth) said it would be impossible to build up a reserve if the subscription were reduced.

The TREASURER said there had been a tremendous rise in membership since the war, which had almost reached saturation point. A reduction of two guineas in the subscription would result in £50,000 a year less income, which would mean going bankrupt unless the Association's functions were drastically reduced.

The North-west Wales amendment was lost.

Gateshead asked that in those cases where members' subscriptions were not chargeable against income tax some compensatory adjustment should be made. Dr. J. C. ARTHUR said members would feel less aggrieved if there could be held out a possibility that when more money was available subscriptions would be reduced.

Dr. FRANK GRAY (Council), speaking as one of the "victims," said the disadvantages had to be weighed against the advantages, and there was no reason for making a difference in subscription between classes of members.

The CHAIRMAN OF COUNCIL said this was a matter which should be taken up with the income-tax authorities, and the Association was engaged on questions concerning members' taxation.

The Gateshead proposal was lost.

Dr. T. O. McKANE (Mid-Essex) moved to instruct the Council to consider a proposal that those not getting an allowance of the B.M.A. subscription on their income-tax assessments should pay a subscription of four guineas instead of six guineas. He said that the resultant increased membership would compensate for the loss sustained. Dr. D. L. GULLICK (East Herts) supported the motion, which was lost.

GENERAL MEDICAL SERVICES

Dr. A. TALBOT ROGERS (Chairman of the General Medical Services Committee) presented the section of the Annual Report and Appendices under "General Medical Services."

He stressed the importance of the setting up of the Willink Committee, and referred to the advantage of having on it Drs. J. T. Baldwin and A. B. Davies, who would ensure that the general practitioners' point of view would be properly understood. He stressed also the general inspection of doctors' surgeries by the local medical committees, which had created a precedent which might well lead to even more tasks being performed by doctors themselves with a minimum

of executive council interference. He repeated many of the points he made in his speech to the Conference of Representatives of Local Medical Committees, reported in the *Supplement* of May 28.

Suggestions that dispensing doctors should receive discounts from wholesale houses had been rejected by the conference on this subject, and at present dispensing practitioners must make the best bargain they could with wholesale houses.

Attempts had been made to get improved rates of payment for trainee assistants, and an offer by the Government, that the remuneration should be raised by £75 a year, had been accepted, starting from July 1. It had not yet been decided how to divide this sum in respect of car allowances.

Income from Private Practice

Dr. H. H. GOODMAN (Newcastle-upon-Tyne) moved that any attempt to assess income from private practice in arriving at the global sum payable to general practitioners be rejected.

The £2m. figure agreed, after the Danckwerts award, as covering private practice for all general practitioners had been confirmed by the Association for the present year, and would again be deducted from the central pool, but doctors who had had private patients at the time the National Health Service started had lost a good deal of their private practice, so that if the figure of £2m. had been correct in 1950 it was too high to-day. The system operated badly for the young general practitioners who had no private practice at all, but rather favoured the older ones with a large number of private patients.

Dr. A. B. DAVIES (Walsall and Lichfield) strongly opposed the Newcastle amendment. Assessment of the private receipts of general practitioners was one of the four legs of the Danckwerts award. The effect of the amendment would be to throw over the Danckwerts award and the Spens recommendations.

Dr. TALBOT ROGERS replied that the £2m. figure had never been accurately checked but had been a compromise. To decide whether or not it was the correct amount it would be necessary to have a proper inquiry. The Ministry and the Association were agreed that the incidence of private practice up and down the country was now so uneven that nothing short of a complete inquiry through income-tax figures could provide the proper answer. Such an inquiry could not be undertaken at present because of the burden of work it would impose upon the Inland Revenue authorities—in fact, there was no likelihood of such an inquiry being held for many years, if ever.

He hoped that the position would always obtain whereby the Association could negotiate the amount to be reckoned for private practice and eventually that it could be negotiated down and not up, but in the meantime it would be unwise to place obstacles in the way of the existing method, which had been working successfully in the past few years.

The Newcastle-upon-Tyne amendment was lost.

Call for Increased Remuneration

Dr. A. COLEMAN (North Glamorgan and Brecknock) moved:

That in view of the ever-increasing cost of living, the Minister should be approached with a view to obtaining a corresponding increase in the remuneration of general practitioners.

The betterment factor, which fluctuated with the cost of living, was an important consideration not yet fully taken into account. The Government had so far declined to admit that a fresh betterment factor should be applied each year, yet it seemed a reasonable request. He quoted comparative figures to illustrate earnings, cost of living, and retail prices on a national scale.

"The time has now arrived when we should insist on the Government immediately reviewing the whole betterment factor question," he said. "An increase of at least 25% should be asked for, and it should be backdated, if possible, to the date of the Danckwerts award." As a long-term policy, he asked if it were possible to work out some easier and totally different scheme from the central pool.

Representatives of East Hertfordshire, North Middlesex, Newcastle-upon-Tyne, and South-east Essex, all of whom had similar motions on the agenda, supported North Glamorgan and Brecknock.

Dr. A. V. RUSSELL (Council) suggested that they should exercise discretion in this matter. If they were going to tie remuneration to cost of living, what was going to happen when the cost of living went down? Recently he read a headline in the Press, "Doctors on the ramp for more money." He begged them not to approach this matter from a trade union point of view.

Dr. TALBOT ROGERS said that it was very important that they should not try to get something at the wrong moment and in the wrong way. They had been told that the most important factor in their remuneration was betterment; he did not agree. The rise in the cost-of-living index, of which so much had been made by the previous speakers, was very largely an industrial figure; it did not include many of the things which cost the professional classes more. The most important thing they got out of the Danckwerts award was the flexibility of the central pool. The amount paid to the profession in capitation fees, loadings, etc., under the whole distribution scheme for the year 1952-3 amounted to £49m. Since then there had been two financial years, 1953-4 and 1954-5. In addition to that £49m. there had been paid out to general practitioners as a whole another £14m., and a further £100,000 in group practice loans. There was still another £1,400,000 to be paid out as a final settlement, and he hoped the final payment would be received in June, 1956. He did not agree that, as one speaker had said, the Danckwerts award was being whittled away; he thought it was being maintained and used intelligently. Many of the things referred to by speakers supporting the North Glamorgan and Brecknock motion as raising the cost of living, such as the higher cost of electricity, petrol, etc., were reflected in the rise of the practice expense allowance.

Dr. F. SMITH (Lanarkshire) pointed out that at the Glasgow meeting an *ad hoc* committee was set up to examine the whole question of medical remuneration, and until it had reported it was inopportune to debate the question at length.

Dr. S. WAND (Birmingham) reminded the meeting that the figures making up betterment were compounded according to the purpose for which they were needed, which for their purpose did not conform with any of the patterns quoted. It was clear that it was no part of Government policy to attach higher income levels to the cost of living. Appropriate action must be taken at the appropriate time. Was a time of strikes and Government changes the atmosphere in which to conduct negotiations?

Dr. A. COLEMAN (North Glamorgan and Brecknock), in reply said that he had in mind mainly the betterment factor, which so far had been refused revision by the Government. He agreed that the moment was not appropriate for negotiation, but pointed out that the motion had been put down before the present situation developed, and asked that the motion be referred to Council.

The meeting refused to allow this motion to be referred to Council, and it was lost by a very large majority.

Group Practice

Dr. R. M. WARREN (Southampton) moved:

That this meeting is concerned with the policy of the Association in regard to group practice, and, having regard for the full implications of this policy, suggests that the Council give this matter further consideration.

He recalled that acceptance of the Danckwerts award by the Ministry of Health was conditional on the setting aside of £100,000 a year for the encouragement of group practice. Practitioners would eventually provide sufficient premises for a nation-wide workable health centre scheme. Might there not be a risk, when the time was ripe, of the State acquiring those premises? Practitioners then working in them would be on a par with those working in State-owned hospitals and be salaried servants, which would be a great step towards establishing a full-time State medical service.

Dr. TALBOT ROGERS said that the danger had been foreseen and avoided. By the time any Government could say to a doctor, "These are not your premises. You built them with State money and the State has a lien in them," the doctor would be able to reply, "But I have paid that money back. I merely had a loan." Everything had been done to ensure that in rural areas the definition of a "group practice" would be interpreted very leniently.

The Southampton amendment was lost.

Drugs for Private Patients

Dr. F. BOOTH (Mid-Cheshire) moved:

That this meeting considers that the British Medical Association should continue to press for the supply of drugs and appliances under the National Health Service to private patients.

He said that at previous meetings it had been stated that this service should be given as a part of the National Health Acts and not as a concession. The Council should continue its efforts to achieve this end, but it did not seem to have been very successful so far.

Dr. R. A. G. HAMILTON (Harrow) asked whether, as a matter of expediency, a concession could be obtained in respect of life-saving drugs.

Dr. R. P. HENDRY (Rugby, with South Warwickshire) supported the motion.

Dr. C. W. WALKER (Cambridge and Huntingdon), speaking as a member of the Cohen Committee, opposed the motion. Everybody was entitled to State medicine provided they complied with the regulations. What could justifiably be debated was whether the present regulations were good, just, and reasonable, and he thought they were. (Cries of "No.") He said he himself had very few private patients, and there was no outcry from them that they were not allowed State medicine. The outcry came from doctors. The permanent officials of the Ministry disliked the idea, probably because it was more difficult administratively, and, he thought, because they felt, as he did, that it was liable to abuse. ("Why?") Also, there would be no difficulty, if the motion were carried, in the Ministry knowing exactly how much private practice there was, and if the sum came to £20m. instead of £2m. the £20m. would be deducted from the central pool. ("Oh!")

The case of the purely private practitioner was hard, and something might be done to alleviate it.

If the principle were accepted private patients could be "bribed" with the offer of State medicine, and State patients could be made to feel so uncomfortable that they would want to become private patients. ("Shame.") He did not like the idea that he should debase the standard of his State practice in order to get more private patients.

Dr. A. BROWN (Chairman, Private Practice Committee) said that the Committee would go ahead as soon as the Council gave the word.

Dr. TALBOT ROGERS said that the point was one which would be pressed with the new Minister (as soon as it was known who that was to be) at the coming session of Parliament. Nothing had so far been said which seemed to question the wisdom of the Association's existing policy on the matter. A point which had not so far been stressed was that a number of private patients were penalized through being unable to afford some of the new and expensive life-saving drugs. The fears that had been expressed over the possibility of having two standards of practice did not appear to constitute such an important risk as that of private patients being penalized in the way he had mentioned.

Dr. BOOTH, in reply, said it was unfortunate that Dr. Walker should have shown such a lack of appreciation of the moral standards of the general practitioner. (Applause.)

The Mid-Cheshire motion was carried with three dissentients.

Dr. R. GREEN (Brighton and Mid-Sussex) moved:

That this Representative Body notes with regret the contents of Appendix II of the Annual Report of Council, and reaffirms its conviction that the opinions of the Cohen Committee on this matter are unacceptable. It deprecates the total absence of reference to the interests of the patient in Appendix II and considers

that private patients have an equal right to free medicine and that this right should be granted.

He disagreed strongly with the idea that the use of E.C.10 for private patients would lead to different standards of practice. Such a statement was little short of a gratuitous insult to the profession. A former Minister had once remarked that if a patient could afford to pay his doctor he could afford to pay for his drugs too. If that was the view of all the Governments since 1948 it implied that only the wealthier members of the community were private patients. That was far from being the case. "We all know that some of our wealthiest patients are on the State, whilst some of the most impecunious have elected to remain private patients." Private patients were of three kinds: (1) Those who were too old for insurance contributions in 1948—and they, as a class, were literally dying out; (2) those who preferred on principle to pay for their doctor's services rather than that they should be paid by capitation; and, finally, (3) those who were accustomed to consulting their doctor in the privacy of their own homes and who felt that it would be unfair to call upon a State doctor to attend them in that way. Many private patients remained so at financial sacrifice to themselves, and the cost of drugs to them was an additional burden. Private patients, he thought, were much less likely to call upon their doctor unnecessarily. The provision of E.C.10 for them would not be likely to alter that position, as they had to pay a fee in any case. If all the remaining private patients decided to put themselves on State doctors' lists and were accepted the Government would have to pay a capitation fee for each one of them and provide all the drugs they needed. Surely those who preferred to pay their doctors for actual attendance should be allowed to do so while the Government paid for the drugs without having to pay a capitation fee. The refusal of this request seemed stupid and unjust.

Dr. W. WOOLLEY (Bristol) took strong exception to the statement that many doctors in private practice would be unwilling to accept the imposition of any necessary safeguards. The Bristol Local Medical Committee had sent out 253 letters and a questionnaire on the subject, and, out of 240 replies, only 3 had expressed unwillingness.

Dr. ENID HUGHES (Denbigh and West of Flint) said that the Cohen Committee's opinion that treatment and prescription of drugs were so intimately bound as to be one particular action was quite unacceptable. The mere writing of a prescription by a consultant did not constitute the treatment of a patient.

The Brighton motion was carried unanimously.

The Cohen Committee Report

Dr. F. A. BELAM (Guildford) moved a resolution regretting that no minority report in favour of the supply of drugs for private patients was issued by the Cohen Committee, and instructing the Council to make inquiries of individual private practitioners concerned to find out how many would be prepared to accept suitable safeguards.

Attention had already been drawn to the very invidious remarks of the Cohen Committee as to what would happen if the private patient were allowed to have his drugs free.

Dr. W. E. DORNAN (Sheffield) opposed the motion. The first part he considered to be thoroughly bad, as it implied criticism of the members whom the Association had nominated to the Cohen Committee. Those members had, after carefully considering the whole matter, decided not to press for the issue of a minority report on what was quite a small proportion of the report as a whole, because there had been other much more important aspects concerning general practitioners on which there had also been strong minority opinions. To have published a minority report on a comparatively small though admittedly important aspect of the committee's work would have resulted in a flood of other minority reports on much more important aspects of the work of the committee.

The CHAIRMAN OF COUNCIL said that he agreed with Dr. Dornan. The publication of the minority report asked for would have led to the issue of a number of other reports of a character which might perhaps have been regretted

afterwards. It was therefore felt to have been better that there should be no minority reports at all.

Dr. A. BROWN (Chairman of the Private Practice Committee) said that, provided the Council consented, an investigation into the willingness of private practitioners to accept suitable safeguards would soon be undertaken.

Dr. C. P. WALLACE (Guildford) said it was important that the Representative Body should establish the principle that whenever a committee was appointed to inquire into any matter, if members of the Association disagreed on important points they should definitely state so in a minority report.

The Guildford motion was put to the meeting in two parts and both were carried.

Prescribing of Proprietary Preparations

Dr. A. BARKER (East Kent) moved:

That when an executive council becomes aware that a new preparation is being prescribed, which does not appear to be a drug forming part of the pharmaceutical services provided under the Act, it shall immediately circularize all general practitioners on its list informing them of the fact; that no general practitioner shall be liable to be surcharged for prescribing such a preparation until such time as the aforesaid notice shall be circulated; and that attention should be drawn to excessive delay in notifying general practitioners of unacceptable prescribing.

He asked that this be referred to Council for consideration. Mr. A. B. DAVIES hoped that the motion would be thrown out. He mentioned that there were about a thousand new preparations issued every year. If this were passed, *carte blanche* would be given immediately to the prescribing of them.

Dr. FRANK GRAY and Dr. TALBOT ROGERS also spoke against the motion, the latter saying that prescribing must be a matter for the clinical judgment of the practitioner, subject, on the question of excessive prescribing, to the opinion of his colleagues on the local medical committee. The motion was lost.

Economy in Prescribing

Dr. SHAW SMITH (North Middlesex) moved that, in view of the manifest disquiet in the profession, full information be published on the present definition of excessive prescribing and also how the penalties to which doctors are liable are defined.

Dr. TALBOT ROGERS referred the meeting to the article by Dr. D. F. HUTCHINSON in the *Supplement* of March 26, and described the procedure taken in cases of possible excessive prescribing.

Dr. R. H. MOORE (North Middlesex) said that, while there were risks in having a definition, the Council should consider the matter and make a report.

Dr. J. D. BOTTOMLEY (Goole and Selby, with Wakefield, Pontefract, and Castleford) and Dr. G. P. HENRY (Glasgow) supported the motion.

Dr. FRANK GRAY (Council) said that the reports of the referees on these cases should be published.

Dr. D. F. HUTCHINSON (Council) said that in the past three years only 14 cases had been investigated. The procedure set out in his article was that followed in every case. If anybody could suggest a better method of dealing with complaints the General Medical Services Committee would examine it.

Dr. G. D. THOMPSON (Lancaster) said that, as a member of a local medical committee, he had been astounded to discover what some doctors had been prescribing, and not only young doctors.

The North Middlesex motion was lost.

Surgery and Waiting-room Accommodation

Dr. K. T. GREY (Consett with Hexham) moved that representations be made to the Inland Revenue authorities that capital expenditure involved in bringing surgery accommodation up to modern requirements should be subject to income-tax relief.

Dr. TALBOT ROGERS said it would be impossible for the Government to allow such a concession for doctors' premises

and deny it to other professional and commercial enterprises. At present, income-tax relief could be claimed for expenditure on renewals and repairs to surgeries, and this might be prejudiced if an attempt were made to extend the principle.

Dr. J. B. W. ROWE (Harrow) said that, commercially speaking, the outlay of capital expenditure was expected to produce an increase of trade—a consideration which did not apply to the expansion or improvement of a doctor's surgery, because there would be no scope for it.

The motion was lost.

Refresher Courses

Dr. A. G. CHAMBERLAIN (Dorset) asked the meeting to express the view that the grant made towards the expenses of engaging a locum tenens during the period that a general practitioner was attending a postgraduate course should be 20 guineas a week. Much as the Ministry's efforts were appreciated, it was felt that 16 guineas was still inadequate. It was the Ministry's policy to encourage attendance at such courses, and they therefore ought to help doctors to meet the expenses involved.

The Dorset motion was lost.

Dr. W. N. LEAK (Mid-Cheshire) asked that general practitioners should receive mileage fees for attendance at refresher courses. He said that the one-day type of course was most useful for the rural doctor who was out of touch with hospital activities and consultant colleagues, and it seemed unfair that he should be put to extra expense and loss of time and still have to pay travelling expenses.

Dr. A. B. DAVIES (Walsall and Lichfield) said that the resolution was "not asking for butter on bread but for jam on cake!"

Dr. TALBOT ROGERS said that every effort had been made to secure the best terms for doctors attending such courses, but asked that the matter should be referred to Council.

The motion was so referred.

General Practitioners and Institutional Midwifery

Dr. A. ELLIOTT (Stratford) moved that every general practitioner who desired it should have access to maternity beds at his local maternity hospital. One disturbing feature of the Health Service was the isolation of the general practitioner in relation to maternity and local hospital services. There had been a recent trend towards institutional midwifery which the Minister had tried to stem, but it was doubtful if he would succeed. There were prominent obstetricians who still declared that it was safer for a woman to have a child in hospital than at home. It was only by access to hospitals that the general practitioner could keep up his technique in this regard.

Mr. D. S. PRACY (Nuneaton and Tamworth) said that the encouragement of domiciliary midwifery would prove an encouragement to the country as a whole and would, further, ensure against a breakdown of the midwifery service should an epidemic break out in a maternity hospital.

Dr. J. S. M. ORD (Glasgow) said that anything which would help the general-practitioner obstetrician should be wholeheartedly supported.

Dr. D. L. GULLICK (East Herts) was doubtful about the practicability of the motion, although he supported it in principle.

Dr. A. W. HENDERSON (Oxford), supporting the motion, said there had been a falling off in the general practitioners' approach to maternity since the National Health Service started. Doctors would have to show the authorities that they were really interested in the subject before they could get very far.

Dr. J. A. PRIDHAM (Dorset) supported the motion, and said that the problem was grave and widespread in his area.

Dr. L. CRAWFORD (St. Helens) disagreed that the suggestion was impracticable. Ready access to the maternity unit in his area had been granted and the consultants had not been upset.

Dr. H. C. PALIN (Burnley) said it depended on the size of the maternity hospital, and thought that the project was impracticable if it were sought to be applied to teaching hospitals.

Mr. A. STAVELEY GOUGH (West Herts) opposed the motion on the grounds that the Association was already doing all it could by way of attachment of general practitioners to hospitals in order to get what they needed.

Mr. J. R. NICHOLSON-LAILEY (Taunton) said that if the country was to have good obstetric general practitioners they must be furnished with the facilities to do their job properly. He suggested the deletion of the words "at his local maternity hospital," which he thought limited the possibilities.

Dr. TALBOT ROGERS agreed with the proposed amendment. If there were no local maternity hospital, the motion as it stood would rule the general practitioner out of having any access to beds at all.

The motion was agreed as follows:

That every general practitioner who desires it should have access to maternity beds.

Trainee General Practitioner Scheme

Dr. H. F. HISCOCKS (South-east Essex) moved that the trainee practitioner scheme supported by public funds is unnecessary and extravagant and that its abolition would be welcomed.

He referred to Appendix VII of the Council's Supplementary Report, para. 13, and said that there seemed to be a tendency nowadays to use spoon-feeding methods in many walks of life, but in medicine the hard way of gaining experience was good and provided all that was necessary. Published accounts for the National Health Service revealed that in 1952-3 the scheme cost £97,278 in Scotland and £351,012 in England and Wales.

Dr. J. A. BROWN (Birmingham) said the scheme was an excellent one which had been a great success in many areas. After further debate:

Dr. TALBOT ROGERS said the scheme was subject to careful observation by the General Medical Services Committee, and asked the meeting to turn the motion down.

The CHAIRMAN said that the motion if carried would mean an alteration of the policy of the Association, and therefore it would require a two-thirds majority.

Dr. HISCOCKS, in replying on the debate, said that those in charge of this motion were not stressing the abuses of the scheme, but only that the observation period was now at an end, and the results had shown it to lack what they regarded as essential.

The motion was lost by a large majority.

The meeting stood adjourned at 5.35 p.m., and the representatives with their ladies afterwards dined together at the Dorchester Hotel, and the dinner was followed by a dance.

Thursday, June 2

The meeting resumed at 9.30 a.m., with Dr. GRANT in the chair.

On the suggestion of the CHAIRMAN, a telegram of congratulation was sent to Mr. Charles Evans, F.R.C.S., the leader of the successful Kangchenjunga expedition.

GENERAL MEDICAL SERVICES (continued)

Dental Services

Dr. J. LECKIE (Aberdeen) moved that the fee for administration of a dental anaesthetic by a medical practitioner should depend not upon the number of teeth extracted but upon the degree of care and skill and the responsibility involved.

Dr. FRANK GRAY asked that this be referred to Council. This was a matter which concerned the dental as well as the medical profession. The medical profession had always received the greatest courtesy and consideration from the representatives of the dentists.

The reference to Council was agreed to.

Dr. J. C. ARTHUR (Gateshead) moved that the principle of payment for the arrest of dental haemorrhages should apply universally to haemorrhages following extractions at local authority clinics.

This also was agreed to as a reference to Council.

Dr. R. D. MILFORD (South Essex) asked that claims for treatment of dental haemorrhage should not be submitted to the dentist concerned but should go direct to the executive council. Dr. TALBOT ROGERS gave reasons why, unless there was any great difficulty, it would be better to leave the matter as it was, and the meeting endorsed this view.

Dr. F. LISHMAN (Bishop Auckland) asked the Council to explore with representatives of the dental profession the possibility of forming local dental rosters on a 24 hours' basis to deal with emergencies. Dr. F. GRAY hoped that the meeting would not express a definite opinion on a matter which was one for discussion between the two professions.

The CHAIRMAN pointed out that the motion was a reference to Council, and in this form it was accepted.

National Insurance Contributions

Dr. R. P. HENDRY (Rugby and South Warwickshire) said that at the last Annual Representative Meeting it was referred to Council to take up with the Ministry the present practice of requiring a full week's national insurance contribution for any portion of a week for which a person was certified as fit for work. It was now stated that the Ministry contended that the proposed alteration would completely upset the whole actuarial basis of the national insurance scheme. He asked the meeting to reject this contention and to refer the matter back for further information and consideration.

Dr. TALBOT ROGERS opposed the motion on the ground that the Ministry was right in its contention. It was not possible to isolate the matter from its possible other applications; what applied to sickness would inevitably have to apply also to short spells of unemployment. The proposal would mean a rise in the cost of the weekly national insurance stamp and would add to the difficulties of employers.

Dr. J. B. W. ROWE (Harrow) said that the primary advantage of the proposal would be its stimulus to further production by encouraging people to go back to work sooner than they might otherwise do. He thought that the Ministry were taking a superficial view *vis à vis* the national economy.

Dr. HENDRY, in reply, said that illogicalities resulting from the applications of the scheme were matters for the Ministry to deal with rather than the medical profession.

The voting on the Rugby motion was at first declared as 109 in favour and 108 against. On a recount the figures were 134 to 115, and the motion was declared carried.

Assistants in General Practice

Dr. TALBOT ROGERS moved the approval of the report of the subcommittee on Assistants in General Practice set out in Appendix VII.

Dr. D. F. HEATH (Birmingham) moved to insert the words "Honorary Secretaries of B.M.A. Divisions" in the appropriate recommendation, so that they, along with deans of medical schools and others mentioned in the recommendation, should help to ensure that final-year students and newly qualified practitioners were made aware of the importance of entering into a formal agreement when accepting a post as assistant.

Dr. J. B. W. ROWE (Harrow) moved to insert the words "obtaining a legal, written agreement" in the Birmingham amendment instead of "entering into a formal agreement."

Dr. ALISTAIR FRENCH (Marylebone) supported Dr. Rowe's suggested amendment.

The Harrow amendment was agreed.

Dr. TALBOT ROGERS moved the recommendation in the Appendix which sought to make it clear that executive councils shall, in consultation with local medical committees, periodically review all cases in which consent had been given to the employment of an assistant; also that executive councils may, after due notice, withdraw their original consent to the employment of an assistant or modify the number of additional patients otherwise permitted under their allocation scheme.

Dr. R. S. V. MARSHALL (South Staffs) thought that the matter was one for the profession itself and that the execu-

tive councils should be kept out of it. He thought that the G.M.S. Committee had been the victim of its own good intentions.

Dr. K. C. BAILEY (West Somerset) said that the problem was not as great as had been made out. The subcommittee's own figures showed that less than 1,600 assistants were employed in England and Wales, and only about two-thirds of single-handed doctors' assistants had been so employed for the sake of the additional numbers alone. Many of the difficulties were not of a nature to be left to the decision of executive councils, with their majority of non-medical members. If the assistant and the principal agreed with each other as to what was expected there would be protection for everybody and the matter would be dealt with in relative privacy.

Dr. W. E. DORNAN (Sheffield) said that in July, 1952, approximately 1,760 whole-time assistants had been employed in England and Wales; by July, 1953, the number had shrunk to under 1,600, and by July, 1954, it had gone down to between 1,300 to 1,400, according to official figures in the possession of the Medical Practices Committee. It was absolute nonsense to suggest that the principle was unworkable in so far as executive councils were brought into the assistant-principal relationship, for they were in it already. The G.M.S. Committee merely asked them to exercise the powers they already had.

Dr. FRANK GRAY (Council) asked the meeting to consider the case for the assistants very carefully, as they were not represented at the meeting, and could not speak for themselves. They had claimed, through their subcommittee, over a period of three years, that cases of abuse did exist, although no one suggested that such cases were more than a minority. If the review which the recommendation sought showed that no such abuses in fact existed, then all would be satisfied; if it showed that there were a few cases, then matters could be put right.

Dr. A. V. RUSSELL (Council) said that while there were bad principals, there were also bad assistants. Surely all that was needed was a really well-drawn-up agreement.

Dr. TALBOT ROGERS said it was not intended to give the executive councils more power; the recommendation merely suggested that there were times when those powers they already had might wisely be used.

Dr. S. WAND said that the future of the profession was in the hands of the assistants, and their attitude of mind towards the National Health Service—indeed, towards a State-salaried service—might be coloured by what happened to them in their early years of practice as assistants. The recommendations provided practical suggestions for dealing with the grievances that undoubtedly existed—suggestions which the assistants were satisfied were well worth trying in their present form.

The recommendation was carried.

Dr. TALBOT ROGERS then moved the further recommendation that a principal implementing a "view" registered with the executive council should have a right to claim retrospective payment on the basis of notional lists for a period of up to a maximum of one year. He said it would provide some incentive to the doctor to take his assistants into partnership during the difficult period when the practice was not sufficient to support two partners although it was supporting a principal and an assistant.

Dr. H. H. D. SUTHERLAND (Council) said the recommendation might be construed as a means of securing a hidden sale of goodwill, which was expressly forbidden.

Dr. JOAN CHAPPELL (North Middlesex) agreed that the recommendation amounted to a "bribe."

Dr. I. M. JONES (Sunderland) said the suggestion was no more immoral than the basis of payment enunciated as a result of the Danckwerts award: both were financial devices for overcoming a particular difficulty. Some principals were subjected to a definite hardship when they took a partner. In such a case the principal felt that he was being financially punished for doing what he believed to be right in the interests both of the Service as a whole and of the younger unestablished members. The argument about the sale of goodwill did not apply.

Dr. R. B. L. RIDGE (Enfield and Potters Bar) strongly opposed the recommendation on the ground that it was one of a series designed to stop improper practices by rewarding the perpetrators when they ceased to carry them out.

Dr. TALBOT ROGERS thought the payment of money would not contravene the Act, being another adjustment similar to the payment by notional lists and loaded capitation fees.

The recommendation concerning retrospective payment was lost, and the report as a whole, amended, was adopted.

General Practitioners and Hospitals

Dr. A. ELLIOTT (Stratford) asked for a reaffirmation of the policy of pressing for the provision of more beds under general-practitioner care and for diagnostic facilities in hospitals for general practitioners. As the Ministry had said that new hospitals were to be built in 1956-7 and 1957-8 it was important to reaffirm B.M.A. policy for more general-practitioner beds. Diagnostic facilities had increased, but in some areas general practitioners still had no access to them.

The motion was carried.

Dr. R. P. HENDRY (Rugby) moved a resolution viewing with dismay the continued disregard of the wishes of the profession locally regarding the general-practitioner member of regional hospital boards, and instructing the Council to press immediately for the inclusion in the personnel of the boards names submitted by the B.M.A. and local medical committees.

Dr. F. E. GOULD (Birmingham) said that at present people did not know whether the general-practitioner member was appointed by the Minister, the regional hospital board, or the senior administrative medical officer.

Dr. T. D. CULBERT (Manchester), speaking as a consultant, supported the motion, and suggested that there might be specialist representation on local executive councils.

Dr. W. WOOLLEY (Bristol) said that more notice should be taken of who the doctors locally wanted to represent them on the board.

Dr. TALBOT ROGERS pointed out that there was no absolute right under the Act to have a general practitioner on any board, but in practice there was no board with no practitioner member, and several with two.

Dr. HENDRY, in reply, said that while there was no legal right to have a general practitioner on a board, there was a moral right.

The Rugby motion was carried.

Dr. B. HIRSH (Manchester), on the general approval of the report under "General Medical Services," said that some penalty should be imposed on people who brought complaints adjudged frivolous, or were found guilty of deliberate falsification. That complainants could perjure themselves without risk of penalty was encouraging the bringing of complaints against doctors.

Dr. H. GUY DAIN (Birmingham) said that the disciplinary machinery was protective, and it was in the interests of a doctor that when a complaint was made he should have a fair chance of rebutting it. People who were dissatisfied could not be prevented from expressing their dissatisfaction, but he hoped nobody would leave with the idea that there was no protection against frivolous and stupid complaints.

The remainder of the report was approved.

Dr. W. N. LEAK (Mid-Cheshire) moved that further and more urgent consideration be given to bringing hospitals and general practitioners closer together. He said that the breakdown of the old custom of a combined appointment on the staff of a local hospital with a general practice had done irreparable harm to doctors and to patients. The dichotomy between the general practitioner and the hospital should be removed or mitigated as much as possible.

Dr. D. L. GULLICK (East Herts) said there was almost a division of the medical profession into two, and anything to bring the profession closer together would be for everybody's good. Dr. P. A. MCCALLUM (Torquay) said that a consultant called in for a domiciliary consultation should always be met by the general practitioner, and Mr. A. DICKSON WRIGHT (Marylebone) hoped there would be unanimous support for the motion.

The Mid-Cheshire motion was carried.

Monthly Payments

Dr. H. H. GOODMAN (Newcastle-upon-Tyne) moved that doctors in the National Health Service be paid monthly by right without having to make application. He said that all doctors in Newcastle were paid monthly and were well satisfied with the system, and the executive council had not had to increase their staff. Although all doctors could apply for monthly payments on hardship grounds, they did not like a "means test."

Dr. D. W. K. BUCHANAN (Dundee) supported the motion, and Dr. J. B. FORRESTER (Glasgow) spoke in opposition.

Dr. TALBOT ROGERS said that the great majority of part-time consultants were also paid quarterly. It was thought by the Ministry and the Association of Clerks of Executive Councils that a monthly payment system would mean an increase in administrative work. It was open to local medical committees to negotiate with executive councils to change the system. A doctor who applied for monthly payment on hardship grounds did not have to undergo a "means test"; his word was taken.

Dr. R. P. HENDRY (Warwick): "Is it more hardship for the council to write three cheques a quarter than for a doctor to live on his hump for three months?"

The Newcastle motion was carried by 138 to 123.

Reclassification of Closed Areas

Dr. M. J. EVANS (South-west Wales) moved:

That, in view of the fact that areas which had been closed since the start of the National Health Service have recently been reclassified and declared intermediate despite no change in the ratio of doctors to patients, this meeting instructs the Council to keep a close watch on the activities of the Medical Practices Committee and to take action to safeguard the interests of the Association's members.

He said that over the last five or six years there had been no alteration of the character of his district, no influx of population, and only a few extra doctors owing to elderly practitioners taking in assistants, yet the area had been declared intermediate, the average list in the area being only 1,250 per doctor.

Dr. W. E. DORNAN (Chairman of the Medical Practices Committee) said that the power, reluctantly given by Parliament and more reluctantly agreed to by the Representative Body, to impose restrictions was in order to ensure that the best use was made of available medical manpower, so that additional doctors should not be introduced into general practice in relatively over-doctored areas, and not for the protection of the interests of established practitioners. Areas in South-west Wales had been recently declared intermediate because since 1948 more complete information had been obtained about the possibility of newcomers establishing successful practices and because the relative position of the area had altered enormously, one area in Wales having had an increase in the number of principals of nearly 300% since 1948.

Dr. A. M. MAIDEN (Lincoln) said that much of the uneasiness felt about certain decisions of the Medical Practices Committee could be removed if full reasons were given to local doctors for refusing an application.

The South-west Wales motion was lost.

Obstetric Services

Dr. J. C. ARTHUR (Gateshead) moved that in view of the wide variation in different executive council areas of criteria for admission to the obstetric list, it was more than ever essential that this list should be abolished. Executive councils had been advised on the qualifications required of new entrants to the obstetric list, but local committees interpreted this advice in widely differing ways. Gynaecology and obstetrics should remain a major subject, but its teaching should be similar to that of medicine and surgery, and those who practised it should be free from any necessity of having extra qualifications.

Dr. P. G. TODD (Southampton) moved as an amendment the deletion of the words "it is more than ever desirable that this list should be abolished" and the substitution of

the words "that any duly qualified registered medical practitioner who applies to go on to the obstetric list should be placed on it without further question."

Dr. J. S. NOBLE (Blyth) said that the conception of the original motive had been good, but the result had been abortive. To abolish the list would open the way to the abolition of general-practitioner obstetricians—something which many people would like to see happen. All the meeting could do was to reject the motions, because even the Winchester motion, which asked for an integration of standards, brought in the obstetricians and gynaecologists. He asked the Council to note that the feeling of the meeting on the matter of obstetrics was that its criteria should be looked into.

Dr. L. H. BOOTH (Hastings) said that the passage of time had proved the value of the list and had shown that the standard of midwifery practice among general practitioners was higher.

The CHAIRMAN pointed out that the present policy of the British Medical Association regarding obstetric lists was that any practitioner who was a qualified medical practitioner should be entitled without question to put his name on the obstetric list.

Dr. J. S. M. ORD (Glasgow) said that the policy just outlined by the Chairman had been adopted in Scotland since 1948. It was felt in Scotland that midwifery was done as well there as anywhere else.

The Southampton amendment was carried, and also as the substantive motion.

Dr. CATHERINE HARROWER (Glasgow) moved that the services of a specialist anaesthetist should be available to the general practitioner in obstetric cases under the domiciliary scheme. There were many general practitioners who were perfectly capable of carrying out complicated manoeuvres provided that they had the proper facilities at hand. There was admittedly a great shortage of qualified anaesthetists, but if the meeting accepted the proposal in principle the difficulties could be dealt with afterwards.

Mr. J. R. NICHOLSON-LAILEY (Couch) strongly supported the motion. Although under the domiciliary scheme it was theoretically possible for a consultant anaesthetist to be called it had always been resisted by the regional boards.

Dr. TALBOT ROGERS said that all would agree the proposal was worth while, but he felt that it was something which should be discussed and thoroughly investigated by the Council before the Minister was approached.

Dr. T. D. CULBERT (Manchester), speaking as a specialist anaesthetist whole-heartedly supported the motion.

The motion was carried.

Intermediate Certificates

Dr. R. W. MCCONNEL (Buckinghamshire) moved that an intermediate certificate of incapacity covering a period of up to four weeks be allowed after an initial certificate covering the first week. Although it might be said to be open to be abused, the profession could be trusted to make proper use of such a time-saving facility.

Dr. H. S. HOWIE WOOD (Isle of Wight) supported the motion, but thought it ought to carry some sort of safeguard to prevent its use in unsuitable cases.

Dr. TALBOT ROGERS asked that the motion should be rejected. Discussions had taken place with the Ministry on this and kindred matters, and already the concession had been made that a certificate could be granted after four weeks for much longer periods. It was essential for the proper administration of the fund that the Ministry should have frequent certificates in the earliest stages of illness, and the provision of these was surely not too much of a hardship upon doctors.

The Buckinghamshire motion was lost.

Advertising Methods of the Pharmaceutical Industry

Dr. DAVID BLEND (St. Pancras) moved:

That the Council be asked to take note of the irritation and inconvenience caused to general practitioners by the advertising methods of the pharmaceutical industry as a whole and to inquire

into the problem and confer with representatives of the industry to alleviate it.

Most doctors found postal advertising a nuisance and most of it found its way into the waste-paper basket. There were always the advertisements in the *British Medical Journal*, and if a doctor required further information on them he could ring up or write to the firms concerned. Some doctors received many visits from travellers, resulting in much waste of time.

Dr. A. G. MANLEY (Richmond) said the motion did not proceed from any desire on the part of the medical profession to dictate to pharmaceutical firms how to conduct their business; rather was co-operation with those firms sought in order that they might be able to utilize their resources to better advantage. Thousands a year were spent on advertising that could be put to better use, possibly in the way of research, to the greater benefit of the country.

Dr. ELSIE WARREN (Kensington) hoped that the meeting would vote against "irritating our pharmaceutical colleagues." Dr. S. SMITH (Tower Hamlets) said that it would be an advantage to have pharmaceutical advertisements issued in a standard form which could be filed for easy reference.

Dr. TALBOT ROGERS hailed Dr. Smith's suggestion as one which was highly constructive. Firms must receive some sort of response from doctors, otherwise they would cease to spend their money.

Dr. E. C. DAWSON (Council) said that the pharmaceutical firms had advertising managers to advise them, and they would not take any notice of what the Association said.

It was agreed to pass to the next business.

COMPENSATION AND SUPERANNUATION

Dr. A. N. MATHIAS (Chairman of the Compensation and Superannuation Committee) moved the annual report under this heading.

Dr. J. W. MCCARTHY (Hendon) moved to reaffirm the decision of the Representative Body in 1951 that compensation for practices should be paid forthwith.

He said that the arguments applicable in 1951 were now more cogent owing to the lower purchasing power of the £. Practices increased in value as the value of the £ decreased, and they must be worth more now than in 1951. The money could be used to better advantage than getting interest at 2½%.

Dr. H. L. TAYLOR (Newcastle-upon-Tyne) said that they saw their capital value dwindling month by month. All other undertakings nationalized by the Government had been repaid in full.

Dr. D. L. S. JOHNSTON (Halifax) pointed out that the profession had not asked for nationalization; it was thrust upon them, and the compensation was a pistol held at their heads, because unless they had signed on the appointed day the right to compensation would have been lost. This was the doctors' money, and the Government was getting it at very cheap interest.

Dr. J. A. L. VAUGHAN JONES (Leeds) said that when negotiating the £66m. it had not been realized that inflation would ensue to the extent it had. About £44m. remained to be paid, and the Government could devise means of paying this without causing further inflation. He was confident that with sufficient pressure the Treasury must yield to proper representations.

Dr. A. MCGLASHAN (Manchester) pointed out how he could have invested his compensation and increased its value.

Dr. MATHIAS said the Ministry's view was contained in one sentence from a letter:

"We are quite clear that the original settlement was intended as a once-for-all settlement which would stand irrespective of any changes in the level of values."

To get the money would involve legislation, because present conditions were written into the Act and not made by regulation. It would also be argued that to release £44m. would be a further step in the inflationary direction.

The Hendon amendment was carried with one dissentient. Dr. J. C. ARTHUR (Gateshead) moved:

That doctors wishing to incur capital expenditure or new or improved surgery premises should be able to obtain an advance payment of compensation.

He said this would be a very good use to make of the money, because a doctor would have to pay more than 2½% on money obtained for the purpose from elsewhere.

Mr. F. W. SHEPHERD (Huddersfield) supported the motion. While the Treasury may find it difficult to pay out the full sum, it might be willing to pay out a certain proportion a little sooner than anticipated.

Dr. MATHIAS asked the meeting to pass the motion and to give them a mandate to go to the Ministry.

The Gateshead motion was carried.

Dr. J. S. NOBLE (Blyth) moved to reaffirm the recommendation of the General Medical Services Committee that a practitioner on taking another into partnership should thereupon be entitled to at least a part of the compensation moneys due to him.

This was carried.

An amendment by Halifax was next taken, that the rate of interest should be raised to an adequate level. This was carried.

Assessment of Pension

Dr. J. C. ARTHUR (Gateshead) moved that parity of assessment of pension with salaried officers would be obtained only if practitioners were allowed to opt, at the time of their retirement, for the system most advantageous in their particular case.

Dr. MATHIAS submitted that the motion was premature, as there was at present no information on the curve of a practitioner's remuneration, but it was hoped that by the next meeting, as a result of the first actuarial investigation of the superannuation fund, the information would be available.

Dr. ARTHUR agreed that more information was required, and the motion was carried as a reference to Council.

Superannuation Payments on Sessional Fees

Willesden requested the Council to explore the possibility of superannuation payments being made on sessional fees paid by Government departments to part-time medical officers. Dr. J. G. FREEMAN HEAL, in moving, said there was an appreciable minority of general practitioners who earned a regular income from this kind of work.

Dr. I. M. JONES (Sunderland), supporting the motion, said that the money which was paid out for Government work was already taken into account in the calculations of the central pool; it should therefore be considered as part of the general practitioners' income for superannuation.

Dr. H. M. COHEN (Birmingham) moved to insert after "Government departments" the words "and local authorities."

Dr. HEAL opposed the Birmingham amendment.

Dr. MATHIAS hoped that the meeting would not accept the amendment. As the motion stood, the matter could be dealt with directly by negotiation with the Ministry of Health, but if the amendment were passed special legislation would be required to enable local authorities to deal with it under a totally different set of regulations.

The Birmingham amendment was withdrawn and the Willesden motion was carried.

MEDICAL BENEVOLENCE

Dr. H. M. GOLDING (Chairman of the Charities Committee) moved the section under "Medical Benevolence." It was not the custom to single out individual charities for mention, but this was a year of some significance for Epsom College, which was holding its centenary, and an appeal had been made for a centenary fund. The Council had voted £1,000 towards the appeal. As this year's meeting was in London, it was also appropriate to mention the Clothing Guild organized by the Ladies' Guild of the Royal Medical Benevolent Fund. Dr. Golding said that the fact that he had been speaking to Motion 91 reminded him of the words in the 91st Psalm, "Thou shalt not be afraid." That

was the message that the Charities Committee wished to give to all members who might fall upon times of distress. (Applause.)

PRIVATE PRACTICE

Dr. A. BROWN (Chairman of the Private Practice Committee) presented the Annual Report under this heading.

Remuneration of Local Treasury Medical Officers

Dr. J. C. ARTHUR (Gateshead) moved that the fees for practitioners acting as regional medical officers for the Treasury should be two guineas for a full examination and one guinea for a short report.

Dr. R. COVE-SMITH (Marylebone) asked that consideration should also be given to the examinations that had to be conducted at the request of the Treasury Solicitor for compensation cases. The guinea fee offered for that work should be brought into line with other Treasury medical work.

The Gateshead motion was carried.

Emergency Treatment under Road Traffic Act

Dr. E. C. DAWSON (Derby) asked the meeting to express the view that the time is now appropriate for an upward revision of the 12s. 6d. fee and 6d. mileage for emergency treatment under the Road Traffic Act, 1934.

Dr. R. FORBES (Hendon) said that the existing fee had been included in the Road Traffic Act, and to alter it would require an amending Act. If the fee were taken out of the Act and put into regulations the Ministry of Health might say that the service was one which doctors might reasonably be expected to undertake under the terms and conditions of service.

The Derby motion was lost.

Ministry of Pensions Form

Belfast drew attention to the inadequacy of the fee of 5s. paid for a medical report on Form M.P.A.O.38 for submission to the Ministry of Pensions, and asked that representations should be made for its increase to a fee of one guinea.

Dr. S. NOY SCOTT (Council) asked the meeting to reject the motion. No opinion was required on the form, but merely the copying of information from the record card.

Dr. R. P. HENDRY (Rugby) pointed out that sometimes a very long and complicated history had to be reported. The motion was lost.

OCCUPATIONAL HEALTH

Dr. J. A. L. VAUGHAN JONES (Chairman of the Occupational Health Committee) presented the reports and appendices under "Occupational Health."

He said it was still Association policy that the Ministry of Health should exercise overall supervision of all the health services, with possible delegated responsibility to other departments. The setting up of an Industrial Health Advisory Committee by the Ministry of Labour was a step warmly welcomed, the constitution of it seeming reasonable. The reference of the Committee was limited to workers covered by the Factory Acts, but it was hoped that eventually the Government might implement the Gowers Report, thus including supervision of most of the working population.

There was growing recognition of the contribution to be made by the profession in attaining positive health in industry. It was clear from inquiries to the Association that the work of the Occupational Health Committee was becoming increasingly scientific.

The Ministry of Transport had accepted many of a sub-committee's recommendations on medical standards for road, rail, and air transport; three years ago the Ministry of Agriculture had been assisted by the Committee informing the profession about the increasing use of toxic chemicals in agriculture; and this year they had collaborated with the Association of British Insecticide Manufacturers in the preparation and circulation of precautionary measures against possible fatalities from careless handling of these dangerous

insecticides. Recently the Committee had been asked by the Ministry of Pensions if it wished to make any representations on the question of cadmium poisoning and the present restrictions on the prescription of byssinosis. The Association, through its Occupational Health Committee, must accept the new scientific and technical responsibilities being placed upon it, and this might require a re-organization of the Committee's work in possible collaboration with the Science Committee.

Remuneration of Industrial Medical Officers

Dr. VAUGHAN JONES proposed that the following recommendation of Council be adopted:

That the revised statement on the remuneration of industrial medical officers set out in Appendix III of the Annual Report of Council be approved.

He said the revised remuneration ranges were a considerable increase over the former scale and bore comparison with similar grades in other services.

Ethical Rules for Industrial Medical Officers

Dr. R. P. HENDRY (Rugby and South Warwickshire) moved to urge the Council to circulate among all non-members of the Association a copy of "The Duties and Ethical Rules for Industrial Medical Officers."

Dr. VAUGHAN JONES said that there were extreme difficulties in getting hold of non-members who were known to be industrial medical officers. He thought that the matter could be dealt with by the exercise of good will on both sides.

The motion was lost.

MEDICAL ETHICS

Dr. ROBERT FORBES (Chairman of the Central Ethical Committee) moved the report of Council under "Medical Ethics." He said that the Ethical Committee had kept under scrutiny professional ethical standards. Many letters were received from members posing ethical situations and problems. The committee realized that there was some danger that the ethical standards of the profession might be lowered. Some were over-critical of the Committee's efforts. Indeed, one writer in the *Supplement* last week had described the Committee as the "Old Guard." He did not know whether that term was meant to be complimentary, but some committee appointed by the Association had to accept the responsibility of examining the behaviour of members of the profession, to promote ethical conduct, and, on occasion, to chide, exhort, or advise. He asked members to imagine the reactions of a young man entering the profession in 1948, who had since that time followed all its discussions, deliberations, and activities. Such a young man might not be wrong (although Dr. Forbes personally thought he would be) if he were to assume that the profession was over-anxious in the matter of money. Members would all agree that there was much more in medicine and its pursuit than the making of money. (Cheers.) They would also agree that if the highest concept of medicine was to be maintained and achieved its members must proceed along strictly ethical lines.

Loans of Hospital Records to Government Departments

Dr. FORBES moved for approval the following recommendation of Council:

That the following statement on the loan of hospital records to Government departments be approved:

(a) That medical records be lent to the medical officers employed by Government departments only when written consent has been given by or on behalf of the patient.

(b) That the form of consent signed by or on behalf of the patient should include a statement that the patient agrees to his hospital records being made available to the medical board in order to assist them to consider and assess claims.

(c) That, wherever practicable, and particularly where disclosure of information may have an adverse psychological effect upon the patient, the practitioner who compiled the record or,

if he is not available, one nominated by the hospital authority for the purpose, should be consulted on the wisdom of disclosing to the patient all of the confidential information contained therein, and should take the opportunity of reviewing the notes before they leave the hospital.

In answer to Dr. J. B. W. ROWE (Harrow), Dr. FORBES replied that the recommendation was designed deliberately to relate solely to hospital records. He also explained to Dr. A. A. VICKERS (Worcester and Bromsgrove) that the consent form mentioned was a specific one and had no relation to the ordinary form of consent to anaesthesia and operation.

Dr. I. M. JONES (Sunderland) thought there was some misapprehension about the procedure. In fact, nothing was done until a claim was made by a particular person for a disablement pension under either the Ministry of National Insurance or the Ministry of Pensions. It was within the power of the chairman of the medical board, if he felt that he could not assess the claim properly without access to the records, to ask for the original hospital record to be made available to him. There was no question of it going to lay persons.

The Council's recommendation was accepted.

Professional Secrecy

Dr. R. D. MILFORD (South Essex) moved:

That this meeting considers that the exchange of medical details concerning patients should take place only between doctors and deploras the increasing tendency to exchange confidential medical details direct with lay persons.

He hoped the motion would not be regarded as the expression of a pious hope. It was an appeal to the Representative Body to review the whole question of professional secrecy and the changes that had taken place over recent years.

Mr. A. STAVELEY GOUGH (West Herts) asked for the deletion of the word "only." The emergency bed service could only work if a clerk could take details and in due course forward them to the hospital and arrange for the admission of a patient. There were cases which, in the interests of the patient and of the doctor, needed the intervention of clerical assistants.

Dr. FORBES said that it would be impracticable to conduct the health service if it were insisted that medical information should pass only through the hands of doctors. He suggested the insertion of the words "wherever practicable" after "That this meeting considers . . ."

Dr. MILFORD said he was agreeable to the deletion of the word "only." The motion was accepted.

Dr. C. P. WALLACE (Guildford) moved for the appointment of a special committee by the Council to consider the effects on the future of the profession of the continued operation of rules with regard to anonymity in broadcasting and press publication. He said that the question of anonymity had been approached from too narrow and special an angle. It should be approached from the point of view of the public. It was most important that members of the profession should have the opportunity of declaring their views on medical matters, subject, of course, to the ethical code.

Dr. FORBES said that there was a subcommittee already in session, set up by the Central Ethical Committee, to do this job.

Dr. WALLACE withdrew his motion.

PUBLIC HEALTH

The Award of the Industrial Court

Dr. J. B. TILLEY (Chairman of the Public Health Committee) presented the Annual and Supplementary Reports under "Public Health" and also the appendix on Rules for D.P.H. Courses.

He said that the staff side of Committee C of the Whitley machinery had carefully considered the salaries in the public health service and made representations to the Management Side which were not acceptable; the matter had been taken to arbitration, the result of which was of the very gravest

concern, but having gone to arbitration the award must be accepted. This branch of the profession which chose to practise preventive medicine received, under the award, a different rate of remuneration from that reasonably to be expected in other branches. Those who went to the arbitration did so considering not only money but status within the profession, and there was no other easy means of assessing status than income. Unless the profession as a whole showed what it thought was the proper place for public health in relation to other branches of the profession, then public health would surely die.

It was a great satisfaction, Dr. Tilley said, that with one exception the findings of appeals committees had been accepted by employing authorities, and the management side of Committee C had done all it could towards this end. Only Middlesbrough had refused to implement the findings of an appeals committee, and the only possible action had been taken in making an advertisement for a post in Middlesbrough the subject of an Important Notice.

The Public Health Committee had been asked to examine its constitution to see whether it could not widen the representation, but it was the Representative Body which elected the Committee and could nominate young people as members.

The Committee felt strongly that the responsibility for food hygiene should be transferred to the Ministry of Health.

Remuneration in the Public Health Service

Dr. J. C. ARTHUR (Gateshead) moved:

That in view of the dangers presented to the medical profession by the low levels of remuneration in the salaried medical services of the State and local authorities, steps be taken urgently by the Association to bring the remuneration of medical personnel in these services to a level comparable with that of the rest of the profession engaged in hospital and general practice.

Dr. H. GUY DAIN (Birmingham) stressed the importance of the effect of the recent disappointing award of the Industrial Court on the public. So few candidates were coming forward for the D.P.H. that many medical schools had stopped the course. Medical officers of health could help to raise the standard of health of the whole community, yet so poor a reward was offered that doctors did not think it worth while. General practitioners and consultants had been given more money, but those in the public health service had been left behind, to the great public danger.

The Gateshead motion was carried.

Greenwich and Deptford moved to recommend that the salary of divisional medical officers of the London County Council be raised forthwith and be in accordance with the scales for medical officers of health—that is, in relation to the population served.

Dr. J. B. S. MORGAN (Derbyshire) said the salaries of those in the London area should not be treated in isolation, and moved that the matter be referred to the Council.

This was carried as a reference to Council.

Part-time Work for Local Authorities

Dr. A. BARKER (East Kent) moved that the scale of fees for part-time sessional work with local authorities should be increased immediately following on the rise in salary of public health medical officers.

This was also carried as a reference to Council.

School Health Service

Dr. A. A. VICKERS (Worcester and Bromsgrove) moved that the Council take all possible steps to ensure that the arrangements in para. 94 of the Annual Report be universally adopted throughout the country. These arrangements relate to obtaining the concurrence of the general practitioner before local authority medical officers refer school-children for special investigation and to the sending of any special report to the child's own doctor.

Dr. TILLEY accepted the motion as a reference to Council.

Clean Milk

Dr. H. S. HOWIE WOOD (Isle of Wight) called upon the meeting to declare in favour of the transfer of the responsibility for clean milk production from the Ministry of Agriculture and Fisheries to the local sanitary authority.

Dr. TILLEY said that there had been dissatisfaction in some areas with the present position, but local sanitary authorities varied so much in size that it would be unwise to accept a direct transfer of the whole responsibility, and he felt the proper course was to refer it to Council. The meeting agreed.

Notification of Infectious Diseases

On behalf of Dartford it was moved:

That this meeting is of the opinion that a review of the legislation concerning the notification of infectious diseases should be carried out by the Association with a view to making recommendations to the Ministry regarding the form of revision, which is long overdue.

The Dartford motion was carried.

Dangers of Fumes from Diesel Oil

Dr. D. F. WHITAKER (Guildford) urged the Council to draw the attention of the transport authorities to the possible dangers of fumes from diesel engines and the remarkable coincidence between the increased use of diesel fuel for transport and the rise of mortality from lung cancer and other respiratory diseases. He viewed with alarm the forthcoming replacement in London of 1,800 electric trolley buses by diesel-engined vehicles.

The motion was supported by Dr. F. A. BELAM (Guildford), Dr. R. HALE-WHITE (Marylebone), Mr. J. R. NICHOLSON-LAILEY (Taunton), and Dr. J. B. W. ROWE (Harrow), and was carried.

ARBITRATION MACHINERY

Dr. E. A. GREGG (Chairman of the Committee on Arbitration Machinery) presented the section of the Annual and Supplementary Reports under that heading. He said that this question was not as simple as some people imagined. General practitioners had never participated in Committee A of Whitley. They were determined that when any question of such urgency arose as to demand arbitration they should have a full say in what type of arbitration it should be. Their friends in the public health field had felt able to get some assistance through Whitley machinery and some through the Industrial Court. They had had recently one outstanding example of how such machinery worked, and he would not be surprised if they did not find them coming round to the kind of idea which general practitioners had on this subject. He drew special attention to the closing words of the section in the Supplementary Report of Council:

"After careful consideration of the whole position the Council is of the opinion that the profession would be well advised to rely, for the present, on *ad hoc* arbitration arrangements when disputes occur."

The sections of the report were approved.

Dr. J. L. McCALLUM (Westminster and Holborn) moved: That the Council should examine the possibility of getting some form of arbitration for the profession alone, and press that the arbitration tribunal should be comprised of personnel permanently appointed, independent and mutually agreed.

He said that the crux of the matter was whether or no they were to appeal to an umpire in arguments with the Government, and what form the arbitration tribunal should take. The matter had become complicated by the fact that they were not being considered as a profession, but in relation to other parts of the National Health Service.

Dr. GREGG hoped that this motion would not be passed in its present form. He was prepared to have it referred to Council.

The Westminster and Holborn motion was carried as a reference to Council for consideration.

The meeting adjourned at 6.30 p.m.

The Report of the A.R.M. will be continued in next week's Supplement.

REMUNERATION OF PUBLIC HEALTH MEDICAL OFFICERS

RECOMMENDATION TO LOCAL AUTHORITIES

A circular (M.D.C. No. 24) signed by the Joint Secretaries of Committee C of the Medical Whitley Council has been sent to all local authorities in England, Wales, and Scotland. The circular advises these authorities that Committee C has accepted the Industrial Court's award¹ on the recent claim by the Staff Side for increases in the remuneration of public health medical officers, which was submitted to the Court for arbitration (see Supplement, May 7, p. 214).

The Committee C circular recommends that all local authorities should put the award into effect as from January 1, 1955.

Committee C recommends that the following arrangements should also be given effect as from January 1, 1955:

(1) Deputy medical officers of health should, as from January 1, 1955, be placed on a scale the minimum of which should be 66½% of the minimum of the scale for the post of medical officer of health. Their annual increments should be the same as those for the medical officer of health. Detailed arrangements for calculating the salaries of deputy medical officers of health are set out in M.D.C. circular No. 8.

(2) Medical officers, not acting as county district medical officers of health, duly appointed as divisional or area medical officers for divisional administration of the health services (including the school health service) should be placed on the revised salary scale applicable to senior medical officers as from January 1, 1955—that is, £1,415 × £50—£1,765 × £65—£1,830—with the following additions according to the population of the division:

	£
Not exceeding 150,000	50
" " 250,000	150
" " 400,000	250
Over 400,000	at discretion

Committee C also recommends that the following arrangements, promulgated in previous M.D.C. circulars, should continue to be observed:

(1) Medical officers of health holding combined appointments should receive £100 per annum above the appropriate salary scale indicated by the total population of the combined districts for which they are medical officers of health (M.D.C. circular No. 1).

(2) Medical officers who are assistant medical officers or divisional or area medical officers under a county council, acting as district medical officers of health (either for single or combined districts) for a definite proportion of their time should receive as regards the salary relating to county council work the appropriate portion (calculated in accordance with the Spens formula, as set out in appendix B to M.D.C. circular No. 2) of their salary as assistant medical officers, divisional or area medical officers, as the case may be, together with the appropriate proportion of the salary selected from the appropriate range for county district medical officers of health plus a similar proportion of £100. (M.D.C. circular No. 3).

(3) Medical officers of health holding part-time appointments should be remunerated in accordance with the Spens formula.

Committee C recommends that assimilation to the new salary scales shall be on the "corresponding points" principle. An illustration of how this would work in practice in regard to medical officers of health and their deputies may be helpful. In a county borough (population 125,000) the authority had selected a salary scale of £1,950 to £2,200 for the post of medical officer of health, the range of commencing salaries under the previous award (No. 2285) for population groups not exceeding 150,000 being £1,750 to £2,050. Under the new award (No. 2565) the range is £1,940 to £2,250; and, on the basis of "corresponding points," the new scale for the post of medical officer of health will be £2,146 13s. 4d. to £2,404 3s. 4d. If the medical officer of health is, on January 1, 1955, on the fourth point of the old scale—that is, with a salary of £2,100—he should be assimilated on the fourth point of the new scale—that is, given three increments of £51 10s. on the new scale—and his salary will therefore become £2,301 3s. 4d.

¹ Copies of the complete Industrial Court Award (No. 2565) can be obtained from H.M. Stationery Office, price 9d.

The minimum of the scale for a deputy medical officer of health with the same authority would be 66½% of £2,146 13s. 4d.—that is, £1,431 2s. 3d.—and if, on January 1, 1955, he is on the third point of the old scale he should be assimilated on the third point of the new scale—that is, given two increments of £51 10s. on the new scale—bringing his salary to £1,534 2s. 3d.

The figure of £2,146 13s. 4d. stands in the same position in the new range of commencing salaries (£1,940 to £2,250) as the minimum of the old scale (£1,950) stood in the old range of commencing salaries (£1,750 to £2,050). £1,950 was £200 above the minimum possible commencing salary and £100 below the maximum possible commencing salary. To preserve this ratio of £200 to £100 it is necessary to take the minimum (£1,940) of the new range of commencing salaries and add to it two-thirds of the difference between £1,940 and the maximum of the new range of commencing salaries (£2,250). The difference amounts to £310, and two-thirds of it is £206 13s. 4d. When added to £1,940 this gives £2,146 13s. 4d.

In one case—the assistant medical officer scale—the new scale has one more increment than the old. In this case it is recommended that officers on the maximum of the old scale (£1,300) at January 1, 1955, should be placed at the seventh point (£1,325) of the new scale as from that date, and should thereafter proceed to the new maximum (£1,375).

Committee C recommends that the incremental date of all officers should remain unchanged, except as is provided in the paragraph above.

GENERAL MEDICAL COUNCIL

MEDICAL DISCIPLINARY COMMITTEE

The Medical Disciplinary Committee of the General Medical Council met on May 26 and 27, and dealt with some twenty penal cases. Sir DAVID CAMPBELL presided.

Adultery Arising out of Professional Relationship

The Committee considered the case of EBENEZER FRANCIS THOMAS, registered as of Tullamore, Offaly, Eire, M.R.C.S. Eng., L.R.C.P.Lond. 1941, who was charged that, having entered into professional relationship with a married woman, he had been found guilty of adultery with her by decree of the Divorce Court.

The Committee found the facts alleged against Dr. Thomas proved to its satisfaction, and judged him to have been guilty of infamous conduct in a professional respect. The Committee instructed the Registrar to erase Dr. Thomas's name from the *Medical Register*, subject to his right of appeal within 28 days to the Judicial Committee of the Privy Council.

Charges of Indecency

The Committee considered the case of ROBERT TAYLOR NOEL SIMPSON, registered as of High Street, Great Wakering, Essex, M.B., B.Ch., 1942, Q.U. Belf., who appeared on the charge of committing a serious offence against a woman patient, indecently assaulting three other women patients, and making indecent suggestions to three others.

The Committee found that Dr. Simpson had been guilty of infamous conduct in a professional respect and directed the Registrar to erase his name, subject to the right of appeal within 28 days.

"Grievous Bodily Harm"

The Committee considered a charge against ROBERT PHILIP STRANG, registered as of 40, Harley Street, M.R.C.S. Eng. 1940, M.R.C.P.Lond. 1946, who appeared on the charge that he had been convicted of shooting at a police detective, and imprisoned for 18 months.

The Chairman said that the Committee took a grave view of this conviction, but it had taken into consideration the representations made on Dr. Strang's behalf and had postponed judgment for two years.

Drug Offences

The Committee considered the case of JAMES MCKENZIE, registered as of Rochdale Road, Middleton, Manchester, M.B., Ch.B. 1944, U. Aberd., who was summoned on the charge that he was convicted at the magistrates' court at Middleton on September 13, 1954, of five charges of unlawfully procuring and supplying a quantity of amideone to himself. He was further charged that he had been convicted at the assizes in Manchester in November, 1954, upon an indictment of five counts of unlawfully procuring a dangerous drug, and was ordered to be imprisoned for 12 months, 26 other charges being taken into consideration.

The Committee postponed judgment for two years.

The Committee gave further consideration to the case of RALPH MARTIN CASE, registered as of Edgbaston, Birmingham, who at the session of the Committee a year ago had been found to have been convicted in 1953 at Grantham of unlawfully procuring dangerous drugs. Judgment had been postponed until May, 1955.

The Committee postponed judgment for one further year.

The case of THOMAS LEVEN, registered as of Irvine, Ayrshire, also came up for judgment, which had been postponed since May, 1953. Dr. Leven had been found to have been convicted in 1952 of contravening the Dangerous Drugs Regulations by procuring for himself *in cumulo* 567 grains of morphine sulphate by presenting to chemists prescriptions in the name of his patients.

The Committee decided not to instruct the Registrar to erase the name, and this closed the case.

The case next considered was that of JAMES ROSS, registered as of Park Grove, Barnsley, against whom the Committee had found at its May, 1954, session that he was convicted in 1953 of failing to enter in a register true particulars of certain drugs obtained by him.

In this case also the Committee decided not to instruct the Registrar to erase the name and closed the case.

Other Convictions

The Committee considered the case of FRANCIS CARMINOW DOBLE, registered as of Dean Street, London, W.1, who was summoned on the charge that at the Central Criminal Court in November, 1954, he had been convicted on indictment of having used an instrument on a woman to procure her miscarriage, and had been imprisoned for twelve months.

The Committee instructed the Registrar to erase Dr. Doble's name from the *Medical Register*.

The case next considered was that of ROBERT LINDSAY, registered as of St. Ninian Drive, Inverness, who in November, 1954, was summoned to appear before the Committee on charges relating to convictions of committing a breach of the peace and of resisting arrest and of being found drunk. In March, 1955, there had been a further conviction of committing a breach of the peace.

The Committee found the convictions proved, but postponed judgment for one year.

The next case was that of WILLIAM JAMES, registered as of Richmond Villa, Llandyssul, Cards., who was summoned on two convictions of being in charge of or driving a motor-car whilst under the influence of drink. The Committee postponed judgment for one year.

Adjourned Cases for Judgment

The remaining cases on the list were those in which the inquiry had taken place at a previous session, and the facts had been found proved, but judgment had been suspended for a period and the practitioner was required to produce testimonials.

The first of the adjourned cases was that of MOREEN CATHERINE O'BRIEN, registered as of Woodhouse, Sheffield, against whom it had been found in May, 1954, that she had forged 17 medical certificates for national insurance purposes which purported to relate to herself and to have been issued by other practitioners. The Committee did not direct the Registrar to erase the name, and this closed the case.

The next case was that of WILLIAM FRANK CRUICKSHANK, registered as of Westwood, Brechin, against whom it was found in May, 1954, that, being on the Medical List for the

county of Angus, on frequent occasions he had failed to be at his surgery during his consulting hours or to make arrangements for the treatment of patients in his absence; also that he had failed without reasonable cause to visit or treat certain individual patients. The Committee was not satisfied with some of the evidence that Dr. Cruickshank now brought forward, and postponed judgment for a further year.

The Committee decided not to erase the name of HERBERT ALBERT KENNETH ROWLAND, registered as of Cleator, Cumberland, who in July, 1954, had been found to have submitted prescriptions to a pricing bureau with a view to obtaining payment from the executive council with intent to defraud.

The same course was taken in the case of PATRICK ALOYSIUS GALLEN, registered as of Grant Street, Glasgow, against whom in 1953 certain convictions of being in charge of a motor-car when he was under the influence of drink were found proved.

In the case of GRAHAM GEORGE ROBERTSON, registered as of North Ridge, Bedlington, Northumberland, who had been convicted in March, 1954, of driving a motor-car while under the influence of drink, the Committee decided not to erase his name.

The Committee also decided, on the production of testimonials and other evidence, not to erase the names of ROBERT JOHN GORDON WILLIAMS, registered as of Abersoch, Caernarvonshire, who had twice been convicted, in 1948 and in 1953, of driving or being in charge of a motor vehicle when under the influence of drink, and of PATRICK STEPHEN GERRARD CAMERON, registered as of Kirton Park Terrace, North Shields, against whom convictions had been recorded in 1946 and in 1953 of driving a motor vehicle when under the influence of drink.

In the case of PATRICK JOSEPH CONLIN, registered as of c/o Barclay's Bank, Dudley, Worcestershire, who had been found to have been convicted in 1950 of being in charge of a motor-car whilst under the influence of drink, the Committee again postponed judgment for a further year.

Finally, in the case of HERBERT TREVOR DUKE, registered as of Manchester Street, London, W., who in May, 1954, had been found by the Committee to have been convicted of an act of indecency, the Committee decided not to instruct the Registrar to erase the name, and thereby closed the case.

Correspondence**Checking the "Medical Register"**

SIR,—As one of the 2,659 practitioners who were struck off the *Register* recently, owing to the General Medical Council being "unable to trace me," I was interested in the report in *The Times* of Sir David Campbell's remarks on this subject.

In the first place, what is the object of this inquisition? Is not a duly registered practitioner entitled to practise as and when he wishes and to change his address at will? Secondly, if we grant that it is necessary, why, when the missing practitioner has duly disclosed his whereabouts, is it necessary to fine him one guinea and require him to find two colleagues to vouch for his identity? Thirdly, in my own case, I admit that a registered letter was sent to me, and by an extraordinary set of circumstances did not reach me, and the Council was therefore legally justified in its action, but I should be interested to know what were the "considerable efforts to trace" in my case. The block of flats where I live is only a stone's throw from the offices of the General Medical Council, and personal or telephone inquiry would have immediately supplied the necessary information.

It is significant that within 48 hours of my being "struck off" I received a communication to that effect both from the B.M.A. and the Medical Defence Union; neither of these bodies appear to have had any difficulty in tracing me.—I am, etc.,

London, N.W.1.

British Medical Association**ANNUAL REPRESENTATIVE MEETING, LONDON, 1955***

Friday, June 3

The meeting resumed at 10 a.m., with Dr. GRANT in the chair. A meeting of the Council had taken place earlier.

SCIENCE ACTIVITIES

Mr. J. R. NICHOLSON-LAILEY (Chairman of the Science Committee) presented the several matters in the Annual Report under "Science."

Crash Helmets

Mr. DICKSON WRIGHT (Marylebone) moved that the meeting again affirm the life-saving value of crash helmets for motor-cyclists. He said that crash helmets had proved their great value during the war. The major contribution to road accidents came from motor-cyclists, who often suffered head injuries which made them permanently mentally and physically incapacitated.

Dr. J. M. C. GILL (Aberdeen and Kincardine Counties) asked the Council to take action with a view to securing that the wearing of a crash helmet was compulsory for all users of a motor-cycle. He said the Road Accident Research Laboratory had stated that in 1952 2% of motor-cyclists wore protective helmets, and in 1955 30%, which he thought a generous estimate. In the 15 months ending March, 1955, of all motor-cyclists involved in accidents in the Metropolitan Police District, 18.28% wore crash helmets, and in the north-east counties of Scotland Police District 5.17%. Splinter-proof glass was now compulsory for car windcreens, and the compulsory wearing of crash helmets would reduce the ghastly slaughter on the roads.

Dr. J. A. PRIDHAM (Dorset) opposed the motion. We were now riddled with regulations, he said; let us not have more compulsion. Educating public opinion would produce the desired result. Dr. J. S. M. ORD (Glasgow) also opposed the motion.

The motion was lost.

Dr. R. P. HENDRY (Rugby and South Warwickshire) urged the appointment of a deputation to the Chancellor of the Exchequer to press for the abolition of purchase tax on crash helmets and similar protective clothing. He said that protective clothing was not a luxury, and the revenue should not be boosted at the expense of risk to life and limb.

Mr. NICHOLSON-LAILEY asked the meeting to reject the motion as it stood. In conjunction with other organizations a further and concentrated attack was being made on the Department of Customs and Excise.

The motion was lost.

Mr. LAWRENCE ABEL (Marylebone) gave details of a meeting which he had attended on behalf of the Association with the Board of Customs and Excise on January 14.

*The first part of this report appeared in last week's *Supplement*.

on the subject of crash helmets. The Board officials were told that many injuries would have been avoided had crash helmets for motor-cyclists been compulsory. Sir Hugh Cairns's figures had been quoted, showing that during the early part of the war 15% of Army motor-cyclists who did not have crash helmets and who received fractured skulls were invalidated out as permanently unfit for service, while 85% of those who recovered were absent from duty for approximately four months. Head injuries accounted for more than 90% of road fatalities. The deputation had suggested that the first thing to do was to take off purchase tax from crash helmets. The Act relating to industrial injuries included a clause exempting miners' and quarrymen's crash helmets from purchase tax. But the deputation were told that it was not possible to include helmets for motor-cyclists.

HOSPITAL AND CONSULTANT SERVICES

In the absence, through illness, of Dr. T. Rowland Hill (Chairman of the Central Consultants and Specialists Committee), Mr. J. R. NICHOLSON-LAILEY presented the Annual and Supplementary Reports of Council under this heading, also the revised report of the Special Subcommittee on Hospital Medical Staffing, the report of the Geriatrics Joint Committee, and the report, by a subcommittee of the Psychological Medicine Group Committee, on the Medical Use of Hypnotism.

Mr. NICHOLSON-LAILEY outlined the negotiating machinery for consultants. He said that it had been attempted to model the negotiating machinery on the efficient machine of the general practitioners. It could not be an exact copy, since the problems were different in each case. Although the addition of the Joint Consultants Committee might seem to have made the business of negotiation cumbersome, slow, and at times exasperating not only to the medical profession as a whole but to the consultants themselves, it must be clearly understood that any semblance of fission between the Royal Colleges and the Central Consultants and Specialists Committee would be a most disastrous thing, particularly if the Minister had to consult three or four influential bodies in order to get advice or endorsement of some medical policy. He asked the Representative Body not to do anything which would suggest that the profession as a whole were so critical of the consultants and specialists, so condemnatory of their methods, that they would drive them away from the main body of the profession. Three times in the past five years he had sat in responsible committees of consultants and specialists and had heard it seriously proposed that they should form their own organization and negotiate without the Association. He had been the first person to rise and condemn such an attitude. The profession had to work together, and he appealed for a spirit of tolerance, understanding, and patience.

OVERSEAS BUSINESS

The order of the agenda was interrupted at this point to permit of overseas business being taken. Dr. GREGG drew particular attention to the award of the Gold Medal of the Association to Sir Henry Newland.

Major-General J. C. A. DOWSE, in the absence of Mr. Gilks (Chairman of the Overseas Committee), welcomed overseas representatives. He said the very high proportion of membership outside the British Isles was an indication of the keenness and enthusiasm shown by overseas colleagues for the affairs of the Association.

The Colonial Service, with its magnificent tradition of service and achievement, was in a stage of rapid transition and faced an uncertain future. Many Colonial territories were moving rapidly towards self-government, an essential feature of which was the assumption of full control of the services provided by the Government in those territories, including the medical service. Very few could supply the full demand for doctors, and doubtless would continue to rely for some time to come on recruitment from the United Kingdom. The advent of self-government gave rise to present and future problems closely affecting the well-being of the medical services. Some step towards solving these problems had been taken by the creation of H.M. Overseas Civil Service, but the B.M.A. hoped the U.K. Government was determined to retain some measure of responsibility for looking after the interests of those recruited.

The following representatives of Overseas constituencies then briefly addressed the meeting and brought greetings: Mr. E. G. GIBBS (New Zealand), Mr. K. B. FRASER (Queensland), Dr. J. LEON JONA (Victoria), Sir PHILIP MESSENT (South Australia), Dr. CHANG HOEY CHAN (Malaya), Dr. L. O. ABEYARATNE (Ceylon), Dr. A. M. M. WILSON (Uganda), Dr. H. PITT GRAHAM (Gold Coast), and Dr. J. C. McFEELY (Irish Medical Association).

The Empire and International Bureaux

Dr. H. G. DAIN moved approval of the reports of the Committees of Management of the Empire Medical Advisory Bureau and of the International Medical Visitors' Bureau.

The reports were approved.

HOSPITAL AND CONSULTANT SERVICES (resumed)

Negotiating Machinery

Dr. R. P. LISTON (Council) reminded the meeting of the note of warning sounded by the Chairman of Council at the Conference of Honorary Secretaries on March 31 about the spirit of sectionalism which had crept into the profession. Dr. Gregg had said that the British Medical Association was the only body which could claim to represent the profession in this country, but had not mentioned the vital reason which had justified that statement. It was one which gave the lie to the suggestion that the Association was the trade union of the general practitioner. The Association was nothing of the sort. The latest available figures showed that 81% of general practitioners and 70% of consultants and specialists were members. The Representative Body would be well aware of the dangers which lay ahead if Dr. Gregg's warning went unheeded, but the Representative Body would do well to ask themselves whether they were taking any steps to prevent sectionalism becoming a permanent feature of its members' professional lives. The Representative Body was the governing body of the Association and determined its policy. He asked whether it could in truth be said that it was at present carrying out or being allowed to carry out those functions. The Representative Body was becoming, if it had not already become, the rubber stamp for decisions already reached by the autonomous bodies. It was fair to say that the G.M.S. Committee had not at any stage departed from Association policy, though there might have been signs of strain at times, but

that did not apply to the Central Consultants and Specialists Committee.

"You will recall the *fait accompli* with which we were presented last year," he said. "The Joint Committee rose to the tarnished fly of £3m. thrown to it in secrecy, gobbled it hook, line, and sinker, and, in doing so, spewed up Spens and the yardstick accepted by the Representative Body!"

At the Council meeting of April 13 disquiet had been expressed by various members that decisions on proposals now being discussed by the Central Consultants and Specialists Committee might be reached before the Representative Body itself had considered them. The reply given by the Chairman of that Committee (Dr. Rowland Hill) had not been at all convincing. The Association was faced to-day with a very real danger in this matter of autonomy. The Representative Body was in the same helpless position in which the Trades Union Congress found itself in dealing with its own autonomous bodies. He asked whether, in granting autonomy, the Association had not given up its power and authority to speak for the profession as a whole.

"We must resist such influences which are not and cannot be for the good of the profession. We should make it our endeavour to persuade others that within the fold of the British Medical Association lies strength and progress, and that without lies weakness and regression." (Applause.)

Mr. LAWRENCE ABEL (Marylebone) moved to recommend to the Council that, where it is considered necessary, in all negotiations with the Ministry of Health on matters of hospital medical staffing professional, legal, and financial advisers should be consulted before final decisions were reached.

Dealing with the Defence Trust, he said that the general practitioners had saved for some 40 years. The consultants had not done their duty in paying for negotiations and the work that the Association had carried out.

The CHAIRMAN OF COUNCIL said that, in gathering their funds, consultants had difficulties which were not shared by the general practitioners, who had their contributions to the fund deducted at source. The consultants had tried but had not succeeded in getting their contributions treated in that way. Dr. A. SMITH (Lanarkshire) said that in Scotland there was a defence levy deducted at source by the regional hospital board.

The Marylebone motion was carried.

Mr. LAWRENCE ABEL (Marylebone) further moved to instruct the Council to consider the desirability of advising the Staff Side to withdraw from Committee B of the Medical Whitley Council in view of the fact that this negotiating machinery was not working satisfactorily.

Dr. J. B. TILLEY (Chairman of the Public Health Committee) thought that Committee C should be included in the motion.

The motion was carried.

Relationship with Joint Committee

Dr. J. A. PRIDHAM (Dorset) moved to request the Council to review the relationship of the Central Consultants and Specialists Committee to the Joint Consultants Committee. He said the Joint Committee had come out on top of the machinery which the Representative Body had authorized in 1948 and consisted of six people appointed by the Central Consultants (B.M.A.) Committee, the remaining 17 being appointed by the Royal Colleges of England and the Royal Scottish Corporations. The Joint Committee had been entrusted with negotiations with the Government, acting through Whitley B Committee, of which the staff side was the same committee under a different name. All respected the colleges, with their great traditions, but when they came down from their academic groves to the dusty realm of medical politics it did not necessarily follow that they were the best men to represent the consultants in the political field. However, the Joint Committee had been presented as a *fait accompli*, and it had been decided to see how it worked, hoping that in time it would recognize

the value of the Association, with its experience and the fairness with which the Representative Body could deal with any matter presented to it. The present arrangements made matters difficult for the Association because it was often blamed for decisions of the Joint Committee. A most important document which had recently emerged was the Strachan Report, containing references to the employment conditions and pay of the most junior members of hospital staffs. The only way in which those junior members could voice their views was through their divisional machinery and through the Representative Body. It now appeared that, although the report was to come before the Representative Body, it could not be altered by it without appearing to split the profession.

Dr. A. SMITH (Lanarkshire) said that a precipitate move to dissolve the Joint Committee or remove the association with the Royal Colleges would be a step towards setting up a separate organization having nothing to do with the B.M.A., and would be playing into the hands of politicians.

Dr. DORIS ODLUM (Bournemouth), while supporting the motion, said the meeting should not be carried away by emotional appeals. Some kind of joint structure should be maintained. Dr. S. F. L. DAHNE (Reading) opposed the motion, but thought there were several ways of working out better machinery, preserving the prestige of the Royal Colleges and the Scottish Corporations. The Council should examine the matter and in a year's time suggest what would be the right machinery. Dr. V. COTTON-CORNWALL (Liverpool) said consultants throughout the country were seriously disturbed at the way in which the machinery was working, and hoped the motion would be carried unanimously.

Mr. NICHOLSON-LEILEY said that the Joint Committee had to represent so many different types that there were bound to be divergences of opinion, but in the six and a half years of its existence there had been no serious disagreement between Consultants and Specialists Committee representatives and representatives of the Colleges. The "Escape Clause," by which one side was empowered to negotiate separately with the Ministry if it thought the other side was being unreasonable, had never been invoked.

The Central Consultants and Specialists Committee had given the Strachan report provisional approval, and the Joint Committee would eventually formulate their own policy on it. Any suggested alteration of the terms and conditions of hospital staffs would go back to the Central Consultants and Specialists Committee, and thence to regional committees, and the endorsement of the whole profession would have to be received before any agreement was made with the Ministry.

Mr. G. J. CLELAND (Ayrshire) said the democratic principles on which the Consultants and Specialists Committee was appointed must be maintained and enlarged as far as possible, and he strongly supported the motion. Dr. C. P. WALLACE (Guildford) suggested that representatives of the Royal Colleges on the Joint Committee might be made *ex officio* members of the Representative Body and be invited to have an adequate representation on the Council.

Mr. LAWRENCE ABEL (Marylebone) maintained that the organization was not clumsy and had worked well for six years. There was no evidence that consultants were disgruntled; most of them were doing very good work, and thousands were paid better than they had ever been. All members of hospital staffs could get their ideas to the Central Consultants and Specialists Committee or the Joint Committee through attending meetings of regional committees or writing to their representatives.

The CHAIRMAN OF COUNCIL said that in such a matter he had a jealous regard for the interests and importance of the Association. There was only one British Medical Association, which included all kinds and conditions of men, and its doors were open to them all. He was not very keen on doctors who put more emphasis on things specially associated with their branch rather than on being members of a great profession. Any fear he had was lest the influence and importance of the B.M.A. should suffer in any way.

The cure lay with all members of the profession being willing to meet in their local Divisions, being available to be sent to the Representative Body if they were the best men in the Division, and taking their place as doctors among other doctors.

The Dorset motion was carried almost unanimously.

The Withdrawal of Heroin

Dr. J. W. TAYLOR (Aberdeen and Kincardine Counties) moved a composite resolution:

That this meeting protests against the threatened withdrawal of that most excellent sedative heroin, which is of inestimable value in so many conditions, and recommends that it should still be manufactured in this country for use by medical practitioners, but not exported. It instructs the Council to seek direct access to the Government (a) to obtain the reversal of the decision on the banning of heroin, and (b) to ensure that in future no drug be prohibited without full discussion with the British Medical Association.

Dr. Taylor said that there was no adequate substitute for this most valuable drug. Those who used it were fully conscious of its dangers as well as its benefits, and not enough consideration had been paid to the views of the general practitioners—its main users. It had been stated in the House of Lords that a perfectly good substitute was now available in adequate supply and that the Government had taken the opinions of the statutory bodies (the Central Health Services Council, the Standing Medical Advisory Committee, and the appropriate bodies in Scotland and Northern Ireland) and that the Government could do no more than follow the technical advice and guidance given them. That was a fair enough statement, but the question arose whether the advice given was strong enough or the representation adequate. Such matters ought to be referred to the British Medical Association as the representative of all branches of the profession. Proprietary substitutes were stated to be no more than "as good as," which was not good enough. When something better was introduced the medical profession would abandon heroin of its own accord. The manufacture and sale of heroin was already well controlled, and an extension of the control to forbid its export would possibly satisfy the other nations concerned while leaving it possible still to use this most effective and excellent drug.

The CHAIRMAN OF COUNCIL said that in discussions in the Standing Medical Advisory Committee of the Ministry of Health such a dreadful picture of world heroin addiction had emerged that it was felt that any small sacrifice which might be involved in this country in forgoing the use of heroin was well worth making in the interests of the international situation in this respect. He wished to make it plain that those who had attended the Committee were not there as representatives of the Association; they had attended in their individual capacity. Had the B.M.A. had the opportunity of circularizing Divisions in the ordinary way, information might easily have been obtained from all over the country from bodies of doctors regarding the use of this drug.

Dr. J. S. HAPPEL (Winchester) supported the motion and welcomed the Chairman of Council's statement that the Committee had not been voicing the views of the Association. The ban was a bad decision and the motion now before the meeting offered a neat and satisfactory solution. Winchester was concerned with the precedent to be established. There were other addiction drugs in the country much more important, such as morphine, the barbiturates, or pethidine. He asked which would be the next to be banned. All through the years medical men had varied in their clinical estimation of the value of any particular drug; fashions had changed and changed back again. So it was with heroin. He asked the Representative Body to vote against this ban irrespective of their personal clinical assessments of the value of heroin.

Dr. R. HALE-WHITE (Marylebone) said that he knew of no satisfactory substitute for heroin, and even if there were

such a thing the argument was still false, because all general practitioners knew that individuals reacted to different things, and a long and depressing case of pain sometimes required three or four alternative treatments before the patient was made comfortable. He referred to the large majority of countries mentioned in the House of Lords debate on April 27 as having abandoned heroin, and said that Great Britain had been one of the few to stand out against the ban when it was first requested by United Nations. Yet heroin addiction had persisted and increased in countries where its use had been forbidden, which was exactly what might be expected. Prohibition of any drug or of alcohol only succeeded in encouraging its illicit and subversive use.

Dr. J. S. M. ORD (Glasgow) said that as a police surgeon he had not come across any abuse of heroin in his district. He felt that the distribution and use of the drug ought to be in the hands of the medical profession rather than that, by its prohibition, it should fall into the hands of unscrupulous persons, as would most likely happen.

Dr. G. D. THOMPSON (Lancaster) said the export and use of the drug should not be banned simply because another country could not control its use. Dr. ENID HUGHES (Denbigh) asked whether regulations similar to those controlling the use of cocaine could not be used to prevent heroin addiction. Dr. J. S. NOBLE (Blyth) said that pethidine was doled out to the nursing profession and morphine was doled out to miners, yet heroin was to be withdrawn from everybody.

Dr. A. J. MACLEOD (Outer Isles) said that, just as doctors deliberately did without other things which might be used in the interests of some patients, they should go without heroin in the interests of the world.

Mr. G. E. MOLONEY (Oxford) was sure there were more addicts to morphine than to heroin: "Why pick on the demon heroin when there are many more physical wrecks in Britain due to addiction to the demons gin, rum, and whisky?"

Dr. J. G. M. HAMILTON (Edinburgh) said that to be effective international action was seldom painless. Britain's reputation in the control of drugs of addiction was by no means a good one, and was the cause of much disrepute attaching to us internationally. "In this instance there is a bucket with a hole in it, and we have an opportunity of plugging the hole." The use of heroin was to some extent a prescribing habit, and on many occasions substitutes would be effective. He asked the meeting to be adult and responsible in its attitude to this matter.

Dr. H. G. DAIN (Birmingham) proposed an amendment which he thought more properly gave their view of the Association's position. (The text of this amendment forms the latter part of the motion as finally carried. See below.)

Dr. S. WARD said the debate had been on a parochial level, with little reference to the grave international situation. He deprecated that, on a matter affecting the well-being of unfortunate people throughout the world, a clever emotional appeal should have been made. Statements had been made seeming to indicate that doctors were treating carcinoma of the lung every day. He asked the meeting to take a decision dispassionately on the merits. Should a few sufferers be allowed a little extra suffering in order to try to solve a grave international problem which undoubtedly was spreading? "It may not prove the solution, but surely it is worth trying."

Dr. J. W. TAYLOR, in reply, said that in spite of the large quantity of heroin prescribed annually there were only about 40 addicts in the country.

The motion was taken in three parts, the third part being Dr. Dain's amendment, as follows:

(a) That this meeting instructs Council against the threatened withdrawal of the most excellent sedative heroin which is of inestimable value in so many conditions, and recommends that it should still be manufactured in this country for use by medical practitioners but not exported.

(b) That the meeting instructs Council to seek direct access to the Government to obtain the reversal of the decision on the banning of heroin.

(c) That this Representative Meeting of the British Medical Association wishes it to be known that the Association has not been consulted or asked for an expression of its views in any way on the question of the abolition of the manufacture and use of heroin. The Association, representing as it does the doctors of this country, considers this a serious omission on the part of the Government, and in the absence of such consultation the Government cannot claim to have ascertained the views of the medical profession before arriving at its decision.

On a show of hands, the first and second parts of the resolution were so obviously carried as not to require a count, and the third part was carried with three dissentients.

Remuneration of Hospital Medical Staff

Mr. J. R. NICHOLSON-LAILEY moved approval of the paras. (46 and 223 respectively) of the Annual and Supplementary Reports of Council.

He said that claims had been made for a further increase in the remuneration of S.H.M.O.s, an increase in the remuneration of non-clinical medical superintendents, the payment of domiciliary consultation fees to members of hospital staffs holding whole-time contract, an increase in the salary scales for regional hospital board headquarters medical staff corresponding with that given to hospital medical staff, and for certain improvements in the emoluments of house-officers, and these would continue to be made until satisfaction was obtained. Retrospective payment of the increased salaries agreed upon last session had not been pressed because the operative date was accepted as part of the agreement, and a claim for an increase in the basic rate of consultants' remuneration could not be pursued until there was more solid ground to go on, and more time was needed to see what could be done.

Dr. T. D. CULBERT (Manchester) moved:

That this meeting deplores the fact that the instructions to Council contained in the resolution of the last Annual Representative Meeting have not been carried out, and demands that the Council do so forthwith.

This resolution of 1954 deplored the inadequacy of the agreement reached on the remuneration of hospital medical staffs and urged that steps be taken to reopen the matter immediately with a view to implementing the Spens report as applied to consultants and specialists and obtaining adequate betterment; in the event of disagreement the matter to be referred to arbitration.

He said it seemed that the Spens report had been allowed quietly and tacitly to drop, and instead of its implementation there was to be an inquiry, and no one could say when that would finish. Mr. NICHOLSON-LAILEY said more time must be allowed before confronting skilled, hard-headed negotiators, trained for the job and doing it every day of their lives.

The Manchester amendment was carried.

Dr. J. B. S. MORGAN (Derby) moved to express dissatisfaction with the results so far obtained for whole-time consultants and specialists and to urge that renewed efforts be made on their behalf. Dr. E. C. DAWSON (Derby) supported the motion.

Mr. NICHOLSON-LAILEY said the matter was under discussion.

The Derby amendment was carried.

Dr. V. COTTON-CORNWALL (Liverpool) moved to refer to Council that the S.H.M.O. maximum rate of remuneration be raised to 80% of the consultant maximum.

This was agreed.

Dr. A. G. CHAMBERLAIN (Dorset) moved that the remuneration of hospital house-officers should be brought into line with that of newly appointed national service medical officers. He could see very little difference between the work done and the responsibilities taken by house-officers as compared with the work and responsibilities of serving officers doing their two years' national service. The respective remunerations of the two classes varied between £425 in the case of the house-officer and about £900 plus a ration allowance in the case of the service officer.

The motion was referred to Council.

Mr. WELDON WATTS (Newcastle-upon-Tyne) moved that the remuneration of general practitioners doing sessional work in hospitals be increased.

This was carried.

The Revised Report on Hospital Medical Staffs

Mr. NICHOLSON-LAILEY moved approval of the revised report on Hospital Medical Staffing. He also outlined some of the features of the Strachan Report.

Miss GLADYS SANDES (Marylebone) moved:

That this meeting instructs the Council that a survey of consultant establishments is essential before decisions are taken on any changes in hospital medical staffing. The review should be undertaken by representatives appointed by the Ministry and by the Joint Consultants Committee. Any review committee so appointed should include representatives of the Consultants and Specialists Committee of the region concerned.

The motion was carried.

Dr. E. W. GOODWIN (Leicestershire and Rutland) moved:

That there should be a maximum expansion of the consultant establishment so as to provide a service adequate for the needs of the country in accordance with the expressed policy of the Central Consultants and Specialists and Joint Committees.

The motion was carried.

Dr. D. J. CAMPBELL (Sheffield) called for an expansion of the consultant establishment in the hospital services, particularly in those specialties in which the present ratio of consultants to S.H.M.O.s was low.

A motion to this effect was carried.

Dr. S. F. L. DAHNE (Reading) said that, while taking note of the need for expansion of the consultant grade, any such expansion should absorb existing S.H.M.O.s who were already doing consultant work.

Mr. A. STAVELEY GOUGH (West Herts) asked that the motion should be taken as a reference to Council because it had very wide implications and might be bad in relation to the report's effect on the senior registrars who had a very serious grievance in trying to get jobs with an under-established consultant's fee. Mr. NICHOLSON-LAILEY also asked for its reference to Council.

Dr. DAHNE, in reply, pressed for a straight vote on his motion, reiterating that the majority of S.H.M.O.s were doing consultants work, whether or not other people thought they were.

The Reading motion was carried.

Dr. E. W. GOODWIN (Leicestershire and Rutland) moved that all grades of medical staff who will be vitally affected should have representation on all committees dealing with the preliminary review of hospital staffing, and on all later committees concerned with putting the report into effect.

This was agreed as a reference to Council.

Dr. DAHNE moved an amendment to a motion by Dartford which the Dartford representative had wished to withdraw, but the meeting withheld permission. The amendment sought to draw attention to the position of doctors graded as S.H.M.O.s who, despite the fact that they are engaged in consultant work, are remunerated at S.H.M.O. rates, and to ask the Council to treat the matter as one of urgency.

Dr. D. L. PUGH (Maidstone) spoke in support. He said many such doctors undertook consultant work without supervision. It was a common adage in the economic and social life of the country that a fair rate should be given for the job concerned. The limited number of doctors concerned in this motion did feel a sense of injustice and hoped to secure the support of the Association in their negotiations.

The Reading amendment was carried.

A motion by Liverpool was also carried that in any reformed structure of staffing the grade immediately below that of consultant should be linked with the consultant grade and be regarded as part of the senior medical staff.

Dr. ANNIS GILLIE (Women Members' Representative on Council) spoke on paragraph 29 of the Strachan report, which she said referred specifically to medical women, and

married medical women, as a source of part-time staffing. Owing to social changes to-day young married medical women found it more difficult than before to undertake part-time work. They could often, however, undertake such work if it was in the immediate vicinity of their homes, but found that it was not available there. She thought that full use ought to be made of the services of such women, and that regard should be had to the fact that their inability to undertake regular part-time work while rearing families was a temporary phase in their lives; later on, when their domestic conditions allowed them greater freedom, they would be able to undertake more work, but they ought not to be made to feel handicapped at that stage by having been put in a pool with no outlet earlier on because of the limited opportunities they had for working while bringing up their families.

A motion by Liverpool reiterated the resolution passed last year by the A.R.M. that no further S.H.M.O. posts be established and that existing posts should be subject to biennial review with a view to upgrading.

This was agreed to.

A motion by Reading, that all existing S.H.M.O. posts should be subjected to a review by an independent central committee with a view to upgrading, was also carried.

Internal Administration of Hospitals

Mr. J. R. NICHOLSON-LAILEY introduced the section of the report on internal administration of hospitals.

Dr. V. COTTON-CORNWALL (Liverpool) had a long resolution on the subject of the Bradbeer report:

(a) That this meeting, believing everything concerning the patient must be of importance to the clinician in charge and that, therefore, the lay and ancillary services must be subordinate to the medical, considers that the recommendation of equal tripartite administration by the Bradbeer Committee on Internal Administration of Hospitals is not in the interest of the patient.

(b) That this meeting affirms that under no circumstances shall the medical and nursing personnel of hospitals be under the control of lay administrators.

(c) That this meeting affirms that it should be obligatory for the hospital management committee to consult with the representatives of the senior medical and dental staff.

(d) That this meeting welcomes the recommendation in para. 72 of the Report that, when medical administrators are appointed, they should be of consultant status with clinical responsibility. It considers that paras. 77-8 are unworkable.

(e) That this meeting deplores the suggested downgrading of deputy medical administrators, when such are considered desirable, to an R.M.O./R.S.O. grade.

(f) That this meeting reaffirms its belief that it is in the interest of the patient to maintain the close link that at present exists between the medical and nursing professions.

(The paragraphs in the Bradbeer report to which this resolution referred were set out in the *Supplement* of May 21.)

He said that Liverpool was very disturbed by the implications of the Bradbeer report, and hoped the meeting would express itself as equally disturbed.

Dr. L. A. GIBBONS (Council) said it was obvious from the Minister's answer to a question in the House that he preferred information obtained through the Ministry from the secretaries of local hospital management committees. He supported the amendment. Mr. A. STAVELEY GOUGH (West Herts) thought that too much had been read into the report, which was in some ways constructive and helpful to the medical profession by establishing their rights to be consulted at staff level on all occasions. Dr. A. SKENE (Liverpool), referring to the proposed tripartite administration arrangement, said that it clearly implied that the medical and nursing administrators would be subordinate to the lay secretary of the management committee.

Dr. J. G. M. HAMILTON (Edinburgh), referring to para. (d), said that in Scotland there was almost unanimous agreement that the present Scottish system of non-clinical medical administrative superintendents was desirable and should not be altered.

Dr. COTTON-CORNWALL, in reply, said that the Bradbeer report did not refer to Scotland.

The Liverpool amendment was carried except that para. (d) was taken as a reference to Council.

Dr. D. P. CRAWFORD (East Kent) moved as a reference to Council that a medical superintendent should be appointed to each general hospital where there was no such appointment, by election from senior medical staff by group medical advisory committees, in consultation with the medical staff committee, and that the tenure of office should be for periods of three years.

This was carried.

Dr. COTTON-CORNWALL further moved a recommendation that all medical boards and medical advisory committees in hospitals should become statutory bodies within the framework of the National Health Service, and this was agreed.

Dr. A. A. VICKERS (Worcester and Bromsgrove) asked to what stage the deliberations of the Central Consultants and Specialists Committee on consultant organization had reached. Mr. NICHOLSON-LAILEY said that they were still engaged in an inquiry into and consideration of the organization of consultants and specialists and hospital group committees and everything pertaining to it.

Geriatric Units

Dr. H. D. CHALKE (Chairman) introduced the report of the Geriatrics Joint Subcommittee on the treatment and rehabilitation of chronic disablement (Appendix IX attached to Supplementary Report of Council).

He said the basic principle was that the whole problem of the aged was centred on the home and very closely bound up with the general practitioner, and there should be somebody in each area to whom the general practitioner could turn, and who had responsibility for deciding the temporary or permanent disposal of the infirm. It was essential that the welfare service should be under the same control as the public health service and part and parcel of the local health authority in order to deal more effectively with the need for more hospital bed accommodation. Also, something must be done preventively before the ageing became helpless, chargeable, and useless.

Dr. J. E. BLUNDELL WILLIAMS (Worcester and Bromsgrove) moved that in recommendation 17 in the report of the Geriatrics Joint Subcommittee, which read, "There should be an increase in Part III accommodation to meet present and future needs," the words should be added, "particularly with regard to the provision of an increased proportion of single rooms."

The motion was carried.

A motion by Mid-Cheshire was met by an amendment by Dr. R. W. MCCONNELL (Buckinghamshire) to expand it to read: "That this meeting recommends that stress be put on the need for more domiciliary and institutional accommodation for the aged, elderly, and middle-aged," and this was carried.

Bath asked that the Council should make representation to the Government to produce homes for old people, accommodating a sufficient number in each to be an economical proposition, and this was agreed to. A recommendation by Greenwich and Deptford was also carried urging the provision of geriatric and chronic sick hospital facilities. A motion by Wandsworth asked that age should not be a bar to admission to hospital, and this was agreed to.

Dr. W. N. LEAK (Mid-Cheshire) asked that propaganda be considered to arouse the public conscience on the need for people to accept the responsibility for their aged relatives, except where hospital treatment was essential.

A motion calling for such propaganda was carried.

At the end of the business on the report on "Hospital and Consultants Services," Mr. Nicholson-Lailey received an ovation for the way in which he had dealt with the business in Dr. Rowland Hill's absence.

Representation of Whole-time Consultants

Dr. J. B. S. MORGAN (Derby) urged that there be a higher proportion of whole-time consultants and specialists on the Central Consultants and Specialists Committee. He felt that the present representation was disproportionate.

Dr. E. C. DAWSON (Derby) said that since a Derby motion on similar lines had been defeated two years ago the Association had set up a Constitution Committee which it was hoped would deal with the question, and also with the constitution of the Consultants and Specialists Committee. He asked for a reference to Council.

Mr. NICHOLSON-LAILEY also asked for a reference to Council. The Association was most anxious to avoid sectional interests in allocating the proportions on committees.

The motion was referred to Council.

Private Beds

Dr. A. SUTHERLAND (Bath) moved that in view of the increasing membership of the various provident schemes the Minister be asked to arrange that more private beds should be available in hospitals.

Dr. W. M. EVANS (South Middlesex) moved as an amendment that the Minister should be asked to arrange that some section 4 and 5 beds be available at all major hospitals. Although the Minister had said on several occasions that the overall picture for the country showed a sufficiency of these beds, regionally there had been a shortage.

Dr. F. E. GOULD (Birmingham) said there were very many reasons why the Minister should be asked to provide private beds, but to suggest that they should be provided because payment for them was being subsidized by provident schemes was immoral and unwise. Dr. A. V. RUSSELL (Council) said there was nothing immoral in somebody being willing to pay for what they wanted. Payment for a section 4 or 5 bed was one step in the direction of cutting down the expenses of the health service.

Mr. G. E. MOLONEY (Oxford) said that private practice seemed to be regarded by some doctors as well as by many potential patients as something rather shady. There was nothing wrong in a patient relieving the State by paying his way with the aid of a provident society.

The South Middlesex amendment was carried.

Study Leave

Dr. D. S. GREIG (Stirling) moved that the Ministry be asked to state its policy in respect of study leave and to reinforce its instructions to regional hospital boards to make study leave available to hospital officers.

Mr. NICHOLSON-LAILEY said that boards were not making all the efforts they could to provide the necessary facilities. There was a sum of money provided by the Government specifically for study leave expenses; it was not much, but the people in the smaller areas ought to get their share of it.

The motion was carried.

ASSOCIATION BUILDING

Mr. L. DOUGAL CALLANDER (Chairman of the Estates Committee) presented the report of Council under "Estates." He said that arrangements had been made for the redecoration of Tavistock House over a period of five years. The Council Chamber was to be redecorated and the lighting, heating, and acoustics of the building would also receive attention. The alterations to the Scottish House would be completed in about twelve months' time. It was also hoped to have very much better library accommodation. Town planning consent was being awaited with regard to the Burton Street side. The buildings were in fairly good condition, but there were certain costly repairs which had to be carried out.

PUBLIC RELATIONS

Dr. H. GUY DAIN (Chairman of the Public Relations Committee) presented the report under "Public Relations." He said that each year there had been an increase not only in the amount of work passing through the public relations department but in its value. Opportunities that had

presented themselves had been taken. Whenever the Council wished to issue an important document on such subjects as geriatrics or hypnosis or any other the Press were invited to attend and learn what it was about in order that the public might appreciate the scientific work which the Association carried out. A place had been secured on the Independent Television Advisory Committee for the Association. The Advisory Committee had drawn up a code of behaviour for advertisers, and this was now available. "We have had," said Dr. Dain, "a busier and more useful year than we have ever had before in our Public Relations Department."

The report was approved without discussion or dissent.

The final business of the day was the approval of the paragraphs under "Armed Forces," which were moved by Major-General J. C. A. DOWSE, chairman of the Committee.

The meeting adjourned at 6 p.m.

Saturday, June 4

The meeting resumed at 9.30 a.m., with Dr. GRANT in the chair.

Votes of Thanks

A warm vote of thanks was accorded to all who had contributed to the pleasure and convenience of the representatives and their ladies. These included the Council of the Metropolitan Counties Branch, the Ladies Committee of the Branch, and the London Association of the Medical Women's Federation.

OTHER MOTIONS BY DIVISIONS

Opposition to Whole-time State Salaried Service

Dr. ALISTAIR FRENCH (Marylebone) moved:

That this meeting, representative of all branches of the profession, expresses its strong opposition to a full-time State-salaried service, and reaffirms the resolution passed in May, 1946, July, 1953, and July, 1954: "The medical profession is, in the public interest, opposed to any form of service which leads directly or indirectly to the profession as a whole becoming full-time salaried servants of the State or local authorities."

This was not an attack on a salaried medical service, but his Division felt that no member should be compelled to practise his profession in such a service.

The motion was supported by South Staffordshire.

Dr. H. C. PALIN (Burnley) moved as an amendment that the meeting affirms its objection to any form of whole-time State-salaried service, and asked that the Council should state what immediate counter measures should be taken in the event of an attempt to bring in such a service.

Dr. FRENCH hoped the amendment would be withdrawn. His motion had been carefully thought out. No steps could be taken to introduce a comprehensive salaried medical service without amending legislation.

The CHAIRMAN OF COUNCIL said that he had sympathy with anybody who wanted to maintain the fighting spirit of the profession. But it was impossible to forecast along what lines an attack might come. The matter should be left to Council.

Burnley withdrew the amendment, and the Marylebone motion was carried without a dissentient.

Another motion by Marylebone reaffirming that the Spens reports still remain the yardstick and basis of all negotiations on remuneration for doctors in every branch of the National Health Service was carried unanimously without discussion.

ORGANIZATION

Dr. J. A. PRIDHAM (Chairman of the Organization Committee) presented the report under "Organization," including proposals for amendments of Articles and By-laws. He praised the work of hon. secretaries of Branches and Divisions. Circumstances of recent years had made their work more difficult, and but for what they did the B.M.A. would collapse. His committee had set up a strong sub-committee under the chairmanship of Dr. Dornan to help

the newly qualified and pre-registered. They had had a letter of appreciation from the British Medical Students Association.

Association Membership

Dr. R. P. HENDRY (Rugby and South Warwickshire) drew attention to the fact that there had been a net fall in Association membership of 366 over the years 1953 and 1954, contrasting with a net increase of 3,718 in the years 1951 and 1952. This should be considered as a challenge, not a catastrophe, and a small committee should be set up to consider this problem. He thought that the assurances given, in good faith, last year were on the optimistic side. Medical schools were turning out doctors by the hundred, but the Association would have to have been founded before Julius Caesar to reach its present size if its rate of increase (33) had been only that of last year. He agreed that the time was not quite ripe for a reduction of subscription, but something needed to be done which was not being done. He was reluctant to suggest a new committee, for the profession was riddled with committees, but some inquiry should be made.

Dr. R. G. GIBSON (Council) thought the Organization Committee was capable of doing this without more committees. Dr. D. L. GULLICK (East Herts) agreed with Dr. Gibson. Dr. R. H. MOORE (North Middlesex) said that members at the periphery did not feel they had a sufficiently active part in the Association.

Dr. PRIDHAM said that between May 31, 1954, and the corresponding date in 1955 there had been a rise in membership of 1,125. Many factors affected membership, including the pre-registration year and the call-up.

Dr. HENDRY said that last year 1,400 members resigned, and 2,900 the year before, compared with 700 in 1951. The figures were not satisfactory.

The proposal for the setting up of a new committee was withdrawn and the rest of the motion, drawing attention to the membership position, was carried.

Newly Qualified Practitioners

Dr. ALICE GILBY (Westminster and Holborn) asked the Council to examine the availability of pre-registration posts in hospitals and report to the next Annual Representative Meeting. Some young doctors had to wait unemployed for from a few weeks to six months, and they could not fill in the time as locumtenents.

Mr. C. D. MEADOWCROFT (South Middlesex) said that in view of the urgency of this matter the Council should be instructed to take immediate action.

A motion on these lines was carried.

Autonomous Bodies

Dr. J. A. PRIDHAM moved as a recommendation to Council:

That the autonomous powers of the General Medical Services Committee and the Central Consultants and Specialists Committee be renewed in respect of the year 1955-6.

That the Representative Body looks to these committees to ensure (1) that no action be taken by either which may prejudice the interests of another part of the profession without full prior consultation with the appropriate interests, and (2) that their autonomous powers will be used so as to expedite and not delay the work of the Association.

Mr. G. A. POLLOCK (Edinburgh) said that the motion as it stood suggested that consultation should take place only if the activities of one part of the profession affected adversely another part. He suggested that the word "affect" should replace the word "prejudice."

The amendment was rejected and the recommendation of Council carried.

CONSTITUTION OF THE ASSOCIATION

Dr. R. G. GIBSON, in the absence of Mr. H. H. Langston (Chairman of the Constitution Committee), moved that the report under "Constitution of the Association" be approved.

He briefly described how the work of the Committee was proceeding.

Dr. J. M. ALSTON (City of London) proposed that liaison committees organized on a district basis under the National Health Service, and consisting of members representing general practice, hospitals, and public health work, should be commended to all Divisions. In North London a committee with two representatives from each of these sides of the profession had presented a report on what could be done for the old people of the district, and were now engaged in a similar inquiry into small epidemics in families and small communities.

Dr. E. C. DAWSON complained that they had too many committees already. This was a job for the Divisional Executive.

The motion was carried with the proviso that such committees should be organized only when an equally desirable end could not be attained through existing organizations.

Dr. W. N. LEAK (Mid-Cheshire) proposed that in order to relieve the burden of the Council and also to stimulate interest at the periphery wider use should be made of delegation and co-option.

This was accepted as a reference to Council.

Miss GLADYS SANDES (Marylebone) moved to ask the Council to investigate the possibility of combining the Scientific Meeting and the Representative Meeting so that all members might have the opportunity of taking part in both the scientific and the medico-political activities of the Association.

The CHAIRMAN said that it would be helpful if representatives expressed their opinions on this point. It would mean that instead of giving three or four days to the Annual Representative Meeting they would have to give seven or eight.

Dr. J. S. M. ORD (Glasgow) urged that it be turned down on the score of increased expenditure. Dr. R. W. MCCONNELL (Buckinghamshire) thought it a good idea. People attending the Representative Meeting tended to become too politically minded. Dr. R. HALE-WHITE (Marylebone) thought it would be of the greatest value. It would mix together people interested in the political and in the scientific side.

The CHAIRMAN OF COUNCIL supported the idea. It was the kind of thing which had been done in the World Medical Association.

The Marylebone motion was carried.

Dr. J. E. MILLER (Glasgow) moved that the Council consider the appointment of resident medical secretaries to the regional officers in the larger cities of the United Kingdom, on the same lines as the successful Glasgow regional office, thus making for decentralization of the Association's activities and the making of a more efficient personal service available to members in each area. Provincial members were entitled to a more efficient regional service. Periodical visits by an officer from Headquarters in London were not adequate. In the Glasgow regional office Dr. McCutcheon had succeeded in making Glasgow one of the most B.M.A.-conscious cities in the country.

Dr. DAIN suggested that they might be better off as they were. The secretaries visiting the regions from Headquarters had the advantage of being in constant touch with the work of the Association in London.

Dr. J. C. MACARTHUR (Lanarkshire) supported the motion. The visiting secretaries from London had closer affiliation with the central office than with the regions.

The motion was supported by representatives from Manchester and Liverpool and was carried.

REFORM OF THE NATIONAL HEALTH SERVICE

Dr. H. H. D. SUTHERLAND (Chairman of the Amending Acts Committee) reported on what had been achieved and attempted since the Special Representative Meeting, 1951. One matter which had been under close consideration was whether there were adequate safeguards in section 10 of the Amending Act, 1949. The section, good enough so far as

it went, was not a complete cover, and it was possible that they might have to think again on this matter and take legal opinion.

Dr. E. C. WARNER asked for further information concerning the action taken with the departments on a number of recommendations passed in 1951.

The CHAIRMAN OF COUNCIL was proceeding to read a long document setting out the recommendations to which reference had been made and the action taken, upon them when a representative protested at the waste of time involved in reading such an elaborate document and suggested that it be circulated to representatives. This was agreed to. Dr. Gregg said that everything that was in the document had been published at various times, but here the information had been brought together.

Dr. WARNER withdrew his motion, saying that he had achieved his object.

The N.H.S. and Politics

Dr. J. B. WRATHALL ROWE (Harrow) moved:

That it is undesirable and detrimental to the interests of the health of the nation for the facilities and services of the National Health Service to be the means of gaining political capital, and the Council is requested to take such action as will cause the Health Service to be removed from the political arena.

He said that the National Health Service had been subjected to political influences. If anyone had any doubt of that he had only to read the manifestos of the political parties in the recent General Election. A situation might arise when a party, in the hope of reaching office, would make the most extravagant promises in which the doctors working the service might find themselves involved.

The motion was carried.

REMUNERATION POLICY

Dr. J. G. M. HAMILTON (Chairman of the Committee on Remuneration Policy) moved for approval the report of Council under that heading. He was not in a position to say anything more than that the Council hoped and expected to be able to report next year.

SCOTLAND AND WALES

Dr. HAMILTON also presented the report under "Scotland." Speaking of the visit of Danish doctors, he said that a sum of over £1,000 had been contributed for their entertainment. He also mentioned the successful conference of area secretaries in Scotland, which would be repeated again this year.

The report was approved, as also was the report under "Wales," moved by Dr. LESLIE W. JONES.

OTHER ASSOCIATION ACTIVITIES

Motions by Winchester concerning the improvement of catering and other social amenities at Headquarters were referred to Council.

A motion was moved by Wandsworth that in acute mental illness the procedure for obtaining effective treatment and supervision is not satisfactory, and that the Council be asked to examine and report on the problem.

Dr. S. WAND said that a few weeks ago representatives of the Association gave evidence to the Royal Commission on the law relating to Mental Disease and Deficiency. The deputation consisted of three psychiatrists representing various groups in that specialty, and representatives of public health and general practice. Various recommendations were made which would ease the lot of these unfortunate people and improve their conditions. Dr. DORIS ODLUM endorsed what Dr. Wand had said.

The Wandsworth motion was carried.

Dr. C. P. WALLACE (Guildford), referring to the paragraph in the Annual Report concerning the suggestion made by the Council to the Minister of Health to set up a working party to review the intake of medical students from the point of view of the number of newly qualified practitioners likely to be absorbed into the various branches of the

profession, protested against such interference on the part of the Council. The last thing they should wish to do was to regiment the administration and education of medical students. He thought the Council had been guilty of a grave strategic error.

The CHAIRMAN OF COUNCIL said that Dr. Wallace's criticism did not seem to him justifiable in the circumstances.

Miss GLADYS SANDES (Marylebone) moved a vote of thanks to the Chairman of the Representative Body for his excellent conduct of the four-day meeting.

The vote was carried by the representatives standing and applauding.

Dr. GRANT thanked the meeting, and associated Dr. Beauchamp, the Deputy Chairman, who had at times taken the chair, with the compliment. He also thanked the entire staff of the Association for their work throughout the year.

The meeting terminated at 1.20 p.m., and a Council meeting followed.

ELECTIONS

During the course of the meeting the following elections took place: *Chairman:* Dr. IAN D. GRANT. *Deputy Chairman:* Dr. A. BEAUCHAMP. *Ten Members of Council by meeting as a whole:* Mr. A. LAWRENCE ABEL, Dr. O. C. CARTER, Dr. H. GUY DAIN, Dr. ROBERT FORBES, Dr. FRANK GRAY, Dr. I. M. JONES, Mr. H. H. LANGSTON, Dr. J. A. PRIDHAM, Dr. S. WAND, and Mr. A. DICKSON WRIGHT. *Two members of Council by representatives of Scottish Constituencies:* Dr. G. W. IRELAND, Dr. J. C. MACARTHUR. *One member of Council by representatives of Constituencies in Wales (including Monmouthshire):* Dr. T. W. DAVIES.

Surgeon Rear-Admiral JAMES HAMILTON was elected by the meeting as representative of the Medical Branch, Royal Navy, on the Council for the period 1955-8.

Six members nominated as Direct Representatives in the approaching election to the General Medical Council: Dr. J. A. BROWN, Mr. L. DOUGAL CALLANDER, Dr. O. C. CARTER, Dr. H. GUY DAIN, Dr. E. A. GREGG, and Dr. S. NOY SCOTT.

ANNUAL GENERAL MEETING

The 123rd Annual General Meeting of the British Medical Association was held in the Great Hall of B.M.A. House, Tavistock Square, London, on Saturday, June 4, 1955. In the absence of the President, who was in America, the chair was taken by the CHAIRMAN OF COUNCIL (Dr. E. A. GREGG).

The notice of the meeting, which had appeared in the *Supplement* of April 30, was received.

The minutes of the last Annual General Meeting, held in Glasgow on July 5, 1954, and published in the *Supplement* of July 10, were confirmed.

Balance Sheet and Income and Expenditure Account

On the motion of Dr. KATE HARROWER, seconded by Dr. R. L. CORNIE, the Balance Sheet and Income and Expenditure Account for the year ending December 31, 1954, were approved.

Appointment of Auditors

On the motion of Dr. ENID HUGHES, seconded by Dr. J. HAZLETON, the following resolution was adopted:

That Messrs. Price Waterhouse and Co. be and are hereby appointed Auditors of the British Medical Association until the next Annual General Meeting, at a fee to be arranged by the Council.

President, 1955-6

The CHAIRMAN said that Dr. T. C. Routley, the incoming President, was not with them, and the induction speech which would have been made on that occasion could be appropriately made when they met him in Toronto. Meanwhile they would wish to express their thanks and appreciation to Sir John McNee, the Immediate Past President, for his services during the year. In these words of appreciation they associated Lady McNee.

He announced that in the absence of the President for 1955-6 Sir John McNee had been invited to act for the President on all appropriate occasions.

President-elect

The CHAIRMAN reported that Dr. Alexander H. Hall, O.B.E., M.D., of Hove, had been elected by the Representative Body as President of the Association, 1956-7. (Applause.)

Presentation of Treasurer's Badge

The CHAIRMAN said that Mr. A. M. A. Moore, who had held the office of Treasurer for six years, and had performed his duties in the quiet unobtrusive way which was natural to him, rendering most useful service, was kindly presenting to the Association a Treasurer's badge, to be worn by his successors.

Mr. MOORE, who was received with applause, said that he was very grateful to the Representative Body for electing him a Vice-President of the Association, and he hoped that he might continue to serve it in some capacity. He wished also to take this opportunity of expressing to Dr. Macrae and his colleagues in the secretariat, and on the financial side to Mr. Giles and his staff, his grateful thanks for their great loyalty and support during his time as Treasurer. He now had pleasure in presenting to the Association a badge to be worn by the Treasurer on certain formal occasions, and amid applause he invested Mr. Dougal Callander with the badge.

Mr. CALLANDER thanked Mr. Moore for this handsome emblem, and said that he felt himself fortunate to be the first Treasurer to wear it.

The meeting then stood adjourned until 8 p.m. on Monday, June 20, 1955, at the Royal York Hotel, Toronto.

EXTRAORDINARY GENERAL MEETING

An Extraordinary General Meeting of the British Medical Association was held, following the Annual General Meeting, on June 4, 1955, in the Great Hall of B.M.A. House, Tavistock Square, London. In the absence of the President the chair was taken by Dr. E. A. GREGG (Chairman of Council).

The notice convening the meeting, which had appeared in the *Supplement* of April 30, was taken as read.

The following resolution was proposed from the chair as a special resolution:

That Articles 5, 6, 10, and 18 be altered in the following manner:

(1) By altering Article 5 as follows: After "Each Branch" add "of the Association not in Great Britain or Ireland."

(2) By altering Article 6 as follows: After "1st January, 1938," delete "but so that this proviso" and add "Provided further that the Regulations and By-laws may provide that any member admitted to membership before the 31st December next occurring after the date of the grant to him of a qualifying diploma within the meaning of the Medical Acts may compound his subscriptions for such period as may be prescribed by the By-laws of a lump sum but so that each of the foregoing provisos."

(3) By altering Article 10 (c) as follows: After "(vii)" add "in the case of an Associate on the 31st day of December next following after he shall have ceased to reside within the area of the Branch by which he was elected or (viii)."

(4) By altering Article 18 as follows: At the beginning insert "Subject as hereinafter provided." After the words "Corporate Group and of no other" insert "Provided, however, that any member whose address as registered for the time being in the Register of Members of the Association is within Great Britain or Northern Ireland who has become a member of a Division other than that in which he resides in manner provided by the By-laws shall be an ordinary member of such first-mentioned Division and of no other."

The CHAIRMAN formally moved: That this Extraordinary General Meeting amend the Articles of the British Medical Association in the manner above indicated.

This was carried by a show of hands, none dissenting.

The meeting then terminated.

OVERSEAS CONFERENCE

The Overseas Conference was held in the Old Library at B.M.A. House on Saturday afternoon, June 4. Mr. J. L. GILKS, Chairman of the Overseas Committee, was prevented from attending because of the railway strike, and the chair was taken by Professor P. C. C. GARNHAM.

Seventy-four Branches

The Secretary of the Overseas Committee, Dr. E. GREY-TURNER, recalled that the first Overseas Conference was held at the Centenary Meeting of the Association in London in 1932.

There were, Dr. Grey-Turner said, 74 B.M.A. branches outside the United Kingdom. Thirty-eight of these were "corporate branches," which managed their own affairs. They included the six Australian branches, the New Zealand Branch, the Ceylon Branch (which, as the Ceylon Medical Association, was about to become affiliated to the B.M.A.), the four branches of Southern Rhodesia, known collectively as the Medical Association of Southern Rhodesia, and the 26 branches in the Irish Republic, which collectively formed the Irish Medical Association. Then there were 33 unincorporated branches, mostly in the British Commonwealth but including three in foreign countries; the smallest was that on the island of St. Vincent, which had only eight members. The overseas branches were represented on the Council and the Overseas Committee, and were entitled to send representatives to the Annual Representative Meeting. Finally there were the organizations which were now independent associations affiliated to the B.M.A.—the medical associations of Canada, South Africa, and India. The branches in Pakistan were dormant and that in the Sudan inactive.

Incorrect Information

Dr. Grey-Turner said the problem about advertisements for overseas appointments was to obtain information where there was no branch or affiliated organization. The Council had agreed that in the case of certain advertisements a clause should be added that information could be obtained from the Secretary; the information so given was shown to the advertiser. Advertisements by the Sudan Government offering five-year appointments were misleading. It appeared that the Sudan Government were replacing British medical officers by Sudanese whenever these became available, using the three-month option to terminate the agreement.

The Association had had instances of the Colonial Office supplying misleading information to doctors whom they recruited for Her Majesty's Overseas Civil Service. The difficulty was that the Colonial Office was recruiting doctors for governments over whom they had little or no control. The Association suggested that when a man was interested in an appointment he should be put into direct contact with the employing government, but the Colonial Office would not agree.

Insecurity

Why was the Overseas Civil Service not getting the doctors it wanted? Dr. Grey-Turner gave three causes. First, there was the general feeling of insecurity of tenure. Good compensation terms were not wholly the answer. Coupled with insecurity of tenure was the fear that a man returning to this country would be unable to obtain an appointment. It was a justified fear. Second, there was fear of civil disturbance, which might not deter the doctor but influenced his wife a little and his mother-in-law a great deal. Thirdly, there were pay and conditions of service: this cause was the only one which the colonial governments could remedy.

The official view was that if more payment was made to doctors all other grades would make demands. The Overseas Committee took the view that this was a nettle which the Colonial authorities had to grasp. It was important that the doctors recruited should be men of the highest quality, which could be the case if selection was possible.

Dr. Grey-Turner announced that the Colonial Office had made representation to the Treasury that the gratuity of a

short-service colonial medical officer should be exempt from taxation in the same way as that of a short-service commission-holder in the Services.

In a reference to the long-standing dispute with the Cyprus Government, Dr. Grey-Turner said that the difficulty arose in the first place because the administration did not consult the B.M.A. The Association was trying to persuade the Colonial Office to induce colonial governments to consult the local profession—as was done in this country—when changes affecting doctors were to be made. Failure to consult, as in Cyprus, had taken place in Gibraltar and the Leeward Islands. It was noticeable that in every case it was a small colony that was at fault.

Speaking of the activities of overseas branches, Dr. Grey-Turner instanced the clinical meetings organized by the Middle East Branch, which functioned as a supranational medical society in the area, and the 17 meetings, addressed by distinguished medical men, held during the year by the Matabeleland Branch.

Discussion

Dr. A. M. M. WILSON (Uganda) said that the Association should be prepared to give unbiased information to applicants applying for overseas posts.

Mr. W. A. L. TUCKER (Aden) spoke of "very out of date" information supplied by the Colonial Office. He warned that a junior officer going to the colonies must be prepared to take the rough with the smooth. He referred to the time lag in filling posts, and said he would like to see more direct contact between the colonial governments and the B.M.A. and the various teaching hospitals.

Dr. T. WILSON (Malaya) agreed that anyone recruited as a general duty officer had to take what came; this should be made clear to him.

Dr. H. PITT GRAHAM (Gold Coast) remarked that the standing order that an officer would be posted without regard to his family circumstances was known to the Colonial Office.

Dr. J. LEON JONA (Victoria) said that the B.M.A. should say it was not going to encourage young men to go overseas unless they could be guaranteed a career.

Dr. A. C. E. COLE (Tanganyika) thought that a difficulty in recruitment was that, whilst a young doctor would like to go overseas, he did not want to stay there all the time and certainly did not want to be thrown on the scrap heap. The Colonial Office should arrange for a channel for the employment of doctors on their return.

Dr. J. O. MABAYOJE (Nigeria) thought that all the outcry against expatriate officers in the colonies would die out with self-government. He stressed the importance of salaries.

Mr. C. BELFIELD CLARKE (Council) supported Dr. Grey-Turner's remark about the lack of any sense of urgency in the Colonial Office on the shortage of recruits for the overseas medical service, and noted a similar lack of urgency over supplies.

Dr. J. R. LAUCKNER (Nigeria), Dr. G. H. WATTLEY (Trinidad), Dr. B. H. GANDEVIA (Victoria), and Dr. A. D. WILLIAMSON (Malaya) also spoke.

OVERSEAS LUNCHEON

A luncheon in honour of the overseas Representatives was given by the Council of the Association at the Russell Hotel on Thursday, June 2. The chair was taken by the Chairman of the Representative Body (Dr. I. D. GRANT), who proposed the health of the overseas Representatives, of whom 25 were present.

Dr. A. NIMALASURIA (Ceylon Branch) responded to the toast, and thanked the parent body for the hospitality shown.

Empire Medical Advisory Bureau Reception

In the evening the chairman, Mr. L. R. BROSTER, with Mrs. Broster and members of the committee of management of the Empire Medical Advisory Bureau, welcomed the overseas Representatives and Delegates at an "At Home" in the Bureau's offices in B.M.A. House.

PROCEEDINGS OF COUNCIL

Meetings of Council were held on June 3 and on June 4, the latter being the first meeting of the new Council. Dr. E. A. GREGG presided over both meetings.

Deaths were reported of two former members of Council—Dr. James Hudson, of Newcastle-upon-Tyne, who was a member of Council for 13 years, and Dr. R. Langdon-Down, a Vice-President of the Association. The Chairman was authorized to send letters of condolence to the relatives.

A letter was read from Sir Henry Newland expressing his appreciation of the honour conferred on him by the Council in awarding him the Gold Medal, and from Dr. P. T. O'Farrell, thanking the Council for recommending him for election as Vice-President.

The assistance rendered to Canadian doctors pursuing postgraduate training in the United Kingdom by the Empire Medical Advisory Bureau was the subject of appreciation in a letter read from the Canadian Medical Association.

The Council of the World Medical Association conveyed its thanks for a voluntary gift to help to tide it over its present financial difficulties.

It was reported that Professor D. E. C. Mekie, of Singapore, had been elected to represent the Far Eastern Branches on the Council.

Dr. J. B. Tilley was asked to act as delegate of the Association at the annual meeting of the Norwegian Medical Association being held at Oslo from June 16 to 18.

The award of the Industrial Court on the remuneration of public health medical officers, which had now been accepted by both sides of Committee C of the Medical Whitley Council, was reported. The Council agreed with the terms of a letter which the Secretary had written to the Ministry of Labour and National Service concerning the possibility of making *ad hoc* arrangements for arbitration by a tribunal composed of persons chosen for their special competence to deal with the affairs of professional people, in the event of any dispute which might occur in Committee C in the future.

Dr. J. A. Moody was reappointed representative of the Association to the Governing Body of the British Postgraduate Medical Federation for the year 1955-6.

Dr. H. Guy Dain was appointed to act, if necessary, for the Chairman of Council during the absence of the Chairman from June 12 to 26 in Toronto.

Committee Reports

A report was made by Dr. ROBERT FORBES, chairman of the Central Ethical Committee, on the conduct of a member, and a recommendation for expulsion was carried.

On the report of the Science Committee, moved by Mr. NICHOLSON-LAILEY, recommendations for awards in the Nurses Essay Competition were agreed to.

On the recommendations of the Private Practice Committee the Ministry of Education is to be asked to agree that the medical examination of entrants to courses of training for teaching is a matter for the family doctor.

Mr. Nicholson-Lalley presented the report of the Central Consultants and Specialists Committee, which contained one recommendation—namely, that the British Commonwealth Medical Conference be asked to consider the possibility of undertaking the arrangements for interchanges of senior registrar appointments between the United Kingdom and other parts of the Commonwealth.

Reports by the Amending Acts, Compensation and Superannuation, General Medical Services, and Journal Committees were presented and approved.

It was agreed that the constitution of the Welsh Committee be amended to include the presidents of the North Wales, the Shropshire and Mid-Wales, and the South Wales and Monmouthshire Branches.

The Council approved a recommendation that a reception be arranged for members of the Society of Medical Officers of Health on the occasion of the centenary of the Society in May, 1956, and that an address of congratulation for presentation to the Society be prepared.

Approval was given in principle to the purchase of a house for the Belfast Regional Office, suitable for conversion into an appropriate centre for the Association in Northern Ireland.

Medical Manpower

The Minister of Health had invited the Association to submit a list of medical practitioners whose names it wished to be considered for appointment to fill vacancies which will arise on the National Medical Manpower Committee in July, 1955. The Council agreed that the following names be submitted: Sir Russell Brain, Dr. H. D. Chalke, Sir Zachary Cope, and Dr. D. F. Hutchinson. It was understood that the Minister would shortly consult the profession on the chairmanship for the three years from July, 1955. In anticipation of such an approach it was agreed that Sir Zachary Cope (if appointed a member) be nominated for the chairmanship.

On the question of heroin, which had been before the Representative Body, it was agreed that the Home Secretary be asked to receive a deputation.

British Medical Guild

The meeting of Council was succeeded by a formal meeting of the trustees of the British Medical Guild, when the Chairman (Dr. Gregg), other officers, and staff were re-appointed. The Executive Committee was also reappointed, with one change, that of Dr. H. D. Chalke in place of Dr. Kenneth Cowan. The financial statement was also presented.

DINNER AT THE HOUSE OF COMMONS

ENFIELD AND POTTERS' BAR DIVISION

Through the courtesy of the Member of Parliament for Enfield West (Rt. Hon. Iain Macleod, M.P.) the Enfield and Potters Bar Division's summer social meeting was held at the Houses of Parliament in the evening of June 4. The chairman of the Division, Mr. R. M. Millen, and Mrs. Millen received some 170 members, their ladies and their guests, and after a conducted tour of the House of Lords and the House of Commons the chairman presided over a dinner in the Members' Dining-room of the House of Commons. The principal guests were Mr. Macleod, Lord Webb-Johnson, and Dr. E. A. Gregg. Lord Webb-Johnson, proposing the toast of the B.M.A., said that he was proud to have been at one time an active partner in its deliberations. In semi-humorous vein he spoke of some of the things in the medical field to which a canvasser for the Government in the recent election might now expect it to give attention. More seriously, he reminded his audience that the spirit of service was a tender part of medicine: "Regulations plus plus equals spirit minus minus." Dr. E. A. Gregg, replying, stressed that the life of the Association was in its Divisions. Mr. Macleod proposed the health of the Enfield and Potters Bar Division. He spoke of his ties with the medical profession, and referred to the fact that his father when in practice in Skipton had been chairman of the B.M.A. Division. Mr. R. M. Millen responded.

PROFESSIONAL SECRECY IN THE PUBLIC HEALTH SERVICE

The Council of the B.M.A. has approved the following statement which has been agreed by its Public Health and Central Ethical Committees:

There are occasions when disclosure of confidential medical information is demanded from medical officers in the public health service. The general relationship between doctor and patient will inevitably suffer unless reasonable precaution is taken to ensure that disclosure is authorized by the individual patient, his parent in the case of a minor, or by some other competent person. It must be remembered that there are instances when the local

authority is possessed of statutory authority to receive or to make disclosure of medical information.

To maintain the confidential relationship of doctor and patient (or examinee), it is desirable that information only of a general nature be given to lay persons without revealing intimate or personal details. Not infrequently detailed personal information is sought by such bodies as the children's committee or the welfare committee of the local authority. In those circumstances information should be submitted only through a medical officer nominated for the purpose, who would be responsible for appraising the medical report and deciding the extent to which personal information could be disclosed.

The medical officer of health as adviser on medical matters to the council of the local authority and its committees should be consulted whenever it was proposed to review medical reports.

HOSPITALITY

A Swiss doctor, living in Thusis, 2,200 ft. above sea level, would like to exchange his very pleasant house for similar accommodation from July 24 to August 13. He can offer accommodation for 8 people and would like a house for his family of 6.

A Norwegian doctor would like to arrange exchange holiday for himself, his wife, and 2 small sons. They live on the west coast of Norway.

A Danish doctor, unmarried, aged 29, would like to stay as a paying guest with a British medical family for 3 weeks during August. He would prefer a country district.

Several German and Norwegian children would like to take part in holiday exchanges with British children, and there are some requests for accommodation as paying guests outstanding.

For full details, please communicate with Brigadier H. A. Sandiford, Medical Director, International Medical Visitors' Bureau, B.M.A. House, Tavistock Square, London, W.C.1.

Correspondence

Patients, Politics or Both?

SIR.—Dr. Hugh Cartwright (*Supplement*, June 4, p. 272) says he agrees with many of the statements I made in my Presidential Address to the Metropolitan Counties Branch (*Supplement*, May 14, p. 225), but he takes me to task on others. You were good enough to give much space to this address, but it was, of necessity, abbreviated. Otherwise Dr. Cartwright would have realized that I am not quite so happy about our activities as he thinks, nor am I quite so hard on the periphery. May I correct this impression with two further references to what I said?

Speaking of the delaying tactics adopted by the Ministry of Health, I said I sympathized with any representative of ours who had to cope with this, provided he did not himself become affected in the same way and did not permit this technique to undermine his enthusiasm. Later I said that some might feel that our spokesmen were losing a sense of urgency. Referring to the periphery, I made it plain that I was not using the term in the ordinary geographical sense, and said that if anyone "does not think the present state is good enough they must say so openly instead of grumbling to themselves." I am very glad that Dr. Cartwright has spoken openly.

I agree entirely with him about the events of 1948, and I can see how bitter a great part of the profession must be feeling still. I can understand that the blow was so stunning that it may well have temporarily paralysed action and even thought, but I cannot understand how an individual doctor can feel justified in palsied acquiescence because of something that happened seven years ago. Surely the time has come when anyone who is really dissatisfied with medicine as it is to-day should make any effort of which he is capable for its improvement. It is no longer any excuse to say, "Look what happened in 1948," and if the crew of the Association is dissatisfied with those on the bridge (to use Dr. Cartwright's simile) it should see that they either

amend their ways or are replaced. Members of the B.M.A. are free to say what they like openly, without fear of a charge of insurrection or mutiny or of being put in irons. The trouble is that many do not use their freedom of expression and action, but, unlike Dr. Cartwright, prefer to remain inert, or content themselves with complaining of frustration to each other.—I am, etc.,

London, N.W.1.

R. HALE-WHITE.

Patients of a Vacant Practice

SIR.—Dr. Donald M. O'Connor's letter (*Supplement*, April 30, p. 209) gave me great pleasure. I also am the second oldest practitioner within miles, having joined the panel on its first day—January 1, 1913.

Keeping a practice intact so that the goodwill can be sold for the sake of a deceased doctor's dependants is one thing; refusing patients who want to come on one's list at the request of the Ministry or of the B.M.A. is quite another. The final price was fixed in July, 1948, and I have never had any compunction about taking over patients from a vacant practice.

After being absent on two wars, I had a lean time after each recovering an income above existence level; and why should not a newcomer, who has been given a list without any payment, not blaze a trail for himself? Further, I think this fortnight's notice to change doctor is a big interference with liberty. The last person I personally wish to see in my surgery is one who wishes he was on someone else's panel, and, whilst I am writing, I am further of the opinion, after being 43 years in general practice, that 2,500 is the limit that any doctor can really look after thoroughly. —I am, etc.,

London, N. 21.

E. C. WHITE.

Entry into Practice

SIR.—Doubtless there have always been difficulties in the way of the entrant to medical practice. Since 1948 I have received two offers of partnership in general practice, both of which were on terms which I felt unable to accept. I am sure that there were good reasons for the reservations which were made by the principals concerned, but I wonder how many of the new partnerships entered into since the Danckwerts award have been on terms less favourable to the junior partner than those which the Medical Practices Committee recommend.—I am, etc.,

London, N. 3.

G. W. PIPER.

Association Notices

AREA OF MOMBASA DIVISION OF KENYA BRANCH

Notice is hereby given by the Council to all concerned that as from the date of this notice the area of the Mombasa Division of the Kenya Branch, which at present covers the Island of Mombasa, will include the Coast Province of the Colony and Protectorate of Kenya.

NURSES PRIZE ESSAY COMPETITION, 1955

The following prizes have been awarded in the Nurses Prize Essay Competition, 1955.

1. *Student Nurses*.—Subject: "The use a Student Nurse can make of the varied recreational and cultural pursuits available to-day." First Prize: Joan M. Anstey-Cooke (Bristol Homoeopathic Hospital), 20 guineas; Second Prize: Lesley W. Elliott (Radcliffe Infirmary, Oxford), 10 guineas; Highly Commended: Anne G. Stirling (Aberdeen Royal Infirmary) and June Davis (Addenbroke's Hospital, Cambridge); Commended: Kathleen Forbes (St. Charles Hospital, London).

2. *State Registered Nurses working in hospital*.—Subject: "Cross-infection in hospital wards and departments and its control." First Prize: Claire B. Chetwynd (Royal Northern Hospital, London), 20 guineas; Second Prize: John Sayer (Hackney Hospital, London), 10 guineas; Highly Commended: Lorna G. Newman (Queen Mary's Hospital, Carshalton) and Muriel S. Willa (Queen Alexandra Hospital, Portsmouth).

3. *State Registered Nurses working outside hospital*.—Prize: Elizabeth C. N. Wilson (Martock, Somerset), 10 guineas.

A DAY WITH A HEALTH VISITOR

A GENERAL PRACTITIONER'S POINT OF VIEW

BY

NIGEL G. NICHOLSON, M.B., B.S.

As a result of being elected to a Divisional B.M.A. Committee to study the question of co-operation between general practitioners and health visitors I decided to spend a day as an observer with health visitors outside my own practice area. The morning was spent with a health visitor visiting people's homes, and the afternoon in the infant welfare clinic.

My terms of reference were to answer the following questions: (1) Were health visitors necessary? (2) Could district nurses and midwives do the same job if their numbers were increased correspondingly to the health visitors displaced? (3) Assuming that health visitors were necessary, how could better co-operation be achieved with general practitioners? (4) The type of case in which the health visitor was likely to be most useful to the general practitioner.

Visiting

Most of the 11 visits in the morning were to mothers whose children had not been brought to the clinic, and whom the health visitor had good reason to believe needed attention. The health visitor introduced me by saying, "This is a colleague of mine. Do you mind if he comes in too?" The family did not know, therefore, that I was a doctor, and my opinion was not sought; I was thus enabled to stand aside and take notes. Both the health visitor and myself were admitted without hesitation in every case.

Visit No. 1.—Large family newly arrived in the district—not previously visited. Three previous calls were made, but no reply. Two boys and five girls—youngest girl, aged 1½ years, still at home. The health visitor was reserved until she had established the mother's confidence, but she did find out that the baby was not taking cod-liver oil and had not been immunized. The house was untidy, but not unexpectedly at this time of the morning with six children just gone to school. The mother was recommended to bring the child to the clinic to get "adexolin" and for immunization.

Comment.—A useful visit.

Visit No. 2.—To a school to see a child belonging to a problem family; this child had previously been to school shivering with inadequate clothing. The health visitor had been informed by the teacher. The child's clothes were found to be adequate.

Visit No. 3.—Follow-up of twins delivered five weeks prematurely by caesarean because of toxæmia, and now 4 months old. The mother had not attended a clinic; she had relied upon the health visitor to call, and would probably not have gone to the clinic otherwise. The health visitor advised generally on feeding as she had previously done. She also advised on questions of prophylaxis, but the parents were against vaccination. The mother also needed abdominal exercises, but there were no facilities available without seeing a specialist at a hospital in order to get physiotherapy.

Comment.—Useful visit.

Visit No. 4.—Illegitimate baby aged 1 month. The mother had not attended a clinic so far. Baby on artificial feeding; not taking cod-liver oil. General advice given and accepted. Mother complained of feeling off-colour, and stated that she had had iron injections in hospital. She was recommended to seek further advice.

Comment.—Useful visit.

Visit No. 5.—Problem family, of which one child had been seen at school already (visit No. 2). It had taken the health visitor, by the gentle art of persuasion, years to get into this house at all. A previous health visitor had failed. The mother used to go out and leave her mother-in-law to look after the children. She did not go to work but spent her time drinking coffee in cafés. When the health visitor first got beyond the room grandma occupied, she saw piles of dirty clothes, some of which were covered in dried faeces, and there was not a clean article of clothing in the house. The sink was full of firewood. The stench was the usual one familiar to all general practitioners, but unbelievable to the public as a whole. At the time of the visit great strides had been made. The house was far from clean, but there were some clean clothes, and a fire-guard, which was apparently an innovation. The mother was deaf, which made communication difficult; the children, except for the baby of 9 months, and one other child at school, had at least one square meal a day—at school. The mother could afford to smoke, but could not afford to pay the nominal sum for this child to have a lunch at school. The bedrooms were inspected, but it was difficult to find out who slept where. Two girls slept in one 3 ft. bed, so-called "double" by the mother, and one of them had enuresis, but the mother was not sure which one it was. There were no sheets and the blankets were filthy. The floor was covered with feathers from a burst pillow—they had obviously been there for some time. The child was not taking cod-liver oil.

Grandma was also visited—she complained of various aches and pains, and it was suggested that the general practitioner should be asked to see her. The grandmother said that she had had nine operations, and did not like doctors.

Comment.—Hard work for the health visitor, but she was achieving a great deal by patience and persistence.

Visit No. 6.—Door answered—mother and baby moved to a different area.

Visit No. 7.—No reply; mother handed over from midwife—obviously out.

Visit No. 8.—Called to see an old man as a follow-up, but he was found to have died nine months previously. The health visitor called out of interest, as a result of checking through her files. The widow was advised about various welfare services.

Visit No. 9.—Visit to old lady, who was found to have died suddenly a few weeks previously. The health visitor had been calling because a neighbour had informed her about the old lady.

Visit No. 10.—Follow-up visit to mother of two children; the youngest, aged 4, was at home and was not taking cod-liver oil. The health visitor had been calling because the mother had previously been in the care of a psychiatrist. She was now found to be keeping reasonably well.

Visit No. 11.—Child who had recently had operation for squint. Not immunized—mother was apathetic and unlikely to respond to advice. Child not taking cod-liver oil.

Infant Welfare Clinic

The afternoon was spent with one of the health visitors watching her advise mothers in her area, while other health visitors did the weighing and sundry other duties. In all, twenty-eight consultations took place and the mothers had obvious confidence in the advice they were given. Most of the advice given was on feeding and minor complaints, and reassurance of the mother on the progress of her child.

One case, a child aged 4 years, had been referred to a paediatrician, who confirmed rickets when much younger. At the interview, the mother said that he had never taken cod-liver oil, whereas the health visitor said that at the time the mother was very definite that he had done so. Since diagnosis was confirmed he has done well on adexolin drops, and there are no obvious reminders of the past.

In another case the mother refused vaccination either from general practitioner or clinic. She was advised of the added dangers of smallpox near London Airport, but she was still adamant.

Once satisfactory feeding was established with a steady weight gain, whether it was on the breast or by artificial feeding, the mothers came to the clinic as they considered fit. If they asked how often to come, they would be told once a month up to six months, and thereafter three- to six-monthly. Many mothers chose to come up more frequently, especially with their first baby. The health visitors were fully aware that over-attendance at the clinic would lead to overcrowding and the risk of unnecessary cross-infection. Where there were feeding difficulties, attendances were made according to the need.

All mothers were advised of the importance of vaccination and immunization and given a free choice of either their own or the clinic doctor. It appeared that fifty-fifty was the choice.

Following the clinic we held a meeting which was attended by the deputy area medical officer, the senior health visitor for the area, and a number of health visitors attached to the clinic. Various points of view were brought forward, and quite a lively discussion took place.

Duties of a Health Visitor

The duties of a health visitor must be clearly understood. First, they attend at local authority clinics—infant welfare, school clinics, antenatal clinics, and other clinics organized by the local health authority. Quite a large part of the health visitor's time is absorbed in the organization of these clinics. It is probable that the training of a health visitor is not necessary for much of these duties. For example, filing, marshalling children, and weighing of babies could be done by less skilled people with very little training. In some clinics these duties, which have to be done on a sessional basis, absorb so much time that there is little time left for visiting.

Secondly, they visit. Since the National Health Service began, health visiting has been concerned with not only the children but the whole family where necessary. Naturally, old people are the greatest liability in this respect. I understand that in some areas health visitors have so little

time left after clinics that they cannot do the infant visiting they would like to do, and there is no time left for visiting the aged.

Selection of Cases for Visiting

The mothers visited were selected as being in need of advice for the following reasons: (1) Where those handed over from midwives were unable or unlikely to attend the clinic, and for whom further advice was considered necessary. (2) Where mothers had failed to attend the clinic and were known by the health visitor to require advice. (3) Any cases where the general practitioner had asked the health visitor to call for some reason.

This method is known as "selective visiting" and is obviously making good use of the health visitor's time.

The health visitor did not visit old people unless she had received information from some source that there was a patient to whom she might be of assistance. Whereas the doctor visits old people with the object of treating ailments, the health visitor acts as a welfare visitor; in other words, she goes to advise on any problems they might have. For example, she may be able to get the help of the W.V.S. to go round visiting the lonely and bringing papers and flowers. In some areas there are funds to provide wireless for the bed-ridden—no doubt the health visitor would be in contact with them. The health visitor would arrange for blind registration through the blind visitor, and thus obtain for blind people the various benefits to which they are entitled. The health visitor may also be able to advise on public assistance and other questions in relation to money. In some districts the house-bound elderly have the benefit of a "meals on wheels" service organized by the W.V.S. The health visitor would be able to help in this direction, and she may be able to recommend a home help when she thinks it is justified. Making arrangements for old people's linen to be washed and advising patients where they can get chiropody free are other functions of the health visitor.

Are Health Visitors Necessary?

Health visitors, I feel, do perform a useful job. Their greatest use lies in the tedious task of trying to upgrade the filthy homes, and the day-to-day management of babies.

Mothers can be classified into three categories. First, the intelligent mothers who will study infant welfare for themselves and require no advice except in extreme circumstances, when a doctor is usually necessary. Secondly, the mothers of moderate intelligence who need, especially with their first child, advice from some authority and are willing to attend the clinic. If all these mothers flooded the doctor's consulting-room he would be snowed under. And, thirdly, the mothers of low intelligence who jog along from day to day on tit-bits of advice from grandmothers and neighbours. These mothers rarely come to the clinic without goading, and the health visitor has to go out and train them. No doctor could afford the time to give these women intimate advice on how they should bring up their children, wash them, tidy the home, do the washing, manage their budget, and many other details of domestic life which the health visitor includes in her repertory.

I conclude, therefore, that the health visitor services, properly run, are a great asset to the community, and that it would be a retrograde step if they were disbanded.

Could District Nurses and Midwives do the Same Job?

In country districts, district nurses and midwives do manage to advise the community as a whole on health matters, and are often very useful in this capacity. The more experienced district nurse with a shrewd personality manages to learn the essence of a health visitor's job. My own personal feelings are that in the more industrial and populated areas it would be better to maintain the health visitor services as they are to-day than to increase the number of district nurses in proportion to the number of health visitors, provided a better liaison with general practitioners

can be achieved. More emphasis should be laid on the health visitors' visiting duties than on those of acting as clinic receptionists.

Co-operation with the General Practitioner

Occasionally a doctor will find that a parent quotes the health visitor as offering advice contrary to his own. This apparent contradiction is usually due to a misapprehension on the part of the mother. Nevertheless, even the most minor difference in advice can be exaggerated to such an extent that the parent is hopelessly confused.

It is easy for general practitioners to be exasperated by having to go out in the evening to see a child that has already been seen at the clinic earlier in the day, only to find that it is a minor ailment which could have waited until the morning. Health visitors should be prepared to accept the responsibility of telling the mother in obvious cases that there is no need to call the doctor until the next day, and that an aspirin, or part of one, is all that is required for a reasonable night's sleep. The more experienced health visitor does in fact do this.

Occasionally a health visitor will suggest that a patient should be seen by the doctor without giving adequate reasons. Sometimes this will result in the doctor being called to see an elderly patient rather against the patient's will. When he gets there the patient does not give all the details that the health visitor was given, and he will find his visit wasted. If on the other hand the health visitor had written a note to the doctor describing briefly the symptoms of the case as she saw it, and where she thought he might be able to render assistance, he would have been enabled to grasp the situation at once.

Suggestions for Improving Co-operation

The all-important establishment of liaison between health visitors and doctors should not depend on chance meetings. It seems reasonable to ask that when a health visitor is appointed to a district she should make an effort to visit the local general practitioners as a matter of courtesy. For example, it might be a good idea to drop in at the end of morning surgery, or write and suggest that they meet, or else wait until some opportunity arises which affects a patient and where the health visitor feels that useful work could be done by co-operation.

The average doctor at qualification knows very little about the health visitor's duties, and in what instances co-operation would be to their mutual advantage.

The general practitioner should not leave the entire onus of establishing contact to the health visitor. He should visit the school and infant welfare clinics, especially when he has a particular case to discuss. Tea-parties have been tried to achieve contact, but this can be accomplished far better by exchanges of view on specific cases.

The sort of controversial subjects on which mothers delight in playing the doctor versus the health visitor are: should a child be reduced in its feed if it is gaining over eight to ten ounces a week? Should a child be fed by the clock, by demand, or by convenience to mother and child? Should a hungry child be fed in the middle of the night? Should a baby wear wool next to its skin? Circumcision. And complementary feeding—does it work?

Should there be any divergences of opinion most health visitors are prepared to fit in with the doctor.

Cases Where the Health Visitor is Most Useful

Many doctors are not aware of all the duties which health visitors will willingly undertake. For example, they are prepared to take scales round to a patient's house and do test feeds on the spot if a doctor requires it.

Where a doctor encounters feeding difficulties, the health visitor will be only too glad to help by providing National dried milk, and advising the mother of all the finer details that her doctor cannot be expected to do—for example,

sterilization of bottles and teats. The health visitor's eye is trained for a different type of detail from that of the doctor.

The health visitor will be only too glad to observe any behaviour problems in children and report back details which the doctor will find invaluable in his handling of the case—details which sometimes only come to light from neighbours by accident.

Any health visitor of experience must be able to recall many instances in which she has achieved great improvement in people's way of living in dirty homes by gentle tact and persuasion continued over long periods.

Cod-liver Oil

No doctor would question the importance of vitamins A and D in the first few years of life. As a result of this study, I was very intrigued by the high incidence of children who were not being given cod-liver oil, although the health visitors with whom I spent the day were very insistent on its importance when interviewing the mothers. In every instance children who were not taking it were given adexolin drops as a substitute.

In all there were twenty-five mothers questioned on whether their children took cod-liver oil, as distinct from other sources of vitamins A and D, and only ten of these were actually taking it; this means that over half the children refused it. It is interesting to note that none of the mothers visited could get their children to take cod-liver oil, whereas those seen at the clinic gave a higher incidence of success. This was possibly due to the fact that the mothers who needed to be visited were of lower intellect than those who came to the clinic.

It is possible that many mothers smell the cod-liver oil for themselves, and are reluctant to press it on their infants when they show the slightest signs of rejecting it. They are glad to have an excuse to give it up without further trial. It is well known that the smell is very persistent and difficult to eliminate. Some of the Ministry cod-liver oil was sampled by the health visitors and myself, and we all agreed that it was very unpleasant.

I investigated the possibility of giving children B.P.C. emulsion of cod-liver oil made by two different manufacturers. These emulsions have the added advantage that they contain calcium. One made sold under the B.P.C. title was sampled by myself and my own babies, both under 2 years, and we were unanimous that it was no better to take than the Ministry cod-liver oil. It is generally agreed that the emulsion manufactured by Messrs. Scott and Bowne is readily taken by most children. Unfortunately the comparative cost in terms of units of vitamins A and D was unfavourable in the case of "Scott's emulsion", as against adexolin drops in the proportion of 3:1. Scott's emulsion would not therefore be an economic substitute to issue in place of adexolin.

On the other hand many children who will not take the Ministry form will take "seven seas" cod-liver oil. It would appear, therefore, that if an effort was made to refine the Ministry cod-liver oil and make it more palatable there would be less recourse to substitutes on the part of the clinic. This might result in an overall economy.

I wish to thank Dr. Maddison, Medical Officer of Health for Area 10 of Middlesex, and his staff for their great kindness and help in making it possible for me to visit one of the clinics in his area.

Corrections.—In the report of the Annual Representative Meeting under the heading "General Practitioners and Institutional Midwifery" (*Supplement*, June 11, p. 278) Dr. H. N. Rose moved the resolution on behalf of the Stratford Division, and not Dr. A. Elliott as stated. Mr. D. S. Pracy in the following paragraph said that "the encouragement of domiciliary midwifery would prove an economy to the country," and not "an encouragement to the country" as printed.

Dr. J. O. M. Rees presented the Guildford motion on diesel oil (p. 284), and not Dr. D. F. Whitaker as stated.

OPHTHALMIC GROUP COMMITTEE

EARLY TREATMENT OF BLINDNESS

A meeting of the Ophthalmic Group Committee was held on Friday, May 13, with Mr. O. GAYER MORGAN in the chair.

A report was received of a discussion between a deputation appointed by the Committee and representatives of the Ministry of Health on a number of recommendations submitted to the Ministry by the Committee for achieving earlier diagnosis and treatment of diseases causing blindness. These recommendations had been adopted from the report of a subcommittee of the Ophthalmic Group Committee, consisting of Mr. G. W. Black, Mr. J. Marshall, and Mr. O. Gayer Morgan, who had considered the subject in the light of the Ministry of Health circular on the subject (R.H.B.(53)115) and the Sorsby Report.¹

The Size of the Problem

Figures before the subcommittee had shown that the number of people registered as blind was increasing and that this increase was largely concentrated in the higher age groups of 70 years and over. It might be expected, therefore, that the problem would grow. Figures had also shown that, although 90% of cataract cases were fundamentally remedial, only 20% received treatment, which convinced the subcommittee that there must be a positive drive to achieve earlier recognition and treatment of this condition. It was believed that "a substantial proportion of untreated cases may well be elderly people who apply to the National Assistance Board for relief and are passed on by officers of the Board to the local authority, examined by local authority medical officers, and registered without being referred to an eye clinic to see whether treatment is needed." The subcommittee had been informed that in one geriatric unit it was found that out of 128 patients 12 needed ophthalmic attention, 4 of whom needed operation for cataract and 5 treatment for glaucoma.

With these considerations in mind the subcommittee recommended, and the Group Committee subsequently recommended to the Ministry:

Recommendation (1).—That examinations for registration purposes should be undertaken only by consultant ophthalmologists;

Recommendation (2).—That when a person is referred to the local authority because of defective vision the medical officer of health of the authority should at once get in touch with the person's family doctor, and, having obtained from him information as to the person's general health, arrange through the family doctor for an examination to be carried out by a consultant ophthalmologist;

Recommendation (3).—That when a person is registered as blind the general practitioner should be notified of the fact and should be informed of any treatment which is proposed.

Diagnosis of Glaucoma

The subcommittee did not think that the provision of more glaucoma clinics, although maybe desirable, would by itself help to achieve earlier diagnosis of glaucoma. In its view the main difficulty was that persons in need of treatment do not reach the eye clinics for examination by an ophthalmologist. The following recommendations were therefore put to the Ministry:

Recommendation (4).—That ophthalmic opticians should be required to adhere strictly to a procedure whereby the general practitioner would be informed if the patient had any abnormality of the eyes, or vision which could not be improved to a satisfactory level with glasses, or otherwise required treatment outside the scope of the supplementary ophthalmic service; and

Recommendation (5).—That paragraph 2 (c) of E.C.L. 78 51, which states that a patient who is referred back to his general practitioner should not normally at that stage have glasses prescribed, should be replaced by an instruction that glasses shall not be prescribed in such cases.

¹ *The Causes of Blindness in England, 1948-50*. 1953. H.M.S.O., London.

The Sorsby Report found that 98% of glaucoma cases occur from the age of 50 onwards, and the subcommittee thought that the significance of this fact should not be disregarded. The Group Committee therefore decided to ask the Ministry of Health for its support in adopting a policy that sight-testing in the case of persons over the age of 50 should be undertaken by ophthalmologists, or that no person over the age of 50 should have glasses prescribed without a medical eye examination (Recommendation 6).

Discussion with the Ministry

Following the Group Committee's discussions with the Ministry of Health on its recommendations, and after consultation with the Faculty of Ophthalmologists, the Ministry has issued a circular (No. 4/55) requesting local authorities to arrange for examination and certification of blind and partially sighted persons to be carried out in future only by ophthalmologists of consultant status. The Group Committee asked the Ministry to safeguard the position of S.H.M.O.s who have been doing this work.

The Ministry thought that the effect of this circular would be to bring the patient's general practitioner into the picture. It would see what could be done to encourage the organization of postgraduate refresher courses for general practitioners on this subject.

The Ministry approved the Group Committee's third recommendation, and the Committee has since recommended that medical officers of health should be responsible for sending the necessary information to general practitioners.

The Ministry hoped that circular E.C.L. 15/55 to executive councils would help to achieve the object of the Group Committee's fourth recommendation. In this circular the Ministry requested executive councils to remind ophthalmic medical practitioners and ophthalmic opticians of their obligations to inform the patient's general practitioner in specified circumstances, and to emphasize the importance of observing it particularly where there is any suspicion of glaucoma or other serious disease of the eyes, so that the general practitioner might then arrange for treatment at hospital if necessary.

The Group Committee's deputation to the Ministry stressed that a temporary improvement in sight as a result of glasses being provided, or even the fact that glasses have been obtained, makes it unlikely that many patients will go back to the general practitioner so that treatment may be arranged. The Ministry said it would be difficult to insist that in no case should glasses be prescribed when the patient is referred back. For instance, on humanitarian grounds it was sometimes necessary for the patient to have glasses straight away. For this and other reasons the Ministry was not able to accept the Committee's fifth recommendation.

The Ministry was in favour of recommendation (6), but said that it was impracticable at the present time owing to the large increase in out-patient facilities which would be necessary to deal with the extra two million sight tests which would be thrown on to the hospital service.

Other Business

Certification of Blindness

The Committee was of the opinion that as this was now recognized as consultant work, and as the revised form of report (B.D.8) was more detailed, there was every justification for seeking an increase in the present fee of 2 guineas. The Committee decided to recommend that the fee should be raised to 3 guineas, and that where the examination is carried out at the patient's home it should be 4 guineas.

Form O.S.C.1

The Committee considered a suggestion from a local medical committee that, as a contribution towards the earlier recognition of serious ocular disease, form O.S.C.1

should be valid only for three years, instead of indefinitely as at present, and that a person needing a retest after that time should be required to obtain a new O.S.C.1 from his doctor.

The Committee was doubtful whether such a procedure would be practicable owing to the difficulties which would arise in checking the date of issue of O.S.C.1's. It thought that it would be preferable to require a new O.S.C.1 for every sight test and decided to invite the General Medical Services Committee's comments on the matter.

Criteria for Central Professional List

Because of the importance of making a medical sight test available to as large a proportion of the population as possible, and taking into account the fact that the Supplementary Ophthalmic Service is likely to continue in being for some time, the Committee discussed whether the present standard required for admission to the central list of practitioners entitled to test sight under the supplementary service is too high. The Committee had no definite evidence, however, that the diminishing number of applicants for admission to the list is a result of the present criteria and it was not therefore in a position to reach any conclusions. It intends to go further into the matter at a future meeting.

Appointments on Ophthalmic Services Committees

The Committee decided, with the object of facilitating the appointment of ophthalmic medical practitioners to fill vacancies on ophthalmic medical services committees, to ask the Ministry to consider making these appointments valid for three years.

Correspondence

Because of the present high cost of producing the Journal, and the great pressure on our space, correspondents are asked to keep their letters short.

Health Centre in the Army

SIR,—I noted the article, "A Health Centre in the Army" (*Supplement*, May 21, p. 233). As a similar centre is in operation in Kuala Lumpur, Malaya, I thought that a few comparisons might be of interest.

This centre has a larger practice extending over the whole Kuala Lumpur area. There are about 2,000 British women and children with smaller numbers of Malay and Gurkha families. British and Malay troops and a few local civilians, Malay, Chinese, and Indian, also come under the care of the centre. In all about 5,000. The staff consists of two R.A.M.C. medical officers, a Soldiers, Sailors, and Air Force Association sister (a State-registered nurse, State-certified midwife, and health visitor), a civilian State-registered nurse, who is also a State-certified midwife, a sergeant and four male nursing orderlies—two British and two Malay—the latter invaluable as interpreters. This is not excessive in a tropical climate such as this.

The building and furnishings are good; each room is decorated with a washable plastic paint, the colour being chosen by those using each room. The medical equipment is perfectly satisfactory. The centre includes a large waiting-room, two consulting-rooms, two treatment rooms, store, office, night orderlies' room, bathroom and toilet facilities. The experience of working in the centre does underline the great importance of the actual layout in saving the time and feet of the staff and in providing easily cleaned, quiet consulting-rooms.

The advantages of working in such a centre are several. There is a staff able to provide a service similar to that of a hospital casualty department 24 hours a day. In addition, usual outside visiting is maintained. Health visiting, a school health service, and child welfare clinics are also undertaken. The close co-operation with the medical, surgical, and obstetric specialists, who visit the centre

weekly, is valuable both to the doctor new to the Tropics and to the patient. It is particularly useful to be able to discuss problems directly with the specialist, and has many of the advantages of a domiciliary visit by an N.H.S. consultant. The ready availability of all the diagnostic aids of the British Military Hospital, Kinrara, which is some nine miles away, and the luxury of a dental centre 20 yards away, help to make a high standard of medicine possible. It is pleasant to work in such conditions as these, and for one about to return to civilian practice it is cogent to consider the likelihood of similar conditions and facilities obtaining in general practice.—I am, etc.,

Kuala Lumpur.

J. B. CHAPMAN.

Charges for Prescriptions

SIR,—How much longer do we G.P.s who do our own dispensing have to wait before the B.M.A. presses on our behalf for a change in the present absurd method by which we have to account each month for the shilling taxes we have collected for items dispensed to N.H.S. patients? I often wonder who it was who "dreamed up" the existing laborious administrative arrangement and who agreed to it on our behalf. Under it the patients get no receipt and many think the money goes to the doctor, while we members of an honourable profession are subjected to the further indignity that we may be called to account if the total of our (unpaid) monthly tax-gathering falls short of our colleagues' average.

If we must have this method of taxation, what is there to prevent executive councils from issuing us with serially numbered rolls of tear-off tax receipts to hand to patients, the amounts so collected to be deducted from our quarterly N.H.S. cheques? This would be simple, practical, business-like, and not open to abuse. The only hope of securing it will be, I suppose, a revolution led by irate village post-mistresses and children who cannot bear to see Daddy run his pen through those lovely stamps he has just stuck so carefully on all those bits of paper.—I am, etc.,

East Dereham.

CHARLES S. THOMSON.

Ship Surgeons

SIR,—I have read the various letters on the question of ship surgeons with some interest. It is likely that the question of the salaries of ships' doctors could merit some discussion between the profession and the companies. The argument that a doctor has only a few hours' surgery a day at sea, and that he is having a free trip, is not really cogent. A policeman on his beat is not paid for the trouble taking place there, but for the preventive effect of his being on it. The doctor likewise is paid for being aboard. Nothing much may happen on a ship, but something may. Doctors who have experienced one or the other have entirely different views on the sinecure of being a ship surgeon.

Things happen suddenly, strangely, and often dramatically. Ships pass through dangerous areas where smallpox, yellow fever, malaria, and so on are endemic. The surgeon has to see that none become endemic on the ship. He has a lot to do with morale aboard, where crews are notoriously hypochondriacal and passengers even more so. He will begin to hear their problems and worries too, since he is privileged to move among all ranks without ceremony, and professional secrecy is respected. There is no specialist's opinion available, buck-passing cannot be done, and it is up to him alone. He sweats with fear lest an appendix case should present itself. He wonders, if he himself should get ill, just where he is likely to get a specialist's opinion.

There are only 300 ships in the Merchant Navy with over a 100 souls aboard necessitating a doctor. Of these, most are passenger cargo ships which largely carry migrant doctors, recuperant ones, the young man seeing the world, or any medical men who wish to travel for a while. Their pay is about £57-£70 a month—equivalent to a second mate. The doctor is one of the four senior officers, but pay does not necessarily go with seniority. Doctors working for a permanent career at sea graduate to the larger passenger

ships, are adequately paid, and charge their passengers. But I doubt that there will ever be enough to take on this wandering life permanently and man all 300 ships. Meanwhile, the companies are obliged to employ the services of doctors inexperienced in this very different form of practice. Salary to them must be a matter of economics, the acquiring of the services of doctors for such pay as they will accept to do it. If the basic pay for fleetling employees is inadequate the fault is in ourselves. When you think of it, shipping companies are extraordinarily accommodating employers. At least I know of no other walk in life where, if one should wish to go to sea for a year or two and see how others live, you can do so, find time while doing it to study, write, or anything you care to within reason. It would be a pity if such an opportunity were removed.—I am, etc.,

Dublin.

CORMAC SWAN.

Association Notices

G.M.S. COMMITTEE

ASSISTANTS AND YOUNG PRACTITIONERS SUBCOMMITTEE

Elections will be held in August to appoint representatives of assistants and unestablished principals to the Assistants and Young Practitioners Subcommittee of the General Medical Services Committee for the session 1955-6. The newly appointed Subcommittee will come into office on September 1, 1955.

For the purposes of election, England and Wales is divided into five regions: (1) South-west and Wales, (2) South-east, (3) North-west and Midlands, (4) North-east, and (5) London and Home Counties. The General Medical Services Subcommittee (Scotland) appoints two representatives for that country as a whole.

Each region is based upon a regional office of the Association and elects two direct representatives to the Subcommittee—one assistant and one unestablished principal. The G.M.S. Committee appoints six of its members to serve on the Subcommittee. One assistant and one unestablished principal from the Subcommittee are co-opted to the G.M.S. Committee.

The electorate and membership of the Subcommittee, apart from the representatives of the G.M.S. Committee, are restricted to the following classes of practitioners:

- (i) Assistants in general practice.
- (ii) Practitioners engaged predominantly in general practice as principals (including those in partnership) whose total gross professional income does not exceed £1,500 per annum.

Assistants

The electoral roll for assistants is compiled from the Association's records and each eligible assistant should by now have received a letter from the secretary of the Committee advising him that unless he signifies to the contrary his name will automatically be included in the roll. Any assistant who does not receive such a letter should inform himself to be eligible for inclusion in the roll should communicate with the Secretary, B.M.A. House, Tavistock Square, London, W.C.1, not later than Wednesday, July 6.

Unestablished Principals

Applications are invited from principals whose total gross professional income does not exceed £1,500 and whose names are not already included in the electoral roll. Such applications should be made not later than Wednesday, July 6, on the form set out below.

Nominations

Electoral rolls will, as indicated above, be closed on July 6. On July 12 a copy of the revised roll for his area will be sent to each eligible assistant or unestablished principal,

asking for the submission of nominations not later than August 2. If there is a contest in any particular area, voting papers will then be issued.

For the use of unestablished principals only.

GENERAL MEDICAL SERVICES COMMITTEE ASSISTANTS AND YOUNG PRACTITIONERS SUBCOMMITTEE UNESTABLISHED PRINCIPALS

I
(Block letters, please)

of
hereby apply for inclusion in the electoral roll of unestablished principals.

I declare that I am engaged predominantly in general practice as a principal with a total gross professional income not exceeding £1,500 per annum.

and I undertake to inform the Secretary of the Committee at B.M.A. House of any change in my status which affects my eligibility for membership of the electorate.

Signed

Date

TO BE RETURNED NOT LATER THAN FIRST POST ON
JULY 6, 1955.

Diary of Central Meetings

JUNE

Branch and Division Meetings to be Held

- HEREFORD DIVISION.—At Hereford General Hospital, Friday, July 1, 7.30 p.m., annual meeting.
- PARLIAMENTARY DIVISION.—At Royal National Throat, Nose and Ear Hospital, Gray's Inn Road, London, W.C.1, Friday, July 1, 8 p.m., technical meeting and discussion. Mr. Wallace Black: "Congenital Deafness."
- WIMBORNE DIVISION.—At Guinness Brewery, Park Royal, Wembley, Wednesday, June 29, 2.30 p.m., conducted tour of Brewery. Members and other guests are invited.

FIRST NEW HOSPITALS SINCE 1939

The Minister of Health, addressing the Annual Conference of the Association of Hospital Management Committees at Hastings on June 17, said that he hoped very shortly to be able to announce the complete list of those new hospitals to be included in the expanded capital investment programme covering the two years 1956-7 and 1957-8. Sixty-million pounds had been spent during the first seven years of the Health Service on "make do and mend," so far as capital work was concerned, with repairs, adaptations, conversions, and extensions. Now, at long last, paper plans were going to be translated into actual structures embodying all that was considered best in modern methods of construction, design, and layout.
