LUBRICANTS are a vital need for every factory, power plant and machine shop. But it is not enough just to buy the best lubricants. Expert advice on lubrication is also needed.

Trained Standard-Vacuum specialists render complete lubrication service, by studying each problem, no matter how large or small, and finally recommending the correct GARGOYLE Industrial Lubricant. The customer gets the benefit of 90 years' experience, gained in solving lubrication problems throughout the world.

Standard-Vacuum's Lubrication Service helps to keep machinery running at peak efficiency, and eliminates costly breakdowns — thus increasing the productivity of Indian industry.

The Inflated Version

Considerable excitement was caused in the past weeks by reports of serious differences of opinion amongst members of the Planning Commission in regard to both the size and pattern of outlay under the Second Five Year Plan. These differences were attributed to divergent views on what we should aim at and what would be practicable, assuming the maximum of effort possible in a mixed economy and a federal structure. One was led to believe that in view of this, the draft outline of the Second Plan published in February 1956 would be drastically changed in the process of finalisation. But, to put it euphemistically, the spirit of compromise has prevailed and the draft outline has now become the final version, with added length and bulk.

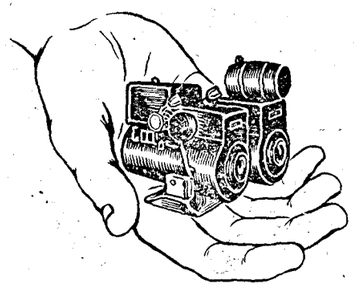
It would by and large be correct to say that the final version is in no way different from the draft outline. Planned outlay in the public sector is unchanged at Rs 4800 crores; allocations to major sectors like agriculture, industry, transport, etc. remain the same. Excepting a few minor items, the physical targets remain as before, and the sources of finance are no different from those in the draft. There is therefore a look of staleness about the final version, which is not entirely redeemed by the embellishments.

The questions which were left unresolved in the draft outline remain so. This is merely another aspect of the sameness mentioned above. We still have the same targets for taxation, viz. Rs 350 crores from existing taxes and Rs 450 crores from additional taxation, or a total of Rs 800 crores in five years. What precisely—or, for that matter, roughly—are the new levies that will or should be attempted is covered by the old formula—taxation will be on the basis of the recommendations of the Taxation Enquiry Commission. It is known that very recently, Prof Kaldor was in Delhi, advising the Government amongst other things, on ways and means of making the Indian tax structure more capable of meeting the demands of development. But it does not seem that the Planning Commission has benefited much from Prof Kaldor's efforts in this direction. Nor, apparently, have the State Governments been able to put forward more concrete proposals in this regard at their meetings with the Planning Commission. The alternative explanation of course is that all concerned consider it grand strategy to keep silent about it.

The taxes, new and old, are expected to yield Rs 800 crores over the five year period. As against this, of the outlay of Rs 4800 crores under the plan, Rs 1000 crores constitutes what is broadly called current developmental expenditure. They will not, that is to say, result in the building up of tangible productive assets. Clearly, the current receipts from taxation are inadequate to meet even this part of the developmental outlay, contrary to all that the Taxation Enquiry Commission and the Finance Minister have said so far.

Public capital formation under the Plan will therefore be financed entirely by a draft on private savings (from income after tax), foreign resources and deficit-financing. This is, in principle, probably acceptable to the traditionalists who would like Governments to borrow, if at all, for purposes of 'productive' expenditure. But in practice, it is likely to render the 'investment' expenditure dependent on the least reliable of

financial sources. One might object to this on the ground that deficit-financing could be what the Government decides; if therefore voluntary lenders, within the country as well as outside, do not live up to the Planning Commission's expectations, there will always be the Reserve Bank to borrow from. But in actual fact, the extent to which Government can deficit-finance will depend on very real forces operative in the economy. Shri Neogy is apparently sceptical about the financial targets and believes that if the planned outlay is put through, it will mean rampant deficit-spending. He sees in this a grave danger to the middle classes; that apart, the psychological and other repercussions of such a spending spree could be most awkward to the planners, especially against the complacent attitude towards rationalisation of organisation and control in the economy.



The deficit-finance spectre is all-too-familiar, and there is little point harping about it now. Very much similar is the common criticism regarding the Commission's expectations of external assistance. It is, however, significant that the Commission now says clearly that 'any shortfall in resources to be raised externally must be made good by greater effort at augmenting domestic resources, if the plans for investment are to go forward smoothly.' This is indisputable. The point really is: how exactly are the domestic resources to be augmented? The balance of payments deficit on current account for the five-year period will be, according to the Planning Commission, about Rs. 1120 crores. Whatever additional domestic resources we garner will therefore, have to be such as will enable the procurement of foreign exchange. In simple terms, if the expected foreign loans and grants are not forthcoming, we shall have to produce more export goods and reduce our imports. If this is what we are forced to do, what happens to the beautiful allocation of investment under the plan—which, obviously, assumes that no special effort need be made to fill the gap in regard to foreign exchange?

These are, it may be repeated, old doubts carried over from the draft into the final version. Having recapitulated them, one might ponder whether the Commission had any real alternative. There is, of course, the age-old prescription of adjusting outlay to probable receipts from various sources. That would have satisfied nobody, since spending on such a conservative scale would have made mockery of the plan for 'accelerated' development. The answer really is that, having noted the financial risks, the plan should look for methods of insuring against these. The most effective and basic insurance is that of getting labour to produce more and to accept only a part of its additional produce for current consumption. This is a matter of organisation, and widespread appreciation of what the plan seeks to do and why. It is true that deficit-financing will impose higher prices on the middle classes. But the higher prices are an indication that some of the people who produced little and consumed something are now consuming more and, what is equally important, producing something for the benefit of society. What these people produce may be capital goods or consumer goods. But the essential thing is to get them started on the job of production, so that with the passage of time, they can become net contributors to the social product.

All this involves tremendous adjustments in the organisation of production as well as of distribution. And far-reaching changes in the organisation of these processes must necessarily involve institutional changes. It is here that the Commission, so to speak, soft-pedals. Take the question of agricultural production. The Plan envisages an increase of about 18 per cent in food production; this, according to the Vice-Chairman of the Planning Commission, is not adequate and we should have an increase more like 40 per cent. But how? It is not surely just a question of water and fertilizers, and the Japanese method of cultivation. Along with these, and more important, there should be a more intensive application of human effort. This is particularly relevant because on employment considerations, if not any other, we cannot plump for large-scale mechanisation of agricultural operations. A new spirit has to be infused into the rural sector. How can we do it if we are not prepared to change the agrarian structure? One has only to read the Commission's chapter on Land Reform and Agrarian Reorganisation to see how futile the approach is

It is not necessary to be a Marxian to appreciate the interconnections between economic and social structures and movements. And, in any event, one does not have to be afraid these days of recognising the validity of at least some of Marx's propositions. The Planning Commission have talked for long of physical planning as opposed to financial planning. Working out an input-output matrix is just one aspect of physical planning. Equally important is the institutional side to physical planning. It is therefore somewhat of a pity that the final version of the Second Five Year Plan gives no clearer indication of the Commission's thinking on this than the draft outline did.

Fulton to Aachen

CONSISTENCY may not be one of Sir Winston Churchill's virtues. But history, surely, will not deny the elder British statesman a sense of perspective and of history. In his life, he has espoused many causes. But, over and over again, he has shown statesmanship by fighting his former convictions. Sir Winston has no political affinity with Communism. Immediately after the establishment of Communism in Russia, he sponsored a military crusade against the Lenin regime. Until the invasion of Russia by Nazi Germany, he did everything to ostracize the Soviet Union. But, with astute realism, he initiated and maintained the wartime alliance with Communist Russia in the war against Hitler. With the end of the war, he renewed his crusade against Communist Russia. His Fulton speech anticipated the Truman Doctrine. Marshall Aid and NATO were the inevitable consequences, and causes, of the "cold war". Two rival power blocs were created.

As the "cold war" continued, the hostility between the rival power blocs was intensified. Throughout the "cold war", Sir Winston worked for closer Anglo-American alliance, and for integration of Western Germany into Western Europe. It would be irrelevant to analyse his assumption that Stalinism encouraged unity among the Western Powers and helped political and military incorporation of Western Germany into NATO. Nor would it be relevant to discuss whether the closer Commonwealth tie was an indirect sequel to Stalinism or a natural consequence of the British withdrawal from Asia or an instinctive protective shield against an aggressive American foreign policy. What is relevant is his instinctive response to changing international developments. He was as timely in his Fulton pronouncement as in his latest Aachen speech.

Germany and NATO are the two aspects of the single problem which threatens peace in Europe. As long as Germany remains disunited, Europe must remain divided. Throughout the "cold war", the Western Powers have argued that NATO and the integration of Western Germany into NATO are essential to prevent Communist aggression in Europe. France has always been a reluctant supporter of this "cold war" strategy. But, outside France, Sir Winston was the first Western statesman to concede that Russia might have legitimate suspicions about a re-united, re-militarised Germany. To alleviate Russian fears, he suggested, two years ago, an Eastern Locarno Pact. This was the first time that any Western statesman admitted that Russia's fears about a re-armed, re-united Germany were not entirely baseless.

As a logical corollary, Moscow, proposed, during the Geneva "summit Conference" among the Heads of State that the problem of Germany should be settled only after the creation of such a security system. Russia argued, could a sovereign, united Germany be included as one of its participants. This suggestion was summarily rejected by the Western Powers in their insistence that the problem of Germany should be settled first.

At Aachen last week, Sir Winston, in effect, endorsed the Russian proposal for an all-European security system. His suggestion for inclusion of Russia into NATO is, in essence, a plea for creating an all-European security system. Transformation of NATO into such a system of European security is a better alternative to the recent NATO Council meeting's suggestion for extending NATO's activities to political and economic spheres. Both for political and economic integration of Europe, organisations already exist. But NATO, whose existence is threatened by the gradual elimination of the "cold war", cannot only be kept alive, but can be enlarged by converting it into a mutual security arrangement for the whole of Europe.

Sir Winston is realistic in not only suggesting inclusion of Russia in NATO, but in conceding that the problem of Germany can be settled only in the context of an agreed plan for the security of Europe. This may embarass Bonn. Washington may feel puzzled at Sir Winston's inconsistencies. But Paris will welcome his realism as a good omen for the Franco-Soviet discussions in Moscow.

Time and time again, Moscow, has emphasised that NATO is the prime cause of continuing world tension. Even those who do not accept this Russian stand will concede that NATO and all regional military alliances are obstacles to disarmament and to world peace. Conversion of NATO into an all-European security system will further the cause of disarmament. Russia has made many concessions during the recent London talks on disarmament. Marshal Bulganin has indicated, during the Russian leaders' visit to Britain, that Russia is willing to discuss plans for reduction and control of both conventional and nuclear weapons. On the eve of the French leaders' visit to Moscow, Russia has announced a further reduction in her armed forces.

Moscow's repeated peaceful gestures emphasise the changed foreign and economic policies in Russia since Stalin's death. It is ridiculous to suggest that Russia is cutting her armed forces as she is now in a position to equip her reduced army with nuclear weapons. It is churlish to maintain that deeper economic influences are forcing Russia to slash her army budget. One of the main arguments for disarmament is that, it will not only lessen the threat of aggression, but will release resources for economic improvement. Statesmanship demands that the Western Powers must be prepared to test the sincerity of Communist Russia. Sir Winston's Aachen proposal will have achieved its purpose if it inspires the Western Powers to reach an agreement with Russia on peaceful co-existence.

Weekly Notes

Qualitative Credit Control

THE pattern of the control that will be exercised by the Reserve Bank over the banking system in the future is indicated by the directive issued by it to scheduled banks this week restricting advances against stocks of paddy and rice. The Reserve Bank directive refers to the increase in scheduled bank advances against paddy and rice from Rs. 11.64 crores at the end of March 1915 to Rs. 24.62 crores at the end of March 1956, which appears to support the government view that speculative holding of stocks is at the root of the recent 'abnormal rise' in prices of paddy and rice. Perhaps the same may be true of other commodities as well.

The Reserve Bank has directed that no scheduled bank should increase the credit limit already sanctioned to anyone nor grant any new limit exceeding Rs. 50,000 to anyone in respect of advances in any form against the security of paddy and rice. To ensure the implementation of this directive, the Reserve Bank has also directed that in cases of composite advances, the advances against paddy and rice should be separated together with the respective limits.

Since these steps will at most help to freeze credit against paddy and rice at the present level, the directive also insists that the margin maintained in granting credit against security of paddy and rice should be increased by ten per cent of the total value of the security over whatever margins have been maintained at present. The Reserve Bank has also directed the banks "to endeavour to achieve a reduction in aggregate advances against paddy and rice to a level which at any time hereafter would not be more than 25 per cent above that of the corresponding week last year, wherever existing advances are higher than that limit."

The action taken in connection with advances against paddy and rice is evidence of the determination of the Reserve Bank to utilise its wide powers under the Banking Companies Act, 1949, for the purpose of controlling prices wherever any upward trend can be traced to the activities of the banking system. In this way, it will make up through qualitative control for the weakening of its quantitative control in the context of deficit financing.

If this directive is seen in the light of the fairly prompt response of the authorities to the recent increases in food grain prices and the activities of the Forward Markets Commission, it would appear that the mechanism for controlling prices in a heavily deficit-financed economy is slowly taking shape. That is a good sign.

Food Crisis in East Bengal

ALTHOUGH Maulana Bhasani, the 67-year old leader of the Awami League had to undertake a fast before attention was attracted to the acute food crisis in East Pakistan, conditions in that region have been difficult for some time past. Rising food prices had already indicated some months ago that there was a severe shortage of food which could be met only by immediate and urgent steps. Reports from East Pakistan show that food grain prices had risen in some districts already in February to nearly 25 rupees per maund in respect of rice as compared with Rs. 9-8 to Rs. 11-8 per maund during the same period last year.

In an interview at the Mitford Hospital on Monday, the 13th day of his fast, Maulana Bhasani gave a harrowing picture of conditions in the province. The Maulana said that some villagers had not had rice for the previous 1½ months and were living chiefly on a particular variety of vegetables called data, and on sweet potatoes. Plantains and jack fruits, with which they used to supplement their diet at this time of the year, were not available this year due to flood damage.

One aspect of the food crisis which has been stressed by Maulana Bhasani is the lack of purchasing power in the province. He insisted that conditions this year were much worse than ever before, even than in 1943. "At that time", he said, "when rice was selling at Rs. 60 and above per maund, people had the means to buy it, but today there were few buyers when rice was selling at between Rs. 45 and Rs. 35 per maund." When this is the case, there is obviously a case for relief operations, quite from the need for ensuring adequate supplies of rice.

Some estimates placed the requirements of East Bengal at somewhere between 3 to 4 lakhs of tons though in his statement at Dacca this week, Shri H. S. Suhrawardy has suggested that the total deficit amounts to one million tons. It is true that early in March an agreement had been signed with the US for the import of 165 thousand tons of rice, costing Rs. 16 crores under the US Emergency Agricultural Commodities Export Programme. It appears that 15 thousand tons of rice will be made available by India.

The reluctance on the part of the Pakistan Government to import food grains from abroad has, it appears, arisen to some extent from the fear of disturbing the precarious equilibrium in Pakistan's balance of payments which has been recently achieved. The inadequate capacity of the Chittagong and Chalna ports is also said to have something to do with the unwillingness of the Pakistan Government until recently to resort to imports.

Obviously, however, these reasons do not really justify the complacent attitude towards the food situation adopted by the Pakistan and East Bengal Governments. It should not have been impossible, for instance, to arrange for transport of food grains by the overland route through India from West Pakistan. This is, in fact, what Shri Suhrawardy has suggested. Since West Pakistan has by no means a surplus of food grains at present, imports could not be avoided in any case. That the Pakistan Government shoud have allowed balance of payments considerations to prevent it from importing food grains to meet the crisis is clearly not very much to its credit. That they should look upon rationing as a solution to the problem shows the extent to which the two Governments adopted an entirely unjustifiable attitude to this very important question facing them.

Although India herself is facing difficulties on the food front, though by no means so acute, it would be an act of good neighbourliness for her to offer to supply to East Pakistan immediately some quantity of food grains, preferably rice, and further to volunteer the use of her rail and port facilities for the transport of food grains to East Bengal to mitigate the crisis within the shortest possible period.

Pakistan's First Plan

SKETCHY newspaper reports indicate that like India's first Plan, the Pakistan Five-Year Plan for 1955-56 to 1959-60 prepared by the Pakistan Planning Board under the chairmanship of Mr. Zahid Hussain lays special emphasis on agriculture. Such an emphasis certainly appears to be justified for considerable difficulties in practice have arisen from the concentration of effort in that country, since Partition, on development of industries to the relative neglect of agriculture. To rectify this situation, the Plan gives first priority to village aid and agriculture, with one-third of the total expenditure of the public sector devoted to programmes of irrigation, village aid, reclamation and drainage. Industry claims about 27 per cent of the public expenditure on development, in addition to a large investment programme in the private sector. Transport and communications absorb about one-fifth of the total expenditure of the public sector.

The total cost of the Plan is estimated at Rs. 1160 crores, of which Rs. 800 crores is for the public sector and Rs. 360 crores for the private sector. The estimate of financial resources for the Plan shows a substantial dependence on foreign assistance; foreign aid and loans are expected to provide Rs. 380 crores and foreign investment is expected to amount to Rs 40 crores, the total accounting for 47.5 per cent of the Plan. Of the balance, Rs. 150 crores will be public savings and Rs. 590 crores private savings. Of the latter, about Rs 270 crores will be drawn into the public sphere.

The Plan aims at bringing about an increase of 20 per cent in the national income of Pakistan, which, allowing for a 7.5 per cent increase in population, will raise the per capita income of the country by 12 per cent. Among its principal targets are the creation of two million new jobs and a 13 per cent increase in food grain production. To achieve these targets, it is proposed to carry the agricultural and industrial development programme to 26,000 villages. Three million additional acres will be irrigated; the target for generation of electrical energy is 580,000 kilowatts; 250,000 new houses are expected to be constructed.

As the Planning Board calculates the foreign exchange component of the Plan at Rs. 530 crores, it calls for a special effort at improvement of the balance of payments situation. It visualises an increase of exports to the extent of Rs. 40 crores per annum and a reduction in imports of Rs. 10 crores, thus increasing foreign exchange earnings for the Plan by Rs. 50 crores per annum.

The Planning Board has shown recognition of the need for a certain measure of austerity and has recommended strict control over luxury imports. It has also emphasised that 'resources that can be devoted to improvement of social services are limited by the need to provide a solid base of agricultural and industrial progress upon which further social services depend. Whatever else may be said about the Plan, the Board cannot therefore be accused of showing lack of realism.

Apart from schemes directly included in the plan, a provision of Rs 100 crores is made for new productive programmes in East Pakistan which have still to be prepared, such as flood control and small irrigation and drainage works. A similar reserve of Rs. 40 crores is provided for West Pakistan.

While India's First Five-Year Plan was published a few months after the commencement of the period which it was to cover, the Pakistan draft comes in the second year of the Plan period. Knowing how difficult it is to step up expenditure, this does not augur well for the achievement of the fairly ambitious targets set up by Pakistan's first Plan. It is something that a start has been made, however, for the Board that has prepared the present Plan is the third body to have been set up for the purpose. If political developments in Pakistan do not again prevent concentration on the urgent economic tasks that face the country, this Plan should mark the first step in the process of bringing rapid economic development to Pakistan.

France Seeks Friends

M MOLLET, the Socialist Premier of France, can claim much to his credit during the short time he has been in office. He and his Foreign Minister have not been unsuccessful in their efforts to create better understanding between East and West. They have been honest in their criticism of the Western Powers' policy to Russia. Their emphatic comments on the Western Powers' exclusive reliance on security have been widely appreciated. M Mollet and his Foreign Minister are now in Russia for friendly discussions on world problems. At the recent meeting of the NATO Council, France took the initiative for a more positive approach to Russia in order to settle the world issues in dispute. Peace-loving peoples and nations will welcome the French Socialist Government's attempts to create greater understanding between the Western Powers and the Communist bloc.

No exception will be taken to French efforts to win friends. Even as Russia is interested in ensuring French or British co-operation for an agreed solution of European problems, French or British co-operation for an agreed solution of European problems, France is not uninterested in securing Russian help and co-operation in solving French problems in west Asia and in French North Africa. France is one of the three powers who, along with America and Britain, have a responsibility to maintain peace between Israel and Arab States. France has been eager to accept Russia's demand for consultations on west Asian issues. She has openly requested Russia to co-operate with efforts to solve France's disputes in North Africa. France hopes to enlist Russia's support for dissuading Cairo from fomenting trouble in French North Africa. France has the world's sympathy in her gesture in granting independence to Tunisia and Morocco. France claims that the situation in Algeria is different. Few accept her insistance that Algeria is a Department of France. Even moderate nationalist Algerians have now turned hostile to the idea of Union with France. Algeria is one of M Mollet's blind spots. For the prestige of France as also of her Socialist Government, an agreed solution of the Algerian problem is to be devoutly desired.

Dream and Reality

THE conflict between idealism and realism would seem to be nowhere more glaring than in the Congress attitude to prohibition. On one side, there are those who would have prohibition at any cost, irrespective of the other factors involved and regardless even of considerations of practicability or success. To these it would seem to matter little if in trying to cure one evil more evils arise in its place. Prohibition is a creed with them; and having convinced themselves of its soundness, they have no qualm in forcing

it on others, presumably on the ground that the latter may often know not what is good for them.

The other school of thought on the question has perhaps no less faith in the advisability of promoting sobriety in the nation; but it would seem to be disinclined to fly in the face of hard realities or create more complications in the process. To this section, the drive against drinks is not just a ritual of legislation to be gone through in the name of Congress ideology nor a fetish. Neither is it an end in itself, but rather a means to the end of educating people out of the craving for drinks and diverting their interest from it, so that their conformity with law may be voluntary and real and not just technical, as may often be the case in 'prohibited' areas. Again, with this school of thought, prohibition is only one of the many measures of national reform that could be usefully thought of, but not pursued until its advantages are carefully weighed against other, and may be more urgent, national needs.

While those belonging to the first school of thought have always been vocal, those belonging to the second have understandably enough been rather silent. Indeed, it is only their action or lack of action in the sphere of checking the drink habit that would seem to provide a clue to their way of thinking. But that does not apply to our outspoken Prime Minister, Pandit Nehru, who recently gave effective expression to his realistic views on the subject. While declaring that India was much more favourably situated for a policy of prohibition than other countries because of the widespread public sentiment in favour of it, he was nevertheless concerned over the methods to be adopted, inasmuch as 'sometimes they might fail to achieve their purpose and lead to other dangers.' He added, "A law which goes half way, to begin with, and is effective is perhaps better as a step than a law which is supposed to go the whole way and is rather ineffective."

That represents one aspect of the problem; another and an equally important one was highlighted recently by the Chief Minister of Madras, Shri Kamaraj Nadar, though not so much by speech as by action. In deciding to relax prohibition in the Nilgiris in order to attract tourists, Shri Nadar was bowing to the economic factor which is generally brushed aside by ardent votaries of prohibition until the sheer compulsion of events leaves them with no option but to change their attitude. In the process, however, the extreme sanctity that is apt to be attached to prohibition in certain quarters, and the place of supremacy that is given to it among contending national demands of no less importance, lay themselves open to scepticism. But would a touch of scepticism be bad in the stupor of thought that prevails in various quarters?

Shell of Freedom

THE breakdown of the London talks on Singapore's future will be widely regretted. Mr. David Marshall, Chief Minister of Singapore, sorely disappointed, has said that the offer of internal self-government, with Britain retaining imperial powers, is like 'a Christmas pudding with arsenic sauce.' Much has been made of the strategic location of this South-east Asian territory and the presence of a large number of Chinese, who, it has been said, might seize power and join up with the Peking regime. If there was such danger, the Singapore delegation could not be deemed to be less aware of it than the British authorities, nor less concerned about means for averting it in any settlement that it sought with the Colonial Office. In any case, it was the readiness of the delegation to recognise the strategic position of the territory and Britain's anxiety to maintain her base there that made the Singapore demand for freedom so modest. The delegation had insisted only on internal independence, granting considerable power of control to Britain in external matters. But the Colonial Office's response to this was not generous enough. Whatever internal freedom it was prepared to grant, it sought to take away indirectly by assigning extensive powers to the proposed supreme security council which was to control all internal security affairs.

The conception of security can be very elastic; and as Mr Marshall strikingly pointed out, he could be prevented even from laying a sewer in the road on the ground that it obstructed traffic and through it endangered the delicate structure of security. "They wanted to deprive us of all dignity and responsibility." Mr Marshall poignantly remarked. But Britain's Colonial Secretary, Mr. Lennox-Boyd, while stoutly defending his stand on the ground of strategic realities and Communist perils, would seem to have indicated that the door is still open for negotiations. And considering the fact that the main point of difference hinges largely on the powers to be granted to the security council, it should not prove difficult to arrive at a reasonable compromise provided Britain is prepared to trust Singapore's leaders to know what is best for them and also to be quite capable of looking after their country without the stultifying protective arm of the Colonial Office. The stalemate that has resulted from the breakdown of talks cannot continue for ever. And statesmanship demands that it be ended soon to restore goodwill and understanding on all hands and put Singapore firmly on the road to democratic evolution.

Cloth Export Duty Goes

ALTHOUGH Government's belated decision to abolish the 6¼ per cent. ad valorem export duty on coarse cloth will undoubtedly arrest the falling trend in India's cloth exports, it would be wrong to expect any spectacular improvements in this direction in the immediate future. Internationally, the increasing manufacture of substitutes like rayon and other synthetic fibres and the fact that a number of countries like Egypt, Pakistan, Burma and Iraq, which were previously large importers of cotton textiles have now started cloth production themselves, have caused a shrinkage in the world market for cotton textiles.

Competition in the international market has also been becoming keener during the last few years. Japan has begun throwing as big a weight of cloth into world markets as she did before the war. It is well known that she has been able to do this by cutting down her cost of production, in which process she has been assisted by the co-operative attitude of Pakistan with regard to the supply of raw cotton. But competition has also been forthcoming from China, West Germany, Bulgaria, Pakistan, Egypt etc.

In view of these factors, the decision to abolish the export duty on coarse cloth, which occupies an important position in our total exports, is undoubtedly welcome. It will help the country to meet to some extent the competition offered by these countries, but only if the national situation does not at the same time become more difficult. If internal prices continue to rise owing to scarcity or high production costs, India will not be able to derive much benefit from the abolition of export duty.

17th Parallel

MR. NGO DINH DIEM'S regime in south Viet Nam may not be democratic. But Mr Diem is clever in exploiting circumstances. Since the Geneva Agreement on Indo-China, there has been a stalemate in Viet Nam. Under the Agreement, the cease-fire should have been duly followed by a general election throughout the country. General elections have not been held; the country remains divided; Mr. Diem makes no secret that he has no intention to hold a general election. After prolonged hesitation, Britain and Russia, co-chairmen of the Geneva Conference on Indo-China, have issued an appeal to both south and north Viet Nam to make preparations for a general election. Mr Pham Van Dong, Premier of north Viet Nam has promptly responded to this Anglo-Russian appeal. Mr Diem remains adamant. He disowns his responsibility to hold general elections. There is, thus, continued deadlock in Viet Nam.

Two events have helped Mr Diem to persist in his refusal to cooperate with north Viet Nam in arranging for general elections. Immediately after the Geneva Agreement on Indo-China, the Heads of States reached an understanding during the Geneva "summit Conference" not to wage an atomic war. Mr. Diem's intransigent attitude is helped by the knowledge that the Communist bloc will not encourage north Viet Nam to violate the cease-fire agreement. Mr Diem argues further that he has no responsibility to abide by the Geneva Agreement, as he was not a party to that Agreement. This is where the political vacuum in Viet Nam enters the picture. Under the Agreement France has a responsibility to ensure implementation of the Geneva decision to hold general elections in Viet Nam. France has quit Viet Nam; the French forces are no longer there. France is no longer able to discharge her responsibility. Mr. Diem is aware of these circumstances. He has also the tacit support of America. That is how and why Mr. Diem is one of the major beneficiaries of the prevailing international atmosphere of co-existence.

Off the Record

On the Case for Nationalisation

FEW will disagree with the proposition that in bringing into existence a Socialist pattern of Society, the State has to play a big part. But equally truly, few will agree on the extent and nature of th's part. Whatever the form it takes, the essence of the transition lies in reducing inequalities in economic power, and introducing new values in society. This inevitably means that some of the institutions to which one has always been accustomed will need to be transformed, if not changed. The trouble is that those who are intimately connected with such institutions and know their strong points are convinced that extension of State power should be such that these institutions are not jeopardised. Extension of the power of the State in th's context does not mean only nationalisation. Even legislative measures directed towards reduction of econom'c power meets with ferocious opposition.

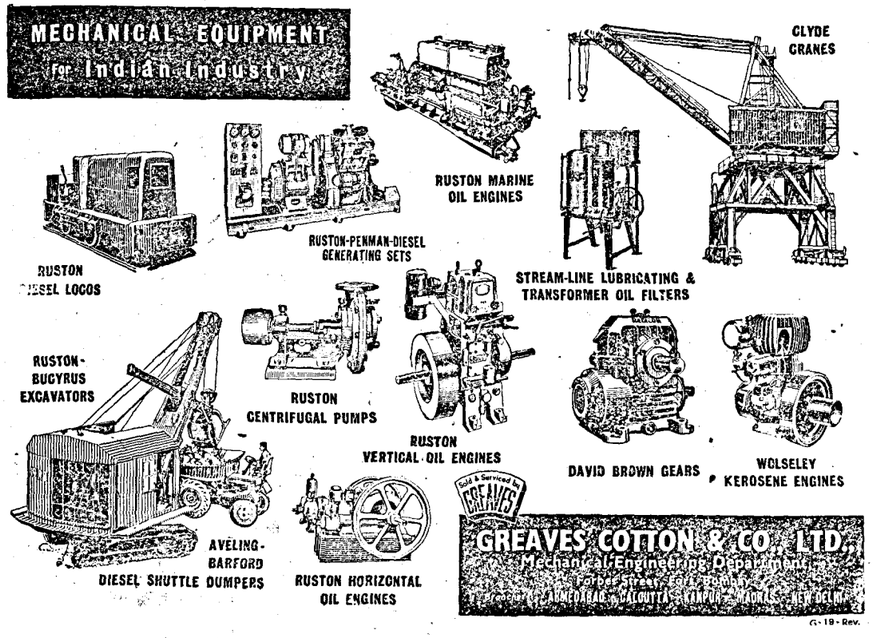
There is always a plausible reason for such opposition. The landlords see no reason for legislative imposition of ceil'ngs on personal holdings when no such restriction exists on urban property and when large-scale farms are associated in the popular mind with efficiency of product'on. Labour leaders desire protective legislation for labour and greater political importance to that class, but are scandalised by any talk of restricting the right to strike or of enforcement of discipline by the State. And, of course, industrialists feel that nationalisation of industries is the last thing that the State should do, if it wants real development.

Admittedly, it is all very confusing to the Government, which has set its sights in a particular direction and finds that movement in that direction cannot be in a manner agreeable to everybody. Not unnaturally, it takes shelter in vague policy statements and compromise formulae, in the hope that friction might be minimised. But in the process, it only adds to friction, because the reason for vagueness is interpreted differently by different people.

A case in point is the recent Industrial Policy Statement. Many were surprised that this had only a mild reaction. It could not have been otherwise, considering how little it differs from the Industrial Policy Statement of 1948. But in the meantime, the environment has changed and those who probe deeper into such matters find that the dangers of nationalisation have increased. Subsequent to 1948, air transport and insurance have been taken over; the old Imperial Bank has been nationalised; Government has made it very clear that new units producing iron and steel shall be State-owned units. Several such instances could be cited and it is against this background that extension of State power in the industrial field is disquieting to many, including Dr. John Matthai.

Dr. Matthai's position is that free enterprise should be the rule and State enterprise the exception in a developing economy. He, therefore, disapproves of the greater stress placed on State enterprise in the Industrial Policy Statement and considers it unwarranted. Neither of the two grounds put forward in support of nationalisation, viz., the necessity for State ownership in a Socialist Society and the need for speedy and planned development—appear tenable to him. For him, nationalisation is permissible only when there is a proved necessity for it. Only nobody can define 'proved necessity' in a manner acceptable to all concerned.

Dr. Matthai unfortunately uses 'nationalisation' in a wider sense than is commonly understood. He uses it to mean not only the taking over of existing units of production but reservat'on of fields for State enterprise. He is, therefore, not concerned with the narrow question whether or not the State should use its resources in taking over established industries instead of establishing new ones. Apropos of reservation of fields for the State, he finds no sanction for it either in theory or in practice. The second criterion, viz., that of rapid development through this means, comes in for its share of criticism in the process.



The substance of Dr. Matthai's argument is this: the impression that nationalisation is an essential element in socialism is not supported either by socialist thinking or socialist practice. If the trend has been different in the USSR, it is because before the October Revolution there was no democratic government worth the name in Russia; if Karl Marx advocated socialisat'on

of the means of production, it was because such franchise as there was in his time was based on property rights and therefore the State was run by vested interests. Since Marx's time, political democracy has come to be based on adult franchise and has made vast progress. We have such a democracy in India; and within this framework, nationalisation as a necessary agency of socialism has little place.

Dr. Matthai's points are to a large extent well taken. But certain nagging doubts remain. Either we accept that adult franchise in India has given us a parliament truly capable of reflecting the views and aspirations of the common people or we do not. If we accept it, the fact that Government-in-parliament has sworn adherence to a Socialist State in which State enterprise shall have an increasing share will have to mean that the majority of people want it so. It no longer becomes a question of doctrine. If, on the other hand, we treat it as a doctrine imposed by some, parliament loses its claim to be the mind and mouth of the populace. Which means, in other words, that you may have adult franchise, but you do not have effective policy-making by the people. The fact is, adult franchise is necessary but not sufficient to ensure the ideal democracy in which socialisation of means of production becomes superfluous. In the ideal democracy, the State's business could be, as Dr. Matthai observes, just to lay down a general plan and leave the working of it to others; this is because under the assumptions of an ideal democracy, conformity to the plan will be assured by the self-imposed discipline of the 'democrats'. One does not have to strain much to see how far we are yet from such an ideal.

Dr. Matthai's second point is that Government's organisational and administrative resources are not capable of meeting the demand for speedy development through nationalisation Few will question the administrative difficulties implicit in the extension of the public industrial sector. The point, however, is not whether the administrative machinery is now inadequate or ill-suited to the tasks of running industrial enterprises; it is whether it has always to remain so. Like many others who are afraid of bureaucracy and red tape, Dr. Matthai seems to believe that whatever else may happen to society at large, the character and tone of the administrative services will remain unaltered. For him, they will always be too slow in their decisions, too fearful of change, too unwilling to take risks and so on. They will, of course, remain so as long as the rules and regulations under which they function remain what they are today. Why, if as a nation we are all desirous of change and development, should these rules and regulations be maintained in their out-of-date forms?

We do not like to give greater freedom of action to the administrators because in a democracy their business is to implement Parliament's decisions. If Parliament does not choose to give them greater scope for initiative, it is not entirely the Government servant's fault that he sticks to precedent and waits for somebody else to take decisions. But then, should Parliament enlarge the freedom of action of Government servants, not a few will deem it the beginning of the end of democracy. It is principally because of this dilemma that the liberals opt for a free enterprise system. But that still leaves the question of rapid development unanswered. Free enterprise will lead to industrialisation and all that, provided certain 'freedoms' are given to it. In the present state of the world, and particularly in underdeveloped countries, these freedoms cannot be given to entrepreneurs, except through State intervention. To do so would, again, be to take a retrogarade step in terms of political democracy. And if it is not done private enterprise also will remain too unwilling to take risks or lose money.

From the London End

Automation and Employment

THE problem of the relation between man and machine is by no means new. The suggestion is, however, now being made that the advent of 'automation' has engendered a fundamentally new situation and that, while in earlier times, science had followed industry, it is, as Professor Bernal says in his recent **'Science in History'**, "now tending to catch up with industry and lead it as its place in production becomes clearly understood." Automation is the conscious application of science to the organisation of the 19th and early 20th century. The advent of automation has created a new situation; the reaction of workers must also be new. No longer are workers likely in their own interests to think of the machine as a mere lever to lighten the expenditure of human effort. The coming of the robot age in Britain has been so sudden that with the realisation of its implications there has been a sharp reaction among workers.

In Coventry, 12,000 men at the Standard Motor Company struck work on the ground that the company was installing £4 million of equipment for the manufacture of new tractors which would permanently displace about 3,500 men. The Managing Director of this company has announced that—

> ". . . . . we are not installing £4 million worth of equipment in order to employ the same number of men. We can't carry people for fun."

The strikers complained that the introduction of automation in the Standard Motor Company was made without consultation with the trade unions concerned and that there were no guarantees that those who would be declared relundant could be absorbed in alternative work in the factories of this company. The strike, which lasted for more than one week, has now ended on the understanding that the eleven trade unions concerned are to make a determined effort to obtain agreement at an official level that automation in any industry should take place only to the extent that it does not bring harm or unemployment to its employees.

The strike possesses a more than local significance. It has stimulated considerable controversy and brought a statement from the Minister of Labour promising the early publication of the report which the Department of Scientific and Industrial Research has been preparing for more than three years. The Government, it is clear, conceives of automation as a "good thing". It has failed so far to indicate ,however, the longer term or the social implications of this new industrial revolution. The Labour Party, on the other hand, has shown itself not only gravely confused over the issues at stake, but unable to suggest how what is now regarded as inevitable can best be implemented. The trade unions see in automation only the very short-term implications for employment, while the Trade Union Congress has remained silent on the question.

Mr John Diebald, the leading exponent of automation in the U S A, has pointed out that the production process so far was divided to allow for the most efficient use of individual human skill. Mechanisation in most cases, he claims, did not change this fundamental feature of production. Machines were developed around human skill. Automation, on the other hand, says Diebald, takes a new approach. It views the production process as an integrated system and not as a series of individual steps divided according to the most economic distribution of human skill or even of individual machines.

In effect, this definition does give a greater sense of reality to the economic distinction between capital and labour, and more particularly to the relative costs of each of these factors in the determination of their respective uses in industry. To clarify this crucial relationship, the Earl of Halsbury has spoken of the "breaking point" before which automation is uneconomic and after which it becomes economic. Speaking at the Margate Automation Conference last December, he said:

"What determines this breaking point? When depreciation costs of new automatic machines (A) are equal to depreciation costs of old machines plus cost of labour power (B) (which new machines will replace) then the breaking point has been reached. When A is more costly than B, automation is uneconomic and vice versa.

"The variable factor here, of course, is wages. When wages are low B will tend to be less costly than A, tending to make automation 'uneconomic'. When wages are high B will tend to be more costly than A making automation 'economic'. The successful struggle of the workers, therefore, for higher wages and shorter hours will tend to make automation socially necessary, facilitating further improvements in living standards. The resistance of the employers to these demands, the employment for example of 800,000 women in the engineering industry at shockingly low wages, tends to make the automatising of their work uneconomic, even though the technical possibilities for such automation exist."

On this basis, at the current level of wages in British industry, automation appears to be definitely feasible. The breaking point which the Earl of Halsbury spoke about has already been effectively calculated in one very large firm. The Austin Motor Corporation had calculated that after it had installed its automated line for machine cylinder blocks, output would be increased by 20 per cent, machine operating costs would fall by 17% and labour costs would be reduced by 81 per cent. Already, this automation has resulted in a £ 2 million saving in inventories. The British catering organisation, J Lyons & Company, has installed computers which not only work out the weekly pay packets of about 10,000 employees, but earry out a daily analysis of bakery and confectionery orders from all the London teashps and draw the attention of the management to shops that are doing well or badly, take charge of the firm's stock control of tea and do many other jobs besides. These computers have replaced about 300 clerks. Studies of comparative costs of automatic and non-automatic production are now being made by all the large industrial organisations in the country. There can be little doubt that the two examples given here are typical of automation generally in the country.

The social impact of automation as defined by Mr Diebald and the Earl of Halsbury has raised the question whether the planning of industrial development even in Wes-

tern countries is not a vital necessity. The **New Statesman and Nation** has recently written lengthily on the inability of capitalism to maintain employment even without automation in any normal situation. It, therefore, asks the fundamental question whether automation in the present unregulated structure of British industry would not involve further economic concentration, a reduction in the area of competition and the strengthening of the large companies and near-monopolies. In this situation, this journal states unequivocably that "we cannot achieve an orderly transition or work out the right social priority when we have a government that believes that what is good for Standard Motors is good for Britain".

The consequences of the general framework of the "profit system" must be a general lowering of living standards, a marked rise in unemployment and inevitably a slump of dimensions that will possibly mean the end of capitalism itself. This far-reaching estimation of the consequences of automation is not without significance. It shows the issues which are being raised by the introduction of automation.

The controversy has also covered "the causes of automation". In Left wing circles the view is increasingly held that the introduction of automation in industry in the United Kingdom, as no doubt in the United States, is the result of the military preparations that have already taken place. Automation, it is claimed, has been made technically possible by the military developments of radar and electronics generally and of automatic controls and mechanisms for aircraft and guided missiles. The inspiration for the present fervour for a quick transition into automatic industry therefore comes from rearmament which, it is stated, provides one of the surest and most profitable outlets for automatic factories.

The contemporary social fabric is however likely to be with us for some time still and considerations as fundamental as those examined above do not help in a discussion of the short-term prospects of labour displacement in newly automated factories. The report of the Industrial and Scientific Research Department is being awaited eagerly for more light on this aspect of the question.

Hooghly Mills

CORNERING attempts do not seem to be over yet. In recent months, many companies under the managing agency of Gillanders Arbuthnot and Co., Ltd., have been targets for cornering activities. Some time ago, Gondalpara Jute Mills changed hands. Air-Conditioning Corporation is no longer under the managing agency of Gillanders. By the time these lines appear in print, the fate of Hooghly Mills Co., Ltd., the jute manufacturing concern under the managing agency of Gillanders Arbuthnot will be decided.

An extraordinary general meeting was scheduled to take place on Friday last. A group of shareholders, who seek to change control and management of Hooghly Mills, requisitioned the meeting. Results of this meeting are not known at the time of writing. But the issues involved may be discussed.

During the last few months, there have been attempts at cornering of Hooghly Mills shares. As a result, the group, which has requisitioned the meeting, is reported to have acquired nearly fifty per cent of total shareholdings. With the help of the remaining shareholders, Gillanders may outvote this group, "although this is by no means certain".

Gillanders are prepared to sell their managing agency rights. But they insist that the cornering group must pay the remaining shareholders the same price as it pays to Gillanders. This, the group is reported to be reluctant to do. To safeguard the interests of shareholders, Gillanders have asked the remaining shareholders to appoint a Gillanders' director on the Hooghly board as their proxy to vote at the extraordinary general meeting.

Our Delhi Letter

K C Neogy Vindicated

AT last Shri K C Neogy has been vindicated. His projected minute of dissent has become a part of the Second Five Year Plan. The members of the Planning Commission have expressly recognised that in a document of "such wide scope there is always room for differences in emphasis which must be appreciated". Shri Neogy's note has come to be paraphrased in two sentences. He is quoted as having "specially stressed that in view of the magnitude of the Plan it will be difficult to implement it in a period of five years and that deficit financing on an excessive scale may prove dangerous to the economy and may cause hardship to certain sections of the population. He has also drawn particular attention to the need for balanced development of transport and production generally." The members agree that "these considerations are important and should be constantly kept in view in carrying out the Plan". And then, almost as a concession to themselves, it is stated that "these aspects have also been considered fully in appropriate sections of the Plan".

The fact is that "these aspects have been considered fully" and then ignored in laying the basic structure of the Plan. But that does not matter. Shri Neogy's right to have his say has been respected. He may prove to be a true prophet of despair and that would be his final—if sad—triumph over the contents of the monumental volume that he denounced in no uncertain terms. But for the present he is proceeding on leave to have a well-merited holiday at a hill station. The talk of his resignation, which started even before he joined the Commission, has evaporated and despite differences with Shri V. T. Krishnamachari and Shri Gulzari Lal Nanda, he might find the atmosphere in the Planning Commission more congenial for his work (due to the appreciation of the Prime Minister for his point of view) when he returns to his desk towards the end of June.

V K Krishna Menon

Mr. V. K. Krishna Menon's star is on the ascendant. Having shone brilliantly in the firmanent of international politics, he is shedding light on the complex problems of national economy. He was actively associated with the scrutiny of the draft outline of the Second Five Year Plan on behalf of the Congress Working Committee. He has been nominated as a member of the economic committee of the Cabinet. Shri Krishna Menon has now joined the Cabinet Committee on heavy industry which includes the Prime Minister, the Home Minister, the Defence Minister, the Minister for Production, the Minister for Commerce and Industry, the Finance Minister and the Minister for Natural Resources and Scientific Research. He may be shortly called upon to look after the nation's health when Rajkumari Amrit Kaur proceeds abroad, principally to the United States, on a tour of several months.

Atomic Energy Programme

The cost of India's atomic energy programme for the next five years is estimated Rs. 63 crores. No provision has been made for the programme in the Second Five Year Plan. Meanwhile there are unconfirmed reports that the Soviet Union has offered a reactor to India. It appears that willingness of the Soviet Government to set up a reactor in India was expressed by Mr Bulganin and Mr Khrushchev during their visit to this country.

The Government of India is faced with the problem of finding and training enough personnel to man the reactors that are to be established under the programme already accepted, It is therefore unlikely that the Soviet offer will be accepted in a hurry.

Commission for Oil

The decision has been taken to convert the Oil and Gas Directorate of the Ministry of Natural Resources and Scientific Research into a Commission, on the lines of the Central Water and Power Commission. The Minister for Natural Resources and Scientific Research, Shri K. D. Malaviya, may head the Commission, which will have wide financial powers. It will execute the Rs. 39 crore programme of oil exploration for which a sum of Rs. 11.5 crores has been provided so far in the Second Plan. Meanwhile negotiations are under way with the Standard Vacuum Oil Company and the Assam Oil Company for the exploitation of oil that may be found in West Bengal and Assam respectively. The Government is already participating in a joint venture with Stanvac in the exploration of the oil resources of the West Bengal basin on the understanding that if oil is discovered, the Government will have a majority share in a rupee company to be formed for its exploitation.

Meanwhile talks will be continued with the Assam Oil Company to reach an understanding on the formation of a rupee company to tap, exploit and refine oil found in Assam. The Government's view at present is that the refinery in Calcutta should be a separate concern while the rupee company should devote itself exclusively to exploration and exploitation of oil. The Government is reportedly agreeable to the Assam Oil Company holding a majority share in the former, but would like to keep financial control over the refinery. There are also differences on the size and location of the refinery. These can perhaps be reconciled. But the Assam Oil Company is not prepared to talk itself out of an interest in the refinery because that is where the profits come from. The talks will be resumed shortly.

Meanwhile a High level committee of the Cabinet may be formed to work out the programme for oil exploration, advise the Government on the administrative set-up of the Oil and Natural Gas Commission and lay down policy regarding the Government's participation in joint ventures with foreign oil interests.

It now appears that the synthetic oil project of the Ministry of Production is likely to be abandoned. Instead a less ambitious scheme for the carbonisation of coal is being formulated.

Rehabilitation Finance for Jute

The procedure for giving loans to jute and textile mills for the rehabilitation of machinery is likely to be streamlined. The Secretary of the National Industrial Development Corporation, Shri L K Jha, will address letters directly to each individual factory, indicating the Government's terms for giving loans and asking the owner to apply for it on a simple form that would be attached. This will cut out red tape. The terms are liberal. An interest rate of 4½ per cent is charged and a simple hypothecation

is regarded as adequate. No security of collaterals is required. In the case of one jute mill, the N I D C has sanctioned Rs. 22 lakhs on a second mortgage. A loan of Rs. 6 lakhs has also been sanctioned to another jute mill. But the amounts have yet to be disbursed. No application has been entertained so far from the cotton textile industry. The N I D C has between Rs. 20 to Rs 25 crores at its disposal for the rehabilitation of the two industries during the Second Plan period. It would like to disburse the amount quietly. The procedural reform has been undertaken at the personal initiative of the young and energetic Minister for Industrial Development, Shri Manubhai Shah.

Letters to the Editor

Technological Change

I HAVE followed with interest the controversy provoked by Dr Raj's article on Small-Scale Industries. After reading X's latest rejoinder I am at a loss to understand what the logical flaws or hidden assumptions were in Dr. Raj's reasoning which X believes he has brought into the open.

X obviously agrees that it is only logical to take into account the dole required to maintain the displaced workers. The need for doing so was explicitly stated by Dr Raj in his article. If it is agreed that the leakage on account of the dole has to be taken into account, it follows that the choice of techniques in any one industry cannot be determined with reference solely to the relative profitability of different techniques in that industry, and this was Dr Raj's main thesis. But now X's complaint is that Dr Raj "did not care to state or work out the amount of dole or the number of workers displaced". This, it seems to me, is not a logical flaw whatever else it may be, and if Dr Raj had ventured some estimates of this earlier I am not sure whether X would not have acsed him of being still more "long-winded".

As regards the Keynesian and Marxian tools of analysis, I did not see any statement in Dr Raj's article to the effect that one was superior to the other or that the same problems could not be analysed with either of them. But, in economic analysis, different models do emphasize different factors, and here the difference in emphasis between the identity of saving and investment in the Keynesian theoretical system and the correspondence, which Marx stipulates as necessary, between the surpluses from Department I and consumption outlay in Department II is of some importance.

Also, when one speaks of propensities, one has in mind the behaviouristic tendencies of the individuals within a community, and there is nothing contradictory between individuals having a zero propensity to save and saving and investment being equal and positive for the community as a whole. And this would be always so as long as receipt of income and expenditure are not instantaneous. To say, therefore, that the saving emerges because of some assumed lagged relationship, and that otherwise propensity to save could never be zero when saving for the community as a whole is positive is a kind of logic-chopping which, whatever else it does, does not certainly clarify the issues involved. The main point obviously is that, even when the propensity to save is zero, the existence of time-lags may help to prevent an inflationary burst, but that a constantly rising level of output will be still necessary to maintain the same rate of investment. How is this the same thing as saying that "a certain rate of investment could not be maintained if the elasticity of supply of consumption goods, in spite of, say, a possibility of an infinite increase in their output, were not such as to meet adequately the demand for consumption goods"?

I agree with X that in a scientific discussion a person's face is less important than his argument. I shall therefore sign this letter as:

Progress in Middle East

Economic Developments in the Middle East 1945 to 1954. Department of Economics and Social Affairs, United Nations, New York,. pp 236. Price 17sh 6d.

DESPITE political disturbances, and perhaps because of the changes brought about by them, the Middle East made rapid progress in the post-war period. Taking the region as a whole, the rise in national income was distinctly greater than the population growth which indicates that the demographic rate of investment must have been exceeded. That progress during this period was most marked in the oil industry indicates that the dominating position of this industry in the economies of mid-eastern countries has, if anything, been strengthened during the post-war period.

The study of post-war economic developments in the Middle East, carried out by the department of Economic and Social Affairs of the United Nations, shows that although achievements are still far short of needs, this region has been achieving a fairly satisfactory rate of progress. In spite of the peculiar forces operating on most countries of the world during this period, it is interesting to note that this progress was achieved 'with marked monetary and price stability and without imposing too great a strain on the balance of payment'. That the rate of advance has been accelerated during the latter part of the period covered by this study has encouraged the authors of the Report to conclude that 'there is good reason to believe that in future, progress would be more rapid'.

Whether because of the political changes that have taken place or otherwise, the countries of the Middle East are, it appears, paying increasing attention to problems of development, and the fact that the rise in per capita income was not always much by corresponding consumption indicates the increasing proportion of national product that is being absorbed by investment. At the same time, the Report notes that in certain countries the increased provision of social services by Government has made a significant contribution towards raising the standard of living of large sectors of people. The Report finds that political and administrative reforms have in many countries increased the efficiency of the Governmenal machinery, and the need to produce quick results to satisfy the people has resulted in concentration of Governmental effort on such basic development projects as irrigation, power, transport and communications and the supply of agricultural credit. With the major resources of the State concentrated in these fields, Governments have found it necessary to leave other fields such as manufacturing and mining to private enterprise.

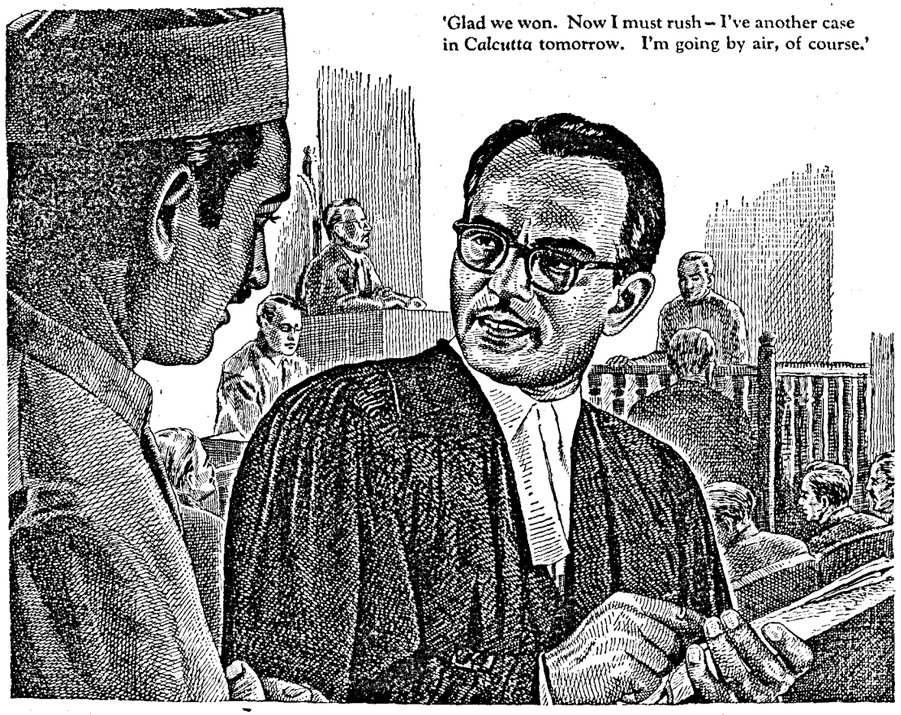
Investment in the oil industry increased from 1,000 million dollars in 1945 to approximately 2,200 million dollars in 1954. The proved resources of the area showed an increase of 240 per cent over the 1945 figures so that the share of the Middle East in world reserves rose from 40 to 60 per cent over the period.

Production of crude petroleum quadrupled over the period, raising the share of the Middle East from 9.4 per cent to 19.7 per cent of world output. This was in spite of the well-known fall in Iran's oil production as a result of which Iran's share in Middle East output declined from 55 per cent in 1946 to 2 per cent in 1954. Obviously, therefore, the fall in Iran's output was more than offset by the increase in the production of oil in Iraq, Kuwait and Arabia. Now that an agreement has already been reached between the Iranian Government and a consortium of major oil companies as a result of which Iran's crude oil output is expected to be restored to the 1950 level by 1957, the impact on the economy of oil in the Middle East will have to be considered seriously.

While production of crude oil increased so rapidly, refining capacity increased comparatively slowly. It is well known that there has been a powerful tendency in operation for refining capacity to be set up at the consuming centre rather than in the Middle East; as a result, the bulk of crude oil was exported as such and a decreasing proportion of the world's refined oil was produced in the Middle East.

The measure of attention which is now being paid in the Middle East to the more eventual interest of various countries is proved by the efforts being made to utilize and conserve the region's natural and refinery gases which were hitherto burned in large quantities. In Saudi Arabia a field pressure maintenance plan was completed at a cost of 19 million dollars to re-inject high pressure gases into the oil reservoir. In Egypt a fertiliser plant has been built to utilize the gases of the Suez refinery while in Kuwait natural grases are being utilized to distil sea water for drinking purposes.

The growing oil activities in the issue as well as changes in oil agreements have resulted in higher revenues for oil-producing countries. Not all this increased revenue, unfortunately, was utilized for economic development. Nevertheless, the absolute amount spent for such purposes has tended to increase. The high and rising volume of investment in this region is, therefore, to be principally explained in terms of the prosperity of the oil industry.



But the development that has taken place in the region, financed though it has been by revenues derived from the oil industry, has in fact been fairly diverse. Agricultural output in 1953 was a little more than one and a half times that of 1945. It is interesting to note that land reforms in Egypt and other eventual and social changes in the region are credited with having removed some of the greatest obstacles to development. "The importance of raising agricultural production to keep pace with the advance of the other sectors of the economy", says the Report, "is being increasingly understood, and efforts are being made to expand domestic output of food and agricultural raw materials; such an increase is essential if development in industry, transport and other sectors, is not to lead to inflation or an unbearable strain on the balance of payments, or both".

The increase in agricultural production is mainly attributable to the extension of cultivated area which in 1953 was more than 40 per cent above the pre-war average. This extension was made possible partly by greater mechanization, partly be increased irrigation, and in recent

years, by exceptionally favourable weather conditions. Yields per acre have, however, risen only slowly, and during the last two years of the period covered they were only slightly higher than the pre-war level. Efforts in these countries are, however, now being directed towards increasing yields as a primary object so that unfavourable changes in weather may be offset in future. An important feature of the improvement of agriculture has, however, been the lack of diversification. The combined share of cotton and grains in the exports of the region actually rose over the period. The need to expand output of livestock products and fruit is only now being realised —a realisation stimulated presumably by the fall in world prices of grains in 1953-54 and by the market surplus in US cotton. Industrially too, the region also made good progress. A large number of new industries were established for the first time in the region. Isral, Egypt and Turkey were among the foremost. But even the less industrialized countries like Iran, Syria and Iraq built up during the period consumer goods industries such as textiles and building materials such as cement, glass and bricks.

The authors of the report stress that industrial growth in the Middle East has been achieved mainly by private enterprise. At the same time this development has owed much to various forms of Government encouragement including tarrif protection, exemption from customs duties for raw materials and machinery, remission of taxation, provision of crude oil at reduced rates, allocation of foreign exchange and preferential treatment in final purchases". Since there is likely to be an intensification of Government aid during the next few years, the Report visualises a further acceleration of industrial progress in the immediate future.

Apart from a carefully-prepared introduction which endeavours to present an over-all view of the main economic trends in the Middle East, the present Report carries separate chapters devoted to individual countries: Egypt, Iran, Iraq, Lebanon, Syria and Turkey. These studies throw more detailed light on economic development in the respective countries and the part which has been played by Government policies. They are highly useful, and one would have liked the department to carry out similar studies of some of the other areas in the Middle East which, though smaller, are no less important.

'Glad we won. Now I must rush – I've another case in Calcutta tomorrow. I'm going by air, of course.'

When you have a journey to make, think first of flying. It's the fastest way to travel, and often the only way to get there in time. You escape all the tedium of a long journey – flying is so quick, convenient, and wonderfully comfortable.

Crisis in the Cotton Market

K D Umrigar

THE forward market in cotton futures in Bombay is not likely to resume normal business for some time longer. The authorities concerned are, it appears, not satisfied that the reopening of the market in the immediate future will, in any way, ease the tension and general uncertainty created by the suits recently filed by some members of the East India Cotton Association against the Forward Markets Commission and the Association.

There is no doubt that the situation has been causing grave concern not only to the cotton trade, but also to the Forward Markets Commission. Under the Forward Contracts (Regulation) Act, the Commission is the 'eyes and ears of Government'; it advises Government from time to time, on what action is necessary for the proper regulation of the market. The association is fully aware of the fact that the Commission has wide powers which it has been directed to exercise if and when it feels necessary to do so in the best interests of the trade and in public interest.

Some members of the Association, it is true, do not see eye to eye with the Commission, accusing it of 'undue interference' with the day to day working of the market. In other words, they are opposed to its functioning as a body superior to the East India Cotton Association. The importance of the Association which has hitherto carried on its affairs admirably can hardly be denied. It is the oldest organisation in this country and has guided the trade correctly, thanks to its competent and experienced President, Shri Purshotamdas Thakurdas, who is undoubtedly a great authority on cotton transactions.

Government has, however, come to the conclusion that forward markets in cotton and other commodities would work better if they were controlled under suitable legislation enacted for the purpose. Very soon, we shall have legislation controlling transactions in stocks and shares also; in fact, it is now on the anvil of Parliament. It seems to be the desire of Government to bring the functioning of public organisations such as the EICA into conformity with certain laws and regulations governing trade and industry. Rightly or wrongly, this is being construed by a section of the trade as 'regimentation.'

"If the passing of the Forward Contracts (Regulation) Act is 'regimentation', then you might say that the whole country is being subjected to regimentation," according to official sources. The Forward Markets Commission cannot possibly abdicate its functions which have been well defined by the Act. It has already granted recognition to the EICA and approved its bye-laws with some amendments. The suggestions made by the Commission, after it was brought into being under the Act, in regard to the proper regulation of trade were, no doubt, resented by the Association. In fact, even to this day, a section of it is of the opinion that it should not be dictated to by the Commission.

A Climax

It cannot be gainsaid that the views of the President of the EICA were similar. He wrote to the Chairman of the Commission that the Association would never reconcile itself to any dictation from anybody. Recently, the differences of opinion between the President and the Commission reached a climax when Shri Purshotamdas Thakurdas tendered his resignation, and his colleague, Shri Chimanlal B Parikh, followed suit. Their resignations have been the subject of comment in trade circles which regret much the step taken by the President and Vice-President.

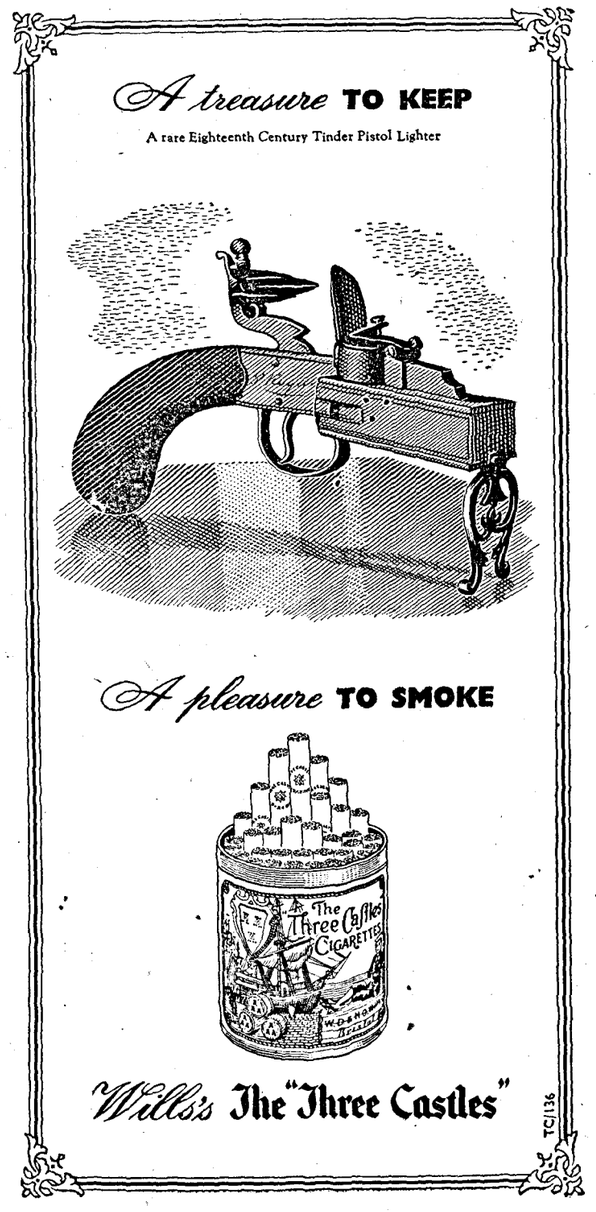
Are the differences between the Association and the Commission so serious that they cannot be ironed out by a free and frank discussion at a round table? I know of a much more serious crisis which occurred many years ago, as a result of the obstinate attitude of the then Government of India towards the cotton trade, but the difficulty was surmounted after a free exchange of views. At any rate, trade circles are not happy over the unfortunate incident, and they hope that the Board of the Association will take a dispassionate view of the matter and bring about harmonious relations between the Forward Markets Commission and the Association.

Let us examine briefly the whole position culminating in the resignations of the two stalwarts of the cotton trade. Shortly after the Association had been granted recognition by the Commission, the first difference of opinion between them arose. The Commission proposed that the Association should adopt a system of margins, and it was only because the Commission refused to grant permission for the opening of trading in the February 1955 contract and the market had consequently to remain closed for nearly six weeks, that the President of the Association ultimately agreed to the imposition of margins. At that time, some members of the Association thought that the President should not have yielded to pressure from the Commission.

Subsequently, the Commission recommended certain amendments to the bye-laws of the Association, and suggested that the matter could be properly thrashed out by discussion. But the Association is stated to have expressed its unwillingness to meet the Commission and it took unilateral positions causing embarrassment, to some extent, to the latter.

As early as October 1955, the Vice-President of the Association, during a discussion with the Commission, expressed the view that it was desirable to commence trading in the May 1956 contract as early as possible with a view to avoiding a squeeze on the February 1956 contract, the prices of which had been rising by leaps and bounds. The Commission fully shared his fears and granted permission on October 24 for the opening of the May 1956 contract in the hope that it would, to some extent, divert pressure on the February contract and bring down prices to a reasonable level. Unfortunately, the opening of the May contract did not have any appreciable effect on the price of the February contract.

Meanwhile, the question of cotton prices was raised at the meeting of the Export Advisory Council by the Minister for Commerce and Industry, who had been apprised of the position of the market. The Minister told the Council that Government would not release any further export quotas for cotton till prices stabilised themselves at lower levels. Later, the price of the February contract declined from Rs 709 per candy on November 26 to Rs 688|8 per candy on November 30, but thereafter it rose again.



The Commission was of the view that illegal option business was responsible for pushing up the prices of the contract, and so it thought it desirable to discuss the situation with the President of the Association. The Commission advised him to examine the books of certain operators suspected of doing illegal option business and to take disciplinary action against them, if he was satisfied that there was adequate evidence against them. But no action whatsoever seems to have been taken by the President, and the result was that the situation deteriorated further, the price of the February contract rising to Rs 731|8 per candy. Thus, the market was heading for a crisis which was partially due to the 'unbridled option business going on in the market.' In the circumstances the Commission had no alternative but to address a letter to the President of the Association 'pointing out that the rapidly rising trend of the prices of the contract was likely to create a serious situation, if it was not arrested in time and inquiring what action he proposed to take so as to prevent the situation from getting out of hand'.

Prices Not Representive

As the President of the Association did not take the necessary action, the Commission wrote to him again on December 21, referring to the fact that the price of the contract had 'reached a point where prices were not representative of the supply and demand position and were influenced by heavy speculative activities' and advising him specially to 'convene a meeting of the Board immediately to consider the position and to assume the emergency powers provided in the bye-laws'. This was further impressed upon him by the Chairman of the Commission, who personally called on him to discuss the matter. Shri Purshotamdas Thakurdas, presumably after discussions with his colleagues on the Board, did not feel justified in taking the measures suggested to him by the Chairman of the Commission. As a result, the price of the February contract rose to Rs 747 per candy.

The Commission, therefore, addressed a letter to the President asking the Association to take appropriate action under its bye-laws so as to prevent the prices of the February contract from rising above Rs. 700. When the facts of the situation came to be known to the trade, the Board passed a resolution on January 6, declaring an emergency and fixing a maximum price of Rs 700.

These are the circumstances in which the Commission intervened and directed the Association's Board *to resort to special powers* 'in the public interest.' It is not necessary to go into further details which are too well known. The Commission appears to have been justified in intervening in the matter, as the prices of important varieties of cotton came down after its intervention, but the President of the Association and his colleagues felt otherwise. It is rather difficult to say what would have happened if

Milk for the Millions

G A Rao

THE problem of milk supply in India has many facets. In spite of the enormous cattle wealth in terms of number, milk supply has always remained an unsolved problem. Though in view of the economic condition of the peasant the use of milk would be a luxury, in the urban areas, milk is used almost everywhere as a principal item of diet. However, the supply of a sufficient quantity of pure milk has always been a problem.

Bombay has set an example in the supply of good milk, with the implementation of the Bombay Milk Scheme. Two institutions have been working on this scheme: The Aarey Milk Colony and the Kaira Co-operative Union in Anand. The solution of the milk problem in Bombay should serve as an example to other cities.

The Kaira Union is a unique institution in the country. It stands for the very spirit of co-operation. To a large extent, the success of the scheme is due to certain favourable circumstances in the life and vocation of the peasants in and around Anand.

The factor, which is of the greatest importance, is the economic position of the peasant. The peasant of Gujerat comes next to that of the Punjab in economic prosperity. With valuable gifts of nature, such as a rich soil, combined with a favourable monsoon, the peasant is assured of a good harvest. This prosperity makes it possible for him to rear buffaloes, which supply plentiful milk for consumption and sale. Rearing of buffaloes is the rule rather than the exception in Anand.

Bajra, which is a staple crop in these parts, provides the farmer food and the stalks serve as rich fodder for the cattle. The farmer does not have to incur fresh monetary expenditure to maintain his animals. Viewed from this angle, milk and milk products are by-products of agriculture, Bajra being the main crop.

The intelligence of the peasant helps him to choose the best course of action. In January 1946, a meeting was called to start the co-operative venture under the chairmanship of Shri Morarji Desai. The people had no difficulty in understanding the value of such an organisation for them. Thus the Kaira Co-operative Union began to function. This mutual understanding and co-operation has resulted in the steady growth and final success of the institution. Now, within 7 years of its inception, the facilities afforded by the Union are being availed of to the fullest extent by the peasants and this has contributed much to their advancement.

Constitution and Structure

The Kaira Union is an apex institution, with 64 affiliated village societies spread over a radius of 14 miles around Anand. Every morning and evening, trucks go to the villages on cart tracks to collect milk. The members come to the collection centres with their milk. Here, the milk is measured and its price paid in cash on the spot. The milk is examined and tested in the presence of the member supplying the milk and the price is based on the fat content and not solely on the quantity of milk—to discourage adulteration. The trucks take the milk to the dairy, which is equipped with modern machinery for processing and cold storage. The pasteurised milk is sent to Aarey. The Union has thus a ready market for the milk produced by its members.

The administrative affairs of the Union are dealt with by an elected body consisting of representatives from village societies. This elected body is advised on technical points by two experts who have had training in dairying in the United States and New Zealand. The village societies in their turn have similar elected bodies to attend to their own administrative problems. This administrative set-up has worked very well.

Aarey vs Kaira Union

The chief customer for the Kaira Union is the Government of Bombay. In pursuance of the scheme, a milk processing plant has been erected at Aarey, and the Union gets the full benefit of this institution.

The special features of the Kaira Union which distinguish it from the Aarey scheme may be summarised as follows:

1 The development of dairy farming on co-operative lines, with minimum possible Government aid.
2 The development of dairy farming as a subsidiary industry, agriculture being the main means of subsistence.
3 The development of dairy farming as a cottage industry, where the cattle are kept and maintained by the farmer on his farm.
4 Provision of an additional source of income and economic security

Table illustrating the progress made by the Union from 1947-48 to 1954-55.

	1947-48 July to June	1948-49 July to June	1949-50 July to June	1950-51 July to June	1951-52 July to June	1952-53 July to June	1953-54 July to March (9 months)	1954-55 April to March
Number of societies	8	13	27	33	58	62	64	64
Number of farmer members	432	924	1,995	3,873	8,992	11,307	14,741	18,983—*
Profit : Rs.	2,852	2,237	81,125	2,30,000	5,91,355	6,69,546	4,89,570	5,76,160
Bonus to societies : Rs.	—	—	24,865	72,731	1,10,586	1,36,889	99,790	1,10,537

* The number of farmer members has now increased to 20,482 and the share capital of the Union has increased to Rs 3,17,900.

since the enterprise supplements the farmer's income. Thus the Kaira Union encourages a system of dairy farming for the rural parts where similar conditions prevail. It is true that one cannot expect a ready-made market, as exists for the milk produced by the Kaira Union; but milk processing and storage, or a dairy for a group of unions, is bound to be a practical proposition, considering the profits the Kaira Union is making. The Aarey scheme has, however, struck a totally different line of development. It is entirely run by Government. It is State-owned and State-managed.

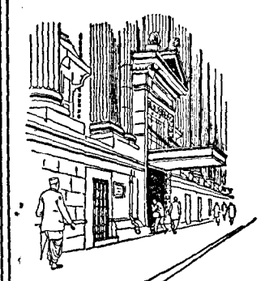
It seeks to provide pasteurising facilities to urban sellers of milk who would otherwise have had unsatisfactory and insanitary conditions for their cattle and milk. In Aarey the cattle are moved from the city to the Colony where better facilities are provided for care of the cattle. It has set standards and the consumer is assured of a steady supply of milk of a good quality at a fixed rate.

The Pricing Problem

What is of real importance is the pricing problem. Common sense requires that the scheme which can supply milk at the lowest rate should be preferred. If the Aarey scheme is given up, the objection would be that the urban milk sellers would have to face the risks of the trade single-handed. A successful milk policy must be able to reconcile these two opposing trends. If pricing were to be the only consideration, the Kaira Union would win, for it is able to supply milk at As 10 a seer, as compared with As 0-13-6 a seer, which is the price of milk bought by Government from elsewhere.

Probably the most convincing argument in favour of the Kaira Union is its brilliant progress report. In 1948 (June to July) the profit was Rs 2,237. It rose to Rs 5,76,160 in 1954-55 (April to March). The bonus distributed to societies was Rs 24,865 in 1949-50 (June to July). It rose to Rs 1,10,537 in 1954-55 (April to March). The dairy in its new premises, is capable of handling 3,00,000 seers of milk a day, of which 1,50,000 can be converted into milk products. The dairy can turn out 10,000 lbs. of butter and ghee, 12,500 lbs. of milk powder and 1,200 lbs. of caseine every day.

STATE BANK OF INDIA



Successors to the Imperial Bank

The need of the day

Our country's economy is expanding rapidly and with the Second Five Year Plan in sight it will gather further momentum. The need for a strong and efficient banking system has never been greater than today as the nation's savings require to be pooled and managed in a resourceful, confident and prudent manner.

The State Bank fulfils these expectations. It has started upon a programme of opening 400 additional branches throughout the country within the next five years.

The State Bank of India offers to serve you efficiently in many ways. It takes care of your savings and valuables, lends moneys against goods, produce and other approved securities and assists you by accepting appointment as executor and/or trustee of your will or trust. Its wide and varied services are at your disposal. Why not talk things over with your nearest bank agent, or write for information?

The State Bank's local head office at Bombay, one of more than four hundred offices waiting to serve you throughout India

STATE BANK OF INDIA

Largest of the Indian Joint Stock Banks

The principles of co-operation are stuck to in the working of the Kaira Union. The division of profits is one example of the observance of the co-operative principle. The profits are divided between members in proportion to the milk that they sell to the Union and not on the basis of the share capital contributed by the members. The contribution of the member towards the working of the Society is the determining factor in the sharing of profits, though every member is given equal opportunities to avail himself fully of the facilities afforded by the Union.

The Kaira Union has been slowly expanding its sphere of usefulness to members. And it has been responsible for some important dairy development features which include cement concrete cattle standings, silo towers for storage of fodder, quality control of milk, artificial insemination service, manure pits and land transformation and research.

The Kaira Milk Union marks a step forward in the annals of co-operation in India. We should have many more institutions of that type.

What Price Nationalisation?

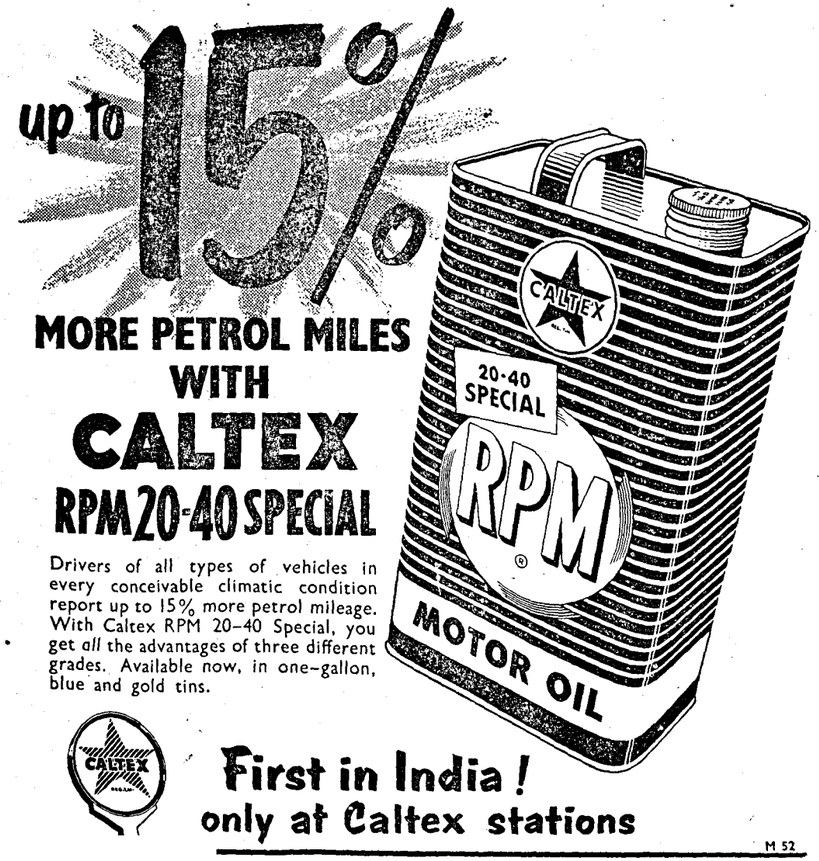
(From a Correspondent)

THE Joint Select Committee of Parliament on the Life Insurance Corporation Bill has submitted its report and the third reading of the Bill will be taken up for consideration by the Lok Sabha during the current session. Apart from organisational problems, the most important issue is the compensation to be paid to the companies whose business has been taken over. Out of the 149 Indian companies affected by the Nationalisation Bill, about 62 are 'surplus' companies, as disclosed by the latest available actuarial valuation of their assets and liabilities. It is learnt that according to the formula for compensation, as it has emerged from the deliberations of the Select Committee, these 62 companies (whose aggregate business in force as on 31st December 1956 amounts to over Rs. 1,000 crores), will between them receive approximately Rs. 4 crores by way of compensation.

Briefly, the compensation formula is that the surplus companies should be paid a sum equivalent to 20 times their future dividend-earning capacity. The companies concerned have no objection to this principle, but they point out that the formula adopted by the Select Committee for estimating the dividend-earning capacity is not fair.

They have advanced two grounds in support of their view. First, instead of estimating the surplus as on 19th January 1956, the date of nationalisation, or for reasons of convenience, as on 31st December 1955, the amended Bill seeks to take into account the average rate of surplus as disclosed by the last two valuations of each of the companies, and the average business in force for the six-year period 1950 to 1955. Life insurance business during the last decade has been going up steadily, even rapidly, and the trend is surely going to be maintained and even strengthened in the years to come. Therefore, by taking into account the figures of business and surplus-earning capacity of an earlier date, the value of the property nationalised and its earning capacity are being underestimated, and the shareholders of the companies are being deprived of their just due.

The second flaw in the formula is even more serious and less justifiable. As is well known, the whole of the actuarial surplus of life insurance companies does not belong to shareholders. The Insurance Act of 1949 permitted up to 7½ per cent of the surplus to be allocated to shareholders. Many companies in fact have been allocating 7½ per cent to their shareholders, and the prices of their shares have been attuned to this expectation. Special considerations have prevailed in the case of companies that have made a smaller allocation. Now the compensatton formula seeks to reduce the shareholders' share of the surplus from the customary 7½ per cent to a uniform of 5 per cent for all companies, thus slashing substantially the compensation payable.



It is true that some companies in the past allocated 5 per cent only, but these usually were companies of long standing whose business had grown to sizable proportions by the flux of time, and whose quantum of surplus therefore would be very large on the basis of the statutorily-permitted maximum of 7½ per cent. It is not correct to affirm that those who have set aside a smaller percentage for shareholders are the more 'enlightened' companies. Other things being equal, a ten-year old life insurance company, however enlightened its management, would need to set apart a higher share of the surplus (within the limit placed by the law of the land), than a fifty-year old company.

It has been contended by the companies concerned that by reason of these two flaws in the compensation formula, the shareholders of the surplus companies stand to receive only 41.7 per cent. of their just due on a proper appraisal of the value of their property. Without going into the mathematical nicety of these calculations, it is evident that under the Nationalisation Bill as it stands, the State proposes to acquire an established business with an assured future at a price which is less than fair.

Ultimately, the action will be sought to be justified in terms of Government's—and the country's—declared objective of progressing towards a socialistic pattern of society. This argument, however, assumes that every shareholder is a 'capitalist'. How far is this true?

There are no statistics available about the pattern of shareholdings in our country. But so far as insurance companies are concerned, the following facts are relevant and well-known. Firstly, there is no Managing Agency system in this field. Secondly, there are severe statutory restrictions on the percentage of an insurer's capital that may be held by an individual or an institution. This and the fact that the profits of life insurers are stable, compared to those in manufacturing industries, have helped to make the shareholding in insurance companies' capital very widely spread in the community.

Because of these features, it can be said that only a small number of these shareholders would be living on their interest income. The majority belong to the middle-class having non-speculative investment habits. Is this class of people to be called upon to sacrifice in the name of progress towards a socialistic pattern of society? If so, they are doubly sinned against—first by the 'unscrupulous' insurance managements of the past (in so far Government's charges are true), and secondly by an honest Government aspiring to usher in Socialism by constitutional methods. The greater is the pity.

Tista Flood Problem In West Bengal

— Embankments No Solution

Kumud Bhushan Ray

AT a meeting at Darjeeling on April 4, 1956, the Technical Committee of the State Flood Control Board, West Bengal, proposed that an embankment should be constructed at a cost of Rs. 20 lakhs on the left bank of the Tista River for protection from floods in the Barnes-Mainaguri area. Now an embankment along the right bank of the Tista River was constructed in 1955 for the protection of Jalpaiguri Town (AB, see Fig. 1). After the proposed left embankment is constructed, the flood waters of the Tista in the Jalpaiguri-Barnes-Mainaguri area will be confined within its wide channel. The question that naturally arises is: will this pair of embankments provide a permanent solution to the flood problem posed by the Tista?

Embankments constitute the oldest form of river engineering in the alluvial plains of the world. In China they have been in use since 603 B C having been first constructed in different provinces in the interests of individual land-owners. In A D 69 under the Han Dynasty they were also put up along the banks of the Yellow River, but old records show that serious difficulties were experienced after their construction; in many instances they proved uneconomical and sometimes positively harmful.

Embankments do not prevent erosion of river banks, so that the channel gradually becomes wider and shallower and develops a tortuous alignment. The hydraulic mean depth of a wide and shallow channel is less than that of a narrow and deep channel of the same sectional area, so that when owing to erosion of river banks there is widening and shallowing of a channel, its hydraulic mean depth goes on decreasing. Moreover with the development of a tortuous alignment, the length of a river channel goes on increasing, so that its slope of water surface goes on flattening. The velocity of a current of water in a river decreases with a decrease in the hydraulic mean depth and also with a flattening of the slope of water surface. Thus with the widening of a channel and the formation of bends due to erosion of river banks, there is gradual decrease in the velocity of a current of water. The drainage capacity of a river also decreases. With inadequate drainage capacity, excess water goes into channel storage, so that the flood water level in the river goes on rising. When the water level rises to the brim of the channel, excess water goes into valley storage, riverside lands are submerged and there are floods.

River water transports silt load. The catchment of the Tista lies in the Himalayas, which are 'young' mountains formed in the tertiary era of geological time. An enormous amount of detritus is formed by the action of nature's forces of denudation, which forms the silt load of the waters of the Tista. The power of a current of water to transport a silt load varies in geometrical progression with its velocity. Hence as the velocity of a current of water decreases, it goes on depositing a part of its silt load on the channel bed, raising its level. With a rise in the level of the channel bed, there is automatically a rise in the flood water level also.

Thus the construction of embankments along a river causes a gradual rise in flood water levels in its channel, and in a few years, the height of the embankments becomes insufficient. To keep the flood water confined within the embankments, it becomes necessary to raise their height. In China, as a result of repeated raising of the height of embankments, the Yellow River now flows high on a ridge of its alluvial plain.

In the U S A., embankments or levees were constructed along the Mississippi River near New Orleans in 1777. Between the years 1833 and 1927, the heights of levees were raised by as much as 17 feet, between Memphis, Tennessee, and Helena, Arkinsas. In spite of such a rise, levels were overtopped and breached. In the year 1882, there were 284 levee breaches. The largest number of levee breaches, however, occurred during the great floods of 1927, in which 20,000 square miles in 6 States were submerged; there were about 350 deaths, 60,000 people became homeless and damage to property was estimated at 270 million dollars. Hence after the floods of 1927, instead of raising levee heights, three overbank leveed floodways have been constructed to drain away the surplus flood water that cannot be accommodated within the leveed river channel.

In the U S A, levees have also been found to accentuate the meandering tendency of a river. The Yazoo Levee District in the Lower Mississippi River has 178 miles of levees. Owing to erosion of river banks and consequent meanderings of the channel, the original levees have mostly been undermined and destroyed, necessitating the construction of new levees on successive retired alignments. A total of 305 miles of levees has therefore had to be constructed for the maintenance of the original 178 miles of levees in the Yazoo Levee District.

In India also embankments or as they are called 'bandhs' have been found to give rise to more evils than they eradicate. In his book, 'Various Problems connected with the Maintenance of Rivers and Drainage Systems of the Gangetic Delta', (1920), Addams-Williams, a Chief Engineer of Bengal, wrote:

> "With regard to embankments, our experience has been that wherever they exist, they have raised problems as great as, if not greater than, those with which they were intended to deal; either in course of time they have raised flood levels, or have led to the extinction of rivers by causing silting, and have brought about water-logging and severe epidemics of malaria and other diseases".

In his Foreword to the Book, 'A Comprehensive Treatise on North Bihar Flood Problems by Ghosh, Hall, a Chief Engineer of Bihar, too came to the same conclusion:

> "In the old days, whenever a flood problem arose, the answer was let us build a 'bandh'. Famine relief work, which frequently comprised the erection of bandhs, was in no small measure responsible for the present trouble. The problem is not to prevent floods,

which has been the erroneous idea in the past and which has led to the promiscuous construction of private bandhs which are the primary cause of the havoc now caused by floods, but to give them (floods) an easy run-off."

In the publication, 'Multi-purpose, Projects in India: Damodar Valley.' published by the Government of India, it is stated:

"The present policy of keeping floods in check by marginal embankments is not successful. It costs large sums of money, is unremunerative and does not provide protection against major floods.

Experience in ancient China, in the U.S.A. and in India, therefore makes it apparent that embankments on a river provide no permanent solution to the flood problem.

The Tista Channel

At the Ferry Crossing, connecting Jalpaiguri Town with Barnes across the Tista, the channel width on March 13, 1955, was 11,540 feet or a little over 2 miles, while the low water level in the flowing channel was 267.48. A remarkable feature was that from about 7,200 feet to 10,200 feet, the dry channel bed was in places as low as 262.71 (Fig. 2). This means that although a 3000 foot width of the Tista channel was lower than the low water level of 267.48 in the flowing channel, it formed a part of the dry channel bed. Or, in other words, the current of water in the flowing channel had deposited silt and raised the level of its banks during the dry season, so that the Tista flowed on a ridge, and not over the lowest parts of its 2 mile wide bed.

The maximum discharge, carried by the Tista during the very high flood of 1954, as recorded on August 24, 1954, has been calculated roughly as follows:

1. Discharge Q_1 spilling over the right bank of the Tista. Spilling area over a length of 2,500 feet and average depth of 1' 6", and average velocity 3 feet per second. $Q_1 = 2500 \times 1.5 \times 3 = 11,250$ cublic feet per second.

2. Discharge Q_2 passing through the main Tista channel. Sectional area of channel at highest water level—35,500 sq. ft. Average velocity, from surface velocities at 3 points —8 ft.—secs. $Q_2 = 35,500 \times 8 = 284,000$ cubic feet per second (cusecs).

3. Discharge Q_3 passing through a breach in the Barnes-Domohini railway embankment. Section of water flow through the breach—3500' x 5'. Average velocity of water about 8 feet per second. $Q_3 = 3500 \times 5 \times 8 = 140,000$ cusecs.

Total discharge carried by the Tista:

$$Q = Q_1 + Q_2 + Q_3$$
$$= 11,250 + 284,000 + 140,00 \text{ cusecs.}$$
$$= 435,250 \text{ cubic feet per second (cusecs).}$$

It will be seen that the 2 mile wide Tista channel could carry a discharge of only 284,000 cusecs, while the amount of water spilling over its left bank and flowing into the Dharla river was about 50 per cent of this. There is thus sufficient fall from the Tista into the Dharla to induce such a large flow. The velocity decreased, so that large volumes of sand have been deposited on fertile paddy lands.

With a sectional area of the main Tista channel at 35,500 square feet, and width of channel at 11,540 feet, the average depth of water in the channel is about 3 feet. Thus, although the river has a steep slope of about 3.5 feet per mile near Jalpaiguri Town, owing to the small average depth of water and consequent low hydraulic mean depth, the average velocity is only about 8 feet per second. No wonder that with such a low velocity during high floods in the Tista, when river water transports a large silt load, a current of water deposits a part of its silt load on the channel bed. Thus on account of the widening of the Tista channel to about 2 miles, there is deposit of silt, leading to a rise in the level of the Tista channel bed and in flood water levels.

Rise in Channel Bed

The rise in the level of the Tista channel bed has led to the rise in the dry season low water level and in the flood season high water level. From the gauge readings, maintained at Barnes, the lowest water level registered in the dry season and the highest water level in the flood season in the years 1941-1954 are as shown in the table below.

A study of the gauge readings shows that there has been more or less gradual rise in the low water level from 258.84 in 1941 to 263.90 in 1954, or a total rise of about 5 feet. Similarly there has been a gradual fluctuating rise in the H.F.L. from 266.54 in 1941 to 277.50 in 1954, or a total rise of over 10 feet. In this period, there has thus been an appreciable rise in the channel bed and water levels in the Tista River near Jalpaiguri Town.

In the tributaries of the Tista, there has also been an appreciable rise in the channel bed and water levels. For instance, in the Karala River, which has its outfall into the Tista in Jalpaiguri Town, the dry season water level on March 16, 1955, just south of the bridge on the Railway Station Road, was 4' 6" above the invert of the pukka drain outfall, while previous to 1950 the dry season water level used to be 1' 6" below the invert. The rise in the dry season low water level in the Karala River in the 5 years from 1950 has, therefore, been 6 feet.

In the Ghish River, another tributary of the Tista, in the year 1903, the water was deep enough in the channel at the railway bridge to bathe in. Now there has been a rise in the channel bed of the Ghish, so that it is within about 5 feet of the bottom of the girders, while the channel is dry in the dry season.

A HISTORICAL STUDY—The present course of the Tista channel does not appear to have existed around seven hundred years ago in 1206 and 1255 A.D., when the Mohammedan army invaded Assam, the Karatoya used to be the western boundary of the Kamarupa Kingdom, and it was the only large river that was crossed by the invading army. It is probable, therefore, that in the 13th century, Tista water used to flow through the Karatoya, which then had a large channel, as mentioned by the Mohammedan historians.

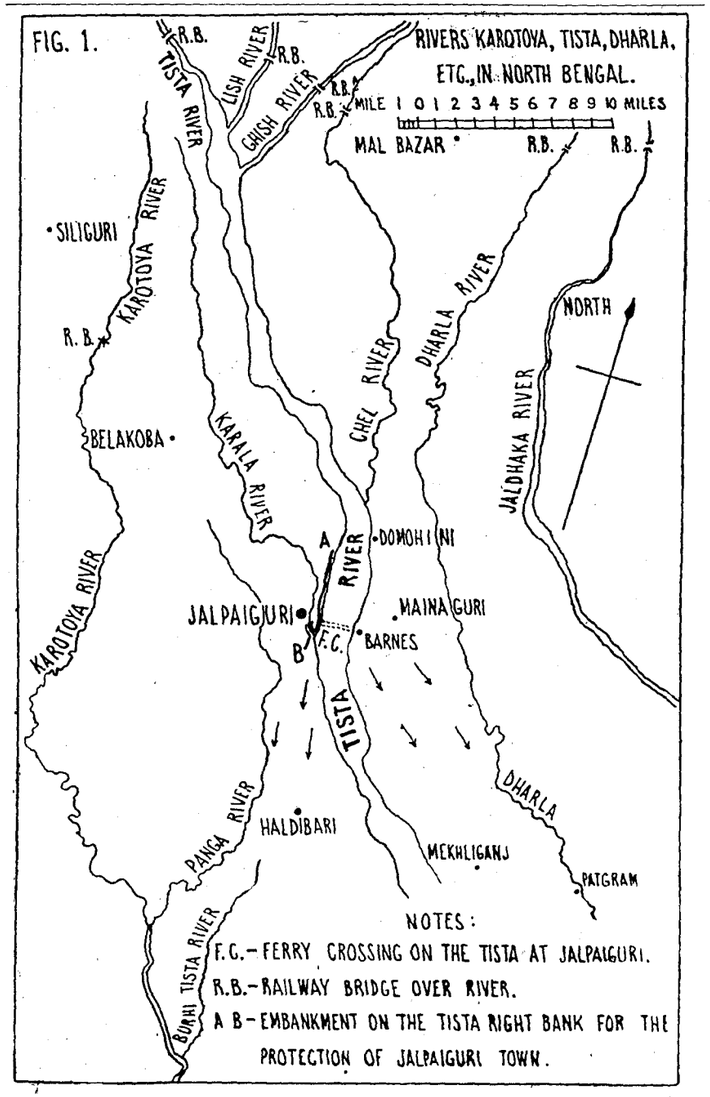
From the Kalika Purana and from inscriptions on copper grants of land made by ancient kings of Kamarupa, some interesting facts come to light:

Chapters 81 and 82 of the Kalika Purana give a vivid description of a colossal flood in the Brahmaputra valley in Assam, when the sage Parashurama cut a suitable outlet with his axe in the hills on the banks of the Brahmaputra Kunda or lake, as a result of which the water stored in the lake found its way into the Brahmaputra channel and the water rose to such a high level that it was difficult to distinguish between the water of the furious Brahmaputra and that of the sacred lakes in Kamarupa.



In ancient times, there was considerable intercourse between India and China. Communication between Assam and China though existent was exceedingly difficult, being about two months' march through pestilential jungle and mountain, as Hiuen Tsiang the Chinese pilgrim has noted. Nevertheless, communication did exist long before the days of Hiuen Tsiang, as is testified by Chang Kien, Chinese soldier-explorer in Central Asia in the second century B.C. who has stated that there was trade between northeast India and southwest China, through routes among the southern barbarian people. Although the sources of the Indus, the Sutlej, the Ganga etc. were more or less known to be across India's border, it is strange that in spite of the close intercourse between Assam and China, geographers and geologists were not certain even at the end of the 19th. century, of the Tsangpo in Tibet being the upper reach of the Brahmaputra in Assam.

From these facts, it appears that the Tsangpo at one time drained its water into a large lake in East Tibet, which has been described in the Kalika Purana as the Brahmaputra Kunda. The Dihong, a north bank tributary of the Brahmaputra, in extending its channel by cataract action across the East Himalayas, captured the water of the Brahmaputra Kunda, the outfall lake in Tibet for the Tsangpo. This natural phenomenon appears to have been described in the Kalika Purana as if the sage Parashurama cut a hill with his axe on the bank of the Brahmaputra Kunda. The sudden exit of an enormous amount of water, stored in the Tsangpo Outfall lake through the Dihong and the Brahamaputra, must have created an abnormal flood height in the Brahmaputra channel, so that all the inhabitants of the riverside plains perished. This enabled the hill-tribes who lived on hill tops and were not affected by the floods, to occupy the country. The several tribal kingdoms in East Kamarupa, were established in the 13th century. Durjay, the capital of Kamarupa on the banks of the Brahmaputra, must have been affected by the abnormal flood, so that it was shifted to Kamata, near Cooch Behar, also in the 13th. century.

It appears, therefore, probable that the Dihong captured the water of the Tsangpo, stored in the Outfall Lake in Tibet, sometime before the 13th century when the tribal kingdoms were established and the capital was shifted from Durjay.

Around Calcutta Markets

Steady Trend

TRADING on the stock market here has been characterised by certain contradictory trends during the last few days. Clearing shares have, more than once, tried to move up. But these attempts have not been very successful. Far more significant is the lack of response of cash scrips to the steady trend in clearing shares. Optimists, however, believe that cash scrips will gradually follow the bulge in clearing shares. That remains to be seen.

This week's steadiness in clearing shares is mainly due to settlement considerations. 'Budla' charges indicate that the weak 'bull' position persists. Meanwhile, the precautionary measures taken by the stock exchange authorities seems to have had the intended effect. It has not halted, but checked the rising trend in Indian Iron. Last week's interim clearing in Indian Iron seems to have frightened weak 'bulls' away from the market. It has also had a salutary effect on 'bears'.

Indian Copper

There is more than one reason for the spurt in Indian Copper. This scrip began to steady up as the new industrial policy assured investors that existing private industries will not be nationalised. That is why, despite the Government's known policy towards mining and mineral resources, all the existing private mining shares have been moving up since the announcement of the new industrial policy.

Two other factors have helped the recent spurt in Indian Copper. Last week, the judgement in the case and counter-case between this Company and the Bihar Government was delivered. It was in favour of the Company. There were also rumours that the Company was contemplating an issue of bonus shares on the basis of five shares for each four shares held, instead of the earlier report of one for one held. These developments coincided with reports of good working results of the Company to boost Indian Copper up in the last few days.

Iron's Rights Issue

On Wednesday last week, the stock exchange authorities decided to effect an interim clearing in Indian Iron to insulate the market against the possible consequences of over-activity in this scrip. It was doubtful whether there was any valid reason for the spurt in Indian Iron immediately after the announcement of the new industrial policy. This aspect of the problem is discussed later. But the fall in last year's output was appreciably below market expectations. And this encouraged speculation in Indian Iron.

Few believe that New Delhi will allow the Company to raise the dividend. But reports are now current that the Company is now considering the question of issuing right shares. At the last annual general meeting, the Chairman disclosed that the Company was not in need of raising fresh capital for implementing the first expansion plan, but would be in need of fresh capital to finance the second expansion plan.

Steel Prices

This problem has some relation to steel retention prices. Last year, the Chairman observed that the question of issuing right shares could not be decided without knowledge about the steel retention prices. New Delhi has since announced steel retention prices. Both Indian Iron and Tata Steel have been allowed identical steel retention prices. But the "special element" is rather unfavourable for Indian Iron. This encourages the assumption that the Company may decide to issue right shares.

This is where the second expansion plan enters the picture. Last year, the Chairman hinted that circumstances might arise which might discourage the Company from starting the second expansion plan. Some are curious to know whether the implications of the new industrial policy are such as to discourage the Company from implementing the second expansion project. It is not known what the Company has decided. In the absence of this information, it is difficult to say whether the Company will be issuing right shares.

Conflicts

This week's price movements indicate that investors are in two minds about recent economic developments. There is nothing new in the second Plan as it has emerged finally. So the publication of the final Plan has made no effect on the market. Investors are divided about the new industrial policy. They are also undecided about the effects of the provisions of the Bill to amend the Reserve Bank Act. So far as stock markets are concerned, provisions relating to reserve requirements of scheduled banks seem to cancel out the effects of amendments aimed at facilitating massive currency expansion.

Immediately after the announcement of the second Plan, existing mining shares started moving up. Indian Copper are still moving up, but for reasons which are different. The rising trend in mining shares in general has, however, been halted. Coal shares have behaved similarly. Despite the assurance that the private sector in this industry will be allowed facilities to expand, both private colliery-owners and investors seem agreed that the permitted scope for expansion is not enough.

Jute Shares

Jute shares should have been the major beneficiaries of the new industrial policy. Jute is one of the few industries which the Government has no intention to take over. Unlike the cloth industry, it is not shouldering any burden to help expansion in cottage or handloom industries. New Delhi is interested in stimulating the jute industry. This is the only industry which is receiving financial aid from the National Industrial Development Corporation for financing plant modernisation and renovation.

Despite these alluring prospects, Jute shares remain depressed. For one thing, stocks of jute goods with the mills are piling up. For another, the spinner's margin remains unfavourable. For months, the industry has been expecting heavy Russian orders. These orders have not yet materialised. Meanwhile, in anticipation of Russian orders, the industry has been induced to expand output. In consequence, stocks with the mills are mounting. Rising mills' stocks are having a depressing effect on Jute shares.

Around Bombay Markets

Firm Trend Renewed

Thursday, Morning

ALTHOUGH the week opened on an easy note under pressure of profit-taking, the firmness noticed towards the close of the previous week manifested itself again during the rest of the week. Sentiment was favourably influenced by rumours of a possible abolition of the export duty of 6¼ per cent on coarse cloth, and by the confirmation of these rumours on Monday, when the official announcement was made.

This change, which has put India into a better position to compete with other countries in world markets, coupled with the train of bonus issues announced by some leading textile mills gave a further fillip to boost the value of cotton mill shares. This in turn imparted fresh vigour to other leading countries of the market. A streak of uncertainty was noticeable for some time due to rumours of Pandit Nehru's resignation, but the market's reaction to such fleeting reports proved, as always, to be short-lived. The undertone at the close of the week remained fairly steady.

After a week of hectic activity in the Ahmedabad share market, details have become available this week of the bonuses proposed by different mill groups. Among these groups is the Kasturbhai group of mils, including Arvind Mills, Nutan Mills, Ahmedabad New Cotton and Saraspur Mills. This group has continued to be a particularly strong favourite of investors.

There has been a substantial increase in the price of Tata Chemicals during the week. The interest in this scrip is becoming increasingly broadbased as it is expected that the company's working results during the current year will be quite satisfactory. This belief has been further strengthened by the steady progress maintained in the output of soda ash.

Under its programme of expansion, the rated capacity of the soda ash plant of Tata Chemicals is expected to be increased from 140 to 200 tons in the near future. There are rumours that an ambitious programme of expansion aiming at a target of 400 tons of soda ash is under way. On this basis, investors are inclined to hope that the company will be able to recommend an ordinary dividend for 1955-56 in accordance with the hope expressed by the Chairman at the last annual meeting.

At the close of the week, the undertone remained fairly steady thanks to better advices from Calcutta. Indian Irons and Kohinoors were particularly bright on the last day.

Cotton

Active Spot Market

THIS week marked a landmark in the history of the Bombay cotton market, as it saw the acceptance by the Board of the East India Cotton Association of the resignation of Shri Purshotamdas Thakurdas, who had nurtured the Association and raised it to its present status and dignity. It was a sad affair not only for the Association but for the cotton trade as a whole. He fought bravely for a cause which he considered vital and submitted his resignation when he could not see eye to eye with the Forward Markets Commission and its "increasing powers of regimentation".

Meanwhile, in sharp contrast to the funeral atmosphere in the futures market, the spot market at Sewri was very much alive and highly active. Fairly brisk buying was noticed on almost every day of the week with mill interest being confined to Jarillas, in particular, Laxmi and Jaydhar. Another daily feature was the sustained interest shown by mills in purchasing American cotton. A prominent mill group purchased about 1200 bales of Californians 1.5/32" good middling for October-November shipment at around Rs 1,461.

In the foreign section, East Africans have been keenly sought after at steadily rising prices. This is attributable mainly to the free buying allowed at Kamala. As a result prices of these varieties were pushed up by as much as 50 points locally.

On the world cotton front, there has been a significant but none the less unfortunate development. The International Cotton Advisory Committee, which met recently to consider the world cotton situation, threw up its hands in despair over the problem of the disposal of American surplus cotton. Much was expected of this meeting which represented more than 35 different nations in the free world, comprising over 90 per cent of world cotton interests. The ICAC's confession of failure means a serious blow to all cotton growing countries. Despite repeated assurance by the U.S. President and Secretary of Agriculture that the United States would not 'dump' this cotton overseas, there is a lurking fear in all cotton producing countries outside the USA that as a last resort it might fall back upon that step.

Oilseeds

A Week of Records

IT was a week of records in the oilseeds market. The price rise in the oilseeds market during the week—in castor, groundnuts and linseed—has indeed been remarkable, thanks to paucity of stocks as against keen demand, mainly for local consumption.

In the castor section, the tight statistical position induced eagerness on the part of buyers to buy as much as was available. Quality seeds were bid at high levels and there was a strong bull grip on the market with the bears selling briskly. There were reports of demand for castor oil by Japan to the tune of 3,000 tons and likely inquiry of about 500 tons by Australia. Although the recent increase in the export duty in respect of castor oil stands in the way of any substantial exports of castor oil, the mere fact that there is demand at rising prices served to strengthen the hands of the bulls. In the event, the maturing May contract crossed the 150-mark at Rs 153-12 on Wednesday while the September delivery was quoted at Rs 157. A bear operator was credited with having covered about 15,000 candies in the advancing market.

The groundnuts section also ruled sympathetically firm thanks in this case to normal inter-play of supply and demand. Although evidence of strident advance in prices is available in the spot rates, it is not likely to be maintained in view of the Government's known prejudice against speculative rises.

Although linseed prices too managed to put on a bold front, conditions were none-too-favourable. Shippers have reported considerable loss following the imposition of duty and their failure to provide for covering their requirements. About 3,800 tons of linseed oil have been shipped to the UK and by the end of the month the total shipments will amount to 8,000 tons.

2500 Years Ago

IT was not until Hodgson recovered some hybrid Buddhist Sanskrit texts from Nepal and these texts were read by the most eminent Indologist of the time that European scholars could accept that the Buddha was a real person and not a legendary figure. This was in the early thirties of the last century. Amongst these texts was a manuscript of Lalita Vistara which narrates the Buddha legend in considerable detail until his first preaching. Subsequent archaeological excavations confirmed some of the episodes of Buddha's life given in this text. But no one knows yet in what language this Prince of the Sakya clan spoke, nor how authentic are the sayings which are attributed to him. Soon after Hodgson's important findings, a very different source came to light. This was the Pali texts, faithfully preserved in Ceylon. The Sanskrit texts were much later than the Pali, except perhaps some earlier passages which were embedded in them. And so much later stuff had been incorporated in them that scholars failed to find any historical basis in this material or even to reach any general agreement. As late as 1856 H H Wilson still held that it was "not impossible, after all, that Sakya Muni is an unreal being, and that all that is related of him is as much fiction as is that of preceding migration" (in the Jataka stories).

If the historicity of Buddha's life was open to so much doubt, no less confusing were the manifold and widely variegated doctrines that are accepted in many Buddhist lands, doctrines that range from the primitive simplicity and rigid ethics of the Hinayana schools to the rich exuberance, idolatory, elaborate ritual and the vast pantheon of gods and goddesses, benign, bejewelled and resplendent as well as grotesque and malevolent, of the Mahayana schools. At one end there is severe austerity, at the other there is wild proliferation that staggers imagination. Which of these represent the true doctrine?

Over the last 100 years or more, the search has gone on. Many new sources have been discovered and old ones re-examined, for wherever the doctrine had spread, it had left behind a rich store of literature, legend and tradition. Apart from materials preserved in Pali, Tibetan and Chinese, the layers of later accretions on the Sanskritic texts are being patiently removed to unearth the original Prakrit base; fragments in Prakrit recovered from Khotan, other treasures from Central Asia and the desert of Gobi as well as Mongolian texts are bringing to light many things that had not even been suspected before. As a result of all this research, what has come to be established is the substantial authenticity of the Canon, if not of the hard core of the doctrine, which is now seen to be substantially the same in all the different recensions. The present state of knowledge on the subject has been summed up as follows:

"Although these schools develop special doctrines, nothing of these divergences is found in the canon itself. The variants that occur usually refer to historical or legendary events in the narrative portions attached to most of the discourses. The result of all this..... is to show how all schools inherited an authoritative series of texts. It reduces the likelihood of the notion that behind this tradition lay a forgotten or misunderstood form of primitive Buddhism."

This much about the work of the scholars. No one will question the utility of this extensive research which, it has to be admitted to our

shame, has been largely carried out by Europeans who find nothing in Buddhism as a religion and little in it of philosophy. The interest of those who are Buddhists by religion is of course quite different. Like all religions, Buddhism exercises varying degrees of influence on those who profess it, much more on those who are poor and lowly and very little on the modern mind even in the East which is trying consciously to attune itself to western science and ways of thinking. But curiously enough, it is not only on the religious, that Buddha's life and legend and his gospel exercise a fascination today. The people of South-East Asia, irrespective of religion, have come under its spell which started to work when Asia began to rise from its torpor, look around and take stock of things. It is not only those who brought about Indian renaissance who turned to Buddhism for inspiration, but a similar movement has been on in all these countries, the cultures of which have a common root. Much of it in the initial stages of awakening in Asia was romantic and revivalist but the phase of revivalism is passing or has passed, but something still endures. It is good to remind ourselves that this is the country of Buddha's hallowed birth, that this greatest of India's sons first turned the wheel, the Dharma Chakra in the Deer Park at Sarnath, slowly at first, then with gathering momentum, as it began to work on the minds of men, freeing them from fear, superstition and ignorance. The gospel kindled a spark wherever it went and it went very far indeed. Where Buddhism spread it made the national genius flower as it had never flowered before. The fire went out long ago but there is still a spark somewhere under the ashes. Blow away the ash, and it will kindle again.

It is good to remember that India was once the instrument of this great re-awakening 2500 years ago. It is much more important to make the anniversary, which is being celebrated to-day all over the Buddhist world and in the places of Buddhist pilgrimage in this country, "the home-coming of the Buddha whom we had forgotten a little although he was always in a corner of our minds". Nothing grander could have been said on this occasion and Pandit Nehru has said just this. But how to call back home what has nearly been lost to us?

The Buddha Jayanti celebrations have been planned long in advance. The A I C C at its session held in Amritsar in February last passed this resolution:

"This Congress, meeting in the year when the 2,500th anniversary of the Parnirvana of the Buddha will be celebrated, offers its reverent homage to the memory of this great son of India whose life illuminated not only the land of his birth, but also distant countries. In this age of growing violence and terrible weapons of destruction, the message of non-violence and tolerance and compassion of the Buddha is more needed than ever before".

Committees have been appointed, programmes have been drawn up, the places associated with Buddha and Buddhism have been refurbished, roads have been built, arrangements made for visitors and even a herd of deer has been put behind wire netting at Sarnath to give it the semblance of a deer park. There is a programme of publications also. Some of the important Buddhist texts will be reprinted, so that the people who are interested may have easy access to them. Lectures by scholars of international reputation have been arranged under the auspices of the UNESCO and symposiums have been planned for publication. Buddhist texts are hard to come by. They have been mostly printed abroad and are only to be found in a few libraries, so the publication of such texts is most welcome and will remove a long felt want.

Perhaps the most important part of the celebrations, however, is the monument to be erected in New Delhi to commemorate the occasion.

This paper has been trying to sell the idea to New Delhi, quite unsuccessfully so far, of establishing an International Institute of Buddhistic Studies at Sarnath where the gospel was first preached. The Government, however, has alreay a vested interest in the Pali Institute at Nalanda; it is prepared to supplement Pali studies by sponsoring the publication of Buddhist Sanskrit texts and is also willing to help set up another and a smaller institute for their study. Pandit Nehru has imagination, he has delved deep into the past to discover India and has also grasped firmly the roots of Indian culture that lie embedded in the gospel of Buddhism. But great minds some time display a strange ambivalence. No gilded bust or animated stone can be more enduring than Buddha's message and the most fitting commemoration of the Jayanti would be to found an educational and research institution, which will bring back home what had gone out from India and has been nearly lost to her through these many centuries. In course of time, such an institute is bound to come but it is sad to think that the present occasion has been lost.

Nehru Proposal for Algeria

FRANCE'S Socialist Premier and Foreign Minister have returned from Moscow sadder, though not wiser, men. It was not necessary for M Mollet to visit Moscow to be convinced that it was now possible "to organise peace". This has been evident for some months now. M Mollet can take credit that he and his Foreign Minister have not been unsuccessful in their efforts to create a climate in which East and West can negotiate to reach greater understanding. Russia, suspicious of the Western Power's insistence on negotiating from strength, has appreciated the Mollet Government's frank criticism that world peace cannot be attained as long as the Western Powers rely exclusively on security. Moscow has reciprocated this gesture by inviting the French Socialist Premier and his Foreign Minister to Russia for talks on world affairs.

But the talks between French and Soviet leaders do not seem to have yielded any positive results. France has many commitments. She has informed Russia that Paris has no intention to disown these obligations. Russia is opposed to NATO. But Russia made it abundantly evident immediately prior to the French leaders' visit to Moscow that she had no intention to request France to disown her alliances and commitments. Russia desires freer trade with France as with other European countries. With both France and Britain, Russia has arranged plans for exploring prospects of increased trade relations. On no other issue has there been any progress as a result of talks between French and Soviet leaders. M Mollet's discovery that Russia is not opposed to the principle of reunification of Germany, is not news. Both Russia and France are in favour of world economic aid under the auspices of the United Nations. But this issue cannot be solved without America's support to such plans.

If M Mollet went to Moscow to enlist Russian support to France's policy to West Asia and to North Africa, he must have returned a disappointed man. It is evident that Moscow does not accept Paris's claim that the tense situation in Algeria is due mainly to Arab interference. Algeria is not only M Mollet's, but France's main problem. M Mollet may have impressed Russia and even some Asian-African nations, including India, that, to quote Pandit Nehru, "there are special factors and complexities in the Algerian situation". But he has not succeeded in convincing either Russia or India or any other Asian-African nation that the complications in Algeria are obstacles to the grant of freedom to that country. France's NATO allies may find it diplomatic to remain silent on her claim that Algeria is part of France. But, all Asian-African countries, besides Russia, will endorse Pandit Nehru's emphatic reminder to Paris that the Algerian issue is basically and essentially a Colonial problem.

M Mollet's policy to Algeria is not only a negation of his and his party's past declarations. It has been so ruthless as to deepen suspicions that it stems from narrow party or domestic political considerations. He has shown statesmanship by transferring power in Morocco and Tunisia in face of opposition by "colons" and the Army. His stubborn attitude to Algeria is, therefore, all the more puzzling. His policy of massive retaliation in Algeria may have the support of MRP, Gaullists and Poujadists. But he is making the same mistake his party has committed throughout the post-war era. His policy of violence in Algeria is opposed not only by M Mendes-France but even by M Pinay, and M Faure seem to be in favour of starting negotiations with the Algerian nationalist leaders. He has succeeded in getting reluctant support of the Communists so far. But as the Communists are showing impatience with his Algerian policy, MRP may decide that it is no longer necessary to support his coalition Cabinet in order to wean the Government away from Communist influence. On top of these domestic political cross currents, there is revived agitation for fundamental constitutional reforms in order to eliminate perpetual political instability.

Sufficient time has elapsed to convince all impartial observers that M Mollet's Algerian policy has failed. He is under a delusion in hoping that his agricultural and administrative reforms will ease the situation in Algeria. He has plans for holding elections in Algeria three months after pacification. But he has not yet responded to Ben Bella's appeal for negotiations on the basis of independence for Algeria. Not only the militant, pro-Arab National Liberation Front, but even the moderate pro-French Democratic Union of Algeria has now lost faith in M Mollet and his Government. M Mollet had the opportunity to negotiate with the Democratic Union. But he refused its leader's request for talks, thinking that he would succeed in suppressing the violent nationalist movement so that elections could be held later on the issue of Algeria's organic relation with France. His hopes have been shattered, but he shows no intention to modify his Algerian policy.

This is the broader background against which Pandit Nehru's proposal for the solution of the Algerian problem has to be viewed. In Ben Bella's recent gesture, M Mollet has the assurance that the essential condition to start negotiations can be fulfilled. He has repeatedly insisted that negotiations cannot start until law and order has been restored. Violence must end. As the National Liberal Front is willing to negotiate, M Mollet has now the chance to negotiate in a calmer atmosphere. He has accepted, what Pandit Nehru calls, "the personality" of Algeria. But neither he nor France has yet conceded the "national entity" of Algeria. This is the crux of the problem. M Mollet can solve the Algerian problem the moment the principle of "national entity" of Algeria is conceded. Under the Nehru proposal, the French settlers in Algeria can continue to live there on an equal status. In return for transfer of power, Algerian Muslims may even accept this aspect of the Nehru plan. But they must first be assured that France accepts the "national entity" of Algeria. M Mollet must decide soon whether the Nehru proposal is acceptable to France as a basis for discussions with Algerian nationalist leaders. Indo-China must be a constant reminder to him and his government that France may lose all rights and interests in Algeria by delaying negotiations unduly.

Wanted a Transport Board

THAT the Railway Ministry should have to set up a separate unit to look after the transport of steel and machinery indicates how urgent the transport problem has become. There is vociferous complaint from many quarters that the bottleneck in transport alone will wreck the Plan, but no one has suggested yet how this bottleneck can be broken without breaking the Plan as surely by diverting the resources away from the Plan targets.

There is no question that the separate unit can ensure transport of steel and machinery, however desperate the general transport situation might be, provided it can secure the highest priority for these. But even if transport has to be rationed, it would not be enough to give priority to steel and machinery alone; coal and cement have to be moved, and so also foodgrains and other essential consumer goods, if the objectives of the Plan are to be fulfilled. On the contrary, the favoured position given to steel and machinery might lead to more transport being provided for them than is strictly needed or provided at a time when there is no real urgency for it.

While rationing of transport and the institution of a system of priorities may be unavoidable, it is but fair to expect that before this desperate remedy is sought, every effort should be made to utilise all available transport—road, rail, sea and inland water transport. The first step for it is to set up a Transport Board which will try to co-ordinate, instead of setting up ad hoc bodies to solve particular problems as they arise, as in the case of rail-sea co-ordination.

It is amusing, if not disconcerting, to find that the Railway Board should still be living mentally in the early thirties and try to grab traffic from the roads in order not to "burden the industries with such a high incidence of transport costs" as that of road transport. By high taxation on motor vehicles, by protection to the automobile industry and by every possible means we have retarded the development of road transport systematically and persistently ever since the present Government took over. Does it not occur to the Railway Board that if we had an adequate road transport system which could take over the short hauls from the railways, the railways themselves could have operated more efficiently and at a lower cost? It is time that the railways stopped engaging special staff to prevent licensing authorities from issuing licenses to public carriers on routes that run parallel to railway lines. The Railway Board's solicitude for industry is indeed touching, had it not gone to the point of stopping people from moving their goods at a higher cost rather than not moving them at all.

Events during the last few weeks, such as Pandit Nehru's support to Prof. Galbraith's proposal to raise passenger fares, and the decision to attach a special officer for sailing vessels to the Directorate General of Shipping, besides the separate unit for steel and machinery show that the Government of India is groping towards a transport policy though Lalbahadur Shastri's Ministry may be still offering concessions to encourage more railway travel. It was at last agreed to have a probe into the idle capacity of our railway system but the beginning of such a policy is to have a Transport Board for the country which will look into every possible means of transport and not ignore either road or water transport, both on sea and on the rivers. There are now encouraging signs of a change in attitudes, but only signs, nothing more definite than that.

National Income in 1954-55

INDIA'S national income at 1948-49 prices increased by only Rs 130 crores to Rs 10,170 crores during the year 1954-55 as compared with increases of Rs 580 crores and Rs 360 crores during the previous two years. With the estimated national income for 1955-56 put at Rs 10,800 crores according to the Second Plan, this calls for an increase of Rs 630 crores during the last year of the First Plan. The press-note on national income issued by the Cabinet Secretariat shows also that per capita income remained unchanged between 1953-54 and 1954-55 at Rs 269, the increase in total income being evidently offset by the increase in population over the period. The estimates are presented in the table below.

There has been a sharp fall in national income at current prices and a still steeper fall in the per capita income at current prices and the per capita net output in 1954-55 was even lower than that in the base year of the First Plan, 1950-51. This is, of course, explained by the fall in prices, particularly of foodgrains, during the year. The press-note, however, naively comments that the fall in money incomes has not adversely affected the general population because prices have also gone down. Even if the fall in money incomes and in prices exactly offset one another, it would be misleading to imagine that the fall in prices had, therefore, no effect on the economy. The estimate of National incomes, being a statement of the result of the interaction of various forces, cannot indicate causal relationships that bring about changes in economic activity and hence in the aggregate figure.

The absence of any large rise in national income at 1948-49 prices between 1953-54 and 1954-55 was, it is further stated, "almost entirely due to no rise in agricultural production between the two years". As industrial production was expanding rapidly over the period covered, it follows that the increase in industrial production during the year was just enough to compensate for the growth of population, keeping the per capita income unchanged.

	Net Output at 1948-49 Prices (Rs crores)	Per Capita Net Output at 1948-49 Prices (Rs)	Net Output At Current Prices (Rs crores)	Per Capita Net Output At Current Prices (Rs)
1948-49 ..	8,650	246.9	8,650	246.9
1949-50 ..	8,820	248.6	9,010	253.9
1950-51 ..	8,850	246.3	9,530	265.2
1951-52 ..	9,100	250.1	9,970	274.0
1952-53 ..	9,460	256.6	9,820	266.4
1953-54 ..	10,040	269.0	10,490	281.0
1954-55* ..	10,170	269.0	9,910	262.1

*Preliminary.

Exports and Imports

AS was to be expected, the opening addresses of Shri Karmarkar and Shri Krishnamachari at the meetings of the Import and Export Advisory Councils held last weekend at Delhi featured the foreign exchange budget for the Second Plan prominently. Talking of imports, Shri Krishnamachari said that the increased tempo of industrialisation envisaged in the Second Plan was already beginning to have an effect. During January-March, 1956, imports were running at a level considerably higher than in the corresponding periods of the last two years. The balance of trade in these three months has already shown a deficit of Rs 45 cores, and, judging from the rate of licencing, particularly for capital goods, this deficit was likely to increase. The Plan, Shri Karmarkar said, envisages an enormous expansion in our imports, but our foreign exchange resources are not limitless. It will not be an easy task to find the resources even for our essential imports. It will be necessary, therefore, to make every possible saving of foreign exchange, particularly on items not directly related to our development plans. He conceded, however, that the import of essential consumer goods cannot be indefinitely restricted, but a judicious pruning was still possible.

This cautious tone with which Shri Karmarkar initiated the Import Advisory Council's meeting is largely absent from Shri Krishnamachari's address before the Export Advisory Council on the following day. He felt gratified that the return to the buyers' market after the Korean boom did not materially affect India's exports, and that in the last two years exports have increased by Rs 70 crores to approximately Rs 700 crores. As a result, despite the expansion in imports, there was no deterioration in our balance of payments position. Unlike his colleague Shri Karmarkar, Shri Krishnamachari prefers to think in terms of the balance of payments, rather than of trade. This has its advantages no doubt. But in deliberations relating strictly to merchandise exports and imports, the more limited concept of the balance of trade is, perhaps, more relevant. And in any case, the facts that the balance of payments is showing a surplus and that our sterling balance has actually risen over the last year, are matters to cause concern in the light of our commitments in the Plan. The section on "Foreign exchange resources" in the Second Plan is, of necessity, weaker than many other sections. But, while rightly laying considerable emphasis on the need for increased imports in the Plan period, no large increase in export earnings has been assumed. Not only this—Shri Krishnamachari has now hinted at the emergence of certain new factors since the Plan was drawn up which would tend to weigh on the import side more heavily.

Shri Krishnamachari referred to the recent trade treaties with several countries which, if implemented to the fullest extent, should lead to a substantial increase of exports. The magnitude of such improvement is difficult to predict, if for nothing else but that the nature of such treaties is determined more by our needs for specific imports than by our capacity to export. Prima facie, it appears that the payment position would become more adverse, although with a larger volume of trade. To what extent the imports planned under the treaties would increase our capacity to export and thereby offset the likely reduction in export surpluses in some commodities from competing home demand, are factors on which it is only possible to speculate. Shri Krishnamachari must be as fully aware of the difficulties in increasing the volume of exports as the members of the Planning Commission. Why, then, blame the authors of the Second Plan for having posed the problems and postponed the solution? What better solution has he offered? No reader of the relevant section of the Plan can fail to appreciate the sobriety and sense of history of the drafters of the Plan.

It is now clear that his Ministry will soon take steps to standardise textile production for both internal consumption and exports. There are also references to the controversy relating to the restrictions on mill production of textiles, but he has avoided any pointed remarks. Just as well, perhaps.

He has expressed sympathy for the jute mill industry in which the gap between the prices of raw jute and the finished article is gradually narrowing. The expansion of mill production seems limited by the supplies of raw jute. Talking of the tea industry and its recent difficulties, one wonders how the producers and the trade will receive his remark that their industry is one where Government controls are almost non-existent. Even if we discount heavily all the complaints that the private sector makes Government cannot altogether absolve itself of all responsibility for the state of the industry. Shri Krishnamachari has now announced that he is going to ask the Tea Board "to take a vital interest in regard to the health of this industry".

Russia is Playing the Game

Our Delhi Correspondent Writes :

TOWARDS the end of last year when the Government of India declared that "trade rather than aid" would be the pattern of economic collaboration with the Soviet Union, sceptics laughed. Messrs. Bulganin and Krushchev were then in India and were using every opportunity to woo the nation. Pancha Shila was endorsed. Indian stand over Kashmir was supported in terms which have since been modified. Nehru was hailed as a great leader. But most significantly India was promised technical know-how and capital goods. It was emphasised that Russia wanted to be India's "equal" partner in building a better world.

But no one believed the Russians and some even doubted the sincerity of India's declaration that its Government would not accept large-scale aid from the Soviet Union. Western critics saw an element of aid in the low rate of interest to be charged for the Rs 55 crore export credit for the Bhilai Steel Plant. It was rumoured that the Soviet Union had offered and India had accepted an atomic reactor for experimental purposes. The gift of a complete set of equipment for a 3,000 acre mechanised farm was publicly made by B and K and acknowledged by Government spokesmen. The Indian Government was known to be negotiating for Russian war-planes. This was regarded as the thin end of the wedge for putting an end to the monopoly that the industrial West had so far enjoyed in India. Western critics thought that through aid or trade, the Russians would enter the Indian market to stay. Had not the giant pavilions erected by the Soviet Union, China and other peoples' democracies at the Indian Industries Fair served notice already that the Communist world was making a bid to oust the West as the only supplier of capital goods and know-how to the under-developed countries?

Shortly before B and K left, however, an Indo-Russian trade agreement was signed by which India was to buy one million tons of steel from

the Soviet Union during the next three years and it was stipulated that the value of Russian imports from India would be as nearly equal as possible to the total value of Russian exports to India. Nobody took the last clause very seriously. Doubts were expressed on the possibilities of stepping up Indian exports to Russia from a paltry Rs 2 crores worth annually to about Rs 25 crores or so. The value of the million tons of steel alone would work out to between Rs 60 to Rs 70 crores.

Since then however the Russians have been scouring the Indian markets and buying whatever they can, with a diligence and acumen for bargaining that has not only won the admiration of prospective sellers but also the confidence of the Government of India that they mean to honour the trade agreement both in letter and spirit. So far jute manufactures, hides and skins, pepper and cashew nuts have been purchased of a total value of more than Rs 7 crores through private channels. Besides, 500 tons of coffee have been bought through the State Trading Corporation. Inquiries are being made in the line of woollen piecegoods and shoes, as also for a number of other manufactures. A large staff is working under Mr Magunov, a former Deputy Minister in the Soviet Government and now the Trade Representative in New Delhi, exploring the possibilities of the Indian market. That the Russians are proving to be hard bargainers is nothing to gloat about, nor is it something to be regretted. The point is that the Russians have bought almost as much from India as we are indebted to the Soviet for importing about a lakh tons of steel, and there is a good chance that the Russian purchases will soon total the value of 2.4 lakh tons of steel that have been ordered from that country. It is a hopeful sign that economic relations between India and the Soviet Union will not be one-sided.

Films on Africa Banned

IN its concern for maintaining cordial relations with Africans, the Government of India has banned eight films which are centred on Africa or have the great continent as their background. To describe all these films as 'anti-African' or even to impute to any of them a consciously anti-African motive would be far-fetched; but the overall impression they are apt to leave on the mind of the spectator is that of a superior civilisation trying to carry on with an inferior one or taking a remote, patronising interest in its doings. It is perhaps not so much in the theme itself as in its treatment and in the role assigned to African characters as a sort of exotic human foil to set off the grandeur of European adventure or romance that this bias against Africa, whether deliberate or not, is most evident. One may even go a step further and say that the African characters in such films are prone not only to appear queer and subservient in contrast with others, but also a little ridiculous.

This may be no more than a reflection of the way the white man, in his ignorance and cultural isolation from the coloured races, looks normally on the African. But that is not the truth; and it hurts the African who is striving to shake himself free of the shackles of the past and is very sensitive to what the rest of the world says about him or how it depicts him. If the white man could put himself in the place of the African, he would be able to understand the position. The latter is not particularly amused by the odd impressions which the white man collects in his travels in Africa and which he later gives expression to in various forms to the amusement of his own people. It is easy to accuse the African of touchiness or want of humour; but in his largely defenceless state, and caught as he is in the grip of the struggle for racial rehabilitation, he cannot possibly be expected to be over-tolerant of others' foibles or their strange notions of entertainment or to overflow with humour. That can come only when the African has become free and is completely self-assured.

West Bengal Government Publications

India's Villages

A collection of articles on the structure of village communities of India originally published in the Economic Weekly of Bombay. Introduction by M. N. Srinivas and published by the Development Department, Government of West Bengal. Price Rs. 4-8-0. Price including forwarding charges plus sales tax Rs. 5-13-0. Price (English) 7 sh. 6 d.

West Bengal District Records
New Series - Burdwan.

Contains almost all letters received by the Collector of Burdwan as preserved at the Burdwan Collectorate Record Room.

Edited by Asok Mitra, I. C. S., Price Rs. 20/-.
Price including forwarding charges plus sales tax Rs. 24-8-0.
Price (English) £1-9 Sh. - 11 d.

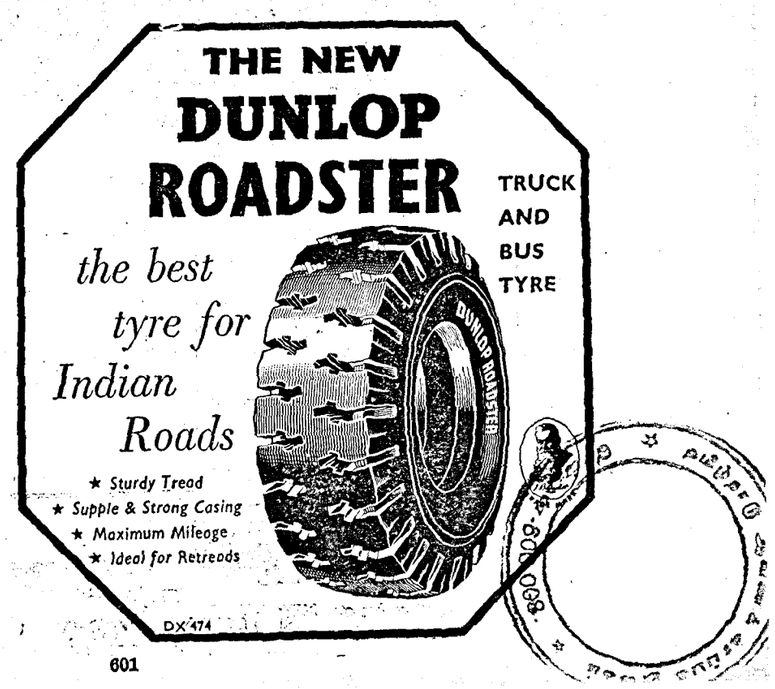
Cash Sales at:-

Publication Sales Office,
1, Hastings Street, Calcutta

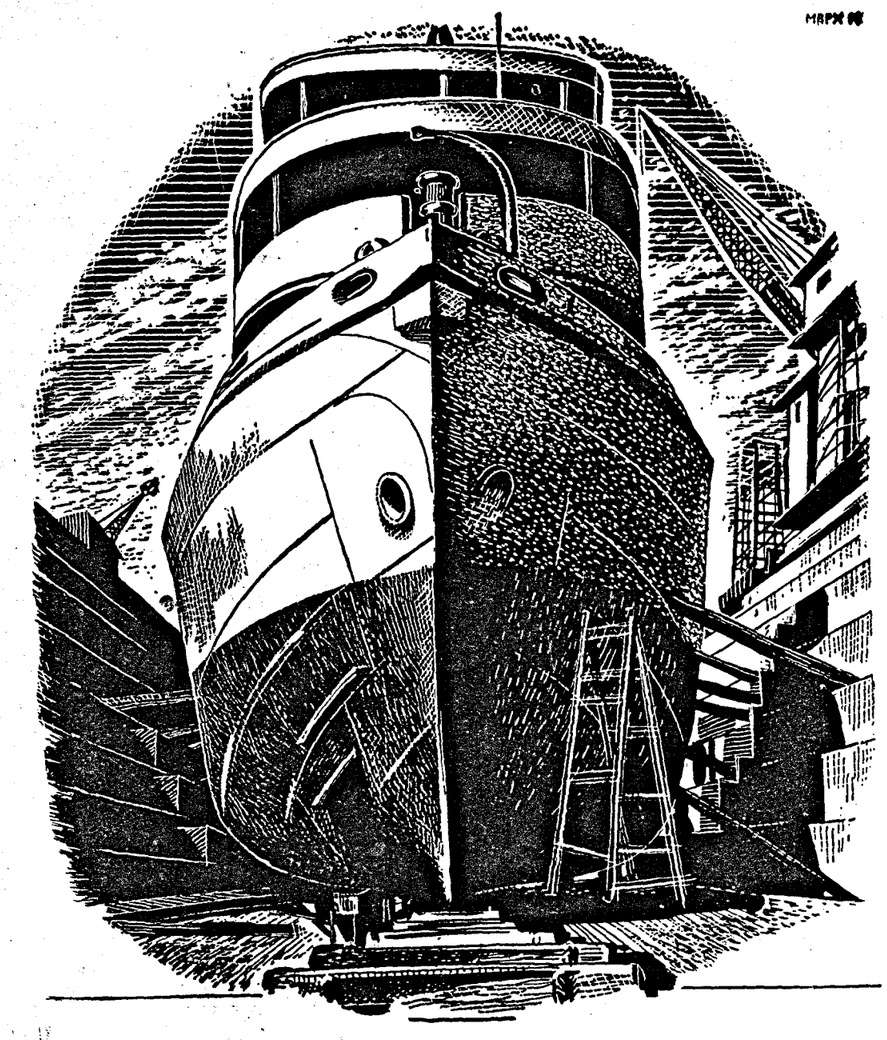
For mail orders please remit the amount of price including forwarding charges to—WEST BENGAL GOVERNMENT PRESS, PUBLICATION BRANCH, 38, GOPALNAGAR ROAD, CALCUTTA-27.

Strategy or Colonialism?

FAILURE of the London negotiations relating to Singapore is ostensibly due to differences on the question of ultimate responsibility for internal security of the island. Mr David Marshall agreed that defence and external affairs must remain under British control. But Singapore's Chief Minister was unable to accept the demand of the Colonial Office that Britain must continue to have a dominant voice in the internal security of the island. Suggestions have been made that Britain cannot accept responsibility for defending the strategic bastion of Singapore without ensuring the maintenance of law and order in that island. This sounds plausible. But any such argument ignores the changing world political and strategic circumstances.



Singapore's strategic importance in the Commonwealth defence system can be over-emphasised. Even strategists may feel inclined to endorse Mr Marshall's outburst that, as a strategic base, Singapore is likely to prove a death-trap. To emphasise this is not to suggest that the irredentist Chinese element is not a threat to the island. In Singapore, the Chinese are an influential majority. This population factor explains why Mr Marshall is in favour of federation with the Malayan mainland, as also Tengku Abdul Rahman's reluctance to enter into any federal relationship with Singapore. But it is unwise to deny Singapore freedom in order to avert the Chinese threat. This threat, or rather the population aspect of it, can be averted through a federation of the whole of the Malayan Peninsula, including Sarawak and Borneo.



That is a possible solution of the racial problem in Malaya. But the ideological conflict can be resolved only through transfer of power to the Malayans so that the Chinese Communist elements can no longer exploit colonialism for fomenting trouble and dissension. With the grant of full independence, both the mainland and the island will hope that the international political situation will so change as to minimise the irredentist threat. Thus interpreted, the failure of the Merdeke Conference in London assumes a changed significance. Mr Marshall has been very outspoken in his speeches in London. He has repeatedly stressed the colonial people's distrust of the Colonial Office. This is the aspect of the Singapore problem which will be the main issue under discussion between Pandit Nehru and Singapore's Chief Minister. It is an issue in which India, an Asian member of the Commonwealth, is vitally interested. In the wider interest of freedom and peace in Asia, as also in the interest of the people of Singapore, there will be hope that the New Delhi talks will succeed in evolving a formula which will be acceptable to London as a basis for further negotiations with Singapore's political representatives.

Friendly Advice to Washington

INDONESIA has much to be grateful to America. Washington's friendly intervention and efforts hastened the freedom of Indonesia. Many newly-independent Asian nations are, similarly, grateful to America for her firm advice to her Western war-time allies to transfer power to their colonial countries. During and immediately after the war, America was the most popular Western country in Asia. To-day, she has few friends in this region. This has been a puzzle to Washington. Washington should be wiser by President Soekarno's friendly advice. Nationalism is the mainspring of efforts in Asia and Africa. "Fail to understand it", President Soekarno warned American Congressmen, "and no amount of thinking, no torrent of words, and no Niagara of dollars will produce anything but bitterness and disillusionment".

Washington is not unaware that nationalism has been, and is, the major influence in Asia and Africa. Nor can America be accused of conniving at colonialism in these regions, though some of the recent aspects of Washington's foreign policy is liable to such criticism. Washington's main trouble is that it does not know Asia. Its Asian policy is so tinged and obsessed with Communist fears that it fails to realise that it has only been backing wrong horses in these regions. Almost without exception, American-sponsored regimes in Asia are discredited and reactionary rumps. She is lavish with money and military aid to those nations in this region who support her foreign policy. Washington should be wiser by President Soekarno's warning that military aid can only make the recipient countries more dependent on America, "and their worth as genuine partners in the universal struggle for liberty, peace and prosperity will consequently decline". Recent elections in Ceylon, Burma and Indonesia reflect the democratic inclinations of these countries. Happenings in India since independence emphasise this country's democratic preferences. It is one of the major flaws of Washington's foreign policy that, in its preoccupation with security, it has not only failed to encourage stable democracy, but has occasionally seemed hostile to the progressive, democratic elements in Asia and Africa.

Pedigree of Community Projects

WHAT Mr. Marriott says about the Etawah Project in the issue of April 28 is substantially correct. It is, however, not an easy matter to trace the pedigree of the idea behind *community projects*. In fact two different strands of thought combined to develop the idea of community projects. One was that of integrated development of villages. Several notable attempts had been made in the past in this direction by the late Maharaja of Baroda near Kodinar, Tagore in Bolpur, Gandhiji in Wardha, Sir Daniel Hamilton in Gosaba, etc. The other was the use of an extension agency, comprising of a number of village level workers, backed by a hierarchy of experts and administrators, for stimulating the development of agriculture. American experiments at agricultural extension, the rural development work done in the Tennesse Valley and elsewhere, and the scheme prepared by Prof. A. V. Hill during the war for using demobilised soldiers as village level workers for stimulating food production indicated possible lines of approach. Both these sets of ideas were for some time under consideration at the Centre as well as in the States of authorities who were responsible for the development of agriculture or of backward classes or the settlement and colonisation of displaced persons.

The Etawah Pilot Project undertaken by the U P Government was only one of several attempts that were made by these authorities. The Firka development programme of Madras, the rural development schemes of West Bengal and Delhi, the refugee settlement schemes of Punjab and U P are some of the others which may be mentioned in this connection. The Etawah Pilot Project was, however, given a more conscious agricultural extension bias somewhat on American lines, because some American experts like Mr Mayer were associated with it. These experts, however, had no official connection with the Ford Foundation or the U S Point 4 Programme. Although the Project was mooted earlier, actual work on the project was started in 1948 in a group of 64 villages. The main items of work undertaken in Etawah were—reclamation of usar lands, ravine reclamation and bunding of uplands, construction of roads, construction of sanitary wells, agricultural demonstration, supply of seeds and manures and horticulture. Etawah was thus largely an agricultural extension project. It was moreover concentrated in a particular area and there was no programme at that time for progressively covering the whole country with a number of projects of this kind on a planned basis.

The idea of community projects and extension blocks designed progressively to cover the whole country took shape gradually during the years 1951 and 1952. It is not correct to say that the authorities of the U S Point 4 Programme or Ford Foundation first propounded the idea to the Government of India. In fact in January 1951 when the American official Mission headed by Mr. John Loftus came to India to discuss with the Government of India proposals for aid under the Point 4 Programme, they made no proposal for any programme of the community project type. The projects that were considered at that time were general agricultural extension including provision of implements, seeds and fertilisers, industries related to agriculture e.g., manufacture of fertilisers and implements, irrigation projects including tube-wells, etc.

It was in July 1951 that the Directorate of Economics & Statistics, Ministry of Agriculture, first prepared a model scheme for intensive development of groups of villages. In preparing this model they took into account the experience of Etawah, Delhi Development Scheme, Firka Development Scheme and other schemes mentioned earlier. This scheme which was at first called "Integrated Development Project" was designed to be repeated in different areas of the country on a planned basis and envisaged the comprehensive development of agriculture, animal husbandry, public health, co-operation and panchayats in selected groups of villages. Each project was to start with about 50 villages in the first year and to cover about 300 villages in the fifth year.

Shortly afterwards when the Ford Foundation Team led by Mr. Paul Hoffman visited India in August 1951, this scheme was revised, training and education was added to the programme and it was called the "Intensive Development Area" Project. It was this revised scheme that was put up to the Ford Foundation team for consideration along with a number of other schemes, e.g., demobilisation of Rajputana desert, establishment of a rural university, setting up of an all-India Medical Institute, etc. The Ford Foundation rejected the other projects and accepted the "Intensive Development Area Project" which they commended very strongly. It was decided to entrust the work to the Indian Council of Agricultural Research and in October, 1951 the I C A R addressed letters to the State Governments proposing the establishment of 5 training-cum-development projects and the setting up of 15 pilot development projects scattered all over the country. Each of these pilot projects was to cover 100 villages. The agreement with the Ford Foundation was signed on the 19th January, 1952.

The model of "community projects" as we know it now was later developed on the basis of this earlier project taken up by the I C A R with financial assistance from the Ford Foundation. Towards the beginning of 1952, when the U S authorities indicated to us that they were interested in financing on a fairly large scale, under the Point 4 Programme, schemes of this type, the first scheme of "community project" was prepared by the Planning Commission in consultation with the Ministry concerned. In this scheme a greater emphasis was given to health and education and rural industry was added as a new item. Each Project was to cover 3 blocks of 100 villages each. The scheme underwent some changes as a result of discussions with the T C M authorities and State Governments and the various experts and the final shape was given to it in April, 1952. The agreement with T. C M regarding community projects was signed on May 31, 1952. The subsequent history is well known and needs no recapitulation.

A Calcutta Diary

What is Getting West Bengal Down

ONE could hardly have chosen a worse time of year to start a new diary, which should be breezy, diverting, effortless and inconsequential. All the circumstances are unpropitious in Calcutta now. The weather has been oppressive, and the brightest remark (the brightness of which is beginning to wear out) one hears is: "It isn't the heat, my dear; it's the humidity which gets you down." Of breeze there is not a breath; of rains not a drop, until Monday afternoon. To come to work is an effort, let alone doing a spot of work. This rambling on the weather acquires relevance from the fact that the Bengali situation today—on the lines of the existentialists' human situation—is not far different in several significant characteristics. It is not the heat of the Bengali temper which is getting West Bengal down; it is the humidity.

It is doubtful whether ever before there has been such indifference to politics as is to be seen in West Bengal today—a State justly famous for its political consciousness. Not as though particular questions are not discussed in the tea shops and coffee houses, but quite early, the proceedings degenerate into a denunciation of personalities. Unfortunately, most of the things said against Ministers and politicians are very close to the truth. All this has led to dangerous cynicism, and it is not surprising that the Bengali creates in most observers the impression of sulking. That many of the well-known Bengali grievances are founded on actual injuries inflicted makes no difference to the impression. Writing from Calcutta, the commentator has a hard time of it avoiding the two fatal oversimplifications: (a) joining in the Bengali moan with no thought of West Bengal's own deficiencies; and (b) harping only on the Bengali's faults without looking closely into its external causes.

* * *

To make the first of the many generalisations which are sure to follow, what is happening today is due largely to what in Europe has come to be called the treason of the intellectuals. Even the not-so-young Bengalis remember that until quite recently there was an incorruptible core in Bengali society. It is becoming increasingly difficult to trace and locate that core. The literary circles, the Press, the University—all the institutions where one would normally look for evidence of the Bengali spirit present a sorry picture which conveys to one a sense of despair. It was interesting, and saddening, in recent months to watch how each of the important sections of Bengali life today acted on, and reacted to, the scheme for a merger between West Bengal and Bihar.

The idea, it is now obvious, had an illegitimate birth; its death has been mourned by none. But these two events are less important than the process the scheme went through during its brief life. First, the politicians, or rather the politician, Dr Roy, for nobody else counts for much. He agreed to the union scheme, as the merger was called in the revised version, without reference to a single colleague, either in his cabinet or in his party. Dr Roy has never tried very hard to conceal his contempt for the majority of men around him, all his own nominees; the public, less insensitive than the politicians, took the indifference to heart, and has since registered its protest effectively enough. Humbled, Dr Roy is entitled to claim that he acted according to his lights and, surely, a Chief Minister's threat to resign if the scheme did not go through could not have been taken very seriously by anybody. The public may also rejoice that it is still within its power to tell a conceited Chief Minister where he gets off. What of the rest, those whose business it was to lead opinion?

* * *

Almost everyone stands disgraced. First, the Congress politicians. It was no secret that the union scheme evoked very little enthusiasm among them. And yet, not one leader of any importance had the courage to get up and say to Dr Roy's face that the scheme was nonsense. Rarely have Bengali politicians been guilty of such cowardly silence. Some of them actually went into hiding on various pretexts; those left in town spoke as little as possible or, against their personal convictions spoke in favour of the merger. Leadership was thus left to non-Congress hands which, in spite of their many differences, were at least able to pull off a significant election victory.

Men who must be called intellectuals, in the absence of a better term, behaved worse. Inspired no one knows by whom, a "statement" was taken round to writers and a distressingly large number of them signed it without really believing in the merger. Destitute of conviction, the statement made no difference to the issue; but it became painfully obvious that there are writers and journalists who, to be on the right side of Dr Roy, would sign almost everything approved by the Chief Minister.

* * *

The Press made the poorest showing. Since discretion is going to be the least of the virtues of this diary, it might as well mention names. The **Statesman,** still the most influential daily, said the merger scheme merited consideration. The **Amrita Bazar Patrika,** still the favourite of the mofussil bar libraries, came out in full support of the scheme, which is easily explained by the control a Deputy Minister openly exerts on its policies. The **Jugantar** and the **Ananda Bazar Patrika** supported the idea, for they dared not write otherwise. The **Hindustan Standard** maintained complete editorial silence for the best part of a week, and then asked the people to judge—as though the public needed the paper's kind permission to judge! The Press was, to put it quite plainly, gagged.

Here then was an important question affecting the future of the Bengalis, and everyone let the State down. The politicians were more mindful of their position in the party, which is dependent upon leadership at the all-India level, than of what people thought. The writers the only ones who could have asked the Government to go to hell or at least to leave them alone, fell over one another to wrest a smile from the Chief Minister. And the Press remained silent when it feared it could not get away with worse. Not the least distressing part of the whole story is that everyone remains where he was: Dr Roy in Writers' Buildings, the writers where they used to be, and the newspaper proprietors and editors in their tiny little offices —all indifferent to the people, and the people insufficiently aware of the insult.

— **Flibbertigibbet**

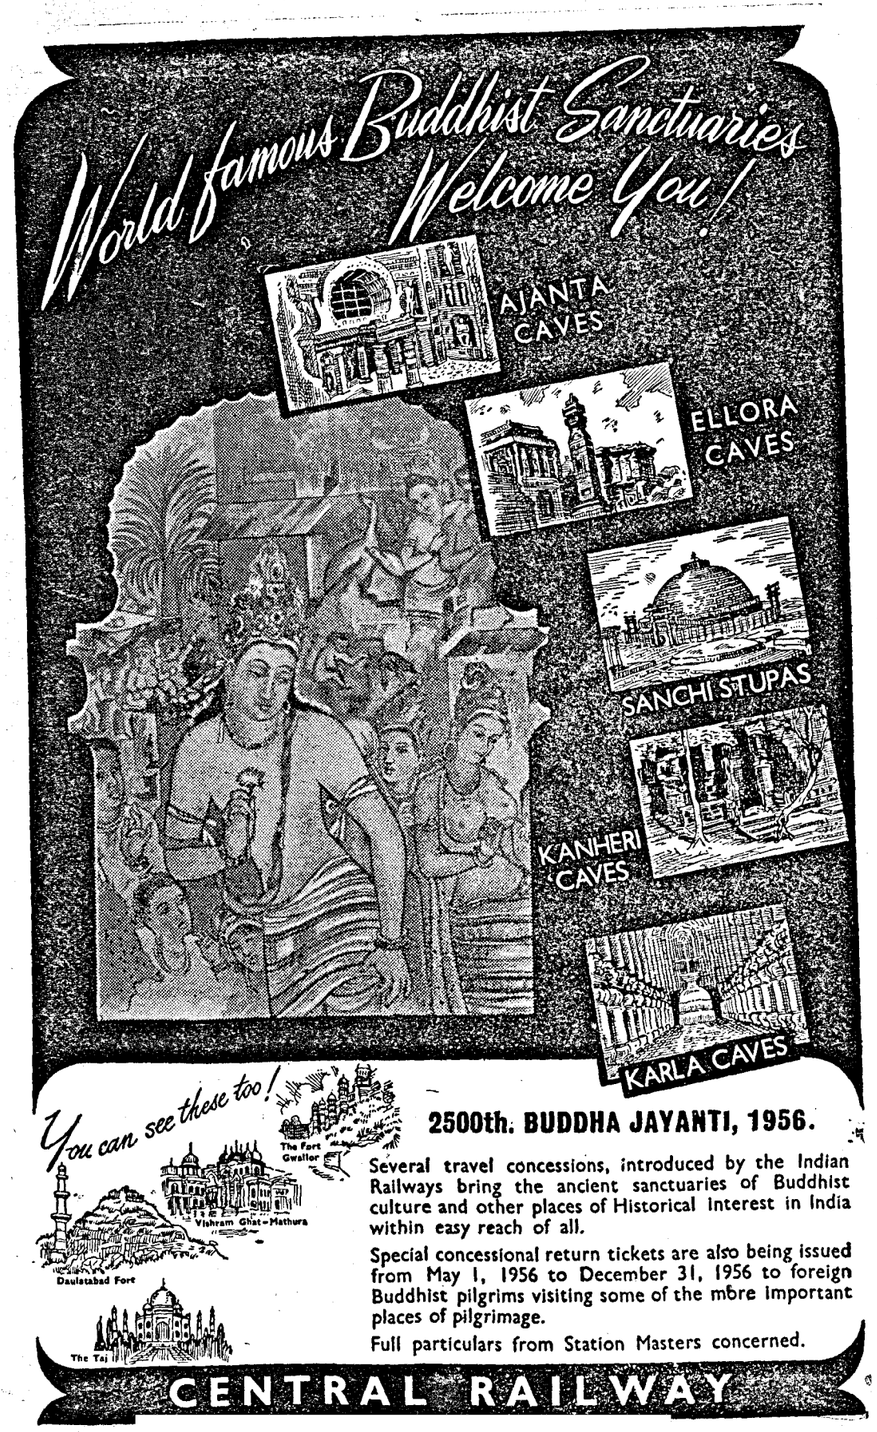
From the London End

The Deadlock on Singapore

THE hopeless and long expected collapse of the Singapore negotiations adds, as James Cameron of the **News Chronicle** puts it, "one more shabby item to the apparently endless catalogue of colonial impasses that have decorated this Government." The long apologia issued by the Colonial Office for its stand throughout these negotiations now makes it abundantly clear that the British authorities have not reconciled themselves to one of the more powerful facts of our time: the determined will of the dependent people generally to shake off their status of dependency. The Colonial Office statement persists in its talk of "H. M. Government's responsibility" and "mission" in spite of the world having by now come to read through such protestations and come to recognize hypocrisy even when it emanates from the most skilful of its practitioners. The basic and overwhelming fact of Britain's position in the lengthy negotiations has been the refusal to cede, to transfer, even in the future, the ultimates in sovereignty: internal law and order and external relations. As the Colonial Office put it, "we have had to take properly into account the position of Singapore as a mercantile centre depending on a stable government for its prosperity and as a major strategic base in the defence system of the free world." The mercantile importance of Singapore to Britain is well known; as for its strategic uses, the statement reflects not only the persistence of a fundamentally archaic mentality in the War Office but certainly of the interests of Australia and New Zealand in the South-East Asian area.

From the Singapore side the negotiations have not always reflected a singleness of purpose or a unity of approach. The leader of the visiting delegation, Mr. David Marshall had, it appears, staked the life of his coalition and precarious government on success being achieved in London. The pertinency of the proposals first formulated in Singapore thus became increasingly lost in the course of his negotiations resulting not only in making the British more obdurant but in a steady deterioration in the relations between different members of the Singapore delegation. Even when the final break was made inevitable Mr. Marshall persisted in concocting "new ideas"—ideas which were disavowed and condemned by his colleagues and treated with contempt by the Colonial Secretary.

The Singapore delegation on the first day of the negotiations found themselves facing an important tactical disadvantage. They were requested to accept a series of British proposals as the basis for discussion; their own proposals were thus not even effectively tabled. The visiting delegation asked initially for independence, probably within the Commonwealth. The British, in turn, offered a "constitution"—a document of considerable detail, prepared well in advance, symbolical and characteristic of the British contemporary approach to colonial problems, but with sufficient variation to acknowledge the fact that Singapore was not Nigeria nor the West Indies. The proposed constitution gave Singapore internal self-government but with one very significant and over-riding proviso: "the right on the part of Her Majesty's Government to take action in Singapore in exceptional circumstances." In other words, the Constitution provided for the unexpected—at any time—incursion of British power, without such incursions being called for in Singapore and at the same time without infringing upon the constitution. On precisely this point, the negotiations broke down. As the Colonial Secretary put it, the British Government refused to agree to a constitution which "contained no powers whereby Her Majesty's Government could ensure the discharge of its responsibilities short of suspending the Constitution."



The device by which the British intended to ensure this fundamental proviso was the Defence and Security Council:

> "In recognition of the fact that external defence and external affairs would be matters of mutual interest and to take account of the link between internal security and external defence and of Her Majesty's Government's continuing responsibility to maintain law and order in the absence of adequate local forces, there should be set up a Defence and Security Council."

It would have been clear to the Singapore delegation that the very existence of such a Council would permanently compromise their powers over internal affairs. Instead, they accepted the porposal and went on to take a stand on its composition which, if accepted, as the British recognized, would have made the Defence and Security Council redundant. The functions to be given the Defence and Security Council were such as to make it necessary for Britain to have a majority on it. It was in the light of advice of the Council that the British Government was to be enabled to make Orders in Council, i.e. to make the incursions for which it required power (though it was made clear that such advice was not essential). In the British conception the Council was to be composed of equal representation of the British and Singapore Governments with the British High Commissioner acting as Chairman. The Singapore delegation proposed that the Chairman be a Malayan and that the British Government act only on the recommendations of the Council.

The "new idea" which occurred to Mr Marshall after he "chatted" with British Labour leaders involved the right of Britain to take action in Singapore only by a British House of Commons' resolution. Fundamentally, this would not have been any improvement; it neither met the wishes of Singapore nor of Britain. In turn, therefore, the members of the visiting delegation forsook Mr Marshall and Mr Lennox-Boyd, the Colonial Secretary, dismissed the idea.

What of the future? Mr Bevan, the Opposition spokesman on Colonial affairs, suggested that the Cyprus Path is not an impossibility in Singapore. The cry of **Merdeka** in Singapore is becoming alarmingly loud to British ears. Mr Marshall has called the Colonial Office "fascist minded" and M. Lee Kuan Yew of the Peoples' Action Party has indicated his Party's intention to strive to follow the uncommitted nations of Asia rather than what the **Times** declared to be the British Policy—"to make Singapore remain in the democratic world". These very conflicting positions suggest that the turmoil which has encompassed the whole of Malaya since 1945 will continue and that the British approach to the urge for independence will be in terms of armed warfare, wherever the brass hats want to squat or wherever the economic interests involved are too weighty to be ignored,

Supply of Industrial Labour in India, 1892-1943

Pravakar Sen

AN attempt has been made in the present paper to investigate the trend of the supply of labour to industry in India over the period 1892-1943, and to draw, on the basis of that investigation, certain plausible inferences concerning the process of industrialisation in the country. The choice of the period does not have any especial significance. It has been dictated by the fact that no comprehensive statistics of the supply of labour to industry are available for any year prior to 1892 and, so far as India before independence is concerned, for any year later than 1943.

The present paper falls into two parts. The first part presents the statistical material and analyses and interprets it from certain chosen points of view. The second part offers a few permissible inferences drawn from these data bearing on the process of industrialisation.

I

An investigation of the trend of the supply of labour to industry in India has to face two difficulties both of which are ultimately traceable to the same source. The first arises from the fact that there being no time-series available for the entire country of any suitable indicator of the supply of labour to industry such as the daily average number of workers employed in factories, it is not possible to find the statistical trend of the supply of labour to industry. Such a series has been started only since independence. In this circumstance, the trend referred to will be found to be no more than a broad tendency, a certain drift intuited from data available for six rather unevenly spaced years in the entire half century under review. The second difficulty arises from the fact that for the purpose of studying the process of industrialisation the definition of an industrial worker on the basis of which all available statistics are organised would appear to be somewhat narrow. This point has been discussed at some length in the following paragraph. It will be noted that both these difficulties are really due to the scarcity of statistical organisation which is one of the many scarcities from which an industrially backward area is prone to suffer.

An industrial worker is, in the light of the statistics of the daily average number of workers employed in factories presented below, a person who works in a factory and a factory is an establishment of 20 or more people engaged in manufacturing with the help of some form of mechanical power. This definition would appear to be too narrow for a study of the process of industrialisation of an area in the initial stages of its development because during these stages the scale of plant tends to have a wide dispersion of distribution, so that an arbitrary minimum of 20 workers, although a perfectly sensible criterion of a factory from the point of view of statistical organisation, might lead to a significant underestimation of the true moment of industrialisation. There is no reason to believe that the possibility of this underestimation has been reduced over the years. For during the half century under review, industrialisation in India has been both intensive and extensive. There is a second reason why the definition might be regarded as too narrow for our purpose. It is that workers employed by contractors do not figure in our statistics. In view of the growing volume of work done by contractors in building and construction, engineering and communications, this omission might prove to be another source of underestimation. Another minor irritating factor is that it is not very clear whether the statistics presented below refer to wage-earners alone or to all employees. A distinction between the wage-earners and other employed factory labour is maintained in the statistics that are being compiled since independence.

Measurement of Supply

The measurement of the supply of labour to industry should be a matter of elaborate census operations, and for a study of the process of industrialisation, the definition of an industrial worker should be broad enough to cover every kind of machinery in existence or in operation. That is to say, a perfectly adequate definition of an industrial worker would be a person who either works with a fabrication driven by mechanical power or with things made with the aid of such a contrivance. Such a definition of an industrial worker would of course cut across the conventionally fixed boundary line between agriculture and industry and would include all labour in the economy oriented to mechanical power. Although this might go against the currently accepted convention in these matters, a measurement carried out on the basis of the definition of an industrial worker just proposed, of supply of labour to industry in this strict sense of economic activity to mechanical power would be a good indicator of the trend of industrialisation.

In the present study, however, we are prevented by statistical limitations from applying such a measure. We draw our conclusions not on the basis of the aggregate supply of labour to industry but on the basis of the daily average number of workers employed in factories. But as agriculture in India has been very little industrialised, there is no further limitation of a general nature to the results of our inquiry except those indicated above. Before proceeding to present the available statistical material let us, however, note, in passing, another difficulty from which the following analysis might be thought to suffer, but in fact does not.

This concerns the schedule sense of the supply of labour. It may have already become clear that in the following analysis we are not going to regard the supply of labour in the so-called schedule sense of the numbers of persons who are prepared to offer their services to industry at various wage rates. It is true that statistical limitations prevent us from measuring the aggregate supply of labour in the schedule sense. But even if it were not so, we would not gain anything by constructing such a measure. For we are interested in a universe of human beings who are distinguishable from the others in that they have decided to work with machines for earning their livelihood and not primarily in that they react in a particular manner to an economic variable such as wages. Wages do play a part in the making of the former decision. But they do not exhaust the entire gamut of the motivational factors.

Let us therefore note that the following analysis of the trend of the supply of labour to Industry in India is subject to the two general limitations mentioned above. The first of these limitations is that the paucity of data does not permit the fitting of a statistical trend. The second is that the somewhat narrow definition of an industrial worker on which the available statistics are based creates a bias towards underestimation of the extent of industrialisation in so far as this is sought to be gauged from the data selected. The analysis is subject to a further limitation which will be discussed later.

The set of figures presented in Table 1 refers to the daily average number of workers employed in factories, so defined under the Indian Factories Act, 1934, in all British Indian Provinces, except North-West Frontier Province, in some Indian princely States such as Kashmir, Patiala, Gwalior, Baroda, Mysore, Sandur, Travancore, Cochin, Bundi, Indore and in some others of the Eastern States Agency. A notable exception is Hyderabad.

It would appear from the manner in which these statistics have been collected that figures for different years are not very strictly comparable for, in the first place, the figures were not obtained by carrying out censuses for the years concerned. They were complied from various administrative records in which notoriously incomplete data find their place. There is no knowing as to how the degree of reporting by various areas had changed over the years. Nor is there anything in the sources to indicate whether corrections were made in the older data when brought together with new data to reflect the change in the degree of reporting by these geographical units. Secondly, since part of these data was first compiled by the Royal Commission on Labour in India of 1929 and then taken over almost entirely by the Labour Investigation Committee of 1946 and since the latter does not clearly indicate the relationship of the earlier set of data to the latter, it is possible that no thought has been given to the problem of making them comparable over time. In view of the gradual improvement of statistical organisation in India over the years, the presumption is that the figures for earlier years are likely to be underestimates to a larger degree than the figures for later years.

Data for Different Periods

It will be observed from Table 1 that the entire period of 51 years from 1892 to 1943 is divided, thanks to the irregularity in the collection of data, into five parts of unequal length. While the first of these parts, 1892 to 1912, is of the maximum length of 20 years, the second, from 1912 to 1923, is the second longest part covering 11 years. The third, the fourth and the fifth and last parts of the entire period are respectively from 1923 to 1933, from 1933 to 1939, and from 1939 to 1943, that is, 10 years, and four years long. While this division is somewhat unsatisfactory from the statistical point of view, it is not wholly incongruous with the development of certain broad economic forces in India.

The period of 20 years from 1892 to 1912 is marked by an attitude of indifference on the part of the British Government in India towards the industrialisation of the country, an attitude which followed in the wake of the laying of the railroads by British private enterprise warmly encouraged by the Government. The latter half of this period is however marked by considerable nationalist agitation having both political and economic implications symbolised in the Swadeshi (which means home-made) movement. Following the partition of the province of Bengal, which incidentally was again partitioned at the time of independence, the economic agitation takes the form of the boycott of British goods, burning of British wares in public, taking of the vow to buy only Indian goods. It is needless to point out that the part of Indian industry which was owned and managed by Indians at this time received a great fillip from this agitation.

The second period, that is, 1912 to 1923, covers the First World War, which stimulated Indian industry greatly, and its aftermath. This period not only stimulated Indian industry directly; it also prepared the way to further industrialisation. For it is during the First World War that the British Government in India realised that a certain amount of industrialisation of the sub-continent was imperative in the interest of the defence of the empire, if for no other reason. In 1922 the first Fiscal Commission was set up and a policy of discriminating protection was adopted by the Government. This was the first time that the Government came forward and started taking a direct interest in the industrialisation of the country. The result is that the third part of the period under review, that is, 1923 to 1933, marks the beginning of a policy of protection to industry in India. It also covers the depression of 1929-31.

The fourth part of the half century, 1933 to 1939, carries forward the implication of the second political movement led by Gandhiji, that of "civil disobedience" which was marked by a more intense campaign of boycott of British goods, a larger impetus to industry owned and managed by Indians and so on. It also represents a temporary intensification of Governmental interest in industrialisation on a provincial level with the acceptance, in 1937, of executive responsibility in the provinces by the Indian National Congress. This refers to projects for electrification of rural areas and road-building etc undertaken by the Congress administration during the short period of its tenure. Of course the policy of protection was still there, although the Indian elements in industry were charging the Government with favouritism towards the British elements.

Average Daily Number of Workers Employed in Factories in India, 1892-1943.

Year	Number of Factories	Number of Workers			Total Number of Workers
		Men	Women	Children	
1892	656	254,336	43,592	18,888	316,816
1912	2,710	685,822	130,025	53,796	869,643
1923	5,985	1,113,508	221,045	74,620	1,409,173
1933	8,452	1,167,284	216,837	19,091	1,403,212
1939	10,466	1,498,218	243,516	9,403	1,751,137
1943	13,209	2,158,319	265,509	12,484	2,436,312

Source: Main Report, Labour Investigation Committee, Government of India, (New Delhi, 1946), page 13.

The last phase, 1939 to 1943, represents a tremendous intensification of industrial activity under the pressure of the Second World War. Though Gandhiji led the last and the largest political movement in Indian history, the "Quit India" movement in 1942, curiously enough, the industries were not directly involved in this movement or for long; and while the political struggle for independence was on, there was no slackening of industrial effort. Thus while the political movement grew by stages from "swadeshi" to "Quit India", a corresponding pattern of efforts was evolving on the economic plane which led the country towards greater and greater industrialisation. In so far as the division of the period under review follows the natural pattern of this evolution, it helps rather than hinders the task of explaining the data presented in Table 1 in terms of these broad economic forces at work.

It will be seen that the total number of factories more than quadrupled in the 20 years from 1892 to 1912, more than doubled in the next eleven years from 1912 to 1923, increased by about 40 per cent over the next ten years from 1923 to 1933, by about 20 per cent over the next six years from 1933 to 1939, and finally by about 25 per cent over the last four years of the period, 1939 to 1943. Abstracting from considerations of scale, it would appear that over the entire first three decades of the half century under review, a period marked by Government in-

difference towards industrialisation only temporarily relieved by the exigencies of the First World War, there was almost a uniform rise in the number of factories, at the rate of about 26 per cent annually. On the other hand, over the last two decades of the period, a phase marked by some degree of Government encouragement to industry, there was an almost similarly uniform rise in the number of factories, but at the much smaller rate of about six per cent annually. This result is not an argument in favour of laissez faire and against State interference in economic activity. It only reflects the fact that the process of industrialisation in India as it had been developing until, say, 1923, had undergone a complete change in character in the subsequent years. The nature of this transformation will be one of our main concerns in the second part of this paper. Assuming that the policy of protection was not a fundamental mistake and apart from the question whether its administration could be improved in practice, we may view the foregoing result as an indication of certain basic changes in the character of industrialisation which demanded protection, if that apparently small rate of progress were to be maintained. When considerations of scale are introduced in the discussion, however, the apparently small rate of increase in the number of factories during the latter part of the period in question no longer appears small.

In contrast to the spectacular rise in the number of factories over the half century, the increase in the average daily number of male adult workers employed in factories in India was small. Between 1892 and 1912 the annual rate of increase was approximately 8 per cent; between 1912 and 1923, the rate of increase was down to 6 per cent per annum; between 1923 and 1933, the early period of protection, the rate of increase dwindled to approximately half per cent per annum; between 1933 and 1939 the rate of increase again went up to almost 5 per cent per annum; finally between 1939 and 1943, the rate of increase went up to almost 10 per cent per annum. While it is certain that the abnormally low rate of increase of half per cent for the period between 1923 and 1933 was due to the depression of 1929, and the much faster rate of increase during the last phase was due to the pressure of war, the broad tendency towards a falling rate of increase of the average daily number of workers employed in factories over the entire period is unmistakable.

Between 1892 and 1923, the first part of this half century, the rate of increase was approximately 10 per cent per annum; between 1923 and 1943, the second part of this period, the annual rate of increase was only 5 per cent on the average.

Sharp Fall in Female Workers

A broadly similar, although in a particular respect more marked, tendency is the growth of the average daily number of female adult workers employed in factories over this period. Between 1892 and 1923, the annual average rate of increase was about 13 per cent. Between 1923 and 1943, it came down to the strikingly low figure of 1 per cent. This extra-ordinary fall in the rate of increase of the average daily number of female workers is due, among other things, to the introduction of laws binding employers to engage female workers only under certain specified conditions of work. These conditions must have proved unprofitable to the employers, for the falling rate of increase in the average daily number of female workers will be seen in due course to have reversed an earlier tendency of replacing male workers by female workers. The annual rate of increase in the average daily number of female workers employed in factories was approximately 10 per cent between 1892 and 1912 and about 6 per cent between 1912 and 1923. Between 1923 and 1933, there was an actual decrease in the average annual rate of 0.2 per cent, this reflecting both the impact of the depression of 1929 and of social legislation. Between 1933 and 1939, the annual rate of increase was only 2 per cent while during the last phase, 1939 to 1943, it went up to 2.2 per cent under the impact of the war.

Similar Trend in Child Labour

The development in respect of the annual average daily number of children employed in factories, while consistent with that regarding male and female workers, is striking in one respect. Between 1892 and 1923 it increased at the rate of 10 per cent per annum approximately, but over the period between 1923 and 1943, factory employment of child labour decreased at the rate of 4 per cent annually. This was a direct outcome of social legislation more than anything else. Between 1892 and 1912, there was an increase in the annual average daily number of children employed in factories at the yearly average rate of approximately 9 per cent. Between 1912 and 1923, the rate of increase fell to 4 per cent. Between 1923 and 1933 there was a decrease in the absolute figure, the rate of decrease being 7 per cent per year. Between 1933 and 1939, the decrease was at the higher rate of 8 per cent per year. During the period 1939 to 1943, however, there was an increase in the absolute figure, the average rate of increase being 8 per cent per year. This was presumably due to the impact of the war.

Declining Rate of Increase

Finally, taking the average daily number of all workers, men, women and children, employed in factories in India, we find that between 1892 and 1912, the number increased approximately at the rate of 9 per cent per year. Between 1912 and 1923, it increased at the rate of 6 per cent per year. Between 1923 and 1933 there was a decline in the absolute figure, the rate of decrease being 0.04 per cent per year. Obviously, this was in part due to the depression. Between 1933 and 1939, there was again an increase in the average daily number of workers, the rate of increase being 6 per cent per year on the average. Between 1939 and 1943, however this rate further increased to almost 10 per cent per year. In spite of this later tendency towards an increase, primarily due to war, the long run tendency is unmistakably downward. Between 1892 and 1923, the average daily number of workers employed in factories in India increased at the annual average rate of 11per cent. Between 1923 and 1943, the annual average rate of increase came down to only 4 per cent.

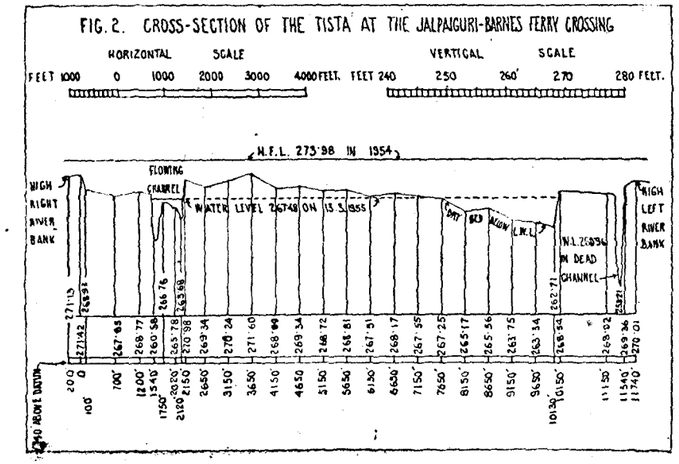
Tista Flood Problem in West Bengal

Embankments No Solution

Kumud Bhushan Ray

(Continued from previous issue)



BEFORE the Dihong captured the water of the Tsangpo some time before the 13th century, the Brahmaputra drained the 'rain-shadow' area of the Assam Valley, north of the Central Hills of Assam, and carried a small discharge. It had, therefore, developed a tortuous course via Mymensingh Town with an outfall into the larger Meghna, draining the immense rainfall on the southern slopes of the Central Hills. With the capture of the Tsangpo water, the Brahmaputra carried a much larger discharge, its channel got deepened, while its alignment was straightened, from Dhubri to Goalundo past Sirajganj Town.

The improved Brahmaputra channel appears to have a better outfall for the Tista water. A cut-off channel from the improved Brahmaputra to the Tista must have been established sometime in the 13th century. Through this channel the Tista water was being diverted into the Brahmaputra. During the latter part of the 18th century, the Tista water stopped flowing through the Karotoya and its diversion through the present Tista channel was completed. The present position is that the Karotoya and its tributaries—the Panga, Burhi Tista, etc.—are completely cut off from upland water supply. As a result of this, Tista water now flows through its present channel, while the Karotoya and its tributaries are dying rivers.

A study of rivers in the East Himalayas, shows that the Arun, a tributary of the Kosi, has by cataract action deepened and lengthened its gorge across the Himalayas and captured the Yaru River valley in Tibet; but the tributaries of the Tista have not yet been able to cut across the Himalayas into Tibet. The deepening and lengthening of the gorges of the tributaries of the Tista is however, continuing and in this process enormous amounts of silt load are being added to the waters of the Tista.

It has been explained that the velocity of a current of water in the wide channel of the Tista is so low that a part of the enormous amount of silt in its water is being deposited on its bed, and there has been a gradual rise in the level of its channel bed, dry season low water level and flood season high water level. The Karotoya, on the other hand, being cut off from the Tista upland water supply, transports little silt load. There is thus little or no rise in the channel bed, the low water level or the high water level in the Karotoya or its tributaries.

The Dharla, which flows into the larger Jaldhaka River, carries a small discharge and consequently transports a small silt load. There is thus little or no rise in the level of its channel bed, or in its low water level or high water level as compared to that of the Tista. On the other hand, the Tista water spilling over its left bank near Barnes, which in the high floods of 1954 amounted to as much as 140,000 cusecs or about 50 per cent of the discharge carried by the main Tista channel, deposits the whole of its silt load while flowing over the paddy lands in the Barnes-Mainaguri area. The desilted Tista overflow water nearly doubles the discharge in the Dharla. The clear water helps to downscour the Dharla bed, so that its channel and consequently its flood water levels have remained lower than those of the Tista.

Overflow of Tista Water

With a gradual rise in the channel bed and water levels in the Tista, and with little or no rise in those of the Karotoya, the Tista water spilling over its right bank in Jalpaiguri Town has a natural tendency to flow into the channels of the Panga, Burhi Tista and other tributaries of the Karotoya. There have thus been several breaches over the years in the railway line between Jalpaiguri and Haldibari by the overflow water from the Tista trying to flow into the Karotoya.

The south end B of the embankment A B (see fig) constructed in 1955 along the right Tista bank for the protection of Jalpaigur Town, has been connected to the bank of the railway line between Jalpaiguri and Haldibari. Thus the railway line, south of the point B to Haldibari, will continue to be threatened by overflow water from the Tista, in its tendency to find its way into the tributaries of the Karotoya, while lands between the Tista and the tributaries of the Karotoya will continue to be submerged during floods.

Similarly with a gradual rise in the channel bed and water levels in the Tista and with some lowering in those of the Dharla, the Tista water overflowing its left bank has a natural tendency to flow into the Dharla, between Mainaguri and Mekhliganj. It has been mentioned that in the high floods of 1954 as much as 140,000 cusecs of Tista water spilled over its left bank. Is it any wonder that there have been several breaches in the railway line south of Mainaguri?

An embankment on the left bank of the Tista, as proposed on April 4, 1956, will probably connect the Tista left river bank with the railway line through Mainaguri. South of this connection, the railway line will continue to be threatened by the Tista water spilling over its left bank in its tendency to flow into the Dharla, while the river side lands between the Tista and the Dharla will continue to be submerged during severe floods, in spite of the embankments.

Comparison with Urban Surface Drains

A study may now be made of cutcha or unpaved surface drains in a city. By erosion of their banks, these drains gradually become wide and shallow. Owing to this and also on account of the flat slope available, the velocity of water is very low. A current of water deposits a part of its silt load, so that there are accumulations of debris in a drain as islands and sand banks, round which the drainage flows in tortuous courses. Such a surface drain has inadequate drainage capacity. Hence during and after a heavy and prolonged rainfall, excess water is incapable of being quickly drained away and roads get submerged.

To prevent flooding of roads, a Municipality does not put up embankments along both sides of a surface drain. Of course, such embankments are able to confine the drainage coming down from the upper parts of the town within the drain. But the embankments would also prevent rain water, collected on the road suface as well as from road side dwellings and compounds from flowing into the drain.

A method by which a Municipality may prevent submergence of a road by overflow from a surafce drain, is by ensuring a reduction in the volume of drainage from the upper parts of the town by the construction of small dams across a drain, thereby creating reservoirs to hold part of the heavy rainfall in storage. The drainage water may be released through sluices in the dams over a longer period. The regulated lesser discharge through a surface drain in the lower part of the town will not then overflow and submerge the roads. But the submergence of a part of the upper town above a dam across a drain is not likely to be tolerated by the citizens, even if the stored water is utilised to generate hydro-electricity at the fall created at the dam across a drain, or is used for the irrigation of gardens of these citizens.

To prevent submergence of roads from overflow from road side drains, a Municipality usually deepens a surface drain. The increased drainage capacity of a narrow and deep drain enables it to accommodate and drain away quickly the maximum discharge for a heavy and prolonged rainfall. To maintain the sectional area, the sides and bottom of a drain are generally paved with brickwork or concrete and cement plastered. The municipal staff also cleans any accumulation of debris in the drain, so that its sectional area is maintained.

Narrowing and Deepening a River Channel

If a wide and shallow river could be narrowed and deepened in the same way as a municipal surface drain, its drainage capacity would be increased, maximum discharges accommodated within its channel and drained away quickly. There would then be no spilling over banks, no overflow and submergence of river side lands and no flood damages. River channels have been deepened by dredging, but it is not always a practical proposition to do so.

A river, however, commands a great force, its own current of water, which has the power of eroding the material on its channel bed and of transporting of the silt load thus formed. In the alluvial rivers of India, this great force has been utilised by the Steamer Companies for narrowing and deepening a wide and shallow reach of a river by the use of 'bandals' for maintaining navigation by steamers. The disadvantage of 'bandals' is that with the increase of velocity in a current of water at the beginning of the flood season, the channel bed is downscoured and the lines of 'bandal' are undermined. An improved type of 'bandal', which is able to maintain, its position and alignment on the channel bed and thus continue its action of narrowing and deepening the river channel even in the flood season, has been used in the Beki River in Assam in 1949. Since then, the improved type of 'bandal', which is known as 'permeable screen', has been used by the NE Railway in rivers in North Bengal and Assam, for depositing silt on selected parts of the wide and shallow channels.

Permeable Screens in the Tista

A study of an earlier map of Jalpaiguri shows that the Tista had a narrower channel. From 1898-1905, the author was a student in the Government Zila School, Jalpaiguri. He remembers that the Tista had a half-a-mile wide channel. The greater depth in this narrow channel made it possible for a steamer to ferry passengers and vehicles across. He also remembers a steamer trip up and down the Tista, carrying Tea Planters and high government officials of Jaljaiguri.

By the use of the 'permeable screens' it is possible to narrow and deepen the Tista back to its former width of about half-a-mile. With an increased drainage capacity in the narrowed and deepened Tista, the flood water level will be lowered and there will be no spilling over the Tista banks. Submergence of river side lands will thus be prevented even without embankments while a permanent solution to the Tista flood problem will thus be ensured.

Deficit Financing in Nepal

Y P Pant

IN a recent article in The Economic Weekly (Budgets in Nepal, issue of April 21) I had drawn attention to the annual deficit amounting to more than a crore of rupees which appears to have become a regular feature of budgets in Nepal. I had also pointed out that deficit financing has been restorted to in Nepal, in spite of the general neglect of developmental work. Even otherwise, however, the peculiar circumstances that prevail in Nepal make deficit financing a highly dangerous operation. These circumstances are examined below.

Nepal has a dual monetary system. One has therefore to face several difficulties in gauging the total supply of the two currencies. Some estimate of the volume of Nepali currency in circulation is available, but there is no means of knowing the volume of Indian currency that is in circulation in Nepal. Not to speak of the general circulation, until recently, no distinction was made in the budgets between Nepali and Indian rupes. Besides, no index number of prices in the country has been computed so far. The only measure of the value of the Nepali rupee, however imperfect, is to be found in the exchange value of the Nepali rupee in terms of the Indian rupee. Nevertheless, it is clear that during recent months, prices have risen sharply in the hilly regions, where the circulation consists predominantly of Nepali currency, while they have fallen somewhat as a consequence of falling prices of food grains in India in the Tarai, where Indian currency circulates. This situation in the Tarai may not last, since the prices in India show an upward trend. But that prices in the two parts of Nepal should move in opposite directions in this manner shows how complex the problem is.

Exchange Depreciation

During the last fifteen years, the exchange rate between the Nepali and the Indian Rupee has fluctuated between 57 : 100 and 195 : 100. Before the outbreak of World War II, the exchange rate was practically stable at 120 - 125 Nepali rupees to 100 Indian rupees. This stability existed because the Nepali currency region imported very little, even of necessities, from India, thanks to rigorous import restrictions and service earnings abroad. Though in the new set-up increasing commodity imports from India are one of the factors responsible for the decline in the value of the Nepali rupee, other factors like increasing speculative dealings and administrative disorder also play a part.

During the last six months or so, due to the favourable effects of certain short term measures taken by the Government under His Majesty's direct rule, wide fluctuations have been eliminated and excepting very short term variations, both the official and the market rates have remained stable at 175 to 100. From a long term point of view, however, this rate is unfavourable to the country's economy. Some measure of exchange control has been set up very recently by prohibition of the import of certain items, such as silks and liquor, and the Government sale of Indian currency at 175 to 100 rate for approved imports on the governmental list, which includes rice, sugar, machines, kerosene, cotton cloth and other necessities. It is, however, doubtful whether these measures will solve the problem of the exchange rate.

Foreign Trade of Nepal

Foreign trade is also important for the budget since it affects the impact of the deficit on Nepal's domestic economy. Accurate statistics of external trade do not exist. So it is difficult to judge the situation correctly. The major part of Nepali trade is with India. Statistics published in the **Indian Trade Journal** based on information obtained at railway stations adjacent to Nepal, Tibet, Sikkim and Bhutan, however, give some idea of the general trend of foreign trade. Besides the trade with India, there is some trade also with Tibet which is carried on over the Himalayas but it is only of minor importance. Exports are principally from the Tarai, while the hilly regions are the principal importers.

The Department of Commmerce and Industry has recently made some rough estimate for the years 1948 to 1951 (see Table I), of the exports to and imports from India.

Influence Obscure

These figures do not include invisible items such as travel in India by Nepali subjects and the purchase of Indian services which probably result in a sizable deficit. The voluminous exports of foodgrains from Nepal Tarai to the adjacent Indian districts in UP, Bihar and Bengal could not, however, have been correctly estimated in the above statistics in view of the existence of the same currency unit. This accounts, no doubt, for the deteriorating exchange rate of the hilly regions, which use Nepali currency and which are dependent even for some of their daily necessities on India. Prices of the main exports have tended to fall recently, while prices of the main imports have remained steady or risen slightly. In fact, the influence of the balance of payments on the economic situation is still quite obscure, as only a part of the trade between Nepal and India partakes of the character of international trade. The Tarai exports substantial quantities of food grains to India, while Kathmandu Valley is always deficit in food, but since the currency circulating in the Tarai is the Indian

TABLE I
Exports and Imports
(In crores of Rupees)

	(1948)	(1949)	(1950)	(1951)
Imports				
Cloth (constitutes half of the total) cigarettes, sugar, bicycles, salt, petroleum and kerosene etc.	7.8	8.0	8.4	9.3
Exports				
Rice and jute (constitutes about two-thirds of the total) from the Tarai, woollen blankets known as pasminas, ghee, oilseeds, fruits, vegetables and timber.	8.8	12.4	13.7	14.2
Export Surplus	+1.0	+4.4	+5.3	+4.9

rupee, the impact of this trade is not directly felt on the rate of exchange of the Nepali rupee.

Created Currency

It is unfortunate that instead of properly attacking the difficulties that the economy faces by suitable measures, the only means for financing the budgetary deficit adopted by the Government has been the increased issue of paper currency and larger coinage. It is estimated that the total increase in paper currency and coinage (as shown in the budgets) for the four years 1951-52 to 1954-55 amount to Rs 6.05 crores, i.e., at the rate of Rs 1.5 crores per year on the average. The liberal employment of such means has aggravated the financial difficulties of the country. Table II gives a comparison of exchange rates and the amount of new money created.

TABLE II
Exchange Rate and Creation of New Money

Year	Exchange Rate Nepali Rs. for Indian Rs.	Money created Rs. in crores
1950-51	110 : 100	3.00 (rough estimate of total)
1951-52	115 : 100	1.20
1952-53	145 : 100	1.60
1953-54	160 : 100	1.25
1954-55	185 : 100	1.10
1955-56 (to January 1956)	175 : 100	.04

Though the data is far from exhaustive or accurate, the inverse relationship between the two is nevertheless quite clear. Fresh creation of money has generally been followed by the adverse movement of the exchange rate.

Deficit Financing Not Justified

Deficit financing merely for meeting current financial needs in the country can never be justified. Apart from this, some specific circumstances of Nepal's economy militate against the use of deficit financing. First, the Indian rupee being legal tender in Tarai, which embraces about half the area of Nepal, the possibility of a flight from the Nepalese currency has to be reckoned with. Second, Nepal is in the unique position of attracting a large volume of foreign investment, if confidence in the Nepali currency can be established but this confidence is slowly waning. Until the Government establishes public confidence in the Nepali currency by liquidating the present dual currency system and modernising the system of note issue, fresh creation of money will have dangerous consequences. Until the country's currency is unified, the present monetary chaos will continue. Third, a significant part of the new money created is wasted almost as soon as it is issued. Since a major item of revenue, land tax, is fixed in amount being in rupees per unit of land, depreciation of the Nepali rupee resulting from deficit financing tends to increase the budget deficit and call for more deficit financing. This vicious circle has to be broken.

Scope for Increasing Revenue

The Government has already taken some steps towards wiping out the deficit and very recently, some other measures have been also announced. There are a number of sources for augmenting revenue, but it is doubtful whether many of these can be tapped immediately. It is quite certain that an improvement in administration would increase custom yields very substantially. There is also considerable scope for increasing the yield from land revenue and in fact a revision of land revenue assessment has been long overdue in all districts. A thorough overhaul of the land tax, however, may well have to await the completion of the cadestral survey, which according to the recently announced Draft Plan may take some ten years. In these circumstances, it might be better to introduce immediately a tax on agricultural income which can be easily done. Besides yielding more revenue, such a tax would also correct the inequity of the present land taxes. A step in this direction has been taken by the recent proclamation taxing at a progressive rate owners of Birta lands, which had so far been exempt from tax, whose income exceeds Rs 5,000 annually. This tax is expected to add about Rs. 15 lakhs annualy to Government revenue.

Revenue from the forests can also be greatly expanded by honest efficient and incorruptible management of forests. A six-year plan of forest development is under way, under which the sale of products of small forests, and control over the sale of the timber of dry trees are to be taken over by the Government, which will also ensure preservation of forests by means of afforestation, new plantations and scientific marking of trees that are to be felled each year.

Tax Prospects and Proposals

The introduction of a system of income tax is also under contemplation. Though desirable by all means, it is doubtful how far an administration system which is unable to administer effectively the relatively simple custom tax can be expected to administer an income tax efficiently. There is no doubt, however, about the need for a fundamental change in the tax system. Under Rana rule, taxes, if any, were levied mainly on the poor. For example, there was a tax on coolies while the families of the Ranas and big landlords enjoyed special concessions even in the matter of payment of land dues. Provided the administrative machinery can be made more efficient and honest, there is also scope for some sort of estate duty over and above the agricultural income tax. Some reliance can be placed on a variety of taxes like sales tax, business profit tax and so on. After the completion of the Kosi, Rapti Doon, Trisuli and other projects, road tolls and betterment levies for irrigation water etc, may provide an important future source of revenue. It must be repeated, however, that all these additional sources can be tapped successfully only when the necessary steps have been taken for improving the administration and for stabilizing the currency.

For wiping out budgetary deficits, needless to say, it is also necessary to curtail expenditure, especially on defence and general administration. It is regrettable that expenditure should have increased substantially in the 1954-55 budget though there has been no expansion of developmental programmes.

In this way, by increasing revenue and reducing general expenditure, it should be possible for the Government of Nepal to balance its current budget and avoid the dangers implicit in deficit financing under the conditions existing today. These conditions should in any case be improved, so as to make it possible for the Government to incur moderate budgetary deficits in the future, should the necessity arise, for the more legitimate purpose of development programme, rather than for meeting revenue expenditure which in any case should be met only from revenue.

The Bharat Line Limited

Speech of the Chairman Mr C R Srinivasan

THE following is the speech of the Chairman, Mr C R Srivasan, delivered at the Tenth Ordinary General Meeting of the Shareholders of the Bharat Line Limited, held at Bhavnagar on Monday the 21st May 1956:

Gentlemen :

It gives me great pleasure to welcome you all to the Tenth Ordinary General Meeting of the Company. The Directors' Report and the audited Balance Sheet and Profit & Loss Account have been in your hands for some time now. I trust I have your permission to take them as read.

You will notice in the agenda for the meeting there are several items included which have not hitherto found a place there. The Companies' Act I of 1956 came into force in April last and under the provisions of the New Act, much that was assumed in the past, now requires formal affirmation by shareholders after due notice. The intention obviously is to associate shareholders more intimately in the affairs of the Company; the need to do so arises not merely because there have been instances where their interests have been neglected for lack of sufficient and suitable safeguards; it arises also in the context of our expanding economy which depends in part on joint stock enterprise wisely directed and watchfully supervised for the service of the country's interests. It may be that some of these provisions of watch and ward impose needless and vexatious burdens on the freedom of enterprise, but so long as they are administered with understanding and sympathy, those who are moved and motivated by an identity of interest between the Company and the country should find little difficulty in adjusting themselves to the new conditions and if an informed and instructed body of shareholders emerge in consequence, it is all to the good and none may gainsay its value and importance. Incidentally it may help the private sector to recover its proper place in public economy.

The economy that we recovered from the foreign administration was one of shreds and patches and its reconditioning called for care and caution, especially with the limited mobile resources at our disposal. The First Five Year Plan was drawn up with emphasis on the agricultural sector and by all accounts a very good job of work has been done in the First Plan period. The Second Five Year Plan commences with the current official year and though its contours are yet to be defined with precision, it is common knowledge that this time the accent is on the industrial sector. The need to create a balanced economy with a view to widening the range of employment and raising the standard of living is now increasingly recognised and means and methods to this end are now vigorously canvassed in all informed circles. Considering the size of the plan frame and the prospect of recourse to deficit financing to service substantial parts of it, it is obvious that the success of this adventure turns largely on the measure of willing and wholehearted cooperation forthcoming from the community; in particular, wisdom lies in enthusing the private sector to engage in the task ahead, without doubts or misgivings.

Impact of New Forces

It is not so much the socialistic pattern of society to which our course is set that alarms the business community; they are realists and can appreciate the impact of new forces in a changing world. Everywhere these forces are at work; only in India additional momentum has been imparted because these forces had been dammed for decades past; but our political propagandists, in their anxiety to show that they are in the vanguard of the new movement, have unfortunately laid more stress on the break with the past than the build for the future. The business community is naturally exercised over recent developments and a restatement of Government policy in the context of the socialist pattern was clearly indicated. This has now been clearly enunciated by the Prime Minister in Parliament and should serve to enlighten concerned interests where they stand in the new economy. Industrial programme and progress will be attempted and achieved on a three tier basis. There will be at the base a public sector comprehending industries which, for reasons of security and scale of investments, can best be run on Government ownership and control; in the middle, there will be a composite sector where private enterprise is intended to supplement Government efforts; at the top there will be a private sector where private enterprise will have full play though subject to regulation in public interest. Rightly understood, interpreted and administered, few will be disposed to quarrel with this distribution of responsibilities in a country's economy if the international forces unleashed in the 20th century are properly appraised and assessed. It cannot, however, be denied that what is being attempted is a controlled economy with facets of freedom.

Fair Weather Needed

It is not enough, however, if Government restate their policy in clear terms. They must also create and maintain conditions under which industry, howsoever placed, can thrive and give of its best. The primary requisite in this direction is a period of industrial peace. In my address last year I have dealt at length with the problems posed by labour and by way of illustration cited facts and figures to establish that neither in their own interest nor in the interests of the country could the way they had reacted to the needs of the situation be justified. Government is not unaware of what is happening; but the machinery of Government moves so slowly that oftentimes it serves but to illustrate the juristic maxim that justice delayed is justice denied. I am sorry that so far as our experience goes the position has, if anything, aggravated and the infection has begun to spread to higher ranks also. Not merely is the weapon of strike indulged in on the smallest provocation as the recent dockyard strike in Calcutta illustrates, but the 'go slow' virus seems to have lodged itself deeply in the body politic. The output is steadily falling and the turnover per man hour has declined in every industry. Apart from standard wages, incentive bonuses have been offered by way of additional inducement, but it is early days yet to assess how far this will stop the rot. In marginal industries working under competitive conditions the

strain on enterprise is beginning to sap all enthusiasm for expansion. That this should happen when the country is being called upon to co-operate with a large scale expansion in the industrial sector is a tragedy too deep for tears. I hope those who are framing the plan will turn their attention to this festering sore in the system and see their targets are not defeated by it.

Problem of Transport

In a rapidly developing economy where progress on many fronts is contemplated there is one danger that farsighted men should guard against well in advance. I raise this note of warning because I am afraid in the frame work of planning sufficient attention has not been paid to the multifaced problem of transport. As it is, with the limited objectives we have achieved under the First Five Year Plan, transport has already become difficult, seriously upsetting the production and distribution programmes of industrial units. Traffic on the railways has become so congested that it is seriously suggested that propaganda should now be taken on hand for discouragement and not encouragement of traffic. There has also been large scale diversion of coal traffic to coastal shipping; but with rising costs on the one hand and avoidable delays at the ports on the other the rates offered are so uneconomic that shipping companies find little enthusiasm in a situation that should normally stimulate enterprise. The turnover of every shipping company engaged in the coastal trade has registered a fall and the margin of profit is fast coming to vanishing point. More ships should be commissioned to cope with the coastal traffic, but frankly the incentive is not there.

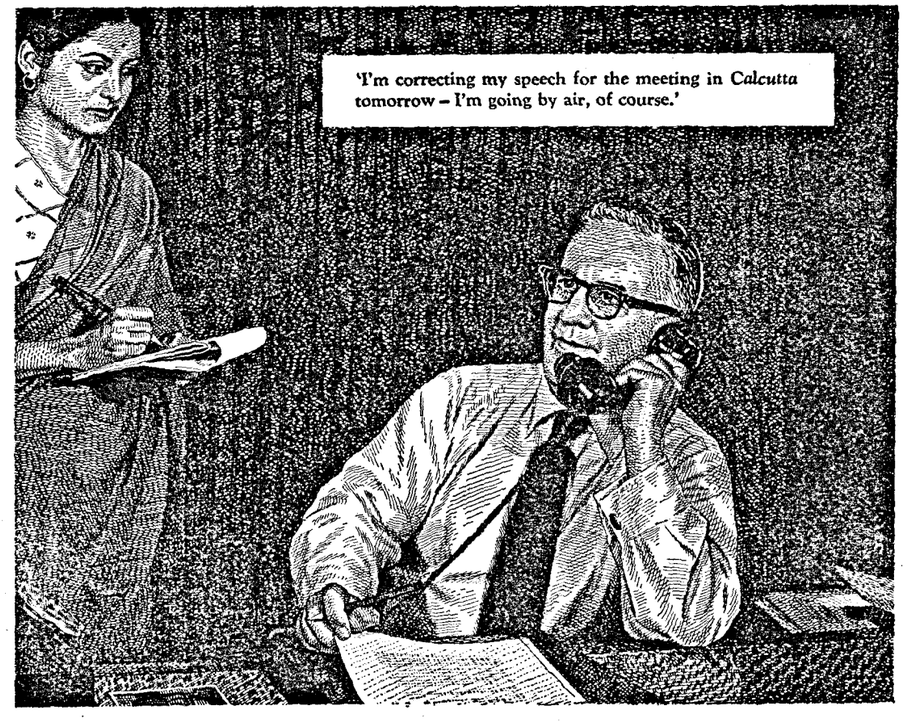
Nearly a year back shipping interests applied for raising the freight rates, but after repeated representations a token 5% increase was allowed in October last year. During the interval the costs of replacement, services and materials, have kept on rising with the result that the original increase, which the Indian Shipowners considered a year back as barely sufficient to meet their liabilities, is out of date to-day, and suitable representations have been made to the Government in the matter. Whereas the Coastal Trade saw the last increase as far back as in 1951, the other Trades with which India is intimately connected have seen increases ranging from 21% to 45% during the same period. Examples are not uncommon where the Conferences concerned have increased their freight rates by 21% within the last twelve months. The Coastal Trade has meanwhile been compelled to suffer heavy losses. The Government of India would appear to be cognisant of this position because at the Meeting of the Consultative Committee of Shipowners held in Bombay in November last the Hon'ble Minister for Transport stated:

"One of the matters which have of late agitated the Indian Shipowners is the question of suitable increase in the coastal freight rates. The Shipowners had proposed to put up the coastal freights by 10%, but Government have found it possible to agree to an increase of 5 per cent only. I know this has not been generally appreciated, but Government are committed to review the matter after the Rail-Sea Co-ordination Committee has submitted its report. If that report is not received by March 1956, Government would take up the matter again on their own with a view to examining whether any further modification in the freight rates could be justifiably made."

Freight Rates

The Rail-Sea Co-ordination Committee have not been able to bring out their Report so far. In the meantime, the second interim increase, which was contemplated by the Hon'ble Minister for Transport to be effective soon after 1st March, materialised only some time during the current month. Even this increase is to the extent of 5% only on general cargoes effective 1st April last. The freight rates on Railway Coal will be revised with retrospective effect from 1st April this year only after the Government receive the recommendations of the Rail-Sea Co-ordination Committee. On the other hand the freight rates on coal moving on private account or for bunkers will continue at the present level till the Government take decision on the recommendations of Rail-Sea Co-ordination Committee and will have no retrospective effect as on Railway Coal. This piecemeal treatment takes no cognisance of loss in earnings already suffered by the shipowning community, nor does it take into account the changed circumstances of the case which have been duly represented to the Government and which call for higher increases in the freight structure, nor even is the present increase in any way commensurate with the increase effected by foreign shipping on foreign trade routes with some of which the Government themselves are associated.

Unless, therefore, further substantial relief is forthcoming without loss of time, I am afraid, there is little prospect of improvement in coastal traffic. A modest target is fixed under the Second Five Year Plan for the expansion of shipping raising the total tonnage to less than a million tons in 1961 and shipping companies have been asked to frame programmes of expansion during the Second Planning period. I wonder, however, if in the conditions that prevail today the response will be adequate. Government is no doubt anxious to help with credit facilities; but unless the prospects of making both ends meet are visibly improved, few will come forward to take advantage of the credit facilities offered. Earlier experience is not calculated to enthuse enterprise either. Shareholders are aware that we were induced to enter the Persian Gulf trade with promise of Government co-operation and assistance. Though two years have passed, a lot of spade work had been done, and quite a sizable trade had been built up, at a considerable sacrifice, we still await concrete proposals as to the manner and measure of help that Government intend to extend to stabilize this new line of traffic. Another matter, which is likely to affect the financial side of the Company's operations, is the recent strike of the Company's floating staff officers, the arbitration award in respect of which imposes considerable additional financial burden on the Company. It seems that the time has come when, as in the case of the ships' crews, the emoluments of the officer staff should also be standardised: and it will be in the interests of the Shipowners that they seek immediate appointment of a Commission to examine the subject from all angles and evolve fair standards of emoluments for the officer staff linked with the Country's cost of living index. I am afraid that unless a ministry of shipping is separately organised to study and service the interests concerned, the shipping industry will not develop as much as it should if the expanding needs of the situation are to be adequately met. At the request of Government we have diverted two of our ships to the Russian Service, but it will be possible to assess its potentialities only after an initial proving period. All that I am concerned to stress in this context is that there is no lack of enterprise provided fair conditions and fruitful co-operation are assured.



The Report of the Directors gives a comprehensive picture of the year's work and though earnings have fallen and the margin of profit reduced, we have been able to maintain the dividend at the previous level. I do not propose to make any detailed comments. My thanks are due to my colleagues on the Board and the Management for the cordial co-operation they have extended and I bear testimony also to the good work of the staff both ashore and afloat. With these words I now formally move that the Directors' Report and the audited Balance Sheet and Profit and Loss Account for the year ended 31st December 1955, already duly sent to the Shareholders be and are hereby adopted.

Hindustan Motors

HINDUSTAN MOTORS have decided to raise the capital of the Company by issue of five lakh cumulative convertible redeemable preference shares of Rs 100 each. Shareholders whose names appear on the register of the Company on May 25, 1956, are entitled to one such preference share for every ten ordinary shares held by them. Additional shares may be allotted to shareholders at the discretion of directors. Necessary consent of the Central Government has been obtained for the issue.

These preference shares not only carry preferential cumulative tax-free dividend at the rate of six per cent per annum, but have additional attractions of both conversion and resumption rights. Holders will have the right of converting these shares into ordinary shares at any time between July 1, 1961, and June 30, 1966. On the other hand, the Company has the right of redeeming these shares at any time after June 30, 1963, on three month's notice.

Directors state that they have decided to raise the capital of the Company for expanding its activities, to meet the increased demand for vehicles anticipated during the second Plan period, to ensure manufacture of a larger number of parts and components of vehicles of various types and to make the factory increasingly self-sufficient as well as to diversify manufacturing activities of the Company.

When you have a journey to make, *think first of flying.* It's the fastest way to travel, and often the only way to get there in time. You escape all the tedium of a long journey – flying is so quick, convenient, and wonderfully comfortable.

Around Calcutta Markets

Moderate Optimism

RECENT price movements on the Calcutta Stock Exchange indicated that cash scrips were slowly responding to the continued activity in speculative shares. For the first time in recent months, there were occasional enquiries for Jute and Tea shares. Raw jute was quietly steady. By the middle of this week, the falling trend in jute goods seemed to have been halted. After the recent sharp set-back, due to free imports of silver coin from Nepal, silver prices also seemed to have steadied down at the current lower levels. Spurt in shellac continued, though the rise in prices in the last few days was not as steep as in the last fortnight.

Speculators are moderately optimistic. Industrial production is mounting. Statistics indicate that agricultural output is also improving. Neither the last budget's tax proposals nor fears of progressive expansion of the public sector seem to have affected industrial profits or incentive. Cornering activities continue, though such efforts have become much more selective. Bonus or right issues continue to offer opportunities to speculators to push equities up. As speculative scrips move up, cash scrips begin to crawl up. Activity still remains rather poor, but it is showing signs of broadening.

Market Notes

Fears of growing taxation continue. But investors seem satisfied with the Prime Minister's assurance that the Government will not impose any ceiling on individual wealth or income. Behind the growing feeling of optimism, there is the spreading belief that the second Plan cannot be implemented without inflation. There is also the belief that, after the coming general election is fought and won, Congress will feel less enthusiastic about the "Socialistic pattern of society", that, nationalisation threats will recede, even as the idea of fixing a ceiling on individual wealth has been abandoned.

From the behaviour of stock markets in the last few days, it would seem that speculators have not yet had the time to study or digest the final report on the second Plan. They seem convinced that inflation cannot be avoided. As final taxation targets remain the same as in the Draft Outline, they argue that the worst is now known. Investors are less sure about both the problems of inflation and taxation. That is why, they remain hesitant. But speculators hope that as equities continue to move up, investors will be tempted to enter the market.

Monetary Measures

Equities may not be booming. But speculative scrips are gradually gaining ground. Even so, the precautionary measures undertaken, or under contemplation of the Government, may be analysed in detail. Some months ago, the Reserve Bank issued a directive to scheduled banks to submit fortnightly returns of their advances. Last week, the Bank issued another directive to scheduled banks to restrict their advances against stocks of paddy and rice. Can it be that stock market operators believe that the Government is only interested in checking speculation in bullion and in commodities?

It is in this context that some of the provisions of the Bill to amend the Reserve Bank Act needs to be properly appreciated. Some of the provisions of the Bill seek to empower the Reserve Bank to demand increased reserve requirements from banks. It is clear that the aim of the amending Bill is not only to check any undue expansion in bank credits, but to strengthen the Reserve Bank's direct powers of supervision and control over bank credits. In the final report on the Second Plan, there is emphasis on this aspect of money market control. It is stressed that the Reserve Bank will have to ensure its wider powers to check inflation.

Tax Prospects

Speculators may not be wrong in assuming that these contemplated monetary measures may not succeed in neutralising the inflationary consequences of the proposed deficit. But there are doubts whether the Planning Commission's references to taxation as an anti-inflationary weapon have been adequately appreciated yet. It seems to be assumed that even the final Plan envisages additional taxation of Rs 450 crores. Whether such an increase in taxation can be enforced without any adverse effect on equities, is not beyond controversy.

Wednesday Evening

But the main point is that there are hints in the final report on the second Plan that taxation problems may have to be examined again in the event of inflation developing as a sequel to the estimated deficit financing during the second Plan period.

No less relevant are the Planning Commission's references to the future system and structure of taxation. There are suggestions about a tax on wealth, a tax on gifts and about including capital gains in estimating incomes. Strange as it may seem, speculators seem to be enthusiastic about Prof. Kaldor's suggestion that the standard rate of income-tax should be lowered, without appreciating his other suggestions aimed at augmenting tax revenues through a more detailed and inclusive assessment of incomes. Tax reforms and suggestions under New Delhi's contemplation may encourage incentive, but are not likely to favour holders of equities.

Jute Shares

Reasons for the spurt in some speculative scrips are not far to seek. Indian Copper turned hesitant as it became known that the Company's bonus issue would be on the basis of one new share for two shares held by shareholders. This scrip has since recovered the lost ground on buying by speculative-investors who want to have the benefit of the right issue. Besides, there is the prospect that the forthcoming dividend may be higher. That remains to be seen. But it is not common for such a scrip to recede back before the quotation becomes ex-right, ex-dividend.

In this week, there have been occasional enquiries for Jute shares. Output of jute goods have been expanding. Exports and internal consumption of jute goods have been growing. But the industry's profits have not been satisfactory as Indian jute goods remain relatively cheap. There are reports that the Government may fix minimum export prices for jute goods. Such fixed minimum prices can be higher than the prevailing prices without affecting exports. It is, therefore, hoped that, with higher fixed export prices, the industry's profits will grow. These hopes are encouraging some speculative-investors to test the market for Jute shares.

Around Bombay Markets

Firm Tone

THERE was a noticeable undercurrent of firmness when the market opened for the week under review, in contrast to the subdued note on which it had closed in the previous week. Indian Iron principally initiated the recovery, which was further helped by a fair appreciation of cotton textile shares. The rise in Indian Iron, it is reported, is the result of a squeeze which rumours of a possible rights issue, that have never quite died out, were persistent enough to raise Indian Iron from Rs 36-11 last Wednesday to Rs 38-1-6 during the course of the week. Removal of export duty on coarse cloth early last week accounts for the strength in textiles, acting in conjunction with the sustained domestic demand for cloth which shows no sign of abatement. There is further the prospect of a revision of the Government's textile policy which gained fresh impetus from the speech of the Minister for Commerce and Industry at the last meeting of the Export Advisory Committee. For the declined trend of cloth exports, the Minister said that "blame must be laid on the shoulders of the Government. I am prepared to accept the responsibility for it". After this the market naturally expects a final announcement that the earlier proposal for freezing mill production will be abandoned.

A notable development was the announcement by the Bombay Stock Exchange on Monday that trading in Tata Steel ex-right shares would commence on June 4. When official trading in letters of renunciation had started, the quotation of the latter moved around Rs 58. Meanwhile, on selling pressure, the cum-right shares had declined to Rs 250-8. The members of the Stock Exchange will now have freedom to alter the rates of the ex-right shares and letters of renunciation in such a way that the overall rate is maintained at the cum-right quotation of Rs 255. Whatever may be the technical details, speculators appear to have taken a bearish view which accounted for the landslide on Monday's kerb trading. As the week progressed, apprehensions about the new issue became more and more pronounced and Tata Steel closed on a distinctly weak note.

In the miscellaneous section, Indian Copper and Surat Electrics atracted particular attention. Indian Copper declined from Rs 7 to Rs 6-11 when the India Copper Corporation Limited made the long awaited bonus announcement of one share for every two held. The market had expected a much higher dividend. However, support was forthcoming at the lower level in the hope that the final dividend would be more in line with market expectations.

Prices Continue to Hit Ceiling

SHRI Madanmohan Ruia having been unanimously elected President of the East India Cotton Association, traders believe that there will no longer be any opposition to the directives of the Forward Markets Commission and futures trading may be resumed soon; in fact, it may be resumed before July 15. The Minister for Commerce and Industry will be in the city on June 2 and the new President of the EICA, it is expected, will take the opportunity to appraise him of the present situation so that immediate action may be taken to end the stalemate that has continued since December 23 last.

Meanwhile, the spot market at Sewri has been recording new high levels in the more popular varieties like Jarilla, Oomra and Moglai, the quotations approaching the respective ceilings in most cases. As prices have hardened, business has dwindled, which clearly shows how great is the dearth of quality cotton. The assurance given to the Export Advisory Council by Shri T T Krishnamachari that Government does not propose to ban the exports of zoda and yellow pickings was naturally welcomed by the trade. Ban on the export of these varieties had long been apprehended by the trade, though it knew fully well that as these cottons are not usually used by the Indian mills, little purpose would be served by banning their export.

In the foreign section, early in the week, Americans and Egyptians tended to weaken. This, in turn affected sentiment in respect of African cottons, which had been having a hectic rise for some time past.

Restrained Bill Speculation

PROSPECTS of sizeable business in castor oil with Japan would appear to have kindled the speculative sparks in the oilseeds market during the week under review. Despite sustained enquiries from Japan, however, the actual business done in the last few days amounted to only 600 tons of BSS castor oil at £134 per ton c.i.f. on the basis of shipments at the end of the current month. Even this business is, according to certain circles, subject to the availability of import licences in that country. In the circumstances, it is clear that the only reason why prices should be moving up steadily is because bulls are interested in pushing up the market. The statistical position was undoubtedly strong, warranting a rise. But to counteract that, there have been increased arrivals recently from Hyderabad, and the rise of prices has only induced more growers to offer sizable quantities on the market. Despite these factors, if the market insisted upon scaling new heights, and actually succeeded in doing it, it was because the bulls had the market in their firm grip. At a time when the Government is very touchy about rises in prices, be it of foodgrains, or other commodities like cotton, it should be no surprise if it decided overnight to clamp down restrictions on trading. Perhaps it is this fear lurking in the minds of those who are really responsible for the price rally that led to a moderate decline in values towards the close of the week when castor May, which recorded the peak of Rs 161 during the early part of the week, came down to Rs 152-4.

In sympathy with castor futures, groundnuts also ruled steady. Bulls were encouraged by higher upcountry advices, and a shortage of ready stocks. Towards the close of the week, however, the supply position improved when both Madras and Saurashtra turned sellers. But as demand was not equally keen, prices shed a few points. Even the entry of Vanaspati interests and crushers into the market did not help and prices ruled quietly steady. The fear that restrictions on bank advances might be extended to oilseeds also induced Vanaspati and crusher interests to be chary in their purchases.

Pending the settlement of outstanding shipments of linseed oil to overseas buyers, there was no fresh business in linseed. The market, however, ruled quietly steady.

Who Does the Planning?

MORE than a year has passed since the draft of the Draft Plan-frame was presented to the public. Examination of this draft by economists and technicians at the expert level and by administrators and political groups, it was thought, would be carried on intensively for the next few months so that ideas could crystallise and take shape. After exhaustive study and discussion, the final Plan that would emerge, it was assumed, would incorporate the results and supply the missing links, if any, and strengthen the weaker ones in the Plan-frame. It was also taken for granted that the Planning Commission would satisfy itself about the internal consistencies and make the final plan ship shape.

During the year that has passed, controversy has been focussed on various points from time to time,—the limit of deficit financing, the role of village industries, and the management of economic undertakings in the public sector. Partly associated with this last, but also independently of it, controversy has raged on another point viz. the financial procedure best suited for the tasks that the Government have undertaken. Finally, there was uncertainty about the capacity of the Railways to move the goods.

On the first of these, viz., deficit financing, the Planning Commission appears to have taken a firm stand, in that of the range of deficit proposed in the Draft Plan-frame of Rs 1,000 to 1,200 crores, it accepted the latter figure. This firmness, however, is deceptive and further, it does not appear to have been based on rational or intelligent anticipation of the possible consequences of deficit financing of this magnitude and preparedness to meet these consequences by counter-measures worked into the body of the Plan which it finally placed before the public. And because behind its stand there was no studied defence, the Commission accepted, without a murmur, the implied censure that the Plan it had put up would not be able to meet the consequences of this order of deficit financing and has to be substantially strengthened for the purpose by raising the target of foodgrains. If the target for food grains lacked any basis which could stand scrutiny, what could one say of its other targets? How could one be sure that the targets are consistent, that they are the optimum attainable and that,

in fact, they would be attained?

The question of village industries, however, has sometimes been discussed, though perfunctorily, at the expert level but thinking on the subject has been dominated all through by the group within Congress which stands for a creed radically different from that of the Avadi resolution, later passed by Parliament which commits Congress as well as the present Government to "planning with a view to the establishment of a Socialistic pattern of society where the principal means of production are under social ownership or control, production is progressively speeded up and there is equitable distribution of national wealth".

In the attempt to skip a step in the jump to planned development at a high level of industrialisation, the struggle with primitive communism has proved harder for the Government so far than struggle with vested interests in the private sector. The issue, however, has not been squarely faced by the Planning Commission. The Commission has chosen the line of least resistance, and toed the political line rather than make its authority felt.

True, implementation of the Plan is not the responsibility of the Planning Commission but would it not be interpreting its functions too narrowly to suggest that the Commission need not go beyond laying down what must be pretty obvious viz, that the "plan resolves itself into a series of well defined administrative tasks", which fall primarily in the public sector? Not that the Commission itself disowns all responsibility in this matter. Take one of the tasks which is naturally of fundamental importance, when a large expansion of industry is being planned in the public sector. What should be the form of organisation for developing industry? How could Parliamentary control be reconciled with efficient management of industry which calls for initiative, speed and flexibility of operation, none of which can be expected under the present system of cumbersome, vexatious and time consuming departmental administration?

De-centralisation of the economy both in the sense of location of industries and in terms of distribution of economic power is one of the professed objectives. An inevitable feature of underdevelopment is the shortage of administrative organisation and enterprise. So there is natural tendency towards concentration, both within and outside the Government. This tendency is strengthened and not countered when Parliament is alert enough to exercise its authority but not wise or experienced enough to devolve control and share responsibility. Parliamentary wisdom takes or rather should take—for in this matter, experience is limited and yet inadequate—the form of accepting gracefully certain conventions and codes of behaviour on the one hand and of appropriate organisations on the other. This is certainly one of the Key Factors in Development, not the elementary exercises in arithemetical ratios which the Plan parades in a section under this title. But what has the Planning Commission to say on "questions relating to the organisation of public enterprises"? They are "under constant review and greater experience is needed before a clear view as to relative advantages of different forms of organisations emerges". There is much to be said for keeping an open mind but surely this is not a virtue in framing the integral parts of a Plan?

Apart from industries in the public sector, there is also the important consideration of administration of projects and implementation of the various schemes in which also the plan finally divides itself. The present dilatory financial procedure, it has been bitterly complained, has been responsible for many of the lapses and shortfalls in expenditure which is the only measure we have got of performance. On this vital question the Plan is discreetly silent.

Finally, there is the question of railways. Any one in trade or industry will confidently say that what finally dispose of the Plan is: Transport. Shri K C Neogy's caveat was that not only we are trying to do too much, railways would not be able to move the goods and the Plan will be caught in a transport bottleneck. What he wanted was a larger allocation to the railways. There is no question that railways have an enormous job to do. Pandit Nehru himself has suggested increase in passenger fares to keep down traffic. The Railway Minister followed with an announcement that the number of passenger trains would be cut and the number of goods trains increased. Right on the top of this comes the announcement that concession return tickets, promised in the railway budget speech, would soon be introduced. Meanwhile, a whispering campaign has started about the capacity of our railway system and how much of it is being actually utilised. And these doubts have not been laid to rest by the finding of the Estimates Committee that railways keep no statistics which can answer this question and any way, they do not use the statistics which they collect. The Commission does not even attempt to say how the relative claims of production and transport could be reconciled without wrecking the plan in the process.

All along the line, there is vacillation and reluctance to come to grips with concrete problems. This raises the uneasy thought, was it the Planning Commission which produced the Plan? Platitudes can be produced at less cost and if they are no good unless they come from the highest level, there is no dearth of politicians in the country to do the job. Indeed it is difficult to escape the impression that the Commission must have been so busy with ad hoc enquiries with which it is pestered all the time that its major assignment was also treated on an ad hoc basis. This voluminous document should be the last of the series. The Planning Commission is supposed to be an Expert Body and is not charged with execution except the Community Project Administration, the planning part of which should alone be its responsibility. The time has come when it has to be made into a proper expert body, which will formulate the plan and place it before Government, so that we can be sure what exactly the Commission recommended, and where exactly Government fails in execution. The separation of functions between the Planning Commission and the Cabinet is obscured and negatived by the presence on it of the Prime Minister and the Finance Minister. It was perhaps desirable at one stage that Pandit Jawaharral Nehru should take up the Chairmanship of the Commission when planning was new to the country and support nad to be gained for so novel an idea. Now it is no longer necessary. There are other means of extending the support of the Government to the Commission in the latter's dealings which the State Governments which are probably the most difficult part of its present undertaking. It is high time that the Commission concentrated on the main job of planning and equipped itself properly for it by recruiting a select team of high level technical experts, who are completely independent of the Ministries and departments of Government.

Favourable International Setting

INDIA launches her Second Plan under more favourable international auspices. Peace is a condition of plenty. Peace still eludes the world. There are many world issues still in dispute. But the "cold war" is now less intense. Confidence spreads that the rival power blocs will settle disputes through negotiation, and without the use of force. In under-developed countries, including India, there is growing hope that, as diversion of resources for military preparations ceases, they will receive adequate economic aid and co-operation from the rich, major powers to ensure progress in poor countries. In each and all undeveloped countries, poverty is a constant threat to stability. Because they are poor, their economies are not complementary. With the exception of Japan and India, most of them are non-industrial, agricultural countries. There is scope for economic intercourse between them. But they must depend on Russia and the Western Powers for aid in men and money to become industrially strong. They have a common interest in world peace.

Bandung is symbolic of their united desire for peace so that they can prosper. Bandung is a conglomeration of countries which are not only poor, but most of which were under colonial rule till the other day. Colonialism is still a threat to some parts of the areas which Bandung represents. Britain still clings to her island fortresses. Trouble intensifies in Algeria. Africa remains a semi-colonial continent. Korea and Viet Nam remain divided. Formosa is a source of irritation to China. SEATO and the Baghdad Pact violate the Bandung principle of freedom from political, military or economic domination by foreign powers. Bandung is determined to end colonialism so that all Asian and African nations can enjoy political freedom which alone can ensure their economic strength and independence. Bandung's political aims have almost been achieved in Asia. These objectives will be in time attained in Africa.

When Bandung's political aims have been fully achieved, its economic objectives will assume significance. Though undeveloped, Bandung countries are not too poor to help each other.

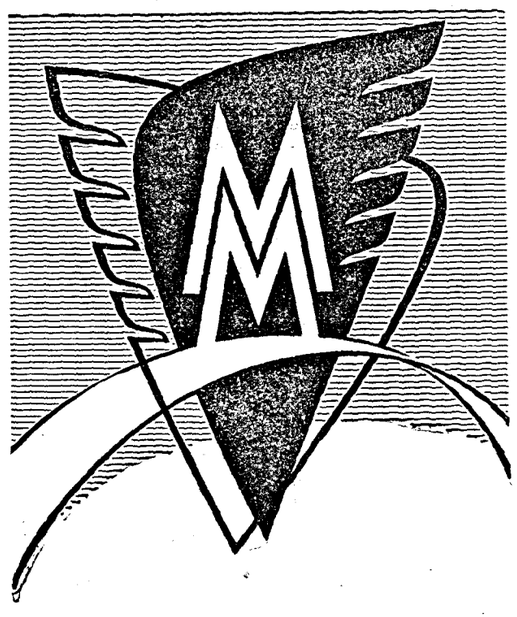
The Second Plan, it is good to see, has not been unmindful of the development problems of the under-developed regions of Asia and Africa. For historic reasons, not only has this region been largely under-developed, the economies of all these countries have either remained isolated or developed affiliations with the respective colonial powers, which had dominated them. As a result, says the Plan, "the volume of trade within this region itself (sic) has not developed sufficiently and the scope for complementary effort and mutual assistance as between countries in the region has remained largely unexplored". Some of these countries are now planning their own development and as development proceeds, "problems of mutual adjustments in the matter of specialisation in certain lines of production and of mutually advantageous terms of trade and exchange of know-how and experience will assume increasing importance". This is obvious. It is important that the development of these countries should be co-ordinated and that a beginning should be made, with freer exchange of information and ideas.

But even more important is some sort of joint action in order to retain within these countries a larger share of the gains from their foreign trade. This could be done by pooling their resources and channelling the control over the shipping, exchange banking and insurance through a corporate body on which all these countries would be represented. A beginning could be made with the group of countries which are contiguous and have close economic relations to make such a proposition workable. The next task for these countries to attain would be, again through collective effort, to secure better terms in the exchange of their products with the capital goods of the West. Bandung countries may be industrially backward, but they are rich in agricultural and mining resources. As the emphasis shifts from aid to trade they should be able to obtain fairer exchange terms for their products so that they can pay for economic assistance secured from the West.

All this could be the prime aim of ECAFE had its parent organisation, the U N, not been dominated by interests which can have little sympathy for all that Bandung stands for. Where ECAFE fails, can the Colombo Plan succeed? It is curious to find, however, that even after the Bandung Conference, the Planning Commission holds that mutual aid and co-operation could still be channelled through the Colombo Plan. Despite, therefore, its well-meaning observation "that planning in India has thus to be viewed in its wider regional perspective" it fails altogether to get the wider perspective.

Bandung is no racial or economic threat to the West, even though racial, political and economic problems of Asia and Africa are its prime concerns. Good neighbourliness among Bandung countries is as much desirable as world peace. Even without the latter, the former objective is a worthwhile pursuit. But Bandung is no less an influence for world peace than the "hydrogen stalemate". Two years ago, the world stalemate was reached. It still continues. There is agreement among the rival power blocs not to start an atomic war. But on all other disputed issues, there is stalemate. East and West are not agreed on Germany. Korea, Viet Nam and Formosa are open threats to peace. There is no agreement on disarmament. Geneva's promises remain unfulfilled.

Allegations and counter-allegations continue. But the international climate is now less uncongenial. America persists in doubting the intentions of the Communist bloc. Immediately after the failure of the Geneva Conference among four Foreign Ministers, Russia started accusing the other side of insincerity. There has been a change in Moscow's tactics in recent months. It started with the Russian leaders' visit to some Asian countries. As the Geneva "summit" conference reached an understanding not to wage an atomic war, Russia started a peace campaign. She has since been assiduously cultivating friends in Asia and Europe. Moscow has patched up its quarrel with Belgrade. There is now greater understanding between Russia and Britain, and between Russia and France. Russia has gained valuable friends in Asia.



Three developments since the Geneva "summit" Conference deserve emphasis. Asian nations have always been opposed to a foreign policy based exclusively on security. They have always resented regional military pacts as threats to peace.

Bandung embodied their common hope that the rival power blocs will reach an understanding so that the United Nations could concentrate their energies and resources on world economic development. For the first time since the "cold war", the Socialist Government of France emphatically endorsed the Bandung principles of peace. Moscow's bid for gaining friends through economic co-operation combined with the French Socialist Government's insistence on world economic issues has caused a shift in the Western Powers' foreign policy. In both the Karachi and Teheran meetings of SEATO and the Baghdad Pact, the need for implementing the economic functions of these organisations was expressed. Even Mr Dulles now feels convinced that NATO must fulfil the totality of its aims.

Internal developments in Russia since the twentieth Party Congress have impressed the world about Moscow's sincere peaceful intentions. More than the posthumous dethronement of Stalin, the campaign against the personality cult is significant. Malenkov's survival even after his dismissal was the first sign of tolerance within Communist Russia. Much has happened since then. Russia's present leaders have admitted that mistakes have been made. Within the Party, freedom of thought and expression is now encouraged and tolerated. The Communist Party of Russia may not tolerate the existence of rival parties, but recent internal developments in Russia will be welcomed as significant gestures of the present regime's intention to introduce gradually greater individual freedom within that Communist country.

While these two developments are to be welcomed, the doubts stemming from the American presidential election hang like dark clouds over the world. Since the emergence of America as a dominant world Power, the uncertainties of the presidential elections have always cast shadows over the world. Mr. Eisenhower's ill health creates additional complications. It is useless to speculate whether Mr. Eisenhower will still decide to run for a second term, or whether the Republican Party has any chance to win the presidential elections without Mr. Eisenhower as its nominee. There will be hope that the scheduled meeting between President Eisenhower and Pandit Nehru will not have to be abandoned because of the President's illness.

Russia has furnished ample evidence in recent months that she is sincere in her advocacy of peaceful co-existence. Marshal Tito's impression that far-reaching changes are happening within Russia should convince Washington of Moscow's keen desire to reach an understanding with the Western Powers. Even if the conditions of President Eisenhower's health prevents any serious discussion between him and Pandit Nehru, it may be assumed that the latter will press on Mr. Dulles the need for a change in America's attitude to Russia. Soon after Pandit Nehru's participation in Commonwealth Prime Ministers' Conference and his talks with either President Eisenhower or Mr Dulles, he will meet, along with Colonel Nasser, Marshal Tito. These three world statesmen are well fitted to act as mediators between East and West. Their task will be to pursuade both sides to be more accommodative to each other. There will be hope that they will succeed in their mission.

Pre-Planning the Elections

CONGRESS can no longer equate itself with the country. But it is still the largest political party. Its leaders are aware of the lessons of history. Political parties cannot thrive unless they represent the wishes of the people. Ideological considerations cannot be ignored. But a political party cannot survive without a strong party organisation. With the approach of the next general election, Congress has been wise in concentrating its efforts on both fronts. Avadi reflects the Congress shift to Socialism. Social and economic legislation since then has represented the pronounced socialist bias of Congress. Its foreign policy has been paying good dividends. At Amritsar, it took steps to introduce strict discipline within the organisation. Congress is taking no chances. It is clever in implying that it has to take precautions to win the elections so that it can save the country from chaos.

Deeper influences explain some of its major political and economic decisions. But it has timed its actions deliberately to suit its interests as a political party. India lives in her villages. Congress has exploited this socio-economic make-up of the country to strengthen its hold. Village uplift is not only one of the main aims of the Second Plan, Community Projects and National Extension Service are being implemented to fit in with party tactics. Nationalisation of the Imperial Bank has been justified as a means to revitalise the village community. Congress has taken elaborate pains to convince the people that widespread malpractices as well as the existence of "privileged sections" within the private sector have compelled the Government to nationalise life insurance. These are not the only actions to assure the country that Congress is opposed to vested interests, and is a government of the people. Abolition of landlordism and reform of the Company Law are supposed to mirror the economic consciousness of Congress. Progressive reform of the Hindu Law reflects the social conscience of Congress.

There are wider economic compulsions behind the bolder Second Plan. It has two socio-political aspects which are relevant to party politics. Relative expansion of the public sector implies fulfilment of the Avadi pledge. This aspect of the Second Plan reflects the popular belief that Socialism implies nationalisation of major means of production. Pandit Nehru's pronouncements indicate that Congress leadership is not unaware of the recent evolution in Socialism. New Delhi's preoccupation with the Kaldor plan for reforms of the system of taxation emphasise this awareness. Pandit Nehru is pragmatic in his approach. He has justified the envisaged broadening of the public sector as assumption of control by the State over the strategic points of the economy. These tactics provide him and Congress room for manoeuvre against the doctrinaire Socialism of PSP, even as such a policy ensures political support and economic co-operation of industry.

Creation of full employment is one of the major aims of the second Plan. It has an economic basis. But the Congress Party, if not the Congress Government, has always laid emphasis on the popular, political aspect of employment. It has claimed credit for focussing the country's attention on the growing unemployment problem. This explains the Second Plan's professed emphasis on the development of village and small-scale industries for the dual purpose of creating employment and of supplying consumer goods. Political rivals of Congress, however, are mistaken in thinking that Congress is posing as a Labour Party in order to win the vote of the workers. This may be one of its aims. But the simultaneous stress on the expansion of heavy industries within the public sector and the spread of technical education indicate the concern of Congress to win over the educated middle-class. Praja-Socialists and the Communists are over-optimistic in hoping that they can exploit the frustration of this section of the community in their political fight against Congress.

Success of the Congress Government's foreign policy, the bolder Second Plan, its bias against the private sector and its emphasis on employment have enhanced the election chances of Congress. Its political rivals are in a predicament. Communal organisations like Hindu Mahasabha have lost prestige. PSP remains a house divided against itself. As Congress has shifted to Left, PSP has found itself in a dilemma. Political developments within Russia and the closer relationship between India and Russia have caused embarassment to the Communist Party. Though the Congress claim that it is a national Government is not conceded, many of its rivals are committed to lending support to some of its major policies. Recently, the Mahasabha has declared that it will support Congress on issues like Goa, Kashmir, the Second Plan and refugee rehabilitation. CPI is also committed to supporting Congress on many national issues. PSP has always lent support to Congress on issues on which it endorses Congress policy.

Congress is not uninterested in taking advantage of conditional support to it by its rivals. But the recent proposal of Pandit Nehru is none the less intriguing. He has advocated that elections should be direct only at the base, and indirect thereafter. Three years ago, Jayaprakash proposed such a plan for elections so that a people's government could be formed. Panchayat Raj is not an entirely new concept. Some such plan for elections was tried in Yugoslavia.

The idea goes back to Gandhiji, but its implementation through the present system of Panchayats will mean perpetuation of the undesirable alignment of power and influence which goes with unequal land holding. That is to say, indirect election will strengthen the very system the Congress is committed to change through measures of land reform but in which progress has been the least satisfactory. If and when land is redistributed, and village panchayats become genuinely democratic, they could be a suitable medium for indirect elections, but not at the present stage.

Pandit Nehru is not as much interested in the representative aspect of this system of election as in its cheapness and simple mechanism. In a vast and poor country like India, there is much to be said for indirect elections except at the primary stage. There is another point. The Yugoslav experiment, as also the Jayaprakash proposal, is based on indirect primary elections on a non-party basis. Pandit Nehru's silence on the precise basis of the proposed direct panchayat elections is highly

significant. Can it be that Pandit Nehru has not forgotten the implications of the unexpected success of Independents in the last general election?

Congress organisation alone spreads even to the villages. Even if indirect representation on the basis of direct panchayat elections is introduced, Congress will meet only minor opposition, except perhaps from CPI in some States, as none of the other political parties has the requisite organisational set-up. On most of the political and economic issues, Congress is now sure of winning the elections. Only on the issue of reorganisation of States will it meet with stiff opposition. Pandit Nehru may boast that the Union Government has reached its decision on reorganisation of States in the wider interests of the nation even at the risk that Congress may lose the elections in some States. But the Congress Party has taken adequate precautionary measures. At Amritsar, it issued a directive warning Congressmen that resignations from legislatures and ministries on the issue of reorganisation of States will not be accepted. It is difficult to understand what could be the motive behind MPCC's naive move to bypass this clear directive.

Through enforcing discipline, Congress hopes to win the elections even in the States where linguistic controversies are most bitter by nominating veteran Congress leaders to contest the seats. It is futile to speculate whether Congress party tactics will ensure its success in the elections in Maharashtra and Punjab. But a developing political trend needs to be emphasised, though Congress does not yet seem to be aware of it. Recent elections in West Bengal for the State Assembly as well as for Parliament have been lost by Congress nominees on the issue of reorganisation of States. On this issue, all the Left parties with the single exception of Dr Lohia's Socialist Party (India) have combined with the Communists to nominate single candidates to contest the elections. CPI has made overtures to the parties of the Left to reach an electoral alliance for the next general election. PSP seems to have learnt the lesson of the last general elections. It is now willing to enter into an electoral marriage of convenience with CPI. With such an electoral alliance, the combined Left may succeed in winning more seats than it is possible for both CPI and PSP by contesting the elections separately. Congress won the last general elections on the split vote. By entering into an electoral alliance, the major rivals of Congress, PSP and CPI, may prevent repetition of circumstances which helped Congress to win an overwhelming majority. Any development which enhances the chances of a strong opposition emerging out of the elections will be welcomed by those who profess faith in democracy.

Paramount Traders

Noble Chambers,
Parsee Bazar Street,
Fort,
BOMBAY. 1

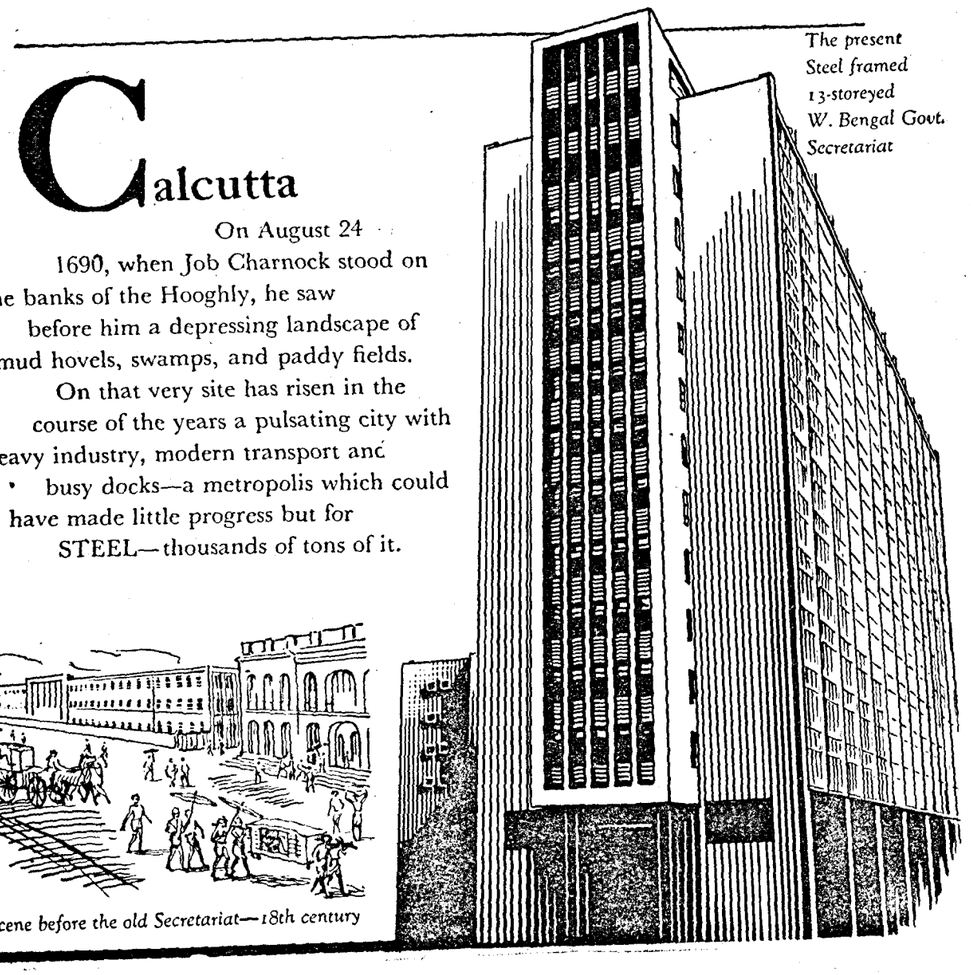
We Indent as well as we Import :—

Textile Machinery Parts & Accessories, Autoloom Shuttles, Autoloom Pickers, Automatic Pirns, Silk Shuttles, Droppers, Warper Bobbins, Lappets, Leather Beltings, Picking Bands, Printing Gum, Tallose Power, Mutton Tallow, Weaving Accessories, Spinning Accessories, Loom Accessories, Card-Cans, Beam Flanges, V-Belts, Lubricating Oils, Sizing Materials etc. etc.

We represent Indian Manufacturers for :—

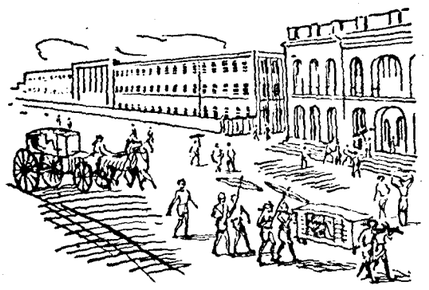
Ring Rabbeth Bobbins, Warper Bobbins, Slubbing and Roving Bobbins, Weft Pirns, Universal Pirns, Pickers, Leather Beltings, Roller Skins, Industrial Material Handling Equipments such as Elevating Trucks, Lift Jacks, Beam & Bobbin Trucks, Platform Trucks, Spindle Tapes, Bundle Bandings, Cotton Bandings, Tubular Bandings, Card-Cans, Card Can Springs, Cradle Springs, etc;

We Specialise in :—



Japanese Autoloom Shuttles, Autoloom Pickers, Droppers, Automatic Pirns and Silk Shuttles.

" Where now the city stands,
there was once naught but the city's site. " OVID



Calcutta

On August 24 1690, when Job Charnock stood on the banks of the Hooghly, he saw before him a depressing landscape of mud hovels, swamps, and paddy fields.

On that very site has risen in the course of the years a pulsating city with heavy industry, modern transport and busy docks—a metropolis which could have made little progress but for STEEL—thousands of tons of it.

Off the Record

Life Force Overwhelms

IT is a nice Plan, it covers everything, agriculture, industry, employment, administration, education, health and housing. A number of chapters have been devoted to each of these. The chapters are easy reading. They may sometimes tax the reader's patience but never his intelligence.

The Plan begins with an examination of the achievements of the First Plan, explains its approach to and gives an outline of the Second Plan and then goes on to examine the finance, foreign exchange, and employment aspects. Then comes the administrative tasks. Finally there are chapters on labour, backward classes and social welfare services, the last being devoted to rehabilitation of displaced persons.

There are two paragraphs by way of conclusion right at the end of this 640 page report in the second of which a caveat is entered by Shri K C Neogy that the magnitude of the Plan is such that it will be difficult to implement it in five years and that deficit financing on such an excessive scale may prove dangerous. Shri Neogy, it is added, had also drawn attention to the need for balanced development of transport and production. "All the Members of the Planning Commission agreed" reads the concluding sentence, "that these considerations are important and should be constantly kept in view in carrying out the Plan and that these aspects have also been considered fully in appropriate sections of the Plan" (emphasis ours)

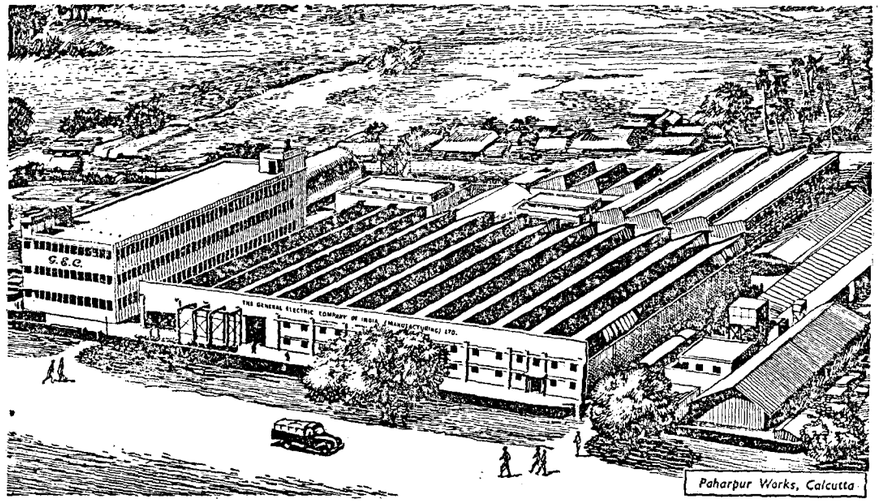
The sting is, therefore, in the tail and this one concluding paragraph disposes of the 640 pages of the report. This is the Final Plan. It follows the Draft Outline which in its turn followed the Draft of the Draft Plan-frame which was submitted to the National Development Council in March last year. There can be no finality in planning. The Planning Commission follows this dictum of adventurous living and it left the targets for food and cloth, the main props on which the Indian economy rests, to be decided by a free fight. The target for cloth production and the textile policy generally was not finalised in the report that was published and presented to the Parliament. They were announced a month after the publication of the Plan. The target for food production was discarded immediately after its publication and has been left to the Food Ministers of the State Governments who are to meet at the end of the month and consider the situation *de novo*.

Democratic planning is not all backwards and forwards; in the field of industry movements may be lateral, in agriculture, gyrations are not ruled out. But don't think it is planning by fiat, China way, though China too may be thinking of raising her food production target at an identical rate.

As it has turned out, the end of the Plan has become its beginning. What will follow is at the moment anybody's guess. Yet, strange to think that the caveat which Shri K C Neogy has entered was for pruning and not expanding the Plan any further. This, however, is reassuring. The country wants to move forward rather than listen to the voice of caution, goaded on by—shall we say?—*elan vital*, for there is nothing in the targets or the econometrics of it to explain or account for the logistics of the present move. This has inspired a correspondent to break into verse as follows:

Little Planning Wagtail

(With apologies to John Clare)



Little trotty wagtail, he went in the rain,
And tittering, tottering sideways, he ne'er got straight again.
He planned to get up from below and then to look down from the top,
But he found himself in a muddy hole which even he knew was flop.

Little planning wagtail, so flexible all about,
Even pursued in tri-lok sabha, he hoped to find his way out.
He first wanted thirtysix hundred crores but soon jumped to fortyfour
And then he settled at fortyeight but might even ask for more.

Backward forward wagtail, in a non-linear programme mood,
He rushed into a transport mess, then got frightened about his food.
But did he lose his heart? No, wishful thinking came to aid.
There's not much difference between 3 & 8 in appearance,
hence as increment rate!

Little trotty wagtail still goes his wilful way.
A "cautious" nag may block his path but the "vital" urge wins the day.
He waddles in the puddle and waggle goes his tail
And chirrups up his wings to dance upon the China rail.

Tremors and Earthquakes

The tremors of the present century have all had their origin in America and it is the situation in the U S which gives Western Europe the greatest cause for anxiety.

The sharp drop in automobile sales in the U S, the levelling of industrial production in the U K for the first time in two years and the indication that production in West Germany can no longer be expected to increase have led to a search for appropriate counter measures.

In Britain, the question of 'trade defence' against a possible recession in the U S is being discussed and a confused debate has been going on about the advisability of raising or lowering the bank rate.

THE current economic situation reveals three outstanding developments:

(1) The production of motor vehicles in the United States has fallen by 23 per cent between the first four months of 1955 and 1956;

(2) Industrial production in the United Kingdom has levelled off for the first time in two years and is now no higher than it was a year ago; and

(3) Industrial production in Western Germany has now reached a level where further increases can no longer be expected.

A lively controversy has been provoked in all these three countries on the need for appropriate counter measures. In the United States and Germany, the heads of the Governments concerned have disavowed the interest rate policies their respective central banks have pursued in the past two months. In Britain, the question of "trade defences" against a possible recession in the United States is being sharply raised and a debate, albeit a confused one, about the advisability of raising or lowering the bank rate is raging in and out of Parliament.

This turn in economic events has been sudden, almost unexpected. And yet economists in the United States have for some time viewed the American boom with considerable misgiving; many of them have instinctively felt that "this situation cannot last". Professor Reder of Stanford University wrote some three months ago that "a turning point in the business cycle is suspected", and the Economic Commission for Europe in the 1955 Survey questioned the official restraints on economic activity in many of the European countries. In the United Kingdom the situation has been overshadowed by the magnitude of wage claims, yet now and then symptoms of weakness appear which point to the over-all direction of economic trends: fall in sales and exports of motor vehicles, slump in the carpet and textile industries, etc. These pointers have of course not been taken very seriously and there is probably some justification for this attitude but the wage-price spiral cannot be regarded as lightly; it does have an over-whelming influence on economic affairs.

Commodity Markets Weakening

Although prices in general have proved to be flexible in only one direction, tendencies in the international commodity markets portray a developing situation which is in tune with the other sensitive indicators of economic activity. Thus the commodity market trend, which was beginning to emerge in the first quarter of the year, has become more clear-cut over the past two months. In 1955 industrial raw materials generally ruled firm with rubber and the major non-ferrous metals as leaders. Foodstuffs and agricultural products were weak. Today the markets for industrial raw materials are very much weaker than those for foodstuffs and agricultural products. Even with regard to the latter, the price pattern is only being maintained by the agricultural price policies of the US Administration.

It is however the situation in the United States that gives Western Europe the greatest cause for anxiety: the tremors of the present century have all had their origin in America. And it is towards an understanding of the nature of these periodic tremors and when these tremors are likely to turn into earthquakes that many in this part of the world direct their attention. Hence **The Economist** suggested that while the situation in the United States did not immediately give cause for alarm, "watchfulness" on the part of the United Kingdom would bring rewards; this journal then went on to examine the most desirable forms of "trade defences" to be adopted should the situation in America really become serious.

Soft Spots in the U S Economy

The American economy is showing two weaknesses which in the view of your correspondent are particularly infectious. There is firstly the weakness in the demand for steel and steel products and secondly the weakness in the demand for agricultural products. The "soft" spots which began showing themselves at the turn of the year are now being reflected in the fact that over 80,000 new 1956-model passenger cars and an equally substantial quantity of farm implements are in dealers' stocks with little chance of their being worked off. In other words, the rise in what the Americans term "inventories" reflects the fundamental weakness in the demand for steel. According to the US Department of Commerce **Survey of Current Business**, ". . . inventories in manufacturing and in lines of trade other than new car retailing have evidenced a rather steady expansion since the Spring of 1955" and further, "the continued growth of inventories have raised book values for manufacturing, wholesale and retail trade firms combined to $ 83½ billion at the end of last February—an increase of about $ 6 billion over last February".

The inventory structure described above follows a performance in the American economy which has been described as "breath-taking". During 1955, the seasonally adjusted GNP rose by 2½ per cent in quarterly intervals—for the year as a whole it rose by 2 per cent. Such a rate of growth for a highly industrialised economy is certainly "breath-taking". It is all the more so when the increase in output has been largely the result of increased employment (and very slightly that of price increases). The Federal Reserve Board's index of industrial production recorded a rise of 11 per cent in 1955 and the gain in the second half was somewhat larger than in the first.

Breathtaking Expansion

This remarkable expansion in the American economy—an expansion which tended to become cumulative as the months of 1955 rolled by—appears in retrospect as an approach to the peak of the customary business cycle. This interpretation is not only justified by the growth of inventories and the decline of sales in the opening quarter of 1956 but also by the nature of the 1955 build-up. Personal consumption expenditure on durables in 1955 proceeded at a rate considerably higher than that on non-durables. Further, while personal consumption expenditure had increased between 1954 and 1955 by 8 per cent, the increase in gross fixed investment proceeded at a higher rate viz 12 per cent. Of the increases in fixed investment, that of house construction and producers' durable equipment was the most rapid. These features are symptomatic of the well-known building-up of activity to the peak of the business cycle when either an earthquake takes place, or, when appropriate policy measures are set to work, the crack-up at the peak takes the milder form of a tremor.

The Turning-Point?

The developments in the first four months of this year in the United States suggest that the turning-point has been reached. Weak spots have appeared precisely where the boom was most in evidence in 1955. Last year the smaller motor car producers were able not only to increase their share of the market but to increase their net profits as well. Now each of these small producers faces what one American commentator describes as "extinction". Further, such giants as General Motors and Fords have joined the ranks of firms calling for production holidays. Taking 1947-49=100, the index of motor car production rose to a peak of 212 in November 1955 and has since steadily fallen to 164 in April this year. The index for the production of durable manufactures as a whole has come down in the first quarter of this year to the September 1955 level. Automobile production is now running at about 10 per cent below that of last year and major car producers have projected a more or less proportional cut for the entire year.

The slump in the US motor vehicle industry (and in the demand for farm equipment) has not yet produced an impact on steel production. As the manufacture of durables has continued unchanged, steel output has not yet been affected.

Company Profits Decline

The **Monthly Letter** on business and economic conditions issued by the First National City Bank for May 1956 contains some revealing information on company profits in the United States in the first quarter of this year. For the 777 firms reported on, net profits fell by 8 per cent between the fourth quarter of 1955 and the first quarter of 1956.

TABLE I

USA—Selected Economic Indices
(1947-49 = 100)

Period	Industrial Production	Consumer Prices	Wholesale Prices
1952	124	113.5	111.6
1953	134	114.5	110.1

1956 March	153	76	2834

TABLE IV

Expenditure on New Plant and Equipment By U S Business

$ millions

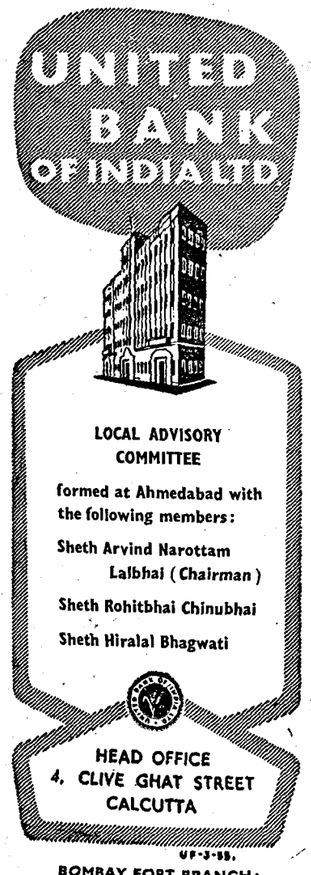
	1954	1955	1956 (Expected)
Manufacturing Industry	11,038	11,439	15,036
Durable Goods	5,091	5,436	7,685
Non-Durable Goods	5,948	6,003	7,351
Mining	975	957	1,141
Railways	854	923	1,307
Public Utilities	4,219	4,309	4,989
All Industries	26,827	28,701	34,893

This sharp fall may no doubt partly be due to seasonal influences, but in the case of companies in the automobile, electrical equipment and radio industries, profits have fallen compared to those in the first quarter of 1955.

The other depressed area of the economy, agriculture, has been in the doldrums for some months. In February this year incomes of farmers at a level of $1,839 billion were some $60 billion less than a year ago. The short and quickest answer to the troubles of the American farmers (in this election year) has been the Agriculture Act of 1956 which by the time it has been through the processes of legislation has become so repugnant to the Administration that President Eisenhower has vetoed it, only to announce equally rigid high price supports for a number of commodities in the coming crop year. The uneconomic and opportunist remedies to the problems of American farming do nothing more than either postpone the collapse of American agriculture or imperil the international market for the commodities of other agricultural countries. The US policy of funnelling farm surplus to countries abroad under the Mutual Security Act has caused more than consternation in Australia and Canada.

Next to automobiles and farming, house construction has become the main cause for concern. Up to September last, the number of private house constructions started was about 17 per cent above that for the corresponding months of 1954. A seasonal slump set in after that; it has however continued into the new year. Probably this continuation in the decline in housing has been the result of a tightening of mortgage lending terms by agencies of the Federal Government. In any event, the pressure for work by building contractors forced the Government at the end of January 1956 to rescind its tighter lending policy and yet new private construction expenditure on dwellings was some $20 million less in February 1956 than in February 1955. Many informed Americans believe that the post-war housing shortage has been overcome and that the current recession in house construction is likely to develop into a serious slump.

The one important but unpredictable factor likely to have a marked influence on developments is investment in durable producers' equipment.



According to the First National City Bank Monthly Letter this "key item in business change" reflected an increase (in expenditure) of $1½ billion between the fourth quarter of 1955 and the first quarter of 1956. Business plant and equipment expenditures are scheduled, it says, to total $35 billion in 1956, exceeding 1955 by 22 per cent. This optimistic forecast is repeated by a McGraw-Hill survey which found 1956 business investment plans amount to $33.4 billion or 13 per cent above that of 1955. By the look of things in the United States, this "key item" will determine whether "it" is to be a tremor or an earthquake.

The doubts about the course of the American economy which are widely held even in the United States should have suggested to the monetary authorities a more liberal financial policy. And yet as late as April last, another round of discount rate advance was announced by the twelve Federal Reserve banks. Simultaneously the Federal Reserve authorities jointly conducted open market operations by selling Government securities, thereby adding pressure on the banks to borrow. Member bank borrowings from the Federal Reserve averaged $1.1 billion during April, higher than in the first quarter of the year and slightly above the billion dollar peak of November last. In this situation the major banks adjusted their rates, forcing up Treasury bill yields to 2¾ per cent from 2.17 per cent previously. Stock and share prices fell correspondingly and the Stock Exchange in New York remains in the doldrums.

For some reason Federal Government expenditure has been showing a decline of about 2 per cent every quarter since the beginning of 1955. This decline has occurred on both defence and other expenditure items. On the other hand, Federal receipts have been running about 11 per cent higher in the first five months of the 1956 fiscal year compared with the corresponding period of 1955.

Against these positively deflationary features in the American economy (except the hoped-for intentions in business investment), the wage-price structure continues its upward trend. Wage demands have received official support this Spring—minimum wages are generally increased by a third—as well as the support of collective bargaining pressure. Prices for industrial products have risen by 0.5 per cent per month since June 1955 and the overall wholesale price index has been rising at an annual rate of 3½ per cent in the same period.

The United States economy, possessing as it does a number of deflationary elements and one or two inflationary ones, appears to be precariously poised at a very high level of income and employment. It is to the buoyancy of the capital goods sector and the "possibility of heavier government spending on public works and defence", that one has to look hopefully for countering the depressive influences emanating from automobiles, farming and housing. In this uncertain, precariously-balanced position, the American economy is most vulnerable to shock or downward pressure from any quarter. And should the hopes placed on business investment be not realised, the tremor may become more serious.

The Indian and Chinese Plans

Similarities and Differences

K N Raj

Comparative studies of the Indian and Chinese Five Year Plans have usually brought them out either as contrasts, reflecting the totally different philosophies and attitudes which are supposed to underline them, or as broadly similar blue-prints, embodying the aspirations of two peoples who have a great deal in common.

This is an issue on which the statistical data at our disposal and the knowledge of actual conditions in China are both too meagre for any judgment to be more than guess-work.

But from whatever little one can make of the information that is available on the Chinese Plan for a comparative analysis, it would appear that the differences between the two plans are not so much in their structure or in the relative magnitudes of what is proposed to be achieved as in regard to certain supporting policies.

LET us first consider the similarities. In so far as international comparisons between standards of living have any meaning, it is perhaps a reasonable assumption to make that the per capita levels of consumption and income reached by 1952 in China were more or less on a par with those in India in 1951. Though there are considerable differences in the estimates about China's agricultural output, it is fairly certain that the amount of foodgrains available per person was greater in China than in India. But, on the other hand, the availability of cloth and of other consumer goods like sugar was obviously very much less. Some estimates of the per capita income in China in 1952 have placed it at about 10 per cent lower than the per capita income in India in the same year, and this may well be a correct appraisal, but in view of the numerous unknowns in the comparison no serious difference is perhaps made if we assume that it was actually about the same in both countries. With a population of a little under 600 million people, this would give for China a national income of over Rs. 15,000 crores in 1952 in terms of Indian currency.

The total outlay on the Chinese Plan in its first year has been estimated at about 8600 million yuan, which works out at the current exchange rate to about Rs 1600 crores. This, however, includes expenditure of a recurring character on various items, and it would appear that the outlay on capital construction proper was not more than about 60 per cent of this amount i.e., about Rs 960 crores. On the other hand, it excludes investment on private account which, in the context of the Chinese Plan, could not have been more than a fifth of the public investment, so that the total investment in the economy in that year may be placed at around Rs 1150 crores. This works out to less than 8 per cent of the national income.

Investment Targets Not Higher

By 1955, the rate of outlay on the Chinese Plan was 50 per cent higher than in 1953, and by 1957 it is expected to be stepped up still further. But the national income will also go up alongside, and it is therefore unlikely that, by the end of the Plan period, the rate of investment in the Chinese economy will be very much higher than about 11 to 12 per cent of the national income.

These estimates, it will be obvious, are based on somewhat heroic assumptions, and must be treated with caution. Nevertheless, they suggest two conclusions which we may accept at least as tentative hypotheses. One is that the rates of investment that are being attempted in China in its First Plan are considerably lower than those aimed at in the Soviet Union in the nineteen twenties, and lower than even those attempted and realised in the countries of Eastern Europe in the period after the Second World War. The other is that the targets in regard to these over-all rates of investment in China's First Plan are not significantly higher than those which are proposed in India's Second Plan.

It is not only the targets in regard to the over-all rate of investment that are similar; the expected increases in total national output are also not very much larger in China. At first sight this may seem to be not correct, since the estimated increase in national income in India in the period of the Second Plan is only about 25 per cent while the anticipated increase in the combined output of agriculture and industry in China in the course of its First Plan has been placed at about 43 per cent.

But the industrial output which has been taken into account in the estimate for China appears to cover only the output of factory enterprises, and, in addition, the weightage given to industries in the index of total output seems to be based on the gross value of their output and not on the net value added as is the case in India. Both these are likely to give the estimates of the changes in total output an upward bias. Our guess about the basis of computation of these indices is borne out by the fact that, if we impute to agriculture and industry in the Chinese estimates a weightage of 3 : 1, and apply this to the estimates of the increases in output in each of these sectors (23.3 per cent in agriculture and 98.0 per cent in modern industry), we get an increase of 43 per cent in the total output which is the same as the official estimate.

Share of Factory Industry

The share of modern factory enterprises in the Indian economy is obviously no smaller than in China. If, therefore, we were to give agriculture and industry the same weightage of 3:1 to the Indian estimates of increases in output, the over-all increases in output would work out as follows:

	(in percentages) First Plan	Second Plan
Increase in the output of agriculture and allied pursuits ..	18	18
Increase in the output of factory enterprises ..	43	64
Increase in the total output of agriculture and industry ..	24	30

With a larger weightage to industry, as would be justified in the Indian case, the increases in total output would appear to be even larger. This means that the actual difference between the planned in-

crease in China over the period of its First Plan and the increase expected in India during the Second Plan is not really as large as may seem at first sight.

The estimates that are available in regard to the targets for specific commodities support this conclusion.

Thus the planned increase in the output of foodgrains in China is only a little over 13 per cent as compared to about 15 per cent in India. In the case of cotton piecegoods, the amount available in China was to begin with far smaller than in India (the per capita availability being perhaps only about a third) and so the planned increases are also larger, but considering the initial disparities the difference is still not very enormous as will be seen from the fact that the planned increase is 24 per cent in India as against about 55 per cent in China. In regard to the output of producer goods also, while there are differences in particular items, the broad orders of magnitude of the planned increases are very much the same.

No Full Employment in China

Apart from these similarities in regard to the targets of investment and output there are several other features in common between the two plans. For instance, it has been made clear in China, as in India, that despite the progress expected as a result of the plans, the problem of unemployment will continue to be serious. "It will still be impossible", says the Report on the Chinese Plan, "to completely eliminate unemployment, a legacy of old China, and to make full use of surplus labour power. The solution of these problems will demand continued effort in the periods of the Second and Third Five Year Plans".

Slow Pace of Socialist Transformation

It is also clear that the fear of aggravating the position in regard to unemployment has affected many policies in China as in India. To cite one instance, the Chinese have decided to go slow with the nationalisation of retail trading for fear of the numbers that would be thrown out of employment. This will be obvious from what the Report on the Chinese Plan has to say on the subject.

"With regard to the socialist transformation of commerce, after the winter of 1953 the volume of trade handled by private retailers was cut rather sharply as a result of the somewhat too rapid increase, in certain places, of the volume of retail trade handled by State trading organizations and especially co-operatives. Readjustments have since been made. In order to maintain the business of private retailers, small traders and pedlars in urban and rural areas, the State has temporarily stopped the increase or suitably reduced the retail sales of all state trading organizations and co-operatives in cities and towns where their volume of retail trade increased to an excessive degree . . . All cities and towns should, taking local conditions into consideration, work out what should be the proportion between the volume of state and privately run retail sales in each trade, which will not only stabilize commodity market prices but also maintain the business of private retailers".

Similarly, the Chinese Plan places almost as much stress on hand and household industries as the Indian Plan. "Local industry and handicrafts in our country play an important part in supplying the needs of production and of everyday life of the urban and rural population. During the past few years, because of defects in planning and other reasons, some branches of local industry made the mistake of expanding production blindly, thus adding difficulties to the organization of industrial production in the country as a whole. But in general it is right to actively promote local industries. In the future, too, in accordance with the requirements of the state plan and the policy of serving the needs of agricultural production, we should continue to make proper use of local industries and handicrafts. Some areas and certain departments underestimate the role of local industry and handicrafts in the national economy and therefore do not guide and help them actively or systematically. This is obviously wrong, and must be corrected".

In regard to medium and small enterprises, the Report on the Chinese Plan says that since they "can be built and put into operation in a comparatively short time, bringing quick returns on investment and adding to our productive capacity, they not only play an important role in increasing supplies of industrial products and supporting agricultural production but also constitute an indispensable factor in increasing accumulation of funds and in supporting and assisting construction of the big priority projects".

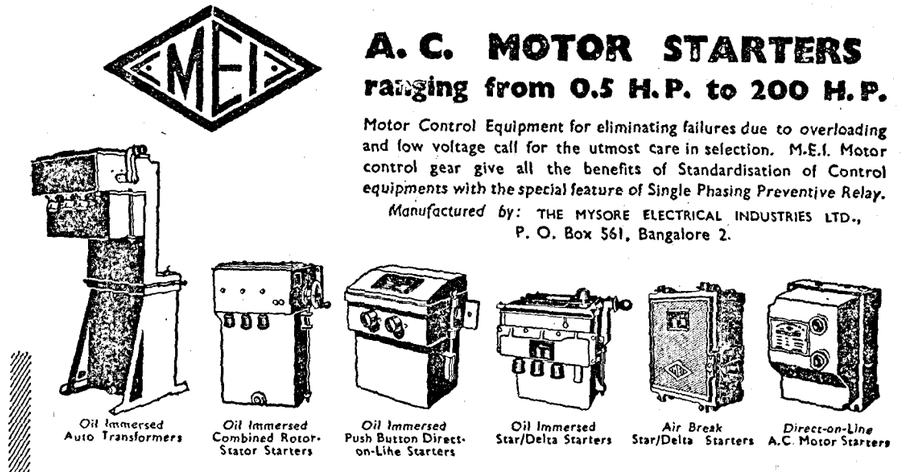
Strategic Hold of Public Sector

What then are the differences between the two plans? The first important difference, as one should expect, is in the relative roles of the public and private sectors. But it is possible to exaggerate the share of the public sector in China. For small-scale enterprises form such a large proportion of the existing units in production and trade that the share of the public sector is not often as large as would appear from the published statistics which relate to the ownership of the more modern medium and large-scale enterprises. It is clear, however, that one consideration is always kept in mind in China, namely that of securing in the hands of the State as large a proportion as possible of the enterprises which are likely to be in a position to earn large profits as the rate of investment increases. Apart from the ideological objective of "socialist transformation", this is designed to provide the financial resources for investment and to gain control of the economy at strategic points.

It would be wrong, however, to assume that the profits from State enterprises account at present for the bulk of the finance available to the Government or even that they are adequate to avoid the need for deficit financing in China. For it would appear that the total tax revenue of the Government in China in 1953 was equivalent to about Rs 2200 crores (at the current exchange rate), which works out to about 15 per cent of the national income. Though defence expenditure accounted for about two-fifths of this, it is probable, in view of the relatively low administrative expenditures in other fields, that investment of the order of at least 5 per cent of the national income was being financed from taxation. Also, more than an eighth of the total tax revenue was derived from the agricultural grain tax.

Countering Inflation

As regards deficit financing, it would appear that there have been gaps between the income and expenditure of the Government fairly regularly, though these have been concealed in various ways such as by taking credit for the surpluses of previous years. Thus, in 1954, despite a loan of the equivalent of Rs 150 crores that was raised, there was a gap between total revenue and total expenditure of about Rs 330 crores. It is, therefore, not unlikely that this method of finance supports investment of the order of 1½ to 2 per cent of the national income as in India, though it is difficult to be very sure or precise about this.



But even if there is no deficit financing, investments of the order contemplated must be expected to generate inflationary pressures. One of the important differences in the Chinese Plan compared to the Indian is in the measures designed to prevent an inflationary rise in prices. It is clear, for instance, that this is the main purpose of the nationalisation of wholesale trade, which does not figure at all in the Indian Plan but is a very integral part of the Chinese programme. With the gradual stepping up of investment, and the failure of harvests, the Chinese economy appears to have felt the beginnings of inflationary pressure towards the middle of 1953. In November, 1953, therefore, the State started planned purchases and supplies of foodgrains, and later followed this with similar operations in cotton and cotton textiles as well as in edible vegetable oil. "There is no doubt", says the Report on the Plan, "that these measures are an important guarantee of fulfilment of the Five Year Plan by the state and conform to the immediate and long-term interests of the people. The implementation of this policy will, of course, bring about a certain change in the way of life of hundreds of millions of people and a reorganization of supply and distribution. During the first few years of this great reform, it is very difficult to ensure that there are no shortcomings in the way it works out. But we must realize that our positive achievements are the main part of the picture".

It is also obvious that there has been as much hostility in China to the idea of State control over distribution as in India. For the Report goes on to say that "there are some people who have adopted an attitude of doubt or even opposition to the policy of planned purchase and supply of grain. Some, seizing on certain defects in our work, deny the tremendous achievements made in carrying out this policy. They fail to see that on the whole the situation is good". The policy of nationalisation of wholesale trade has, therefore, been adopted in China, not without opposition, nor without an appreciation of the difficulties and limitations, but primarily for the reason that it has been found to be the only way of preventing speculation and inflationary rise in prices. The relaxations in regard to retail trading, which we have referred to earlier, confirm this impression.

Investment Priorities Different

There is also one other significant difference between the Indian and Chinese Plans. It is in the distribution of investment and in regard to certain priorities in investment. For, though both of them emphasize the development of producer goods industries, and steel also figures prominently in both, the allocation in the Chinese Plan for industries producing machines is considerably larger. There is provision not only for industries producing tractors, power generating equipment, and various types of metallurgical and mining machinery, but also for the production each year of equipment necessary for setting up an integrated iron and steel works. "When the two heavy machinery plants . . . which begin construction in the present five-year period are completed, they will be able, according to their projected capacities, to produce every year a complete set of iron smelting, steel-making rolling mill and coke oven equipment for an integrated iron and steel works with an annual capacity of 1,600,000 tons of steel". In the Indian Plan, there was originally a provision of obout Rs 150 crores for such industries, but it has been cut to around Rs 32 crores in the final draft

Matching this emphasis on ma-

chine-making industries is the conspiciously lower priority given to transport in China. Railways, in particular, account for a much smaller proportion of the total proposed investment. This is despite the fact that China has, to begin with, a railway network less than half as extensive as India. The greater attention given in India is usually sought to be explained with reference to the proposed expansion in the output of coal and steel. But not only is the targeted increase in steel in China almost as high as in India, but the proposed increase in the output of coal is twice as high, being 23 million tons in India and 50 million tons in China. The real reason for the difference between the two plans in this regard is that, just as residential construction and such other requirements are usually discouraged in a period of scarcity, the Chinese Plan is based on a very much lower priority being given to passenger traffic than is the case in the Indian Plan.

This could have been considered merely as a difference in the conception and structure of the two plans, if the targets in each case were internally consistent. We have no means of testing the internal consistency of the Chinese Plan, particularly because there is almost nothing known about its foreign exchange aspects. But it is clear that the Indian Plan is heavily dependant on external aid to cover its direct foreign exchange requirements. It is also clear that the railways account for nearly half of these requirements and that, even if the necessary external assistance for this Plan is forthcoming, the relatively small allocation given to machine manufacturing industries will make the process of industrialization for some more years to come as heavily dependant on external aid as now. Since there is no assurance about external aid either for the immediate future or for the years to follow, the priorities in this regard in the Indian Plan cannot be interpreted as based on anything more firm than a somewhat Micawber-like hope that something is bound to turn up.

Allowing for all the assistance that China may be receiving from the Soviet Union, and the unpredictability of the aid that India may get from the West, it is difficult to escape the impression that the Chinese Plan shows far greater awareness of the implications of the targets that have been set, and willingness to face them, than one is able to detect in the Indian Plan. As a pencil sketch of what should be done the Indian Plan undoubtedly compares favourably with the Chinese and, as a model built on detailed statistics and carefully worked out input-output ratios, it may be even technically superior on a point or two. But as a programme of action, it does not have the claws and the teeth for coming to grips with the problems which it will necessarily have to face.

This is not to suggest that the Chinese Plan has not its own weak points and share of unsupported beliefs and aspirations. As for difficulties in implementation, it is already becoming clear that the impetus which the Chinese economy received from land reforms, immediately after the Revolution, is rapidly running out, and that the increases in consumption on the part of the small peasants are tending to dry up the marketed surpluses necessary for industrialisation. The implications of this have been brought out forcefully in a report on agricultural co-operation submitted by Mao Tse-Tung in July, 1955: "As everyone knows, the level of production of marketable grain and industrial raw materials in our country today is very low, whereas the state's demands for these items grow year by year. Therein lies a sharp contradiction. If, in a period of roughly three five-year plans, we cannot fundamentally solve the problem of agricultural co-operation, if we cannot jump from small-scale farming with animal-drawn farm implements to large-scale farming with machinery — which includes state-sponsored land reclamation carried out on a large scale by settlers using machinery . . ., we shall fail to resolve the contradiction . . . In that case our socialist industrialisation will run into formidable difficulties".

Time alone will show to what extent the gigantic movement that has been initiated in China for the formation of agricultural co-operatives will deliver the goods. But at least one thing is clear. In a country in which there are no vast virgin areas to be brought under cultivation as in the Soviet Union, and where by intensive cultivation the yields per acre are already among the highest in the world, large-scale mechanised farming will have a hard task producing the surpluses necessary for industrialisation, while feeding, at the same time, those who are displaced by the mechanisation and the twelve million additional human beings who, by the natural growth of population, have to be provided for each year in China. One would have expected, in the face of this enormous problem, at least a token recognition of the need to make a beginning with family planning, but that would be weak-minded, and obviously even hard-boiled Marxists must have their share of illusions to cling to.

THE INDIAN IRON & STEEL COMPANY LTD.

NOTICE

NOTICE is hereby given that in connection with the financing of the cost of the further expansion which the Company is required to undertake in contribution towards the increase of steel production under the Second Five Year Plan, application was made to Government for consent to the issue of further Ordinary shares at par on the basis of one new right share for each Ordinary share held. Advice has now been received that Government have sanctioned the issue of new Ordinary share capital at a price of Rs. 13|8|- per share.

In according their sanction Government have stipulated that no fresh issue of capital shall be made until after the 1st November 1956.

By Order of the Board,
MARTIN BURN LIMITED,
F. G. Liversedge,
MANAGING DIRECTOR,
Managing Agents.

Non-Monetized Economy and Development

Sukhamoy Chakravarty

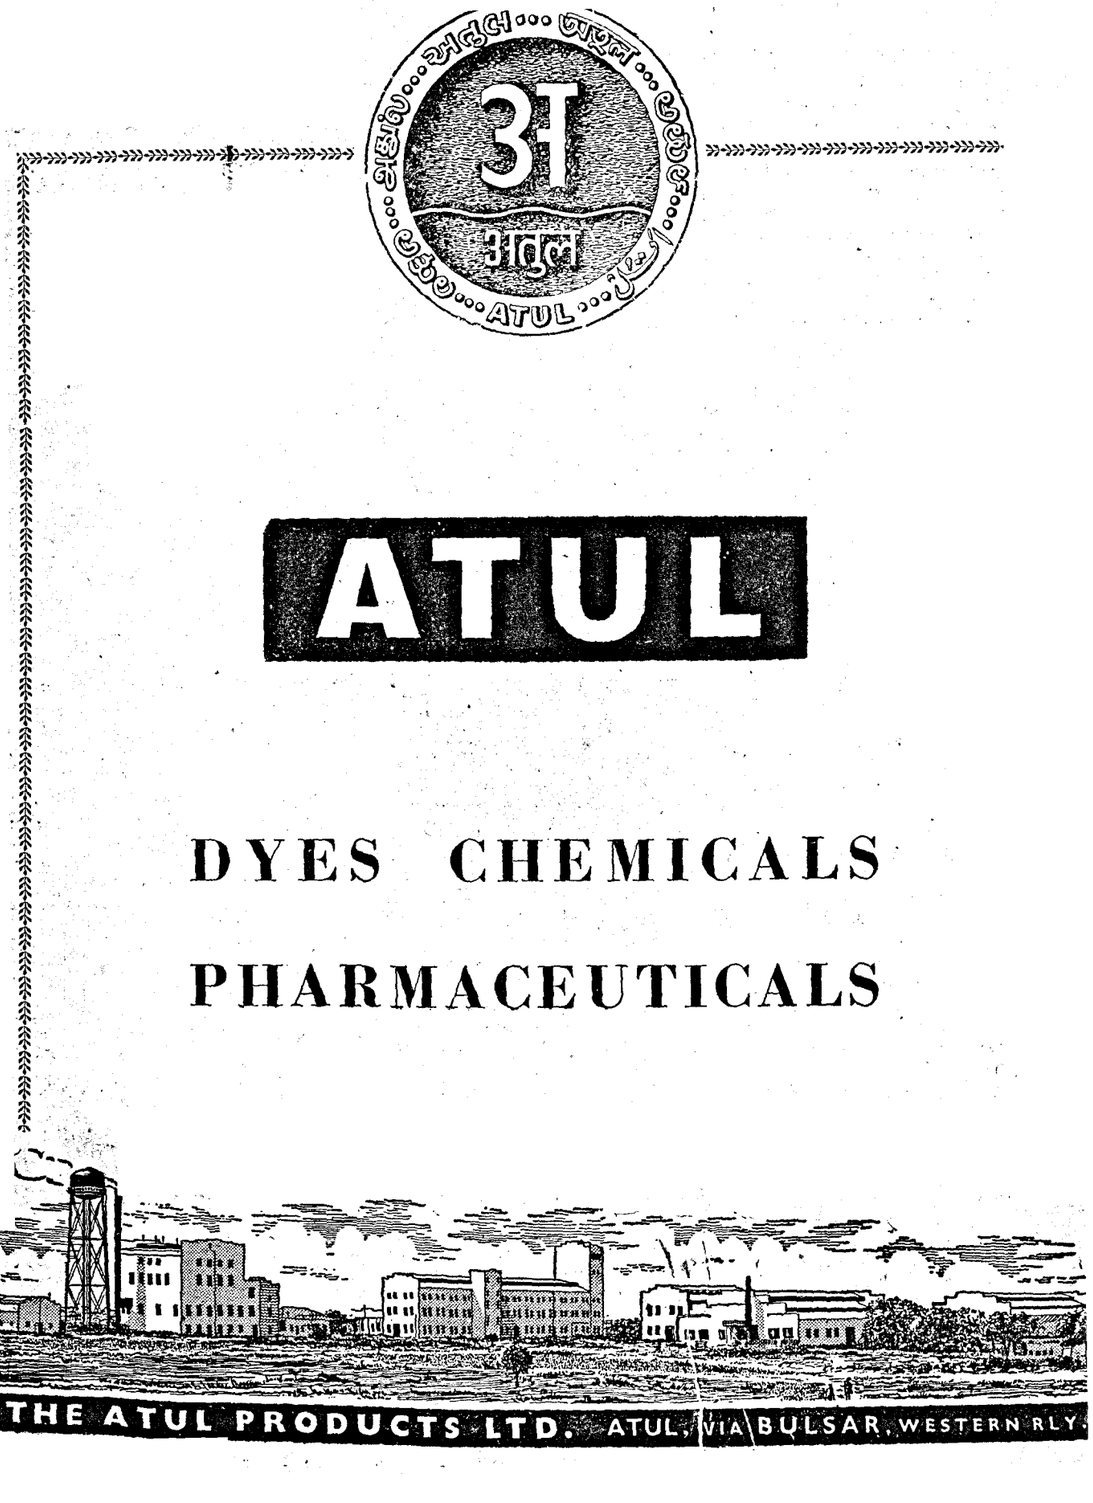
The non-monetized sector is only remotely connected with the process of accumulation. It should, therefore, be excluded from national income estimates to make them more meaningful in relation to economic growth.

NATIONAL income statisticians and others often tell us these days that quite a significant part of the Indian economy is, in fact, not monetized. All that they mean is that the proportion of the total national output that has a monetary counterpart is much lower here than in the economically advanced countries. They do believe, however, that the proportion is apt to rise in the course of economic development. Beyond this no effort is made to bring out the implications of a non-monetized sector from the point of view of economic development. An attempt will be made in the course of this paper to clarify some of the conceptual and analytical issues connected with the question of non-monetization from a growth-oriented standpoint. It need not be presumed that what is said here applies in toto to the specific situations prevailing in India.

To start with, we do not mean by a non-monetized economy an "amonetary" economy of the Crusoe type where the question of any commodity having general purchasing power is ruled out by the sheer logic of the situation. We mean by a non-monetized economy only a partially monetized economy where the characteristics of money have not yet sufficiently crystallised. This results from the fact that money does not discharge here all the functions that are logically associated with the concept of a really monetary economy. What money does has been dealt with ad nauseum in economic literature but it is unfortunate that the whole discussion from Knapp onwards has been conducted from the point of view of the evolution of credit. Here our purpose is not to discuss credit, but economic development. This is not to deny the importance of a developed credit system in the process of economic growth. Schumpeter with his great insight into the process of economic development sought to analyse the intimate relationship between the two as early as 1911.

From the point of view of economic growth, the crux of the monetary system lies in the fact that wages there are paid out in terms of money. A non-monetary economy, on the other hand, is one where in the Marxian terminology the question of the exchange of labour-power against money never arises. There one may conceive of any commodity as a numeraire in the Walrasian sense, but the commodity remains only a 'shadow money' unless we postulate that labour is being compensated in terms of that commodity. The generalised purchasing power which a unit of money represents follows from its purchasing power over labour. So long as money cannot purchase labour because labour power has not become a saleable commodity, the role of money is bound to be limited in character. Only when money starts performing the task of wage payment do we have a genuinely monetized economy. This, however, presupposes the emergence of capitalist relationships. From this point of view, the difference between the monetized and the non-monetized sectors of the same economy boils down to the fact that in the former we have a developed wage-labour-capital relationship while in the latter, the above relationship has not yet developed or is, at its best, only in an embryonic form.

This interpretation may sound somewhat amazing especially to those accustomed to thinking in terms of two rival antitheses: money—non-money, capitalist-pre-capitalist. Money—non-money antithesis is, at bottom, not a real antithesis at all. For money understood in the sense of a circulating medium only and having little or no connection with production relationships has been prevalent since very ancient days. As a matter of fact, the money economy understood in this sense had not even registered a uniform trend of expansion till it merged in the money-economy in our sense of the term. (Compare M M Postan in 'Essays in Economic History' Ed. by Carus-Wilson.)



From this basic feature of a non-monetized economy, follow the other interesting features.*

A non-monetized sector is largely an unorganised sector. We are not here referring to organization in its broad sociological sense—custom may be an important factor in setting the pattern of social organisation. We mean by organisation economic organisation. This lack of organisation stems from the very inadequate development of social division of labour and the emergence of the related phenomenon of commodity-production. Market as an economic institution has therefore only a very limited scope. If market for commodities hardly exists, it would surely be out of the question to postulate a market for assets. Accumulation, under the circumstances, is not possible for to store things having no universally recognised common denominator and having no opportunity of exchanging negotiable assets (if there be any) against goods is not a meaningful economic activity.

A non-monetized economy, therefore, implies little or no capacity for accumulation and consequently, little or no possibility of changing the technique of production for initiating a rise in the level of productivity.

What happens when this non-monetized sector is placed vis-a-vis a money-economy? There is no doubt that money infiltrates into this sector. But this infiltration in itself is not significant for the dissolution of the non-monetized economy. If people start using money in the 'circulation sense', that does not lead to the gradual emergence of a really monetized economy. In most cases, it gives birth to an usurious economy, which clings like a parasite to a predominantly non-money economy. One can notice this phenomenon acutely in what are believed to be the non-monetized parts of our own economy. The fact of the matter is that money has no inner dynamic of its own so that we have an ever-expanding money economy unless perfect differentiation of economic functions. This imperfect functional differentiation in its turn is due to the prevalence of pre-capitalist relationships. As such, the notion of self-sufficiency in the meaningful sense is subsumed in our definition of non-monetization.

* There are some, however, who find the essence of a non-monetized economy in the notion of 'self-sufficiency'. But self-sufficiency in the economic sense arises out of the mere basic phenomenon of im-

money is utilized as money-capital in the *process of production itself*. That means unless the infiltration of money into a non-money economy is at the same time accompanied by the emergence of capitalist relationships, we get only a very partially monetized sector where only a small proportion of total output is exchanged against money.

The fact that we have such a wide non-monetized sector in India is at bottom due to the tardy development of capitalist relationships in this country. Non-monetization is only a subsidiary characteristic of pre-capitalist relationships. It is, of course, not suggested that for purposes of economic development, contraction of non-monetized sector or the emergence of a capitalist economy is either inevitable or desirable. Our discussion relates only to the implication of a non-monetized sector.

The above discussion has certain interesting implications. One particularly obvious policy implication is connected with the question of deficit spending. Creating new money need not necessarily lead to as high an increase in prices as may be expected on ordinary considerations since the ratio of the total value of final transactions in terms of money to the total national output is expected to rise. On this point, the Japanese experience during the late 19th century following the Meiji *restoration is quite relevant.*

Apart from this above all-too-apparent implication, we have some other interesting implications. They relate to the concept of national income and the use to be made of national income data.

The valuation of the total net output of the non-monetized sector raises all sorts of awkward questions. The current practice of accounting has its theoretical basis in the neo-classical approach to the economic problem, viz., the satisfaction of consumer's needs with scarce resources. From that point of view, there is no other logical way out but to include the output of the non-monetized sector in the total national output. But that does not solve any of the complicated questions that arise in this connection: How are we to ascertain the total output? How are we to 'net' it? Which set of prices are we to employ for converting the heterogeneous collection of items into a homogeneous mass? The general practice is to evaluate them at prices ruling in the monetised market-bound economy. But which set of prices: wholesale or retail?

Prof Kuznets suggests that they should be valued at retail prices, in *order that due account may be taken* of those services usually performed in peasant households, but which are customarily discharged in developed economies by specialised institutions. This suggestion may be quite significant for the problem of making detailed comparisons between industrial and pre-industrial economies. But it is difficult to see how it solves the basic problem of the meaningfulness of totals so arrived at as indications of economic welfare. This is the point that has been raised by Prof Frankel. On the basis of neo-classical reasoning, which provides the theoretical scaffolding to the current practice of calculating national income, it can hardly be denied that in applying the techniques of national income accounting to the non-monetized parts of the economy, there is generally a passage, not too legitimate, from one set of logical categories to another.

But the whole problem looks altogether different if our central quaesitum is economic growth. As we have already seen, the categories of accumulation fit awkwardly into the scheme of an economy where the characteristics of money are so diffuse. In this sector, the surplus of production above consumption, if there be any, is a **physical surplus** and not an **economic** surplus for the value categories are singularly inappropriate in this context. As such, the question of the productive *deployment of this surplus* does not arise. Now, if our purpose is to find out a concept of national income which may be used as an index of economic growth, we need consider only such sectors of the economy as employ reproducible Capital and as augment the total stock of reproducible Capital in the process of accumulation. So far as the non-monetized sector is concerned, it does not face the above test. As such, it cannot logically form a component of a growth-oriented national income total. Estimates of national income, like the G.N.P., etc, which attempt to include the non-monetized sector, stand on an altogether different conceptual footing from the approach here suggested.

Supposing, however, that the current practice is unobjectionable, it is easy to see that it makes models of economic growth based on postulated relationships between income, investment and savings extremely precarious. If one leaves out the savings question altogether, and concentrates merely on the investment —income relationships, one is dealing with an incomplete description of economic reality. Because in such models as these, the demand aspect of the question is totally ignored. If the economy is centrally planned, we *may have some justification* for assuming away the worries of a deficient or excessive effective demand but talking about a mixed economy, one realizes at every step the inadequacy of a model of economic development having no demand component.

For accommodating demand aspects, we have to introduce savings explicitly into the picture. But how stable is the savings—income relationship in an economy having such a wide non-monetized sector? In truth, the process of economic development implies in itself a varying coverage of the non-monetized sector. As such, it will automatically lead to discrepancies between the postulated savings-ratios and actual savings ratios. From the mathematical point of view, we may be in a position to employ some more forbidding techniques to take account of the situation but, in practice, the models reduce themselves to empty formalisms. To be on such grounds, we must be in a position to relate the changes in savings-ratio to changes in the nature and extent of the non-monetized sector. But in the nature of the case, it is difficult to establish any precise relationships. Should we then break up total savings into two components: monetized and non-monetized? This procedure is not meaningful either for the non-monetized sector is not accumulation-oriented, as we have seen.

The way out of the impasse appears to be in adopting a definition of national income that comprises only such sectors as are directly relevant from the point of view of economic development. Sectors which are remotely connected with the process of accumulation viz. the non-monetized sector, will be automatically left out. The result will be a loss in the comprehensiveness of the totals arrived at but this loss will be more than compensated by the greater accuracy of the relevant data as well as by the heightened meaningfulness of the economic magnitudes involved.

more of them...

More industries and more people in employment —it is a chain-link.

Modern industries, large and small, generate further economic activities and open out employment avenues direct and indirect. They add to national wealth and lead people to prosperity.

Capital Output Ratio—Its Uses and Abuses

Arun Ghosh

The capital/output ratio can be used as a rough guide to the rate of growth that can be attained in an economy with a given rate of investment—and conversely, as an indicator of the savings necessary to attain a given rate of growth. But there is danger in attaching too much importance to it even in this limited context. The ratio holds good only in the long run; it tells us nothing about the investment in "human capital" required to bring about a certain rate of growth; and it hides the truth that in an emergency, a given amount of capital can yield far greater output than past relationships may indicate.

For determining investment priorities, however, the concept is of no use at all and for choosing between two rival technologies, it can only be one of the many criteria that have to be satisfied.

IT has been suggested by Dr Ashok Mitra that the capital/output ratio is determined principally by the level of wages and the productivity of labour*. In a Crusoe-Friday economy, where Crusoe sits and orders and "feeds" Friday, and the latter toils, Crusoe's investment may be identified with the wages (in kind) paid to Friday out of Crusoe's (past) savings. (Investment in the economy would be given by Friday's toil, valued at Friday's wage.) Likewise, the outlay on wages by the entrepreneur could be treated, in the modern setting, as the investment by the entrepreneur; and in a Kalecki-type model of the economy where entrepreneurs are the only savers—there being no savings out of wages paid to workers—one view of investment would be all outlays necessary to bring about production, total wage payments (including the wages part of the cost of intermediate goods) being the most important constituent of such outlays. In this view of investment, the use of machinery and equipment can be allowed for by adding to total wages paid, the replacement cost of capital consumed in the process of production. Given the capital equipment and employment, output would be determined by labour's dexterity, or labour productivity. Finally, since the depreciation of capital is likely to be of a small magnitude as compared to the outlay on wages, for all practical purposes the capital/output ratio would be given by the level of wages and the productivity of labour. Thus, one way to lower the capital/output ratio would be to lower wage rates.

Mitra's interpretation of the capital/output ratio is based on an "instant" view of capital; given certain fixed assets, production requires the application of labour; and for the economy as a whole, provision of wages in advance of the fruition of output may be taken to imply a corresponding saving out of current income, which alone makes possible the act of production.

The merit of Mitra's formulation is that it exposes the danger of identifying a higher capital/output ratio with greater capital intensity. Though under certain circumstances these two may well be associated, there is no warrant for the belief that of two processes, the relatively more labour intensive method necessarily has a lower capital/output ratio. The capital/output ratio obtaining for the two techniques will be given by the twin factors (a) the output accruing from the two methods of production, and (b) the sum total of savings—in Mitra's formulation, current savings—necessary in the community to produce the requisite amount of output.

While Mitra's formulation helps to remove this popular misconception, it falls into an opposite kind of error through, I believe, an attempt to seek an explanation of the observed "constancy" of the capital/output ratio in countries like the U S A where rapid increases in labour productivity have not brought about any reduction in the capital/output ratio in the long run, because of a simultaneous rise in real wage rates. This separate issue we must reserve for another occasion. The inherent weakness in Mitra's formulation of the concept of the capital/output ratio can be seen from the following extreme example.

Let 'X' be the total (replacement) value of capital in an economy and let 'Y' be the value of net output in that economy in a given year such that X = 3Y. Further, let the expected life-span of the fixed equipment be assumed to be 30 years, so that capital consumption during the year would be X/30. Further, let the total wage payments be taken as 2Y/3. On Mitra's view, therefore, the investment involved in producing an output of 'Y' would be given by 2Y/3 + X/30, or 2Y/3 + Y/10, or 23Y/30, giving a capital/output ratio of 0.77 : 1. On the other hand, under the simplifying assumptions made above—and without entering into an argument as to the definition of capital—the capital/output ratio has been defined as 3 : 1 in the first sentence of this paragraph.

How does this contradiction arise? Even if we accept, for the time being, Mitra's concept of capital and of investment it would be seen that Mitra compares—in terms of magnitudes—investment during any given period with the total net output in that period, which has been produced by labour in conjunction with the accumulated capital (savings) of the past, and not merely in conjunction with the savings (investment) of the current year. It will be conceded that in a period of depression net investment may well fall to zero or be even negative, but net output will be a positive magnitude. Mitra gets out of this difficulty by a twist of logic whereby wage payments are defined as investment, so that we get a fairly "even" series of the investment/output relationship; in any case, wage payments must be positive for output to be positive. But following Mitra's own logic, we may well derive the following absurd relationship between investment and output.

Value of gross output
— input of materials (incl. depreciation)
= net output
≡ all factor payments (including wages and remuneration to other factors necessary to bring about production)
= investment

Hence, investment ≡ net output, and capital/output ratio is always unity.

Mitra does not state this explicitly; but his thesis, whereby outlay = investment by a twist of his own logic, is obviously not intended to give a definitional equation of the economic system. This approach to

* Ashok Mitra: A note on the Capital/Output Ratio, The Economic Weekly, Annual Number, January 1956, Page 109.

the concept of capital/outlay ratio has, on the other hand, some special uses;* but the usefulness of this concept arises mostly from disproving a series of popularly accepted notions and beliefs, and not as a valid concept in itself.

At this stage, it may be useful to ask as to what really the capital/output ratio really connotes. There can be two ways in which the problem can be examined; from the strictly theoretical point of view, starting with a definition of capital and from the operational or measurement point of view. We will here adopt the latter method by reason of its greater simplicity.

Difficulties of Measuring Aggregate Capital

The value of existing stock of fixed capital and equipment—i.e. of durable replaceable capital—can be taken either as the gross (investment) value of existing capital less accumulated capital consumption, or as the replacement value of existing assets and equipment.** There may be differences in the value of physical assets as measured in the two ways noted above, arising out of changes in the price level. But even if an adjustment for price changes were to be made, in measuring the total value of the existing stock of physical assets, two difficulties would arise: the difficulty of relative price changes, and of a change in weights, in the valuation of total output; and more significantly, the lower valuation of existing physical assets in the event of a rise in real wage rates.

The first of the above two difficulties, i.e. a change in relative weights, is essentially a problem of measurement, and reflects the inadequacy of usual procedures of index number construction for deriving any "constant price" series. But the problem of lower valuation of capital in a period of rising real wage rates (or vice-versa) remains. (Indeed, this is one of the lessons which emerge from Mitra's analysis of the capital/output ratio.) Since durable assets have a long life, in a period of inflation the money value of existing physical assets tends to be understated. This can, of course, be corrected by allowing for price changes. But in a period of rising labour productivity (and rising real wage rates), the real value of existing physical assets—produced at a lower level of real wages—would get understated.

It is thus conceptually difficult to define, and operationally difficult to measure capital in the aggregate *sense; and hence, correspondingly, to* derive the average capital/output ratio. Furthermore, for purposes of projections or for planning, the average capital/output ratio has not much significance, especially because of distortions in past relationships *arising from valuation difficulties* noted earlier. An alternative formulation, which avoids the above difficulties is the marginal capital/output ratio, which relates the additions to output accruing from additional investments made from year to year.

Marginal Ratio

A number of different formulations are possible in respect of the marginal capital/output ratio. To begin with, in deriving the capital/output ratio, capital may be taken to connote not only fixed investments but also working capital required for production.* It is obvious that in computing the capital/output ratio, the requirements of working capital cannot be assumed away; but correspondingly, violent fluctuations in inventory holdings cannot also be included in computing the capital/output ratio, which has some significance only as an indicator of a long-term relationship. The remedy for this lies in taking the marginal capital/output ratio over a number of years, so that all cyclical and random fluctuations (in inventories as well as in output) may be evened out.

From the measurement point of view, it is easier to take marginal savings as giving the numerator, and output increases as the denominator. This procedure saves a number of awkward difficulties connected with the valuation of capital or its quantitative measurement, and allows for bad investments or investments abandoned before completion, as well as preliminary expenses on exploration, etc. But even this procedure does not allow for a number of difficulties inherent in any analysis of the marginal capital/output ratio.

Time Lag between Investment and Return

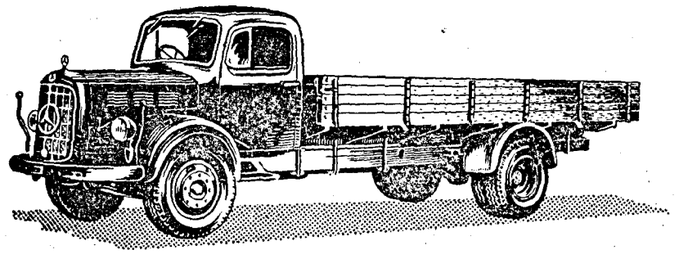
The first difficulty is connected with the roundaboutness of the process of production, and though apparently simple, makes for difficulties in interpreting the capital/output ratio. With varying lengths of the 'gestation' period of investment, the danger of simultaneous association of investment and output is manifest; what is not so obvious is that under conditions of competition—allowing for a certain degree of "lumpiness" of capital—the capital/output ratio, adjusted for the discounted value of output over the expected period of life of capital, should be equal for all investments. In computing the capital/output ratio, therefore, should allowance be made for the lag between investment and the accrual of output? If no allowance is made for this lag, investments maturing quickly would appear advantageous over investments which may, in the long run, be better. On the other hand, no computation of the capital/output ratio, after allowing for such lags, would have any meaning. Not only would the concept be vague, but the measurement of the capital/output ratio would be nearly impossible.*

Another difficulty—a relatively minor one—is that in an expanding economy, the capital/output ratio must always be rising. This, again, follows from the 'lag' between investment and the accruing output, so that in a period of expanding investment, the capital/output ratio will always tend to rise.

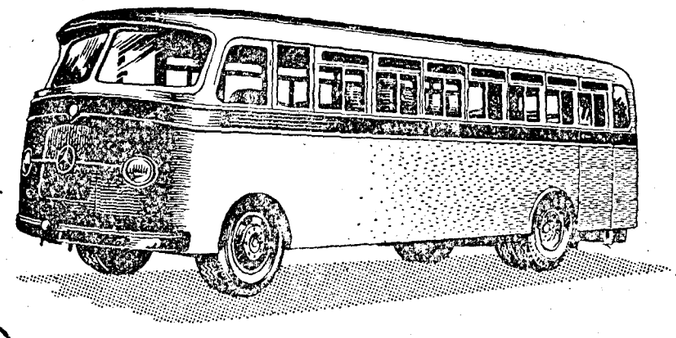
But the major difficulty in the measurement of the capital/output ratio—whether the average or the marginal concept be under considera-

* One may recall Keynes' treatment of all Government expenditure as investment, for the purpose of his multiplier analysis. That was useful for a given type of analysis; and obviously, it was not intended to imply that all Government outlay was to be treated as "investment" in every context.

** There have been attempts to link the gross value of output with gross investment (cf., for instance, **The Economic Bulletin for Asia and the Far East**, November 1955, p 26), but the precise significance of this relationship is not very clear.



* This pertains not only to the derivation of the marginal capital/output ratio but also the average capital/output ratio; but in the latter instance, the importance of fluctuations in inventories—which depend to a considerable extent on speculative considerations — is minimised.



* Frequently, a capital/output-capacity ratio is recommended as a meaningful measure, in order to determine investment priorities. This can only relate to physical output capacity, and has some relevance in the limited context of planning the investment programme (with alternative types of equipment) in a single industry. But obviously, the concept has no further use either for the economy as a whole, or even for comparing sectoral capital/output ratios (which, as we will see later, mean very little themselves).

Money Makers Both...!

To step up your haulage income and profits, invest in a Tata-Mercedes-Benz vehicle that's specially designed and built to boost your transport business!

Sturdier, more powerful engines . . . heavier payloads . . . better road-holding . . . easy, economical maintenance. . . and, above all else, outstandingly low fuel consumption place the Tata Mercedes-Benz vehicles in a class by themselves.

tion—is that the cost of investment in 'training' etc. is seldom or never treated as part of investment for reasons of conceptual and of measurement difficulties. With increasing complexity of the process of production, labour has to acquire technical skill and technical knowledge; and the need to allow for the cost of training etc. as an overhead investment cost is admitted almost universally. But in practice such allowance is seldom made, if only because not all expenditure on education can (or should) be regarded as investment; and by the same token, expenditure on health, and indeed, even on nutritive foods, can well be regarded as "investment". (The danger of logical hair-splitting is that strictly in theory there can be no limit to the extent of such "splitting" of hairs until they are reduced to "electrons" or "protons".)

Use of the Concept

Where does all this lead us? We are still a long way from a satisfactory definition of the capital/output ratio, and we seem to be receding from the position where any sensible use can be made of this much boosted concept. And since all workable definitions appear to fail us, we may enquire whether, and to what extent, the concept of the capital/output ratio can be of use for policy making.

The concept of capital/output ratio was suddenly "discovered" after Harrod's exposition of his model of the growth of an economy; and the first use of the concept was to give the rate of growth that can be attained in an economy with a given rate of investment. Leontief extended this use by treating capital as an "input", in his input-output analysis, for deriving the structural relationship in any economy between output of different kinds. There have, of late, been some attempts to treat the capital/output ratio as a criterion for determining investment priorities. Finally, it is recommended as a criterion for the choice of different technologies for deriving a given output, as Mitra has done, for instance.

That the capital/output ratio can be used as a rough guide to the rate of growth that can be attained in an economy with a given rate of investment—and conversely, as an indicator of the savings necessary to attain a given rate of growth—few will deny. But as already observed earlier, there is danger in attaching too much importance to the capital/output ratio even in this limited context. The capital/output ratio holds good (as a constant) only in the long run; it tells us nothing about the investment in "human capital" required to bring about a certain rate of growth; and it hides the truth that in an emergency, a given amount of capital can yield far greater output than past relationships between investment and output may indicate. Factories can be worked on a second or third shift if necessary; the use of capital can be rationalised; and the same equipment can give significantly different outputs with different types of labour. Ashok Mitra's concept of "dexterity" as a factor in the capital/output ratio thus reappears as an incontrovertible factor in the equation.

How to measure the capital/output ratio even for the limited purpose indicated earlier? My own preference is to treat output increases as a function of the rate of saving. This has its limitations, as we have seen, but making allowances for cyclical variations, the above measure of the capital/output ratio would have the twin advantages of measurability and of practical significance in the context of changing prices and labour productivity. No adjustments are necessary for a comparison of the rate of savings with the rate of growth of the economy.

Investment Priorities

The use of the capital/output ratio as a criterion for determining investment priorities is, however, to put it mildly, not very correct. For the economy as a whole, the output accruing directly from any investment is quite unconnected with the total increase in output in the economy resulting from the investment; for a private investor, what is relevant is the discounted net return (profit) on his investment, for the entire period of life of the investment. This is so obvious that the point need not detain us any further.

Where a choice is necessary between two rival technologies, the capital/output ratio can be only one of many criteria for the choice of the best alternative. The choice of technology for promoting development, however, is a subject by itself, and quite a few readers of the **Economic Weekly** are at present exercised by the manifold aspects of this problem. Without delving any deeper into this subject, therefore, it may be well to sum up our conclusions on the notion of the capital/output ratio.

The function of capital is to raise labour productivity. But capital is only one of several elements—though undoubtedly a very important element—in raising labour productivity. There is use in abstracting capital from the other factors only as an analytical exercise; in planning for development, the capital/output ratio (as obtaining in the past) tells merely of the physical asset formation necessary for obtaining a given output; the concomitant expenditures on education, training, etc. which are equally necessary to obtain the given output are not indicated. This is generally recognised, but frequently forgotten when making ready comparisons. It may well be that in a given situation, expenditure for raising the level of technical skill, as well as expenditures that will increase general awareness, initiative and enterprise—howsoever these may be fostered—may be of greater benefit in raising the level of output in an economy, than the introduction of isolated pockets of highly mechanised industrial units. The fact that a few foreign investments have, in no country, raised the general level of industrial development, is proof of this.

The capital/output ratio is a useless concept in the determination of investment priorities; and hence, of little use in actual planning. Ashok Mitra's concept of the capital/output ratio is perhaps more useful in this connection than capital/output ratio as it is generally understood; but Mitra's concept is **not** an appropriate concept of the capital/output ratio either for a private investor or for the economy as a whole.

For practical purposes, a rough measure of the capital/output ratio is best derived from the savings coefficient. It is easy to calculate the statistical relationship between the rate of savings and the growth of national income—the former adjusted for external borrowing. Like many other simple correlations in statistics, the relationship may not give a correct structural equation of the economic system, but is good enough for prediction.

Economic Growth and Sectoral Balance

Amlan Datta

The Second Five-Year Plan has shifted the emphasis from agriculture to industry. The need for greater attention to industry, and some attention to heavy industry, is beyond question. But industrial development will mean greater demand for food and raw materials from an expanding sector of the economy and a growing non-agricultural population.

Under the circumstances agriculture cannot be neglected without exposing the economy to serious shortages, culminating possibly in rising food prices which may lead to general inflation.

If planned investment is to be maintained in the face of inflation or increased imports, it may be necessary to have recourse not only to price control and rationing, but also to compulsory requisitioning of agricultural produce.

This, in its turn, may have serious political repercussions, jeopardising the professed democratic aims of the Indian Plan. It is against this background that the Prime Minister's studied stress on food output comes with a welcome ring.

THE problem of balanced growth is considered here under one special aspect, viz., the balance between different sectors, rather than different stages, of production in a growing economy.

It is common knowledge that in a developing economy there occurs a definite redistribution of the economically engaged population among the different sectors, so that an increasing proportion of the total labour force finds occupation in manufacture rather than in agriculture, and, at a later stage, in the services sector rather than in the other two. It will be noted that the word "labour force" is used here in a wider sense than "wage labour", the services sector containing a high proportion of independent or self-employed persons. Incidentally, this shows that beyond a certain point, the proportion of "wage labour" tends to decline in a growing economy, unlike what Marx thought.

There is a popular belief that the shift from agriculture to manufacture takes place because of the higher efficiency of labour in manufacture relatively to agriculture; and similarly for the shift to services. Reflection suggests that this could hardly be the whole explanation. Let us for simplicity consider a closed, but growing, economy, and concentrate chiefly on the shift from agriculture to manufacture. In such an economy, the shift of the labour force from agriculture to manufacture is only possible because, and to the extent that, demand for manufactured product rises even faster than increased physical productivity of labour in this field, or, to put it the other way round, because average labour productivity in agriculture rises faster than demand for agricultural produce. Thus in an important sense, it is not lack of labour efficiency in agriculture, but rather the increase of such efficiency, which lies at the basis of the shift from agriculture to manufacture. And similarly for the shift from manufacture to services.

Agricultural Revolution—A Precondition to Industrial Revolution

There are important advantages in looking at the problem from this point of view. It serves to emphasise the importance of "revolutionising" agriculture as a precondition of the "industrial revolution". An inefficient agricultural system is a drag on the industrial revolution.

Let us look into the matter a little more closely, still thinking in terms of a closed, self-sufficient, economy, working within the institutional framework of free markets. In an underdeveloped economy, the increased income resulting from additional investment is likely to be spent in large part on agricultural products, particularly food stuff. This is because the income elasticity of demand for food is likely to be high at a low standard of living. Similarly, the demand for textiles, and, therefore, the derived demand for cotton, will rise sharply. And similarly for certain other agricultural raw materials. On the other hand, the demand for services, which are more or less free of dependence on raw materials, is not likely to rise much at this stage. Now, starting with an industrially backward and agriculturally inefficient economy, with a large technological lag to be made up in both sectors, suppose that substantial investment is made in manufacture, without agriculture being reformed, and with the supplies of agricultural produce consequently inelastic.

Under the assumed conditions, the expansion of manufacture will be limited by two factors. In so far as agricultural produce is an input in relation to manufactured output, agricultural stagnation will act as a brake on industrial expansion, the more so the more difficult it is to find substitutes for agricultural products. There is also the problem of the sale of the manufactured output, arising from the lack of correspondence between the pattern of consumers' demand and the composition of the additional output. The investment in manufacture will create a certain amount of new income, representing the costs of the new manufactured output.

This new income will create additional demand of which only a part will fall on manufactured articles, the other part being divided between foodstuff and other non-manufactured commodities. In other words, the increased expenditure on manufactures will be less than their additional cost of production, thus preventing sale at a profitable price; while, on the other hand, the increased expenditure on foodstuff will tend to raise food prices, supply being inelastic in this field. The original investment in manufacture will, therefore, fail to start an expansionist process. On the other hand, if increased investment in agriculture accompanied the expansion of manufactured output, a part of the increased income originating in the agricultural sector would have been spent on industrial product, and balanced advance might have been possible*.

* The rise in agricultural prices relatively to industrial prices may change the relative elasticities of demand in the consumers' market. For the moment, however, we ignore this complication. In any case, inelasticity of supply of agricultural produce will limit industrial expansion by creating shortages of relevant inputs.

Pace of Development Conditioned by Agriculture

From this preliminary analysis certain conclusions follow. Distinguishing between successive phases in the development of an economy from an industrially backward stage, and concentrating attention chiefly on the characteristics of demand at each stage, it appears that in the early phase of economic development the pace of industrial development is importantly conditioned by the pace of increase in agricultural output, and, more particularly, the production of foodstuff. At a later stage, the increase in the demand for foodstuff slackens markedly, and the rate of increase of food production as such is no longer an important limiting factor on industrial expansion.

This simple formulation of sectoral balance is subject to certain qualifications which under certain circumstances may become very important. But before we turn to these qualifications, it is worthwhile insisting that the formulation even in this simple form is important enough. Our initial assumption of a closed economy is not wholly realistic, but it does not make our conclusion completely inapplicable to important segments of historical experience.

Experience of Western Europe

In explaining the divergent rates of industrial expansion of different Western countries prior to World War I reference is generally made to their unequal endowments in terms of natural resources, supply of entrepreneurial ability, and other factors. But not enough attention is always given to the state of agriculture as an important limiting factor. Yet this is important. And it is probable that some of the other factors, such as the supply of entrepreneurial ability, are imperfectly and distortedly understood when they are divorced from the environment in which a relative stagnation of agriculture forces them to function.

The point may be illustrated by comparing the relative positions of France, on the one hand, and Germany and the United States, on the other hand, before World War I, industrial expansion having been markedly less vigorous in France than in the other two countries. In Germany the yield of wheat per unit of land is estimated to have increased by nearly 60% over the three decades covering the last two of the nineteenth century and the opening one of the twentieth. There was also a small increase in acreage. In the US, total acreage under wheat production nearly trebled in fifty years, there was also an increase in yield per unit of land. In France, on the other hand, neither area under wheat cultivation nor yield per unit of land seems to hav increased much over the last four decades of the last century. Thus, in the United States we find a balanced growth of agriculture and industry, while in France agricultural stagnation, itself traceable partly to some institutional factors, seems to have operated both as a cause and an effect of lack of industrial dynamism. The fact that between 1860 and 1900, population grew very much less in France than in Germany or the U.S. must, indeed, be taken additionally into consideration in order to appreciate the difficulty of the French economy.

Development in India

Reference may also be made in this connection to one of the industrially backward countries, viz., India, to illustrate how agricultural stagnation may limit the possibilities of industrial expansion. Under British rule, there occurred a remarkable expansion of railways in India, particularly designed to connect the hinterland of raw materials with the ports. India differs in this respect from tropical Africa, for example, where lack of transport is often adduced as one of the principal causes of the very limited development of an exchange economy and, hence, of continued economic stagnation. As an acute observer of the Indian economic scene has observed. "The Indian case affords a dramatic example of the impact of a revolution in transport unaccompanied by a similar revolution in the means and methods of production" (H.B. Lamb: "India: A Colonial Setting" in Economic Development: Principles and Patterns, ed. Williamson and Buttrick). What British rule signally failed to accomplish, or, rather, what it never tried to accomplish, is to set Indian agriculture on a modern basis. As a result, the few industries set up in India had to function on the basis of a very limited domestic market, or else depend on foreign market.

Role of Foreign Market

This is a convenient point at which to introduce the role of foreign market in economic development. The dependence of a growing economy on foreign market is determined chiefly by its supply of resources and the pattern of its growth. Ordinarily, relatively slow growth of agriculture is accompanied either by a slow growth of manufacture, or, lacking a wide home market, rapidly developing manufacturing industries are compelled to seek an outlet for their products in the foreign market. John Stuart Mill criticised Adam Smith for illogically lending his support to the idea of foreign trade as a "vent for surplus". But Mill's criticism assumes away too many things. It assumes away the possibility of a country's industrialising itself more rapidly than what is strictly permitted by its current or possible rate of agricultural expansion, through dependence on foreign market for sale of "surplus" products. It should be quite obvious that the urge for selling abroad a surplus in this sense is quite distinct from the urge to build up a foreign surplus of which Joan Robinson speaks in her exposition of a "beggar-my-neighbour" policy. The first is an exercise in growth, of which the historically most significant examples come from comparatively self-sufficient, backward countries, breaking, for the first time, into the world market and transforming their domestic economies; the second is an attempt to "export" unemployment in a period of depression. Conceptually as well as functionally, the word "surplus" stands for two different things in the two contexts.

Japan's Need for Export Outlet

While some countries may expand their agriculture beyond what is strictly necessary to maintain their current growth of manufacture, and dispose of their surplus agricultural produce in the foreign market, other countries may feel compelled to seek a foreign outlet for their manufactured articles even after they have done all in their power to make their agriculture more efficient. To this second group will belong countries which are heavily populated, and desirous of rapid economic development. Japan is a case in point. Japan's bid for the world market has been so spectacular that it has caught universal attention. But there has also been much quiet work in developing agriculture. Thus, the yield of rice per unit of land increased by nearly fifty per cent in the thirty years preceding World War I. Agricultural production itself is estimated to have increased nearly threefold between 1873 and 1913. (G.C. Allen "A Short Eco-

There was not a year in which India did not drain the Roman Empire of a sum equivalent to about one and a half crore of rupees. Thus complained Pliny, in the first century A.D., of Rome's unequal trade with India.

Pliny's statement testifies to the superiority of India's industrial skill and commercial organisation which had given her practically a monopoly of the European market in a wide range of goods. In the succeeding centuries

India's pre-eminence in world trade was never seriously challenged; until Europe forged ahead with the advent of the Industrial Revolution.

With a rich store of natural resources and the traditional skill of her workmen, now aided by modern technology, India is working hard through her Five Year Plans to regain her ancient position of pride in the world of trade and industry.

nomic History of Modern Japan", Appendix.)

Agricultural development is a desirable, even necessary, support for industrial development in more than one sense. Not only does it help to enlarge the domestic market for manufactured articles, but it is also a source from which labour and capital flow to industry. That a reorganised agriculture yields surplus labour to growing industry is a commonly noted phenomenon. Less noted until recently, is the fact that the extraction of surplus funds, whether in money or in kind, from the peasantry has been one of the traditional ways of supporting capital formation in the early phase of industrialisation. In the case of Japan, land tax formed one of the chief sources of revenue of the government in the early period of industrial development.

Pattern of Soviet Development

The USSR offers an interesting study in this respect. From the point of view of natural resources and population pressure, the USSR resembles the USA rather than Japan. The pattern of Soviet economic development has, however, been significantly different from that of the USA not only in institutional terms which are well known, but also in terms of the balance between agriculture and industry. Russia has been agriculturally self-sufficient since well before the Revolution. But what is remarkable here is the performance of her agriculture during the last three decades of extra-ordinarily rapid industrial development. Though agriculture has undergone during this period radical organisational changes, and though it has been mechanised so as to make it possible to draw away labour force to the growing industries, total grain output and livestock product show a distinctly disappointing record. (By contrast, the output of industrial crops has increased by a much higher proportion.) Over the forty years following 1913, total grain output in the USSR increased by not much more than a half—a performance which compares strikingly unfavourably with that in the USA or Japan over a comparable period. Partly, this may be due to soil conditions in Russia; but partly it is due also to Soviet economic policy. In the USSR, attention has centered chiefly on rapid industrialisation, and the rural economy has been exploited to feed the growing industries, an exploitation which was specially painful because agricultural productivity remained at a low level all the time. This, however, brings us back to one of our earlier questions: With a limited home market, how could the Soviet Union clear her increasing industrial output? In the case of the USSR, neither expanding consumers' demand nor foreign market provided the necessary outlet. The outlet has been found in what we may call the "government market" for capital goods. The main part of the industrial output has consisted of capital goods, and these have been directed by the State to the production of further capital goods, for mechanising agriculture, building up heavy industry, and strengthening defence, while the consumer's market has remained limited throughout. An alternative line of economic development in the USSR would have been, as suggested by Bukharin in the closing years of the 'twenties, to allow industrial expansion to be geared to the growth of agriculture, with greater attention paid to the increase of agricultural output, and with free relations of exchange between agriculture and industry; in short, something resembling the sectorally balanced growth that we have discussed earlier. With Bukharin's model, industry would still have been under state management, but the peasants would have been spared the methods of force used against them, consumer goods industries would presumably have received greater attention, while the rate of industrial expansion would have probably slowed down to some extent.

Scope for Improvement of Indian Agriculture

In the light of the above, some comments may be made on recent economic development in India. As has been noted earlier, Indian agriculture has been in a painful state of stagnation for a very long time. "Stagnation" is, indeed, a mild word here. As the Indian census of 1951 points out, since 1920 agricultural output in India has been lagging behind population growth. Under the circumstances, improvement of agriculture was on the order of the day when the First Five Year Plan was introduced. Between 1950-51 and 1954-55, a comparatively brief period of four years, the production of food grains showed a welcome increase of over thirty per cent (from 50 million to 65.8 million tons). While part of this increase was due to good monsoons, part must be accounted for by more solid improvements, such as, extension of irrigation, reclamation of uncultivated land, and introduction of better farming (e g Japanese type of rice cultivation). It is evident, nonetheless, that there still remains an enormous scope for further improvement of agriculture, and that with the present food production the Indian population can only be maintained at a very low dietary level. Also very important is improvement of the livestock to add value and variety to the Indian diet. The contrast between the diet of North West India and that in the North East and the South is an unmistakable pointer to the need for changes in this direction. Meanwhile India also requires to develop her industries to provide greater employment and to raise her national output. The Second Five Year Plan has shifted the emphasis from agriculture to industry. The need for greater attention to industry, and some attention to heavy industry, is beyond question. India has vast reserves of iron ore. There is no reason why these resources should not be properly developed, in order to meet growing home demand, and, ultimately, even to develop export. But industrial development will mean greater demand for food and raw materials from an expanding secondary sector of the economy and a growing non-agricultural population. Additional demand for foodstuff will also arise from the natural growth of population. Under the circumstances, agriculture cannot be neglected for some years to come without exposing the Indian economy unduly to serious shortages, culminating possibly in rising food prices, which in turn may lead to raising wages and general inflation. The alternative is increased imports of foodstuff and other agricultural products. In the face of an inflation or increased imports, planned investments will have to be cut down, or if the level of investments is to be maintained, it may be necessary to have recourse not only to price control and rationing of consumption, but also to compulsory requisitioning of agricultural produce, in some form or other. This in its turn may have serious political repercussions, jeopardising the professed democratic aims of the Indian Plan. It is in this background that the Prime Minister's studied stress on food output, while initiating in the Parliament the discussion on the Plan's principles, comes with a welcome ring.

The Choice of Technique

Joan Robinson

The dilemma of the choice of techniques is a real one and it is no good pretending that there is one obviously right answer to it. To weigh up the alternatives we need to know more, e g:

How much greater, for a given investment, the output of consumer goods would be if small scale industry is fostered, or how much additional investible funds can be extracted (for planned investment) if capitalist firms are allowed to re-equip?

Whether different kinds of investible resources are required for the different techniques?

The technique with the larger wage bill may be scattered all over the country and may not require further overcrowding of city slums. On the other hand the more mechanised technique fosters modern engineering and the technologist's outlook on life. Any one who has a prejudice for either side can find plenty of plausible arguments to support it.

IT is no wonder that the argument about small-scale industry and the choice of technique should be bewildering the readers of **Economic Weekly**, for the subject is one of very great complexity.* There is no ready-made answer to it in the existing corpus of economic doctrine. The kind of theory, based on the rate of interest and marginal products, to which Mr M N Ghosh refers, has been worked out (and not very satisfactorily, one must admit) for situations in which there is already full employment. The Soviet debate (which again is far from satisfactory) also assumes full employment in the economy as a whole and is concerned only with alternative schemes of investment for one particular bit of the whole national plan. Neither deals with the Indian case, of which the essential feature is the existence of a large (and probably growing) mass of surplus labour which requires to be equipped to make it productive. Moreover, when the analysis is properly set out it does not provide a simple knock-down answer, but leaves us in face of a political problem.

To sieze the question we must go back to the beginning. The Indian economy is very lop-sided, and lacks the capacity to produce capital goods in sufficient quantity to provide the rate of accumulation that is considered desirable. To get the economy into balance is going to be a long job and will require heavy investment in the investment good sector. Foreign-exchange earnings may be regarded as contributing to the capital-good sector, since they can be used to import machinery and technical know-how, but export markets are limited and are vulnerable to the vagaries of world trade and to political pressure. India has therefore decided to build up a capital-good sector of her own. For inescapable technical reasons the capital-good sector requires investment in schemes with a long gestation period and a high capital/output ratio. Moreover, to carry out the grand programme, it is necessary to plough back into the investment sector a large part of its own product as it emerges. (The first output of the new steel mills, should go into building steel mills.) Thus for a very long time to come a large number of workers (including those engaged in earning foreign exchange) must be supported by the rest of the economy, without contributing anything to their own sustenance. But an immediate increase in total consumption is urgently needed. It is therefore necessary to allocate a part of the investible resources at present available to increasing the output of consumer goods by schemes with a quick yield. How the allocation is made is a larger question than that at present under discussion and for the moment must be taken as given.

The argument about the choice of technique is concerned with the best way of disposing of the ration of investible resources allocated to the consumption good sector. Dr Rudra is, of course, quite right in pointing out that nothing can be settled by an example drawn from a particular industry, but Dr Raj's type of analysis can be applied if we take it to refer to the consumption-good sector as a whole, assuming that a well balanced mixture of schemes is arranged so that the flow of consumer goods emerging will be reasonably fitted to the demands of consumers.

A great deal of confusion has been imported into the discussion by calling techniques which require a higher ratio of capital to output "more advanced" instead of "more mechanised" or "more capital using". (The confusion is partly only verbal. Dr Raj talks about technological change, which implies new inventions, when he means an increase in the stock of equipment of types already known. Dr Rudra defines his terms quite clearly but the overtones of "advanced" are misleading in the sense that he uses the word.) Let us distinguish "superior" from "more mechanised" techniques. Technique A is superior to technique B if it yields a higher return, in the form of a future flow of product, net of depreciation, both per unit of labour and per unit of investment. We have a certain sum of money to invest (taking wages and prices as given). If project A promises a higher rate of net output than project B, and at the same time will require less labour to operate when it has been installed, then so much the better for A. To prefer B on the ground that it will offer more employment would be extremely hard to justify. Some people, however, do prefer B. The extra workers left free if A were installed (as compared to the case where B is installed) would require either to be equipped for production, or to be supported by some kind of dole, or they would remain as a reproach. For the politicians therefore B may seem to provide an easier line than A. Some people also prefer technically inferior methods of production for aesthetic or religious reasons. It is against this sort of view that the economic pundits are (somewhat confusedly) protesting when they argue against labour-

May 12, M N Ghosh, "Choice of Technique".

A Rudra, "The Problem of Technological Choice".

using techniques. And so long as they stick to favouring techniques which are properly speaking **superior**, they have a very strong case. But it is precisely the pundits, with their conception of "the production function" and "factor endowment" who should be most ready to accept the idea that "more mechanised" is not the same thing as "superior" and that different degrees of mechanisation are appropriate in different circumstances. (In his reply to Y's chaff about the pundits, Dr Raj was putting on a cap that did not fit, for he does not fall into this confusion.)

The true problem, explored by Dr Raj and Dr Rudra, is to choose between a more mechanised technique, which requires a larger investment per unit of output with less labour to operate it, and a less mechanised technique which requires a smaller investment and more labour. In Dr Raj's example technique I (handlooms) is inferior to II (semi-automatic looms), and I drops out of the argument. Technique III (fully automatic looms) offers a smaller output for a given investment than II, and requires very much less labour. How should we choose between them?

On pure capitalist principles of profit maximisation, the choice of technique depends upon the relation of wages to prices. Given the expected prices for the product, a higher level of money wages favours III (which requires less labour to operate) and a lower level favours II. At some level of wages they both promise an equal profit on the investment. In a high-wage country, II has long since been out of the question, but in India it still may be as good an investment as III.

What light does the profit criterion throw on the question of which is the right choice for the nation? Dr Raj's main point is that there may be a bias in favour of III even if it is not more profitable than II. III is appropriate to be operated by capitalist firms (the assumed investment ration is put, say, into extension and modernisation of existing factories) while II is appropriate to scattered small scale concerns. III has organised interests to press for it, and plans already worked out. II requires help in marketing, finance, and organisation to be given to many small producers. It is the line of least resistance to give organised industry its lead. Moreover, within organised industry there is a bias in favour of mechanised techinques. Machines are more docile than men. The future is uncertain, and wages are more likely to rise than to fall. There is a certain snob value in the "latest thing", and the latest thing, being drawn from high-wage capitalist countries is highly mechanised. All this means that a more mechanised technique is preferred even when it is somewhat less profitable.

But to rely on these arguments is to miss the real issue. Dr Raj has fixed his example so that technique II is the most profitable (though it would not be so if it was obliged to pay the rate of wages that obtains for III). Here there is a clear case for II, and nothing more need be said.*

The interesting case to discuss, and surely the most general, is the one in which the wage rate is such that technique III promises a higher rate of profit on investment*. This is the situation which Dr Rudra presumably has in mind and his argument may be restated as follows:

If we put this year's ration of investment into III we shall have a smaller increment of output next year, but a larger increment of profit. This profit represents a surplus available for investment, so that next year's total investment can be greater. (Dr Rudra suggests that it can be used for labour-intensive land reclamation schemes, which are valuable in themselves and provide employment.)

The essence of the argument is that the smaller increment of output yields the larger increment of surplus. This is the central issue, though in actual cases it is always overlaid with confusing complications.

Now pause and consider what is really being said. Surely if there were a larger total output next year (if technique II were preferred) there must be a greater potential surplus —a greater excess of consumable goods over the bare subsistence of the population. For a private employer surplus is an excess over wages, but from the national point of view wages are just as much part of the product as profits.

The trouble is that technique II involves more employment (of wage workers or self-employed artisans) and the potential surplus cannot be extracted from the workers once it has come into their hands. With technique III the potential surplus is smaller but more of it is neatly collected in the form of profits and so can be easily tapped.

Here comes a question that no one seems to have raised during this discussion. Is it so easily tapped? How much of the profit will be transmitted abroad? How much will be distributed and consumed by the families of capitalists? How much will be invested by the firms to whom it accrues instead of going into the Plan? Everyone seems to equate profit with investible surplus, but this seems to me a rather dubious assumption. By choosing technique III rather than II, we are, to state the matter crudely, preferring profits to wages, and this can be justified only if the profits are put to better use than wages from a national point of view.

The dilemma of the choice of techniques is a real one and it is no good pretending that there is one obviously right answer to it. To weigh up the alternatives we need to know more. Can Dr Raj give us an estimate of how much greater, for a given investment, the output of consumer goods would be (allowing a reasonable interval for getting through teething troubles) if small scale industry is fostered, and can

* It can be seen in Dr Raj's example that the wage rate at which II and III are equally profitable is approximately Rs 1,380. At any higher wage, III is more profitable than II.

*The example can be re-arranged as follows:
Investment Rs. 160,000

Technique	I	II	III
Cost per loom Rs.	50	200	10,000
No. of looms	3,200	800	16
No. of workers	3,200	800	1
Wage rate Rs.	300	900	1,500
Value of product Rs	960,000	1,200,000	96,000
Wages Bills Rs	960,000	720,000	1,500
Gross Profit Rs	0	480,000	94,500

The investment is the initial cost of new looms, and to arrive at net profit on the investment it would be necessary to know the rate of amortisation of each type.

Dr Rudra tell us how much additional investible funds he expects to be extracted if capitalist firms are allowed to re-equip? It would be a great help to have even the sketchiest idea of the orders of magnitude involved.

Furthermore, it is relevant to know whether different kinds of investible resources are required for the different techniques. If III requires foreign exchange but II can be set up from local production, the initial investment ration might be more generous if II is chosen. (Even poor old I may score heavily on this point.) On the other hand investment in III may draw in foreign loans that would not otherwise be available.

Important but imponderable considerations also have to be remembered. The technique with the larger wages bill is fattening up more people and getting them into the swim of economic development. It may be scattered over the country and does not require further overcrowding of city slums. On the other hand the more mechanised technique strengthens the highly developed part of the economy and fosters modern engineering and the technologist's outlook on life. Anyone who has a prejudice for either side can find plenty of plausible arguments to support it.

It is obvious enough where political considerations come in, and there does not seem to be much hope that pure economic argument will be able to make head against the passions that it arouses.

Salient Features of the Plan

The Plan has been drawn up with four fundamental objectives:

(a) A sizeable increase in national income so as to raise the level of living in the country; (b) rapid industrialisation with particular emphasis on the development of basic and heavy industry; (c) a large expansion of employment opportunities; and (d) reduction of inequalities in wealth and income and a more even distribution of economic power.

THE object of planning in India is to implement the social and economic policy which is embodied in the Directive Principles of State Policy in the Constitution and which has been reflected recently in the enunciation of the Socialist Pattern of Society as the objective placed before the country. Implementing such a policy implies primarily the raising of living standards in the country and for this purpose the generation of a dynamism in the economy which will lift it to continually higher levels of material well-being and of intellectual and cultural achievements.

Standards of living in the country are very low. "There are large areas which are underdeveloped even in relation to the rest of the country and there are classes of the population which are almost untouched by modern progressive ideas and techniques." Since speed is, therefore, essential, the Commission stresses that, "for several plan periods to come, it is on the mobilisation of the effort rather than on the gains and returns arising therefrom that attention has to be concentrated."

Economic development is intended to expand the community's productive power and to provide the environment in which there is scope for the expression and application of diverse faculties and urges. But the task before an underdeveloped country is "not merely to get better results within the existing framework of economic and social institutions but to mould and refashion these so that they contribute effectively to the realisation of wider and deeper social values." These values are summed up in the phrase "socialist pattern of society."

The Approach

The Planning Commission has expounded this approach at some length. Essentially, it says, "this means that the basic criterion for determining the lines of advance must not be private profit but social gain, and that the pattern of development and the structure of socio-economic relations should be so planned that they result not only in appreciable increases in national income and employment but also in greater equality in incomes and wealth. Major decisions regarding production, distribution and investment — and in fact all significant socio-economic relationships—must be made by agencies informed by social purpose. The benefits of economic development must accrue more and more to the relatively less privileged classes of society and there should be a progressive reduction of the concentration of incomes, wealth and economic power. The problem is to create a milieu in which the small man who has so far had little opportunity of perceiving and participating in the immense possibilities of growth through organised effort is enabled to put in his best in the interests of a higher standard of life for himself and increased prosperity for the country."

Sphere of the State

It is the implementation of this policy in a situation in which large scale production and a unified control and allocation of resources in certain major lines of activity becomes essential because of the use of modern technology that makes necessary an increasing measure of economic activity by the State. The Commission insists that "in the rest of the economy conditions have to be created in which there is full scope for private initiative and enterprise either on an individual or on a co-operative basis."

There is an interesting analysis of the key factors in economic growth. These are the rate of growth of population, the proportion of the current income of the community devoted to capital formation, and the return by way of additional output on the investment thus undertaken. On the basis of various assumptions regarding these three the Planning Commission has presented a picture of the growth of the economy which it visualises during the next few Plans. In terms of this projection national income is likely to be doubled in 1967-68 and per capita incomes would be doubled by 1973-74.

The changes in national income, investment and consumption indicated in the Plan will also be accompanied by far-reaching changes in the pattern of economic activity. One of the principal areas in which such a change in pattern will be seen is the occupational structure in India. There has been no substantial change in the occupational distribution of labour over the last three or four decades. Agriculture and allied pursuits absorb about 70 per cent of the working force, mining and factory industry absorb only 2.6 per cent. Small enterprises including construction take up some 8 per cent, about 7 per cent of the working force is engaged in transport, communications and trade; public administration, professions and liberal arts and domestic services account for over 10 per cent.

This shows clearly that the secondary and tertiary sectors have not grown rapidly enough to make an impact on the primary sector. Since the net output per worker in agriculture and allied pursuits is at present barely one-fifth of that in mining and factory establishments and one-third of that in the trade and services sector, a change in the occupational pattern is essential even to increase the per capita national income. As the Planning Commission points out, "Development involves a transfer of a part of the working force from agriculture to secondary and tertiary activities, but this, in turn, presupposes an increase in the productivity in agriculture itself, if the food and raw material requirements of a developing economy are to be met."

Change in Occupational Pattern

The objective of policy from the long-term point of view should clearly be to keep to the minimum further increases in the working force in agriculture. In this sector, effort has to be concentrated on raising productivity and incomes rather than on increasing employment in terms of numbers. Similarly, the Commission concludes that there is little scope for increasing the working force in traditional small scale industries, which are already bur-

dened with excessive numbers. "The bulk of the new employment opportunities", the Commission says, "have therefore, to be found in mining and in modern industry, large-scale as well as small-scale, in construction and in tertiary occupations." While some increases in the labour force in agriculture cannot be prevented for some years, the object is to bring down the proportion of the agricultural labour force to 60 per cent by 1975-76. A four-fold increase in the numbers engaged in mining and factory establishments has to be brought about, and the investment pattern in the plans has to be adjusted to these requirements.

Fundamental Objectives

The Plan has been drawn up with four fundamental objectives:

(a) A sizeable increase in national income so as to raise the level of living in the country;

(b) rapid industrialisation with particular emphasis on the development of basic and heavy industries;

(c) a large expansion of employment opportunities; and

(d) reduction of inequalities in wealth and income and a more even distribution of economic power.

These objectives are inter-related. The achievement of a rapid increase in national income is dependent upon the expansion of the industrial base. The promotion of basic industries like steel, machine building, coal and heavy chemicals are therefore given primary importance under the Plan. The need for a solution of the problem of unemployment in the country complicates the position in this respect considerably. The provision of employment is a need in itself, it does not necessarily follow from the first two objectives. It is however necessary for the fulfilment of the fourth. That development should result in a diminution of economic and social inequalities and should be achieved through democratic means and processes is the basis underlying the approach to the Second Plan.

The fact that to some extent these objectives are contradictory has led the Planning Commission to indicate its view that "excessive emphasis on any of them may damage the economy and delay the realisation of the very objective which is being stressed." The limitation provided by the scarcity of resources is of course the fundamental feature of the present situation.

As the plan aims at laying the basis for rapid industrialisation in the future it lays considerable stress on heavy industries. As the Commission admits, however, investment in basic industries creates demands for consumer goods but it does not enlarge the supply of consumer goods in the short run; nor does it directly absorb any large quantities of labour. The utilization of labour for increasing supply of much needed consumer goods in a manner which minimizes the use of capital is therefore, an essential feature of the Plan. The Commission argues that though the cost of the product may be somewhat higher when labour intensive methods are used this may be justified by the need to absorb labour, which is an important objective in itself. It takes the view, however, that the sacrifice involved in consumption, which is inevitable while the economy is being strengthened at the base, will diminish as the economy expands. In the long run the community will get increasingly large returns.

The Plan is, therefore, claimed to be an employment oriented one. This implies, the Commission says "much more than determining the optimum

scale of investment." The problem of employment, however, cannot be approached merely in overall terms. In its examination of the approach to the Plan the Commission stresses that the problem must be broken up in terms of sectors, regions and classes. Unfortunately this statement does not really find expression in the body of the Plan.

The Plan is expected to provide employment opportunities for the new entrants to the labour force and to relieve under-employment in agriculture and in village and small-scale industries.

It is admitted that "The Plan will not have a sufficient impact on the carry-over of employment of the earlier period." But since unemployment in an under-developed economy is only another aspect of the problem of development the Commission seems to be satisfied that it is taking steps in the right direction so as ultimately to achieve a solution of the problem.

At the same time the Plan stresses that improvements in productivity are the pre-condition for the rapid growth of employment over the long run. Over a period the Commission asserts "The volume of employment grows only as the supply of tools and equipment on the one hand and of the wage goods on which the incomes of the newly employed can be spent is expanded." It is in this context that the Commission makes what appear to be contradictory statements, though they need not necessarily be so. It urges on the one hand that "It is imperative that in a country with an abundant supply of manpower, labour intensive modes of production should receive preference all along the line." At the same time, it says that "It is nevertheless true that labour saving devices in particular lines are often a necessary condition for increasing employment opportunities in the system as a whole."

The aim of the Second Five-Year Plan is to bring about a 25 per cent increase in national income. During the First Five-Year Plan the national income rose from Rs. 9,110 crores to Rs. 10,800 crores which meant a rise in per capita income of 11 per cent from Rs. 253 to Rs. 281. During the next five years it is anticipated that the national income will rise from Rs. 10,800 crores to Rs. 13,480 crores, while per capita income will rise by 18 per cent from Rs. 281 to Rs. 330. All these figures are expressed in 1952-53 prices.

To achieve these targets, the Plan proposes a total developmental outlay in the public sector of Rs. 4,800 crores and an estimated investment of Rs. 2,400 crores in the private sector. Though the investment in the Second Plan will be more than double that in the First Plan, the rate of growth of national income will not be doubled during this period. This is partly explained by the shift in the pattern of investment which is considered to be necessary in order to lay the foundations of industrialisation in the country. The shift in emphasis can be seen in the Table on the next page in terms of the proportions which are proposed to be spent on different items in the Second Plan as compared to the First.

The most striking change is the increase in the share of industry and mining from 7.6 per cent of the total public sector outlay in the First Plan to 18.5 per cent in the Second Plan. The other sector which shows an increase is transport and communications, whose share is increased from 23.6 per cent to 28.9 per cent. Since in each case these are proportions of a much larger amount in the Second Plan, it is clear that there is a very substantial increase in the amounts to be invested in these sectors during the Second Plan. The high investment in transport and communications must in fact be considered as a concomitant of the substantial step up of the investment in the industrial sector and more particularly of the shift in the pattern of industrial investment. The transport component of heavy industries is very substantial indeed.

Corresponding to these increases in these two sectors, the other sectors show reductions. It should be clearly noted, however, that the absolute amounts to be spent in each sector are still higher than before. Agriculture and community development shows a fall from 15.1 per cent to 11.8 per cent, while irrigation and power shows a fall from 28.1 per cent to 19 per cent and social services from 22.6 to 19.7 per cent between the two plans.

The emphasis laid on industry and mining in the Second Plan is brought out still more clearly perhaps by a comparison of the absolute amounts, which show an increase from Rs. 179 to Rs. 890 crores. Apart from this, considerable investment is to take place in this sector on the part of private enterprise, the amount being Rs 575 crores not including some private investment in cottage and small-scale industries.

Of the total expenditure of Rs. 4,800 crores roughly Rs. 3,800 crores represents investment while Rs. 1000 crores is current developmental expenditure. It is this figure of Rs 3,800 crores of investment in the public sector that should in reality be compared with the private sector investment of Rs. 2,400 crores envisaged for the Second Plan. The investment in the private sector is thus to be stepped up from an estimated 1,600 crores to 2,400 crores. The total investment, public and private is to be raised from 3,100 crores in the First Plan to 6,200 crores in the Second.

The scheme of financing envisaged for the public sector outlay of Rs 4,800 crores shows that external aid, deficit financing and the gap to be covered by additional measures to raise domestic resources cover exactly half the total planned outlay. In other words, the budgetary resources that can be raised through taxation, borrowing and other receipts amount to Rs. 2,400 crores.

Rs. 350 crores has been estimated as the surplus from current revenues at 1955-56 rates of taxation. In making this estimate which covers both central and State governments, "provision has been made for only minimum increases in expenditure under non-developmental heads such as defence and administration." The maintenance expenditure on social services and similar developmental items at the level reached by the end of 1955-56 has also been allowed for since expenditure of this type has not been included in the Plan. The Commission stresses that should non-developmental expenditure go up, or should there be any significant loss of revenue on account of the adoption of social measures such as prohibition, there will have to be a corresponding effort simultaneously to raise further resources if this amount is to be obtained.

Additional taxation is expected to provide Rs 450 crores. In arriving at this figure "the recommendations of the Taxation Enquiry Commission have been taken into account." Borrowing from the public is expected to yield Rs. 700 crores as compared with the net absorption of securities by the market (including commercial banks) during the First Plan of Rs. 250 crores. Since Rs. 430

crores of loans mature during the period, gross borrowings over the period will have to be of the order of Rs. 1130 crores. The demand for funds by the private sector has also to be kept in mind in this connection and this is bound to be brisk in view of the private sector's investment programme in the Plan.

The Railway contribution is expected to be Rs 150 crores as compared to Rs 115 crores during the First Plan, while Rs 250 is expected to be obtained from Provident Funds and other deposit heads. The foreign aid of Rs 800 crores estimated under the Plan should be compared to Rs 200 utilised during the First Plan.

This picture is not very bright. That is why the Planning Commission admits that "the Second Five Year Plan will strain the financial resources of the country."

Looked at from another viewpoint also, the picture is equally depressing. Whereas the current developmental outlay in the public sector is Rs 1000 crores, the surplus from current revenues, plus the railway contribution together amount to only Rs 950 crores. "There is thus no public saving available," says the Planning Commission "for financing the investment outlay of Rs. 3800 crores; there is in fact a dissaving of Rs. 50 crores. The entire capital formation of Rs. 3800 crores—and a little more—will have to be financed by a draft on private savings." Allowing for the external aid and the drawing down of sterling balances by Rs. 200 crores, "the amount of current private savings within the economy to be channelled into public investment would work out at Rs. 2850 crores. Even if the gap is covered by public savings, the transfer of private savings to the public sector will have to be of the order of Rs 2450 crores.

The foreign exchange position is also likely to prove difficult during the Plan. The Commission makes a number of assumptions:

(a) That the terms of trade in the next five years will remain on an average, the same as they have been in 1955-56 (first nine months) and

(b) that inflationary pressures will be held firmly under control.

On these assumptions, exports are expected to rise from Rs 573 crores annually in 1956-57 to Rs 615 crores in 1960-61, while imports will rise substantially over the first four years, resulting in a negative trade sterling balances by Rs. 200 crores balance of about Rs 1375 crores over will cover a part of the gap. The the Plan period—or Rs 295 crores a balance of Rs. 900 crores remains to year on average. After allowing for be covered. If the Rs 800 crores of the surplus on invisibles, the deficit foreign aid to the public sector and on current account works out to a Rs 100 crores of private foreign total of Rs. 1,120 crores—or Rs. 224 capital envisaged in the Plan mate- crores a year. Drawing down of rialise, this gap will be covered.

Labour Policy and Programme in the Plan

(From our Labour Corresspondent)

Labour has still not received the attention that it deserves. The chapter on labour contains mostly academic discussion and gratuitous advice to employers and workers with very few proposals for state action.

A socialist society is built up not solely on monetary incentives, but on ideas of service to society and the willingness on the part of society to recognise such service. This clearly absolves the state from monetary liabilities, except when the state itself is an employer. In an industrial democracy, matters are to be settled by the employers and the employees and the state remains the third party.

It is this benevelent and paternal state approach which pervades the Second Plan in the various suggestions made in the chapter on labour.

THE chapter on labour policy and programmes in the Second Plan reviews the progress achieved in the First Plan period, draws attention to existing problems in labour affairs and suggests measures to mitigate existing evils. While most of labour's rights have long been neglected, the First Plan had attempted to recognise them by giving certain assurances. Labour's response, it is stated, has been satisfactory on the whole. The success of the First Plan in the labour field is marked by such factors as improvement in industrial relations, working of the joint consultative machinery at various levels, increase in real earnings, extension of social security measures, planning of the Central Labour Institute, productivity studies, addition in housing etc. It is doubtful whether all these activities should really be attributed to the First Plan since most of them could have taken place even under normal circumstances. The review also admits that much remains to be done, especially in matters like covering the distance between the existing wage and a fair wage for labour.

On this inadequate basis, the labour policy of the Second Plan has been framed, though it has to be trimmed to fit in with the socialist pattern of society. A socialist society is built up not solely on monetary incentives, but on ideas of service to society and the willingness on the part of the society to recognise such service. This clearly absolves the state from monetary liabilities, except when the state itself is an employer. In an industrial democracy, matters are to be settled by the employers and the employees and the state remains the third party mainly to give advice, sometimes to provide the background atmosphere by enacting and enforcing legislation, and rarely to incur expenditure by setting up some machinery for some such purpose as settlement of disputes, employment service or welfare work. It is this benevolent and paternal state approach which pervades the Second Plan in the various suggestions made in the chapter on labour.

Trade Unions

Dealing with the trade unions, the Plan brings out the existing defects in our trade unionism, such as multiplicity of trade unions, political rivalries, lack of resources and disunity in the ranks of workers. The measures suggested to strengthen the trade union movement are reduction in the number of outsiders, recognition of representative unions under certain conditions and improvements in trade union finances.

The state approach to industrial relations can be clearly seen in the statement that industrial peace can best be achieved by the parties themselves and that labour legislation and enforcement machinery set up for its implementation can only provide a suitable framework in which employers and workers can function. The Plan cites some of the recent agreements between employers and employees in Ahmedabad, Bombay and Jamshedpur, on issues like bonus and workers' participation in management. These agreements, particularly the one in Jamshedpur, are no doubt healthy developments in labour matters. They are inadequate, however, to influence the large mass of employers and workers, without the active co-operation of the employers' and employees' organisations.

Measures for Industrial Peace

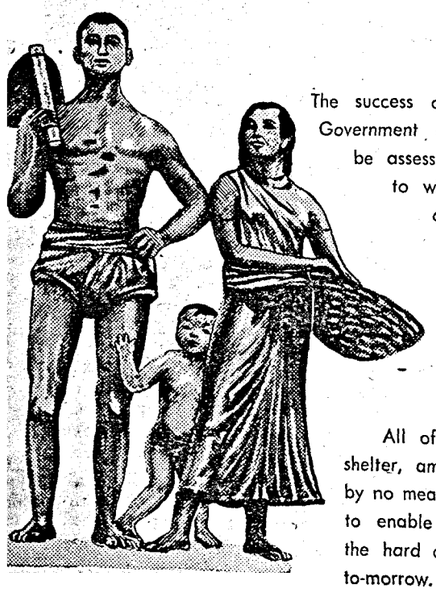
To achieve happy industrial relations, the Plan recommends such measures as undertaking studies in factors which have made for industrial harmony in establishments with a long tradition of peaceful working; avoidance of disputes at all levels, including the last stage of mutual negotiations, namely conciliation; adequate implementation and enforcement of awards and agreements; proper utilisation of joint consultative machinery (bipartite and tripartite); and increased association of labour with management. These are no doubt important methods. The complex problems of industrial relations arise, however, out of innumerable causes, direct and indirect, and hence all methods, which can eliminate or lessen these causes, can be said to be methods of industrial peace. Improvement of working and living conditions of workers, recognition of their status, welfare work, collective bargaining, legal enactment, profit sharing, and such other factors can also be described as methods of achieving industrial peace. Though the matter is mainly between the employer and his employees, the state can play an important role in the prevention and settlement of industrial disputes.

Recent acts of indiscipline and violence have naturally aroused concern and the Plan recommends that in return for recognition of the workers' claims to improve his economic and social status, he should put in hard and efficient work and avoid indiscipline at any cost. Existing provisions for penalising illegal strikes or lockouts have proved inadequate in practice and there have been instances of 'go-slow', 'pen-down' and 'stay-in-strikes'. Making them more stringent may, however, only strengthen the hands of the employers without in any way helping to establish industrial peace. This suggests that methods like enforcement of labour laws are of no use, if the worker is discontented. A contented labour force is a great asset to industrial peace and hence the need to improve the working and living conditions of workers.

The Plan relates wages to productivity. It asserts that improvement in wages, can result mainly from increased productivity. The worker can ask for higher wages,

only if and when he produces more. This is, to put it mildly, unfair. Increased income from higher productivity can be distributed in the form of bonus, profit-sharing and dividends. However, the worker's claim for a fair wage need not depend on the quantity produced, for which many other factors besides labour are responsible. The Plan, however, concentrates on increased productivity and suggests for this purpose such measures as better lay-out of plants, improvement in working conditions, training of workers and introduction of payment by results in areas where at present this principle does not apply.

Two more aspects of wage policy raised by the Plan are: (i)laying down of principles to bring wages into conformity with the expectations of the working class in the future pattern of society; and (ii) the settlement of wage disputes in the interim period. Methods suggested include undertaking of a wage census, appointment of a wage commission, revision of the present series of cost of living indices at different centres, setting up of a tripartite wage board and study of the principles relating to the settlement of bonus and profit-sharing disputes.

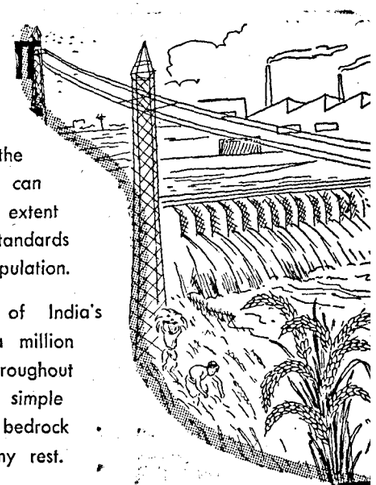


The recommendations of the Plan relating to social security are somewhat vague, in as much as they fail to give a clear picture of the proposed expansion. The possibility of having a unified and comprehensive scheme of social security is alluring, though actual experience of existing schemes in this field of social welfare creates apprehensions regarding their utility. The problem of rationalisation is of topical value and the Plan desires to have a broad policy on this vexed question.

The Plan suggests that certain groups of workers, such as the contract labour, agricultural labour and women workers, need special treatment, because of problems peculiar to them. It may be necessary to have intensive surveys in the problems of these categories of labour before suggestions for improving their conditions are made.

Despite the above, the Plan appears to fall short of the requirements of the country. There is, no doubt, however, that if these proposals are implemented in the proper spirit, much progress can be achieved. Active and willing co-operation of the two parties—the employers and the working classes —is an essential prerequisite for the success of the Plan. The maximum possible effort needs to be made to achieve this co-operation, which in itself should be an important objective.

The state has to bear an additional responsibility in its role as an employer. The public sector is growing and will grow further in future and the acid test for the state is to follow the advice it has so far generously given to employers in the spheres of trade unionism, wage policy, industrial relations, treatment of contract labour and women workers, etc. The Plan recommends that managements of public undertakings should not normally seek exemption from labour laws or ask for other concessions not available to the private sector. The existing practice however is different and Government undertakings try their best to get exemptions from the operation of labour laws, mainly on the ground that they are non-competitive and non-commercial in character. Employers in the public sector should serve as models to those in the private sector, by following diligently the various recommendations made by the state in the labour field.



PLANS and the PEOPLE

The success of the current Five Year Plan of the Government of India and all plans to follow can be assessed, in the final analysis, only by the extent to which they serve to raise the living standards of the bulk of the country's vast population.

Perhaps as much as 75% of India's population live in the half a million or so of villages spread throughout the country, and these simple tillers of the soil form the bedrock on which India's life and economy rest.

All of them must be provided with adequate shelter, ample food, suitable clothes and, last but by no means least, *durable and comfortable footwear* to enable them to advance with confidence over the hard and stony path of exertion to a brighter to-morrow.

Grouse Against the Plan

All Industries North of Vindhya!

(From a Correspondent in the South)

Though CR's call for a merger of the southern States may not have aroused much enthusiasm, his warning against the danger of the South being swamped by the bigger States in the North has not gone unheeded.

The complaint is insistent and universal that the South has had a raw deal, that most of the industries are located north of the Vindhya range and that Delhi's pledge of ensuring parallel progress has not been honoured.

There is little evidence, however, of attempts at remedying the situation by self-help, through closer co-operation among the States in the South, even in the matter of major schemes and projects which are of common concern to all of them.

IN one of his recent public pronouncements, Shri Rajagopalachari had warned against the danger of the smaller linguistic States in the South being swamped, both politically and economically, by the bigger States in the North. This was one of his arguments in support of his case for the creation of a large multi-lingual State in the South.

But even those who oppose the Southern State idea, hold that the South has had a raw deal and will continue to be economically backward compared to the States of the North. Their case is not so much that the allocations for the South in the two Plans have not been proportional to the size or population of the area as that these allocations have not been sufficiently weighted to correct the backwardness of the region. They point out that while the Planning Commission and the National Development Council have always promised to see that there is parallel progress in all regions, with none lagging behind, little has been done to honour these pledges. They notice with dismay that practically every major industrial unit, especially all the foreign aided ones, that have come into being in the last two years, or are proposed to be set up, are to the north of the Vindhya range. What they want is the location of at least some of the new industries in the South.

Andhra, Madras, Mysore and Kerala, the four new political units that will come into being as a result of the reorganisation of States, will together have a population of about 100 million or one fourth of India's total population concentrated in an area (250,000 sq miles) which is about one fifth of India. In an essentially agricultural area, such density of population (which is as much as 1000 per sq mile in some parts) means an adverse man-land ratio. This excessive pressure on land can only be relieved if this surplus man-power is drawn into industries, large and small. But with the exception of Mysore there has been little industrial expansion in the South since 1947.

Lignite Project

True, this has been not due solely to neglect by the Centre. The other contributing factors have been the absence of a private sector capable of entering the industrial field in a big way and lack of coal, access to the coal fields of Bihar being rendered uneconomic by the rail bottleneck at Bezwada and high shipping freights. As a result, most of the major industrial units in the South are in the public sector and are of pre-independence origin; the Hindusthan Ship-yard at Vishakhapatnam and the Iron and Steel works at Bhadravati.

Much hope is now being pinned on the outcome of the pilot project at Neiveli. If the scheme is successful, the lignite mined there could provide the fuel needed by a whole host of industrial plants. But the Neiveli Project which would cost as much as a new steel mill (Rs 70 crores) is still in the exploratory stage. It has yet to be proved that the difficulty presented by the high pressure artesian springs that occur among the deposits can be overcome, and, that, after all these operations, the thermal power derived will be economical compared to coal from Bihar.

Steel Plant and Fertiliser Factory

Success at Neiveli would strengthen the case of the South for the location of one of the steel plants in the South (Salem with traces of iron deposits has been suggested as a possible site, off and on). There are also arguments for the location of a fertiliser factory nearby and the erection of an electrical plant in Avadi. Other industries suggested with less force have been an aluminium plant, a heavy machinery industry and a chemical industry.

As far as the location of an electrical machinery plant is concerned it can be stated that the South has a special claim. While it leads the rest of the country in hydro-electric development, it is at the same time handicapped in its rural electrification schemes by the lack of such accessories as transformers, for instance. The demand for electrical machinery is bound to grow further with the completion of the giant Tungabhadra and Machkund projects. It is a demand which would not remain static after the completion of these projects, as even then the generating capacity would only be 20 per cent of the region's potential.

The case for the location of a fertiliser factory in the South is just as strong because food production in the area, where land holdings are small compared to the North, can only make further advances through intensive cultivation: the use of scientific methods and above all by wider use of chemical manures which for many reasons is not very popular in the region today.

Inter-State Cooperation

Meanwhile inter-State cooperation is necessary in order to develop the full irrigation potential of the region which is estimated at 31 million acres. The inter-State cooperation will be found very fruitful in the matter of the use of waters of the many rivers (the Tungabhadra, the Krishna, the Cauveri and the Periyar) which flow through more than one State. In the absence of such cooperation many areas like the West Coast, which are deficit in food, will continue to remain so, especially as most of the water from the Western Ghats drain into the Arabian sea wastefully. This is equally true of electric power production in the area. Periodical power cuts in one area or the other, consequent on the failure of monsoons, can be obviated by the southern States establishing one big regional grid.

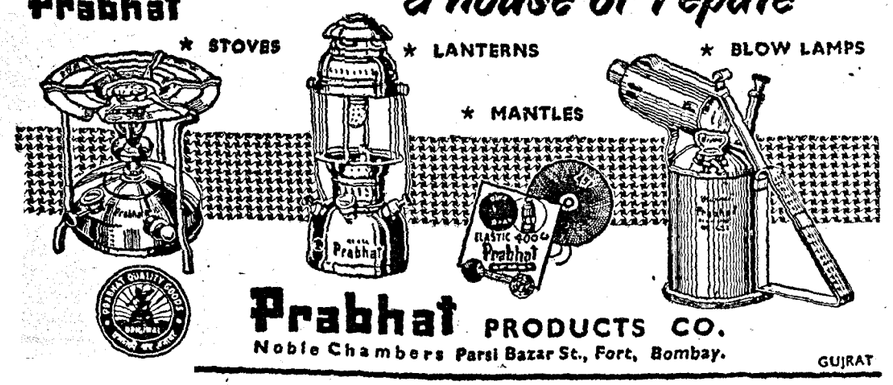
The foregoing has been an attempt not so much to highlight the grouses of the South as to examine what the South itself could do to improve its economy. Central aid to establish a steel plant in Salem or a fertiliser factory in Mysore cannot by itself raise the standard of living or relieve the unemployment situation appreciably. As the Second Plan allocations stand, today, Madras is unhappy because her Rs 400 crore plan has been pruned down to a more realistic Rs. 170 crore plan. Similarly, Mysore which has ambitious projects like the Bhadra and the Honnenerudu projects (the latter is expected, when completed, to be one of the largest single hydro-electric schemes in Asia) is peeved because, of the expected Central aid of Rs. 12 crores, there has been indication so far of only Rs. 3 crores forthcoming.

The decision of the Madras State to spend Rs. 35 crores in the first year of the Second Plan, may suggest that the final size of the State's plan can be of the order of Rs. 245 crores (on the basis of the calculation of the Planning Commission that the total outlay should be seven times the expenditure in the first year of the Plan). But the tameness of the budgets produced by the Finance Ministers of the other Southern States belie such expectations. On record is also the fact, for instance, that the funds realised through additional taxation by these States during the first four years of the First Plan were woefully behind targets: as against an expectation of Rs. 69 crores only Rs. 14 crores was raised.

When this is the record the only salvation for the Southern States would seem to lie in getting more out of the Plan with their limited resources by drastically cutting down all non-developmental expenditure, and avoiding overlapping through participating in the Plan as a region. And if the idea of a multi-lingual State is politically found unpalatable by some, there can at least be inter-State co-operation where major schemes and projects are involved.

Bank of Rajasthan

A SUBSTANTIAL increase of 34.2 per cent in the working funds and a net rise of Rs 64 lakhs in deposits marked the working of the Bank of Rajasthan Limited for the year 1955. The liquid resources of the bank consisting of Cash & Bank Balances, Investments and Bills have been further strengthened from Rs 182.45 lakhs to Rs 248.20 lakhs so that they now form 195.8 per cent of Demand Liabilities and 87.2 per cent of total liabilities as against 168.8 per cent and 86.2 per cent in 1954.



One feature of the bank's working to which the bank has drawn attention in its report suggests an intriguing situation. The average of the bank's advances for the year was only 30.4 per cent of the average deposits "while it should normally be atleast 50 per cent". Two reasons are given for this: (a) The losses suffered by the business community due to the fall in agricultural prices some time after the harvest made them chary of holding stocks and (b) The damage to the cotton and jowar crops, which arrested the growth of advances during the fourth quarter of the year.

Since such factors frequently affect the working of the bank and since it has substantial liquid resources, the report says 'your Directors are, therefore, thinking at an opportune time to open branches of the bank at big commercial centres of the country where surplus funds may be advantageously utilised, throughout the year". While this may no doubt be desirable from the immediate point of view of the bank, it would bring about a drain of funds from Rajasthan to the big commercial centres which is exactly what the Rural Credit Survey Committee had suggested should be avoided. Everything should be done to stimulate the utilisation of funds within the region.

In any case, the low level of advances which form the remunerative class of business was one of the factors responsible for the fall in the net profit of the bank by Rs 13,420. The other factor was the increasing costs arising out of the increase in the average interest paid on deposits from 1.68 per cent to 1.73 per cent and the increase in salary of the staff on account of the Award by 5.02 per cent as compared with the previous year. A provision of nearly Rs 25 thousand has been made for the Reserve Fund to raise it to Rs 3.5 lakhs. Dividend has been maintained at 3½ per cent per annum free of income tax.

Development of Design and Technique

In Handicrafts

Prabha Shah

Here is all the mystique of handicrafts as also a lot of hard commonsense based on years of experience in organising the Potters Industrial Co-operative at Dharavi, Bombay, which much to the annoyance of the organisers has now become a showpiece for the nation.

An account of the Prajapati Sahakari Utpadak Mandal, the Potters Industrial Co-operative, appeared in an earlier issue of this paper (see Progress of Pottery as a Handicraft, issue of March 10, 1956)

HANDICRAFTS have come to exercise an appeal of a sort, which may be termed 'fascination' over the leaders of fashion in particular and the upper strata as a point of reaction to the monotony of utilitarian machine made goods. The folk element in traditional handicrafts with its many local variations and rough, picturesque undertones, makes them look 'cute', 'interesting', 'unusual' and at times even 'exquisite' in the eyes of the cosmopolitan gentlefolk and art-lovers residing in cities and larger towns, who form the new democratic elite. Apart from this elite, even the common folk find interest in handicrafts because they vaguely sense an element of 'Indian'-ness in them, which accords well with the new 'Indian'-ness which they themselves have acquired as citizens of Independent India. This Indian quality, this indigenous character, is not a new aspect of handicrafts; but in the wake of Independence, it has found greater recognition. So, handicrafts have become a part of the new order of things. The great curiousity and interest shown by foreigners in the new Indian nation, and in things Indian has also helped.

Thus, apart from the general appeal of Swadeshi movement, which principally aims at self-sufficiency and larger employment, as pursued by the Khadi and Village Industries Board, handicrafts have stood out on their own and have an independent appeal. In the excitement caused by appreciation of Indian handicrafts at home and abroad (the latter is a subject of great fascination to many lovers of handicrafts who see in it a dollar-mine for this poor but ambitious nation), some individuals and bodies have been impelled to scour the country for specimens of handicrafts as also paper or block designs lying idle in craftsmen's homes. These processes, methods, designs etc. employed by old and present day craftsmen are being studied. Attempts are being made to revive old production units or set up new ones at various centres. These explorations have borne quite good and fruitful results and have helped to bring about a clearer understanding of the problems and the province of handicrafts. The State has also been inspired by all this excitement to shoulder responsibility for supporting this quite noble field of endeavour in addition to a general patronage of handicrafts. In the last few years there has been set up an All India Handicrafts' Board, functioning first under the Ministry of Commerce & Industries and now under the Ministry of Production of the Union Government, which is an advisory body made up of non-officials and officials, presided over by Smt. Kamaladevi Chattopadhyaya, to assist the Centre to formulate and execute schemes for aiding and reviving handicrafts in different centres.

Design Centres for Handicrafts

All this interest, exploration, study and effort have resulted in many activities in the nature of exhibitions, expositions, emporiums, export drives etc. to popularise handicrafts and market their products at home and abroad. But as these activities have widened, the need has been felt for more serious effort to place some of the basic Indian handicrafts on a sound footing, so that regular production of selected articles may take place in organised production units for steady supply to well-defined markets. A necessary preliminary to it is the development of design and technique in accordance with modern needs and technical knowledge. For this purpose, it is proposed to set up central and regional Design Centres.

The idea of these Design Centres, as far as I understand, appears to be as follows: It is proposed that a Design Centre will undertake, with the assistance of several artists and artisans (master-craftsmen), employed fulltime, to plan and execute designs and prepare sample-articles for a number of important crafts. These designs, with all necessary specifications, will then be passed on to practising artisans to enable them to undertake production of these selected products for the market. The team in charge of the Design Centre is supposed to appraise itself of uses and tastes favoured by a modern society, chiefly of city dwellers, and to direct the centre to do research in old and new designs and techniques in order to prepare good samples of well-designed articles in the workship, by a certain amount of experimentation where necessary. These samples, as mentioned above, are to be circulated among different production units in the country (some of which may be functioning while new ones may have to be started with the assistance of various State Governments). Both the All India Handicrafts' Board and the newly formed All India Handloom Board have plans, I believe, to set up such Design Centres in the near future.

Planned Production

The chief business (at least at the present stage) of the Design Centres will be to guide individual artisans or groups of them in undertaking the production of well-designed and well-specified articles for the modern market. The Design Centre will do the spade work by way of research and experiment in the preparation of designs and samples and the work of the practising craftsmen in the country at present will be cut out to executing such designs in planned production. They will be spared the initial hard toil of working out new designs or reorienting old ones and all the teamwork for study, research etc. which it involves. There is also the question of adequate building and equipment necessary for carrying out such work which requires considerable finance which the State can easily put in, but not the artisans, even in groups. It is not clear at present whether it will be the business of the Design Centres to design tools, implements and other equipment also for different crafts. Evidently they will have to furnish artisan-units with written instructions on any new methods or processes (worked out by the Design Centre) which may be involved in the production of the samples issued out by them.

The U P Industries' Department have had some designing of this kind carried out for them by the Lucknow School of Arts. They have after that circulated actual sample pieces amongst artisan-centres from whom they got production according to the sample and given specifications. Now this seems a way, and probably quite a good way, to improve and reorientate designs and the necessary technique in the field of handicrafts towards certain given ends. If efficiently conducted, such Design Centres may very well fulfil the need of supplying well-conceived 'beauty in utility' designs to artisan-groups to undertake profitable and even creditable production of handicrafts for a modern market. Even modern big industry is availing itself of Design Sections in its factories for some such purpose for its own large-scale production.

Design and Craft are One

It is true that at present the artisans and craftsmen are not in any way organised and have generally speaking no idea of what they have to do if their crafts are to survive. The Sreni or guild system of old with its tradition of apprenticeship is gone. There is neither organisation nor living tradition to harmonise and control the activities of artisans and guide them towards a creative end, though through long traditional usage some isolated groups are still carrying out beautiful work and talent is not entirely lacking even in the ordinary artisan groups who survive by catering to a demand which has not been quite supplanted by modern equivalents. But shorn of tradition, the work of artisans everywhere has tended to be a very tawdry and a slavish imitation of modern tinfoil things at their worst. Under these circumstances, it appears obvious that without new initiative injected from the outside, they cannot undertake the task of reorienting their designs to suit the requirements of the times in which they are living. Ignorant and unorganised as they are, they cannot be expected either to take the initiative or secure the resources on their own to meet this challenge. Also it appears quite reasonable that the State is the proper agency to undertake an effort of such large scope, demanding considerable expenditure.

Granted all these, yet the approach presented by the Design Centres, as they are currently conceived, is a fragmentary way of tackling handicrafts, whose nature is basic and complex and demands consonance with its creative spirit. A mass-scale industry is chiefly involved in manipulation for efficiency and therefore it can afford to fragment its processes into separate departments. But by their very nature, handicrafts are concurrent expressions of the potentiality of Man and Material and therefore in handicrafts, these processes must be related at the basic level. Development of design and technique cannot be attempted in isolation, even from the most aesthetic ends in view and in the best conceived plan of study and research.

Handicrafts by their very name emphasise the hands and their creative role. The development of design or technique cannot be attempted separately from the development of the artisan's mind and its capacity

BALWANT SINGH,
Managing Director.

to understand the comprehensive task to which it sets itself. Though the artisan's understanding appears to be intuitive and impulsive when actively functioning yet it represents a stage of comprehension for him of his own personality and the 'personality' of the material which he handles and of the interdependence of the two. The artisan does not manipulate the material to a given end in the most efficient manner possible but he works to express, in however humble a manner, the potentialities of the material which he handles as the medium and through which he seeks an expression of himself. This dual bi-polar inter action of Man and Material is the very basis of the handicrafts. It therefore results in the simultaneous growth of design and technique as the related dimensions of creative expression and effective manipulation.

Tool—An Extension of the Hand

The tool for the craftsman is an extension of his own hand, his own active and responsive personality. It is unlike the machine which is an instrument of a set purpose, or concept of the mind, temporarily formulated for execution. In the same way design for the craftsman is an expression of his own desire and understanding in relation to the material he handles and at the same time a response to the desire and understanding of his fellow men, which he senses through his own. In that way, a handicraft becomes the effective expression of a community's experience and needs. The initiative must always remain, therefore, with the practising craftsman in dealing with design and technique in his craft. If he is not ready to exercise this initiative, he must be assisted and propelled towards exercising it. This, therefore, should be the task a Design Centre should set to itself, in order to release the artisan and craftsman communities from the bemused state of arrested growth in which they find themselves today.

The craftsman must necessarily possess a mobile personality within the limitations of his own individual faculties and the stage of development of the craft to which the community has reached; his is an organic development and so is that of his craftsmanship. If he has become immobilised, he must be helped once again to regain his mobility. This can be done by those who are more alive than he is to his craft, by those who may have better aesthetic appreciation of crafts. Artists, therefore, can help him as any other person with creative understanding and wide experience. But in essence it is he who is to be set back in the stream so that time and its spirit are assimilated by the artisan as a responsive and creative agent and craft once again becomes a living thing. If this is not done, an understanding of modern needs and modern techniques, as they are termed, will only be arbitrary, external criteria that would result in creating styles and fashions, which are brittle and will be set aside for the latest fancy or fad. That is how fashions change and decay in a most discontinuous manner. But crafts need a continuity of inspiration and expression even though very radical changes do occur in the patterns of expression, from the great conflicts of spirit and time in history.

Nothing Mystic in it

The last two paragraphs may appear to be an inebriate poetic digression, unsuited to the practical nature of the problem in hand. But it is not so. Experience shows that every basic problem has to be tackled on its own grounds, even in order to achieve the most practical and concrete results. The fact is that people here and elsewhere are turning to handicrafts because they appear as organic and intimate expressions of man's needs; because they are fresh and unregimented; because they bespeak the work of Man, the producer, confidently making things for Man, the consumer, who are both kinsmen and should know each other.

When the purely external fascination of handicrafts as cute, avantgarde things subsides as it must some day, then handicrafts can stand their ground only by fulfilling their own natural function. If they do not prepare to do so, they must give way to factory-made things, which are at least what they profess to be.

Design has three elements: form, texture and ornament which are closely related to one another and to the Material in hand. Technique, which is the effective manipulation of productive mechanism to carry out design on the material, consists of the tools, processes and the understanding of technical sequence i.e. maturity effected by proper observation of time-intervals in the manipulation of tools and processes. These two must therefore always be developed in such a way that the artisan who applies them remains mobile in his understanding and his creativity.

It follows, therefore, that the Design Centre has to be a Craft Centre. Where craftsmen and artists, who want to become craft-artists, will work together in the midst of an active craftsman community, whose productive activities must always remain compulsively in view while the team in the Craft Centre develops design. Of course designs have to be developed in close conjunction with techniques, assimilating all the characteristic achievements in the craft in hand as practised in the region of its origin and responding at the same time to the stimulus of new achievements effected in a larger or even an alien region.

Even though such a fundamental view of development seems to entail a tremendous expenditure of time, in practice it has been found that a workable basis is attained in a pretty short time and at considerably less expense than would be involved in conducting a Design Centre merely to supply good designs to artisans. Because the research and experiments are carried out from a working craftsman's angle, the problems at once resolve themselves into manageable proportions and appear in their proper perspective. At the same time, the effects which are to be achieved present a clear and concrete pattern of development, one leading out of another.

There is also another aspect to development of the elements of craftsmanship in this manner. When anything definite is achieved, it is easily intelligible to any interested member of the craftsmen's colony and acts as a natural stimulus to him. Also the practical transformation of effective research into actual production takes place very naturally and easily when practising craftsmen are around to carry it out. Sampling of markets is also easily done when those who maintain themselves by their craft are there to carry freshly designed and finished things to consumers who are daily approached anyway.

An experiment on these lines has been carried out successfully by the All-India Handicrafts' Board, who have set up a Craft Centre in the potters' colony at Dharavi, Bombay. The Potters' Industrial Co-operative at Dharavi work this centre themselves on behalf of the Board and with financial assistance from the Board. In two years, remarkable results have been achieved in all the branches of the development of the craft.

Men for the Second Plan

A C Chhatrapati

"Is it possible to prepare a Plan which would enable unemployment being liquidated in 10 years and which would also provide for a satisfactory increase in national income at the same time"?

This was the problem set for the Draft Plan Frame. But in the Second Five Year Plan, the target of 10 to 12 million jobs has been whittled down to a mere 8 million. If it is difficult to provide jobs for men who have none, it is even more difficult to get the right men for the jobs that are there.

AT a time when Government powers to regulate the economic life of the country are being increased enormously, the need for initiative, quick decisions and effective leadership by public administrators becomes imperative. It is doubtful whether a majority of civil servants accustomed to work according to the rigid rules and red tapism of Government office manuals can shake off their habits and make decisions to meet rapidly changing economic situations. The Organisation and Methods section can recommend measures for rapid disposal of files but it can do little to force the bureaucrats to show initiative and take decisions. On the contrary such mechanical controls on administrative efficiency encourage the technique of passing the buck on a large scale.

Since expenditure on training is considered a waste, private enterprise has with few exceptions, shown little interest in apprentice training programmes. Government should take the initiative and arrange such training schemes at private workshops with centralised theoretical training. The adaptation of secondary schools as sources of skilled labour also deserves active attention.

Formidable Task

The problem of administration, that is, provision of leadership, guidance and control, is formidable not only in terms of magnitude but also because the overwhelming proportion of the 8 million men whom the Plan seeks to employ will be educationally and culturally ill-equipped for the tasks to be assigned to them. The Administration which could not plan, organise and assemble resources to spend Rs 2400 crores in the First Plan will be required to gear up and spend Rs 4800 crores in the next five years. At the same time the emphasis on such varied tasks as basic industries and rejuvenation of cottage industries makes the administrative problem more complex and varied than in the past.

According to the Planning Commission the administrative tasks of the Plan involve (1) ensuring efficiency and integrity in administration, (2) building up administrative and technical cadres, (3) getting work done economically and efficiently, (4) training on large scale for meeting the requirements of industry, health, education etc. programmes and (5) organising rural economy—agriculture, co-operatives, cottage industries—on a more efficient basis. The Commission has described in the Plan the action taken by Government to end corruption, to improve administrative efficiency through the Organisation and Methods Division, to build up the strength of the IAS through special recruitment and to institute an industrial cadre. It has also described the proposals for training engineers and skilled labour and has emphasised the need for securing public co-operation in the successful implementation of the Plan.

The Commission has taken a narrow view of the administrative problem by confining attention only to the public sctor. Besides, its discussion of the measures for meeting these tasks is vague and superficial dealing only with the decisions of Government on various aspects of public administration. There is no reference to the problem of management in the private sector at all although the Plan seeks to achieve an integrated economic and social development of the whole country. This omission is particularly surprising in view of the critical references to poor management of private enterprises in the recent Parliamentary debates on the Companies and Insurance Nationalisation Acts.

The execution of the Second Plan will require men suitable for four principal categories of tasks: (1) managerial, (2) technical and supervisory, (3) skilled labour and (4) unskilled labour. To train and adopt the 8 million men for these purposes is a formidable task. Unskilled labour may not require training, but it will certainly require cultural adjustment to submit to rigorous disciplined work in factories and other organized activities like construction. The high rates of absenteeism in organised industries which both India and the Soviet Union experienced in the Thirties indicate that unemployment and poverty do not automatically ensure this adjustment.

Low standard of education and lack of training facilities will make the supply of administrative and technical personnel a more difficult task. Compulsory universal primary education and expansion of secondary education with multipurpose schools and other modifications to meet the future needs of the country must remain distant goals as resources are limited. The large body of educated unemployed does not make the problem of training managerial, supervisory and skilled personnel much easier as concepts of social status make for a preference for white collar jobs. The tragedy of it is that many of them are, by education or by aptitudes, entirely unsuitable for managerial and other administrative functions.

The Failure of Education

Education is for imparting information and developing creative ability, for training in problem-solution or application of principles to concrete situations and for transmitting culture or attitudes for responsible citizenship, appreciation of fine arts, etc. It is widely accepted that education in India fails to perform any function other than imparting information. The mode of examinations and the publication of guides on all subjects have made even book learning easy and less brain-taxing for students. Is it any wonder that India has a relatively poor record in inventions, innovations and original works in science and arts or that entrepreneurs and administrators in the public and private sectors prefer to tread the beaten path rather than show initiative, resourcefulness and adventurous spirit?

The present form of education served the purpose of the foreign rulers of India when the primary

requirement was to obtain a large number of clerical and subordinate administrative staff. The few able administrators required at the top levels could be obtained easily by selecting a few highly intelligent young men and training them through experience at various jobs. This method of recruiting public administrators is grossly inadequate when the activities of Government increase at a very rapid rate or when Government undertakes industrial and other economic activities which entail some special knowledge. Attempts are being made at present to mitigate the shortage of public administrators by special recruitment to the Indian Administrative Service and instituting an industrial cadre. These are only short term measures which do not increase the size of the pool of administrators but only rob the private enterprises of their experienced men for the benefit of the public sector.

The Scientific Management movement has proved that managers are made not born. To meet the enormous needs for managers it is not enough to start diploma courses in Business Management at four universities and an Administrative Staff College in Hyderabad. For the development of a scientific approach to management by the existing administrators there should be a regular systematic programme of conferences on the subject in all important towns where there are a sufficient number of public and business administrators. Again occasional visits of a Galbraith or Urwick are not enough, nor a few conferences at the Hyderabad Staff College once in a life time. To meet the long term needs of the country, it is evident that the system of education at the high school and university level will have to change. More attention should be paid to the development of students' creative ability and attitudes than to imparting information.

The Role of Universities

It is a pity that our universities pay so little attention to the performance of their role in the success of the Five Year Plans. At the instance of the All-India Technical Education Council, the universities in Delhi, Bombay, Calcutta and Madras started courses in Business Management. But there are yet no proposals to convert the existing commercial colleges into institutions which can supply the future industrial managers on a large scale. Commercial education in India at present with its emphasis on theory and lack of contact with the practical needs of the industry is insufficient for the purpose.

The universities can also show initiative in meeting the shortage of engineers and other technical personnel, which is likely to be as acute in the next five years as the shortage of steel and cement. To meet this shortage the universities can expedite teaching in the engineering institutions by having 3 terms of 16 weeks a year instead of only 2 terms. This will only reduce vacation periods and help students to finish the course in 2 instead of 3 years. Such techniques of increasing output of engineers were successfully used in the USA during World War II. Other steps such as permitting a sudent who fails in one subject to proceed further and to repeat only the subject in which he failed, may also be tried.

One thing is clear. The programme of rapid industrialisation will succeed only if long term measures are taken to adapt our human resources to the needs of an industrial society.

How Not To Run State Undertakings

R P Iyer

The great debate is now on how to run the public sector of industry and whatever the form selected for it, public undertakings are going to be the dominant form of future economic organisation. But the Planning Commission has not yet made up its mind as to what this form is going to be. "Questions relating to the organisation of public enterprises are under constant review and greater experience is needed before a clear view as to the relative advantages of different forms of organisations emerge".

In this context, the Report of the Committee of Enquiry into the British Electric Supply Industry, which is now a State undertaking, would be both interesting and instructive. The Committee was firm that a nationalised industry can and should be run strictly as a commercial concern.

THE broad outline of the economic system under which the Second and successive Five Year Plans will be implemented has been formally defined by the Government of India in the Industrial Policy Resolution of April 30, 1956 which supersedes the earlier 1948 resolution on the same subject. This postulates an extension of the public sector and gives the warning that industrial undertakings in the private sector will necessarily have to fit into the framework of the social and economic policy of the State.

While there can be no compromise on the fundamentals laid down in the Industrial Policy Resolution, the "great debate" as to how the undertakings already in being, and to be created, in the public sector should be run is a subject which assumes growing interest.

Great Debate

Recently Parliament discussed a private Member's resolution calling for an investigation into the working of the public sector. The resolution fell through because it was felt that a roving commission charged with a general enquiry would serve no useful purpose. Nevertheless, the debate served the useful purpose of drawing attention to the fact that there is such a thing as the "forgotten public" whose interest has not received adequate consideration in the process of hailing and nursing the dominant economic organisation of the future—the public sector. Perhaps under more favourable circumstances in the future, enquiries by expert bodies on the working of specific segments of State and quasi-State industrial undertakings would evoke better response. In this context the very interesting report of the Committee of Enquiry into Electric Supply Industry (of which Sir Edwin Herbert was the Chairman) on the working of the U K Electric Supply Industry published in January, 1956, deserves careful study and its findings on how a nationalised industry should be run merit serious consideration. Although the Herbert Committee's enquiry covered only one industry (electricity generation and supply) the principles adumbrated in the report have much wider significance.

Historical Background

The committee was appointed in July 1954, "to enquire into the organisation and efficiency of the electricity supply industry in England and Wales in the light of its working under the Electricity Act, 1947, and to make recommendations".

Before discussing the basic recommendations of the report, it would be appropriate to make a brief reference to the historical background of Great Britain's socialised electric supply industry. Under the U K Electric Lighting Act of 1882, there came into being what are called "undertakings with authority to supply in a specific area". With progress in electric supply came the Electricity (Supply) Act of 1919 which provided for the setting up of a Supervisory Board known as the Electricity Commissioners, charged with the task of promoting, regulating and supervising the supply of electricity. In order to carry out their responsibilities, the Electricity Commissioners sought voluntary agreements between various undertakings so as to concentrate generation, through pooling and mutual use, in a relatively small number of efficient generating stations. The Commissioners had no powers to compel electricity undertakings and hence the progress of rationalisation was slow. This led to the creation of the Central Electricity Board under the Electricity (Supply) Act of 1926, on which was modelled the provisions regarding Electricity Boards in the Indian Electricity (Supply) Act, 1948.

The next stage was the enactment of the Electricity Act of 1947, nationalising the industry, under which the British Electricity Authority (since designated the U K Central Electricity Authority) superseded the Central Electricity Board on 1st April, 1948, took over the latter's functions as well as those of the Electricity Commissioners, and also absorbed some 560 authorised undertakings. The Central Electricity Authority was super-imposed over a secondary tier of Area Electricity Boards, 12 in number, and it is this two-tiered organisation which the Herbert Committee set out to examine critically.

Basic Recommendations

The Committee took the position that a nationalised industry can and should be run strictly as a commercial concern, as otherwise the industry "could be used as a device for implementing national policies and for transferring income from one section of the community to another without the burden of these policies being properly weighed in Parliament or by the Minister". The Committee was against preferences of any kind, either by areas or class of consumers. It did not favour subsidy in the form of financial reliance on Treasury guarantees. It dubbed historical cost accounting as unrealistic and thought accruals in the field of depreciation based on this cost as illusory. The Committee underlined that a nationalised industry should stand comparison to the best in the private sector, both in service to its customers and the well being of its staff.

A nationalised industry may succeed in passing the usual tests, and yet fail to give its customers as good or as cheap a service as it might under a different set up. This was the hard core of the problem that the Herbert Committee had to answer, and while it was unanimous in its report that the industry was not in any reasonable sense of the term inefficient, the Committee added the qualification that the "efficiency of the industry could be improved" and also that "it is in danger of losing efficiency partly for reasons beyond its control". This attitude is not only in keeping with the British national trait of under-statement;

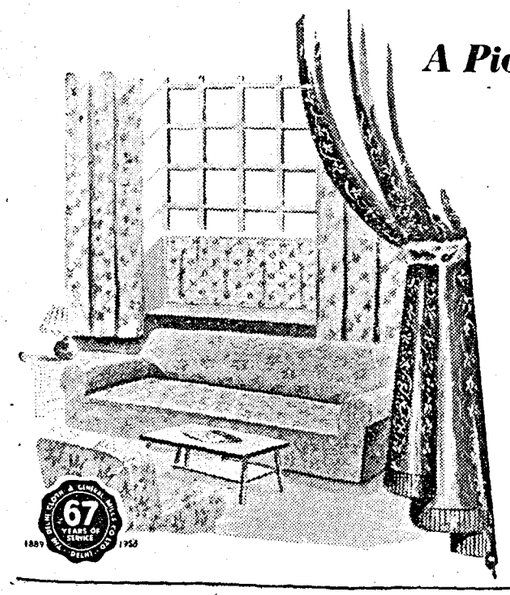
applied to nationalised undertakings, it shows the British way of combining the best features of both the conservative and socialistic elements. In other words, the British may take some of their economic policies from their Labour Party, but they try to make most socialistic experiments work more efficiently by placing them in charge of hardheaded conservative businessmen. There may be some exaggeration in this generalisation, but the inference is difficult to resist that at bottom, this is the principle followed.

Disciplinary Force

Nationalised industries may be getting along without any breakdown of service or may not arouse widespread complaint or criticism. Some of them may be even expanding rapidly. Nevertheless, doubt will remain, in the absence of independent checks at least occasionally, whether they are doing as well as they should. In the case of an industry functioning under competitive conditions, the criterion of success is profits (by whatever name called) which permit continued expansion and attract equity capital. This implies working conditions satisfactory to both management and labour and performance which commands the confidence of the investor. The standards set for State undertakings should be such that they satisfy the criteria that are applied to commercial undertakings.

Even in the field of supplies to rural communities—on which subject sentiment plays a large part with all Governments, leading to jettisoning business standards—the Herbert Committee has come out with the recommendation that normal economic and commercial tests cannot be abandoned. This is certainly an impeccable standard and modification could be justified only where there is a definite national mandate to sustain uneconomic development. In other words, application of any policy which may impair the commercial responsibility of an undertaking should be considered only in rare cases.

Size of Undertakings



The working rule of the Committee that the size of a nationalised industrial undertaking should be no larger than what is necessary to achieve economic viability is of general application. This may sound paradoxical when applied to a nationalised industry. But, nevertheless, this is a necessary concession to reality, if commercial organisations are to function as economic units.

The need for retaining trained personnel already employed, and for attracting suitable personnel in the future, is yet another aspect of the problem which is typical. The need for reviewing conditions which might tend to cause well-qualified persons with the calibre of potential leaders turning away from any particular industry is ever present, from which stem the policy to so frame service conditions as to ensure a continuing flow of suitable men. Allied to this is to limit centralisation to the degree necessary to ensure policy control and to delegate authority to organs at the peripheries, so that they could be induced to shoulder responsibility.

Emphasis on Commercial Aspect

To sum up, in the working of nationalised undertakings, the emphasis should be on commercial aspect and on the running of the undertaking on business lines. The enthusiast for public ownership may demur: "How commercial can you be"? No better answer to this can be given than that given by the Indian Taxation Enquiry Commission which saw "no objection to pricing policies which aim, over a long period, at realising a surplus from the operation of the undertakings". While conceding that "public purpose rather than profit should be the guiding factor in the operation of a public undertaking", the Commission recommended unhesitatingly that "every effort should be made to place Government industrial undertakings on a sound financial basis so that losses are avoided and a reasonable return is secured as far and as soon as possible".

To ignore the implications of these remarks is to invite economic chaos, which will benefit no one in particular.

Consumer Goods and Disposable Income

Do They Balance in the Second Plan?

A Rudra

The principle of commodity balance as applied to consumer goods means that the supply of consumer goods during a plan year must be equal to the demand for such goods arising from the income distribution resulting in that year from planned investment during that and preceding years. Has this principle been observed in the Second Five-Year Plan?

The Draft Outline as well as the final Plan are silent on the question how the targets for the production of consumer goods were arrived at.

The author attempts a statistical estimate of the demand for foodgrains likely to arise in the Plan period, from the data on family budgets in the third round of the National Sample Survey. The results suggest that the target has been fixed rather on the high side and this leads him to the conclusion that disposable income in the last Plan year may be made larger without any fear of foodgrains prices rising in consequence.

THE importance of ensuring commodity balances is beyond question; only recently we experienced the bad effects of falling agricultural prices and then, immediately after, prices have been shooting up, giving rise to widespread fears of inflation. This sort of price fluctuation is nothing but an indication that the problem of the commodity balance for consumer goods has not received due attention. The Second Five-Year Plan, both in the Draft and in the final version, is conspicuously silent as to how the targets were set for the consumer goods. Sometimes one gets the impression that some amount of money was set aside for a sector and specialists were asked to work out how much increase in production could be expected if that much money was spent. There are however references to consumer demand from time to time. Especially, in the case of food grains, it is stated that the rate of food grains consumption is expected to rise to 18.3 ounces per adult and the target of increasing production by 10 mn tons, it is indicated, was based on this calculation. Nothing is said, however, as to how the figure 18.3 oz is arrived at. As a matter of fact, it is indicated that some detailed calculations lie behind at least the food production targets. Thus, it is mentioned that the factors to be considered in this connection are

(1) increase in the total population;

(2) increase in the urban population;

(3) the need to improve per capita consumption;

(4) the need to counter possibilities of inflationary pressures resulting from the implementation of the Second Five-Year Plan; and

(5) effects on food consumption of increase in national income and changes in its distribution.

While we do not see how (4) differs from (5), we have to admit that if e all thes factors were incorporated in the calculation of all the consumer goods production targets, the Plan would indeed be balanced at least in this particular respect. One would only ask that the calculations be repeated for all the intervening years between 1955-56 and 1960-61.

Widely Differing Targets

One feels a bit doubtful however whether these factors were really taken into consideration quantitatively. For one thing, it follows from the very definition of a balanced plan that if one part of the plan is changed, all its other parts are affected. Yet, we find that food grains target has remained unchanged at 10 mn tons increase through all the vicissitudes suffered by the Plan in its eventful journey from the Frame stage to the Final stage; and then, only recently we have witnessed a most interesting triangular controversy between the Agricultural Ministry who wants the Plan target to be 8½ mn tons additional production, the Planning Commission, who wants it to be 10 mn tons and the Chairman and the Vice-Chairman of the Planning Commission, who want it to be 25 mn tons. Surely, no demand calculation could be behind these widely differing targets.

It will be pointed out that consumer demand is not the only thing that is to be taken into account in setting production targets; a part of the volume produced will be kept in stock and a part may be exported; and of course there can always be imports. In other words, the equality to be observed is not

Production = Consumption

but Production = Consumption + addition to (or — reduction from) stock + export (or — import). (1)

Production Potential Determines

If it be so, then it follows that a change in the production target does not necessarily imply a change in consumption target and vice versa. This is quite correct, but it only means that the planners in setting production targets must also keep in view all the three, namely, consumer demand, quantity to be exported or imported and to be stocked. If estimates for all these have been kept in view by the planners for all the chief consumer commodities, it has not been explicitly stated any where. On the other hand, if these calculations have not been made, then, whether the production targets are realised or not, there are bound to be unpredicted price changes and/or fluctuations in stocks, all of which are undesirable and inconsistent with the idea of planning. As a matter of fact, it seems more likely that in setting up the targets, what the planners actually took into account were the possibilities from the production point of view, as appears from the following passage about the food production targets:

> "These estimates are in the nature of first estimates derived from calculations of the production potential expected to be added as a result of various developmental programmes."

Difficulty of Predicting Demand

It must however be admitted that the task of the planners is exceedingly difficult. The statistics of production, consumption and stocks in India are faulty, especially with regard to food items. It is well known that the information available from independent sources about the four variables entering into the equality

(1) differ so much in their coverages, their modes of calculations, accuracy etc that the relation (1) can hardly ever be made to hold. Apart from that, the task of predicting consumer demands is itself a difficult one, especially in a developing economy.

As to this last, econometricians have tried two approaches; the time series approach and the family budget approach. The time series approach is to treat the problem in terms of multiple regression. Thus, the national consumption (say C) of a particular commodity, is supposed to depend on several other macro variables like the national income Y, prices of a few selected commodities p_1, p_2,... p_k etc. The job is to establish an approximate relation between the dependent variable, that is the volume of consumption and the 'independent' variables. Prediction therefore consists in inserting known or targetted values for these independent variables $Y, p_1, p_2 \ldots p_k$ etc and thus obtaining a value for the dependent variable C. Assuming prices to remain constant and ignoring all other factors, the relation boils down to one between the dependent variable C and the national income Y. It is often found empirically that C and Y are related in the following manner:

$$C = aY^b \qquad (2)$$

If this be so, it can be seen that if Y increases to Y/, C increases to C' such that $\frac{C'}{C} = \left(\frac{Y'}{Y}\right)^b$ (3)

If Y is greater than Y/ by α %, it can be seen that C/ is greater than C by roughly αb %. This formula is thus extremely convenient. When this relation holds, b is often called the income elasticity of the commodity.

This approach is not possible in India because of lack of adequate data. If the demand for a certain commodity is to be expressed as a function of the national income, prices of a number of commodities etc, parallel series of values of these variables will have to be there over a long period of time. These are however not available and hence it is impossible to say empirically whether such a relation as (2) holds in India or not.

But whether (2) holds or not, the convenient formula (3) can be made use of under certain assumptions and this result is reached through the family budget approach. This approach is as follows:

Let there be N consumption units in a community. They are broken up into a number of classes according to some variable X attached to each unit. (The unit may be a household or an individual or a number attached to an individual consumer according to some considerations, eg: adults getting 1.0, younger people getting 0.9, 0.8 etc according to age The variable X may be household income, per capita household income, per consumption unit household income etc.) For each class, the amount consumed of a particular commodity per consumer unit during a given period (called the 'basic period') is calculated. Let them be $C_1, C_2 \ldots C_k$. If the number of units in each class be $n_1 n_2 \ldots n_k$, then obviously, the total consumption of the commodity by the community during the base period is

$$\sum_{i=1}^{k} n_i c_i = C \qquad (4)$$

The quantities C_1 C_2 etc plotted against the average X values for the corresponding groups give a curve which may be called the demand curve for the given commodity.

If this demand curve, calculated on the basis of family budget data, for the 'base period' be such that one can assume it to remain unchanged for the period for which prediction is to be made, then prediction becomes possible if one knows the changed frequency distribution of the consumption units according to X during the second period. Thus, if there are now $n'_1, n'_2 \ldots n'k$ consumption units in the same classes as before as a result of population growth and planned income generation, the demand for the given commodity will be

$$\sum_{i=1}^{k} n'_i c_i = C' \qquad (5)$$

This indeed is a simple formula. The difficulty however is that one cannot know the values of $n'_1 n'_2 \ldots n'k$; one has to proceed on the basis of some statistical assumptions. One assumption often made is that the effect of the new income generation and of population growth is such that each class obtains an equal proportionate increase in its average value of X. Apart from being neutral as to changes in the degree of inequality, this assumption has a remarkable statistical advantage; it turns out that if, as is often found empirically to be true, the demand curve is reasonably well fitted by the equation $y = aX^b$ (6) then the difference C'–C equals approximately $C \alpha b$ where α% is the proportionate increase in the average value of X for the whole community.

When X stands for per capita income and the consumption unit is the individual person, we have, as when (2) holds, the simple and convenient formula:

proportionate increase in the per capita demand for the given commodity = proportional increase in the per capita national income x b (7) It is important to remember however that the formula (2) has nothing to do with formula (6). One deals with national income and national demand, the other with the individual person's income and the individual person's demand.

Experience shows that the formula (6) fits data well very often and that even if the mode of generation of new income differs somewhat from that postulated above, the formula (7) may hold true approximately. What is crucial however is the assumption that the demand curve remains unchanged between the two periods. The demand curve changes over time for several reasons; firstly, it is inevitably affected by price changes; then the very change in the frequency distribution from $n_1 n_2 \ldots n_k$ to $n/_1 n'_2 \ldots n'_k$ is likely to change the curve. Thus a consumption unit changing over from a group A to a group B as a result of new income generation may take some time before conforming to the average consumption pattern of he adopted groups. As to the effect of price changes, the family budget approach cannot take account of it. All that can be done is to predict for a period, assuming that the prices in that period will be the same as in the base period. This in itself may be made into a consideration as to the choice of a base period.

As to the other effects, all that can be done is to ensure the choice of the consumption units and the classifying variable X such that the average members of the different groups do not differ between themselves in consumption habits due to any other factor excepting differences in the values of X. Thus, if X be the total household income and the consumption unit the household, the units in the different groups are not comparable, for household size in India is very strongly correlated with household income. If

a household goes up from a lower income group to a higher income group, among the many reasons why it cannot be expected to conform to the average consumption pattern of that group is that it will have a smaller household size than the average household size of the group. Elasticities calculated on the basis of household income and household consumption may as a result be very much exaggerated and yield demand predictions erring seriously on the high side. From experience we find that a reasonable combination is to take as consumption units the individual consumers and as the classifying variable X the per capita income of the households to which they belong. At a time when saving does not behave as a function of income but is itself made into a target it is more appropriate to take as the classifying factor the total monthly or annual expenditure in place of income.

But whatever the choice of the unit of consumption and the classifying variable, the fact remains that the assumption that an individual moving over from one group to another will take over the group averages may go wrong by unpredictable amounts. Prediction in the family budget approach therefore always involves an uncertain margin of error.

Pattern of Family Budgets

In considering the consumer goods targets it is useful to have before our eyes, the relative importance of various components of the average family budget. We find the following picture from the report on the third round of the National Sample Survey:—

	% of total expenditure.
Food articles:	
Food grains	.. 36.8
Other than food grains	.. 26.4
Non-food articles:	
Intoxicants, tobacco, silk, ornaments, etc. non-essential items	.. 4.8
Clothings, bedding, furniture, fuel, light etc.	.. 15.5
Services:	
Education and health	.. 2.6
Housing	.. 1.5
Transport	.. 1.4
Other services	.. 4.1
Amusements, Ceremonials and tax	.. 6.9
Total	.. 100.0

Thus, the most important item of consumption, food, covers more than 60 per cent of the average family budget. This together with the other most important item of consumption, cotton textile, covers about 70 per cent. These two groups of commodities have therefore to be studied very systematically and thoroughly. The services group covers items about which studies, if made, will have to have a very different purpose. For in planning for house construction, education and health services, 'consumer demand' is hardly a useful concept. The investment in these fields will depend on very many factors, but certainly not on what might be the amounts being spent by consumers on them at present. Similar arguments are relevant with respect to the group 'intoxicants, tobacco etc.' After this we are then left with items covering about 8 per cent of the total national consumption. They include several items which are produced by very small industries and either planning for them is difficult (as in the case of furnitures) or information about their demand is meagre, so that it is difficult to make demand calculations for them. In so far as cal-

culations are possible, they should always be done; for no production should take place wastefully. It can however be safely guessed that no such demand calculations are to be found behind commodities belonging to this group for which production targets have been set in the Plan e.g. sewing machines, hurricane lanterns, electric lamps, radio receivers, electric fans, matches etc.

We shall here concentrate only on the two chief items, food and clothings.

Target for Food Grains

The target for food grains is to increase production by 15 per cent over the 1955-56 level. As the national consumption is targetted to rise only by 20 per cent, it implies that elasticity (with respect to total consumption) of food grains consumption has got to be 0.75 if production is assumed to equal consumption both in 1955-56 and 1960-61. For, the population goes up by 6.5 per cent during the five years, so that the increase in the per capita total consumption is 12.8 per cent and increase in the per capita consumption of foodgrains is 8 per cent. This of course means, according to the formula (7), that the elasticity is about 0.75. But this is a fantastically high figure for food grains.

Experience suggest that the elasticty for foodgrains cannot be so high. It cannot exceed 0.3 or 0.4 for the whole of India; it is likely to be very much less for urban consumers. It is obvious that our calculations are not the same as the calculations of the Planning Commission. Perhaps the Commission has chosen a unit of consumption and a classifying variable different from ours. We have already noted that certain choices are likely to give very much exaggerated predictions.

Dangers of Prediction

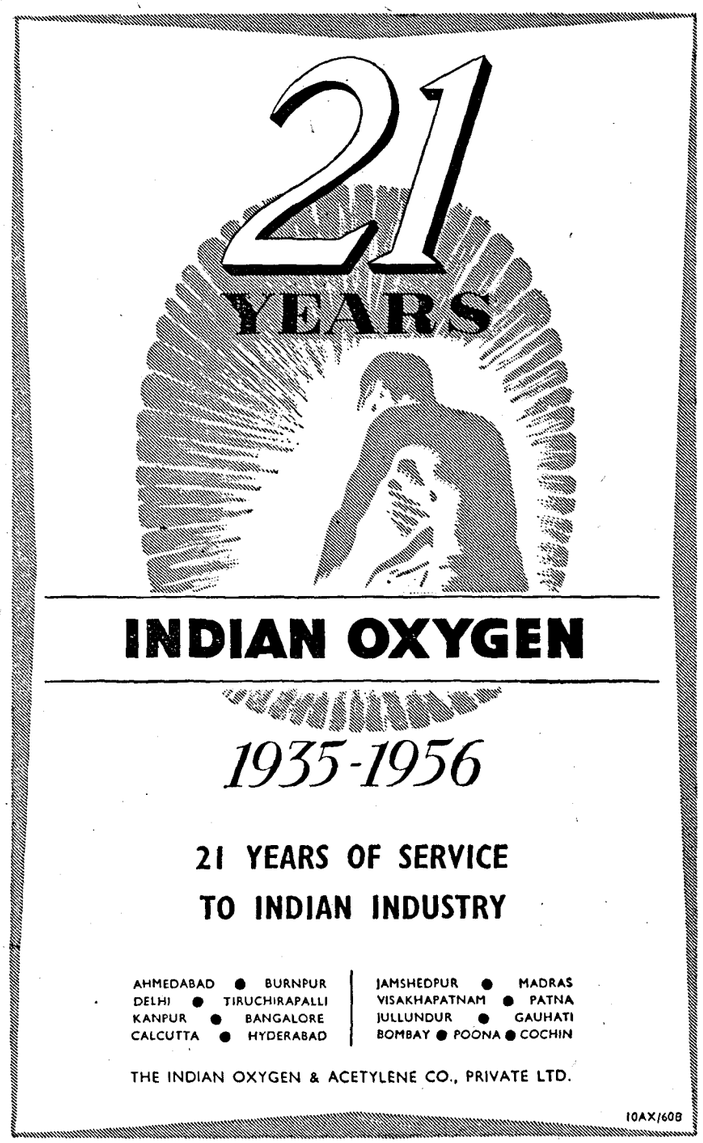
It is our opinion that if indeed disposable income rises only by 20 per cent and the targets are realised, there is going to be over production of food grains. (This is not to say anything about shortages that may occur as a result of the targets not being reached, or artificially created by speculation, smuggling and other antisocial activities, etc.) We do not of course suggest that the production target should be lowered. We have already seen that predictions on the basis of family budget studies contain an uncertain margin of error and it is more so with respect to foodgrains. For example, unemployed workers getting an increase in income do not increase their expenditures on cereals and on cultural pursuits and others in a proportion conforming with the demand curve. Probably they increase their cereals consumption at a very much faster rate. It is always safe, therefore, to give some allowance to the prediction based on family budget studies. Yet the target appears to us to be on the high side; to put it in a more positive way, we suggest that the target of additional disposable income in 1960-61 could be made higher without fear of foodgrains prices rising.

Another disconcerting feature about the Plan is that there is no evidence that the agricultural planners are taking into account demand patterns of consumers in planning for the very long future. Thus, it is known that the demand curve for rice over income reaches an asymptote much earlier than that for wheat. This means that demand for rice will grow at a slower rate than for wheat. If this fact be not kept in mind right from now in crop planning, there is going to be serious imbalance in the grains market in the future: not necessarily a shortage of food grains, but a relative shortage of wheat and a relative superabundance of rice.

Non-Cereal Foods

In considering the other targets for food production also, we discover similar inconsistancies between the implied elasticities and what we think is reasonable. As for instance, it is targetted that the supply of vegetable oils for edible purposes (including Vanaspati) will go up from 1398 thousand tons to 1622 thousand tons, which means a per capita increase in consumption of 9 per cent. This implies an elasticity of about 0.70 which seems to be a bit of an under-estimate.

For sugar however about 40 per cent increase in total consumption or about 30 per cent increase in per capita consumption is targetted. This would mean an elasticity of more than 2.0! This seems to us to be quite off the mark, and there is likely to be overproduction if the target is realised.



It is only for cotton textiles that it is explicitly stated how the target of production for 1960-61 was arrived at. The Kanungo Committee arrived at the target of 8500 million yds production for 1960-61 by assuming an elasticity of 1.25 referring to total national consumption. (This in our opinion is a reasonable estimate of the elasticity referring to per capita income.) It is however not made clear how population growth was taken into account.

Conclusion

A Government planning to undertake deficit financing on a grand scale should have at its disposal very detailed data about consumption habits of different classes of consumers. As the time series approach has to be ruled out in India, the family budget, with all its defects, has to be depended upon. It is necessary that detailed studies are undertaken and not only on all-India basis, but on the basis of much smaller communities of consumers. We think it important that studies be undertaken on the basis first of geographical regions and secondly of economic classes. The consumption habits of the working class in Bombay are likely to differ largely from that of the rent receivers of Bengal. If consumption targets are fixed for such relatively small and homogeneous communities on the basis of their consumption habits of and income flowing to them, and the national target is built up from them, the results are likely to be much more satisfactory.

Price Policy and Marketable Surplus

At least one classification is absolutely indispensable and that is between the agricultural and the non-agricultural population. The rate of development will depend to a very great extent not only on how much the agricultural population produces but more on how much they bring to the market. It is therefore important to know the consumption habits of the agricultural population as distinct from those of the nation as a whole. The agricultural population consumes very much more cereals than urban workers and it may not be all necessary for it from the point of view of nutrition, even after making allowance for the arduous manual labour that agriculturists have to do. This means that, increase in production is not the only way of increasing the supply of grains to the urban market. A suitable price policy can go a long way. But family budget studies, even based on different time periods and therefore different prices, cannot give adequate information on this point.

Agriculture in the Plan

(Contributed)

The year-to-year variations in our agricultural production are so wide, due to climatic conditions and changes in area under each crop, that comparison and conclusions about achievements of targets present serious difficulties.

It is only when the Planning Commission or the Ministry of Food and Agriculture is able to determine, with a reasonable degree of reliability, how much of the annual variation is due to climatic conditions and how much to agricultural improvements, that they will be in a position to set targets realistically.

The measures of land reform in the Plan and the improvements likely to follow from them are equally indeterminate. The Plan, however, appreciates the need for tying up credit with land reforms.

The price policy recommendations are more concerned with checking an inflationary rise than with the possibility of a sharp fall.

THE Government appears to be in doubt regarding the place which agriculture should occupy in the Second Five-Year Plan. The conference of State Ministers of Agriculture to be held in Mussoorie towards the end of this month to fix the targets of agricultural production will probably decide. Agriculture was given the pride of place in the First Five-Year Plan in which about 9.9 per cent of the total outlay was scheduled for Agricultural Programmes, Animal Husbandry, Forests, Fisheries and miscellaneous programmes other than co-operation. The Second Plan allots only 6.1 per cent of the total outlay for these programmes. Percentage outlay on co-operation has, however, been increased from 0.3 per cent in the 1st FYP to 1.0 per cent in the 2nd FYP. On the other hand, in respect of National Extension, Community Development, Village Panchayats and local development, the percentage of outlay allotted has been reduced from 4.9 to 4.7 per cent. Percentage of outlay in respect of irrigation has declined from 16.3 per cent in the 1st FYP to 7.9 per cent in the 2nd FYP.

On the other hand, the agricultural sector has been called upon to yield Rs 76 crores (land revenue Rs 37 crores; agricultural incometax Rs 12 crores; betterment levy Rs 16 crores and irrigation rates Rs 11 crores) out of Rs 225 crores to be raised through additional taxation.

It is noteworthy, however, that in respect of foodgrains, sugarcane and oilseeds, the percentage increase in production envisaged during the Second Plan is actually higher than that in the first. The relevant figures are given in the table.

This is, however, by no means final. The State Ministers of Agriculture would be considering in the forthcoming Conference the possibilities of stepping up the production targets to still higher levels.

Past Performance: Statistical Evidence

Instead of going by press communiques and handouts issued by the Government, it may be useful to examine carefully the performance of the agricultural sector in the recent past as a guide to the future. It is needless to repeat that the statistics are inadequate. But if the State can claim fulfilment of targets on the basis of these inadequate statistics, certainly one is entitled to examine this claim more carefully using the same statistics. The statistics for foodgrains production for the period 1920-21 to 1941-42 show that for the maximum percentage increase in production from one year to the immediate next was as high as 30 per cent ie in 1921-22 when production increased by 30 per cent over that in 1920-21. Similarly, the maximum percentage decline in production was recorded in 1923-24; the production during that year was more than 12 per cent below that of the previous year. Taking the recent statistics which are more reliable, it will be seen that production of foodgrains in 1953-54 increased over that in 1952-53 by 18 per cent, while that in 1950-51 was 7 per cent lower than in 1949-50.

Leaving aside the question of the reliability of these statistics, one salient point which emerges from the above examples is that the variations from year to year are so great, admittedly due to climatic conditions and violent changes in the area under each crop, that comparison of figures and conclusions about achievements of targets are fraught with serious difficulties. To put it bluntly, it is hard to convince oneself about the glorious achievements in the agricultural sector. Even in a country like USA, where agriculture is much less dependent on climate than that in India, year to year variation in gross farm production between 1919 and 1949 ranged from 1 per cent in the Pacific Region to 10 per cent in West South Central Region. An expert's guess is as good as that of a layman with regard to the average year to year variation in the gross farm production in India. Would it be unreasonable to assume that it may be anywhere between 5 to 15 per cent?

Increase in the Two Plans
(per cent)

	In 1955-56 over the base year	In 1960-61 over 1955-56
Foodgrain	14	15
Cotton	45	31
Sugarcane (raw gur)	13	22
Oilseeds	8	27
Jute	64	25

This should not lead one to conclude that there has been very little increase in agricultural production in India during the 1st FYP. On the other hand, there is enough evidence to show that the trend in production is definitely on the upgrade. If this is so, then the next question is what is a reasonable guess about percentage increase in production from year to year?

No Trend Can be Forecast

We do not have comparable statistics for a reasonably long period to enable us to arrive at a fairly rough guess about the trend in production. The data for India, which are comparable, go only as far back as 1949-50. In USA, where more accurate data are available, the variation in production which can be ascribed to trend for a period of 40 years between 1919 and 1949, ranged from 3 per cent in one region to 0.8 per cent in another. This period, it should be noted, was marked by depression and absence of any active state effort to increase production. In fact the state efforts

man and machine...

Today, India's multi-purpose projects have placed her on the threshold of a new era of development, in which man and machine work together in balanced effort for the prosperity of the nation.

Steel plates and pipes.

were directed towards reducing production. It has also to be borne in mind that the average yield per acre was already high in USA, while in India we are only trying to step it up from its present miserably low level.

Let us now examine the available data for India. The increase in production in 1954-55 over that in the base year (which is 1949-50 for foodgrains and 1950-51 for other crops) was 19 per cent in the case of cereals, 32 per cent in the case of pulses, 21 per cent in the case of foodgrains (cereals and pulses), 20 per cent in the case of oilseeds, and 41 per cent in the case of cotton. The percentage decline in the case of sugarcane and jute was 14 per cent and 12 per cent, respectively; production of jute in 1955-56 is, however, much higher than that in 1954-55. This variation in production was observed over a period of 4 to 5 years. How much of this variation do we ascribe to climatic variations and how much to the trend towards increased production? It is only when the Planning Commission or the Ministry of Agriculture can answer this question that they would be in a position to set targets realistically for the Second Plan Period.

Divorce Between Use and Ownership

Doubts also arise while studying the chapter in the Second Five-Year Plan which deals with land reforms. Admittedly, the objectives and the methods of implementation have been more clearly defined in the Second Plan than in the First. The Planning Commission also claims justifiable pride about the progress achieved with regard to the abolition of intermediaries, though, the Plan admits that much remains to be done in some of the States. Conceding that abolition of intermediaries by itself does not prevent divorce between use and ownership of land, the Plan devotes considerable attention to the problems connected with the purchase of rights by tenants as well as with those of illegal eviction of tenants by landlords. Realising that one of the main reasons why tenants are unable to buy out landlords' rights is that they do not have a surplus from which to pay, the Plan recommends that the State Governments should take more energetic steps for bringing tenants in direct relationship with State. The Plan accordingly recommends that the State should accept responsibility for recovery of instalments of compensation payable by the tenant, besides the recovery of land revenue and ensure that the aggregate of the annual payment in the form of land revenue and the instalment of compensation and interest does not exceed the one-fourth or one-fifth of the produce.

The Plan, however, ignores one important point and that is the position of the tenant in the intervening period till final payment by him of the instalments towards the purchase price of land. During this period, the tenant has very little transferable rights in land and is bound to experience difficulties in getting necessary credit, not only for financing normal agricultural operation but also for financing development expenditure. In fact, according to the available reports, the anomalous position of Sirdars in U P—a hybrid product of land reforms by virtue of which the tenant deals directly with the State but still is not a full proprietor as he has not paid the purchase price—with no transferable rights has resulted in shrinkage of credit facilities so far as these tenants are concerned.

Credit with Land Reform

It is, however, gratifying to note that for the first time the Planning Commission has come round to appreciate the need for integrating credit with land reforms policy and has thus devoted a valuable section (Second Five Year Plan, pp 232 to 234) on the possible implications of land reforms on agricultural credit. Obviously, this is a lesson which the Planning Commission learnt from the difficulties experienced by Land Mortgage banks as a result of the recent amendment to the Bombay Agricultural Lands and Tenancy Act, by virtue of which all the tenants acquire special rights with effect from April 1, 1957. Hence the Plan recommends that state governments should be careful not to affect adversely the operations of co-operative institutions while framing land reform legislation. The Plan, however, fails to realise that unless proper credit facilities are provided for the tenant, the land reforms measures may themselves fail to fructify. It does not therefore recognise how imperative it is to give transferable rights to tenants whose status is comparable to that of Sirdars in U P. Though it is difficult to estimate the area which is likely to be cultivated by tenants of this type, it is perhaps not wrong to say that a very substantial portion of the total cultivating area would be cultivated by tenants of this type, even after the completion of land reforms. This is certainly the problem in the case of Sirdars in U P and those tenants in Bombay who would not have paid the final instalment towards the purchase price, in accordance with the recent 'Land to the Tillers' legislation in Bombay. A reader is bound to be disappointed if he is searching for a directive or recommendation from the Planning Commission on this distressing situation arising out of lack of transferable rights for the tenants.

Price Policy and Developments Abroad

Finally, a word about the price policy for the agricultural sector of the Indian economy during the second plan period. If one glances through the Memorandum submitted in 1955 by the Economics Division of the Finance Ministry, Government of India, one would find that the problem of falling agricultural prices was treated as very serious, and as one which needed to be tackled on a comprehensive scale. This Memorandum, it may be noted, was submitted in early 1955. Since then agricultural prices have continued to rise and Government has been forced to take measures for curbing inflationary trends. In fact at present the trend of thought among the officials and non-official circles appears to be more concerned with the problem of preventing inflation during the second plan period in view of the large "uncovered gap", than with the possibility of a sharp fall in agricultural prices. But considering the grave reports about the mounting surpluses in the U S A, and accumulation of stocks with other exporting countries, one is tempted to ask whether the Planning Commission is not being complacent about recent developments in the international agricultural produce markets. Countries like Australia and Canada are deeply concerned about the spectre of possible dumping of stocks with Commodity Credit Corporation by the United States. Are we to assume that the Indian economy is so well insulated against a slump in international commodity markets? No doubt Government is going to float the National Warehousing Corporation and build warehouses; these would be used for price-support-schemes in case the need arises. But a reader might well question whether the problem of a possible fall in prices has been given due thought by the Planning Commission.

Land Reform Proposals in the Second Five Year Plan

M L Dantwala

The experience of the First Five-Year Plan period clearly shows that the progress of land reforms in different parts of India is extremely uneven.

The plain fact is that the disparate progress is mainly the result of the varying strength of landed interests in Congress organisations of the region. The Planning Commission and the Central Committee for Land Reforms know this, but do not possess the frankness to admit it. Instead an attempt is made to hide and even encourage regional recalcitrance to fall in step with national policies under the pretext of "varying local conditions".

If the Government want the people to actively participate and co-operate in the task of national reconstruction, it will have to show greater honesty than is visible in the Planning Commission's chapter on Land Reforms.

FLEXIBILITY and convenience in regard to the immediate programme and an almost doctrinaire adherence to certain Utopian ideals for the ultimate, characterise the Planning Commission's proposals for land reforms as expounded in the Second Five Year Plan. It is considered natural that "while the direction may be clear, the pace and the precise content of land reform programmes have to be related closely to the conditions prevailing in each State". Even in the matter of definition of a technical term like family holding, the Commission has suggested that "the balance of convenience lies in favour of each State specifying according to the conditions of different regions, classes of soil, irrigation, etc., the area of land which may be declared to be a family holding".

It may be remembered that the concept of family holding is crucial to the issue of ceiling on individual holdings. A uniform income criterion suggested by the Committee of the Land Reforms Panel for determining the ceiling is rejected in favour of a more convenient and varying formula. Each State has been given "the discretion to decide whether the ceiling should apply to individual holdings or to holdings of families according to its social conditions and other relevant factors". The experience of the First Five-Year Plan period clearly shows that the progress of land reforms in different parts of India is extremely uneven. For example, under the tenancy legislation enacted during the last five years, reasonable rent varies from 16¼ per cent of the gross produce in Bombay to 60 per cent. for the Tanjore District of Madras. Provisions in regard to security of tenure, resumptions by landlords, right to purchase the leased land, vary from State to State so drastically that it is difficult to conclude that even the broad direction in the matter of land reforms is uniform, unless what is meant by 'clear direction' is no more than that the different States would be enacting some legislation some time which could be characterised as land reform. Does the Planning Commission want us to believe that a legislation which considers one-sixth of the gross produce as reasonable rent and another in which this level is as high as 60 per cent, or the one in which the subtenants have been given occupancy rights and another in which even the principal tenant can be evicted without much difficulty are progressing in the same direction? Can it be said that these divergencies reflect no more than the divergent regional agrarian conditions?

The Planning Commission has not thought it necessary to indicate the exact nature of regional variations which would justify the divergent 'pace and content' of land reforms in different States. The plain fact is that the disparate progress is mainly the result of the varying strength of landed interests in Congress organizations of the region. The Planning Commission and the Central Committee for Land Reforms know this, but do not possess the frankness to admit it. Instead an attempt is made to hide and even encourage regional recalcitrance to fall in step with national policies under the pretext of "varying local conditions". If the Government want the people to actively participate and co-operate in the task of national reconstruction, it will have to show greater honesty than is visible in the Planning Commission's chapter on Land Reforms.

Co-operative Village Management

As against this flexibility and regional convenience, the Planning Commission appear to be fairly convinced as to what should be the ultimate aim of land reforms. This ultimate objective has been expressed as Co-operative Village Management. While explaining the meaning and content of this ideal, it is stated that:

(1) Co-operative Village Management assumes that the ownership of land belongs to peasants.

(2) A distinction should be made between the unit of management and the unit of operation. Thus, even when a larger area or the village as a whole becomes the unit of management, for many years, the common unit of operation may be the peasant holding.

(3) Once the stage of Co-operative Village Management is reached, the distinction between those who have land and those who are landless will lose much of its significance. The resources of the village community derived from agriculture, trade and village industry will be employed in securing maximum increase in production and employment through action in the village as well as through co-operation in activities extending beyond the village. Such a village community will have an integrated social and economic structure and will be linked organically as a production and business unit with the economic life of the tehsil and the district. Thus, a rural economic structure is visualized in which agricultural production, village industries, processing industries, marketing and rural trade, are all

organised as co-operative activities.

It may appear somewhat cruel to dissect this picture of an idyllic community where land will belong not to the individual but to the community and all economic activities in agriculture, trade and industry will be co-operatively conducted. But as so much emphasis has been put on the direction as against pace and precise content, it is necessary to scrutinise this ultimate ideal and the road to it, a little more critically. We are told that during the transition to Co-operative Village Management, land in the village will be managed in three different ways. Firstly, there will be the individual farmers cultivating their own holdings. Secondly, there will be a group of farmers who pool their land voluntarily in their own interest into co-operative working units. Thirdly, there will be some land belonging to the village community as a whole. This will include, among others, lands whose ownership or management is entrusted to the village on the application of the ceiling on agricultural holdings. Thus within the scheme of land management in each village, there will be an individual sector, a voluntary co-operative sector, and a community sector. The aim would be to enlarge the co-operative sector until the management of the entire land in the village becomes the co-operative responsibility of the community. In other words, quantitative changes will become qualitative and the expanding co-operative sector will become a community sector in which, as euphimistically stated, the distinction between those who own land and those who do not will tend to disappear.

Ownership, Management and Operation

Thus there are three distinct aspects of land policy: (1) ownership, this will be of the individual peasant; (2) management, which will be entrusted to the village; (3) operation, which may be either individual or co-operative. As far as the aspect of management is concerned, it is quite clear that the ultimate objective is to vest it in the village community. In the matter of ownership, the exact implications of the ideal are, however, not clear. For, while we are told that Co-operative Village Management assumes that the ownership of land belongs to the peasant, it is also stated that once the stage of Co-operative Village Management is reached, the distinction between those who have land and those who are landless will lose its significance and the management of the entire land in the village will become the co-operative responsibility of the community. Does this mean that the right of management will be so overpowering that it will make the right of ownership nugatory? What will happen to the distinction between the unit of management and the unit of operation when the ultimate ideal is reached, is conveniently left unclarified. Presumably that too will disappear.

For the last few years, one of the principal objectives of our land reforms was to eliminate the dichotomy between ownership, operation and management. For, we believed that both in the interest of productive efficiency and social justice, best results would be achieved when those who manage the land also own it and vice versa. One can understand that under a socialistic pattern of society, the rights of ownership cannot be absolute and must be subject to social control and conform to social policy. But an arrangement under which land belongs to the peasant, but is managed by the village (Panchayat), would be no better than a variant of Soviet collectivisation of agriculture.

Clearer Policy Necessary

From the above it would be evident a clearer statement of policy is necessary unless of course the Planning Commission believes that it is enough for the distant to be enchanting. Firstly, it is necessary to make up our mind as to whether under the ultimate ideal land will belong to the tiller, who will be free to manage and operate it within the frame-work of overall social and economic policy or whether the land will belong to the village or the village community and also managed by it. Phrases like "co-operative management" and "integrated social and economic structure" are no doubt ennobling, but do not carry much meaning unless concretely defined; especially when one's concern is with planning rather than with sermons. Secondly, even if it is necessary to entrust the overall management of agrarian policy to the village community, it is absolutely essential to clearly define the respective rights of the individual and of the community. For, in actual practice rights entrusted to the village community will be exercised by a representative body like the Village Panchayats, subject to all the frailties of an elective institution. The possibility of the distortion of an ideal in the process of institutional implementation must not be a thing unknown to the Planning Commission. Under the Soviet collectives also, land belongs to the community and the M T S provide the needed integration. Is that the ideal we are aiming at?

It may be argued that since authority of management is vested in a democratic and decentralized institution like the village Panchayat, there may not be any conflict between the interest of the individual and that of the village community. Decentralization of authority is undoubtedly a big step in the direction of establishing a democratic society. But it should never be forgotton that in the ultimate analysis, the strength of democracy will lie not so much in institutions however decentralized and benevolent, but in the free individual managing his own affairs in conformity with the values of a democratic socialist society.

Gramdan is Different

Support is sought for the ideal of Co-operative Village Management from the Gramdan Movement. However, in doing so a fundamental distinction between the two is ignored. As the very word indicates, Gramdan rests on an act of voluntary surrender of ownership rights, a process which involves acceptance of an entirely new set of values. The Community Sector of the Planning Commission, on the other hand, will be brought into existence by a process of acquisition, with legal sanctions. Besides, resort will be taken to such administrative aids as preferential treatment in the matter of credit and supplies. This very process will add to the power and authority of State organs, inevitably contracting the orbit of individual freedom. Curtailment of individual freedom is justified only in the interest of a demonstrable social purpose, such as elimination of inefficiency, inequality or exploitation. If an individual is guilty of none of these, any attempt to push him into community ownership and management cannot be interpreted as anything but inspired by doctrinaire attachments.

Perhaps the Planning Commission has sought to compensate for the weakness of the immediate programme by a vision of a highly moral agrarian society. Ironically both contain seeds which may yield a crop of weeds which will be difficult to uproot.

Agricultural Targets in the Second Plan

P Ramanand Rao

Measures adopted during the First Plan are not likely to have contributed an increase of more than 5 per cent in the production of foodgrains. Considering the measures proposed during the Second Plan, therefore, it appears unlikely that the estimated 15.4 per cent increase in output of foodgrains will be achieved. In fact the last two years of the Plan have already shown a declining trend in foodgrain production, while output of major commercial crops has actually fallen below the 1950-51 output.

Thus our agricultural targets are in danger of remaining unrealised in the absence of adequate economic measures and effective changes in the agrarian social structure.

AGRICULTURE was in a pitiable state when the First Five Year Plan was launched. There was an acute shortage of food grains and to meet the chronic food deficit, the major portion of our valuable foreign exchange was regularly being drained out. Naturally, the primary objective of the First Plan was to stabilise agriculture and to achieve self-sufficiency in food. Accordingly, the major part of our First Plan outlay went to agriculture, the targets of additional production set being as shown in Table I below.

According to official statistics, the foodgrains target was over-fulfilled two years ahead of schedule and the oilseeds production exceeded the target by nearly 3 per cent by 1954-55. A detailed analysis of foodgrains production shows that during 1954-55 cereal production was up by 20 per cent and pulses recorded an increase of 31 per cent. In some crops like jowar, maize, etc, the increase was as much as 75 per cent whereas the output of gram increased by nearly 50 per cent. It is not yet clear as to what were the factors that led to such a large rise in production. Official quarters attribute it to developmental measures like the Grow More Food campaign, increased irrigation, supply of fertilisers, manures and improved seeds, land reclamation, National Extension Service and Community Development Projects etc, besides favourable monsoons. The actual achievements of these factors in their respective fields do not appear adequate to account for the increase in food production as claimed.

Irrigation and Agricultural Production

It can be seen from Table II below that the rise in agricultural production and the increase in the area under irrigation have during this period behaved more or less independently. If, for example, we take two pre-Plan years we find that while the net irrigated area during 1947-48 and 1948-49 remained more or less unchanged the production of cereals during the same period fell by 3.5 million tons or 8.7 per cent. On the other hand, output in 1952-53 increased by 6.4 million tons, an increase of 14.9 per cent over the previous year, without any substantial increase in the area under irrigation. No doubt during 1953-54 the net irrigated area rose by 12 per cent and the production also went up by 8.7 million tons or 17.6 per cent over the previous year. But that this was no more than a coincidence would be confirmed by the fact that while in 1954-55, the production fell by 2.6 million tons or 4.7 per cent the net irrigated area actually went up by 4.5 million acres or 7.7 per cent.

Similar absence of correlation or correspondence between the two are also seen in the case of other crops, such as cotton, sugar and jute, pulses etc. The production of jute fell from 4.6 million bales in 1951-52 to 3.1 million bales in 1954-55, a fall of 4.6 per cent as against the Plan target of 5.37 million bales by 1955-56. Similarly, the output of sugarcane in terms of raw sugar fell from 6.0 million tons in 1951-52 to 5.0 million tons in 1954-55 with the Plan target being 6.32 million tons.

It is well known that rainfall has been particularly favourable during the last few years and we can unhesitatingly attribute a part of the large increase in agricultural output to this natural factor. It may not be too far off the mark to attribute up to 10 per cent of the increase in foodgrains to the good monsoons. But the remaining 16 per cent in 1953-54 and 12 per cent in 1954-55 still remains to be accounted for. The increase according to the official version is over 5 per cent per year, which to say the least, appears rather surprising. When

post-war Japan increased her agricultural output at the rate of 2 per cent per year, this was considered very high. This became possible due to special and stringent measures taken by the State. In our case the nature and working of State drives during the First Plan period were not very different from the pre-Plan years. What is more, most of the schemes have hardly crossed the experimental stage. Therefore it may be that what is assumed to be an increase in agricultural production is really something else altogether.

Food Statistics

It is accepted all over that food statistics in India in the past suffered from a considerable degree of underestimation. This was further aggravated by incomplete reporting and coverage which was set right only very recently. Further, estimates of food production in many of the States till recently were based on the old out-dated method, viz the "condition factor". It is only after decontrol that the food estimates all over the country began to be based on the results of crop cutting surveys. This may well explain the surprisingly high rate of increase in the agricultural sector.*

It is a striking feature of the situation that the important commercial crops like jute and sugarcane failed to make any progress. As against the target of increase by 63 per cent for jute and 12 per cent for sugar, the actual output during 1954-55 was lower even than 1950-51 by 4 per cent and 1.2 per cent respectively.

Taking all these factors into consideration it would be nearer the truth to say that besides the increase that took place on account of the two successive good monsoons, measures adopted during the Plan period could be estimated to have contributed an increase of only about 5 per cent in the case of foodgrains output.

However, even with this improvement in production, India is still short of food grains to feed the people at a reasonable standard of balanced nutrition. Table III shows the foodgrain requirements of the country at the end of the Second Five Year Plan.

Table III
Cereals and Pulses Required at the end of the Second Plan

	(million tons)
Cereals at 16 oz. per diem per capita	57.4
Pulses at 3 oz per diem per capita	10.8
Total	78.2

The target of production of foodgrains for 1960-61 is as shown below,

	(million tons)
Increase in Production	10.0
Total Production	75.0
Percentage Increase	15.4

Thus the food targets of the Second Plan present us with a paradoxical situation. As shown above the total requirements of foodgrains (cereals and pulses) by the end of the Second Plan on the basis of 16 oz and 3 oz respectively will be 78.2 million tons as against the envisaged Plan production of 75 million tons. And yet, it appears doubtful whether even the planned target is capable of being fulfilled, in view of the poor results shown by the schemes and programmes during the First Five Year Plan period and equally inadequate measures proposed in the Second.

It may not be out of place to mention here the fact that during the last year of the First Plan period itself, we found a reversal of the trend in agricultural production. After the record production of 68 million tons of food grains in 1953-54, the production declined by 2.3 million tons to 65.8 million tons in 1954-55 and estimated production in 1955-56 shows a further decline of 0.8 million tons. This, further confirms our doubts regarding the effectiveness of the measures adopted in the field of agricultural production.

Contributions of Different Schemes

Table IV gives a breakdown of the contribution expected by the Planning Commission to be made by investment in different developmental schemes to the increase in production. The planners seem to have ignored the experience of the First Plan that it is not the investment allocations but appropriate and effective measures conducive to real development which are likely to yield actual increases in production. The table shows that minor and major irrigation projects and schemes are expected to yield 4.2 million tons. As has already been shown, the actual achievements of irrigation projects and schemes have not been substantial during the First Plan period and there is certainly nothing to warrant any greater level of effectiveness for irrigation during the Second Plan period.

The estimated consumption of fertilisers during 1955-56 was 0.7 million tons and the additional consumption target envisaged during the Second Plan is 1.5 million tons. For the planned target of 2.5 million tons of additional foodgrains from fertilisers we would require 1.25 million tons of fertilisers, leaving a mere 0.25 million tons of fertilisers for the commercial crops. But the planned targets for commercial crops would require, in view of the higher targets planned, much larger quantities of fertiliser. It should be remembered that the commercial crops like tea, coffee, sugarcane etc. require higher per acre dosage of fertilisers than food crops. In any case the residue of 0.25 million tons of fertilisers would be altogether inadequate to meet their requirements. Either the commercial crop producers like tea and coffee plantations will, with their better financial position, secure their requirements of fertilisers while foodgrains production would have to go short, or if the food crops are assured requisite quantities of fertilisers and manures at reasonable prices through rational distribution, the targets of commercial crops would suffer, causing loss of foreign exchange.

Improved Seeds

On what grounds, improved seeds are expected to contribute one million tons of additional foodgrains

Table IV
Anticipated Increases in Production from Investment under Different Heads

	(million tons)
Major irrigation	2.4
Minor irrigation	1.8
Manures and fertilisers	2.5
Improved seeds	1.0
Land Reclamation and land development	0.8
Increased use of improved techniques including application of soil conservation methods and more economic use of water	1.5
TOTAL	10.0

* This is, of course, flatly denied by the Ministry of Food and Agriculture, which asserts that the "statistical increase" resulting from expansion of reporting areas and crop-cutting surveys, largely antedates the First Five Year Plan. —Ed.

it is difficult to see. I am not aware of any new scheme to produce sufficient quantities of improved seeds. It is well known that as it is, improved seeds are in short supply. In the absence of even a target or programme of organised production of improved seeds, in addition to what is being already or is likely to be produced in the existing State agricultural farms, it is unrealistic to expect an increase in foodgrain production of one million tons on account of improved seeds.

Land reclamation and land development measures are expected to realise an additional output of 0.8 million tons of foodgrains. During the First Plan period on an average 6 lakh acres per year are said to have been reclaimed or rendered fit for cultivation by the Central and State tractor organisations, thereby producing 75,000 tons of additional foodgrains. If the rate of reclamation revealed by the First Plan is any index of the capacity of the land reclamation and deep ploughing machinery in hand, one could assert without any fear of contradiction that the target of 0.8 million tons of foodgrain on this account would be very difficult to realise. Only doubling of this capacity could render the target realisable and for this there seems to be no provision in the Plan.

Further, 1.5 million tons of additional foodgrains are expected to result from increased use of improved techniques, including application of soil conservation methods and more economic use of water. It must be noted that the contribution of some of these measures like improved techniques and more economic use of water would probably have been already covered under the figures of improved seeds and additional irrigation facilities. Moreover, programmes like soil conservation methods, improved techniques and economic use of water are measures, that are likely to yield concrete results only after a long period of persistent effort. They are not likely to yield increased output to a substantial extent during the next Plan period. What the Departments of Agriculture in all the States failed to achieve in fifty years, they cannot be expected to accomplish within a bare five year period.

The output targets of commercial crops (Table V) also seem to be rather on the high side. The First Plan targets in some crops were not only unfulfilled, but the output as shown above has actually recorded a decline as compared with 1950-51 output.

One cannot help feeling that the expectations of the Plan from the National Extension Service, the Grow More Food Campaign and similar programmes are unlikely to be realised. The extent of improvement due to these schemes during the First Plan has not yet been properly assessed. In the absence of such an evaluation and in view of the continuing social and economic distress of the rural population, one may be excused the thought that such expectations are bound to end in disappointment. For, it should be noted that the Plan provides for no definite measures for radical reforms which would bring about a real change in the conditions of the tillers. The problem of fair wages for agricultural labour, reorganisation of rural credit etc are very inadequately dealt with. Hopes about co-operative programmes without necessary social and economic measures are also unlikely to be fulfilled.

Price Movements

In a market economy, foodgrains production is governed by the movement of prices. During the First Plan period, declining prices created problems in the mid-Plan years, causing untold loss and misery to millions of peasant families. This may have also been responsible, to a certain extent, for the subsequent fall in agricultural production. The absence of a stable and vigilant price policy assuring the mass of peasantry a stable income and their own requirements of industrial products at reasonable prices is bound to cause agricultural output to fluctuate widely. However, we are now witnessing a rising trend in foodgrain prices. It needs no mention that this rise in prices in no way benefits the mass of the peasants, being in the main the result of speculation by the big grain traders and businessmen. These high prices only result in a state of insecurity and instability in the countryside where the peasant finds prices of manufactured goods rising at the same time (as is already the case) further ruining his economy and in the end adversely affecting agricultural production itself.

Thus our agricultural targets are in danger of remaining unrealised in the absence of adequate economic measures and effective changes in the agrarian social structure. There is no doubt that if such measures and reforms are undertaken and the Plan is supplemented by appropriate schemes and operational measures, not only would the Plan target be realised but even the target of 40 per cent increase considered necessary in order to secure Rs 400 crores worth of exportable agricultural surplus would become a feasable proposition.

TABLE V

Targets for Commercial Crops

	Target of additional production	Estimated production	Percentage increase
Oil seeds (mn tons)	1.5	7.0	27.3
Sugar cane (gur) (mn tons)	1.6	7.4	27.6
Cotton (mn bales)	1.3	5.5	31.0
Jute (mn bales)	1.0	5.0	25.0

Agricultural Output in the First Plan

Wilfred Malenbaum

Areas of great variability in a few concentrated regions, introduce most of the irregularity in the Indian output pattern.

If Bihar and Bombay are excluded, it appears that there has been a reasonably steady upward movement in India during the past six years, of which 40 per cent was due to the steady upward movement in acreage, the residual to increases in yield per acre.

THE expansion of agricultural output in India over the past five years or so has been of basic significance to the entire economy. Agriculture provided about one-half the total national income in 1950-51. With an increase of 20 per cent in its index of physical output, agriculture contributed directly to the overall national income growth of 17 or 18 per cent. Additional contributions came indirectly, through the effects of the increased agricultural output upon the farmers and upon the occupations and services dependent upon them. India is still predominantly an agricultural area; her welfare is the welfare of the rural people.

The recorded expansion in agricultural output exceeded the expectations of the Government of India in the First Five Year Plan. For the foodgrains alone, output was 45 per cent above the target. The increase achieved has served to modify the views of many persons with respect to the elasticity of supply in the agriculture of less-industrialised countries. Roughly equivalent levels of expansion are now anticipted for the Second Plan. It has been recognised of course that "favourable monsoons", particularly in 1953-54, played an important role in the increase. Indeed the Planning Commission itself, in its **Report on Progress** through 1953-54, suggested that only about one-half of the increase in recorded output could be attributed to the inputs during the First Plan and the preceding periods. Actually, no one has yet presented a convincing set of relationships between the additional output (or even half of it) and the changes in irrigation, in seeding, in manuring or in other farm management practices. The need for such analysis is clear, both for current planning in India and for a more complete understanding of the developments of the past.

The difficulties in the way of conclusive analysis are great. There are areas of uncertainty about some parts of the output and acreage totals, arising in part from differences in state procedures over the period since 1949-50. There is almost no systematic information for India, for states or for districts, on such input factors as manuring, seeding, farm methods, etc. Moreover, in a personalised activity like farming, the role of the attitude of the producer may well be fundamental. In a period of years after independence, after decisions on land reform legislation and after it became clear that government in India really believed in improving the well-being and security of the man on the land, the effects of the psychological factors must be taken into account. But in this field, there is only limited methodology for permitting careful weighing of the pertinent factors and their contributions.

The present note scarcely represents an answer to the problem. However, the crude calculations made do suggest that the problem may yield results for a more systematic effort. At the minimum, the note may elicit further examination of the problem. The discussion here is confined to the foodgrains and pulses—the most important Indian crops. During the period, these utilised about 80 per cent of India's cropped area.

The 22 per cent increase in foodgrain (and pulse) output was accompanied by a gradual increase in the area sown to these crops. Through land reclamation and irrigation, India had by 1954-55 augmented her acreage above that of 1949-50 by about 25 million acres, of which some 16 million went into foodgrains, an increase of almost 7 per cent in grain acreage. These acreage increases were gradual over the period, and thus suggest a rather steady expansion in the agricultural base.* Production changes corresponded fairly well with acreage shifts through 1952-53. In the next two years, there were significant increases in yields per acre. Of the total increment in output in these two years as against 1949-50, roughly 30 per cent can be attributed to the increase in acreage and 70 per cent to the increased yield per acre.

This general pattern for the nation as a whole seems to hold for four of the six regions into which Indian agricultural statistics tend to be grouped. Except for East India (West Bengal, Bihar, Orissa, Assam, Tripura, Manipur) and to a somewhat lesser extent for West India (Bombay, Saurashtra and Kutch), production seems to follow acreage changes; in the last few years, yield increases were of particular importance in explaining output.

However, too much cannot be made of the homogeneity of these regions. In a large country, with such marked temperature and rainfall variations, significant differences in foodgrain cropping patterns and in annual yield variations for any single crop are to be expected even within (relatively large) regions of the country. A rough indication of this heterogeneity is given in the accompanying tables. Table I shows the width of the

* There was a small decline in acreage in 1950/51 and a further decline in acreage in 1951/52.

TABLE I

Range in Regional Yields of Foodgrain per Acre

(Tons/Acre)

	Lowest	All-India Average	Highest	Range Amount	Range Ratio to average
1949-50	.163 (W)	.220	.277 (S)	.114	51.8
1950-51	.142 („)	.208	.277 (N)	.135	64.9
1951-52	.122 („)	.214	.264 (S)	.142	66.4
1952-53	.123 („)	.239	.283 (N)	.160	67.0
1953-54	.171 („)	.262	.316 (S)	.145	55.5
1954-55	.188 („)	.252	.340 (S)	.152	60.3

range in regional yields per acre for each of the years.

West India is consistently the low-yield region, while North and South India are usually at the other end of the yield range. Within each region, however, there is also significant year to year variation, as is shown in Table II. There are two extremes of variations (at least as measured by the total range as a ratio of the average yield over the six years.) North India (Uttar Pradesh)has both the smallest measure of variation and reasonably regular trend movement. West India (essentially Bombay) on the other hand has great irregularity and wide range of variation. East India, the other region with an irregular yield movement, can be divided into two components. Bihar, with about half of the foodgrain acreage of the region, tends to have lower yields and large yield variability (43.5 per cent). The remaining part of the region (Manipur, Tripura, Assam, Orissa, West Bengal) shows of course much less variability, and a somewhat more regular trend in annual yields.

Against this (approximate) background, the data for two States—Bombay and Bihar—might therefore be treated separately. Their degree of yield irregularity, and the relative width of the year to year range in yields suggests the possibility that climatic conditions play a more important part in their basic agriculture than they do elsewhere in India.*

Less Variable Regions

Table III brings together relevant acreage, production and yield statistics for all India and for India without the two states of Bihar and Bombay.† Consideration of the data without these two states improves the regularity of acreage and yield patterns. In particular, yield levels for residual India are both higher and more consistent. Variability (again measured by the range of yearly observations) is reduced from 23.6 per cent to 17.2 per cent. There is now an essentially upward movement in yield over the entire period.

It might appropriately be asked how dependent is this residual pattern upon significant balancing out of acreage and output movements in other states which taken alone might well yield irregular agriculture patterns. Such compensatory movements obviously take place and are of importance for the specific levels obtained for the acreage and yields in any residual India. For present purposes, specific states were selected where output or acreage variations have been marked. Thus, the tremendous expansions in acreage and production in Rajasthan and Hyderabad have been noted by the Planning Commission itself.* Notable too are the developments in Madras and Madhya Pradesh. If these states are removed—individually or collectively, the patterns of acreage and yield movements do not change appreciably. Thus, the average yield is increased somewhat, and variability is reduced further to 15.1 per cent. These data apply to a residual India from which six major producing areas have been eliminated. With only 45 per cent of the total acreage in foodstuffs, and 51 per cent of the output, acreage and yield movement reflect the more regular pattern obtained by eliminating only Bihar and Bombay.

The following conclusions may be drawn for residual India, i e excluding Bihar and Bombay:

1. There has been a reasonably steady upward movement in output of foodgrains in India throughout the past six years.

2. Of a total expansion of some 29 per cent—some 40 per cent was due to the steady upward movement in acreage, the residual to increases in yield per acre.

3. The expansion through 1954-55 does not reflect any particular and concentrated benefit of favourable monsoon in 1952|53 or 1953|54. The upward movement in yields is gradual.

For All-India, it can be concluded that:

Areas of great variability, in a few concentrated regions, introduce most of the irregularity in the Indian output pattern.

There remains: 1. need for further analysis of change in the variable area (Bombay and Bihar). 2. need to explain the upward pattern in yield for residual India. What input factors were responsible?

* See **Progress Report**, 1953/54.

TABLE II

Regional Variations in Yield per Acre

Region	Average Yield 1949-50—1954-55	Range in Yields: Amount	Range in Yields: Percentage of average	General characterisation of historical yields
South	.289	.080	27.7	Gradual decline, then marked upward
North	.288	.032	11.0	Gradual upward, throughout
East	.272	.071	26.3	Gradual upward but irregular
Northwest	.212	.066	31.1	Marked upward
Central	.180	.057	31.7	Marked upward
West	.152	.066	43.4	Gradual upward but irregular

Table III

Acreage and Yield Variations

	India			India minus Bihar and Bombay		
	Prod	Acreage	Yield	Prod	Acreage	Yield
1949-50	54.0	245.3	.220	42.5	188.3	.247
1950-51	50.0	240.5	.208	41.6	189.2	.249
1951-52	51.1	239.5	.214	42.4	188.3	.246
1952-53	57.5	250.8	.239	47.9	198.8	.258
1953-54	65.4	259.5	.262	53.8	208.1	.278
1954-55	65.8	262.8	.252	55.2	212.4	.281

* One would expect greater variability the smaller the geographic area. It is unlikely that this explains the observed patterns in Bihar and Bombay since each state has a foodgrain acreage of about the size of other regions—South and Northwest India.

† In 1949/50-1951/52, these two states accounted for about 22 per cent of the total acreage in foodgrains and pulses. In 1952/53-1954/55 the acreage declined to (a bit less than) 20 per cent. Production-wise, the corresponding ratios are 18.5 & 16.8 per cent.

Under National Planning crores of rupees are being spent to improve agriculture, build and expand industries and promote social welfare. As a result, you have a wider scope to increase your income and lead a better standard of life.

Preserve the joys of better living

As a thoughtful man, you too would like to have a plan to make sure that you, your wife and your children always maintain the improved standard of living.

Life Insurance alone can provide a plan for ensuring comfort in old age, funds for the education, marriage and start in life of your children and sufficient resources if the family has to carry on without you.

In fact, any arrangement you consider essential to preserve the joys of today's better living for you and your family can be made through life insurance.

And the cost? Small, easy instalments of premium out of your current income.

Ask your agent today to draw up a plan for you.

Working of Community Projects and NES

Evelyn Wood

It is an odd fact that most of the admiration for the Community Projects and National Extension Service, and for the Programme Evaluation Organisation as their determined critic, comes from foreigners.

Yet a spell of living among village people should convince any one that here, if nowhere else, a new life is beginning for India, perhaps for the whole civilized world.

A GOVERNMENT which supports critical organs with the duty of probing into its own activities is demonstrably in good health. The Programme Evaluation Organisation (P E O) was the first such organ; now, at rather a less official level, comes Industrial Management Unit for Research and Planning (IMRUP). More power to these elbows at the sides of Government! May they keep acutely angular! The Directorship of the P E O has changed. But this Third Annual Report* is no less critical than its predecessors. Further, it is published at a time when the whole of the Extension Service as a rural development mechanism seems to be in a critical state. The last session of the Lok Sabha discussed Community Development and the National Extension Service at great length; and the ministerial response laid the responsibility for further examination and recommendations squarely on the shoulders of the P E O. This is an honour: to be regarded officially as a permanent Commission of constructive investigation, and the P E O will have to work hard to keep earning such an accolade.

This report gives every indication of the P E O's continued ability to evaluate, within the very broad frame of reference given; and no less of its fertility in constructive suggestions. The N E S has growing pains, and these are duly examined, suggestions for palliative treatment being made, even if no radical therapy can now be defined.

The C P A
may have started the right way,
but the N E S
has got itself into a bit of a mess.
Don't let's have the P E O
saying, in 1961, "I told you so!"

There is this danger that the P E O's excellent, constructive advice may go unregarded. There are ominous signs of this. For example, to meet the problem of field-records, the P E O designed a form of report to simplify and standardize cumulative news of what happens in the villages. It seems that the Extension field-workers just won't use the P E O's system.

Extension is a Two-Way Channel

There seems to be a growing realization in the P E O that plans and programmes cannot just be made for village folk and planted by Extension workers. There is constant need for criticism of the programmes by all sorts of village people. This is why the "First Reactions" Report of the P E O was so valuable; and it may therefore be hoped that some of the further studies, which are listed in Appendix I of this Report (pp 63-66) may indicate more of the changing needs and values of village people, besides their negative reactions to Community and Extension programmes worked out for them by non-villagers.

Records by field-workers are vitally necessary for this very reason of logging the changing attitudes and abilities of village folk. The special features of the Community Projects tended to mask the needs and values of ordinary people in the villages. As this P E O's Report now recognizes (not in as many words, of course!), the amenities which account for the additional finances of C P's over N E S Blocks are actually so much bribery to get people in the villages to work together on an official programme.

Section II on pp 13-14 of the Report opens up the whole question of tapping the villagers's practical knowledge. This is a pregnant suggestion. It might have been considered that farmers know how to farm, and that all the gram sevaks who are briefly trained in agriculture can offer is a few new tricks of this trade, for simple and controlled experiment by the village-farmers, and in their own conditions. But here the P E O slips up. On pp 40-41, it is seriously proposed that selected cultivators should have the benefit of "comprehensive advice" from agriculture-trained gram sevaks, who will teach the farmers scientific farming. Well! . . I have seen a gram sevak try this on with a Kannadiga Gowda, and I must say I blushed for the poor boy!

On the other hand the P E O points out that Block Development Officers (B D O's) are mostly revenue men, and suggests that there is no function which they can serve so efficiently as that of being "area specialists". This is a really magnificent concept; if it is adopted, it can really lodge Extension as a permanent, constructive service in rural India. But the advice can only be fruitful if the Block Development Officer sticks to the same Block for many years. And a tested vocation for the work is also required. How many official Extension workers have such a vocation—comparable to that of a Buddhist Bikkhu—or would even be permitted to think about it? Aren't they just shoved out into the rural development field, without being asked whether they want to go and work for and with village people, or not?

Jungle of Development Agencies

There are more topics under Extension between villagers and better educated people to-day. It was possible to start off the Community Projects with a few, crude targets. That won't satisfy village people any longer. We have advanced in complexity. This Report reflects the complexity, and it inevitably reads rather confusedly in attempting to deal with values in the many fields of activity which are now involved.

The attempt to bring other agencies besides the Extension Service into the tally of input in the rural development field is new this year, and much to be commended. But, besides the "regular", old established Departments of Agriculture,

* **Evaluation Report on Working of Community Projects and N E S blocks**—2 volumes: Main & Summary, 230 & 17 pp Programme Evaluation Organization of the Planning Commission, April, 1956.

Public Works, Health and Education, there are other development agencies at work to-day which are less noticed by the PEO. For example, the Central Social Welfare Board (which does get a mention) cuts across most of the fields of work of all the others, and with scant reference to or collaboration with them. In the field of rural industry, the All India Khadi and Village Industries Board, now under the Ministry of Production; the All India Handicrafts Board; and the Handloom Organization of the Ministry of Commerce and Industries all offer panditry and some funds to rural industry. Should not the NES be the channel? Is it?

Panchayats are at last allowed to come under criticism. On pp 18-19 the PEO raises for the first time the radical difference between the statutory and the traditional panchayat. Hitherto, it has always been assumed that the statutory panchayat is referred to; and it is refreshing to see an official publication so forthright about the defects of these very unproven institutions.

With the acceptance of the BDO as the "area specialist 2" for his Development Block, it seems odd that the PEO should question, on p 22, "to what extent" other development agencies should accept that their "activities will be channelled through the project or block agency". Surely no proper question can arise on this principle? Certainly all official bodies concerned with rural development—and, let us hope, all unofficial bodies seeking to promote or implement change in the villages —should at least keep the BDO fully informed of their operations and results. If not, chaos and resentment in the minds of village folk are the most likely outcome of un-coordinated effort.

The PEO's championship of the gram sevak as a man much put upon by his seniors, who is diverted unconstructively from his primary, educational function, runs from pp 22-25. These pages should be compulsory reading for all secretariat personnel, from Ministers downwards, in so far as such desk-experts are concerned with rural development.

Conclusion

Although this PEO's report is not obsessed with certain a priori "improvements" which village folk "must" accept, as were the two previous Reports, this third year's review is packed full of constructive ideas. The confused handling of tabulated material and the comments thereon is probably unavoidable. I would guess that there is never enough time to work on the presentation of the collected data. I would also guess that the preoccupation with such physical data as crowd the tables is not at all a PEO vice; in fact, the comments on such preoccupations in the body of the Report suggest that the PEO is fighting the battle of the real objectives of the Extension movement against those bureaucrats (of whom many are, despite themselves, in the field) who feel the need for concrete economic objectives instead of the Planning Commission's magnificent concept. This was quoted in extenso at the beginning of the Second Year's PEO's Report; it does not need repeating in this review.

It is not the fault of the PEO that the writers of the Report appear to have bitten off more technical matter than they can chew. This indigestion is common to the whole of the rural development organization of governments in India. As such, the PEO rightly sees the complaint as one for systematic treatment.

If many of the statements made in the body of the report—and, more particularly, in the Summary of 17 pages—appear too sweeping, too generalized, it must be realised that the human canvas of this picture is the biggest ever yet attempted. The changes in mind, heart and detailed behaviour of three hundred million people are being depicted. Moreover, these people probably vary as individuals and as groups more than any other contiguous block of the same size, anywhere in the world. One must admire the courage of the development staff in tackling this immense task, and no less the PEO for its equal courage and greater detachment in forming a critical analysis of the new movement, as it grows in scope and complexity.

It is an odd fact that most of the admiration for the CPA and its children, the Community Projects and NES; and for the PEO as their determined critic, comes from foreigners. Indians are only too accustomed to destructive comment on what goes on in the villages. Yet a spell of living among village people should convince anyone that here, if nowhere else, a new life is beginning for India, perhaps for the whole civilized world.

TO UNDERSTAND New India and to follow how its agriculture based mixed economy is shaping, you can do no better than read **The Economic Weekly** regularly.

Established in 1949, on the eve of India's first Five-Year Plan, **The Economic Weekly** reflects the spirit of a nation in the making, while faithfully portraying the changing political and economic scene from week to week. It is independent, analytical and factual; an ideal guide for those who want to keep abreast of developments in this part of the world.

Bright, lively and compact, the paper manages to give a surprisingly wide coverage within a small compass that business executives and serious students of India's economic problems are finding increasingly useful.

"The sponsors of countless Indian weeklies have promised to produce an Indian **'New Statesman and Nation'**, but **The Economic Weekly** alone has set and maintained anything like a comparable standard."—**The Current**, October 12, 1949.

Organisation and Management of Public Enterprises: Bangalore Symposium

Y S Pandit

The formation of the Industrial Management Research Unit for Planning means that the problem of industrial management and organisation in the State sector is now recognised. The progress of the unit and its work would, therefore, be watched with great interest.

From the studies and discussions of the unit the State enterprises would no doubt derive considerable benefit. But these studies and discussions would be useful even to the private sector of industry to which the knowledge may not be denied.

The utility of the work of the IMRUP would enhance if selected persons from private industry are associated with it and invited for discussion. Instead of relying wholly on the experience of the executives of State enterprises, it would be beneficial to draw on the experience of the private sector of industry as well.

SINCE the State has now set the socialistic pattern of development as its objective, it is obvious that its administrative responsibilities would rapidly increase. The field of these responsibilities which has already extended far beyond 'bread and butter' adminstration would also become diverse in character. It will cover all the important aspects of economic activity such as transport, communications, trade and industry. In order to carry out these activities efficiently it is imperative that the State should devote serious attention to the problems of management. The success of the activities which the State would be undertaking would be determined to a large extent on its capacity to work out suitable organisations, select and train proper personnel and evolve correct procedures for the working of the organisations. The object should be to provide adequate checks wherever they are needed without hampering the progress of operations in any way.

Management Problems

The establishment of an Industrial Management Research Unit for Planning by the Indian Statistical Institute since 1st of April is not, therefore, a moment too soon. Under the Second Five Year Plan a large proportion of the investment in the State sector is to be made in important basic industries. The management problems, which are likely to become conspicuous almost immediately and continue to acquire greater prominence in future, as the socialistic pattern of development takes a concrete shape, would naturally be confined to the field of industry.

Broadly speaking, the IMRUP will be concerned with three groups of industrial management problems.

First, it will study and report on the organisational structure most suited for the State enterprises.

Secondly, it will formulate methods for the optimum utilisation of resources through the use of modern management tools such as work-study, statistical quality control and incentive.

Thirdly, the unit will engage itself in examining the various problems relating to industrial planning such as the economics of location, mechanisation, nature of industrial relationship, relative efficiency of techniques, technological ratios etc. and generally provide technical intelligence necessary for perspective planning.

The symposium was the first organised activity of the Industrial and Management Research Unit for Planning. It was designed to find out in consultation with the top executives of State Enterprises and others interested in the subject the type of specific problems which the unit should take up for study and to explore the ways in which the facilities offered by the unit could be made use of by the State enterprises. Along with Prof J K Galbraith and Mr John Strachey who were on a visit to the Indian Statistical Institute, and the Secretary to the Ministry of Production, some top executives of the State enterprises located in Bangalore where the unit is established and where the symposium was held, participated in the proceedings. A paper on public organisation prepared by Prof Galbraith formed the basis of discussion.

On going through the proceedings of the symposium one finds that the purpose for which the symposium was arranged was more than fulfilled. A variety of interesting topics having a vital and urgent bearing on the efficient and successful management of State enterprises were thrown up. But more than that, the symposium provided a golden opportunity to the top executives of State enterprises to compare notes in an academic atmosphere and to voice their opinion without inhibition of any kind. The proceedings of the symposium in which all the participants freely narrated their experiences and expressed their views, as reproduced in the mimeographed report, are, therefore, very informative so far as the working of the State enterprises is concerned.

Allied or Multi-Purpose Corporation ?

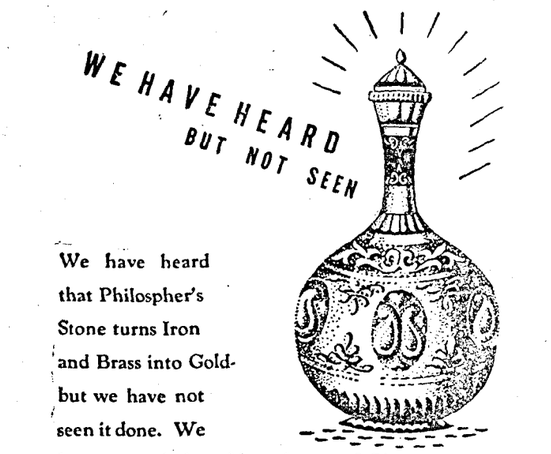
It is an index of the frankness with which opinions were expressed and matters under consideration examined, that although on the topics to be taken up for detailed study by the IMRUP there was general agreemnt on the issues that were discussed the views expressed revealed interesting differences. For instance, Prof Galbraith had suggested that the State should undertake the promotion and management of industrial enterprises through multi-purpose corporations like the Zaibatsu in Japan and the General Motors Corporation and the Tennessee Valley Authority in the USA. The argument in support of the multi-purpose corporation was that an existing organization managing one enterprise, if it undertakes the promotion of another enterprise whether in the same line or different, would be in a position to take the innumerable decisions necessary in the formative period of an industrial undertaking quickly and with confidence, and

economise in the use of the available managerial talent and technical personnel.

While the idea behind Prof Galbraith's suggestion was generally accepted, there was a strong current of opinion that instead of being multi-purpose, the organisation should be allied-purpose in the sense of managing and promoting units in the same industry. There was, however, a view expressed and stoutly defended that what matters is not so much the type of organisation as the personnel.

> "The form of an organisation is not one hundredth as important as the persons in it. You can put a good man in a bad set-up, he would probably pull the whole thing through. Whereas you put a bad one in a fine set-up, he won't pull through".

Regarding the autonomy of Corporations it was revealed that in one case at least the autonomy was given but it had not reached the Corporation. Further, it was more difficult to get a decision after autonomy than before because the part-time directors had no time to make up their minds. "Unless you have fulltime directors, who are devoted to it you just do not get a quick decision."



Similarly, in regard to the scope of industrial engineering in the State enterprises, it was held that the technique of industrial engineering should be made use of from the very start when promoting an undertaking. However, it was strongly argued by some that industrial engineering holds scope when an enterprise has grown old and inefficient, and that, since the State enterprises which were all new "had no time to grow inefficient" industrial engineering had no use for them.

Labour-Management Relations

In respect of labour-management relations it was observed that the State enterprises offered a great opportunity as the working of these enterprises was motivated differently from that of the private industries. An interesting experience of how workers in a Posts & Telegraphs factory were persuaded to increase production, agree to shift working and introduce a number of economies merely by talking things over with them was narrated. One of the participants who had experience of both the private and the State sectors remarked that according to his experience human relationship in the private sector was better than in the State sector but surprisingly no comment was made on this observation.

When the issue of the workers' participation in management from the point of view of the scope it offered to the IMRUP for carrying out specific studies, was under consideration, references were made approvingly to the practice prevailing in Yugoslavia and Russia. It was also mentioned that the Board of Directors of the State enterprises in India include Labour representatives. No light was thrown on the result of this association but in some cases the Managing Directors are reported to have reacted very strongly when the suggestion of workers' participation was put to them.

The formation of the IMRUP means that the problem of industrial management and organisation in the State sector is now recognised. The progress of the unit and its work would, therefore, be watched with great interest. From the studies and discussions of the unit the State enterprises would no doubt derive considerable benefit. But these studies and discussions would be useful even to the private sector of industry to which the knowledge may not be denied. The utility of the work of the IMRUP would enhance if selected persons from private industry are associated with it and invited for discussion. Instead of relying wholly on the experience of the executives of State enterprises it would be beneficial to draw on the experience of the private sector of industry as well.

We have heard that Philospher's Stone turns Iron and Brass into Gold- but we have not seen it done. We have not only heard but also seen LOMA turning grey hair into dark hair.

The Agricultural Labour Enquiry

Reflections on Concepts and Methods

Daniel Thorner

The following critique of the Agricultural Labour Enquiry forms part of an analysis of agrarian statistics and agricultural labourers in India which the author is preparing for the Inter-University Study Project on Labour Problems in Economic Development.

Dr Daniel Thorner is the author of The Agrarian Prospect in India: Five Lectures on Land Reforms, which the Delhi University Press is publishing in July for the Delhi School of Economics.

AGRICULTURAL workers form the most disadvantaged economic group in India today. Their wages are typically low; conditions of work are often onerous; and employment frequently irregular. The level of living which their earnings permit is very meagre. Their daily lives, as it were, reflect the problems of under-development, underemployment, and "surplus" population which figure so prominently in current national and international discussion. Prior to 1947, such concern as the Government of India had evinced in the labour field was focussed on urban workers, particularly those organized into strong or militant unions. In the years since the attainment of independence, Government has shown heightened awareness that the agricultural labourers constitute the largest single section of the national labour force. Accordingly, the Ministry of Labour of the Central Government in 1949 took the important step of sponsoring a nationwide Agricultural Labour Enquiry, the results of which now lie before us*.

The total published output is indeed substantial; if we include the general summary and the supplementary volume of wage statistics, there are eleven volumes totalling nearly 3000 pages, and furnishing 900 tables and numerous charts. Shri V V Giri, then India's Minister of Labour, wrote proudly in 1954:

> "This is the first and the largest socio-economic enquiry of its kind conducted in Asia along the lines laid down by international bodies, like the ILO and the UN and according to the scientific principles of sampling under expert technical guidance." (**Foreword** to Vol I of **Report on Intensive Survey**)

The **Enquiry** covered some 800 sample villages, each in three phases: (1) a broad questionnaire about the village as a whole (General Survey); (2) a second questionnaire that was answered by every family resident in the village, 104,000 families (General Family Survey); and (3) a detailed questionnaire answered by 11,000 families, roughly one out of each three families of agricultural labourers. (Intensive Family Survey).

This large-scale operation was preceded by a series of two dozen odd pilot surveys of individual villages in various parts of the country. Eight of these have been published as separate pamphlets. The main **Reports** present some discussion of the difficulties encountered and indicate those which were considered to be solved and those which continued to offer trouble. As a whole the **Enquiry** has an impressive appearance and has already been quoted in widely scattered quarters—to mention two examples, in publications by an economist of the United Nations Economic Commission for Europe and by an Academician of the Social Sciences Division of the National Academy of the U S S R. Five articles summarizing the **Enquiry's** principal statistical findings appeared in this journal in the latter half of 1955 (**Economic Weekly** issues for August 6, August 13, September 3, September 10, and October 1, 1955).

The Directors of the Enquiry themselves felt enough confidence in their results not only to issue them for the 800 villages studied, but to project them on a State by State basis for India's 27 Part "A", Part "B", and Part "C" States; to calculate further estimates for the six zones proposed in the General Population *Census of 1951*—North, East, South, West, Central and North-West India —and finally to provide All-India figures. Thus we now have in print tables which purport to give nationwide estimates for the number of "attached" labourers and for "casual" labourers; the number of labourers with land and the number of landless labourers; size and number of cultivation units; employment and unemployment of agricultural labourers; average daily wages and total national wages bill (for agricultural labourers); income, expenditure, indebtedness and variation in economic levels of living.

In the years ahead, these tables are likely to be used extensively. It may therefore be worthwhile to take a closer look at the basic concepts embodied in the three questionnaires and at the methods by which the principal data have been collected and assembled.

Agricultural Worker: Casual and Attached

The term "agricultural worker" as used in the Enquiry includes "all those who work in the fields for wages". (**Agricultural Wages in India** Vol I, p 1). The Instructions issued in connection with the second stage, the General Family Survey, amplify this definition. Investigators are to take as an agricultural worker "a person who reports that he or she is engaged in agricultural operations as a hired labourer for wages for 50 per cent or more of the total number of days worked by him or her during the previous year". An agricultural labour family is defined as "one in which either the head of the family or 50% or more of the earners report agricultural labour as their main occupation". (**Rural Man-**

Vol. VI—**Central India** Pp 266 Rs 5/12.
Vol. VII—**North West India** Pp 306 Rs 6/8.

Power and Occupational Structure, p. 449.)

Agricultural labourers are then divided into two categories: "attached" and "casual". It should be emphasized that this is the most fundamental distinction in the Enquiry. In each of the three stages the field investigators were required to record certain data separately for these two types of workers. The "Instructions" accompanying the General Village Questionnaire (the first phase) provide that separate wage quotations be collected "for purely 'casual' labourers who are paid at the market rates and for 'attached' labourers who, whenever required by their master, have to work for him and are not ordinarily free to seek employment elsewhere". **(Agricultural Wages in India.** Vol 1, p. 400) This definition takes into account only two aspects of the conditions of employment, viz., rate of pay and freedom to seek alternative work.

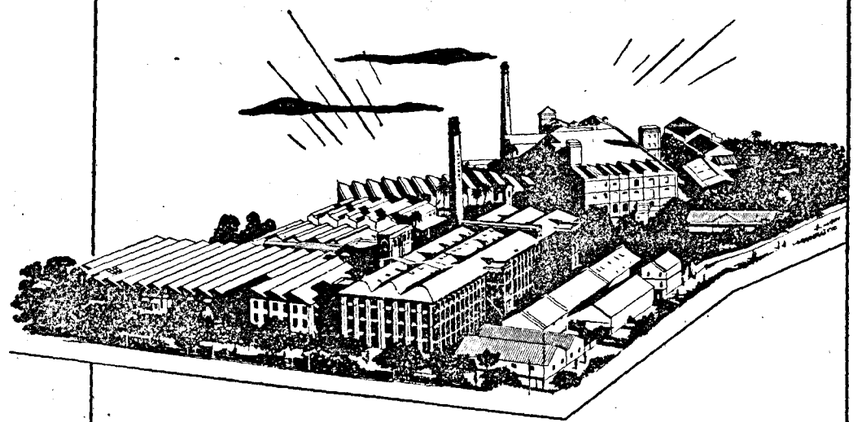
A second set of definitions is to be found in a footnote to the report of the final phase of the Enquiry, although we are not informed whether it was ever issued to the investigators. Attached workers "are more or less in continuous employment and are under some sort of contract with employers during the period of employment", while casual workers are "workers other than attached. They are employed from time to time according to exigencies of work". **(Report on Intensive Survey of Agricultural Labour,** Vol I, p 21) Two additional features, then, are indicated for the identification of "attached" workers: continuity of employment and the existence of a contract.

Many other possible criteria appear in the descriptions of the various kinds of farm labour noted in each of the States in the General Village Survey. **(Agricultural Wages in India,** Vol I). In most cases the difference between "casual" and "attached" workers is stated initially in terms of the period for which a man is engaged and whether or not he receives daily wages. Thus we find that in Assam attached workers "were employed and paid on a monthly, quarterly, half-yearly or annual basis", while casual workers "were employed on daily wages for short periods during busy seasons". In Madras attached workers "were engaged for the whole year or during the busy season for a period of three to six months", casual workers being "engaged either on time or on piece rates". In PEPSU, "casual workers were paid on a daily basis while attached workers were generally employed for longer periods on yearly, half-yearly or monthly agreements". **(Agricultural Wages in India,** Vol I, pp. 55, 114, and 247. Cf for Punjab, Uttar Pradesh, and West Bengal, pp 151, 165, and 182, respectively). In the case of Bihar, on the other hand, "a striking feature of agricultural employment .... was the payment of daily wages both to casual and attached workers". Similarly, in the Rayalaseema area of what is now Andhra, "some of the attached workers got daily wages even though the contract of employment was annual". (Op cit, pp 68 and 120)

What is the evidence that a worker has agreed to serve on an "attached" basis? In Punjab, "contracts for annual employment, generally reduced to writing, were made in the month of **Jeth** (mid-May to mid-June)." In Assam the contract of employment "was often an oral understanding." In Hyderabad, "there were very few written agreements between attached workers and their employers; the agreement was usually oral and was renewed every year if the employer was satisfied with the work". (Op cit, 151, 55, 200)

"Concessions" to Attached Labourers

In every State, we read of "concessions" to attached labourers. Perhaps the most common of these was a loan or an interest-free advance. In Bihar, "an attached worker was usually advanced a sum of Rs 50 to Rs 100 at the beginning of the year and unless and until he returned the sum, he was not permitted to leave his employer". In the Mayurbhanj district of Orissa, employers were able by means of an interest-free advance to ensure that labourers would work for them on any day required by the employers with the understanding that they would be paid on a par with casual labourers for the days on which they worked. In Uttar Pradesh it is noted that the workers usually remain attached to the same employers for successive years, "the reason being that employers generally advance loans varying from Rs 200 to Rs 400 per annum to the attached workers and also gave them a plot of land (generally 2 bighas) either on a nominal basis or free of rent". (Op cit, pp 68, 136, and 166). Land allotments of this type, sometimes with temporary permission to use the employer's implements and/or draught animals for ploughing, are very widely reported for attached workers. Sometimes the land allotment was given on a cropshare basis. House sites or other provisions for accommodation were frequently supplied for attached workers, but often for casual workers as well. This was also true for perquisites such as meals, clothing, footwear, and bedding.



In some areas attached workers were required to work longer hours than other employees. In Bihar, "they had to render customary services such as household work or running errands". In Madhya Pradesh they "also looked after the employers' cattle and [were required] to do non-agricultural work as well if so desired". In Travancore-Cochin, "the attached workers in most cases worked from morning till night and did all kinds of domestic services". (Op cit pp 69, 99, 285).

Freedom to Seek Other Work

Let us return for a moment to the question raised in the original definition of the degree of freedom to seek other work. We have already noted for Bihar, Orissa, and Uttar Pradesh that in effect the workers were tied down by loans which they could scarcely hope to repay. Similar cases are cited for Mysore and West Bengal (Op cit pp 183 and 236). Quite the opposite would seem to be the lot of attached workers in Saurashtra. Although employed on a yearly basis, "the workers were free to terminate their employment at their will. They received free food, clothing, footwear, bedding and accommodation in addition to an annual cash wage; but they did not normally take loans or wage advances, nor was it customary to allot rent-free land to the workers. (Op cit p 275.)

Clearly very many factors have to be considered in setting up meaningful categories to cover this bewildering variety of relationships. We have to deal with periods of employment ranging from a day to a lifetime, with conditions all the way from full freedom to near-serfdom, with payment in regular cash wages as well as traditional harvest shares plus perquisites in kind, with formal written contracts and with oral understandings, with debt-bondage and with tie-in land allotments. In the context of Indian agriculture, the term "attached labourer" has a connotation of unfreedom. There is

In the Indian textile world the name **KOHINOOR** *has been associated with finest quality yarns, threads and fabrics for over half a century.*

THE KOHINOOR MILLS CO., LTD.

Managing Agents: **KILLICK INDUSTRIES LTD.**

KILLICK BUILDING, HOME STREET, FORT, BOMBAY.

no doubt that such a category of especially disadvantaged workers exists, and it would probably be feasible to draw up a set of criteria by which it could be decided whether labourers fall into this class. Certainly no single test such as liberty to take up another job, steady employment or the existence of a contract will suffice to separate out the genuinely "attached" workers. When a labourer is described as not "free to seek employment elsewhere," it may simply be the case that he has freely agreed to remain in a particular job. On the other hand a labourer committed to a particular employer by reason of debt or land-allotment may be employed only "from time to time according to exigencies of work". Thus an attached worker may be employed on a casual basis while a completely free worker may be employed continuously on a long-term contract.

Apart from such workers as can, all things taken together, be classified as "unfree' or "bound" or "attached" (whether for a long or short period), there would appear to be several types of relatively free labourers. These would include regular, indeed, even permanent, workers; and migratory or transient workers; labourers who do a full season's work and those who find employment only at peak periods. To construct proper rubrics under which to separate out these various short and long-term workers with differing degrees of job mobility and a wide variation in bargaining strength would admittedly be a difficult task. It is a task the Agricultural Labour Enquiry has declined.

Rather than abandoning the terms "attached" and "casual" after they had proved in practice to be mutually non-exclusive catch-alls for non-homogeneous groups, the Enquiry adopted a somewhat disingenuous expedient. The terms have remained unalterable, while the specific content and meaning have been left vague, to be filled in at the State and local level.

The profoundly unfortunate consequences of this lack of clarity show up most vividly in the treatment of South India: Madras (including Andhra) Mysore, and Travancore-Cochin. This area is the home of India's heaviest concentration of agricultural labourers. About half of the rural families in the 124 villages studied in Madras (including Andhra), Mysore, and Travancore-Cochin in the General Family Survey were recorded as agricultural labour families. In the final phase of the Enquiry 2,184 of the agricultural labour families in these three States were selected for intensive study. Only 28 of these 2,184 families were classified as belonging to the group of "attached" workers. On the basis of these 28 cases, we are given percentages of "attached" workers as 1.4 for Madras, 1.6 for Mysore (six families), and 0.0% for Travancore-Cochin. **(Report on Intensive Survey of Agricultural Labour,** Vol IV, pp 15, 76, and 122.)

Such figures for the proportion of "attached" labourers in this region are ridiculously small. One of the most striking features of the South Indian rural scene is the large number of farm servants who work year after year if not generation after generation for the same families of landowners. Frequently they are bound to their masters by deep-rooted traditions of mutual obligations and responsibilities. They render a variety of customary services and receive a variety of customary payments and perquisites. The names of such labourers are legion: **Padiyals, Pannaiyals, Pulayas, Paleru, Jita,** etc, etc. The first phase of the **Enquiry,** the General Village Survey, gave considerable detail on the **Pannaiyals** of Travancore. The chapter on Travancore-Cochin, in fact, refers to a series of tripartite conferences among employers, workers and the State Government to settle the wages and conditions of employment of "attached" workers. It was decided in 1948 to set up a standing Industrial Relations Committee with a view to eliminating friction between these workers and their employers. **(Agricultural Wages in India** Vol I, p 286.)

The failure of the Intensive Family Survey to find more than an insignificant handful of such families in its entire South India sample is particularly surprising since the report of the General Village Survey described a considerable number of different types of "attached" labourers for this region. "Attached" workers were found at this first phase of the **Enquiry** in each of the seven zones of Madras, in 17 of the 24 sample villages of Mysore, in half the sample villages of Travancore, and in all the Cochin sample villages.

The conclusion would seem inescapable that a sizable number of the agricultural labour families in Madras, Mysore and Travancore-Cochin whom the Intensive Family Survey has classified under "casual" belong, in any sensible interpretation of the Enquiry's categories, under "attached." If this is so, it follows that the proportion of "attached" workers calculated for the country as a whole (on the basis of the data for Madras and the other States) is seriously underestimated. It also follows that the secondary tables comparing days worked, annual income, expenditure, etc, for "casual" and "attached" workers rest on a defective base, since the averages attributed to "casual" labourers undoubtedly refer to a mixed group made up of both "casual" and "attached".

By contrast with Madras, very high percentages of "attached" labourers are reported for Punjab and especially, PEPSU. Among these "attached" workers are included several distinct groups of cultivators who receive as their principal income a share of the crop in kind. The **Sanjhis,** for example, worked on a kind of "partner" or "helper" basis with the **biswedars,** a type of big proprietor. The **Sanjhi** cultivated lands of the **biswedar** with the use of the latter's bullocks and implements. When the crop was harvested the **Sanjhi,** according to the **Enquiry,** gave a one-fourth share to the **biswedar;** and also gave him two other minor payments. For his part, the **Sanjhi** kept the rest of the produce; he was responsible for paying one-half of the land revenue and irrigation charges.

In the instructions to investigators on how to classify **Bataidars, Bargadars, Adhiars,** and other cropsharers, these cultivators are described as "very closely akin to tenants." It is pointed out that "they share the produce along with the owner or tenants," their share being usually "half or one-third." All such families are to be listed "under the sub-head 'cultivating tenants.'" **(Rural Manpower and Occupational Structure,** p 450.) Had this rule been applied to Punjab-PEPSU, the **Sanjhis** and some other cropsharers would have been excluded from the category of agricultural labourers and classified as tenants.

LABOURERS' FAMILY BUDGETS

I shall not burden this review with any detailed comment on the figures presented in regard to the "family budgets" of the 11,000 labourers' families intensively surveyed. Serious questions about the procedures employed were raised in this journal by Professor V M Dandekar of the Gokhale Institute of Politics and Economics, Poona, when he reviewed the Enquiry's pilot village study in Bihar.* In dealing with the "receipts" side of these family budgets Prof Dandekar observed that the Enquiry's questionnaires required the entering of figures for annual net income from land owned, land taken on rent, land obtained free of rent, and household occupations other than farming. "This is too much to expect", he commented, "both from the investigator and the respondent. Net income is too complicated a concept and the reported figures would have little meaning unless its contents were precisely defined. Secondly, even after precise definitions, it does not seem possible mentally to arrive at figures of net incomes. Thirdly, in an integrated and particularly subsistence family economy, net income separately of land owned, of land taken on rent, of land obtained free of rent and of household occupations other than farming are inconceivable. Therefore, it must be emphatically pointed out that all figures appearing on the receipts side of this schedule against the items mentioned above, can be no better than meaningless guesses mostly of the investigators. It should be noted that matters would not improve substantially, even if the same schedule is filled for every month rather than once in a year." (The use of this schedule on a monthly rather than on an annual basis was precisely what was done for the year 1950-51 in the **Intensive Family Survey.**) Prof Dandekar's conclusion is that "the kind of family budget attempted in this enquiry is in many parts meaningless; in others the reported figures are unlikely to be anything better than plausible guesses . . . ." The final reports of the Enquiry as now issued furnish no grounds for greater confidence in this aspect of the investigation than that expressed by Prof Dandekar.

The procedures of the Enquiry with regard to employment, unemployment, and wages are no more satisfying than those with regard to family budgets. With regard to unemployment, we are told, for example, that "data on the number of days during which the agricultural adult male labourers were fully unemployed were collected month to month for a period of one year. In doing so, only those labourers were taken into account in any month who reported wage-paid employment for at least one day in that month." The Enquiry goes on to assert that it has "firm" data on those workers who did report wage unemployment every month (84 per cent of all labourers) but that "in regard to the rest, forming only 16 per cent who did not work for wages even for a single day in any month, no data could be collected on the days they were self-employed and the days on which they were unemployed." The Enquiry therefore resorted to the **assumption** "that such men were self-employed and unemployed in equal proportion . . . ."

The difficulty involved in comparing the rate of compensation of "attached" and "casual" labourers was dealt with in an unusual fashion. To give the results first, in the words of the **Enquiry:** "The computed daily wage of the attached labourer was less than that of the casual labourer in all the zones and States of the Indian Union. This was perhaps the price which the attached labourer had to pay for the security of employment and stability of income during all agricultural seasons." For the wages of casual workers the computation is stated to have been direct—all payments in cash and kind for the various types of agricultural work were recorded, including customary "perquisites" like cloth, clothing, meals, beverages, etc. The latter were "evaluated in cash in terms of the ruling retail prices." From these data, average wage rates were obtained by weighting them by the number of man-days worked.

The procedure with regard to those workers listed as "attached" was quite different. "The methods of remuneration and employment contracts for attached workers," the **Enquiry** states, "were of such a bewildering variety that the wage rates could not be suitably tabulated." To solve this problem the **Enquiry** resorted to the following expedient: "The computed daily wage of attached adult male labourers has been obtained by deducting the wages earned by adult male casual workers from those earned by all adult male agricultural labourers and dividing the figure so obtained by the man days worked by attached adult male labourers." (Sic ! ! !)

One is reminded of the old story about a shepherd who was asked how he would get the number of sheep in a particular pasture. "It's easy," he replied, "you takes the number of feet and you divides by four."

Where data on exactly the same subjects have been collected at two different stages of the survey, the tables given in the separate volumes exhibit wide variations. Two quite different sets of figures for average daily wages of operations such as ploughing and harvesting are provided by the General Village Survey **(Agricultural Wages in India**—Vol II, p 5) and the Intensive Family Survey, **(Report on Intensive Survey of Agricultural Labour**—Vol I, p 61.) No serious attempt is made to explain or reconcile these discrepancies. In part, these may be due to the fact that the data obtained from the three questionnaires relate variously to 1948-49, 1949-50, and 1950-51. In many tables, data from more than one questionnaire are intermixed. Although there is no explicit discussion of this problem, the fact is that the **Enquiry** used not one but three base years.

The principal data of the Enquiry, what one might call the structural data, show even more astonishing discrepancies. One would certainly have expected that for a given State the relative number of "attached" and "casual" labourers would remain roughly the same from 1948 to 1951, particularly when the data were collected in the self-same villages on the basis of the same "Instructions" and under the same State Supervisor. The table on the next page presents for five States parallel figures from different phases of the Enquiry for the percentages of attached labour families to total agricultural labour families, and the percentages of attached workers to all agricultural workers. It is impossible to discover any consistent relationship within either of these two sets of figures.

For the purpose of a study of agricultural labour in India, the State of prime significance is Madras. It seems particularly unfortunate that at the second stage of the **Enquiry** it was decided for this State alone "to investigate only one out of every two families" in the sample villages. In the end the General Family Questionnaire was filled up for roughly

* **Report on an Enquiry into the Conditions of Agricultural Labourers in Village Dorwan, Bihar State** (New Delhi, Government of India Press, 1951)—**Economic Weekly,** Vol III (September 15 and 29, 1951), Pp 897-99 and 946-49. Professor Dandekar's general criticisms of the **Agricultural Labour Enquiry,** given in the earlier of these articles, remain quite apposite today.

three-fifths of the families in the State's 84 sample villages. (One may note in passing that this important fact is mentioned only among the introductory notes to the volume, **Rural Man-Power and Occupational Structure**, p 2. No other reference to this drastic reduction is to be found, either in the chapter in this same volume on Madras or in the State-by-State Tables at the end of the volume, although the returns from the 60 per cent sample appear under such captions as "Total Population", "Total Number of Families," etc.)

Of the agricultural labour families already listed in the General Family Survey the number in each village selected for the Intensive Family Survey was stated to be "generally 50 per cent." (**Report on Intensive Survey of Agricultural Labour,** Vol I, p 2.) For the country as a whole the final count of families actually included in the Intensive Survey worked out to about one-third of the total agricultural labour families in the sample villages. In Madras the fraction was much smaller. Only 1,535 families of the 8,232 agricultural labour families listed in the General Family Survey were treated in the Intensive Family Survey. But these 8,232 families represented only two-thirds of the 12,447 agricultural labour families found in those 84 villages in the original General Village Survey. In this way the Intensive Family Survey's sample of 1,535 families for Madras ended up as one out of every eight agricultural labour families in the sample villages. It must be said that the most important State for the purposes of this **Enquiry** received the minimum of intensive study.

In the introductions to the various volumes and in the sections on methodology, numerous claims are made for the reliability and precision of the data on the ground that the Survey utilized advanced statistical techniques. The design of the **Enquiry** is described as "a stratified two-stage random sampling—the village being the primary or first stage unit and the agricultural labour family the second stage or ultimate unit." (**Report on Intensive Survey of Agricultural Labour,** Vol I, page 2.) India was divided into 77 "homogeneous" zones on the basis of "broad agricultural and economic considerations"; the number of villages to be allocated to each zone was then calculated on the basis of equal weightage to number of villages and total rural population. The villages were then selected at random with equal probability and without replacement. For the final stage of the **Enquiry**, the required number of families were selected from the list of agricultural labour families prepared during the earlier phase. Once again they were chosen at random, with equal probability and without replacement, the sampling fraction being uniform within each zone.

In practice the delineation of zones was a highly arbitrary operation. The first decision was that each one of the 27 Class A, B and C States should be treated as a separate unit; thus such tiny enclaves as Ajmer, Bilaspur, Coorg, Delhi, Kutch and Tripura automatically qualified as "zones". The Punjab, with a population of twelve and a half million and an area of 37,000 square miles, including plains and hills, irrigated and dry tracts was also treated as a single zone. Its little neighbour State of PEPSU, which has a population and area only one-third of this size and which is situated within the borders of the Punjab, was divided into six zones. By contrast Marathwada and Telegana, the two zones into which Hyderabad was divided, each display a wide variety of geographical, agronomic, economic and social features. To treat this array of disparate and internally variegated areas as a grid of homogeneous cells is statistically impermissible.

The decision to use random sampling for the selection of the families for Intensive Survey from those which had already been categorized in the course of the General Family Survey as "agricultural labour families" is difficult to understand. The returns to the General Family Questionnaire included a great deal of information about these agricultural labour families: whether they were landless or had land, and, if so, on what terms, whether "casual" or "attached", number of earning members, subsidiary occupations of earning members, possession of work animals and ploughs etc. On the basis of these data it would have been possible to construct a stratified representative sampling of the required size in terms of one or more important variates. For example, the Intensive Sample in each village might have been selected so that the proportion of landed and landless families chosen was the same as in the total number

Proportion of "Attached" Labour to all Agricultural Labour by Families and by Workers.

State	Percentage of "Attached" Labour Families to Total Agricultural Labour Families		Percentage of "Attached" Workers to all Agricultural Workers	
	According to General Family Survey[1]	According to Intensive Family Survey[2]	According to General Village Survey[3]	According to Intensive Family Survey[4]
Assam	25.2	11.2	6.2	10.4
Bihar	28.8	1.3	22.4	0.6
Madhya Pradesh	18.0	26.5	13.6	15.8
Madras	5.7	1.4	7.6	3.4
Punjab	34.7	52.7	23.5	50.8

[1] Calculated from Appendix VI, Table 1, "Percentage distribution of different categories of families in terms of the total number of rural families in the different States." **Rural Manpower and Occupational Structure,** pp 504-05.

[2] **Reports of the Intensive Family Survey**: Vol III, pp 205 and 49, Vol VI, p 41; Vol IV, p 61; Vol VII, p 89.

[3] **Agricultural Wages in India,** Vol I, p 31.

[4] **The Intensive Family Survey** reports that practically all "attached" workers in Assam, Bihar, Madhya Pradesh and Punjab, as in most other States, are adult males. The figures for male attached workers in those four States have been taken, accordingly, to represent all attached workers. The figures for these attached workers and for all "casual" workers in those States—which have been drawn upon to calculate the percentages given above—come from the **Reports of the Intensive Family Survey:** Vol III, pp 206-07 and 50-51; Vol VI, pp 42-43; and Vol VII, pp 90-91. The figure of 3.4 per cent for Madras, which reports a significant number of children working as "attached" labourers, comes from the **Intensive Family Survey,** Vol IV, p 29.

RENEWAL OF OUR PLEDGE TO EXPAND INDIAN TONNAGE UNDER THE SECOND FIVE YEAR PLAN

Having added six ships totalling 38621 deadweight tons during the First Five Year Plan period and having also acquired m.t. "JAG JYOTI", India's first commercial tanker, we rededicate ourselves to the building up and expansion of the national mercantile marine under the Second Five Year Plan.

of agricultural labour families in that village.

The ruination of the Enquiry, in fact, may be said to be due to an obsession with the theoretical virtues of random sampling, coupled with an indifference to the formidable problems involved in its application. The published volumes contain several discussions of possible sampling errors, questions of bias, and co-efficients of variation. Nothing is said about the possibilities of non-sampling error inherent in any enquiry conducted by the question survey method. The extent of non-sampling error for a study of this type depends upon whether the designers of the enquiry have formulated with sufficient clarity the concepts about which they wished to gather data; whether the questionnaires and other schedules were properly understood by the field investigators; whether the respondents interviewed by the investigators understood the particular questions put to them; whether the questions posed were such as could be answered verbally with any reasonable degree of accuracy; and, lastly, whether the questions were such that the villagers would be willing to give, or would feel safe in giving, correct information. The plain fact is that in agrarian enquiries in complex economies and societies like that of India the non-sampling errors are likely to be many, many times larger than the error of sampling.

At this stage of our knowledge it would appear that one of the research methods most difficult to apply to the study of India's involved landlord-peasant-labourer relationships is the nation-wide sample survey. In these matters the truth yields itself very slowly, and requires to be sought first in more traditional ways. The problems of analysis, the definition of concepts, the preparation of tentative notions and hypotheses capable of being put fruitfully to empirical testing, all these require patient and systematic work, possibly for some years still to come. To rush in with large-scale sample surveys is simply to waste time and throw away money. The longer the questionnaire, the larger the number of investigators, the more elaborate the scale of operations as a whole, the greater the extent of non-sampling error.

In 1949, when the Agricultural Labour Enquiry was launched, it would have been advisable to keep down the size of the investigation. A dozen or two research officers possessed of commonsense, training, and some insight into the rural scene would perhaps have been enough. These could have been posted to the various regions of India and allowed 18 to 24 months for analyzing the agricultural labour relations characteristic of those areas. They could have been instructed to test part of the information given to them verbally on such items as harvest shares, amount of grain consumed daily, and number of hours worked in a day, by measuring, weighing, and counting for themselves.

To the extent that the General Village Survey included descriptive work, it has produced useful results. The non-quantitative sections of the first volume of the Enquiry (**Agricultural Wages in India**, Vol I) furnish for each State a thumb-nail sketch of its characteristic employer-labourer relationships. Although brief, these accounts provide much interesting information on division of labour, types of payment, the various demands upon labour in the course of the agricultural year, the terms in the local languages for types of labourers, types of services, perquisites, payments, cropshares, etc. The collection and publication of these qualitative data is the most valuable service of the **Enquiry.**

The parts of the **Enquiry** that are likely to attract the greatest attention, however, are the Tables and the sweeping quantitative generalizations made up from them. The trouble is that in our statistical age the temptation to use any tables, no matter how compiled is well nigh irresistible. The more tables, the greater the temptation. One is seduced into believing that no matter how shaky may be the basis of any individual figure, an average or other arithmetical product of a large number of such figures must yield an approximation to the true position. Reflection will show that no amount of manipulation can make more out of the figures than was originally put into them. If the basic categories confuse the essential distinctions, it matters little how many cases fall under each head. Thus if it is not clear what constitutes an attached worker, it does not matter whether the **Agricultural Labour Enquiry** says that in a given State there are 1.3 per cent or 78 per cent of them. An average of such figures, weighted or unweighted, is even less worthy of attention than the original figures themselves.

In the preface to each volume of the Intensive Family Survey we are told that:

> "In the design of the survey, analysis and presentation of data, the recommendations of the ILO in their monograph "Family Living Studies" and that of the UN Statistical Sub-Commission on Sampling were kept in view to the extent possible. The enquiry was conducted in close collaboration with the State Governments and under the technical guidance of the Departmental Committee of Statisticians and Economists. It is hoped, therefore, that the results as also the methods and techniques adopted would be of value not only to the Government and public in India but also to countries in similar stage of economic and social evolution and to international agencies like the ILO and the *United Nations.*"

These surveys may indeed prove valuable to other countries if they serve as an object lesson in how not to conduct agrarian enquiries.

A Policy for Cotton Textiles

R K Hazari

Basically, there appear to be two main causes of the differences over the Cotton Textile Programme :

1) *The level of the capita consumption expected in* 1960; *and*

2) *Value judgements with reference to the decentralised sector and the relative emphasis on the goals of employment and price stability.*

In a controversy of this nature, it is practically impossible to avoid bias but where the choice is between the treatment of a chronic malady and the prevention of an acute disease, the latter should have priority.

In short, price stability is more important under the Second Plan with its inflationary potential than uncertain and costly remedies for diminishing rural under-employment.

THOUGH the Second Plan has been before the public for quite some time now, the Government as a whole still appears to have what may be described at best as an open mind in the matter of textile policy. The draft outline had stated in February that

> "The output targets for mill yarn and mill cloth are at present under consideration and final conclusions have not yet been reached."

The final version of the Plan does not go any further when it says that

> "Overall targets for cloth and yarn production have been envisaged at 8,500 million yards and 1,950 million lbs respectively by 1960-61.
>
> A firm allocation of this output as between the mills and the decentralised sector (powerlooms and handlooms for cloth and Ambar-Charkha for yarn) has yet to be made."

The Plan confirms, however, that

> "the spindleage already installed and licensed for installation is sufficient to produce 1950 million lbs of yarn."

In between and since, a number of conflicting statements have been made by different Ministers of the Central Government. This article is devoted to the rationalisation of these statements as well as other opinions expressed on this subject. One approaches this task with some hesitation since events and policies are moving rather rapidly these days and what is said here may be obsolete by the time it appears in print. The subject, however, is so important and the controversy on it so keen that it is difficult to resist the temptation of risking a plunge. The factual background of the present situation may be briefly recapitulated before we proceed to arguments.

Table I presents the relevant statistics about cloth production, exports and per capita availability since 1950, the first year of the Planning age.

It will be seen that per capita availability of cloth has gone up by nearly 60 per cent since 1950, a part of the improvement being attributable to the reduction in exports. Each of the three sectors of the cotton textile industry has contributed to this increase, though the present author has reasons to believe that handloom production is over-estimated in these statistics. As against a per capita availability of about 16 yards of cloth in 1955, the target for 1960-61 suggested by the Kanungo Report, the Khadi Board's programme and even the Second Plan (Draft Outline as well as the final version) is 18 yards. Together with an export target of 1,000 million yards, this would require a total cloth production of 8,500 million yards in 1960-61. To meet this expected increase in consumption of about 1,700 million yards, broadly speaking, three different lines of action have been proposed by various schools of thought, and one of these is explicitely of the view that the target of 18 yards per capita is unduly low and that, therefore, the increase in production required would be of an order greater than 1,700 million yards.

Khadi Board Proposal

One line proposed by the Khadi Board, and one with which Shri Nanda, the Minister of Planning, is in complete sympathy, is to peg mill cloth production at 5,000 million yards and powerloom cloth production at 200 million yards (incidentally these figures are lower than those quoted in Table I, the discrepancy being particularly obvious in the case of the latter) and also to restrict the present supply of free mill yarn to handlooms at the existing (hypothetical) level of 350 million lbs. The yarn required to fulfil the additional production of cloth estimated at 908 million lbs should come from the Ambar Charkha (improved hand operated spinning wheel) as per the Khadi Board's programme. The Government has not accepted these proposals so far at any rate, in spite of the promise of employment held forth by the Khadi Board. What the Second Plan describes as the "balance of public advantage" appears to have influenced the Government in assigning for the present only Rs 70 lakhs for the Ambar Charkha programme as against Rs 101 crores plus loan faci-

TABLE I

Cloth Production, Exports and Per Capita Availability

Year	Cloth production (in yds)			Exports (in yds)	Available for internal consumption.* (in yds)	Per Capita availability (in yds)
	Mill	Handloom	Power loom			
1950	3,665	805	148	1,120	3,478	9.7
1951	4,076	850	157	823	4,238	11.7

Source : **Indian Textile Industry's Statistical Bulletin Jan 1956 P 14.**

* Includes a negligible quantity of imports and excludes cloth deliveries for "other purposes".

lities to the extent of Rs 632 crores demanded by the Khadi Board. An interesting news item in this connection is a Press release from New Delhi dated March 4, 1956 stating that "There has been a shift towards fine and superfine varieties in the production of handloom cloth during 1955." The Khadi Board' programme is confined to the count ranges 16s to 20s, with an average of 18s .

A second line of action proposed assigns only a minimal or negligible role to the Ambar Charkha but would like handlooms alone to produce *all the extra cloth* required, thereby allowing expansion only of spindles in the mill section. Within this school of thought, there is a deviation, led by the Kanungo Committee, favouring the conversion of handlooms into powerlooms. Most others, however, do not view powerlooms with any favour at all. In the controversy around the Ambar Charkha, this school of thought seems to have vanished from the limelight it enjoyed only a couple of years back, though adherence to it by handloom and spinning mill interests has tended to break up the supposed unity of the decentralised sector and thereby strengthened the case of the mill industry.

The Mill Industry's Case

The third line, put forward by the mill industry, various economists, and also by Shri T T Krishnamachari, the Minister of Commerce and Industry, considers the target of 18 yards per capita in 1960-61 an underestimate and would like to revise the figures to 20 yards, if not 22 yards in view of the recent diversion of exports to the home market, declining mill stocks, full order books with mills, and rising prices particularly of dhoties and saris. (See The Economic Weekly, June 2, 1956 p 642.) The position about stocks is indicated in Table II. Data for the current year are not yet available but if the decline noticed till the end of last year has continued—which is probable since the offtake from the market was reported to have slackened at last only a couple of weeks back—the target of per capita consumption of 18 yards is well on its way to achievement.

Reconciling Employment and Consumption

This school of thought holds, firstly, that handlooms alone are not likely to fulfil even the target of 1700 mn yds (on the basis of 18 yards per capita) due to the difficulty of organisation and high cost and that they cannot, therefore be relied upon to satisfy an additional demand created by higher consumption; secondly complete dependence on the Ambar Charkha for additional yarn supplies would endanger not only the handloom industry but the entire structure of cloth prices and even the budget and the Second Plan through inflation; thirdly, pegging mill production of cloth or yarn or both at the present levels would curtail exports owing to higher home prices, and thereby impair foreign exchange earnings. It is suggested in broad terms, therefore, that the common production programme for the textile industry should be kept free from rigid ceilings. In this programme, the Ambar Charkha should be considered almost wholly as an employment agency in distress areas and not allowed to impinge to any significant extent on the expansion of mill spinning capacity. Further, to meet export and home demand as well as to create an emergency reserve, mills may be permitted to expand their loomage—particularly by installing automatic looms—to such an extent as to create sufficient capacity to produce another 500 million yards.

TABLE III

Average No. of Spindles Worked per Shift Jan 1955

(millions)

Total Spindles installed	1st Shift	2nd Shift	3rd Shift
11.96	10.13	9.46	3.59

Estimates of 'Reserve Capacity'

(mn yds of cloth)

According to	1st Shift	2nd Shift	3rd Shift	Total
G L Nanda	625	1,139	2,139	2,108
T T Krishnamachari	Nil	Nil	230	230

The remainder may be allotted to handlooms and powerlooms, simultaneously making provision for the conversion of the former into the latter. These measures, it is suggested, should meet the Plan objective of reconciling the conflicting goals of employment and consumption stated as follows on p 434 of the Plan:

"Within the limits set by the need to avoid shortage of goods on the one hand, and the extent to which production in small units can be organised effectively to take advantage of a larger market in any individual case, the balance of public advantage will determine whether and at what level the capacity of a large scale industry should be limited."

Reserve Capacity of Mills

To these arguments, the advocates of Ambar Charkha and handlooms reply that the existing mill spindles and looms could be worked more shifts and that the 2.1 million spindles, licenses for which have been granted already, should prove sufficient. In view of the conflicting statistics and expert opinions quoted by Shri Gulzarilal Nanda and Shri T T Krishnamachari, it would be interesting to reproduce some of their figures. In their calculation of spindle capacity, Shri Nanda allows only 2½ per cent of the total spindles in working mills to remain idle on account of repair and maintenance while Shri Krishnamachari considers 5 per cent to be a proper proportion and cuts down the effective capacity further by deducting 0.5 million dilapidated spindles in working mills. The net result is that effective capacity in Jan 1955 is 10.1 million spindles according to T T K and 10.9 million spindles according to Nanda, both of them relying on "expert opinion". Since the number of spindles working on the first shift in Jan 1955 was 10.1 million, T T K finds no reserve capacity, while Nanda discovers unutilized capacity for manufacturing 344 million yards of cloth.

The wide divergence between the reserve capacity estimates of the two Ministers is indicated in Table III. I think that TTK is correct so far as the first shift is concerned; on the second shift, TTK considers another 224 million yards 'possible', taking 4 ozs per spindle shift (which ratio errs on the lower side) but rules it out as improbable. About the third shift, he is definite that the attitudes of employers and employees and the condition of equipment do not justify the optimism of Nanda. One factor to which TTK does not draw attention is that in the case of most mills not equipped with the latest machinery a third shift is seldom economic except when prices go up high enough and labour, raw materials etc are available. An individual mill can produce more at a higher cost on the third shift only if it can market its products easily and at constant if not higher prices—a facility which is normally enjoyed only by the well known mills.

Wide Divergence

Till the suspension of licensing, 2.1 million spindles had been sanctioned by TTK's Ministry. Shri Nanda thinks that together with existing idle capacity, these new spindles worked three shifts could produce more than double the additional requirement of 1700 million yards of cloth. TTK replies that past experience as well as commonsense suggests that some of these licenses will not be utilized, and spindles will take time to be delivered, installed and worked upto the third shift stage; the new spindleage may therefore be expected to give results only after the third year or so.

In weaving also, Shri Nanda again finds enough reserve capacity in the mills, through more extensive third shift working, in the event of a shortage, to produce another 500 million yards of cloth which, in his opinion, renders it unnecessary to allow the installation of additional looms in mills. TTK, on the other hand, would like the mills to have 20,000 more looms, preferably automatic.

Basically, there appear to be two main causes for the differences between the Ministers:

1) The level of per capita consumption expected in 1960, and
2) Value judgements with reference to the decentralised sector and the relative emphasis on the goals of employment and price stability.

In a controversy of this nature, it is practically impossible to avoid bias and the present writer does not claim to be innocent of it, nor does he have any desire to step in where even V I P's fear to tread. All that he would like to say in this connection is that where there is a choice between the treatment of a chronic malady and the prevention of an acute disease, the latter should have a higher priority. Price stability, in short, is more important under the Second Plan with its inflationary potential than dubious and costly remedies for diminishing rural underemployment.

Industry, Investors and the Plan

Genuine investors, who should be as much, if not more, interested in the earnings per share cannot be unconcerned about present yields. It is only the speculator who can live on expectations of future issues of bonus or right shares.

This focuses attention on the unduly low yields on the speculative, though major, equities. As the new Company Law and the Kaldor report will influence the shape of things to come, yields on equities may have to move up to ensure adequate availability of equity capital.

Such a readjustment in equity yield need not necessarily involve any upward adjustment in Bank Rate or in interest rates. This point is not directly under reference here, but the American experience would seem to be conclusive.

DURING the First Plan period, the national income has increased by eighteen per cent. Bank deposits have grown considerably, though the disparity between the rates of growth of bank deposits and of currency expansion has been, and remains, unduly wide. Industrial production has improved, though there has been less expansion in installed capacity. Equities have been buoyant. Both the Union and State Governments have raised considerable loans. And the new issue market has not been inactive.

But investors' reaction to New Delhi's decision to permit issues of bonus or right shares by the two major iron and steel companies only at a premium would seem to contradict both economic and monetary statistics. Indian Iron's sharp set-back since the Government's consent to the Company's request to issue right shares only at a premium of Rs 3½ per share is not mainly due to the fact that the decided premium is a rupee in excess of market expectations. It is mainly due to doubts whether the considerable amount involved in the Company's proposed right issue will be duly subscribed.

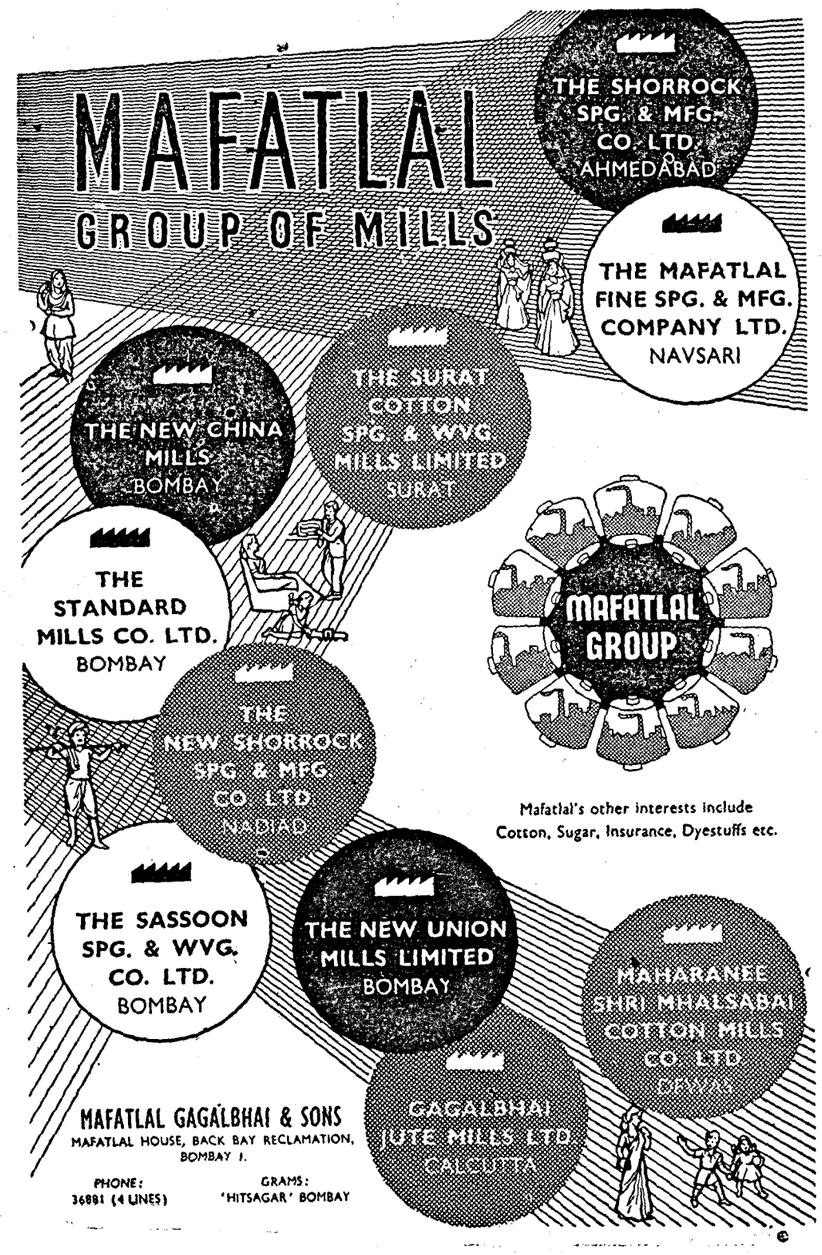
There are wider economic issues which complicate the problem under reference. Industrialists seem reconciled to the Government's new Industrial policy. But investors remain suspicious. They may not be wrong in their suspicions that the public sector will expand gradually to absorb key industries like steel and cement. This may have something to do with the unfavourable reaction to the New Delhi decision to allow issues of new shares by the two iron and steel companies only at a premium. It is clear that, despite Pandit Nehru's assurances that the Government is not committed to wholesale nationalisation of industries, in spite of the repeated emphasis that the two sectors are to be regarded as an integrated whole, these doubts persist.

Company Law Changes

The dearth of equity capital has been a source of persistent complaint with industry in the last few years. Until 1953, taxation alone was blamed for the inadequate availability of equity capital. Two subsequent developments have introduced additional complications. Investors are supposed to have received a shock from the legislation relating to reform of Company Law. Though the psychological impact may be conceded, the reform of the Company Law should not have any lasting repercussion on the investor. On the contrary, the reforms are aimed at helping investors.

That being so, the new Company Law should not adversely affect the supply of equity capital. But, it is arguable, that it may have some temporary repercussion on the problem of financing industries. Some managing agents did help finance the industries they managed. But this could not have been a major source of supply of industrial finance in recent years. It is the administrative aspect of the new Company Law which is more inimical to the present managing agents. But they seem to be reconciled to the reforms, and the new Company Law has had no pronounced effect on the willingness of industrialists to expand.

Taxation and Equity Capital



Taxation has a close relation to the availability of equity capital. Taxation is high. It will increase further during the Second Plan period. To that extent, the diversion of individual savings to the public sector at the cost of the private sector is inevitable. But, then, the gradual expansion of the public sector will result in a considerable increase in national income. It will rise further through simultaneous development in the private sector. All of the expected increase in national income will not be mopped up through rising taxation and public borrowings. Enough should be available as equity capital for the private sector.

It is clear that the Government will implement the substance of the Kaldor report for reform of the system of taxation. This should raise tax revenues, and yet increase incentives to industry. This has been one of the background factors behind the revival in equities in the last two months. Though industry and speculators seem optimistic, investors remain cautious. They have reasons to be hesitant. As a combined result of the new Company Law and the expected reforms of the tax system, industry may be encouraged to plough back profits. But the disbursements to equity holders will be discouraged. In the 1956-57 budget, the outlines of the shape of things to come have been sketched. With the expected changes, the shape of things will become clearer.

Restrictions on dividend payments and on indirect disbursements to shareholders (for instance, a sort of unofficial ban on the issue of bonus or right shares at par) have been mainly responsible for the cautious attitude of investors since March last. But it is necessary to appreciate the precise reason for the hesitancy of investors. Neither the new Company Law nor the Kaldor proposal for tax reforms has much to do with the aggregate availability of equity capital. Both these should, on the contrary, augment the source of equity capital. Only growing doubts about the prospects for yields can prejudice the availability of equity capital.

Dividend vs Earning

Two questions are involved. On the assumption that the private organised sector will have ample

scope for expansion, earnings per share assumes significance. Though the Second Plan, as it has finally emerged, is based on the Plan-frame, the former is more flexible (the cotton textile industry is a possible exception) than the latter in its treatment to the organised private sector of the industry. On this assumption, the earnings-per-share aspect of the problem assumes significance. This has some relation to the future policy relating to capitalisation of reserves. But it would be wrong to assume that any policy involving issues of right or bonus shares only at a premium is necessarily an impediment to the availability of equity capital.

Genuine investors, who should be as much, if not more, interested in the earnings per share cannot be unconcerned about present yields. Along with expectations of future issues of bonus or right shares, the yield factor cannot be ignored altogether. This focuses attention on the unduly low yields on the speculative, though major, equities. Even as industry in India is still mercantilist in outlook, there is too much speculation in stock markets. As the new Company Law and the Kaldor report will influence the shape of things to come, yields on equities may have to move up to ensure adequate availability of equity capital. Such a readjustment in equity yields need not necessarily involve any upward adjustment in Bank Rate or in interest rates. This point is not directly under reference here, but the American experience would seem to be conclusive.

Drain on Capital Market

Immediately after independence, many British companies changed hands at inflated prices. This process involved considerable investment of private Indian capital. During 1954 and 1955, many Indian companies issued bonus or right shares. Some foreign companies issued rupee capital. Considerable funds were invested in oil refineries. Many tea plantation companies and some light engineering companies were bought over by Indian capitalists. Even so, equity capital was shy. As a recent survey of the Reserve Bank relating to 771 companies indicates, only a fifth of the total capital raised by these companies during 1950-53 was through borrowings and equity capital, while four-fifths of the total capital was secured through companies' own resources.

Capitalisation of reserves involved in this process meant subscription

...en so, there has been growing complaint by industry that equity capital is not available in adequate quantities. Statistics up to 1953 have already become out-dated. Only since has deficit financing been implemented seriously. In the last two years, there was considerable private investment in bonus shares and in purchases of British-owned companies in this country. In the current year, the flow of investment seems to have slowed down. Implications of the Second Plan, the new Company Law and fears about rising taxation may have made capital shy. Since the recent payments crisis in Clive Street, companies issuing bonus or right shares have experienced some difficulties.

Outflow to Rural Sector

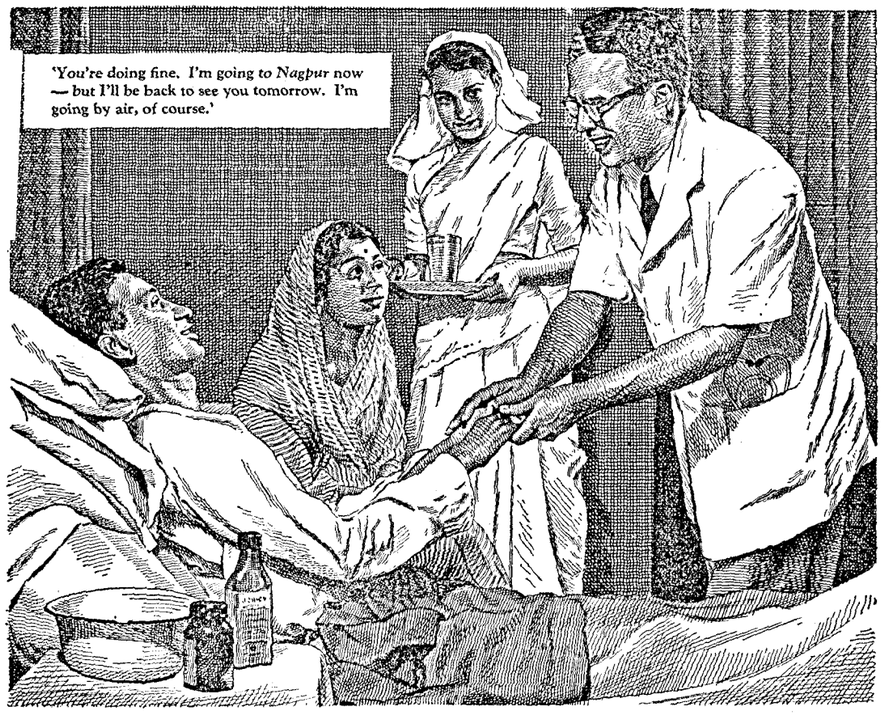
Before the changing pattern of investment is analysed, two related issues may be discussed. Both these issues have been raised by Shri B M Birla in his recent address as President of the West Bengal Finance Corporation. There has been considerable expansion in currency, as a sequel to deficit financing, since the end of 1953. But during and since 1955, the disparity between the rates of growth of bank deposits and currency expansion has been widening. In the current year, the disparity has widened further. Shri Birla argues that this disparity does not mean hoarding of currency, but reflects the growing lack of the reverse flow of funds from the countryside to the town. This, along with rising taxation, is causing scarcity of equity capital.

The scare of relative rural prosperity undermining investment activity had been raised once before. During the war and immediate post-war years, agricultural prices were high indeed. But the urban middlemen, and not the rural community, reaped the maximum gain out of rising prices. And, then, the village community had to pay relatively high prices for the necessities of life. There was no food rationing in rural areas. Villagers hardly enjoyed the benefit of buying cloth at controlled prices. But the situation may change during the Second Plan period. The Second Plan's rural bias, the encouragement to village, small-scale industries, expansion of rural credit and banking facilities and the establishment of rural warehouses should lead to a considerable expansion in the income of the village community. This is at once an opportunity and a challenge to the State Bank and the proposed Insurance Corporation to mobilise rural savings in the next few years.

Whether the disparity between currency expansion and growth in bank deposits reflects rural hoarding, however, is a highly debatable issue. Recent changes in the banking structure ensures canalising of rural savings in the future for productive purposes. Nevertheless, the disparity between the two major monetary indices is highly significant. There is growing suspicion of determined attempts at concealment of incomes. Recent trends in taxation combined with reforms of the Hindu Law do encourage attempts at concealment of incomes. This has been partly responsible for the difficulties experienced recently in securing equity capital. This trend alone justifies serious consideration of the Kaldor plans for reform of the system of taxation.

Resources for Industry

It is no use complaining about the scarcity of equity capital. With the gradual expansion of the public sector, taxation must increase. Therefore, individual savings will not be available in former volumes for the private sector. This does not mean that industry will be starved of finance. In recent years, the pattern of investment has been changing throughout the world. Industry is financing expansion increasingly out of its own resources. Socialist principles of taxation are in favour of a progressive increase in industry's own resources. As industrial profits expand along with direct and indirect limitation on dividend payments, industrial reserves must expand. Thus the future pattern of investment in the organised private sector would involve more and more issues of bonus or right shares.



For equity capital, industry will have to depend progressively on institutional investors. There is the Industrial Credit and Investment Corporation for supplying both equity and "risk" capital to the organised sector of industry. There is the State-owned National Development Corporation to finance modernisation in the two major textile industries of the country. Investment trusts are not important in this country. But the nationalised life fund will remain a source of supplies of both equity and "risk" capital for industry. Bank credits to industry have been expanding. Financial propriety does not prevent supplies of equity capital by banks either through overdrafts or through loans against industrial equities as collateral. Bank credits are expected to play a major role in industrial finance during the Second Plan period.

Small and Medium Scale Industry

Small-scale industries may experience technological troubles. But these industries will not lack finance. Under the Second Plan, provision has been made for aiding these industries. Some of the observations of the Finance Minister in his reply to the debate on the Insurance Corporation Bill imply that these industries may receive additional financial help out of the nationalised life fund. Besides, there is the Small Industries Corporation to look after the technological and marketing problems of these industries.

What of the medium-sized industries in the private sector? State Financial Corporations are supposed to supply the financial requirements of these industries. Unlike large-scale organised industries, these concerns cannot enter the new issue market for equity capital. Nor can these industries offer tangible assets as collateral for loans. These are the explanations offered by State Finance Corporations for the paucity of loans offered by these institutions. If these Corporations are to function like banks, there is no justification for the continued existence of these institutions, especially as their loan rate is as high as six per cent. State Finance Corporations must either encourage unsecured loans at lower rates of interest, or cease to function.

Equity capital, in the sense of individual subscriptions to industrial equities, is likely to remain scarce. But this need not create any financial problem for the organised private sector. Institutional investment has come to stay. This trend will become more pronounced. Simultaneously, the trend towards financing industry out of its own resources is likely to develop further. This latter trend will be encouraged as New Delhi implements the Kaldor plan for tax reforms. Modern trends in taxation make it inevitable that industry will have to finance expansion progressively out of its reserves. And some of the aspects of the Kaldor Plan may even help individual subscriptions to equity capital. If national income expands according to schedule, industry's fears about dearth of capital are likely to prove baseless.

When you have a journey to make, *think first of flying.* It's the fastest way to travel, and often the only way to get there in time. You escape all the tedium of a long journey—flying is so quick, convenient, and wonderfully comfortable.

A Calcutta Diary

The Pathology of a Myth

THE usual place for our fixed images of the dead is the refrigerator we call our memory; thick blocks of ice, recollections of carefully chosen aspects and moments which are happy in retrospect, see to it that the image does not decompose. A nation's way is different; it plants the dead in a hot-house of political enthusiasm, and the result is rich foliage rendering it irrelevant whether the primary seed had ever bargained for this kind of growth. Those who were present at the funeral, and watched the burial, saw the end of a man; the beginning of the myth is what they are later called upon to witness.

The post-mortem life of a leader can take one of two shapes: he can be kept alive as a man, as an undying father-figure about whom no questions are asked, or the body may be thrown into the incinerator and a book placed in the vacuum. In India, for instance, the philosophy of Gandhi has been found easily expendable, whilst the present leadership still worships, externally but sincerely, the man. The Soviet Union may be said to provide an example of the other possible use of a dead leader: the personality is denounced but Stalin's policies are altered but slightly—even if the philosophy is now re-named Marxism-Leninism. It may be that in the choice a leadership makes between the dead man and his philosophy is to be found a clue to the nature and strength of his successors. It may be—I have not examined enough evidence to put it more strongly—that a people which is still creative and growing has less need for an embalmed corpse, for its belief is tangible enough; a people with less vitality will cling pathetically to the man, his photograph on every wall, his statue at every street corner.

* * *

It is quite irrelevant for the purpose of this disquisition whether Subhas Chandra Bose, that gallant patriot of Bengal, is alive or dead. A committee recently collected some evidence and may be expected early to submit its report to the Government of India. It will not be surprising if the committee's verdict is equivocal; it would have been easier for the leader concerned to prove that he is alive than it ever can be for a committee to prove that he is dead. In any case, it is certain that West Bengal will reject the report and continue to believe what she likes to believe. She has certain fixed notions of what attributes and qualities should be found in Subhas Bose, and Bengali ingenuity can be trusted to interpret all evidence to the contrary as just so much more confirmation of what she has always known. A typical example of this was when, at the end of a meeting of the Congress Working Committee, the late Sardar Patel anounced that some financial assistance would be offered to Subhas Bose's widow and child in Austria. Nearly ten Bengali politicians promptly came out with a statement that the whole story was a canard, invented to discredit the Bengali leader.

It was more than the puritanic streak in the Bengali character which spoke in that statement, although even that is interesting enough; it was held to be incredible that so great a man should get married and raise a family. Whilst this innate respect for asceticism was responsible for the people's rejection of Patel's story, it is possible that the second rank leaders who rushed with the statement did so for an additional reason. They might have seen in the story a threat to the myth they had built up around Bose's personality, easily enlarged by his absence. Soon there were photographs of Mrs Bose and Miss Bose, there were facsimile letters from Bose to his elder brother (whose own silence seems, in retrospect, indicative of the possibility that he shared the politicians' fear) and the whole network of evidence caught up with, and closed in on, the agreeable illusion. To this day, however, it is not considered polite to mention the matter of Bose's marriage. It is quite usual to meet people in Calcutta who still do not believe that their idol, a considerable leader by any standards could ever have got married.

Talk to the average Bengali in Calcutta, read any of the nationalist dailies, and you will immediately see the very important position Subhas Bose still occupies in the Bengali mind. Let me repeat it, the Bengali has very good reasons to be proud of so courageous a fighter. What is being examined here, with some caution I am sure I have not been able to conceal, is that extra zeal of which there is not an immediate explanation in available data. Beneath the wholly justified pride over Subhas Bose there is something akin to the desperate possessiveness of a widow to her son, the son who has gone abroad and has not been heard of for a long time. However excessive the display of emotion may seem to the outside observer, it should also be appreciated that grief in a situation such as this can hardly be too much. It is not surprising that the widow has come to develop a resistance to harbingers of what may be bad news. She awaits the postman as intensely as she dreads his approach; she questions his identity when he looks like producing a letter with a black border.

The analyst—and I hope I have kept my judgments to the absolute minimum—is not debarred from being sympathetic, which I claim to be; but he cannot stop there. The widow, when she has other young ones to look after, should be told that her waiting for the son—"missing, believed dead"—is an act of cruelty to her other children. It is a pity that the Shah Nawaz Committee is unlikely to establish Subhas Bose's death or continued existence; either might have put an end to the uncertainty. It seems certain that Bengal's own leaders and newspapers will never do much either to interpret Bose's absence as death or to forget the whole story as an unsolved mystery. They have a vested interest in the story now; they eagerly publish every idle rumour about "Netaji a Member of Mongolian Trade Delegation" or "I 'Phoned Netaji Last Night." All this would be perfectly understandable in a tabloid Press, which Calcutta has not got; the newspapers are serious to the point of being dull. Only in the case of the Netaji myth is sensationalism indulged in—with the result that West Bengal has the afflictions of Wordworth's Margaret. Not a bad subject for sentimental verse, this, but no people in the world today, not even the Bengalis, can live on sentiment and poetry. The problem is not made easier by the fact that there is not, today, an excess of poetry and sentiment either in West Bengal.

—Flibbertigibbet.

Credit Expansion During the Current Busy Season

S N Sen

data regarding agricultural and industrial production and foreign trade during 1954-55 and 1955-56 do not provide any explanation for the higher rate of increase in bank credit in the present season as compared to the previous one. The presumption is strong that this year's increase has been fostered by the speculative holding of commodities. Unfortunately there is some amount of truth in the contention that the Reserve Bank of India and the State Bank were partly responsible.

The high rate of utilisation of cash balances by the banks for the expansion of credit is a matter of serious concern and provides the justification for arming the Reserve Bank with the authority to vary cash ratios. Selective credit control though useful, is not likely to be effective by itself.

THE expansion in the total volume of bank credit granted by the scheduled banks during the current busy season as also the factors that have facilitated it merit careful consideration. The financing of the Second Plan would involve the creation of large quantities of currency. In fact, the total money supply has increased in 1955-56 by about Rs 260 crores, and this is larger than the additions to the money supply in the two preceding years. The behaviour of bank credit under the impact of this factor has got to be watched with a critical eye in the interest of monetary stability.

Certain facts bearing on the situation should be noted at the outset. The present busy season started from October 15, 1955 and from this date to March 30, 1956, the total bank credit granted by the scheduled banks increased by Rs 172.4 crores; total deposits by Rs 18.56 crores; borrowings from the Reserve Bank by Rs 58.84 crores and from the State Bank by Rs 14.76 crores. Total cash balances also declined by Rs 8.4 crores and investments by Rs 30.49 crores.

The accompanying table contains the data relating to the expansion of bank credit in the last five busy sasons. It will be seen that, excepting the busy season of 1950-51, all the other immediately preceding busy seasons witnessed an expansion of bank credit on a much smaller scale than that in the present season. The average rate of expansion in bank credit in the last five busy seasons, 1950-51 to 1954-55, was Rs 118 crores, against Rs 172 crores in 1955-56, and this amount would rise still more by the time the present busy season is over.

Are there any special factors at work during the present season which may explain the rather large expansion in bank credit? But unfortunately the data regarding agricultural and industrial production and foreign trade in the two years, 1955-56 and 1954-55, do not provide any explanation for the higher rate of increase in bank credit in the present season as compared to that in the previous one. The average level of agricultural production during the current year is admitted to be lower than that in 1954-55. The total volume of exports during the eleven months of 1955-56 for which statistics are available is almost the same as that in the corresponding period of 1954-55. The Reserve Bank's price index of exports was 93 during the last quarter of 1955,—about 8 per cent below that in the same period of the previous year. The price index of imports, however, was higher by about 3 per cent—during the same period of both these years. The busy season of 1950-51 witnessed an expansion in bank credit which was slightly larger than that during the present. This expansion took place under the impact of the inflationary upsurge generated by the Korean War. The Annual Report of the Reserve Bank ascribed the high rate of increase in bank credit in that year to "the need to finance trade and movement of commodities at rising prices, to the continued high level of exports as well as to a degree of speculative holding of commodities". The general index of prices rose by 11 per cent during the busy season of 1950-51 and by 8.7 per cent during that of 1955-56. In the former year the value of exports was also larger than that in the latter. It is, therefore, difficult to find adequate justification for the expansion in bank credit that has taken place in the current busy season when all the relevant factors are examined in relation to the years 1954-55 and 1955-56. The presumption is strong that this year's rise in bank credit has also been fostered by the speculative holding of commodities as was the case during the busy season of 1950-51.

Moreover, this year's expansion in

Changes in Total Credit and Deposits of Scheduled Banks

(crores of rupees)

Season	Credit	Deposits
Nov. 25 - May 11 1950-51 (B)	+180.29	+21.81

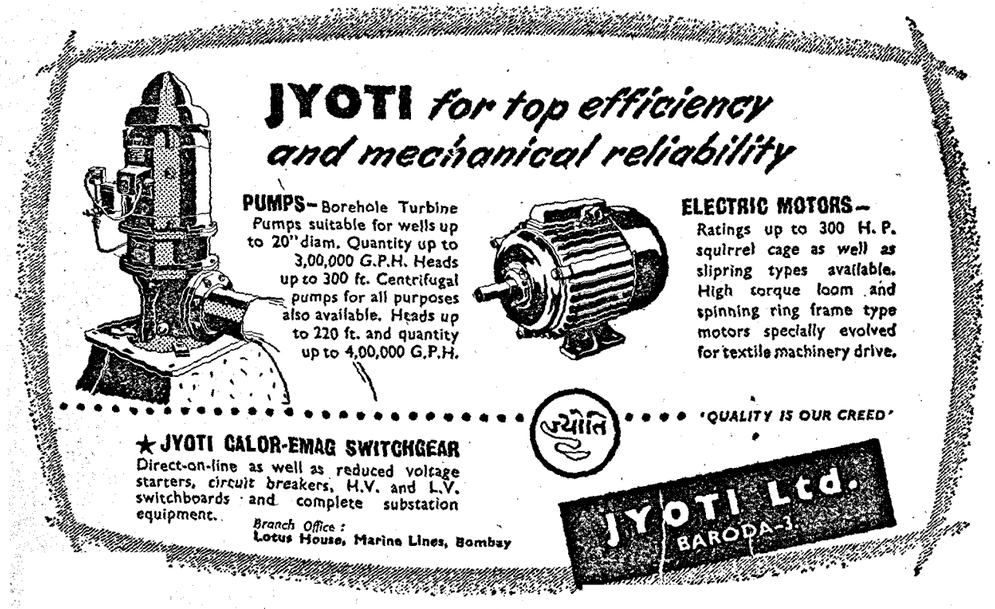
Oct. 15 - March 30 1955-56 (B)	+172.4	+18.86

(B) denotes busy season and (S) slack season.

bank credit should be studied against the background of the events which took place in the previous slack season In the busy season of 1954-55, lasting from October 16 to April 8, bank credit increased by Rs 109.13 crores. In the ensuing slack season, bank credit contracted by only Rs 34.14 crores. Thus only 31.3 per cent of the additional bank credit created during this busy season returned to the banks in the slack season. This rate of contraction of credit in the slack season is much lower than any during all previous slack seasons. The rate of contraction in the slack season of 1951 was 47.7 per cent of the previous expansion in bank credit, and even this rate was regarded by the Reserve Bank as extremely unsatisfactory. This lower rate of contraction of bank credit was stated to be one of the reasons for raising the Bank Rate in November, 1951. The rate of contraction in the slack season of 1955 is the lowest on record. The average rate of contraction of bank credit during the five preceding slack seasons works out at 86.6 per cent of the expansion in bank credit in the previous busy seasons. Had bank credit contracted by the average rate in the slack season of 1955, it would have declined by at least Rs 94 crores. Thus by the end of the slack season of 1955, the economy had retained about Rs 60 crores of the additional credit created during the last busy season. The expansion of credit in the present busy season by Rs 172 crores has thus been super-imposed over an already inflated economy. No wonder, therefore, that the ratio of advances to deposits rose to an all-time high of 73.02 per cent. The previous highest ratio was 69.6 per cent at the end of the busy season of 1951-52, and the high ratio was brought about partly by the decline in total deposits by Rs 26 crores which took place during that season. But during the present busy season, the total deposits have, on the other hand, increased by Rs 18.86 crores.*

The rate of expansion in bank credit in the last few months should have been checked, especially when it was found that the rate of contraction in bank credit in the last slack season was extremely unsatisfactory. Unfortunately there is some amount of truth in the contention that the Reserve Bank had also some share in this expansion process. Scheduled banks' borrowings from the Reserve Bank were the highest, being Rs 65.08 crores on 30th March, 1956. Such borrowings remained above Rs 10 crores in 10 months of the year, 1955-56, as against only 5 months in 1954-55 and 1953-54, 4 months in 1952-53 and 6 months in 1951-52. The Annual average of borrowings from the Reserve Bank formed in 1955-56 3.8 per cent of the total scheduled bank credit as compared to 2.6 per cent in 1954-55, less than 2 per cent in 1953-54 and about 2 per cent in 1952-53. Of the additional bank credit created by the scheduled banks, 8.5 per cent came from the Reserve Bank in March, 1956, and 5.8 per cent in March, 1955, 5.7 per cent in March, 1954 and only 3.5 per cent in March, 1953. Thus the Reserve Bank's share or compliance in this process of expansion of bank credit was also not inconsiderable. The State Bank of India has also some responsibility in this matter since its nationalisation. Borrowings from the State Bank amounted to an all-time high figure of Rs 19.71 crores on the last week of March, 1956, as against only 8.07 crores in the same period of the previous year.

The only step taken by the Reserve Bank was to raise the rate for advances under the Bill Market Scheme from 3 per cent to 3½ per cent as from March 1, 1956 and to withdraw the concession granted to banks hitherto in respect of the stamp duty. This of course resulted in some slight shift away from the method of borrowing through the Bill Market Scheme, the ratio of such borrowings to the total borrowings from the Reserve Bank declining from 51.8 per cent in February, 1956 to 45 per cent in March, 1956. But there is no evidence that it has restricted the growth in the volume of borrowings from the Reserve Bank or in that of bank credit. It is difficult to understand why the Reserve Bank failed to take suitable steps to arrest this rising trend in bank credit, especially as the contraction of bank credit in the slack season was inadequate, and as the ratio of advances to deposits rose above 70 per cent inspite of some rise in bank deposits. There was, moreover, no underlying factor in the economy to justify such a heavy rate of expansion in bank credit. On the other hand, there is a good deal of danger in this process, especially when a faster rate of expansion in currency is going on simultaneously. The other constituent of the money supply viz: bank credit, could not be allowed to proceed at the same time at more than the average pace. An increase in the Bank Rate by (say), half per cent at the beginning of 1956 would not have probably been a bad thing to do. It could have prevented increased resort to borrowing from the Reserve Bank by serving a sort of warning to the banking system to go slow. Time has, moreover, arrived when the Reserve Bank should seriously take up the consideration of evolving a convention to the effect that loans to a bank would be granted only under exceptional circumstances when the ratio of its advances to deposits is near about 70 per cent. As a general rule, banks should regard that ratio as the ceiling, and they should try to remain well within this limit, and when the actual ratio is approaching near this figure they should go to sources other than the Reserve Bank or the State Bank for loans.



Another noticeable trend has been the running down of excess balances which seems to have been the practice with the scheduled banks in the last 3 or 4 years. They are increasingly using up their cash balances in their search for resources for financing the expansion in advances. Thus throughout 1955-56, banks maintained lower cash reserve ratios than those of earlier years. In that year, this ratio never rose above 9.04 per cent while the maximum was 11.16 per cent in 1954-55, 10.16 per cent in 1953-54, and 11.40 per cent in 1952-53. It was still higher in earlier years. In third week of March, 1956, the ratio declined to the lowest figure of 7.8 per cent. Throughout the year, 1955-56, the ratio was always below 9 per cent except in two months, whereas it was above 9 per cent in six months of 1954-55, 5 months of 1953-54, and 11 months of 1952-53. The banks have thus been raiding their cash balances during the last four years in order to increase their advances, helped, no doubt, by the growth in habits of rediscounting. In the five years 1950-51 to 1955-56, the total deposits of the scheduled banks have increased by about 16 per cent, while their total cash balances have actually declined by 8.7 per cent.

The result has been the considerable decline in the amount of excess balances possessed by the scheduled banks. The excess balances have fallen from an annual average of Rs 18.89 crores in 1954-55 to Rs 13.93 crores in 1955-56. On March 23, 1956, the excess balances came down to the low level of Rs 6.89 crores. We already know that the growth in bank credit in the busy season of 1950-51 was larger than that in 1955-56. But in that year the excess balances at the end of the period were 1.5 per cent of the total deposits against only .84 per cent on 30th March, 1956.

It may be urged that there is nothing alarming in this process. These excess balances represented potential lending capacity, and once banks use them up, their dependence on the Reserve Bank for any additional funds would be complete. Our banking system would then come closer to the British, rather than to the American organisation. In the meantime the range of fluctuations in the cash reserve ratios has tended to come closer on account of this factor. In 1955-56, the cash reserve ratios have remained within the limits of 9.04 per cent to 8.08 per cent, against 11.16 per cent and 8.28 per cent in the previous year. Disappearance of fluctuations in this ratio may prove to be an important factor perfecting the control mechanism of the Reserve Bank.

But this rate of utilisation of excess balances is certainly a matter of serious concern at a time when the economy has also to absorb large injections of currency. In view of the increasing resort to deficit-financing which might become necessary in course of the Second Five Year Plan, such activisation of idle balances is fraught with grave danger. It is this fact which provides the justification for arming the Reserve Bank with the authority to vary the cash reserve ratios. Such an authority ought to have been granted to the Reserve Bank long ago. The high rate of expansion of bank credit during the present busy season could have been checked had the Reserve Bank raised the cash reserve ratios by, say, one per cent. That might have slowed down the process of speculative hoarding of commodities, and so made the rate of adjustment of the relative price levels of agricultural and manufactured goods more smooth and less alarming. It is never too late to learn, and let us hope that the Reserve Bank would not fail to use this power vigorously and timely for keeping the growth in bank credit within proper limits. Recourse to the method of selective credit control, though belated, has its undoubted use. But it is not likely to make any significant impression on the growth of total bank credit, except indirectly, and it is not an easy method to administer. The use of the instrument of variable reserve ratios in conjunction with the selective credit control is, therefore, absolutely essential for steering the banking system along the desired direction.

* In a summary of the Annual Report on the Trend and Progress of Banking in 1955, released to the press, the relatively small contraction in bank credit in the slack season of 1955 has been ascribed to "the beginning of the growing diversification of the Indian economy", leading to a general rise in credit demands. It is rather difficult to accept this as a valid explanation of such a disquieting trend. Surely diversification of the economy cannot have proceeded in course of one year at such a pace as to justify an increase in total bank credit from Rs 109 crores to Rs 172 crores and a decline in the rate of contraction in credit in the slack season from 55 per cent in 1954 to 31 per cent in 1955.

Industry in the Plan

Some Unresolved Points

George Rosen

Experience of Indian industries like cement and steel indicate that the investment requirements in the industrial sector will probably be greater than anticipated in the Plan, and that this increase will be felt especially in the public sector, to which are reserved many of the more capital intensive projects.

If there is an underestimation of capital requirements it may prove necessary to tighten priorities further, to extend the Plan over a longer period of time, or finally to change the priorities somewhat to lay greater stress on industries of lower capital intensity.

There is no discussion of price policy in the Plan. This may reflect a belief that price should not interfere with desired social goals. However, there may be some question whether the price system might not be used to a greater degree in assisting in the allocation of resources.

One other industrial area which the Plan skirts is the field of small industries. While an allocation of Rs. 200 crores is made for these industries, the bulk of the discussion in the Plan is confined to the village hand industries. Further exploration of the possibilities of starting ancillary industries performing work on a sub-contracting basis for larger firms would have been desirable.

THE two major general characteristics of the industrial programme in the Second Five Year Plan are

(1) the great increase—a tripling—of proposed investment for large and medium size industry, compared to the actual expenditures in the First Plan; and

(2) a pronounced shift to dependence on the public sector for the largest proportion of this increase.

In the First Five Year Plan an actual investment of Rs 57 crores was made for large and medium industrial projects in the public sector, and one of Rs 340 crores was made in the Private sector. The investment in the public sector was about 55 per cent of that proposed at the start of the Plan; that in the private sector was about 75 per cent of that originally proposed. Of the total investment of Rs 397 crores almost 85 per cent was by the private sector.

The total planned investment in organised industry in the Second Plan is of the order of Rs. 1200 crores. It is proposed to invest over Rs 600 crores in investment in the large and medium industries in the public sector (including the National Industrial Development Corporation). The programme of investment in the public sector is envisaged at Rs 570 crores. This is over a ten-fold increase in the investment in the public sector, and about a two-thirds increase in the private sector as compared to the First Plan.

Low Capital Output Ratio

The Second Five Year Plan as presented in the final version does not attempt to estimate the addition to national income from the industrial sector, anticipated by this great increase in investment in industry. However, since the total increase in national income is the same as that presented in the earlier Draft Outline of the Second Five Year Plan, it may be assumed that the planned increase in each sector also remains the same as in the Draft Outline.

During the period of the First Plan the increase in net national product, with the investment of Rs 397 crores in factory establishments, was Rs 250 crores. This equals a capital output ratio of approximately 1.6:1. For industry this is a low ratio, and its lowness is best explained by the existence of unutilized capacity in industry which could be used to expand output without major investment. For the Second Five Year Plan period it may be reasonably assumed that there is far less unused capacity. This may be one reason for the somewhat higher capital output ratio anticipated in the Second Plan period. With the investment of Rs 1200 crores it is anticipated that net national product from factory establishments will increase by Rs 540 crores—or a capital output ratio of 2.2 : 1.

Possible Alternatives

It is probable that this higher anticipated ratio is still too low. The Second Plan has a system of priorities laying major stress on setting up or expanding output in the producers goods industries—iron and steel, heavy chemicals, heavy engineering and machine building, aluminium, cement, chemical pulp, and light chemicals and drugs. Almost all the industries in which the public sector is investing are in those areas as also over 50 per cent of the proposed investment by the private sector.

Research has already indicated that the capital output ratios in the cement and steel industries will be of the order of 3:1 for new or expanded plants; for such industries as heavy chemicals and heavy machine building, the capital output ratios are probably at least of equal magnitude. This would indicate that the investment requirements in the industrial sector will probably be greater than anticipated in the Plan, and that this increase will be felt especially in the public sector, to which are reserved many of the more capital intensive projects. If there is an underestimation of capital requirements for this development, this may require various alternative solutions. Additional capital may be attempted to be raised, but this is probably the most difficult of the alternatives. Otherwise it may prove necessary to tighten priorities further, diverting investment from lower priority areas in industry or other sections of the economy to the higher priority industrial areas. It might also be considered desirable, as several government leaders have already stated, to extend the Plan over a longer period of time, and several of the lower priority industrial investments could be made later. Or finally priorities may be changed somewhat to lay greater stress on industries of lower capital intensity.*

* The Plan itself says at one point "If due to a stortage of financial resources, a scheme of priorities has to be worked out in connection with NIDC projects, the highest priority will have to be given to schemes connected with heavy machinery....." (p 404) —Ed.

Public and Private Sectors

With respect to the relative roles of the public and private sector, to a certain degree policy is circumscribed by two facts—first, the Industrial Policy Statement which reserves certain industries, or their expansion, for the public sector, and second, the inability of the private sector to finance certain large projects such as the projected great iron and steel works. However apart from these restrictions, it can be stated, based on the accomplishment in the First Plan, that the private sector was reasonably successful in achieving the desirable social goal of increasing production during the period, while at the same time profits increased. The First Five Year Plan with the commitment of a definite government programme of expenditure in the economy, proved highly stimulating to the private industrialist. With the expectation of increased spending in the Second Plan it is to be expected that this stimulus will continue. At the same time the attitudes of the private industrialist with respect to ploughing back profits into industry are increasingly such that, given an atmosphere conducive to this investment, he will continue to re-invest. The private industrial sector is in an early period of self-generating growth, and if this is encouraged, with proper social protection to prevent abuses, it could lead to rapid development of the economy.

The Plan for the private sector as presented in Chapter 19, is inevitably only the rudiments of a plan. It is based largely on the license applications of existing private firms for expansion or production during the next five years. At present rates of expansion, with present plans and attitudes toward further expansion, and with access to capital resources which may be underestimated in the Plan, it would not be surprising if the private sector both exceeded its various targets, and entered into areas of production unforeseen in the Plan.

At the same time the expansion of the government's industrial activities by ten times (in terms of investment), is more difficult to envisage. Apart from the difficulty of raising the capital for the expansion (which may be greater if there is underestimation of the requirements), there is the major problem of whether it will be possible to increase the administrative capacity of the government to handle such greatly increased responsibility within such a short period of time.

No Price Policy

It is of some interest that there is no discussion of price policy in the Plan. This may reflect a belief that price should not interfere with desired social goals. However there may be some question whether the price system might not be used to a greater degree in assisting in the allocation of resources. The present system of relatively low fixed prices for certain major manufactured products, such as cement, steel products, and paper, among others, may make it possible for the government to meet its requirements at relatively low cost; but it also may result in encouraging a presently undesirable demand for the price controlled products. This encourages development in certain low priority fields—such as luxury housing—at the same time as it diverts scarce resources away from higher priority areas. To the degree that such products must be imported, it also contributes to increasing foreign exchange difficulties.

Ancillary Industries

One other industrial area which the Plan skirts is the field of small industries. While an allocation of Rs 200 crores is made for these industries the bulk of the discussion in the Plan is confined to the village hand industries; and the larger part of the investment is planned for these industries. Further exploration of the possibilities of starting ancillary industries performing work on a subcontracting basis for larger firms would have been desirable. With such a large proportion of the investment for large industry in heavy and light engineering, a system of subcontracting parts of this machinery output to smaller firms might lead to greater increases in employment than currently envisaged from this sector. Since the central government is playing a major role in setting up the engineering works its encouragement of the development of ancillary works around government factories could prove fruitful. Such a programme by both the public and private sectors, however would require a conscious policy both on the part of the government and larger private industry to provide credit, needed raw materials and machinery, and proper inspection of finished products to ensure that the small industrialist would be able to enter production, to produce goods of high quality, and to grow. It may also call for steps to reduce the network of red tape which either exists, or more important, is believed by the small industrialist to exist, and which discourages contact between the small industrialist and the government.

This paper has raised certain questions with respect to the size and direction of the industrial portion of the Second Five Year, as well as certain problems with respect to implementing the Plan. The purpose has not been to give unsolicited advice, nor to perform the easy task of criticising from an ivory tower from which choices in a political setting do not have to be made. Rather it has been to stimulate discussion of certain unresolved points in the Plan, without in anyway denying its boldness and scope.

The Coal Sector of the Plan

K M Purkayastha

If the Plan estimate of India's requirements of coal by 1960-61 were correct—happily, it is not—the industrial segment of the Plan would have foundered on the rock of an acute shortage of coal.

The target of coal production put at 60 million tons in the last Plan year may not be attainable but the author does not think that the requirements in that year are likely to exceed 52 million tons. A rise of output of 15 million tons above the present output of 37 million tons is, however, feasible though it is perhaps the maximum that can be attained. Therefore, there is no reason to fear an imbalance between supply of and demand for coal in the Second Plan period, though annual balances may not be easy to strike.

COAL is of major importance in the Second Plan, not only because of its basic role in any large industrial programme, but because of the particular pattern of industrial investment envisaged in the Plan too. The highlights of that proposed pattern are the large expansions of steel and cement output, which will make heavy demands on our available resources of coal.

Even in Prof Mahalanobis' Draft of the Plan, released in April last year, the 1960-61 target for coal was placed at 60 million tons. Its breakdown into different uses was as shown under:—

	mn tons
Railways ..	14
Electricity ..	5
Iron & Steel ..	15
Brick Manufacture ..	5
Cotton Mills ..	1.5
Jute Mills ..	0.5
Paper Mills ..	1
Fertiliser Industry ..	1
Other Industries ..	4
Bunker & Steamers ..	2
Domestic Fuel ..	7.5
Synthetic Petrol ..	1.5
All other uses ..	2
TOTAL ..	60

This is a near output-input analysis for coal consumption as envisaged in the last year of the Plan. This same estimation has been retained in the Plan. Also, the requirements of coal during the current and four subsequent years were given as shown below:—

Year	Production mn tons	Requirements mn tons	Estimated Gap mn tons
1956-57	40.5	47.5	7
1957-58	43.7	48.9	6.2
1958-59	47.6	56.6	9
1959-60	53.9	59.4	5.5
1960-61	60	61	1

Thus, according to the Plan, the coal situation in the country is likely to be critical even in the current year, and though by 1960-61 the situation is expected to improve considerably, a short-fall of 1 million tons is estimated even then.

Sources of Production

Much thought has been given to evolving a programme regarding the sources from which the additional supply of coal may be derived during the Second Plan. This programme is at present as follows:

Mining Source	Output in 1961 (mn tons)	Increase over Current level (mn tons)
Raniganj Coalfield	18.6	5.94
Jharia coalfield	16.69	3.50
Karanpura coalfield	6.00	4.56
Bokharo Coalfield	2.88	.50
Korba coalfield (virgin area in MP)	4.00	4.00
Central India field	5.31	3.00
Singarani (MP)	2.92	1.50
Total increase		23.00

The figures in the last column were based on the output in 1954 of 36.7 million tons. In 1955 total output has moved up by about a million tons, so that if the planned output is achieved, the 61 million tons mark will be reached by the end of 1960.

Critical Appraisal

Against this background of reality and planning in our coal situation, four issues emerge for a critical appraisal. In the first place, are the estimates of the demand for coal in 1960-61 reliable? Secondly, is the target of production set in the Plan capable of achievement, and if not, what is the likely output, taking the various limiting factors into account? Thirdly, is the problem of additional output entirely quantitative, or has it a qualitative aspect as well? And lastly, how will the wage award recently announced for colliery labourers affect the programme for increased production?

Regarding the first question, it appears that even with all the luck in our favour in the expansion of the steel industry, its requirements for coal are not likely to exceed 10 million tons, calculated at the rate of 3 tons of steam coal usable as hard coke for every ton of pig iron manufactured. The two new plants for chemical fertiliser are not likely to be based on sulphur, so that hard coke for its recovery from gypsum will not be needed. The synthetic oil project has been practically dropped. The chances for the demand for coal for domestic use reaching a figure higher than 5 mn. tons appear very remote. On the whole, India's requirements of coal by 1960-61 are very unlikely to exceed 50 mn tons. A maximum of another 2 mn. tons may be allowed to cover a margin of error in these estimates.

Probable Growth of Output

We turn next to the probable growth in output. There is hardly any virgin coal-bearing land left in the Raniganj field, and mining has been already carried to considerable depths below the ground. As against the 5.94 mn. tons of additional coal estimated to be raised from this field, it does not seem to be able to yield more than another 1.94 mn. tons, so that the estimate is too high by 4 million tons. For Jharia too, the estimate is high by at least 1 mn. tons, and by perhaps the same amount in the case of Karanpura field. The virgin area of Korba in South-east Madhya Pradesh is no doubt a very rich potential source, but its exploitation raises a number of problems incidental to opening a new area. Thus, the likely effective output from this field within the deadline of 1960-61 is perhaps 2.5 mn. tons, showing the estimate in the Plan being at least 1.5 mn. tons too high. Summing up the overall prospect, a rise of output of 15 mn. tons is the maximum achievable. This gives an output of 53 mn. tons by 1960-61, which balances well the

maximum likely requirements of 52 mn. tons. Indeed, if the planners' estimate of India's requirements of coal by 1960-61 were correct—which happily is not so—the industrial segment of the Plan would have foundered on the rock of an acute shortage of coal.

Metallurgical Coal

It is an over-simplification of the problem to estimate the demand for coal almost wholly in quantitative terms. Actually, it is the metallurgical coal—the quality with high carbon and low volatile—the deficit of which constitutes the crux of the problem. Today about 8 mn. tons of this quality are being mined. Of this 5 mn. tons are used in the steel furnaces and allied uses, and the balance of 2 to 3 mn. tons go for non-metallurgical consumption. Even according to our own estimates given earlier, the additional requirement for steel furnaces is about 5 mn. tons—a deficit not likely to be met by diverting all the available metallurgical coal to steel furnaces only. The current official assumption is that low grade high carbon coal will be first washed and then carbonised into hard cokes. The method will be wasteful and raises numerous incidental problems. A real solution of the problem lies in the adaptation of non-coking coal, as it is, in low-shaft steel furnances. Experiments on this are in progress in a pilot plant in Jamshedpur, and on its results depend very considerably the future solution of India's coal problem from the qualitative point of view.

Wage Rates and Coal Price

Lastly, it is certain that our coal economy will receive a heavy blow by the introduction of the new enhanced wage rates for colliery labour, awarded recently by an Industrial Tribunal, after a prolonged hearing of the points of view of the workers and employers, for a period of over two years. Briefly the terms of the award are these: that on the present level of wages, dating to the Conciliation Board Award of 1947, the wages of the time-rated unskilled workers have been increased by 61 per cent, those of the skilled surface and underground workers by 31 per cent, and of the piece-rated miners and time-rated loaders and trammers by the same proportion.

Whether these increased wage costs variously estimated at Rs 3 to Rs 3/12 per ton of coal—will be covered by a corresponding increase in the controlled price of coal is yet to be seen. A large gap between costs and price will send many collieries to the wall. Further, the effect of higher piece-rates for machine miners will largely eliminate the cost-advantage of mechanised as against hand-picked mining. On the whole, the award will not operate as an incentive, but rather as a disincentive, in boosting up production by the workers. Thus, even without going into the other economic effects of the award, its probable unfortunate effect on production is hardly to be doubted. But the situation is yet fluid, and any clear conclusions must wait announcement by Government of the revised schedule of coal prices.

The Travail of Planning

The Ministry of External Affairs has a Director of Conferences. The Planning Commission has none. It cannot afford the luxury. Yet, there are more conferences in the Planning Commission and due to it than in the whole of the conference-run Central Secretariat.

If a Directorate of Conferences was established in the South Wing of Rashtrapati Bhavan to plan the output of the planners, the result would be embarrasing in the extreme. You might then have a Planning Commission with a Planning Commission and you would not know which was larger!

SUCH flippant talk is often heard, whenever the Planning Commission is discussed over coffee cups, in the bars or the drawing rooms of the capital—and that happens most of the time. That the Planning Commission is such a favourite subject of conversation is, in a sense, an acknowledgment of its central role in the life of the nation and the activities of the Government. It is an all embracing, ever-increasing role. The Commission, as some one put it, is spreading its tentacles wider and deeper into India's chunk of the time-space continuum. Not only is a bigger sector of the country's economy coming within the purview of planning, the idea of perspective planning, too, has begun to take root. At the practical level, therefore, every time there is talk of administrative economy, the organisation of the Planning Commission expands.

Herein lies the Commission's dilemma. In terms of the task assigned to it, the Commission's organisation is small. The few top-level officers and members of the Commission over-work themselves pitilessly, attending meetings during the office hours and spending almost as much time afterwards to clear their desks. But the multifarious functions that the Commission is being called upon to do, engender a certain amount of specialisation and a corresponding decentralisation of responsibility. And as soon as that happens, there is danger that the various wings of the Commission, like those of the Government, may go their several ways and planning may thus lose the cohesion and unity that should be its essence.

For nearly five years now the Planning Commission has tried to grapple with this dilemma. During the formulation of the First Five Year Plan, and even during the period of its execution, the conflict between its ends and methods was not so pronounced. The First Plan did no more than to project the then current rate of annual development expenditure over a quinquennium. The targets of outlay were modest; deficit financing on the scale that was envisaged proved to be unnecessary. Similarly the planned foreign exchange deficits could not be incurred. Everybody was agreed on according first priority to agriculture. The programmes for expansion of social services were hardly spectacular. Above all, no one contemplated a basic change in the social order.

The creation and compilation of the Second Plan has been comparatively an extremely complex affair. The outlay has been raised progressively to proportions twice as high as the firm resources. The estimates of foreign aid, the extent of deficit financing that the economy can safely bear are controversial; the "gaps" are palpable. Besides, the Plan has a social philosophy which, many believe, is in conflict with the economic reality.

These factors, apart from the ramified data that was available from the Central and the State Governments, impelled the Commission to pause, assess and think at every stage of its work. Planning for the second five years has been much less mechanical than for the first.

In that context, it is intriguing to recall the debate that was suddenly raised by Shri K C Neogy's "note of dissent". Surely Shri Neogy must have held the views he expressed in that note all along; it is impossible to imagine that, like Shri T T Krishnamachari, he flung a surprise at the Commission. The fact is that Shri Neogy had opposed the raising of the Plan outlay at every stage; he had pressed for adequate provision for transport all along. If he was over-ruled in the full session of the Commission, it was always after he had had his say; in fact for months he carried his resignation in his pocket and desisted from sending it in, only because of the personal requests of the Prime Minister. It was again on the intervention of Pandit Nehru that the gist of his thesis was incorporated in a crucial paragraph of the Second Five-Year Plan which cast a doubt on the contents of all its 641 pages.

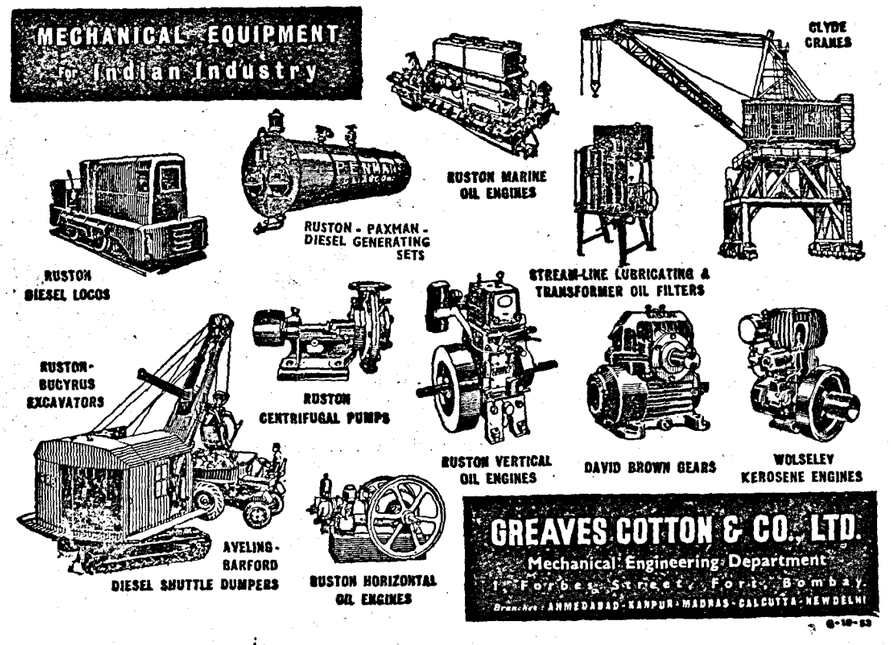
Apart from the dispute among the members of the Commission, another conflict in relation to planning is worthy of mention—the conflict between the Centre and the States. Of course the Planning Commission had the whip-hand; it allotted the funds. But the States did everything in their power to try to secure a larger chunk of the cake. In U P for instance, the size of the Second Plan was revised progressively upwards from Rs 350 crores to Rs 450 crores to Rs 750 crores. Ultimately this largest State of the Union, —populationwise, was sanctioned a Plan of Rs 253 crores. One shudders to think of the waste in time, organisation and administrative resources that such calculated attempts to deceive involved. The Planning Commission officials freely recall that their discussions with the State Governments used to be the most tiresome and frustrating part of their duty.

It was however at one of the last meeting of the National Development Council before the finalisation of the Second Plan that Shri K Hanumanthaiyya shed all reserve to attack the Commission for neglecting the south. He had the sympathy of most of the southern states when he said that from their point of view the Plan was a downright "fraud"—it taxed their resources without making a proportionate provision for spending them in their territory. He backed his charges with figures. All the major development works including steel plants were located in the north; not a mile of new railway line was to be built in large areas of the south under the First and the Second Plans. For a moment, the Council reeled under his vehemence but obviously he was too late!

What is the Commission doing now? The drawing up of the Annual Plan is avowedly the next item on its agenda. Discussions with the State Governments will begin again. But while attempting the task, the Commission is facing again its basic problem—the inadequacy of the organisation in face of its responsibilities. The weakness is likely to prove crippling when the Commission has to grapple with details.

Some of the administrative gaps, however, are being filled. For instance, an Adviser on Oil has just been appointed. But it would be futile to expect that the diligence of its officials would all the time make up for the paucity of their number. Of course, the key personnel of the Commission will never work less than 12 hours a day. By and large, however, expansion of the Commission's organisation would become inevitable, if it has to combine the functions of a watch-dog of the nation's development with those of an author of its detailed blue-prints. And very soon the need of a perspective planning unit may be felt: the Commission has proved itself quite receptive to foreign opinions on the technical aspects of planning and it is unlikely that the seed dropped by M Mikoyan has fallen on altogether barren soil.

The Commission's other problem is likely to be more ticklish. How will it acquire an ideology or at least some kind of cohesion and clarity in the definition of its basic concepts and objectives? It would be futile to expect the harrassed Chief of the Economic Division to accord unity and a semblance of social idealism everytime without injury to the subsisting economic pattern. He did that for the Second Plan by stringing delicately balanced sentences over the whole length of first four chapters. At some stage the differences at the top may overwhelm even men of his calibre.



The Plodiv Fair

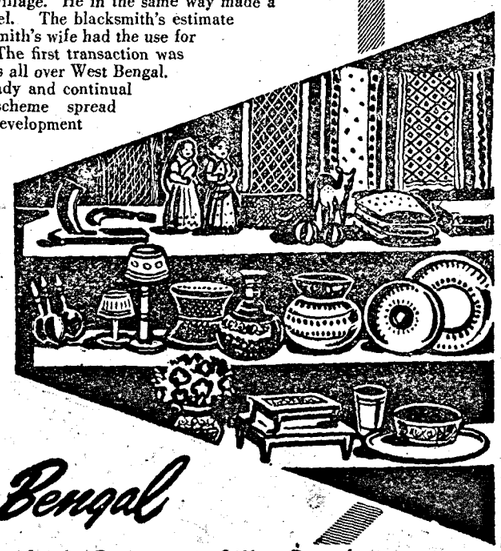
THE Plodiv Fair is not only a major event in Bulgaria's economic life, helping as it does to extend Bulgaria's commercial relations with other countries, but the international importance of the Fair has increased greatly during the past few years. This is because of the vastly expanded export and import potentialities of Bulgaria, which has within a short period of time overcome her backwardness and has become a modern industrial-agrarian country. The nation's industrialisation and electrification as well as the mechanisation of agriculture have vastly increased the demand for plant, equipment and machinery, for industrial raw materials and chemicals as well as for consumers goods.

In addition to the traditional agricultural produce, the export list now includes machine tools, farming machinery, electric equipment and materials, such as electric motors, transformers and radio sets, ores and concentrates, caustic soda, soda ash, penicillin etc.

The Plodiv Fair offers plenty of opportunities for economic co-operation as well as for the exchange of technological experience and scientific knowledge. This was strikingly demonstrated by the XVI Plodiv Fair, held in September 1955, in which twenty countries, i.e. almost half of the countries with which Bulgaria trades, took part.

Henceforth the Plodiv Fair will be held annually. The XVII Fair opens on September 2 and will continue until september 20.

BETTER THAN BARTER
they exchange—spare time labour



The Government of West Bengal is experimenting a new programme for industrial extension in the State.

The first practical step to bring this novel scheme of "The Village Exchange" was taken on December 26, 1954 in an obscure village in the district of Birbhum. A carpenter carved out a small wooden lampstand in his spare time with a piece of waste wood. He estimated its price to be five annas but he could not sell it in the market because nobody in the village had five annas to spare and nobody outside was interested in such a crude product. So he took the lamp-stand to a blacksmith of the same village. He in the same way made a razor in his spare time with a piece of rusty steel. The blacksmith's estimate of razor, too, was worth five annas. But the blacksmith's wife had the use for the lamp-stand and the carpenter for the razor. The first transaction was quickly followed by many other similar transactions all over West Bengal. Every month since then has been a month of steady and continual progress. At the end of October the scheme spread over 1,190 villages in the Community Development and National Extension Service Blocks and as many as 6,098 artisans, craftsmen and other types of producers participated in it. The value of the articles and services exchanged amounted to Rs. 35,451. The additional wealth, thus created, would not be there, were it not for the everexpanding Village Exchange plan.

This was a humble beginning but there was a more significant meaning behind the exchange with its insignificant value reckoned in money. It meant the release of the rural productive forces based on a new-wealth creating concept to —

Future of the Commonwealth

EMPIRES have been built only to be lost. This is the history of empires as of civilizations. Britain built and lost her first empire only to establish a greater second empire. By this achievement, she created history. When, in 1947, she withdrew from south-east Asia, the end of her second empire was confidently predicted. Since her retreat from the Indian Ocean basin, the process of liquidation of her vanishing second empire has been rapid. Sooner rather than later, her second empire will be no more in existence. But with the beginning of the end of her second empire, influences converged which might develop into Britain's third "empire". It was a happy coincidence that a Labour Government was in power in Britain when she chose to liquidate her second empire. As she lost her first empire, she learnt a lesson which helped her to build a second empire. As she lost her second empire, she learnt another lesson which helped her to perpetuate her association with her former colonies in harmony and friendship.

In the gradual transformation, Britain became a British Commonwealth which, in turn, came to be known as the Commonwealth of Nations. It would be uncharitable, as well as irrelevant, to insinuate that the Commonwealth of Nations is an inspired British design to establish a third empire. It is no mean achievement for Britain to remain in friendly association with her former dependencies in south-east Asia through the changing Commonwealth. But further difficulties and conflicts will emerge as Malaya, Singapore, Aden, Cyprus, the Gold Coast, Nigeria, the West Indies and other colonies and protectorates attain self-government. This seems to be the main problem before the Commonwealth as its Prime Ministers discuss in London their common and world affairs. This may not be an inconsequential issue. But it is difficult to appreciate how the Commonwealth's future can depend mainly on the solution of problems which this issue involves.

In the future, the Commonwealth will increasingly become multi-racial in character. Why should such a developing structure create insurmountable hurdles? Even as South Africa became a Dominion, the Commonwealth assumed a multi-racial character. Since 1947, as India, Ceylon and Pakistan became members, the already multi-racial Commonwealth became a free association of peoples and nations of different stock and religion. Racial equality is implicit in the Commonwealth concept. It is the basic condition of its survival. Implementation of this fundamental condition may, conceivably, change the composition of the future Commonwealth. But, if South Africa's adamant attitude forces a change in the composition, the Commonwealth's prestige or future will not be prejudiced in the event. Acceptance of the right of self-government of every area within the Commonwealth is a logical corollary to the concept of human equality. Without doubt, the Commonwealth cannot survive without the acceptance of racial equality of its members.

If racial tolerance is the foundation both of the Commonwealth and the United Nations, the former must attain and develop certain other essential attributes to ensure its cohesion. It was inevitable that the former Commonwealth, composed mainly of Britons, would feel a sense

of strategic unity. All the Asian members of the present Commonwealth depend on Britain for the equipment of their armed forces. But the new Asian members of the Commonwealth have no interest in the British system of global defence. Strategic considerations, therefore, do not any longer bind all the members of the Commonwealth. Like the Army, the government and the administration of Commonwealth members are based on the British model. Asian members of the Commonwealth may feel an urge to lessen their dependence on Britain for defence. But all Commonwealth members, with the exception of South Africa with its white population mainly non-British and of Dutch origin, value the essentially British conception of law and liberty on which their life, society and government are based.

Even so, it is doubtful whether common traditions of law and liberty can perpetuate the Commonwealth when strategic and economic ties loosen gradually. Already, Britain is devising an alternative system of defences. Economic ties still unite the members of the Commonwealth. Though the Commonwealth and the sterling area are not synonymous terms, the latter is still a cementing force for the former. But the Commonwealth is gradually losing its economic affinity. Australia is opposed to the Ottawa system of preferences. Some members of the Commonwealth feel that trade and currency pooling arrangements of the sterling area now benefit Britain at the cost of some of them. As the dollar shortage continues, the importance of the sterling link recedes. Reasons which have caused the decline of sterling also explain why Britain is no longer the banker even to the Commonwealth. If Commonwealth countries have to look increasingly elsewhere to secure supplies of capital, the sense of economic unity must gradually disappear.

Kinship is no longer the connecting link of the Commonwealth. Nor is sterling. Commonwealth members enjoy and value common traditions of law, liberty and racial tolerance. These are valuable links. But as all the areas within the Commonwealth attain independence and the traditions of law and liberty take deep roots, these bonds will cease to be significant. Democracy will be accepted as the only decent norm. What, then, would be the justification and function of the Commonwealth? It is suggested that the Commonwealth should develop as a third force. It lost an opportunity as, under the pressure of transient influences, the late Mr Bevan, the Labour Foreign Minister, pursued a combative anti-Communist policy. As Sir Winston Churchill found it diplomatic to align his foreign policy with that of America, the Commonwealth lost the chance of functioning as a third force. In the current phase of international politics, there is less urgent need for a third force.

But the need may arise again in a different shape, and under changed circumstances. Here is an opportunity which the Commonwealth can seize to justify its continued existence. Even when, and if, the world settles down to competitive coexistence, there will be occasions for disputes and differences between the two power blocs. As Asia and Africa grow in status, differences and disputes may arise between these and other continents. By its character and composition, the Commonwealth is best suited to function as a mediating third force. To function as a third force, it must foster and develop a moral purpose. Law, liberty and racial tolerance must necessarily be the basic ingredients of this moral base. Above all, the Commonwealth must develop a common policy to attain and to maintain individual freedom. Only if the Commonwealth can function at such a high moral level can there be justification for its continued existence.

Postage Stamp Rates for Steel & Cement

A VERY important step has been taken to initiate the dispersal of industries and to encourage decentralisation of their location by introducing postage stamp rates for the transport of two of the basic raw materials of industry viz. iron and steel, and cement. This is an altogether new development, equalisation of transport costs and selling at the same uniform price at all the rail-heads in the country. The system of pooling prices, so as to eliminate the price differences between imported and domestically manufactured steel, had already been in force in steel. Thought shortage has existed in cement for many years and of late it has become far more acute, both large scale imports and price pooling arrangements are new.

To make cement and steel available at the same uniform price at all the rail-heads, however, involves much more than adoption of postage stamp rates for internal transport. For iron and steel, control over distribution has been made more complete and thorough. Under the Iron and Steel (Control) Order which came into force on May 12, 1956, no one is entitled to acquire any iron or steel from a producer or a stock-holder, except under the authority of quota certificate or a permit issued by the Iron and Steel Controller. Nor can iron or steel be used for any purpose other than that directed by authority. The control extends to scrap.

By means of an order issued under section 18 (G) of the Industries (Development and Regulation) Act, 1951, full control over the distribution of cement has been taken over by Government with effect from July 1, 1956. And in order to make cement available at a uniform price at all rail head destinations, the newly formed State Trading Corporation has been entrusted with the responsibility of distribution. The Corporation, however, will utilise for this purpose the existing selling agencies of the producers who have been appointed as its selling agents. It will be the sole importer of cement henceforth. The uniform selling price has been fixed at Rs 102-8 per ton, i.e. at Rs 40 to Rs 50 higher than the present control price. The difference covers, firstly, the incidental freight and secondly the higher cost of imported cement. It is the intention of the Government to import adequate quantities of cement, so that development may not be retarded in any part of the country by the shortage of this essential material. Among the considerations which led Government to take this step was rationalisation of transport, so that movements of cement may cause the minimum strain on the transport system. This is secured, however, by centralised control on distribution and not by introduction of uniform prices which goes along with it.

It is only so far as controlled distribution at uniform prices becomes a reality and the substance of it is not eaten up by an expanding black market, that it can have an effect in the direction desired. But how great will its impact be on the present pattern of location of industries? For cement, many other considerations intervene, e.g. how far is Government prepared to encourage housing and private construction which are outside the sphere of planned development. So, it is better to confine the consideration only to iron and steel.

At present manufacturing industries which use iron and steel as raw materials are largely concentrated in and around Calcutta and Bombay. One of the advantages they derive from their location is that of getting iron and steel at a cheaper price, compared to manufacturers in other places, and greater the distance from the main distributing centres, the greater the disadvantage in this particular respect. But what about the co-operant factors, all those advantages which go with the localisation of industries? To suppose that uniform steel prices will put the backward areas on a par with areas more advanced in the matter of setting up new producetion is fantastic. Those areas which are relatively advanced in other directions e.g. availability of power, ready market for sale of products, trained labour supply and other conditions of commercial development, would be in a position to derive advantage from the present measure and it is only to the extent that this advantage is actually derived that benefits will be widely shared. For the unpleasant fact has to be faced that postage stamp transport rates will raise the price of iron and steel in centres which have so long been doing the bulk of fabricating. So the immediate effect is bound to be higher prices for consumers of steel products which will continue until such time as production develops in areas hitherto unfavourably placed in respect of iron and steel. This can be, at best, therefore, a selective encouragement and to the extent that it enables the social overheads which have been built up e.g. by multipurpose projects, to be more fully utilised, it is a measure to be welcomed. But, to repeat the obvious, price of steel is only one of the many factors, and by no means the most important factor, determining the progress of industries in different parts of the country. Since the question of backward areas is likely to be raised in this connection, it is better to dispel the illusion fostered by politicians that we can, at our present stage of development, attempt anything so spectacular or uneconomic as a general levelling up in the matter of industrial development. To do that would be wasteful. The more important task at the moment is to utilise to the maximum possible extent the existing resources and facilities, including the social overheads, of course, wherever they happen to be located. Equality is an expensive luxury which no underdeveloped country can afford, particularly equality in the matter of regional development of industries.

It is not enough to distribute steel or cement evenly all over the country. De-centralisation and dispersal is equally necessary of capital, skills and other facilities that the Government and the country are in a position to supply, in order to ensure a better allocation of resources. In the last analysis, it boils down to the decentralisation of the administration itself. To forget the essentials in the pursuit of the solution to a partial problem is not uncommon but it is necessary sometimes to emphasise the obvious. Such a situation faces the country today. That planning involves a different approach, that no tinkering at it is possible without upsetting priorities or internal balances seems to have been lost sight of. The decision to have a price pool for iron and steel and cement suggested it. The Mussoorie Conference of State Agriculture Ministers confirmed it. The proposal for an upward revision of coal prices reinforces it. This is not to suggest that there is no case for the price pool or revision of the price of coal or, for that matter, for raising the targets for agriculture. We had asked the question, who does the planning? Now it appears that perhaps the Ministry of Commerce and Industry may be able to answer.

Government of India

3¼ per cent Bonds 1962. Issue Price Rs 98 per Rs. 100 (Nominal). Repayable on the 16th of July 1962.

3½ per cent National Plan Bonds—Third Series (3½ per cent 1967). Issue Price Rs 98-8 per Rs 100 (Nominal). Repayable on the 16th of July 1967.

3¾ per cent Loan 1974. Issue Price Rs 98-8 per Rs 100 (Nominal). Repayable on the 16th of July 1974.

Subscriptions to the above bonds and loan will be received simultaneously and will be limited to a total of Rs 150 crores (approximately). Subscriptions may be in the form of (i) Cash/Cheque or (ii) Securities of the 3 per cent Victory Loan 1957 which will be accepted at Rs 99-13 for every Rs 100 (Nominal) tendered for conversion. Interest will be paid on the 3 per cent Victory Loan 1957 tendered for conversion upto the 15th of July 1956 inclusive.

Interest on the new bonds and loan will be payable half-yearly on the 16th of January and the 16th of July.

Subscription lists will open on the 16th of July 1956 and close on the 18th of July 1956 or earlier without notice.

Applications for the bonds and loan will be received at

(1) Public Debt Offices of the Reserve Bank of India at Bombay, Calcutta, Delhi, Madras and Bangalore;

(2) Branches of the State Bank of India except in the States of Hyderabad and Mysore;

(3) Branches of the Hyderabad State Bank in Hyderabad State; and

(4) Branches of the Bank of Mysore Ltd., in Mysore State.

For full particulars apply to any of these offices or branches, or treasuries.

Weekly Notes

Motor Car Prices

IN August, 1955, Government requested the Tariff Commission to examine and to recommend "what should be the fair ex-works and selling prices of various types of motor vehicles manufactured in the country taking into account the present stage of their manufacture and how the prices should be revised from time to time as more and more components begin to be produced in the country in accordance with the approved manufacturing programme of the several units". The Commission was requested to pay special attention to the extent to which and the manner in which automobile manufacturers whose manufacturing programmes had been approved have discharged their obligations, the further steps that would be necessary to implement them fully and the difficulties, if any, in the way of the full discharge of such obligations in the future and how they should be removed.

The automobile industry is not included in the first and second schedules of the Industrial Policy Resolution; its development has been left to the private sector. The industry is one of the most complicated. It calls for heavy capital investment and engineering skill of a high order, besides exceptional initiative and alertness. Moreover, its development is doubly difficult when the demand for its products is low or inadequate, because automobile production is not economical except on a large scale. Government, now, seems to be of the view that it is time to regulate the prices of automobiles in the country.

There is no question that prices of cars and trucks should be as low as possible. The question is, has the industry misbehaved to invoke price control at this stage of its development? If price control is introduced, it will not be possible for Government to disown responsibility for the development of the industry. Here the purpose of price control cannot be to mop up surplus profits, but it should be to assist the industry to develop quickly, so as to be independent of imports. On the other hand, the institution of price control necessarily presages greater and greater interference from Government in the future. The industry, then, must be in for trouble.

Perhaps it is premature to anticipate, but it does appear reasonably certain that the findings of the present enquiry are going to shape the automobile policy of the Government, even though it may not decide the future of the industry. The automobile industry has been given an opportunity to establish its credentials and how good an account of itself it is able to give is likely to be of decisive importance. For manufacture of automobiles to remain in the private sector, it is necessary for the industry to satisfy the Tariff Commission that it has fulfilled its obligations satisfactorily and carried out its commitments in the production programme with reasonable speed and efficiency.

A Policy for Oil

Our Delhi Correspondent Writes :

IN no sphere of national effort have the Government of India tried so hard and bungled so much as in the formulation of the country's oil policy. Nearly five years ago India entered the arena of international oil diplomacy without knowing it. Inadequate knowledge of the highly technical problems of oil exploration, exploitation, transport, refining and distribution was indeed a handicap, but no attempt was made to learn. A mixture of sentiment, superficial study and interested advice continued to guide the authorities responsible for taking decisions on oil. The influences were multifarious.

Unhappily the administrative machinery dealing with problems of oil continues to be diffused. The Ministry of Natural Resources and Scientific Research is in charge of oil exploration in the public sector. Prospecting concessions over large and potentially oil-rich territory have been given, on the other hand, to Assam Oil Company, a subsidiary of the Burmah Shell Group in Assam and to Standard Vacuum Company in West Bengal. The result is that the Ministry of NRSR is excluded from prospecting in areas where oil is most likely to be found. In fact, the recent strikes at Naharkatiya and other places in Assam have justified the highest hopes of the interests concerned though prospecting in West Bengal has brought up many things but no trace of oil.

There is overlapping again in the refining sector. The Ministry of Production is dealing with refineries in the private sector while the Ministry of NRSR is negotiating for the new refinery in the eastern region. Which Ministry will deal with the refinery projects sponsored by the Saurashtra and Madras Governments remains uncertain because the Government's policy is not clear as to whether private participation in the business of refining will be permitted at all. Until the administrative responsibility is fixed, the projects naturally cannot make any headway.

This is particularly unfortunate for the Saurashtra Government's project for which considerable spade-work has been already made by a private entrepreneur, Mr Nusserwanji H C Dinshaw. With the blessings of the Saurashtra Government, he has drawn up a scheme for the establishment of a refinery at Bhavnagar with a capacity for processing 1.2 million tons of crude oil to begin with. The refinery, however, would be designed for the essential expansion of its capacity to 2 million tons of crude oil. The basic raw material—crude oil—is to be obtained from the National Iranian Oil Company under an arrangement with the Iranian Government which has the right to dispose of a proportion of the oil production of Iran, independently of the international consortium which controls Iran's oil industry. Technical help for the erection of the refinery would be obtained from MM Krebs et Cie, Paris, with whom are associated the group of Atlantic Refineries in France. The Refinery would cost Rs 20 crores to establish but MM Krebs et Cie have agreed to defer the payment of nearly Rs 6 crores, being the value of the equipment to be supplied for the refinery, over a period of 7 years. MM Krebs et Cie have also expressed their willingness to subscribe towards the capital of the proposed venture to the extent of Rs 1 crore. Similarly, the National Iranian Oil Company appears to be willing to subscribe as much as Rs 3 crores. In view of MM Krebs et Cie's willingness to accept deferred payment, working capital of not more than Rs 10 crores would be needed. The proposal is that the Centre and the State Governments should hold majority of the ordinary shares, thereby ensuring controlling interest for the public sector while the balance of the share capital would be subscribed by private industrialists in India. Messrs Birla Brothers are apparently eager to collaborate. The foreign offers may be utilised in the form of a loan to the proposed refinery.

The scheme also envisages the flotation of a distribution company with a capital of Rs 5 crores and an arrangement for transportation of oil from Iran to Bhavnagar with an Iranian tanker Company.

The Saurashtra Government has worked out the economics of the refinery in great detail. The project will it is expected, yield a net profit of about Rs 6 crores a year, exclusive of taxes and should be able to meet the payment of instalments for the purchase of equipment from MM Krebs et Cie very comfortably.

It is a pity that a promising scheme like the one processed by the Saurashtra Government over a period of two years remains in cold storage just because the Central Government cannot decide who should deal with it.

Review Oil Concessions

THE Government of India is known to be seriously concerned over the allegedly large profits being netted by the Standard Vacuum and Burmah Shell refineries. The concessions that these companies have obtained under their agreements with the Government of India are enormous. Besides an assurance that the refineries would not be nationalised over a period of 25 years, they have been allowed to sell petroleum products in India at prices equal to the theoretical and now largely fictious landed cost of similar products imported from abroad based on the cost of transport from the Gulf Ports, whatever may be their actual source of supply. This clause alone would enable them to make profits quite out of proportion to their investments. Another clause prevents Government from taxing them at a rate higher than the general rate obtaining in the country.

The Central Government proposes to study the contracts in detail, particularly after the refining companies have attained full production, with a view to changing the agreements by negotiation, if possible. The refining companies have not altogether shut the doors against such talks. But this is just another instance of the Government having acted in haste to ponder at leisure.

A second instance is the prospecting license granted to the Standard Vacuum Oil Company for exploration in the West Bengal basin. The details of this long-term concession have yet to be published. There is no gainsaying, however, that the grant of a license to a company which holds similar concessions in East Pakistan, across the border, was an initial blunder. Anyone familiar with the geology of oil knows that petroleum occurs below the ground in a continuous sheet extending over several thousand square miles. This subterranean "river" of oil naturally knows no political frontiers. The international law of oil permits any country which sinks the wells to draw from such reservoirs as much as it can. There is evidence that because of political and commercial reasons, Standard Vacuum is more serious about exploration in East Bengal than in West Bengal. That recently Stan Vac diverted a drill ordered for West Bengal to East Pakistan is cited as a glaring case of misdemeanour.

It has also to be admitted, however, that the Government's pettifogging and wobbly policies do not help to instil confidence in the foreign investor. There are whispers here that the agreement with Stan Vac for exploration in West Bengal may be superseded by legislation if modification by negotiation is not possible. The foreign companies naturally contrast the Government of India's keenness to bring oil within the public sector with the liberal terms offered by Pakistan where the share of the State is limited to 25 per cent in most ventures. The fact that the Russians and the Rumanians are being encouraged to participate as much as possible in our oil development programme also acts as a deterrent to western prospectors. Lastly, moves are under way for restricting prospecting leases for oil by amending the Mines and Minerals (Development and Regulations) Act, 1948, and the mining concession rules thereunder.

The oil policy seems to be so confused that a good beginning would perhaps be to centralise authority. It must be remembered that besides the Ministries of NRSR and Production, the Ministries of Commerce and Industry and the Works, Housing and Supply also deal with different aspects of the oil problem. The former is responsible for export and import of oil while the latter looks after distribution and fixes prices. Now the Planning Commission is taking a hand with the appointment of an Adviser on Oil directly at the instance of the Prime Minister.

Naval Bases

AS Britain built her empire, she established naval bases in her colonies. Britain has withdrawn from her former colonies in south-east Asia. Suez Canal has been evacuated. Malaya will soon gain independence. But the British reluctance to quit Singapore, Aden Malta and Cyprus reflects the importance of far-flung naval and air bases in the British system of global defence. Singapore's strategic importance as a naval base has been seriously questioned. Malta is a heavy economic liability to Britain. Hongkong is of doubtful value in an emergency. Soon after Burma, India and Pakistan became independent, Britain transferred power to Ceylon. But Britain continued to enjoy "pocket sovereignty" in the naval base at Trincomalee and in the air base at Katunayake. Ceylon's membership of the Commonwealth helped Britain to enjoy "pocket sovereignty" in the naval and air bases in Ceylon.

One of the issues on which Mr Bandarnaike fought the recent Ceylonese elections was the withdrawal of British bases from Ceylon. In his first major policy statement as Premier, he demanded British withdrawal from Ceylonese bases. He has now announced in London that Britain has agreed in principle to withdraw her bases from Ceylon. Some day, Aden, Singapore, Cyprus, Malta and Hongkong would gain independence. And, then, these areas would repeat Ceylon's demand for withdrawal of British bases. It would be wise for Britain to be prepared for such a contingency. She may emulate America in creating a "long-legged" navy so that her naval forces can be maintained and equipped from home bases. In these days of nuclear weapons and the guided missile, naval bases have lost much of their significance. There is need for Britain, as well as other Western European Powers, to devise a new and modern system of global defence.

Off the Record

How Good is the Monsoon?

THE rains have come. The beginning of the monsoon this year in Bombay was most unpropitious. The monsoon broke prematurely and feebly but in the last few days, it has more than made up. The deluge brings it home to the office goers that it is not the total rainfall during the season which matters so much, he can put up without great discomfort with 80 inches a year but it is the 2½ inches between mid-night and dawn which gets him. For it dislocates the transport system of the city and brings many of the roads under water. Even if the drainage were as good as it could possibly be, it would still not be designed to cope with monsoon floods at their peak. That would be far too expensive, even for the prosperous Bombay Municipal Corporation.

These are, however, mere trifles; for school boys, a rainy day is a lark; for office goers, a minor irritation or a little extra expenditure. But for the economy of the country as a whole, the distribution of the rainfall during the season can be a very serious matter. The monsoon has not progressed far enough yet to warrant a forecast whether it is going to be an average monsoon or the rainfall is going to exceed or fall short of the normal. The papers this morning carried news on the front page of heavy rains in Saurashtra which completely dislocated rail, road and air services, of submerged rail lines in Gujarat and of floods in Malaprabha near Belgaum while on page three two news items follow of the drought in Mysore which has made it urgently necessary to distribute food to the distressed population and of the crop damages in North Behar and in Kerala.

What does it all add up to? Three years ago a complaint was voiced in this paper, much to the annoyance of the serious minded who thought this sort of thing flippant or worse for a respectable journal that we have not yet been able to work out a proper statistical measure of the monsoon. It was argued that

"India is a vast country and conditions differ, in the matter of rainfall as in other things. How can one get a connected picture of the situation, a measure in this particular case, of the distribution of rainfall through space and time? For both are equally important. Unseasonal rains can be as injurious to crops as timely showers, even light ones, can be favourable to them. This is a job for the meteorologist and the statistician to work out between themselves—an index of rain fall which will tell us something of its distribution, so that one can have an assessment which is sorely needed for so many different purposes. And why the total alone? The idea can be expanded and one can some day expect a break down of the figure—the sub-index, for example, of the rainfall for rice-growing areas or the cash crop component of the monsoon for the year!

"That saying about the budget being a gamble in the rains is now heard less often, though substantially the old dictum holds . . . But it is not necessary to argue the point. A workable measure of the monsoon is very necessary, for getting the hang of the economic situation and if one could be found, it would surely prove an effective instrument for policy making also."

—The Monsoon, June 13, 1953.

* * *

The question was also raised that since science had failed to come to the aid of the agriculturist, the latter had to go by folklore. "The cycle of the seasons, the spate of wind and rain, storm and sleet, have always had their local chroniclers and generalisations based upon observation, though perhaps not so precise or accurate, are part of the folklore of the people. These are still the standby of the husbandmen who guide their agricultural and other operations by these popular sayings. Soft rain early in the summer associated with a bumper mango crop in some parts of the country, for instance, is supposed to presage an insufficient monsoon. Similarly, late rains in winter promise a sumptuous rabi crop. And so on and so forth. This is perhaps the best one could expect when there was nothing better to go by than the observation of the naked eye". How good were these as guides?

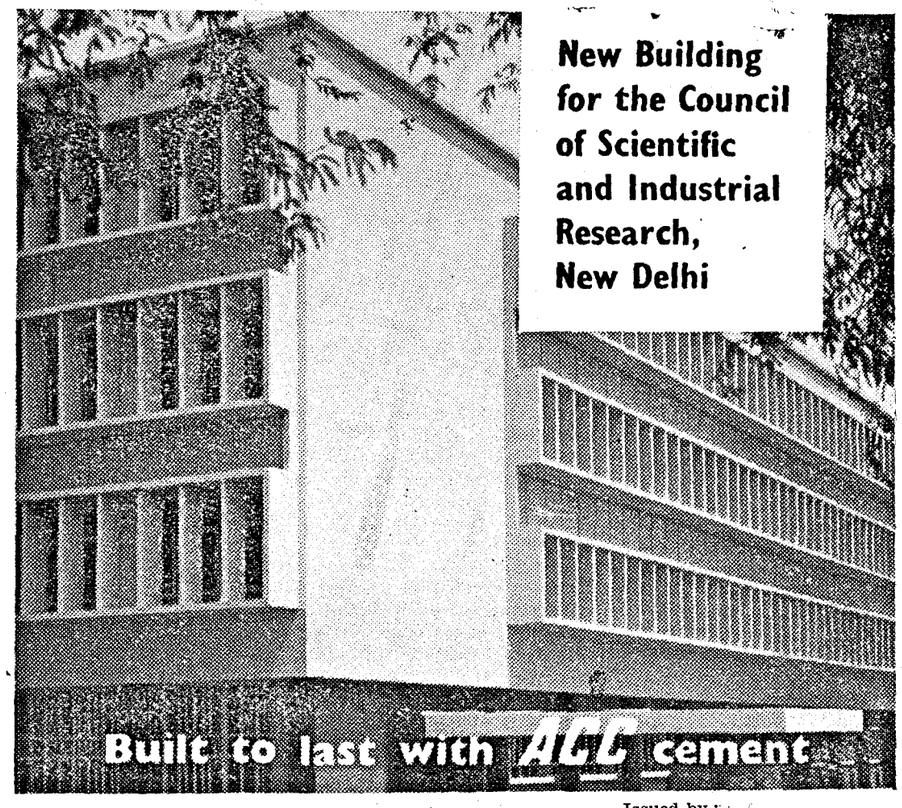
At the time of writing all this, we never thought that any one would take the slightest notice. It was an agreeable surprise, therefore, to find that the Meteorological Department had carefully checked up on many of the popular sayings about rains and found them statistically unproven. About the main question, however, though three years have passed, no answer has been offered yet, but there is hope. Some one in Poona has been working assiduously at the problem and some day, from the mass of statistics which the Meteorological Department has carefully collected over many decades, may emerge the first faint outline of the conceptual pattern into which could be fitted later on the relevant data to provide an answer to the question raised—an weighted index which will tell us of the distribution of rainfall in the different parts of the country and perhaps also separate indices that will suggest how good rains have been for different crops in the different parts of the country. The Statistician-Meteorologist who works out such an index would indeed be a benefactor, not perhaps of the Indian peasant, but of the harassed planners who take upon themselves the onerous task of transforming the economy in setting up targets that would be both optimum and attainable.

* * *

Many readers have complained that without the full text of the Second Five Year Plan, they cannot follow the comments and the questions raised in the Special Number of this paper which was devoted to the Plan. Though the Plan was presented to Parliament in the middle of May, copies are not yet available with the book-sellers who sell Government publications. The complaint has come from such diverse quarters that the subject cannot be dismissed off hand as peevish grouse of lazy people who would not take the trouble of getting Government publications from the proper sources. Doesn't the Planning Commission want people to read the Plan any more, now that it has done with sifting of opinions and has had its fill of reactions and comments? If it does, why is it that copies of the Plan are not to be had anywhere except in newspaper offices?

Frankly, I have not seen any newspaper advertisement so far or posters at any book shop advertising the sale of the Second Five-Year Plan. If any readers have, I shall be delighted to be contradicted.

* * *



An innocent paragraph in the issue of June 9 in the editorial reviewing the Trend and Progress of Banking in 1955 has provoked enquiries about the powers of the Reserve Bank under the Banking Companies Act to interfere with the management of banks. The Report mentioned, and the passage in question was quoted verbatim, that while discharging its responsibilities, the Reserve Bank had exercised its powers during the year for securing

> "replacement of the Chief Executive Officer by a suitable person and appointment of a Banking Adviser, curtailment of the Powers of particular persons on the Board of Directors," etc.

Is the Reserve Bank really competent to do that? A correspondent has raised a pointed enquiry about some recent changes in the top personnel of one of our leading scheduled banks and wants to know whether the passage in question has any relevance to these changes. He is definite that Reserve Bank has no such powers to interfere with the management and cites the instance of an observer placed on the Board of Directors of a leading bank who was later withdrawn by it. The position is as follows: Under clause (d) of sub-section (1) of Section 36 of the Banking Companies Act, the Reserve Bank may, "during the course or after the completion of any inspection of a banking company under section 35 by order in writing, require the company—

> (i) to make, within such time as may be specified in the order, such changes in its management as the Reserve Bank may consider necessary in consequence of the state of affairs disclosed during or by the inspection."

It does not seem that these powers are limited only to such banks as have not yet been given a licence, or that once they have been given the licence, banks may cock a snook at the Reserve Bank. But commonsense suggests that perhaps those who have not yet got their licence would be more amenable to reason and willing to take hints and comply than others who are safe behind their licences. But granted all the logic of the licensing procedure for bringing up the sub-standard banks and for keeping the standard ones on to the narrow and strait path, it is curious that the Trend and Progress does not mention anywhere the names of the banks which received their licences during the year under review. All that is said in the report is the number of banks who received their licences and the number whose applications remained pending at the end of the year. Why this reticence?

Cement means better living for everyone; and the ACC is making more and more quality cement.

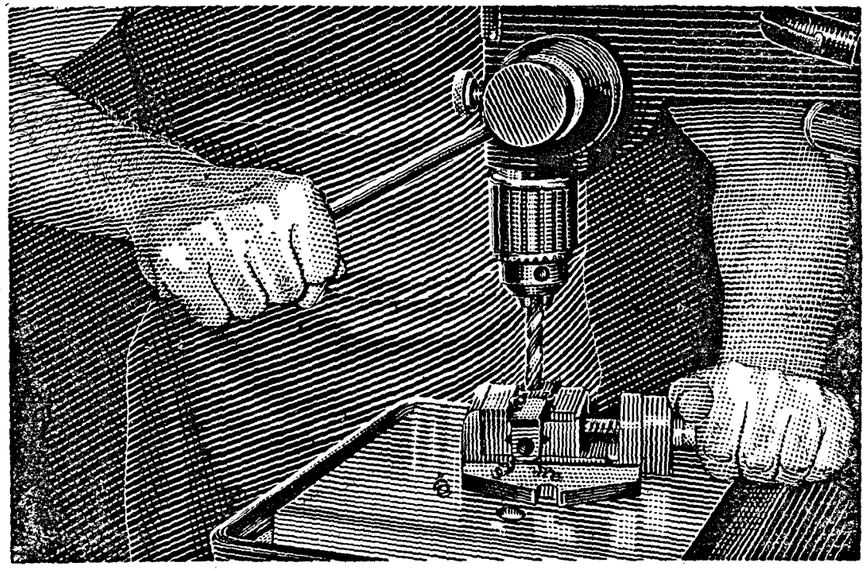
Degrees of Power and Corruption

POWER, or its pursuit, as a determinant of national policy is rather at a discount at the moment —which does not mean that, just because Bertrand Russell once wrote a book on this, it has ceased to be an extremely important factor. The way power comes, the quantity in which it comes, the manner in which it is received, to say nothing of the way it is exercised, are all circumstances which shape the quality of the power that is received, and they are "an intelligible field of study" like one of those tiny stones in Agra Fort which reflect the entire Taj. Before I come to the very prosaic affairs of the Corporation of Calcutta, I had better mention that what I have in mind is a slight emendation of Lord Acton's famous formula. My thesis, for what it is worth, is that while all power corrupts—partial power corrupts absolutely.

Much is heard about corruption in New Delhi, the place to which my theory should be applied first. How did the change-over come? By peaceful negotiation, and "business as usual" was the motto. There is a good deal to be said in favour of this procedure, which did away with violence and made the transfer of power one of the smoothest transactions in the history of the world. It should not on that account be lost sight of that this relatively peaceful manner has in many ways affected the character of the power now residing in New Delhi. It is outside the purview of this diary to speculate whether some other method of seizing political power would have been better, or worse, but after nine years of "independent" administration at the Centre it is not difficult to see that there is a qualitative difference between a gift and what has been earned. I will return to the theme before I have done.

* * *

Despite nationalist criticism at the time, the Calcutta Municipal Act of 1923 was something of a revolution in India. Sir Surendra Nath Banerjea, the architect of that advance in local self-government, had no reason to be ashamed of his truly great achievement. The Act did offer to the citizens of Calcutta a great opportunity of serving themselves and the country. It may never be known exactly why and how this promising experiment failed so sadly in the years which followed, but the Corporation of Calcutta is here to show that, however glorious India's record may be since independence, there was very little warrant for optimism in the country's apprenticeship in local self-government. The Act gave only limited power to Indians, who naturally resented it. Perhaps not quite so naturally, they immediately proceeded to abuse the limited power they got. Whether the alien rulers were hurt in consequence is doubtful. The city of Calcutta certainly bears many ugly scars on her face. Not to put too fine a point on the matter, the civic administration of Calcutta constitutes perhaps the strongest argument against transfer of power to native hands.

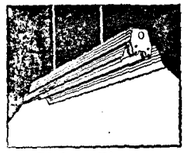


In the course of the past fortnight, for instance, a member of a special committee looking into the state of the city's filtered water supply came out with a statement that what we are in fact drinking is a sort of consomme. Not only are the pipes rarely cleaned; in the tank itself there are all manner of growths—animals, vegetable and mineral, as the quiz programmes put it. The Deputy Mayor of the Corporation, chairman of the special committee, promptly came out with a denial, and said there was nothing the matter with Calcutta's drinking water. He said the opposition was bringing politics into civic administration. Secondly in the northern part of the city, the hive of the natives of Calcutta, the conservancy system has apparently broken down completely. The Commissioner has been blaming it on the Councillors, and the latter have been returning the compliment. Meanwhile, an important Bengali daily, **Jugantar**, came out with a report (the kind of reporting one sees too rarely) that the Standing Works Committee of the Corporation had made it impossible for executives to function efficiently: this committee, it was alleged and it has not been denied, saw to it that the Corporation could not buy the lorries it required because an unnamed supplier, apparently a darling of the committee, did not have the vehicles in stock. The fact that there were other suppliers, quoting lower rates, was ignored by the committee. The money remained unspent, and the roads remain uncleaned.

* * *

The Deputy Mayor's complaint was not in fact far wrong. Politics had indeed come into the Corporation quite early in its life. To this has to be added the point that this is the least of the criticisms against the municipal government of Calcutta. It would be a very cynical view of politics to hold that so important a matter as civic administration should be free from politics. What then is politics to deal with? The real criticism is that a very wrong kind of politics came into the Corporation in the 'twenties, as it later did in the provinces in the late 'thirties. What Sir Surendra Nath Banerjea had in mind was to work the Act; those who were elected came to wreck it. The motives of the Gandhi-led Congress are not questioned here; they were of the highest. The fact remains that the negative attitude of mind with which Congressmen got into these elective bodies made it impossible for them to function in the spirit which had them. In a wider sense than the purely financial, this had a corrupting effect on all the democratic institutions which preceded the advent of freedom itself.

The determination to abuse every piece of partial power which came the Congress' way, so that absolute power could come sooner, made a virtue of political irresponsibility. Is the city corporation going to be elected? We will get in and see that it does not work and thus prove what great patriots we are. Is the University going to be democratised? We will get in, and so debase the alien system of education that its worthless products, frustrated in every walk of life, would join the national struggle and hasten independence. It would be rash to suggest that the policy was thought out in such detail and with such deliberation; and in any case, the policy has paid off, for independence has indeed come. But in those pre-independence days Indian nationalists acted like the man who wanted a hundred rupees, was paid only driblets of ten or fifteen, which paltry sums he so hated that he proceeded to waste them immediately. The final balance sheet shows that a hundred has in fact been paid, but the recipient is a pauper just the same. I will not press the analogy too far, but offer it as a talking point that power in instalments does not necessarily bring with it an equal degree of responsibility, whilst all of it at once always comes accompanied by tremendous responsibility. Concurrent confirmation of the thesis may be found in the difference between the Centre, where power came in its entirety, and the States, where bits and pieces of power had come, and been abused, earlier. The last thing I want to suggest is that the Corporation of Calcutta or the University of Calcutta would be one whit better if more power were given now. It is too late. These seven-month babies of freedom and democracy in India were born weak, and then maimed as professional beggars in Calcutta streets are.



—Flibbertigibbet

give these hands better light—*at less cost!*

A factory cannot afford faults—because faults mean hold-ups, unfulfilled quotas, reduced profits. That's why most modern factories have fluorescent lighting. Production experts have discovered that a good light reduces faults greatly... increases production.

Philips 'TL' Fluorescent Lamps give more than three times more light than filament lamps of the same current consumption! That's real economy! And the light is not harsh—it lights up the working bench evenly. The worker's eyes do not get tired easily if the lighting is well planned! He can do better work. Install Philips 'TL' Fluorescent Lighting and watch output go up... costs come down.

A Philips Fluorescent Lamp gives more than three times more light —lasts on an average 7,500 hours!

PHILIPS

'TL' FLUORESCENT LAMPS & FITTINGS

—make light work for you!

Can we advise you? The Philips Lighting Service Bureau will be glad to show you how you can use fluorescent lighting in your factory—free of charge and without obligation. Please write to Philips Electrical Co. (India) Private Ltd.

From the London End

A New Commonwealth?

BY the time this despatch appears in print, the Commonwealth Conference will have completed its discussions and a long and no doubt platitudinous communique will have been issued. Like past conferences of Commonwealth Premiers, the present one will be utilised to give the not too honest impression of the existence around Britain of a viable and powerful association of States —an impression which is vitally necessary for upholding Britain's status in this power-complex age. In the past post-war years, the periodic Commonwealth Conferences have been occasions for bursts of intellectual speculation on such questions as whether the Commonwealth should be conceived of in "constitutional and legal terms" or whether there is a need for "machinery for regular consultation" and the like. Equally these occasions have been used to extol the "freedom", the "generosity" and to some unthinking persons, "the Western civilized way of life" on which the Commonwealth is said to be founded. The public discussions around the present conference have been no exception.

It is certainly true that for Britain the Commonwealth has been a powerful instrument of policy. The "exchange of views on world questions" and the discussions, although bilaterally conducted, on defence matters, have given these conferences the character of an international demonstration. There can be no doubt that every foreign embassy in London has its ears fixed on the ground—every murmur and every report on occasions like this is scrutinized with a view to assessing their possible consequences to international relations. From this there must follow the overwhelmingly important question of whether the Commonwealth is a force for peace and international harmony. There can be no doubt either that each and every member of this association cannot but conceive of their membership as a factor making for peace although the exact definition or interpretation of a "state of peace" may vary as between each of them. It is to be noted however that insofar as the British Government has been able to give the Commonwealth a demonstrable position in world affairs, to that extent the sovereignty of each of the Commonwealth members has been impinged.

In this system of relationship and in the directive influence of the United Kingdom, a crisis of considerable dimensions has occurred. Even the **Times** has suggested that the "common allegiance" which provided Britain with the main arm of its international policy is now "obsolete". And in your Correspondent's view, the crisis is of very recent origin. The first serious crack in the old Commonwealth system appeared when three members of the Commonwealth concurred in the historic declaration of the Bandung Conference of April 1955. Since then the neutralism and innate anti-colonialist character of that declaration has become the confirmed outlook of the Ceylon Government. This is a definite departure from the old system and it is this which is bringing into focus the possibility of the emergence of blocks within the Commonwealth, and the cohesion of those members with fundamentally similar interests. Here a very special type of relationship is appearing among Australia, New Zealand, South Africa and the Central African Federation, with Britain at the centre.

To day more than ever it is necessary to confront this emerging schism in Commonwealth relations frankly. And it is a matter of considerable credit to the **Times** that it has faced up to this question. In a particularly thoughtful and significant editorial comment, the **Times** described the old system of relationship with remarkable realism:

> "So long as the Commonwealth were homogeneous to the extent of being united by common allegiance to the Crown and being inhabited or at any rate ruled by persons of predominantly United Kingdom stock, there were no differences over fundamental issues."

Now the fundamental issues on which conflict has emerged are the neutralism of India and Ceylon which "places strains on the harmonious working of the Commonwealth" and which "provokes embarrassments and irritations", and Colonialism and racialism. The Indian stand which previously provoked this larger conflict has, says the **Times** "put a strain on her relationships with Britain" and has led to a rupture in India's relations with South Africa.

In a recent despatch your Correspondent attempted to describe some recent developments in South Africa. The path of **Apartheid**, of racial segregation designed to maintain in perpetuity the dominance of the white over the black people, has now been confirmed by the South African Prime Minister in a speech in London. What was illuminating in his elaboration of the methods his Government pursues was the reference to its similarity to the policies and methods adopted by Britain in Kenya and the Central African Federation. From this he drew the conclusion that the task in Africa was to maintain the dominance of what he called "white civilisation". For this, he called for consultation with the other colonial powers in Africa.

The prospect which this position portends is one of sustained war against any vestige of nationalism and for that matter, liberty in Africa. It presents a fundamental incongruity to the tide of the times and insofar as such a war is conducted by members of the Commonwealth, the Commonwealth as an institution becomes heavily tainted and smeared. It is possibly a recognition of this consequence that the **New Statesman** should see the "acceptance of human equality" as the only hope for the institution's survival. Since nothing in the nature of present policies in South Africa, Kenya or the Central African Federation suggests that such a hope is realizable, the parting of ways and the emergence of a new Commonwealth based on identity of interests and ideology is a serious—a very serious —possibility. This is a possibility notwithstanding whatever cohesive factors of an economic character may still influence Commonwealth relations.

Transport in Second Plan: I—Railways

M N Ghosh

Assuming that there will be only a limited increase in the transport of foodgrains, an increase of roughly sixty per cent in total freight turnover may be expected during the Second Plan. The amount of investment required for the purpose may be found by applying a certain ratio to the amount of investment envisaged in industry. This ratio is likely to be intermediate between that found applicable in the U S A and in the USSR.

Improvement in operational efficiency is, however, essential if the amount of investment calculated in this way is to prove sufficient. The author attempts some statistical comparisons which suggest the presence of large idle capacity and considerable scope for augmenting transport without substantial capital investment.

NOTHING in the Second Five Year Plan has aroused as much interest as the question of transport and the allocation for it in the Plan. This is natural because transport is the lynch-pin in any scheme of economic development, and unless transport is adequate, investment in other directions would not bear fruit. Two important questions arise:

(1) Volume of transport needed to implement the production targets of the Plan, and

(2) Capital investment necessary for this purpose.

While (2) depends on (1), the capital cost required for the additional transport may be brought down to the extent that there is scope for more intensive utilisation of existing transport facilities. This is not an unimportant consideration.

The transport need of a country for a particular scale of development depends on so many factors that there is no standard formula for estimating it. That is to say, one cannot straightaway work out the transport component for planned development. Perhaps the extensive input-output studies that are being carried on of different economies in different states of development and of the same economy at different stages of its development may give us some idea later on of the magnitudes involved. The experience of other countries in their early stages of industrialization corresponding to the stage of development of India at the present moment, however, may throw some light on the problems at hand and provide basis for checking the estimates of transport requirements derived by projection of past experience combined with firmer estimates which are possible for specific projects in the Plan. For this purpose USA and USSR have been chosen for comparison, because of geographical and other similarities between India and other countries.

There has been a large number of estimates and counter estimates of the transport requirements of the Second Plan. Further confusion has been created by the different estimates of agricultural production given by Ministers and members of the Planning Commission. Thus according to Shri V T Krishnamachari, Vice-Chairman of the Planning Commission, agricultural production will increase by 40 per cent during the period of the Plan, while in the Draft Plan-frame only a provision of 18 per cent increase had been made. Needless to say, the size of transport required will be quite different if agricultural production increases by 40 per cent instead of only 18 per cent. Unless adequate transport is provided for the higher target, its achievement may cause a heavy slump in agricultural commodities which will remain blocked in rural areas. This will be self-defeating in its purpose. We shall confine ourselves to railway transport alone because it provides the bulk of transport needed for a continental country like India. This is not to underestimate the possibilities of the development of river transport and coastal shipping to meet the increased requirements of transport in the Second and subsequent plans. These will be treated separately.

The increase in originating tonnage due to the establishment of new productive enterprises has been estimated by the Railway Board as 60 million tons, which is about 51 per cent over the existing tonnage. This does not, of course, represent the entire transport requirement of the Second Plan because it does not take into account the average haulage of goods, which may change during this period. Again, the estimate has been obtained by a more or less direct computation of the output of various industrial plants to be installed, with some provision for miscellaneous articles. However, the process of industrialisation implies specialisation in fabrication processes, so that an additional output of 3.5 million tons of steel may mean very much more of originating tonnage in manufactured articles. The changing pattern of distribution and trade are also likely to increase the originating tonnage which a mixed economy cannot altogether avoid, without instituting complicated controls.

Any direct estimate of this type is, therefore, likely to result in an underestimate and we should look for indirect methods of estimation also. The volume of industrial production provides a fairly satisfactory method of estimating the ton-miles of transportation. The relationship between the two for different countries is shown in Table I.

The wide difference in the trends for the USA and the USSR are due to various reasons, one of which is a possible overestimation of the value of gross industrial production in the USSR in 1927-28 values (official index) when some products like

TABLE I

(Indices of Unweighted Freight Turnover in Ton-Miles per Unit Value of Gross Industrial Production)

India (1948 = 100)	
1948	100.0
1952	106.7
1953	104.8
USA (1890 = 100)	
1890	100
1900	130
1910	143
1920	143

USSR		
	(Base 1928 = 100)*	(1928=100)†
1928	100.0	100
1932	78.6	107
1937	66.0	98

* Official Index.

† Hodgeman's Revised Index, "Soviet Economic Growth"

Edited by Abraham Bergson.

machinery were in short supply and had high values. If correction is made for this over-valuation, the index for USSR will show a similar proportionality of freight turnover in ton-miles to gross industrial production as that of USA. Economic development in the USA in the period 1890-1910 was not only rapid, it went hand in hand with a westward movement of population and economic activities, especially in agriculture, the product of which was largely exported, while in the USSR special efforts were made to conserve transport by localising industries in certain zones. The eastward expansion in USSR began only during and after the second world war. In India we have a situation intermediate between that of the USA and USSR. This suggests that the ratio of increase in freight turnover to the increase in volume of industrial production during the Plan may be little more than one.

According to the Draft Plan-frame, domestic product of India from industries and mines during the Second Plan would be as in Table II.

TABLE II

Net National Product by Industrial Origin

(crores of rupees in 1952-53 prices)

	1955-56	1960-61
Mining	95	150
Factory Establishment	840	1380
Small Enterprises	840	1085

Thus the output of mining and factory establishments is to increase by 64.0 per cent. If small enterprises are included the increase is 49 per cent. However, a large portion of the output of small industries is locally consumed and does not need to be transported by rail, so the output of mining and factory establishments will be more important and the increase in freight transport may be about 60 per cent or more.

Coal Transport

This estimate is corroborated by certain features of coal transport. Transport of coal has formed about 40 per cent of net ton-miles of total transport in India, about 35 per cent in the USA, about 50 per cent in the UK and about 20 per cent in the USSR over very long periods (see Table III). This is a very curious phenomenon, but shows that in spite of various technological changes, coal still remains the most important raw material of industry and the pattern of haulage of coal reflects the pattern of industrial activities in the country and the transport needs of other commodities also.

The relative stability of the proportion of coal movements to total ton-miles of transportation in these countries, despite the very large changes that have taken place in their economies during this period is indeed remarkable. Whatever may be the factors giving rise to such a phenomenon, there is no reason to believe that they will cease to operate during the Second Five Year Plan in India. The increase in the production of coal by 62 per cent from 37 million tons to 60 million tons should therefore suggest an increase in the total transport ton-miles of a similar proportion. We should expect, therefore, an increase of about 60 per cent in total ton-miles. The experience of the USSR in this respect is interesting (see Table IV).

TABLE IV

Output of Coal and Total Freight Turnover in the USSR

Year	% increase in the output of coal	% increase in total freight turnover (all carriers)
1928-32	84	84
1932-37	98	93

Thus an increase of roughly 60 per cent in total freight turnover may be expected during the Second Five Year Plan, assuming that there is only a limited increase in the transport of food grains etc. A large increase in agricultural production will mean greater increase in freight turn-over. In the Draft Plan provision has been made for a 35 per cent increase. This might lead to serious dislocation of the productive machinery and failure in realising the targets of the Plan.

Investment in Transport

In any development programme, investment in means of transport bears a certain relation to investment in productive industry. Of course, it depends also upon the dispersion of the centres of production and the patterns of industrial development. It may be possible, therefore, to reduce the transport needs and consequently the investment in transport industries by proper planning of the location of industries and regulation of supplies of raw materials etc. However, as argued above, the transport needed for a given volume of industrial production in India is likely to be intermediate between those for the USA and the USSR. It is reasonable to assume, therefore, that the ratio of investment in transport to investment in industry should also bear the same relation. (See Table V)

TABLE III

(Ratio of Net Ton-Miles of Coal Transported to Total Ton-Miles)

(per cent)

India		USA*		UK		USSR	
1933-34	40.5	1925	34.0	1938	49.0	1928	17.3

TABLE V.

(Investment in Transport and in Industry)

	Percentage of Total Investment		
	Industry	Transport	Ratio
USA (1880-1912)	19.1	18.1	.95
USSR (1928-1932)	41.0	17.3	.45
(1933-1937)	37.1	15.6	.42
China (1952-57)	58.2	19.2	.32
India (1956-61)	28	27	.96

In the USA, transport development during the period 1880-1912 was of an extensive character, following the westward migration of the population. Thus railway mileage increased from 268,000 kilometers in 1890 to 413,000 kilometers in 1912, and the large volume of export of food grains to Europe accounted for a great increase in freight. In India the Second Five Year Plan does not envisage a development of the extensive type, and new mileage to be opened up is small. Similarly it does not envisage a large increase of export of agricultural products to be carried by rail to the ports from the hinterland. Thus we should expect a smaller ratio for India than for the USA. It should be noted that the war-time damage to the Indian Railways has been substantially repaired by the replacement of a large number of engines and locomotives and about Rs 400 crores were spent during the First Five Year Plan for the rehabilitation and expansion of the Railways. There is therefore, no special reason why, the proportion of investment in transport should be higher in India than in the other countries, specially when China can manage with a much lower ratio of investment in transport inspite of the poor condition of its railways after decades of civil war. To some extent, the USSR was able to manage with a much lower ratio of investment in transport because of an increase in operational efficiency in the railways during this period and it may be presumed that this is also the case in China.

Operational Efficiency

There are various measures of operational efficiency in the usage of wagons, locomotives etc. I have defined two such composite indices of wagon and locomotive usage, which take into account the effectiveness of maintenance and repair services, turn-round of wagons, average loading of wagons, percentage of empties, average haulage of wagons and locomotives etc, which together determine the degree of usage of the stock of wagons and locomotives. (Calcutta Review, October 1955) These are:

$$I_1 = \frac{\text{Net ton-miles of freight turnover}}{\text{Total capacity of wagons in tons}}$$

$$I_2 = \frac{\text{Total freight ton-miles x 2240}}{\text{Estimated total tractive power of goods locomotives.}}$$

Table VI below shows these indices for India, USA and USSR:

It shows that the USSR was able to double the index I_1 for wagon usage. In the USA shortage of capital has never been a problem and thus no special effort has been made there to increase the degree of usage of the capital stock of the railways. The conventional indices of efficiency, e g, average haulage of goods engines and wagons also indicate the same thing (Table VII).

The indices of efficiency of wagon and locomotive usage improved remarkably during the First and Second Five Year Plans in the USSR. On the other hand, Indian Railways have not yet been able to reach the peak wartime standards in operational efficiency, inspite of the fact that the equipment now is better than during the 1941-42 period.

One of the main reason for the inefficient use of wagons is the inordinate delay in loading and unloading, which keeps wagons from moving. Roughly about 17 hours of wagon time out of 24 hours is spent in the yards. The Railway Enquiry Committee suggested measures for eliminating this major cause of delay but radical measures may have to be devised to improve the situation if necessary. Shri K B Mathur, the then Chief Operating Superintendent of the EIR, stated in 1948 "The main problem, however, is the limited capacity of the goods sheds, accentuated by slower removals by merchants—the latter is due to marketing conditions, godown accommodation etc and we cannot really do very much". However, these are not insurmountable difficulties and the Railway Board should be able to devise measures to solve them. Some new methods of handling "smalls" traffic in the South Eastern Railways demonstrate how much increase in efficiency is possible in many aspects of operation. Thus wagon loading in October 1955, averaged 239 mds instead of only 154 mds in October 1954, after the introduction of new methods.

If only the wartime levels of efficiency of the Indian Railways could be attained during the Second Five Year Plan, so much less of investment in wagons and locomotives would be needed and there is no reason why with suitable organisation the wartime records could not be improved upon. In a country like India with limited prospects for expansion of foreign trade, growth of indigenous manufacturing industry and specially of heavy industry is essential for rapid economic development and thus any diversion of investment from industries to transport, more than what is barely necessary will retard the growth of the economy. Besides rapid economic development, with increasing investment necessitates an intensive utilisation of the existing means of production and transportation. In India, we can hardly afford the luxury of surplus capacity and insuffi-

TABLE VI

(b) average haulage of wagons

cient use of capital without negating our avowed aim of rapid economic development.

It is necessary from the point of view discussed above to minimise capital investment in transport and this may mean postponement of some of the schemes of dispersal of economic activity in backward regions by development of railways in these regions. Extension of railway mileage should therefore be limited to what is essential for serving the new industries to be developed or would help in the operation of the railways. This may not be consistent with the social aims of the Plan but where such social aims run counter to the prospects of rapid economic growth, the latter should have precedence at least till an independent foundation of manufacturing industries (including heavy industries) is firmly established in the country.

Co-ordination of Transport

Although the Railway system in India is fairly well developed, the same is not true of other modes of transport like inland waterways, road transport, coastal shipping etc which have come to occupy an important place in the economies of other advanced countries. The emphasis on Railway development was mainly motivated by the military and strategic interests of the Indian empire and this explains the preoccupation of Indian Railways with passenger traffic. The Railway administration in India has always tried to put restrictions on competitive modes of transport, often with a sectarian motive and this mentality has not yet been overcome.

The Railway Enquiry Committee (1947-48) had expressed its apprehension about competition from road transport and had suggested more strict control by the Union Government. The Railway Board also still appears to be worried about such competition. It has examined the costs of transport by road and has established the uneconomic character of road transport. It is difficult to see, however, why the railways should be at all worried over competition from road transport or coastal shipping if these are relatively costlier. In fact, there is some traffic like the movement of coal, cement etc, which must be transported by railways since the cost of road transport would be prohibitive. But there is another kind of traffic (specially for short hauls) where the trucks would be more economical. This applies specially to short distance passenger traffic which is served much better by the buses than by the railways. This has been the experience in the USA, where competition between railroads and bus and truck services has resulted in a division of the field of operation for these various modes of transport with consequent benefit to all. Elimination of short hauls by rail will also improve the utilisation of wagons and in fact road transport should be encouraged by the railways specially for this purpose. It is highly desirable to constitute a Transport Board as the supreme authority for co-ordination of various modes of transport, as suggested in a recent issue of the Economic Weekly (May 26, 1956). Only such a body will be able to draw up efficient and realistic plans for transport for the Second and subsequent Five Year plans.

Transport in Second Plan: II—Road Transport

G Isaac

In re-examining the transport section of the Plan, it should be possible to provide a solution that takes note of the existence of acute scarcity of steel. It is vital to remember that road transport is much more economical in the use of steel than rail transport.

Road Transport is again much more economical on fuel than steam traction on the railways. One ton of diesel oil can do the work of nine tons of coal. The employment argument, too, as strongly in favour of road transport.

These considerations do not seem to have influenced the Government of India's policy. That policy has historically been one of limiting and restricting the development of all alternative forms of transport in the interests of Railway earnings. The peculiar dependence of the country on rail transport is the result of the active efforts made in the past to restrict competition to the railways.

THE Second Five Year Plan will create an enormous transport problem, for the solution of which the Planning Commission has envisaged a programme of railway development which will cost Rs 900 crores. Of the additional traffic that will be created at the end of the period approximately 60.8 million tons, as shown below, is proposed to be moved by the railways.

	(Mn tons)
Finished steel and raw products for it including coal.	25
Coal for other industries ..	13
Cement	5
Other general goods ..	17.8
Total ..	60.8

In contrast the expenditure for roads and road transport is Rs 265 crores, while no indication is available of the actual traffic expected to be moved by road. However, as information becomes increasingly available for the basis on which this allocation has been made, grave doubts arise about its soundness, and a re-examination of the whole approach to the transport problem seems to be necessary. An article by Shri K B Mathur, Member, Transportation, The Railway Board, in the first issue of "Indian Railways" may be assumed to summarize the salient points in the "Railway case".

In Shri Mathur's article, the study of alternative means of transport has been limited by assuming that road transport is unsuited for the movement of steel, its raw materials and coal. Since these alone amount to 38 million tons, the possibility of using road transport has been examined only for the remaining 22.8 million tons. Technically, it is difficult to believe that every component of a steel plant or engineering work is so constituted that only a railway wagon can carry it. In fact, very large proportion of the total machinery and steel traffic during the period of the Second Plan can be carried by road. A number of special duty motor vehicles, evolved abroad to carry loads that are beyond railway capacity, are readily available to transport even equipment of peculiar shapes and sizes. As far as coal and other raw materials are concerned, a fair amount is even now moved in motor trucks. On special single lane highways from coal fields to steel plants, it is technically possible for motor trucks to carry coal continuously at a rate of approximately a thousand vehicles per hour, which allows a vehicle spacing of fifty yards at thirty miles per hour; carrying capacity can be substantially augmented by the use of heavy trailers. Operational efficiency of this order may be difficult to achieve, but it does suggest that the assumption that 38 million tons of goods are unsuitable for road transport is untenable.

Costs of Road Transport

The argument that the cost of road transport would be higher requires detailed investigation. The Transportation Member of the Railway Board bases his argument on two assumptions. In the first place, on railway calculations, to carry a million tons of goods, it would require 3,333 motor trucks—at a total capital cost of Rs 11.6 crores. The Railways in comparison require a capital investment of only Rs 4 crores to carry the same volume of traffic. It appears that the cost of road trucks has been calculated at Rs 35,000 per truck. Now, this is the price of a Tata Mercedes truck, a price which is grossly inflated by:

(1) the fact that it is a new product;

(2) heavy taxation at a number of points; and

(3) the low output of a few hundred units at which the expensive plant operates. Given suitable encouragement, release from taxation, a high level of activity, and cheap steel there is no reason why the price per truck should not be halved or reduced even further—no reason why the figure of Rs 11.6 crores should not be reduced to Rs 5 crores or even lower. How exactly the railway investment figure of Rs 4 crores per million tons has been calculated it is not known, but perhaps this too could be re-examined.

The second assumption turns on the relative cost per ton mile of the two methods of transport. The railways carry a variety of common commodities at rates which vary between 20 and 40 pies per ton mile. The transport study group set up by the Government, all the full time members of which were railway personnel, calculated the cost of road truck transport as 72 pies per ton mile. Therefore it is argued on the cost consideration alone road transport can be ruled out. It will, however, be seen that this figure of 72 pies per mile is inflated by:

(a) an extremely high level of taxation—the Centre's petrol tax, the highest **ad valorem** tax on any commodity in the country; sales tax imposed by the States; and octoris, wheel taxes, transit fees etc levied by local authorities;

(b) licensing and other restrictions which reduce activity and utilization of trucks to uneconomic levels;

(c) depreciation calculated on the unrealistic price of Rs 35,000 per lorry.

If relief is granted on these points, it is possible to bring down the cost per ton mile on motor road transport to about 30 pies per mile or below.

The statement of the Railway case shows considerable confusion in the

minds of the Railway planners. Mr Mathur writes "Even in the USA, where road transport has been extensively developed, the volume of goods traffic carried by road constitutes only 10 per cent of the total, despite cheap and indigenous production of both fuel and lorries". The figure of 10 per cent indicates though not accurately, the road transport share of inter-city traffic, and not of total commercial freight traffic. It probably omits traffic between towns, between towns and cities and vice versa, the enormous movements from the cities and towns into the adjacent countryside and vice versa and export trade.

Decrease in Rail Mileage

In fact road transport has established and is widening a broad margin of efficiency over the railways. In the USA the roads carry the overwhelming majority of passengers and probably more than three-quarters of the commercial freight. Railway mileage has actually decreased since 1932. New centres of population are growing up away from the railways. Sites for new factories are determined increasingly by the availability of road transport rather than of railway facilities. It is interesting to note that a new American passenger car is powered with a 200 h.p. engine. Goods, too heavy for the railways, are carried by road transport. In all cases where fast deliveries are required the railways are found unsuitable for the job.

In Europe, it was calculated that the railways moved goods at an average rate of 2 mph. The belief so sedulously fostered that rail transport is essential to heavy industrial development is a myth. In the United States, steel production increased from 15 million tons in 1932 to 117 million tons in 1955, the nation fought a major war in this period, and national income increased from 40,159 million dollars in 1933 to 2,99,675 million dollars in 1954 (i.e. seven times). During the same period, the total railway mileage, the number of goods wagons, passenger wagons, and locomotives in service all declined (see Table below).

The figures speak for themselves. The coal, the cement, the raw materials for the new steel plants, the structural steel for the houses, the machinery for the new factories, the finished products of industry and agriculture, all these which increased American national income by seven times over the last twentytwo years, were carried by road transport and the waterways.

Economy in Steel and Fuel

In re-examining the transport section of the Plan, it should be possible to provide a solution that takes note of the existence of acute scarcity of steel. It is vital to remember that road transport is much more economical in the use of steel than rail transport. A railway carriage to carry a passenger with any degree of comfort requires between three-quarter and a ton of steel. A motor coach for the same amount of steel will carry sixteen passengers. The railway requirements for track, signalling equipment, heavy bridges and stations go to augment an extravagance in steel the country can ill afford. And even when the steel has been put down on a rail road track or bridge, there is the factor of relative usage to be considered. A railway line can only be used by railway engines and carriages and that too only for a few minutes in an hour, because of the hundreds of yards needed fore and aft for braking space. Under ideal conditions, motor vehicles can use a first class, single trunk road at the rate of a thousand vehicles an hour, which allows a vehicle spacing of fifty yards at thirty miles per hour or of hundred yards at sixty miles per hour. Besides, ordinarily, motor cycles, motor cars, lorries, motor rickshaws, light scooters, motorized cycles, cycles and bullock carts give a road an intensity of usage combined with flexibility to which the railways can offer no counterpart.

Road Transport is again much more economical on fuel than steam traction on the railways. One ton of diesel oil can do work equivalent to that of nine tons of coal. Diesel trucks and lorries would release carrying capacity at a time when it is vitally needed. The railways on the other hand require 11 per cent of their carrying capacity to transport coal for their own consumption, and 20 per cent of their capacity to carry the total of their cumbrous stores.

The employment argument too is strongly in favour of road transport. Road transport is very much more labour intensive than the railways and this alone should give it more attention than it has received to-date. The Indian motor transport industry provides employment today for 15 lakhs of workers—one and a half times the number the railways employ. For the same capacity, it provides employment for three times as many people. This employment is provided by some 47,000 operators, a pattern of small enterprise that is socially valuable and extremely flexible. Against it stand the monopolistic railways. The paralysis caused by the recent strike on the Eastern and Northern Railways is a warning of the dangers implicit in committing the country's economy to the care of the railways. Strikes are now inherent in the organization of the railways. Part of the explanation is to be found in the report of the Committee on Railway Corruption. Significant sections of the railway administration have forfeited their moral claim to the workers' loyalty.

It is worth noting that dispersal of ownership is inherent in the nature of road transport. Each of the largest firms in the US including two which doubled their size in 1956 still account for less than half the industry's total volume of freight. Strategic and military considerations argue in favour of an increased emphasis on roads and road transport. Modern warfare turns on dispersed troop movements based on good roads, and on an industry supplying armoured cars, motor cycles, trucks, lorries, weapon carriers. The days of the troop train are numbered; the concentration of troops required

RAIL TRANSPORT IN THE UNITED STATES

Year	Locomotives	Goods Wagons	Passenger Wagons

Source: World Almanac—1955

is too dangerous. The vast marshalling yards and exposed railway lines are major liabilities exposed to both subversion and enemy bombing action.

Small Towns and Villages

India consists largely of small towns and villages dependent for transport primarily on 10 million bullock carts. A large programme of road development is directly connected with their interests in a way that rail transport is not. To the village and the small town, roads and road transport bring freer flowing traffic, lower cost for supplies brought in from other centres and the countryside. They bring better education for children, more employment, better earnings and higher property values. They destroy social barriers, create national loyalties and provide the basis for community growth.

The Administrative Report of India 1918-19 referred to roads as "the most indispensable of all requirements to India's prosperity". It is not difficult to see why, though specific reasons are difficult to state concisely. It was estimated that for every 100 acres cultivated there are 50 acres uncultivated in this country. The main reason for this is that it is uneconomic to cultivate these lands because there are no transport facilities to bring the produce to the markets. In this context it is the shortage of roads and road transport, and not of railways that is important. Surveys conducted by the Road Transport and Development Association in 1943 suggested that through increased production of crops, cheaper and speedier transport, the community earnings in a village can be increased by Rs 277 annually for every Rs 100 spent on roads—quite apart from increased revenue to Government through taxes on motor vehicles and petroleum.

Local Price Movements

Roads and Road Transport are intimately involved with price movements, particularly with movements in the price of food. The local price of food depends on the supplies locally available. Since there are only 33,000 miles of railway line in the country, it can be seen that as far as the vast majority of villages and towns are concerned, supplies are primarily dependent on the 2,74,000 miles of roads and the vehicles that operate over them. The disastrous rise in the price of foodstuffs in districts, villages and towns removed from the railhead, inspite of the large stocks known to be held by the Government, and the high priority given to food movements by the railways, is the result of inadequate roads and road transport.

These considerations do not seem to have influenced the Government of India's policy. That policy has historically been one of limiting and restricting the development of all alternative forms of transport in the interests of Railway earnings. The peculiar dependence of the country on rail transport is the result of the active efforts made in the past to restrict competition to the railways. The policy was applied ruthlessly in the thirties when Government earnings declined; it is enshrined in the Motor Vehicles Act of 1940 and the Code of Principles and Practice and subsequent legislation.

As a result, in the years 1913-14 to 1950-51, road mileage increased by a paltry 75,000 miles to 2,44,000 miles. Of this only 39 per cent is metalled. Per square mile of her territory India has 0.2 miles of roads, as against 2.1 in Great Britain, and 1.84 in France. The rate of increase in the number of motor vehicles on the road, which was, 12 per cent per annum during the period 1920 to 1950, has declined to 4½ per cent in the First Plan period. For every 100,000 of population the country has 76 motor vehicles as compared with Ceylon's 715 and Malaya's 1,391. It has been a continuous process of sacrificing road (and river) transport to the interests of the railways.

The Basis for Progress

However, the time has come to re-examine the fundamentals of our transport policy. It must be realized that railways are the legacy of the 19th century, and that steam traction, on which the railways' share of the Second Plan is based, is, perhaps the most inefficient and wasteful form of transport. Prima facie, in this period of unprecedented change, there is cause for questioning the emphasis in the Second Five Year Plan on the transport mechanism of the 19th century. The modern method of transport is road transport and the transport of the future is air transport. In 1955 scheduled air services carried a greater percentage of the entire passenger traffic across the North Atlantic than did the steam companies. Road and air transport have an organic unity in the sense that one has grown out of the other. In the United States, in the United Kingdom, and in the rest of Europe, it is the motor car industry, with the financial and technical resources acquired in the manufacture of internal combustion engines, that has pioneered air transport. This industrial organism manufactures tanks, tractors, earth movers, motor boats, aircraft—its implications reach into every corner of a nation's economy. It provides the living basis for progress. In comparison the railway industry is a dead branch, cut off from the sap of economc life. Any additional cost involved in transporting the heavy traffic of the Second Five Year Plan on the roads, is a small price to pay for a modern, fast, flexible and expanding system of transport. The saving, calculated on an arbitrary costing system, made by expanding rail transport, will cause a lasting waste inhibiting the country's economy.

Taxation in the Second Plan

P C Bhattacharyya

This bare recital of the finances for the Second Plan pinpoints the inescapable conclusion that the burden has to be shouldered by the Centre not only of raising the taxes that have been allotted to it but also of filling the gap.

The order of deficit financing envisaged in the Plan cannot clearly be exceeded. The public borrowing has also been fixed on a fairly liberal basis. Even if these targets are fulfilled, non-development expenditures may also grow at a rate faster than that assumed in the Plan. The budgets of the State Governments are pointers in that direction.

It would therefore be more realistic to assume that if the Plan is to be implemented successfully, the whole of the uncovered gap of Rs 400 crores will have to be covered by additional taxation.

WITH the presentation of the Plan to Parliament, one chapter in the formulation of the Plan has now come to a close. This is an appropriate occasion for commenting on certain aspects of the Plan. The following is an attempt to focus attention on certain problems of taxation in connection with providing adequate resources for the Plan.

Additional Tax Yields
(in crores of Rs)

Year	Yield Due to Measures taken during previous plan years	during current plan years	Total
1956-57	—	35	35
1957-58	35	45	80
1958-59	80	45	125
1959-60	125	45	170
1960-61	170	45	215
Grand Total			625

Both in the final version of the Plan and the recent speeches of the Prime Minister emphasis has been laid on the need for self-reliance in the execution of the Plan. The Draft Outline envisaged Rs 450 crores of additional taxation to be raised over a period of five years. Half of this was to be raised by the State governments and half by the Centre. The uncovered gap of Rs 400 crores was left to be met from sources which were not very clearly indicated. The emphasis on self-reliance in the final version of the Plan may be taken to imply that this uncovered gap will have to be met mainly from internal resources.

The order of deficit financing envisaged in the Plan cannot clearly be exceeded without danger to the economy. Expert opinion seems to be unanimous on this point. The targets of 'Public Borrowing' have also been fixed on a fairly liberal basis. Even if these targets are overfulfilled, one has always to keep at the back of one's mind the possibility that non-development expenditures may also grow at a rate faster than that assumed for the purposes of the Plan. The budgets of the State governments for the current year are pointers in that direction. It would therefore be more realistic to assume that if the Plan is to be implemented successfully the whole of the uncovered gap of Rs 400 crores will have to be covered by additional taxation.

The State governments are even now finding it difficult to adopt appropriate measures which will enable them to reach their current taxation targets of Rs 225 crores. The field of State taxation is also limited. The responsibility of raising taxes to cover the gap will, therefore, fall mainly on the Centre and the total amount of taxes to be raised by the Centre over the five years of the Plan may go as high as Rs 625 crores. In the first year of the Plan the Centre has been able to enact measures which are estimated to yield Rs 35 crores of additional taxes a year. Over the five years these will yield Rs 175 crores. This leaves a balance of Rs 450 crores to be raised during the next four years. Budgets of each of these years must therefore provide for new measures of taxation yielding additional amounts of Rs 45 crores annually. The scheme for additional taxation will have to be somewhat on the lines indicated in the table.

The estimates for gross revenue at the Centre (including net contribution from the Railways), as revised for 1955-56 are approximately Rs 558 crores. If the above scheme of taxation is accepted, the gross revenue at the Centre will have to reach the figure of Rs 773 crores in 1960-61.

On the face of it this may appear a large increase, but not in any way out of keeping with the order of increase in the national income envisaged in the Plan.

Second Five Year Plan Number

On account of pressure on space and shortage of time, several articles intended for this number have been held over. These will be published in the forthcoming issues and will give a more extended coverage of the Second Plan.

Among the articles awaiting publication are the following:

Transport in the Second Plan
1. Railways
2. Road Transport
3. Sea and River transport.

Five Year Plans and Industrialization in South

(Contributed)

"A CORRESPONDENT in the South" who has recorded his "Grouse Against the Plan" while discussing in your Second Five Year Plan number some of the factors influencing the small allotment of funds under the Plan for development in the South has failed to touch the sore spot, which militates against industry gravitating towards the South, especially Madras. The sore spot is the perennial power shortage afflicting Madras State. The correspondent in referring to the problem makes the observation that "periodical power cuts in one area or the other, consequent on the failure of monsoons, can be obviated by the Southern States establishing one big regional grid". The establishment of "one big regional grid" by itself is unlikely to obviate yearly power cuts unless the monsoon happens to be normal. But what the State has been witnessing in recent years is inadequate monsoons, followed by drastic power cuts. Any amount of additional hydro projects is unlikely to meet the situation, (as the storage of water in the reservoirs is, in the absence of snow-fed streams, at the mercy of the monsoon) and what the State has needed all these years and will need in future is adequate firming up by thermal power.

What the State Electricity Department should have done in the past was to have built a brand new thermal Station (even depending on Bihar coal) of 100MW; instead, the Department went about acquiring the Basin Bridge Steam Station in Madras (even though the option to purchase under the License had arisen) by laying out huge sums without creating any new assets. The Electricity (Supply) Act was then on the legislative anvil, and the Madras undertaking could have been declared a controlled station under the Act, with resultant benefit to the State Grid. The Licensee would have been earning only the very limited return of 5 per cent on the capital employed, against greater return now claimed by the Department.

The situation became much worse by the State, against the known view of the Central Government, proceeding with the Bill to nationalise the Electric Supply undertakings in the State to be followed by laying out further large sums towards acquiring undertakings, again without any accretion in the form of assets. This development also put an end to the possibility of any new Licensee coming forward to electrify new areas and further served as a warning to private sector as to what was in store for it in the State.

This aspect of the State's Industrial policy giving rise to power shortage year after year, has to a large extent discouraged industrialization, and surely posterity will hold those concerned with the policy largely responsible for the plight the State is faced with now. The fanfare with which the inauguration of the Kundah project has been greeted is not likely to result in the goods being delivered. This project also has to depend on the monsoon which has again and again proved fickle.

The hope of the State now rests on the successful outcome of the Lignite project at Neiveli and one can only hope that the present operations would result in the "difficulty presented by the high pressure artisian springs" being overcome. On this will depend whether or not the installation of a thermal station with an ultimate capacity of 200 MW in the region is a practical possibility, as without firm power, the pre-requisite of an industrial base cannot be laid.

Association Meeting

General Insurance has Bright Future

Shri K C Desai's Optimism

I VISUALISE a bright future for our industry, since the scope for insurance companies to add to their premium income, by developing new lines of business as well as by improving further the lines in which they are already engaged, will be growing daily with the progressive implementation of the various schemes for the economic development of the country", said Shri K C Desai, Chairman of the Indian Insurance Companies' Association, Bombay, presiding over its 28th annual general meeting held last week.

Shri Desai, however, added that "the supreme need of the moment is a complete change of outlook on our part—a determination to put our home in order—so as to ensure an abiding place for our business in the private sector". He said that this effort should be supported by an unqualified and categorical statement from the Government that "this business is to remain within the private sector so that insurance companies reassured about their future existence, can go ahead with their programmes of expansion and equip themselves better for their vital role in the coming crucial years".

Case Against State

The year, continued Shri Desai, marked a milestone in the planned economic development of India and also saw far-reaching development in the direction of State ownership of which the amendment of the Constitution and the nationalisation of the Imperial Bank of India and life insurance business were proofs.

Shri Desai hoped that the hard school of experience would lead to a gradual reorientation of the Government's attitude towards the private sector and free enterprise would be allowed to make its proper contribution to the enrichment and diversification of the national economy. Shri Desai referred to the question of compensation and the advocacy of Shri A D Shroff before the Select Committee where he ably argued that the Government was offering only 35 per cent of the real value of the shareholders' interests.

Expressing satisfaction at the Government's decision not to nationalise General Insurance business, Shri Desai said that General Insurance is highly complex, demanding flexibility of management and adaptability to supply a tailor-made service with immense variations in insurance coverages to suit different types of risks. He sought renewed assurance from the Government that this business is to remain within the private sector.

Fair Practices

Referring to the problems posed by the nationalisation of Life Insurance business, Shri Desai said that in the process of adjustment, many companies might be forced to close down their branch organisations and may have, further, to lose the services of those who have worked for them efficiently well over a long period. Besides, there was also the fear of competition for business among insurance companies becoming stiffer. In this general scramble he asked insurance companies to guard against the temptation of adopting questionable methods to circumvent the salutary provisions of the Act.

"With the increasing tempo of economic activity, there will soon be enough business to go round. But in the meantime, it is very essential that we take a long range view of things and concentrate our energies on effecting a radical rationalisation in the working of our business by eliminating all undesirable features that hamper our progress on the right lines", he added.

Immediate Problems

After announcing the formation of a reinsurance corporation which, with Shri T K Desai, as the first General Manager, would play a significant role in the development of the country's economy, Shri Desai pointed out that some of the provisions in the Companies Act would cause unnecessary hardships to insurance companies in their day-to-day work and increase their management expenses on account of the duplication involved. He urged the Government to exempt the companies from their operation so that the companies could continue to function efficiently, unhampered by needlessly irksome rules. He hoped that the State-associated insurance concerns would not enjoy an unfair advantage. Concluding, Shri Desai referred to the continued uncertainty regarding the taxation of profits arising from reinsurance contracts and hoped that the recommendation of the Taxation Enquiry Commission in this regard would be implemented.

The Future of European Communism
—India as the Model

(From our London Correspondent)

A NEW period in the history of European communism is in the offing. The Communist parties in the two crucial Western countries, Italy and France, have not only accepted the U S State Department's version of the Khrushchev report as a correct one, but have made, for the first time, their independent assessment of the remarkable data divulged by the Russian leader. This shows that Communists in these countries are no longer prepared to accept what up to now was a permanent satellite status and that henceforth their acceptance of Soviet developments will be only from a critical and "objective standpoint." When the Italian leader, Signor Togliatti says that some of the prestige of the Soviet leaders "has fallen," he takes a step which brings on trial the whole system of international communist affiliation and relations: this suggests the most pertinent consequences (for European political development) of the Khrushchev report.

Thirty years of Stalinism and the Stalin cult is not easy to live down. The Communist leadership in the Soviet Union may be able to achieve remarkable flexibility in their standpoints over periods of time and change, turn, and adjust positions and lines of Policy. The Western Communists are not capable of such flexibility. For thirty years they have been employed to meet the exigencies of Soviet Policy; it was thus inevitable that their ability to manoeuvre in domestic Policies and more important, their ability to reason (even according to their Marxism) should become stilted and rusty. It is therefore understandable that those who are most surprised by the Khrushchev report are the West European communists. Possibly for this reason, it is the French Communists who are experiencing the greatest difficulty in even believing that Stalin in his years was able to Perpetrate crimes which are now attributed to him. This 30-year heritage is now making itself felt in a coolness towards and a hesitancy to accept fully the new Russian leadership. The French Communists and their counterparts in Britain complain that the Khrushchev report lacks Marxist analysis, that "a more adequate estimate of Stalin, both in its positive and negative aspects will be necessary". For Western European Communists, the Kremlin is no longer the repository of Marxist wisdom. This is the first significant change.

The Italian Communists, the largest in Europe and Probably the most ably led of all the European Parties, have themselves taken one or two steps forward from the Khrushchev report and have made formulations which are fundamentally new to Communist strategy. They have come to the conclusion that the "Soviet model is not and cannot be obligatory any longer". This remarkable shift is occasioned by their new and attractive slogan—"Socialism with liberty" and this is founded on their new view of the class struggle and who the allies are to be in that struggle. The struggle can be non-violent; further, and this is most important, the leadership in the socialist transformation need not necessarily be Communist. In a guarded way, Signor Togliatti suggests that the developments in India are a Pointer of considerable significance for the achievement of "Socialism with liberty." The allies in the class struggle can be many, varied and of diverse interests; the enemy of the people—the "monopolists and imperialists" are, according to Togliatti opposed by "the nation". Italian Communists therefore stand for leading the people and the nation and in this, support will be sought from all sectional groups. Such formulations savour strongly of nationalism and it is suggested that the national character and the peculiarities of the national situation will henceforth become a basic determinant in the formulation of Communist designs and aims. This is the second of the major changes that appears to be taking place in the outlook of European communism.

It is admitted by all the Western Communists that they were not informed of the Khrushchev report by the Russian Party. They see in this a break in the clandestine relationship which existed between them and the Soviet party. They see at the same time a "resumption of full relations" between the C.P.S.U. and the Yugoslav Communist League. More important, they find French socialists feted in Moscow on a State level. All this has caused anxiety; in France the unity of the party is at stake. In Italy it is only the adept leadership of Signor Togliatti that is maintaining continued homogenity and unity. The British Communists are in a patent state of confusion and the departure of Mr Harry Pollitt is possibly an outcome of this situation. There is the search for a new creativeness, a new dynamic for which Communists have a reputation, to lift themselves out of the crisis, largely not of their making, but into which they have willy-nilly fallen. They have had to face the charge that they were a "foreign party", agents of Russian Communism and devoid of nationalism. It was only their singleness of mind that has carried them through the cold war—a period in which the strength of European Communism was severely tested and out of which it has now come out weaker than it was in 1945. All this has forced upon them a realisation which may now have the greatest consequences for European Politics.

To the extent to which this realisation leads to policies divorced from Soviet politics, European communism will again make an impact on developments. The changes suggested by the Italian Communists point to that possibility.

Around Calcutta Markets

Investors' Doubts

Wednesday Evening

EQUITIES on the Calcutta Stock Exchange started falling as it became known that IISCO had been allowed by the Government to issue right shares only at a premium. For about a month now, the trend has been downward. By the beginning of the current week, the selling pressure subsided. But equities still remain hesitant. Investors remain aloof from the market. Even Paper and Engineering shares remain without investment support. As the hesitant trend continues and the volume of business shrinks, the belief spreads that stock markets may not move up confidently during the duration of the Second Plan.

Immediately, the hesitant trend in equities is due to the belief that a loan by the Union Government is imminent. But for the series of resignations from the Union Cabinet and the State Bank, the loan might have been floated by now. In the last few weeks, there has been currency contraction. This means that funds are flowing back into the banking system. Thus the slack season is well under way. Some of the technical indicators of the money market suggest that the loan is imminent.

Loan Effects

Two years ago, when the National Plan Loan was floated, the resultant withdrawal of funds had the effect of starving stock markets of funds. But such a development is not likely to be repeated now. Three years ago, deficit financing had not gathered momentum. Since 1953, deficit financing has been, and continues to be heavy. So the disturbances arising out of the National Plan Loan are not likely to be repeated. Last year's loan programme created no difficulties. This year's loan target should, similarly create no troubles.

Fears that the Government's loan programme will starve stock markets of funds are, therefore, exaggerated. As the Second Plan is executed gradually, as deficit financing gathers further momentum, the public borrowing targets may be enlarged. There is a case for such enlarged borrowings. There is some reason to believe that some investors are aware of such a possible development and its possible effects on stock markets. But even as present fears are baseless, apprehensions about the future, so far as the issue under reference is concerned, would seem to be exaggerated.

Price Policy

Lack of confidence in stock markets is reflected in the hesitant trend in equities. Certain recent developments in New Delhi's economic policy are causing concern to investors. There may be economic justification for ensuring uniform selling prices for iron and steel and cement. Such uniform selling prices may encourage diffusion of industry. By implication, therefore, such a price-policy is likely to discourage concentration of industry in Calcutta and Bombay. This may be in consonance with the Government's avowed aim of decentralising industry. But it has had adverse effects on the Calcutta Stock Exchange.

Calcutta is the main centre of secondary engineering and miscellaneous industries. These industries are heavy users of iron and steel. Until recently, these industries enjoyed the advantage of relatively cheaper prices for iron and steel for their development. Since the announcement of uniform iron and steel prices, these groups of shares have developed a downward trend on the argument that Calcutta's secondary engineering industries would lose the price advantage. Uniform prices for cement would also tend to have the same effect. Whatever be the economic justification for uniform prices for cement and iron and steel, such a policy must have adverse effects on the industries in the Calcutta region. This is, naturally, reflected in the downward trend of the shares concerned.

State Control

Much has been sought to be made of the growing scarcity of equity capital in relation to the proposed IISCO right issue at a premium. More relevant are the growing fears of State trading and the uniform price policy of basic raw materials of industry. Iron and steel and cement are two of the major industries. Recent developments strongly indicate the possibility that the cement industry may be either nationalised or brought increasingly under State control. Such a development was clearly envisaged by TTK in one of his speeches in Parliament in the Government's new industrial policy.

This raises the problem of the existing iron and steel industries. Under the new industrial policy, existing industries were assured that they would not be nationalised. New iron and steel industries will be established and developed only within the public sector. This is not news. But New Delhi's insistence on fixing the issue price of right shares, the announcement of uniform iron and steel selling prices and similar other developments have deepened suspicions that even the existing private iron and steel industries would be brought progressively under State control and supervision. This explains the continued hesitant trend in IISCO.

Jute Shares

Jute shares continue to drop. Besides the general downward trend, there is another explanation for the drooping trend in Jute shares. Some time ago, news emanated from New Delhi that the Government was contemplating fixation of minimum prices for jute goods. It soon transpired that IJMA was opposed to any such policy as it might have adverse reactions among foreign buyers of Indian jute goods. It soon became evident that the alternative IJMA formula of curtailing output would be adopted. IJMA has announced that 2½ per cent of jute looms will be re-sealed. But Jute shares continue to drop as the proposed cut in output is not likely to have any appreciable effect on the prices of jute goods.

Coal shares have recently fluctuated with changes in sentiment. A couple of months ago, they started crawling up as it became known that private collieries would be allowed to expand during the Second Plan period. Later, Coal shares resumed their downward trend as the Tribunal award raised wage costs. There were hopes that the Government would raise selling prices to offset the higher wage costs. Delay in the Government's announcement relating to higher selling prices is aggravating the downward trend in Coal shares.

Around Bombay Markets

Uptrend after Long Liquidation

Thursday, Morning

DALAL STREET had more than its fair share of ups and downs during the last three weeks. To begin with, there was Shri Chintaman Deshmukh's resignation. The news naturally caused a slight set back. But the losses were more than made up on the following day when the new textile policy was announced. What enthused the market was the decision of the Government to licence 14,600 new automatic looms. Though these looms were to be installed mainly for boosting exports, the hint was not lost on the market. Indeed, the market openly expressed its approval in no uncertain manner but over did it the point of drawing a sharp rebuke from the Finance Minister that there was no reason for so much jubilation.

As a result, market leaders like Tata Steel and Indian Iron suffered a loss of the order of about 5 per cent from the high levels reached before the Finance Minister cried a halt. Just before this, news that the World Bank had agreed to give a $ 75 million loan to Tatas, at 4¾ per cent had taken up Tata Ordinary to Rs 206. It was only towards the middle of the week under review that the trend was reversed and industrials recorded all round gains, construction scrips leading. This was certainly a promising start for the new account on Monday. True, the volume of trading did not improve to any great extent; but the change in trading sentiment was remarkable, particularly after the spell of liquidation towards the end of June.

In the textile section, prices moved both ways, profit-taking being prominent at higher levels. Kohinoors were an exception and moved up steadily to Rs. 377-8 at one time, on continuous support from interested quarters. Swadeshi, Nagpur, Century and others also ruled firm.

After moving up to Rs. 196 exright, A C C declined to Rs 188. As holders of right shares have to make a downpayment of Rs 60 per share and the balance of Rs 60 after six months, the terms are attractive enough for investment buying. Dalmia Cement were active on higher dividended announcement, dividend having been raised from 10 per cent to 12½ per cent. Premier Construtions were firm and attracted considerable investment demand on reports of early change in the capital structure of the company. Bombay Burmah maintained a firm trend on anticipation that the interim dividend would be maintained. New India moved up on announcement of the issue of one bonus share for three shares held. The shares are being quoted ex-dividend from this week.

Cotton

Trading in Delivery Contracts

FUTURE trading in coton, which has now been going on for a few weeks, reflected a note of sober optimism. A notable event during the week was the opening of trading in delivery contracts since July 2. The Board of the East India Cotton Association, which met on June, 29, decided to permit non-transferable specific delivery contracts. It was argued on behalf of the trade that although there is usually a tendency for such trading to degenerate into speculation, thereby provoking intervention on the part of Government, this was unlikely to happen under the circumstances prevailing today, especially in view of the existence of two contracts operating simultaneously in the futures market which cover almost all the cotton grown in the country. If this had not been true, the Forward Markets Commission would not have given its permission for such trading.

The following were the latest quotations:

	(Contract December)	
Khandesh 197/3	Rs 117	ON Jarilla
Berar	95	ON Jarilla
Moglai	5	ON Jarilla
320F	55	ON Vijay
216F	101	ON Vijay
	(Contract February—March)	
Vijay 13/16"	25	ON Vijay

An important development in the spot market at Sewri was the keen purchases of Bengal deshi cotton by a party, who has been extending sustained support in this direction. It is believed in market circles that the Textile Commissioner may shortly announce an ad hoc export quota of 5000 bales of Bengal deshi. It is rumoured that this quota might be given to a single Bombay firm. Such an uprecedented step would amount to unjustifiable discrimination in distribution and it is to be hoped that the rumour is unfounded.

Oilseeds

Erratic Trend in Castor

THE Oilseeds market was marked during the week under review by an erratic trend, particularly in the castor futures section. There was a rise in the prices at the start, more due to nervous short-covering than to actual bull manipulation. The technical and statistical positions both warranted a rise in values.

The reverse in the trend of price was due to corrective profit-taking. But instead of merely a mild setback, there was a rather precipitous fall in the price of castor futures. This was because of active manipulation on the part of bears as well as liquidation by bulls. Moreover there was hardly any export demand for castor oil. Another bearish factor was the decision of the U S Commodity Credit Corporation to release about 10,000 tons of castor oil. To cap all these, there was the report that forward trading in new crop castor would be taken up soon.

It is true that in the prevailing circumstances, one can hardly expect any American support, but we have an alternative market in Japan which is credited with having bought already about 700 tons of castor oil of B S S variety at between £ 126 and £ 129 per ton. Castor futures September contract declined from the highest by about seven points to close the week at Rs 133/8, little over two rupees higher than the week's lowest.

In sympathy with the bearish trend in castor futures the groundnut futures market also reflected a bearish trend. After declining from Rs 137/8 to Rs 131, groundnut February very nearly recovered the lost ground only to drift down towards the close to Rs 133/12. The narrowing of the gap between the prices of castor future and groundnut futures has resulted in a considerable shrinkage in the straddle business which was widespread only two weeks back.

Mineral Policy and Export of Ores

JULY 15 is the D day for mining companies who produce for export markets as well as for exporters and shippers of ores. Pending finalisation of the new licensing procedure for export of ores, *current quotas* and registration slips have been validated *uptill* that date. On that day, the export procedure for ores is expected to be announced.

There have been some important changes in respect of minerals. The future development of selected minerals—*only mining* in the case of iron, manganese and chrome ores etc., and both mining and processing in the case of the others—is now the exclusive responsibility of the State. The inclusion of these minerals in Schedule A of the new Industrial Policy Resolution however, has not made much of a difference in mining policy. On the contrary, applications for prospecting licenses for *these minerals* which had been kept *pending* after the announcement of the Industrial Policy Resolution, will now be freely granted. Similar licenses would be issued in the future also, as in the case of many of the minerals under Schedule IV of the Mineral Concession Rules, *1949*.

The Mineral Concession Rules, however, are to be changed very substantially but the major changes would *relate to the terms of* lease granted before the present rules came into force. In fact, this has been long over-due. The conditions of the earlier leases, which are very much out of line with current regulations, will be amended by a *bill which* will be presented when the Parliament meets.

It is lately that the Government has woken up *to the necessity* for a more energetic development of minerals. The First Plan did not even provide for a systematic investigation of our mineral resources; it was later that the allocation for the purpose was more than doubled. But all *this* takes us very far away from the question of export *policy* which is the immediate concern of mining interests. It is here that State trading comes in. The functions and aims of the State Trading Corporation had been deliberately left vague, when the Corporation was formed. *In the* very first meeting of the Board of *Directors of the* Corporation held on June 2, however, it was given out that "the Corporation aims to play a leading role in promoting exports of ores, particularly iron-ore, manganese ore and *chrome ore* from India". (All these, it will be recalled, come under Schedule A of the *Industrial Policy Resolution*). It was at this meeting that the Board "decided to take over" the export of iron ore (manganese was not mentioned).

Leaving aside coal, which is a subject by itself, the Second Plan merely mentioned by way of a mineral policy that the "increasing participation by the State in basic industries *like iron and steel will require* detailed investigation of *deposits* of mineral raw materials such as iron ore, manganese ore, etc." This throws no light *on* the manner of exploitation of these minerals which came out later. In a press *note* issued by the Ministry of Commerce and Industry *on June 22*, the Government first gave out its ideas about export policy for ores. The major considerations which appear to have influenced the Government were (1) "developments in certain countries in the matter of purchase of *ores* and their effect on India's foreign trading" and *(2) the* conviction that the existing trade mechanism was *quite* inadequate to cope with these developments. There was a further consideration; the difficulty of

maintaining equitable distribution of wagons among mining and trading interests had made it virtually impossible "for the limited resources (of transport?) to be used to the maximum advantage" or "for economical arrangements to be made for the transportation of ores and for their handling at the ports".

All this, the press note stated, had made it necessary for the Government to play a more positive role, (a) to overcome the obstacles in the way of increasing foreign exchange earnings from the export of ores and (b) to canalise these exports in the "progressively increasing measure" through the State Trading Corporation. The Corporation, however, as it has already done in the case of cement, may use the existing trading agencies "to the extent practicable". Limited opportunities, nevertheless, are to be given to mining and trading interests for direct export within the limits of the broad policy that may be laid down. This lead to allocation of transport for export of ores and the issue of quotas separately for manganese and iron ores, on the basis of actual exports in the past in the case of shippers and of royalty paid (excluding royalty on quantities supplied for domestic consumption) in the case of mine-owners.

Conservation of minerals in the interest of future development of the country is a sensible policy. So is active development of minerals to the extent that resources permit and the general state of development of the economy may require. The range for it is wide—smelting, refining, benefication, development of metallurgical industries and fabrication. It is not that the Government intends or hopes to utilise all the iron and manganese ore for the above purposes. In fact, the export target for both have been substantially increased for the Second Plan period. But a dog in the manger policy promotes no development. If there is more to it, perhaps the Government would take not only the trade but also the public into its confidence.

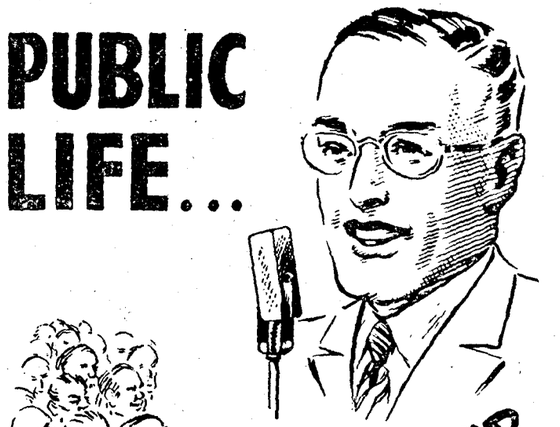
Socialists' Opportunity

MUCH, too much, has been heard about Khrushchev's speech before the secret session of the 20th Congress of the Soviet Communist Party. Mr Dulles's decision to publish the text of Khrushchev's secret speech has paid quick dividends. There is bewilderment among Communist parties outside Soviet Russia. Togliatti is critical. For reasons entirely different, Khrushchev's speech is disapproved by Thorez. Within the Soviet bloc, the reaction has been different. Eastern Germany and Communist Eastern European countries generally welcome the crusade against the "personality cult". Moscow's policy of relaxing its hold on the Soviet bloc has had a favourable reaction. The Poznan riots may indicate that the process of democratisation will have to be gradual. But the process is not likely to be reversed. Within Russia, the new policy is popular. Khrushchev's position still remains secure.

In publishing the text of Khrushchev's secret speech, Mr Dulles has succeeded in spreading embarassment to Communist leaders and parties outside Russia. This explains the French Communist Party's belligerent attitude. More relevant is Togliatti's theoretical approach to Khrushchev's secret speech. Mr Dulles had ulterior motives in publishing the text of the secret speech. His purpose was to make it clear that the present men of the Kremlin could not absolve responsibility for the crimes of Stalin. Not only the present leaders of Russia, but the leaders of all Communist parties in all countries are in a predicament. Khrushchev has tried to explain away his and his associates' compliance with Stalinist terror by their impotence and powerlessness. Communist leaders outside Russia can plead no such excuse in defence of their servile support to Stalinism.

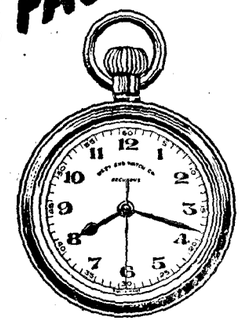
When Khrushchev made his secret speech, he took a calculated risk. Despite the Poznan riots, subsequent events do not prove that the men of the Kremlin have taken too great a risk. It is hasty to conclude that the new Soviet policy has caused a loss of political cohesion within the Soviet bloc. It has, on the contrary, led to a partial reconciliation between Belgrade and Moscow. Mr Dulles is over-optimistic in hoping that the democratising process will hasten the disintegration of the Soviet bloc in Europe. Along with Russia, Eastern European countries may abandon the monolithic structure of Communism. But the latter are not likely to prefer capitalist democracy to Communism. With the gradual acceptance of individual freedom, with Moscow's efforts to foster national Communism, Eastern European countries are likely to remain within the Soviet orbit. Russia and Eastern European countries are dominated by the Slav people. Racial affinity is a binding force between Russia and her Eastern European neighbours.

If the new Russian policy is not likely to wean Eastern European countries away from Communism, it has been tremendously successful in its international aspect. As the men of the Kremlin have announced their determination to reject the "personality cult", Russia has gained new friends. Totalitarian aspects of Communism have been ever deplored by even those who reject American Capitalism. By espousing the cause of tolerance, Moscow has succeeded in acquiring new sympathisers. Not only Tito, but Sir Anthony Eden, M Mollet and Pandit Nehru are impressed with the changing out look of Moscow. As the international tension has eased, Moscow has not only loosened its grip over Eastern European countries. Russia has utilised the opportunity to curtail her military expenditure and armed forces. It is America and some of her Western allies who are now made to look as militarists. Simultaneously, Russia has diverted part of her former military expenditure to raise production so as to enable her to function as a source of supply of capital goods and technicians to under-developed countries.



Crusade against "personality cult" will not prejudice the future of Communism. Mikoyan's outspoken criticism of some aspects of the Marxist-Leninist theory of the inevitable collapse of Capitalism is far more damaging. So is Togliatti's repudiation of Khrushchev's explanatory analysis of Stalinism as "un-Marxist". This is where the struggle between Socialism and Communism assumes significance. Moscow may have retrieved its position to some extent by conceding national Communism. But there are other strategic fronts on which the battle between Socialism and Communism will be fought and won. As Communism fosters and encourages individual freedom, it will be fighting the war from a vantage ground. On the economic front, there may be nothing much to choose between the two ideologies. But both Socialism and Communism have a common interest in fighting the economic battle together to discredit Capitalism as obtains in America. While Mikoyan has warned Communism against any complacent attitude to the theory of inevitability of disintegration of Capitalism, there is a danger that the fight between Socialism and Communism may prejudice, as well as delay, the outcome of the more urgent and crucial battle for freedom from want. Only the Nenni Socialists seem to be aware of this danger. Sooner the Socialists of other countries become conscious of this danger, the better for them as well as the common man throughout the world.

Scarcity and Abundance in Pakistan



ABOUT Sui gas or the Thal development scheme, not to speak of the canal water dispute, there is no dearth of information. These hit the headlines, because international agencies are interested in them and Pakistan is not reluctant to tell the world all about them. This is at one end of the scale—at the other, there are things like exodus of refugees or acute food shortage in East Bengal which cannot be kept out of the news. Naturally such news hit the headlines when food ships are rushed from Soviet Russia and the UNICEF makes an emergency grant for rice ration for children and mothers and food imports are expedited from U S and Burma. In between there are other developments in Pakistan which, not being so sensational, get publicity only in bits and pieces and raise questions for outsiders which are not easy to answer.

An instance in point is the export of cotton textiles from Pakistan which first made their appearance in foreign markets some time ago and have now assumed considerable proportions. About the time that Pakistan cloth first appeared on foreign markets, Pakistan textile industry was complaining of over-production and heavy accumulation of stocks. There was no overproduction, of course, in the sense of per capita supply of cloth exceeding the per capita requirements of the population. Referring to the Pakistan Government's target of 18 yards per head per annum—India has now raised her target to 18½ yards from her present consumption of 16 yards —the President of the Pakistan Textile Millowners' Association made it clear that this only represented "a target of future expectation to be realised when the standard of living and per capita income in the country has suitably risen". But judging from past experience, even in the most favourable years when cloth imports were on the OGL, he said that consumption would not exceed 9½ yards per head and if this was still the effective demand in the country, he maintained that it had been far outstripped by internal production.

The position described above has to be reconciled with the operation of Pakistan's existing aid agreement with America under which she is to get a large quantity of cloth and yarn manufactured in different countries from U S aid cotton. The agreements with different countries e.g. with Britain, this week, for import of cloth made from aid cotton. It is difficult, at sight, to reconcile these two flows of cloth into and out of Pakistan except on the assumption that Pakistan consumers have switched over to superfine and fancy varieties of textiles made from American cotton and therefore Pakistan mills are exporting medium and coarse varieties manufactured from home grown cotton. It is too fantastic an assumption to be considered seriously. What then is the correct explanation?

Reappraisal by Prime Ministers

FROM the communique issued at the conclusion of the Commonwealth Prime Ministers' Conference, it is apparent that Pandit Nehru and Sir Anthony Eden have convinced their opposite numbers that recent developments in Russia call for a reappraisal of the attitude to the East-West conflict. Non-Asian members of the Commonwealth have not turned "neutralist"; nor have they abandoned their faith in regional military pacts. But the Commonwealth as a whole would seem to have accepted the need for a more sympathetic attitude toward Russia. Though the communique is less emphatic about Communist China, it is clear that the Commonwealth is in favour of Red China's admission to the United Nations, and will welcome increased trade relations with that country.

Washington may feel irritated at the Commonwealth's efforts to pursue a foreign policy which is not endorsed fully by it. But some Commonwealth members may have a grievance that the Commonwealth has not emerged definitely as a third force. This raises the problem of the future of the Commonwealth. There are indications that Britain as well as other members are inclined to stress the economic aspect of the Commonwealth link. Satisfaction is expressed in the communique over Britain's "determination" to function as a source of capital for development in the Commonwealth countries. Whether Britain will be able to provide the needed capital, is doubtful. Economic ties are not unimportant. But it is likely that the basic political unity may be a more binding and continuing link. In the "common heritage of parliamentary democracy", the Commonwealth has a dependable foundation. This base will become more solid as the Commonwealth's professed respect for "aspirations for freedom and self-government" is more widely reflected in the transfer of power to the areas which are not yet free.

There is growing doubt about the future of the Commonwealth. Looseness and informality of the association have been its strongest points so far. It may, therefore, seem surprising that, at a time when doubts about its future existence are being expressed, some eminent authorities are arguing the case for a closer and more rigid association. Sardar Panikkar has called for a declaration of Faith by Commonwealth members. He is also in favour of creating a machinery for conciliation, now that the Privy Council has been abolished. To some, these may seem to be risky innovations. No formal or rigid ties can perpetuate the Commonwealth, if the approach to basic social and human problems ceases to be common. It will, or can, survive only as long as it maintains a common approach to fundamental issues.

Side Issues in Food Debate

THERE are interesting side-issues to the food controversy which have got lost in the confusion created by the good imbroglio. Had the controversy been carried on according to approved rules, the question that would arise seriatim are (1) Is it within the competence even of the Planning Commission to alter the targets after they have been fixed? This question was raised by Shri K C Neogy, and appropriately enough, when the Musooree conference was in session. The answer to it is 'yes' and 'no'. Yes, because the Plan itself says: "In view of the considerations outlined in paragraph 10 and especially the need to provide adequate safeguards against possibilities of inflation, it is considered that it is both necessary and possible to achieve higher agricultural targets with relatively small adjustments in regard to resources. With a view to fixing higher targets and ensuring their realisation, the Planning Commission and the Ministry of Food and Agriculture propose to undertake further study of agricultural programmes in each State and region with reference to its crop pattern, land and water resources etc."

But definitely 'no', if the order of magnitude of the proposed increase is borne in mind and the manner of its implementation, through re-allocation of resources. If these are done, what happens to the balances within the Plan and its internal consistency?

The second question that would arise is, what was the basis on which the target was fixed, production possibilities or estimated demand? Again the answer is, 'yes' and 'no'. Yes, because in the paragraph 10 referred to above, the factors to be considered are laid down as follows:

(1) increase in the total population,
(2) increase in the urban population,
(3) the need to improve per capita consumption,
(4) the need to counter possibilities of inflationary pressures resulting from the implementation of the Second Five Year Plan, and
(5) effects on food consumption, of increase in national income and changes in its distribution.

Needless to say that the target, was based on all these considerations the figure arrived at not only happened to be, but had to and did equal the figure which was worked out on the basis of production possibilities. The latter, in turn, suggested the 40 per cent increase also. The increased production in community project blocks and areas served by the N E S as found from two sample surveys in these areas, were put up as the basis for Shri V T Krishnamachari's note that food production could be raised by 40 per cent without any significant increase in investments for agriculture!

Transport Board Strengthened

THE Departmental Standing Committee of the Central Advisory Board of Transport, is now to be strengthened. It is to be expanded by the inclusion of high-level representatives of, among others, the Ministries of Production, Commerce and Industry, Iron and Steel and Defence with the object of undertaking for the first time the co-ordination and advance planning of transport facilities in the light of the requirements of the next two or three years. The immediate concern is the procedure for avoiding congestion in ports which may occur in view of the heavy programme for imports of capital goods.

Government's awareness of the need to co-ordinate transport is revealed by the recent appointment of a Central Authority for the co-ordination of goods movement at all ports in the country in co-operation with the railways and importers. Shri B C Mullick, Director of Railway Movements, Calcutta, is to be in charge of this organisation.

The Standing Committee is likely to set up a number of sub-committees to deal with different aspects of the transport problem. The issue of sea-rail transport co-ordination is, however, to be tackled by the Standing Committee itself. Although the report of the Sea-Rail Co-ordination Committee is not yet available, the desirability of diverting a larger volume of traffic to coastal shipping is being increasingly realised.

Drawback from Steel Pool

HOW hampering the shortage of steel has been can be seen from the speeches of chairmen at the annual general meetings of engineering companies and from the proceedings of the trade associations. Even so, it will come as a shock to many that even when the steel imports which have been promised from the middle of the year is regularly available and processed, the tin plate company, which have installed an additional rolling mill, will not be able to meet the demand. Metal Box have been currently importing 50 per cent of their total requirements. This raises cost—an aspect of shortage existing or anticipated which is not always widely realised. When supplies of essential raw materials are uncertain, prudent producers have to build up and maintain larger stocks than would be necessary, if the supply position were easier. It is therefore natural that while manufacturers welcome the increase in demand resulting from expansion of activities, they should also be disturbed by the fear of inflation and Mr Chiswell Jones (whose review appears elsewhere in this issue) thinks that signs of inflationary pressures which are already present could very quickly upset Metal Box's price structure.

That the burden on the company's cash resources which follows from higher raw material prices and bigger inventories should raise the prices of the products is understandable. But the impact of it on the export of the company's products to neigbouring countries about which Mr Jones complains, requires further elaboration. The imported cost of tin plate, or of tin plate manufactured partly or wholly from imported steel, could not present a serious price disadvantage, particularly if competition in these products in foreign markets demands the use of finer and therefore imported materials e.g. cold drawn sheets. The drawback of duty on imported sheets should normally present no difficulty and it is not the complaint that it does. What does Mr Jones really mean when he talks about drawback of the Steel Equalisation Fund contribution on tin plate used for containers exported from India? The price which consumers have to pay for steel from the steel pool is lower than that of imported steel but higher than the price Government pays to the steel producers in India. Of course, if exporters of metal products manufactured from steel could get their steel at the price paid to domestic producers, they would be in a better position to compete in export markets, just as cotton mills in India who pay for raw cotton a price a little below the world price for such cotton. The price advantage, of course, is confined only to textiles made from Indian cotton. Is that what Mr. Chiswell Jones wants when he says that concession made by Government of India would be more than amply compensated by foreign exchange earnings resulting from it? Some light on this question would be welcome.

Peking's Gesture

MR CHOU EN-LAI has repeatedly expressed Peking's preference for a peaceful solution of the Formosa problem. Peking has always denied that Formosa is an issue in dispute between Communist China and America. Peking has not abandoned the policy of liberating Formosa. But it has been consistent in its claim that it seeks to use peaceful means "as far as possible" for the liberation of Formosa. In pursuance of such a policy, Peking has sought repeatedly to initiate direct negotiations with the Kuomintang regime in Formosa. Mr Chou En-lai has now repeated his Government's willingness to negotiate with the Chinese Nationalists "on specific steps and conditions for the peaceful liberation of Formosa". Even as former unofficial overtures have been rejected, Mr Chou En-lai's official invitation has been promptly denounced by Taiwan.

Peking's terms and conditions for the settlement of the Formosa issue are not unknown. But Mr Chou En-lai's invitation for negotiation is accompanied by an assurance that Peking will not pursue a vindictive policy against Kuomintang personnel for their past "crimes". To convince Taiwan of Peking's sincerity, Mr Chou En-lai has guaranteed "freedom of movement" to those Kuomintang officials who may like to visit the mainland "to find out the situation". Mr Chou En-lai's official offer to negotiate poses an urgent problem for both America and Kuomintang. Washington now has another assurance of Peking's peaceful intentions. By accepting the offer, Kuomintang can not only ease the situation, but can join Peking in ridding the area of foreign influence. It would be wrong to emphasise that Peking's tolerant gesture stems from growing economic difficulties within the Chinese mainland. There can be no reconciliation of disputed issues if gestures by Moscow and Peking are explained away as signs of weakness.

Poznan Riots Not Foreign-inspired

IT is tempting to draw an analogy between the East Berlin riots and the violent demonstrations in Poznan. Riots in East Berlin followed as Malenkov's succession indicated a change in Moscow's attitude. Violent disturbances in Poznan may reflect the growing belief in some Eastern European countries that the crusade against Stalin is a sign of weakness. There may be some evidence to suggest that the Poznan riots may be inspired by some foreign countries. It is not denied that the emigre Polish Government has always been active. Disturbances were well timed to coincide with the Industries Fair. But neither the East Berlin rising nor the Poznan riots can be explained away as foreign-inspired subversive activities.

Moscow's possible reaction to these uprisings within Eastern European Communist countries is more significant than the causes of these violent demonstrations against the local Communist regimes. Within Russia, the denunciation of Stalinism is sincere and widespread. M Khruschev has repeatedly denounced political terror. During his recent visit to Warsaw, he urged the Polish Government to introduce individual initiative as well as to relieve economic discontent. Moscow's directive to Warsaw will necessarily be firm. But those who are anticipating a change in Moscow's attitude are likely to be disillusioned. Denunciation of Stalin has gone too far for the Russian leaders to retrace their steps. Besides, the break with Stalin is paying good dividends. This policy underlines the Russian leaders' determination to allow greater individual freedom. Even as a policy, such an attitude should help Moscow to ensure the co-operation of Russia's Eastern European neighbours.

Off the Record

Oil Makes a Dent

OUR attention has been drawn to two factual errors in the Delhi Correspondent's despatch on "A Policy for Oil" which appeared in the Weekly Notes in the last week. The first is about the prices at which the refineries are to sell petroleum products in India according to the terms of their agreement with the Government of India. In the despatch, the reference was to the 'Gulf rates'. Throughout its history, the f.o.b. price of Middle East crude oil has been closely linked to that of crude oil in the United States. What the Delhi Correspondent referred to was the principle of pricing based on this rate for crude oil and the further condition that India would not be entitled to ask for a reduction in the price of the product because of the economies, if any, arising from refining in India. That is to say, the prices of oil products will not be affected by the fact that they are now being refined in this country. The correspondent is not responsible for the mis-handling of his copy which makes the mis-statement that these rates are based on the theoretical cost of transport from the Gulf ports. The error is regretted.

The other error is that "petroleum occurs below the ground in a continuous sheet extending over several thousand square miles". It does not occur in a continuous sheet in the sense of there being a "sub-terranean river of oil", which knows no political frontiers" as mentioned by our correspondent. This is, however, a matter of choice of words. The reference clearly was to oil bearing strata of rocks which contain, under favourable conditions, reservoirs of oil. Individual reservoirs, however, as is well known, are never large. It is oil bearing strata which are extensive. Oil occurs only in pockets. The position was summed up by Dr. Krishnan in his Presidential address at the last Geological Conference as follows:

"As a result of exploration for several decades it is now known that petroleum is found in sedimentary rocks, mainly of marine origin. What sort of organism gave rise to petroleum and what particular processes control its characteristics are matters of controversy. When these sediments are moderately folded, forming domes and anticlines, they provide the necessary structure for the accumulation and storage of petroleum. The 'reservoir' rocks must be porus in order to be able to hold large quantities of petroleum and gas, and pervious in order to yield them readily when pumping is resorted to. The porus strata should have an impervious cover to seal off and to prevent the escape of the petroleum and the accompanying natural gas from the adjoining strata. The strata must be unbroken by faults and thrusts, for these afford easy routes for the escape of petroleum and gas."

Now the point about continuous sheets is the comparatively recent discovery which has led to geophysical exploration in the place of earlier wild cat drilling. Of course, the fact that "the Siwalik and the associated sub-Himalayan zone bordering on the North Indian plains belongs to the same sedimentary belt as occurs on either side of India in Iran and Burma", to quote Dr. Krishnan again, does not guarantee that we shall necessarily strike oil but it does justify geo-physical explorations and geo-physical prospecting which have produced such encouraging results in Assam.

On what evidence the Minister for Natural Resources has hinted at the possibility of India producing as much as 7 million tons of crude oil a year, and attaining more than self-sufficiency, however, has not yet been given out. But the Assam finds are probably firm enough to have enabled Professor Galbraith to make a dent, though yet only a minor dent, on the hitherto impervious Railway Board. For the first time, the Chairman of the Railway Board has designed to take notice of the suggestion that central traffic control system advocated by the Professor might be a substitute for doubling of tracks, which figures so prominently in the railway programme in the Second Five Year Plan. This is, however, only to dismiss the idea. "This question is being looked into, and if we can avoid the doubling of a section on a long-term basis, we shall certainly adopt the cheaper method." But though sub-judice, Shri Pande has no doubt in his mind that "the central traffic control system would prove economical only on those sections where the increase in traffic is not expected to be very heavy. On all sections where traffic capacity is expected to increase very substantially in this plan or by the next, the doubling of track right now would be the more profitable proposition."

Profitable, yes. But is it not high time that even the Railway Board changed its criterion of profitablity in order to accommodate the new fangled idea of phasing programmes, according to the availability of steel for example?

On the question of the relative merits of electric versus diesel traction, which the Chairman of the Railway Board dismisses on the ground that it cannot be considered unless ample reserves of oil are developed within the country, there also has appeared a dent. The Railway Board has decided to go in for diesel traction during the Second Plan period on a limited scale as it is a "must." The expansion of the electric railway system for Bombay has been abandoned in favour of diesel traction beyond the point which has already been electrified. This, Shri Pande underlines, is no concession to or acceptance of the greater economy of diesel over electric traction. But is it a measure forced by necessity alone? If, however, the decision has also been influenced by the fact of oil finds and the possibility of larger finds in the future, the dent in the Railway Board's thinking might be deeper than it appears on the surface.

The question, however, remains to be answered, and is worth pursuing, whether the import content of electrification is as high as is suggested by Professor Galbraith even after the development of electrical manufacturing units within the country, i.e. large enough to exceed the drain on foreign exchange which dieselisation would involve, if all the oil has to be imported.

While on the subject of oil, it is difficult to resist the temptation to speculate about the future of Assam Oil. Our Delhi Correspondent writes:

"In its negotiations with the Assam Oil Company, over the rupee company to be set up for exploiting oil in Assam, the Government of India is negotiating from a position of strength. The Assam Oil Company naturally wants that the new company to be formed with rupee capital, in which the Government of India is to have only one third share, should set up a refinery also. New Delhi, however, since the granting of the prospecting licence, has decided to keep oil refineries in the public sector.

"It is on this question of refinery that negotiations got stuck earlier. The case of the AOC is that it has been engaging itself in the entire process, from drilling to marketing of oil and that the new rupee company in which it is to have two-thirds share should also do the same, instead of stopping midway. Of course, the Government of India can drive a coach and four through the new Industrial Policy Resolution, if it wants to, but it does not want to and stops firmly at refining. It is no longer in the same position in which it had to offer tempting terms to foreign oil companies for setting up oil refineries. It has now realised that it can mobilise both capital and technical skill for developing the oil industry in the public sector. Delhi's changing attitude has brought forth increasing competition, not only from French and German interests but also from Soviet Russia and Rumania. The Communist countries have also developed oil technology like the others. The oil installations left by the Russians in Austria compare favourably with those in the West. Both Soviet Russia and Rumania are interested in oil prospecting and the former has thrown out hints that it could, if invited, build a refinery or two. French and West German interests are ready to step in, and are only waiting for the green light. Three West German experts are expected to arrive in November on a three-month visit, the purpose being "to study and advise the Government in matters connected with oil production". On the top of all this, there are the Canadians and Americans who are at present engaged in oil prospecting in the two corners of the country, Jaisalmer and West Bengal.

"In the circumstances, the Assam Oil Company should not expect to win all the points. Not that it has no special claim on Assam oil; surely it has priority over others. It knows the Assam area much better than anybody else and it has done prospecting and test drilling intensively. Remittance of profits will raise little difficulty, in the case of this company and political considerations also may go in its favour. It is, therefore, likely that the Government of India will do its best to accommodate Assam Oil Company. If neither of the parties prove unreasonable, a compromise may not be difficult to reach. A rupee company with controlling shares in the hands of the Government for exploiting Assam oil from extraction to marketing may be a possible solution. It will involve no breach of the new Industrial Policy and at the same time, it will secure the economy of not separating oil refining from oil production."

But that's where we started from, when Maulana Azad made that statement about Government insisting on holding 51 per cent of the share capital way back in March last. What a progress report!

Coming Up in a Big Way

Mukund Iron and Steel

THE Mukund Iron and Steel Works Limited have come up in a good big way under the able stewardship of Shri Kamalnayan Bajaj who has been on the Board of Directors for the last seventeen years and is now the Chairman, and of Shri K D Nevatia, Managing Director. The company has passed through many vicissitudes as its main factory was in Lahore before partition. But with the development of its factory in Bombay, the company has now been restored to a position where it can look to the future with optimism.

The accounts of the year ended March 31, 1956 shows what great progress it has made, since out of its current profits it is in a position to pay off arrears of dividends for the last seven years, after writing off the loss of Lahore assets of nearly Rs 2 lakhs and making substantial contributions to the Depreciation Fund (Rs 5½ lakhs) and setting up a Rehabilitation and Development Reserve of Rs 5 lakhs.

The company has a paid-up capital of Rs 30½ lakhs and reserve of Rs. 7½ lakhs in the two new funds created during the year and another Rs 25 lakhs in Depreciation Fund.

Against these assets, the company has a liability of Rs 21 lakhs for loan secured from the Industrial Finance Corporation and another loan to Allahabad Bank amounting to some Rs 32 lakhs.

According to its terms of agreement with the Industrial Finance Corporation, which required an amendment of its articles to that effect, the company is debarred from paying in any one year arrear dividends on preference shares for more than two years. As happily the financial position of the company is now comfortable enough to enable it to clear the entire arrears, it is seeking permission from the Industrial Finance Corporation to do so and to re-amend its articles accordingly. A general meeting of the shareholders will be called for the purpose in due course, after the approval of the Corporation has been obtained. Rs 2½ lakhs are being transferred from the profits of the year to the Dividend Equalisation Fund. Out of this fund, the arrears of dividend can be paid, when the necessary sanction is obtained.

Of the two main activities of the company viz. steel re-rolling and steel casting, re-rolling has suffered in the past from the chronic shortage of billets. The present policy of the Government to promote regional development and de-centralisation of industries is expected to help the company in future and until the supply position of steel is eased by production from the new units, the programme of substantially increased imports will meet the interim requirements.

In casting, the company has reached its present capacity and is actively considering further expansion for which it is trying to enlist the co-operation of foreign firms for technical assistance. Casting is a highly skilled job in which such assistance is still essential. The programme of construction of wagons for the railways is so large in the Second Plan that expansion of casting capacity should be more than worthwhile.

The Balance Sheet is very well produced and its contents fully justify the sumptuous production and get up.

Our Delhi Letter

The Food Imbroglio

HARDLY ever before did a department of the Government of India expose itself to the charges of chicanery and humbug as did the Central Food Ministry at the States Ministers' conference in Mussoorie. Few commentators will use these strong words lightly but if there has been any occasion to use them, the Food Ministry provided it. The details now available, of the manner in which the food targets were arbitrarily scaled up and down, are shocking. The printed copy of the Central Food Minister's speech contains corrections in ink in its most crucial paragraphs. "From the study made in the Ministry for increasing the production of cereals," he said in the original copy, "we have come to the broad conclusion that the production of foodgrains can be increased by 13.5 million tons in 1960-61 over 1955-56 as against the figure of 10-million tons proposed in the Second Five Year Plan". The corrected version substituted 16.5 million tons for 13.5 million tons. It is to be remembered that the National Development Council has recommended a couple of months ago that the agricultural targets should be raised and the Planning Commission had circularised a letter to the State Governments asking them to study the possibility as early as on June 5. Since then the Central Ministry of Food and Agriculture has been processing suggestions for higher targets. It came to the conclusion, on the eve of the Mussoorie Conference that the target envisaged in the Second Five Year Plan could be raised by 3.5 million tons, provided an additional allocation of about Rs 100 crores were made. This was embodied in the printed version of Shri Ajit Prasad Jain's speech. But the target was suddenly changed at a midnight conference in Mussoorie without further study. It was then decided that an increased target of 6.5 million tons was attainable with an additional allocation of merely Rs. 111 crores. Now this sum is sought to be rounded off to Rs. 115 crores. Even a superficial scrutiny of Shri Jain's speech, however, would reveal that he juggled with figures without regard to their relevance to facts.

Take the break-up of the target. The printed version of Shri Jain's speech read:

> "Through the acceleration of the seed multiplication scheme and its expansion to cover all the N E S Blocks in the first three years of the Second Plan, we believe it would be possible to achieve an additional production of 1.9 million tons. The expansion af facilities for minor irrigation is likely to give an additional production of 0.7 million. Schemes for intensification of distribution of fertilizers and better use of farmyard manure may add another 0.9 million tons."

Since these figures total up to only 3.5 million tons, to Shri Jain's speech the following words are added in ink:

> "and the balance may be obtained by the general improvement in agricultural practices".

How this "general improvement" is to yield as much as 3 million tons when schemes for which firm resources totalling Rs 115 crores are being allocated will, in all, account for only 3.5 million tons passes comprehension. Besides, it is noteworthy that when the Second Five Year Plan was prepared , the targets of additional production set by the States totalled only 8.5 million tons. The target was however rounded off to 10 million tons in the expectation that 1.5 million tons would be attained through "general improvement in agricultural practices" though the increase in output expected from every item of such improvement (e.g. from better seeds, etc.) had already been counted in arriving at the total of 8.5 million tons. The Ministry has now taken credit for the same factor for a third time, and how liberally!

The question is: what did the representatives of the States have to say to this jugglery? All reports indicate that they were flabbergasted. Many State Ministers refused to commit themselves. Some laughed at the concept of the "human element" that the Central Ministry propounded to make its arbitrary figures acceptable. One State representative was asked how much additional production he expected by plant protection measures? "How can I say", he replied in justifiable confusion, "there may be no insects to protect the plants from".

The Central Food Ministry was, therefore, hardly able to have its way. All the targets that it propounded were regarded as "tentative". They will be subject to confirmation by the State Governments who have the final say, for it is the States which have to grow the food, not the Centre.

One the other hand, the Central Minister for Planning, Shri Gulzarilal Nanda, firmly and categorically told the conference that there was no possibility of increasing the financial outlay for cereal production. Between his colleagues in the States and his confrere at the Centre, Shri Jain could get nowhere.

Indeed the only hope of the country to get out of the food imbroglio is in the lap of the Gods. A couple of good monsoons may still do the trick.

The Minister for Agriculture, Dr P S Deshmukh, however is pinning his faith in the "human element". Despite the inefficiency of his departmental officials and lack of official imagination both of which he admits, Dr Deshmukh believes that the farmer will play up. He is taking increasingly to the Japanese method of cultivation, more manures, and better methods of farming. The higher production that may be achieved by an awakening in the rural masses will compensate, in Dr Deshmukh's view, the possible floods and draught. One can only hope that he is right. Meanwhile the high level of food imports planned for the next 3 years is not quite reassuring.

Letters to the Editor

Export of Cotton Textiles

PLEASE refer to the article under the title "Cotton Piece-goods Boom—Exports Decline" by Shri Angad Singh Bisen in your issue of June 2, wherein the author has given certain export statistics of Cotton Textiles from India for the years 1954, 1955, 1956 for the period January to June. The figures given by the author do not seem to be correct. They cannot relate to January-June because the June figure would not be available before the end of June. Naturally, the figures must refer to some other period; it appears they refer to January-April, 1956.

Will you please clarify to which period these statistics refer as also the source from which they have been taken?

R K Bhaumik
Statistical Officer,
The Cotton Textiles Export Promotion Council.

Cecil Court,
Apollo Bunder,
Bombay 1.
5th June, 1956.

[The author of the above had also drawn our attention to the heading of the table which had been wrongly printed. The statistics are for the months January to April, *not* January to June. The error is regretted and we are thankful to the Statistical Officer of the Cotton Textile Export Promotion Council for kindly drawing our attention to it.

The figures in the table are those of cloth passed for shipment through the Port of Bombay and were collected from trade sources.—Ed.]

Gas from Cowdung

I NOTICED an item in one of your Weekly Notes in the issue of June 2 on the subject of utilisation of cow dung. Perhaps you are aware that the Ramkrishna Mission at Belur and Shri Satish Chandra Das Gupta at Sodepore made extensive experiments on cow dung gas as domestic fuel.

While I was in the Community Development Project, we installed quite a number of plants in various places. The pity of these machines is that cow dung is a very messy thing and the machines, especially the pipes and channels, need continuous cleaning.

Moreover, plants of this nature need an initial capital outlay in the shape of drums, containers, pipes, gas burners etc., which an ordinary home cannot afford. Actually it is this question of the initial outlay for this equipment, estimated at something like Rs 35 to Rs 40, which stands in the way of the acceptance of the excellent scheme.

One other trouble was the difficulty of maintaining pressure of the gas. The flow of the gas becomes very temperamental, owing to the unevenness of the pressure maintained at the top of the storage drum by improvised weights. We set up one cow dung plant for a small hostel. The gas pressure was so low that food would not cook within the appointed hour. These were of course, remediable defects.

But I am appalled at the statistics that you have given of the actual figure of cow dung used. I would never have thought of that.

Uncivic Calcutta

FLIBBERTIGIBET has every right to feel and think whatever he chooses to feel and think about any country or nation under the sun, and he may also have the rudeness to write it out, but you as an Editor may find it difficult to explain why you had to publish it, I mean the Calcutta Diary in your issue of June 2. His dissertation on Calcutta and its citizens, with conclusions about the characteristics of Bengal as a whole, is a personal affair based on what he sees through his jaundiced eyes. It is hardly necessary to refute it, but since you allowed it to be published, one or two glaring misstatements of facts may be pointed out.

The City of Calcutta shelters too many people for its too few trams and buses to cope with. Roads within the city can hardly allow many more vehicles for public conveyances. The number of people dependent on this city for livelihood is beyond the capacity of the Census to enumerate. Most of the offices, business and Government are in and around Dalhousie Square. The only surprise is the low rate of accidents, in spite of the most 'uncivic'—rush of people in and around the city. But the 'uncivic' rush is a matter 'of course', about which one can write loftily, but for which one can hardly suggest any remedy. The low rate of accidents is a pointer that though 'uncivic', people of culture are practical; they go and they let go.

In the history of the recent growth and development of this city there is a period which can never be fully recorded. This is the period of war, famine, riots of 1946, and the partition of the country. These waves, one after another, made this city a bit shaky. The psychological and the physical impact of the flow of displaced persons from the East on this city is still with us and the city of Calcutta is even now absorbing the shock. It has been able to absorb the shock because of the lessons it learnt in the past. The lessons it learnt taught Calcutta to do without the finer civic virtues and do only what is practicable for its very existence.

Flibbertigibet has yet to learn his lessons about Calcutta. Innocence by dissociation is a fine theme for teachers of morality to dilate upon in the class room, but in applying it so erroneously, he cannot even ask for our thanks.

As to the refugees from the East, Flibbertigibet is requested to remember that when one cannot help it, one must find fault with it. Neither the Centre nor any other State has been very helpful in rehabilitating refugees either within or outside West Bengal. Let me give an example. Saurashtra is the farthest off State from the shores of Bengal and it has only recently offered to rehabilitate some fishermen families from East Pakistan. Representatives of displaced fishermen welcomed the offer, went over to Saurashtra, saw things for themselves, and in spite of obvious difficulties (sea fishing is completely different from river fishing and life in East Bengal is in no way similar to that in the desert of Saurashtra), this rehabilitation work is already in progress. It is not possible to discuss in detail this aspect of refugee rehabilitation here. One can only say that Flibbertigibet is not correct in his assessment of the character of refugees from East Pakistan, however convenient and fashionable his assessment may be.

A Calcutta Diary

A Day Off on Saturday

LAST Saturday was not a half-day in Calcutta. A couple of committees working for linguistic reorganisation of States had decided that West Bengal would observe yet another hartal on the day, and theirs was done. The representative character of the committees has been questioned, with reason. All the popular newspapers wrote pointedly against the hartal, and overheard conversation at street corners rather indicated that, for once, the Press had indeed spoken for the people. The Communists, the most active group on the Left, went into the business with ill-concealed reluctance. They signed the appeal for a hartal only after an odd assortment of parties called the Paschim Banga Rajya Punargathan Samyukta Parishad had done so. Like the Spartans, the Communists followed so that they might lead; there was not much leading needed—as will be shown later. Meanwhile the Government of West Bengal openly opposed the hartal and announced that the police would be out in force to see that there was no coercion, believing, rightly, that there was no popular enthusiasm behind the hartal. It had occurred neither to the Press nor to the Government that apathy is as potent a political factor as enthusiasm.

That the hartal was not a complete success is only technically true. The trams preferred the safety of their depots, and only a few State Transport buses put in an appearance on the roads in the morning. Taxis were scarce, and the shops closed. In the apolitical central area, inhabited mostly by non-Bengalis, some shop fronts seemed unsure of themselves; their doors were ajar, and would have been banged at the sight of the slightest trouble. Few of the offices had anything like a working attendance, and very little work was done. It is of limited interest that the success of the hartal was thus qualified. What is of immense significance is that there could be so successful a general strike with so little popular support.

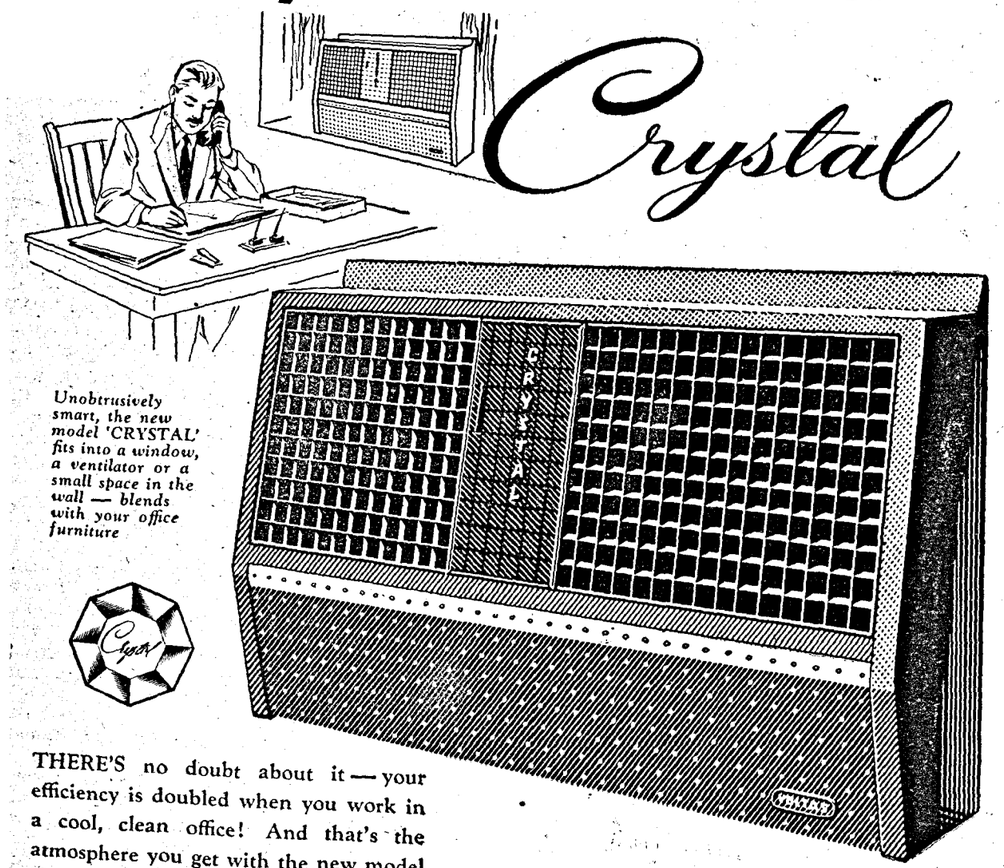
* * *

The straight question to ask is: Who leads West Bengal? The straight answer is: Nobody. This is giving the game away, for most of us have a vested interest in some institution or another which fancies itself to be the leader of the people. The Congress is in power, popularly elected, and is entitled to claim that it represents the people; it does, but only in a limited, and negative, sense. The Left parties are intellectually superior, but their numerical inferiority makes nonsense of such electoral unity as they produce now and then. The parties on the Right have shown, with this hartal on Saturday, that they too can bring the life of the city to a standstill. Each party thus has something to show by way of success in political action. That this apparent success is in reality the sum total of their joint and several failure is the basic truth about the Bengali political scene today.

Let us go over the facts again. It was an unwanted hartal. The majority of the political groups participating in it did so only because they dared not stay out—the elections are coming. The advice offered by the newspapers that the strike should be called off, and the people should work—was ignored. The Bengali Press once used to be unprosperous but influential with its small readership; today it has circulation, a measure of solvency, but no influence either with the intelligentsia or with the people. The Government of Dr B C Roy has many qualities, but the "popular touch" is not among them. In the absence of effective leadership, the citizens of Calcutta proceeded to be led by man's innate aversion to sweating his cursed brow any more than he must. The strike was successful because the organisers had asked the people to do a relatively simple thing—nothing.

* * *

The political parties behind the hartal are congratulating themselves on their success. The Government is pleased that the success was to some extent qualified. Both may be congratulating themselves too soon. What has triumphed is not political action, but the Bengalis' growing political apathy. They would not mind the transfer of a few more areas from Bihar to West Bengal, which was the ostensible cause of the hartal on Saturday. Called upon to stage a general strike, they would also make it successful by omission. It is doubtful whether any political party in Bengal today, or any combination of them, could set before the people a programme of action and then see it carried out. I am not referring to political rowdyism; that lurks only a quarter of an inch below the surface of life in Calcutta, and can be let loose by a score of determined mischief-makers. Politics is irrelevant to their activities; at best it provides an excuse for going into action, and secures for mischief a political cover. The Government knows it, and hence the thousand arrests before every hartal. That part of the people which can be described as politically conscious is now small and unresponsive to any of the recognisable parties, who must themselves know their impotence. People's apathy is their only ally.



Here is cause for reflection. It has already been submitted that apathy is a major determinant in the political evolution of a community. It now remains to examine the nature of this political power wielded by apathy. Other things being equal, it helps the party in power stay where it is, for the people have not the energy to effect a removal. Other things, however, are rarely equal even in the most stagnant of political pools, which explains the uneasiness discernible in the less complacent Congress quarters. There are stirrings to be heard on the Left now and then, but not much vigorous thinking which, however, is not always an audible process. It is—is it not?—fascinating to muse on the many uses some politician could make of this massive apathy. To spur it into energy will be hard work, and it is possible to think of adventurers who would consider it unnecessary. With the people unwilling to bestir themselves either to end what they do not like or to bring in what they do, the scope for pulling a fast one on the people is unlimited. Fascism could do it; so could Communism. It is a measure of the pervasiveness of Bengali apathy that neither is a force in the State. Many will rightly consider this a good thing; it is. Which does not take away the fact that, potentially, apathy may be a more dangerous political quantity than agitation.

From the London End

Unemployment and Flexibility

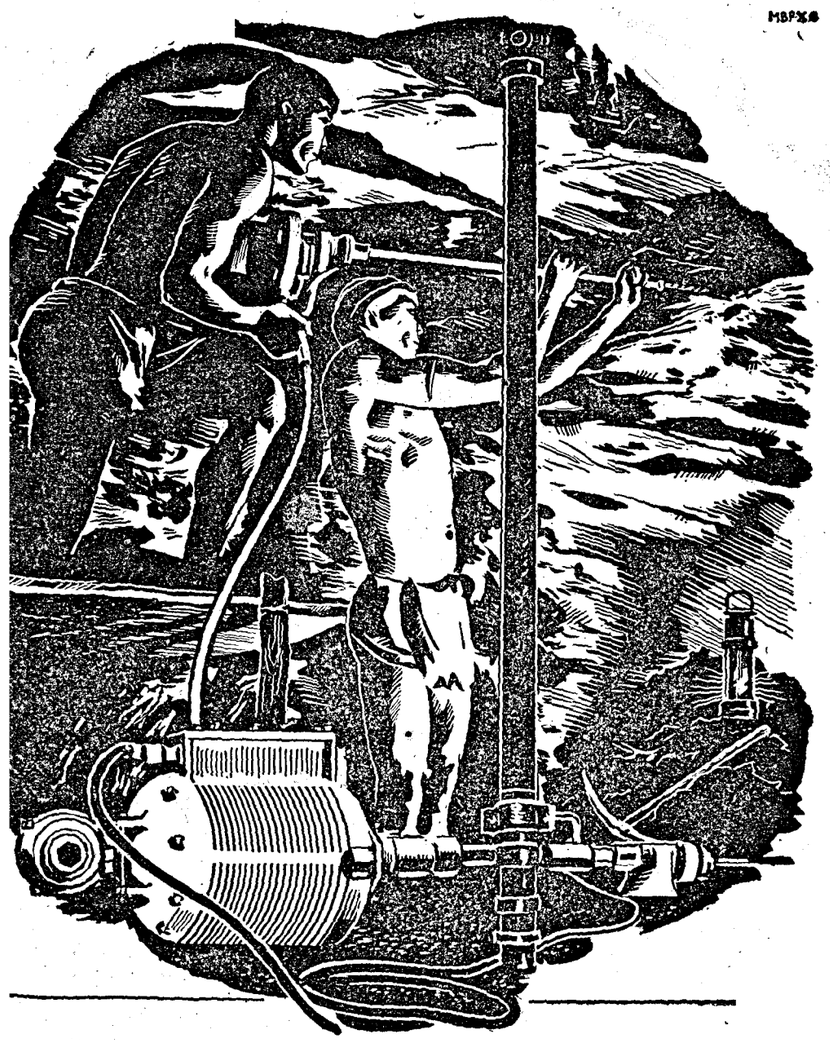
THE gathering storm now shows signs of breaking loose. In a brief period of two weeks, following the announcement of reduction of about 10,000 workers in two British motor manufacturing firms, a large number of workers have been sacked in a whole series of industries which are connected in one way or another with automobile production. In a number of cases, short-time working has become the rule—mainly with a view to avoiding the stresses (and publicity) which outright unemployment would create. The Society of Motor Manufacturers now admits that 11 per cent of the industry's labour force is on short-time.

This is a particularly serious situation for an industry which by common agreement has come to be regarded as a vital indicator of the level of overall economic activity in Britain. And yet the redundancy measures, particularly those of the British Motor Corporation, have come as a sudden shock to the nation. Mr McLeod, the Labour Minister, complains that the sackings have been made "without warning" and of the sudden "flooding of the labour exchanges". All the Ministers find it difficult to understand why the **Financial Times** should claim all of a sudden that "the Ministry of Labour is the authority responsible for finding redundant workers new employment." And yet the basic fact of the Motor Industry, known all along, is that while the production of cars has risen at the rate of about 150,000 a year over the past five years, exports have roughly remained at the level of 1951. The reappearance of a free market in 1951 (with the return of the Conservative Government) and in particular, the abandonment of the previous restriction on the number of cars sold on the home market, had certainly created the conditions for the expansion of the motor industry. And now when the home market shows signs of saturation or alternatively, has become restricted via the credit squeeze and the controls over hire-purchase, contraction of a decidedly cumulative nature sets in.

This is the cold mechanics of the present retrenchment movement and there can be little doubt that this position could well have been forecasted about one year ago. And yet the "suddenness" of it and the absence of "warning" are made as an excuse for the current impasse. However, the more one reflects upon the statements made by the authorities and in particular of their special pleadings, the more one is driven to the view that the current retrenchment movement is welcomed by the Government. Have they not spoken often of the need for "flexibility" and for "overcoming wage rigidities' in the economy? In any event the phenomenon of full-employment and Tory freedom" as the **New Statesman** put it recently, was too good to be true. Maybe the present tendencies working from the contraction of the motor industry proves the ultimate incompatibility of the free market economy with full employment.

An illuminating debate in the Commons this week brought out the main lines of the Government's thinking—although in the opinion of Mr Harold Wilson, of the Opposition, Government's policy did not reflect thinking but "bedlam economics". The Chancellor believed that his policy was succeeding. This policy involved the reduction of home demand for bringing about a major shift of resources from consumption to increasing exports. The Government found that all the indicators—employment investment, consumption and the balance of payments—favoured this policy. While the Government conceded that considerable "painful human problems" were involved in times of slack-employment but, in its view, the switching of labour from one industry to another was a necessary process towards attaining the flexibility which the policy aimed to bring about. All this is no doubt in accord with the Government's designs. What appeared to be flatly contradictory and in some ways hypocritical, was the explanation for the contraction of the motor industry;

> "The truth was that the motor industry could not expect to maintain the proportion of world trade which it had a year or two ago, and therefore there must be some shifting of resources from it."



And yet it remains a fact that in the past two years a major volume of the nation's resources have been directed for investment in the motor industry. And so, too, appears the investment intentions of the industry. The firm making the Vauxhall car hopes by its current capital outlays to double its production in two years; Fords have a current expansion programme of £65 mn and another firm is busy constructing a new large factory. The pertinent feature of the motor industry in the last 4 years of 'free' market has been the war between motor car manufacturers for the home market. The war is no longer being waged in foreign markets. And the casualties in this car war are inevitably the smaller firms and, more important, the redundant workers—the so-called "social casualties".

The drive towards "flexibility" however, has two consequences—the prospect of a decline in employment and industrial production and, secondly, the greater militancy of the trade unions. The first consequence is being fully reflected in the motor industry. Mr Paul Einzig now tells us (in **The Banker**) that an increase in production must cause prices to rise and counterwise, a fall in prices can only be achieved substantially by a decline in production. Already the index of industrial production reflects a weakening of total activity and output has now stagnated to the level of a year ago. The corresponding fall in prices in general has not come about yet, but the Government hopes to forestall trade union action by its call for a "price plateau" in industry. The second consequence is rearing its head in a manner which portends a severe wage battle in the very near future. Workers in the steel industry are threatening to strike—they have already banned overtime working; the railway union has announced its intention to make a new wage claim and coal miners are thinking in similar terms. The costs of flexibility are high. Nevertheless, it appears that the Government aims not to be diverted from its grand design for the country.

Book Reviews

Study of Environment, Not of Operation

Industrial Enterprise in India. By Nabagopal Das, ICS. Orient Longman, Calcutta, pp IX + 200. Price: Rs 8,

Reviewed by **George Rosen**

THIS book is theoretically a second edition of a book which was published originally in 1938. In fact it is almost an entirely new book bringing the developments in industry up to 1955 and the new companies law. The title is the same as the original title. This may be desirable as indicating the connection with the previous book. It is perhaps too broad a title for what the author intends to do—and succeeds in doing. Essentially this is not a study of the operation of industrial enterprise in India. This is a study of the financial and legal environment, and the changes in the environment, within which industrial enterprise operates in India.

The book begins with a brief historical chapter pointing out the relationship between British policy and the lack of industrial enterprise in India. This is a summary and adds little to what has already been done.

It is followed by a discussion of the methods of financing industry in India, as well as a comparison of British and German methods of finance. Two points are worth stressing—first, from the British tradition, the separation of commercial and industrial finance in India, and second, the recent development by the Government, or with Government encouragement, of special institutions to provide long-term industrial finance. Here there is also a discussion of financing methods peculiar to India—the role of the managing agents and of indigenous bankers; and the use of private deposits with industrial firms to provide financing. The key role of the managing agents as sources of capital is rightly stressed, and those abuses of that role which led to the various companies laws are pointed out. There is then a summary discussion of the development of company law in India, culminating in the most recent Company Act and its provisions. The relationship between managing agents and finance today might have been explored further by discussing the relationship between the larger managing agents and industrialists, with the major private financial institutions. However any such discussion should aim not only at describing the situation, but the reasons for it.

Following this is a discussion, buttressed by statistics, of the growth of the joint stock company in India, and, what is of special interest, the recent development of private limited companies and the problems these pose for regulation and control. Finally, and inevitably, there is a discussion of the public sector, the relationship between the private sector and the public one, and the effects of Government business policy and the policy upon the private sector.

The discussion is at all points equable—the author has no "axe to grind" and examines various controversies calmly, dispassionately and without prejudice. His conclusions are usually reasonable, although they may be questioned and argued about.

The book is a good summary of the statistics of growth, of the present legal situation and of the problems of industrial enterprise. It does not however live up to the promise of the title. One would have wished more discussion of how private enterprise in fact operates. There are certain key questions for the future development of India's industry:

(1) First, where capital is presumably scarce, as in India, the structure of the capital market. But this should not be in terms of the laws, but an analysis of the availability of credit in fact to different groups within the economy. There is no shortage of capital for the large industrialist, and interest rates are low. There is a shortage for the medium and small-scale industrialists and interest rates are high.

(2) A second question, though related to the first, deals with the plethora of government regulations, requirements of licences for industrial entry and expansion and for imports, direct government price controls, government distribution of scarce supplies, government control of credit, and government orders. It is obvious that the Government is a main factor in determining the life and death of industrial industries and even firms. How has this operated in fact during the past five to ten years?

(3) Finally, who are the entrepreneurs in Indian industry? Is abolition of the managing agency system likely to change the people taking the risks of expansion and enterprise? What changes are taking place in the attitudes of entrepreneurs as industrial development proceeds?

These are major questions of India's future economic growth, and the role of the private sector in it. Das' book is of interest and great value in presenting objectively the framework within which industry operates. It only skirts the second and more interesting question, except in a few areas, of how it does, in fact, operate today. This is perhaps only another way of saying that it did not do what the reviewer would have preferred and what the title implied it would do. It did nevertheless accomplish its more limited objective clearly, thoroughly and objectively.

"He who is firmly seated in authority soon learns to think security."

J. R. Lowell.

Village Study—Portraiture or Analysis?

An Indian Village by S C Dube. Routledge and Kegan Paul, London. 1955, pp 248.

IF description is cultural anthropology, then this is an excellent treatise on the subject. The description, never uninteresting, frequently rises to the beautiful and is everywhere detailed, objective and seemingly accurate. Dr Dube has given an excellent portrait of Shamirpet, the Telugu village located about 20 miles from Hyderabad city. Its setting, the composition of its population by caste and economic groups, the customs and rituals of the people, their family and home life, inter-group and inter-personal relations are described in detail, and the description always has a warm and human touch about it. The book gives an excellent idea of who the villagers in this central part of the Indian Peninsula are, how they live, what ceremonies and festivals they perform as they go through life or pass through the different seasons of the year; what food they eat (or tell others what they eat), and how they cook it. Similarly, relations between man and wife, father and son, mother-in-law and daughter-in-law, among brothers or between brothers and sisters are described at length. Considerable space has been given to describing how the ways of the villagers are changing —in food, dress, mannerisms, means of recreation—with the coming of education and increasing contact with life in the city of Hyderabad.

As the study largely derives from a survey conducted by a team of specialists from the Osmania University, one would have expected it would contain a lot of statistics. But it is interesting that very little of the quantitative data collected in the survey has been presented in the book. Most of the description of village life can be considered general, at times casual, observation with which the average Indian reader is already familiar.

Important though description is to any science, no science can make much progress if it does not go beyond description and does not seek to bring out the factors which lead to the situations described. This need for analysis is as vital to cultural anthropology as to any other science, inspite of the current fashion in India of describing in great detail readily observable phenomena but without much attention to bringing out the causes which brought these about or the inter-relationship between the various factors or phenomena observed. It is in such analysis that this book is really deficient. For instance, where did all these people come from; how long ago; how have the different groups iter-acted upon one another through the centuries; what are the reasons for many of the customs which are found in the village; which are the cultural values which are really abiding and which are changing, and why; what have been the social, economic and especially historical factors which make Shamirpet what it is, and its inhabitants think and act in the way they do. These questions which are vital to understanding the 'Culture' of the village are left unanswered. Even a systematic treatment of the past history of the village has been omitted.

In the reviewer's view, description concerned in the large part is with the fairly obvious, although it may be of great value to foreigners and urbanised educated Indians who have lost contact with villages, will not do much towards gaining the kind of understanding about Indian village life which the country needs as aids to the programmes of development and reform which are being carried out. From an Indian author, we expect much deeper insight into the life and culture of the village people and the answers to some of the 'whys' and 'hows' mentioned above. It is to be hoped that Dr Dube and others who are doing similar work will not be content with description alone and will analyse the data emerging from village studies on questions of the type posed above in some of their later contributions.

Language Controversy in Ceylon

Moni Chatterji

THE anti-Tamil riots which broke out in Ceylon recently brought to the surface the malaise that the island has been suffering from, the struggle between the two groups speaking the major languages—Sinhalese and Tamil. The Sinhalese had been agitating for the official recognition of their language as the sole state language and the Tamils for parity with Sinhalese. The situation became a great deal worse when the Tamil-speaking people who are settled in the northern and eastern parts of the island, went to the extent of demanding a separate homeland for the preservation of their language, frightened by the prospect that Tamil might not be recognised at all and that Sinhalese might be imposed on them. However fantastic the demand for a homeland for the Tamils might be, nevertheless, it posed a threat to Ceylon's newly-formed Government.

The immigration of Tamil-speaking people from the southern parts of India had been going on for hundreds of years and Tamilians have established themselves in the business, commerce and industry of the island to such an extent that today they have become an integral part of Ceylon's economic life. They have retained their own language, culture, religion and mode of life none of which ever clashed with those of the indigenous population. Tamilians, however, did not merge with the Sinhalese. For some time past, the relation between the two groups has been strained and each has remained a separate entity.

The total population of Ceylon according to the latest census is 7.1 million of which 5.6 million are Sinhalese and 900,000 are Tamil Hindus. Besides, almost half of the island's 496,000 Muslims are Tamil-speaking. Roughly, therefore, 27 per cent of Ceylon's population is Tamil speaking, while 69 per cent speak Sinhalese.

Despite their smaller number, the Ceylon Tamils had their say in the past in the affairs of the island. The British recognised both Tamil and Sinhalese as official languages. As early as 1943, the Ceylon State Council had passed a resolution that steps should be taken to effect the transition from English to Sinhalese and Tamil with the object of making both these languages the official languages of the country. It may be mentioned here that when the language issue was raised in the State Council in 1944, only five of the members voted in favour of Sinhalese being the only state language. The recognition of two state languages has also been the programme of the United National Party since it assumed office in 1947. The leader of the Party, the late Mr D S Senanaike, stated in 1948 in a memorandum to the Minister of Education that

> ". . . it should not be forgotten that our essential task is to create a nation and that our people speak not one language but two or perhaps three . . . Language distinction must be continued because we are not prepared as a nation to lose any part of our cultural heritage, Aryan or Dravidian, but those distinctions must be kept on a cultural plane and not be allowed to create communal distinctions in spheres where they are irrelevant. Whatever be the medium of instruction we must ensure that Sinhalese, Tamils, Muslims and Burghers shall be able to serve in any part of Ceylon".

In 1951 the United National Party (UNP) appointed the Official Languages Commission with the clear direction that Sinhalese and Tamil would be the official languages. At its annual conference in 1954, the UNP reaffirmed its resolve to make Sinhalese and Tamil official languages throughout the country. In the same year, in a note to the Commission on Higher Education appointed by the Ceylon Government, the Governor-General said: ". . . it is the accepted policy of the Government that Sinhalese and Tamil should be the official languages of this country and any examination of this policy would be contrary to the terms of the Commission's reference". As late as October 1955, the then Premier of Ceylon, Sir John Kotelawala, declared in the Ceylon Parliament in no uncertain terms that Sinhalese and Tamil would be the official languages throughout the country. He made it clear that no one should be afraid that the language spoken by 80 per cent of the people could suffer any disadvantage.

An examination of the language question in Ceylon and of the claim of the Tamils would show that there are basic reasons for supporting such a policy. The Tamils in Ceylon form a national minority as different from a linguistic minority. The distinctive feature of a national minority is "the existence of a national consciousness accompanied by linguistic and cultural differences". Their different cultural and linguistic characteristics, religious outlook and racial origin from that of the Sinhalese make the Tamils a distinct national minority. That they are conscious of their separate entity is evident from their demand for a separate state for themselves. However much we may decry it from the point of view of Ceylon's larger interests, the demand for a separate homeland is a reflection of their mind. The problem facing Ceylon today, therefore, may be compared to that of other multi-national states.

The policy of some of the multi-national states with regard to their minorities, particularly on the question of language, may help to indicate a possible solution for Ceylon. In Switzerland although German was the official language for a long time, as a result of the growth of national consciousness of the different minorities the three principal languages of the country were adopted as official languages in 1848. Similarly French was the official language in Belgium for a long time. But due to persistent agitation on the part of the Flemish speaking people, Flemish was also adopted as an official language. In Finland, although 90 per cent of the population speak Finnish and only 9 per cent speak Swedish, Swedish was recognised as one of the official languages. The French-speaking people in Canada constitute only 25 per cent of the Canadian population who are mostly English-speaking, but both English and French have been given official status. South Africa is another example of a country which faced with the problem of choosing between two contending languages—

English and Dutch—has accepted both as official languages. In all these countries, it may be noted, the problem was one of choosing between two languages and almost all of them went in for bilingualism—a lesson which may profitably be learnt by Ceylon.

In countries with numerous languages like India, Burma, Indonesia and the Soviet Union, the decision to adopt one state language has been taken after much deliberation and with the consent of the minorities. In the case of Ceylon this consent is impossible to get. Moreover, in all these states one state language has been adopted more because of the great number of languages and the practical impossibility of having all of them as official languages than on any principle of establishing the language of the majority. Furthermore, as in the case of the Soviet Union, although Russian has been recognised as the only official language, in view of the large measure of autonomy given to the various autonomous regions and states, it has been possible for the different languages to function adequately within their respective regions. Under the Ceylonese constitution, there is hardly any scope for Tamil for no such privilege has been given to it.

The solution of the language problem in the multi-lingual and the multi-national states mentioned above has been based not on the principle of majority rule but on that of reconciling the predominance of the majority with the liberty of the minority. Democracy cannot always travel on the set path of majority rule. In a country with distinct national minorities, the imposition of the majority rule on a conscious minority becomes a clear case of tyranny and despotism. This is particularly so in the case of a language, suppression or non-recognition of which deprives the minorities of their fundamental human right of self-expression. Only a compromise of the rights of the majority and the minority can prevent that.

In a multi-national state, such a compromise can be effected either by the process of bilingualism as has been done in Canada, Finland, Switzerland etc, or by federalism as in the Soviet Union and elsewhere. The problem of Ceylon being identical to that faced by the multi-national states, the solution seems to lie in one of these methods. Far from encouraging Tamil separatism, the two-language solution would ensure co-operation between Tamils and Sinhalese, since most of the Tamils regard the demand of a separate homeland as only an extreme step and a last resort, to be adopted when all other attempts for the recognition of their just claims have failed. Moreover, by accepting bi-lingualism, the Government will not have to face the impossible task of making the Sinhalese learn Tamil and Tamils learn Sinhalese. In fact the Government has only to catch up and follow a process that has already been working in Ceylon. Many Tamils living in Sinhalese areas and Sinhalese carrying on business in Tamil areas have a working knowledge of both languages. The Census of 1946 showed that as against 6.5 per cent of the population who could speak English, 8.8 per cent of the population were able to speak both Sinhalese and Tamil. Moreover, parity does not mean that majority of Sinhalese would have to learn the Tamil language. It means Sinhalese language for Sinhalese people and Tamil language for the Tamil people. In case this solution is unacceptable, the only alternative lies in federalism with complete liberty to Tamil-speaking people to use their own language in their region.

Although after the Ceylon Language Bill was passed by the Ceylon Parliament making Sinhalese the sole state language, the controversy between Sinhalese and Tamil seems to have been silenced, the lull is deceptive and can at best be temporary, as could be guessed from the speeches of the Tamil leaders in Parliament protesting against the passage of the Bill. Time is probably contributing to the consolidation of the Tamil group, and it is possible that there will be a fresh outburst, stronger than ever before. Already the Federal Party has come out with a plan to resist the imposition of Sinhalese language on Tamil-speaking people and to start a 'national liberation movement' for Tamil-speaking areas. This poses a serious threat to Ceylon's newely-formed government of Mr Bandaranaike of which much is expected. The position was well underlined by the Trotskyite leader, Mr Gunwardene, when he told the Ceylon Parliament that the Language Bill would create every possibility of the country being divided —a situation most satisfactory to imperialist powers who want to keep their bases intact in Ceylon, despite Bandaranaike Government's opposition to it. The signs are ominous and sooner the gravity of the situation is realised the better for Ceylon's new progressive Government, the success of which the great majority of the people in this country most devoutly wishes.

Clive Row

AMONG miscellaneous shares quoted on the Calcutta Stock Exchange, Clive Row have been remarkably steady in recent weeks. Working results of the Clive Row Investment Holding Company, Ltd., for the year to March last were good. As a result, the dividend has been raised from 7½ to 13¾ per cent. In January 1955, the shares of the Company were made available to the general public. The dividend recommended is the minimum to avoid the liability, under the Finance Act, 1956, to super-tax at eight annas in the rupee on any part of the Company's assessable profits not distributed as dividend. But the Company has to pay dividend super-tax as the recommended dividend is in excess of six per cent of the capital. The directors are critical of this aspect of the Finance Act.

Tea company dividends, included in the Company's accounts, are for 1954. Such dividends will be lower for the 1955 season. But current prospects are not unsatisfactory. Directors are optimistic about the demand for paper as literacy grows. They are less optimistic about the outlook for the jute industry. Here, the problem of the spinner's margin remains. It is as yet too early to say whether the private sector in the coal industry will be nationalised. But the directors are hopeful of the coal industry's prospects during the Second Plan period. They express the hope that industrialisation during the next four years will help the miscellaneous industries in which the Company is interested.

The Economics of Ambar Charkha

K A Naqvi

From the data published by the All India Khadi and Village Industries Board, the conclusion is inescapable that the method of production of Ambar Charkha is inefficient both in terms of capital-output and labour-output ratios.

A real choice could arise only if the capital-output ratio were lower and the labour-output ratio were higher.

Even if de-centralised economy be the ideal, there are surely better and quicker ways of attaining it by ensuring that the investment is more productive than it is in the case of Ambar Charkha and ensuring further the eventual reinvestment in productive development of what little surplus may arise.

IT is a generally accepted proposition that the aim of planning should be the progressive development of an economy at a fairly rapid rate. In the following discussion it will be assumed that we desire the highest possible long-term rate of growth of our economy, consistent with certain minimum requirements of consumption.

The rate of growth of any planned economy depends on the magnitude of the additional investible surplus. If, for the moment, we ignore the property incomes (rent, profit, interest)*, the magnitude of the additional investible surplus depends on the difference between the value created by the worker and his consumption. To be more exact, the investible surplus per worker is the difference between the net productivity per worker for a certain period and the consumption per worker during the same period.

Given a certain magnitude of investible fund, and also given a certain standard wage per worker (based on what is considered the desirable level of consumption, which is a policy decision) the proper utilisation of the investible funds means the creation of the maximum possible additional investible surplus. A given magnitude of investible fund may create the same amount of additional investible surplus through two sets of technique:

(i) that yields higher surplus per worker but less employment and

(ii) that yields lower surplus per worker but greater employment.

In an economy which suffers from scarcity of labour technique (i) would be more suitable, while an economy which abounds in unemployment and underemployment, technique (ii) is desirable. If, however, one set of techniques gives a lower surplus than another, the set yielding lower level of surplus must be discarded.

It would be useful to develop the concept of "surplus effect of investment" which is the ratio of surplus to investment. (If the surplus is 20 units with an investment of 100, the "surplus effect" is 0.2.) It is obvious that techniques having negative surplus effect are extremely wasteful, because, instead of augmenting the investible surplus, they reduce this surplus created in other branches, and thus retard the rate of economic growth. It is obvious that it would be economically indefensible to invest in those techniques which require greater volume of capital for securing the same output. If, however, a certain technique compared to another required greater volume of capital for securing the same output, and also has negative surplus effect, its adoption is the surest way of drastically reducing the rate of growth of the economy.

The Negative Surplus Effect of Ambar Charkha.

It will be interesting to examine the surplus effect of the modified Ambar Charkha programme, as announced by Shri T T Krishnamachari in his Press Conference on June 18, 1956.

It is proposed to produce Ambar yarn necessary for the production of 300 million yards of handloom cloth, that is, 75 million lbs. According to the estimates of the All India Khadi and Village Industries Board, **The Ambar Charkha Programme, Economics, Bombay.** 125 lakh Charkha sets are required to secure 20.6 million lbs of yarn. On this reckoning, about 4,55,000 Charkha sets will be needed to secure 75 million lbs of yarn.

At Rs 100 per charkha set, the total cost of these charkhas will be Rs 4,55,00,000.

The cost of training spinners, etc, would be Rs 6,20,44,000. (op cit p 18)

The loan requirement of spinners would be Rs 9,04,56,000.*

Since the subsidy per lb is Rs 1-4, the total yearly subsidy would be Rs 9,37,50,000.

The yearly added value will be Rs 3,28,12,500.**

To sum up, then, a total investment of Rs 19.8 crores (cost of charkhas and of training spinners plus loan given above) would yield a yearly output of Rs 328,12,500, or roughly Rs 3.3 crores, the output—capital ratio being 1:6. Further, Rs 9,37,50,000 per year would be withdrawn from the national investible surplus to meet the consumption requirements of the spinners, even when the wage is, on an average, as low as 12 annas per day (It has been suggested that the wage may be as low as annas 8 to 10 in certain regions—ibid p 28)

It may also be noted that one worker, producing 8 hanks (1 hank : 840 yards) per working day of 8 hours, would earn only 3 annas per day, and a subsidy of 9 annas per

* Some of these property incomes can be entirely eliminated (rent, and the excessive interest, particularly in the rural sector, as also excessive profits in trade and commerce) and the remaining are so handled that the bulk of these incomes become available for investment. Since attempts are already being made in this direction, it may be assumed that more vigorous measures will produce better results.

* The cost of training and loan requirements have been calculated on the basis of "Statement I: Summary of Estimated Expenditure". Ibid, pp 44-45. Actually, the magnitude of expenditure would be higher because of more or less rigid overhead costs.

** The per lb wage and subsidy being Rs 1-11 and Rs 1-4 respectively, the value added per lb is annas seven. I am indebted to Professor Charles Bettelheim for clarifying this point.

day would bring his wage to 12 annas per day. (In view of (a), in the next para, at the rate of 1½ as per hank the wage would be annas 6 per day, the real earnings being only 1½ as per day.)

The above calculations are based on the idea that the output per charkha set would be 164.8 lbs. of yarn, which is very unrealistic because:

(a) it has been estimated by experts that the output per worker would be, on an average, 4 *hanks per day*, instead of 8 hanks assumed above; and

(b) the framers of the programme declare that the Ambar Charkha is meant to provide part-time employment to the agriculturist, which would obviously bring down the output per Charkha set.

In view of (a) and (b), the assumption that one Charkha would produce ½ lb of yarn per day and the charkha set would be used for about 330 days should be modified. At best, the output per charkha would be half of what has been assumed above. The cost of charkha and the cost of training would be doubled; the loan requirement, presumably, will remain the same (Rs 9,04,56,000). The total investment, thus, would be Rs 30,55,44,000. The value added, however, will remain the same (Rs 3,28, 12,500), bringing down the output-capital ratio to slightly more than 0.1.

The investment required for producing the same amount of yarn (75 million lbs.) would be less than Rs 6 crores if this yarn is produced by mills (spindlage:4.5 lakhs), the value added being over Rs 3.28 crores: the output-capital ratio would be more than 0.5.

For about 10,000 workers who will be employed in the mill, the total wage bill would be Rs 1.46 crores and the investible surplus would be Rs 1.82 crores.

The total immediate (immediate, because we are not taking into account the investible surplus that would have been created by rational investment of these *funds*. This aspect is partly taken into account later on) wastage of funds involved is thus:

(i) Over Rs 24 crores additional investment; and

(ii) About Rs 9.4 crores per year of subsidy.

(iii) And about Rs 1.82 crores per year of the possible investible surplus.

The Employment Potential

It is claimed in the Ambar Charkha *Programme* that 36,31,300 workers will be employed when 25 lakh charkha sets are produced, i e, about 13.2 lakh workers will be employed if 9.1 lakh charkha sets are produced. Those who consider this potential level of employment to be an overwhelming argument must remember that there is a world of difference between genuine employment and spurious employment: the *former is one* which guarantees a minimum wage to workers and generates investible surplus, while the latter is that employ*ment which keeps* the workers on a starvation wage, and, worse still, not only does not create any investible surplus, but swallows a part of the investible surplus created in other sectors. Further, if we could produce 75 million lbs of yarn per year with the help of about 10,000 labourers and instead choose to produce it with the help of about 13.1 lakh workers, the supposed additional employment is spurious in character. *Indeed, it* is a very complicated, and a very costly method of distributing doles. This is the truth behind the "gainful, full-time employment" whose "political social and moral significance" we are called upon to appreciate.

This distribution of doles (to the tune of about Rs 9.4 crores of subsidy and Rs 1.82 crores of possible investible surplus foregone) is sometimes called "equitable distribution of income". It is, in reality, a wonderful *method of* wasting the scarce and valuable investible fund.

Even the above analysis, however, does not present the total picture of the wastage involved in even the modified Ambar Charkha Programme. Some idea of the wastage involved may be got by finding out the total volume of yarn production possible through the *contemplated* level of investment in the modified Ambar Charkha Programme. With a total investment of about Rs 30 crores *spinning mills* (spindlage 22.5 lakhs) could produce 375 million lbs of yarn, directly employing (at a wage of Rs 4 per day, which is more than five times the average of annas twelve contemplated in the A C Programme) 50,000 workers, producing an investible surplus of Rs 9.1 crores. In other words, less capital is required for the production of mill yarn necessary for the output of 1,400 million yards of cloth (*about Rs* 28 crores: spindlage 21 lakh) than what would be required to produce Ambar yarn necessary for the output of 300 million yards of cloth.

Such huge wastage of investible funds, in the name of employment, is the greatest stumbling block in the path of an increase in genuine gainful employment. For, in future, we will have less capital to invest, and hence lesser number of avenues of employment would be created. In the *long-run, then,* the Ambar Charkha Programme defeats its own purpose.

Impressive Results of Metal Box

GOOD working results of the Metal Box *Company* of India, Ltd., prove that miscellaneous industries are faring well, and are likely to do better during the Second Plan period. There has been a gradual expansion in the containers industry as the demand for packaged goods has improved. Prospects for the canning industry are *promising as* the investment target for fruits and vegetables has been raised from Rs 1 crore to Rs 9 crores. For the year to March last, sales and profits of Metal Box showed increases. In consequence, the dividend has been raised from 12½ to 16¼ per cent. Prospects for the current year are considered to be satisfactory.

Development plans of the Company are making good progress. There has been an expansion in the demand for aluminium pilfer-proof seals; the manufacture of these in Calcutta has started. There has been continued *progress in* the manufacture of polyethylene bags. There is considerable potential demand for products out of this material. Two world-famous manufacturers have plans to produce polyethylene flakes, the needed raw material, in India. Additional equipment for the manufacture of industrial components have been erected. Metal components are manufactured by the Company for numerous manufacturers in the electrical, radio, automobile, bicycle and duplicating machine industries.

Balance of Payments and the Second Plan

THE attached table shows the average annual balance of payments position *during the Second* Plan period. The earlier estimates as given in the Draft Plan-frame and the Draft Outline are also given so that one can get an idea how the various estimates have changed during the process of formulation of the Second Plan. Since all these estimates are *based on* the balance of payments performance during 1954-55, that year's statistics are also shown in the table.

The estimates for the imports of machines, iron and steel manufactures, vehicles, and food, it will be seen, have been revised upwards, while those for other imports have been revised downwards during the Plan formulation process. Total imports, however, are a little lower in the final estimates than in the Second Draft *Plan* estimates, though they are higher than the Draft Plan Frame estimates.

The estimates for exports roughly remain the same; but those for invisibles have been scaled down. *Consequently*, the final estimate for the total current deficit during the Second Plan period is higher than the first estimate, though it is about the same as the second one.

This total current deficit of Rs 1120 crores is to be met mostly from exports and partly from private foreign investment of Rs 100 crores, drawing down sterling balances by Rs 200 crores, unutilized grants and loans of Rs 94 crores, and grants and loans for which commitment is already made of Rs 76 crores (Russian and British aid for steel plants). This leaves a gap of Rs 650 crores which is intended to be covered by the following means:

a) Floating public loans in foreign money markets;

b) Arranging for bankers' credits and export credits for supply of goods from foreign countries;

(c) Loans from the World Bank;

d) Loans and grants from other international institutions and friendly governments; and

e) Direct private foreign investment.

Other capital transactions are expected to be in balance so that no further foreign exchange resource would be required for that purpose.

Balance of Payments During the Second Plan Period

(Rs crores)

	1954-55	Annual Average for the Second Plan Period: Draft Plan-Frame	Draft Outline	Second Plan

Company Meeting

THE METAL BOX COMPANY OF INDIA LTD.

CHAIRMAN Mr. H. CHISWELL JONE'S REVIEW

THE 23rd Annual General Meeting of The Metal Box Company of India Limited will be held on Wednesday, July 18th 1956 at 59C, Chowringhee Road, Calcutta.

The following is a copy of the Review by the Chairman, Mr. H. Chiswell Jones, which has already been circulated to the members.

SALES

During the year under review there was a high level of investment in national development. Investment activity created a rising demand for packaged goods—paints, pharmaceuticals, babyfoods, processed fruits and vegetables, lubricating oils, etc. Enterprising salesmanship and efficient production enabled us to play a significant role in satisfying this demand.

National investment during the Second Plan will create an expanding level of demand and the supply of goods to satisfy this will be a condition both of the success of the investment programme and of continued political stability. To this end your company and its customers have a major contribution to make; the processed food industry in particular is strategically placed. It is to receive active encouragement in the Second Plan and the allocation for horticulture has been increased from Rs 1 crore to Rs 9 crores. These measures are to be welcomed as the addition of processed fruits and vegetables to the national diet will make for important improvements in public health and preventive hygiene. The development of this industry involves co-operation between large and small scale industry since the safe preservation of food requires precision-made cans that only high-speed equipment—equipment inseparable from large scale industry—can produce while at the other end horticulture is a part of intensive small scale agriculture. This pattern of co-operation is already established between the canners, the horticulturists and ourselves.

During the year we made solid contributions to the food and the other industries we serve. In Bombay we commenced manufacture of open top cans for the canning industry. The work of the newly opened Research Division at Calcutta on materials and finishes contributed effectively to improved quality and our access to the extensive research laboratories of our Technical Consultants in the U K continued to provide an invaluable part of our service.

There are, however, some ominous signs: the programme of taxation, increases in railway and ocean freights and the rise in food prices are implied threats to purchasing power. Transport and the shortage of steel and cement are capable of braking the country's economic growth. We have made a good start in the current financial year but there is no room for complacency. We are planning in a spirit of optimism tempered with caution.

PROFIT

The increase in sales of nearly Rs 1½ crores and the further diversification of our business resulted in a return to the more normal profit levels obtaining when the public first acquired an interest in the equity capital of the Company.

Prospects for the current year are good and it is hoped by virtue of increased turnover to maintain this profit level notwithstanding the increased costs referred to later.

RAW MATERIALS

It has been another year of anxiety in the matter of tinplate supply. Indigenous tinplate production remains well below demand and although The Tinplate Company have installed an additional rolling mill, they have not been able yet to obtain the extra tonnage of steel to operate the mill. Supplies of imported steel have been promised for the middle of this year but even when this is regularly available and processed, the extra 10,000 tons of tinplate produced will still leave a large gap between supply and demand. Our own imports are currently 50% of our total consumption.

Because of the time taken to obtain shipments from abroad we have had to raise our stock levels of raw materials thus increasing the strain on our finances. The price of materials and transport has risen during the year and part of the increases had to be passed on to our customers.

We are reluctant to pass on to our customers anything, but direct increases in the price of tinplate, which is our main raw material, and we have met increased costs by production economies made possible by greater overall demand. Nevertheless, there is a limit to our ability to absorb price increases of a general nature and there are presently signs of inflationary pressures which could very quickly upset our price structure. Government are clearly aware of these and have indicated that they have weapons with which they can speedily deal with the problem should it assume serious proportions. I hope they will not hesitate to do so.

There are two aspects of recent price increases which I must stress. The first is the heavy additional burden on the Company's cash resources which follows from higher raw material costs and bigger inventories—the second is that we find ourselves completely priced out of a number of export markets in neighbouring countries. The cost to Government of a drawback of the Steel Equalization Fund contribution on tinplate used for containers exported from India would be small—the gain in foreign exchange would be substantial; very much more so if extended to filled as well as empty containers.

INDUSTRIAL RELATIONS

From May 1955, when work was resumed at Calcutta after the disturbances there, we have had a period of complete industrial peace and at all factories negotiations and consultations with our employees have been conducted in an atmosphere of harmony and a keen desire to reach understanding. The excellent relations throughout the year have materially contributed to the satisfactory trading results and I am happy to say that we recently concluded with our employees a Prosperity Bonus Agreement covering the next three years.

Training of staff continues to receive our careful attention. We have an excellent cadre of young Management Trainees and each year we

send more Indian officers abroad for training. Our Technical Consultants recently sent the Head of their Staff and Personnel Division to discuss how they can best serve us in this all important matter of training. His visit was of the utmost value.

To a degree the success of the Second Five Year Plan will depend on an adequate supply of technicians. We are making our contribution by offering facilities for practical training in our factories to students and graduates from universities, engineering colleges and technical training centres. We have also offered our co-operation to Government in the encouragement of training in scientific management.

Labour Welfare continues to engage our attention. We are operating a most successful Scheme under which sick leave not utilised during the year is offered by employees to a Pool and such leave, to a maximum of 4 months, may be used for the benefit of any employee unfortunate enough to contract T. B. In the treatment of serious cases the Company also meets 75% of the cost of special drugs and medicines. In the two years working of the Scheme more than 20 employees have been completely restored to health and have been able to resume their employment with us. A Benevolent Fund is in operation at all Branches, the Company's contribution being based on the total amount subscribed by the employees. We have also extended recreational facilities to include sports, cinema shows and libraries.

DEVELOPMENTS AND NEW PROJECTS

We have made good progress in our new developments. The expansion in demand for aluminium pilferproof seals has been satisfactory and manufacture in Calcutta, foreshadowed in my last Review, has now commenced with consequent savings in freight costs to many customers.

Progress in the manufacture of polyethylene bags has continued, some printing machinery has been installed and more is on order. The potential demand for products made from this material is considerable and plans have been announced by two world famous manufacturers for the production in India of polyethylene flake—the basic raw material required.

Additional equipment for the manufacture of industrial components has now been installed—we have a substantial order book and a large number of new enquiries which augur well for the future. We are presently producing metal components for numerous manufacturers in the electrical, automobile, radio, duplicating machine and bicycle industries—the list will extend in the near future and we are proud of the contribution we are making to the expansion of these vital industries.

Plans have been completed for the erection of the new manufacturing and office buildings at Calcutta adjoining the new printing factory. We expect the new buildings to be ready in about twelve months time and this will permit us greatly to improve our plant layout, provide adequate office accommodation and generally achieve better working conditions. An extension to the Madras factory is under consideration and we plan to install additional printing equipment there to meet the growing demands for lithographed containers in that area. The Research Division in its first year of operation has made a valuable contribution towards the improvement of indigenous metal decorating materials. The Division has established close technical liaison with our principal suppliers and standardized numerous specifications covering both supply and application resulting in improved container quality. In line with our policy of purchasing indigenous materials wherever possible, the Division has assisted suppliers in satisfactorily producing a number of materials hitherto imported—others, still under test, show considerable promise.

I wish to acknowledge our indebtedness to our Technical Consultants, The Metal Box Company Limited, London, for their continued advice and guidance in all matters affecting the progress and well-being of our Company. We are most fortunate in being able to call on their vast store of knowledge and experience.

STAFF

This has been a year of intense activity and unremitting effort on the part of the staff. The excellent results achieved would not have been possible without their sustained enthusiasm and loyal support. The Board join me in expressing our thanks to them all for their splendid efforts.

MANGANESE

Who Gets The Money?

Here are the facts about a large well run Manganese Mine in Western India.

1. Production is kept at its maximum—over 90,000 tons p.a.

2. No present anxiety about sales—production is already sold at highest prices upto two years ahead.

3. No trouble with transport—this Mine is favourably situated where wagons are not scarce.

4. Sales (mostly for dollars) and stock adjustment total over Rs. 1,25,00,000 p.a.

5. This money is divided :—

(a)	To the workers at the Mines ..	37.2%
(b)	To maintenance & development of the Mines ..	30.3%
(c)	To the State in Taxes and Freight ..	23.8%
(d)	To the owners ..	5.5%
(e)	To the management ..	3.2%

6. The owners comprise many little shareholders—50% hold less than 10 shares of Rs 10 - nominal each 96% hold less than 100 shares. The management is by a corporation with similar composition.

7. Trading in Manganese is a complicated technical business involving many grades of ore. Great experience and confidence between seller and buyer is a prerequisite.

THEREFORE WHAT GOOD CAN STATE TRADING DO IN SUCH A BUSINESS?

IF STATE TRADING DOES NOT RESULT IN GOOD, WHICH OF ALL THOSE ABOVEMENTIONED WILL SUFFER MOST; AND WHY?

Agricultural Credit and the State Bank

D L Gupta

THE problem of agricultural credit is an age old problem. The Indian cultivator is not getting adequate credit and what little he gets, it is only at a very high cost. Yet cultivation cannot go on without borrowing. Government has now assumed the responsibility of supplying adequate credit to the agriculturist on reasonable terms. It is a difficult obligation to discharge, for agricultural finance is both risky and costly. Agriculture is a speculative business, in which success often depends on factors which are beyond the agriculturist's control. Crops may fail for want of rain; while they may be damaged by excessive or untimely rain. Again crops may be too good and prices may fall headlong. When an epidemic breaks out, livestock may be decimated. As a result of all these uncertainties, advances often get frozen and recovery becomes impossible immediately, and difficult even in the long run.

Agricultural credit is more costly than industrial or commercial credit. To supply it and later on to recover it from borrowers scattered over a wide area, is a difficult task. It requires more staff, involves more labour, and takes more time—all of which mean more cost. In view of the high risks and cost, interest to be charged on agricultural finance should naturally be high though there is a limit to it.

Usury in Ancient India

In ancient India, the law makers laid down such limits. According to Vashistha, a professional money lender may charge 15 per cent per annum from his debtor. The law-giver Manu allowed a maximum rate of interest of 24 per cent per annum, and warned that it would be a sin to charge more. Besides, a responsibility had been imposed on the King to see that the peasantry of the country was happy and got the necessary credit at a reasonable rate.

Inspite of these injunctions, however, the professional money-lender used to take full advantage of the pressing need and helplessness of the farmer. In addition to charging very high interest, frequently other charges were imposed under different names. Such undesirable practices have always been known, though they evoked severe condemnation from all quarters.

The Government of India has also tried to check the exhorbitant rates of interest and the malpractices of the money-lender through:

1. Legal control over private money-lending; and,
2. Expansion of institutional credit, through co-operative societies.

A legislative remedy was attempted first in 1879 by introducing the Deccan Agriculturist Relief Act. Subsequently the Indian Contract Act was amended, and the Usurious Loans Act was brought into force. Later on, at the suggestion of the Royal Commission on Agriculture almost all the provinces and States passed some more legislation. These include:

1. Licencing and registration of money lenders;
2. Maintenance of accounts in prescribed form;
3. Furnishing of receipts and periodical statements of accounts to debtors;
4. Fixing of maximum rate of interest;
5. Protection of debtors from molestation and intimidation; and
6. Penalties for infringement of the provisions.

In practice, these acts, instead of giving any relief to the peasants, affected them adversely. Interest rates rose steeply, and credit facilities contracted considerably.

The money-lenders' point of view was that the rate of interest had been fixed very low, while nothing had been done to reduce risks. Moreover, the provision for furnishing receipts and statements of accounts to debtors increased stationery and clerical expenses. Further, it was argued that the various Acts had been framed with a view to favouring the farmers only, without safeguarding the interests of lenders regarding the timely and smooth repayment of their dues. Thus, respectable money-lenders gradually confined their operations to the relatively less risky borrowers. Others adopted various malpractices to evade the law and dealt only with those who would not disclose such practices to others, and would not oblige them to take recourse to a court of law.

50 Years of Co-operation

Co-operative credit was adopted by the Government as an institutional system in 1904. Initially only primary credit societies were set up to raise funds from members and loans from Government, non-members and other co-operative societies, and distribute them in loans to members and other co-operative societies. The Act of 1904 was amended in 1912, in which provision was made for central co-operative banks to finance the primary societies, and to act as balancing centres. Co-operation extended its activities rapidly upto 1929. In this period, enthusiastic co-operators made advances indiscriminately to a very large body of borrowers, disregarding the fundamental principles of co-operative banking. When the Great Depression came many co-operative banks could not meet the depositors' demands and the movement collapsed, particularly, in provinces like Bihar, Bengal, C P and Berar, and in States like Travancore and Cochin. Thereafter numerous schemes for the revival of the movement were tried, but without much success.

In 1935 came the Reserve Bank of India, with an Agricultural Credit Department, with powers to make advances to provincial co-operative banks in British India against government and other approved securities, promissory notes and bills supported by documents of title of goods, and to discount their agricultural bills maturing within 9 months for financing seasonal agricultural operations. But in view of the unsatisfactory financial condition of the movement the Bank extended very little credit at this stage, though it guided the movement and helped it to establish sound banking traditions.

Revival Since World War II

World War II infused new life in the movement. Agricultural prices increased and the repaying capacity of borrowers improved. Since then the movement has not only survived but even expanded considerably. Further, periodical amendments of the Act have enabled the Reserve Bank to extend greater credit through the State Co-operative Banks, including banks in Part B States, on liberal terms and at a concessional rate of interest of 2 per cent below the Bank Rate i e at 1½ per cent per annum, on the following lines:

1. For financing seasonal agricultural operations or marketing of crops, payable within 15 months of the date of the pronotes, and against the security of pronotes executed by good Central Co-operative Banks or Agricultural Co-operative Credit Societies or Marketing Societies and endorsed to the State Co-operative Banks. Loans may also be made against the guarantee of the State Governments concerned.
2. For medium term loans against the guarantee of the State Governments. These facilities encouraged the State Governments to establish State Co-operative Banks. All the Part A and Part B States (except Kashmir), and a majority of Part C States have established such apex banks, and have participated in their share capital, and granted certain initial subsidies and other financial aids to them.

The Reserve Bank's loans to the State co-operative banks are intended to provide them with supplementary funds for meeting the increased needs of the cooperative societies through central cooperative banks, or even directly in certain cases. But some State banks, particularly the new ones, are treating them as the principal source of funds. They have become indifferent in securing deposits at the prevailing high rates of interest as the Reserve Bank is lending to them at a concessional rate. It appears that some banks have utilised their own funds, or those received from the Reserve Bank, for earning interest by employing these in Call Deposits and commercial advances instead of advancing them to cooperative societies. Such misuse of facilities provided by the Reserve Bank requires to be effectively checked. Despite the facilities from the Reserve Bank and State Governments, the State Co-operative Banks, execept in Bombay and Madras, have not been able to develop the agricultural credit movement substantially.

After the sad and costly experience of the 1930's, the cooperative banks adopted a safe, and to some extent a conservative policy in making advances. They have generally granted advances only to the creditworthy, and against the security of land or of sureties owning sufficient unencumbered lands. Many have not been able to get credit from the cooperatives, thus leaving no scope for labourers to become tenants and for tenants to become owners at any time in their lives. Such conservatism is to be deplored.

Socialistic Planning and Co-operation

With economic planning so much in the air, it has become necessary for the Government to provide credit facilities to the non-creditworthy as well, for productive purposes, and against the security of the borrower and of his growing crops. A bank, whether commercial or cooperative, deals with the depositors' money, and thus has a primary obligation towards the depositors. So it must play safe when making advances. It normally refrains from making advances to a cultivator with no tangible security to offer, except his personal capabilities for raising crops, or for the maintenance of the borrower and his family and for construction and repair of his residence and purchase of cattle etc. Cooperators, therefore, expressed their inability to make advances in the desired manner unless the State Governments or the Reserve Bank were prepared to: (i) provide necessary funds, and (ii) establish an authority to under-write the risk involved in such advances.

Moreover, as regards supporting the Government's scheme of credit development, responsible cooperators definitely said,—"the plan which, in a large measure, the cooperatives are expected to carry out should be of their own making. In the light of this, it appears strange that we still hear remarks that cooperatives should carry out the financial or other policy of the State. It must be clearly understood that the cooperatives cannot carry out any policy which is not their own."

Reorientation

In view of these observations, the Committee of Direction of the All-India Rural Credit Survey recommended:

1. Nationalisation of the Imperial Bank of India, to place its large resources and organisation at the disposal of Government; and

2. The establishment of various funds particularly:—

(a) National Agricultural Credit (Long-term Operations) Fund:

(i) to make long-term loans to State Governments, to purchase shares of cooperative credit institutions, mainly designed for giving rural credit;

(ii) to grant long-term accommodation to land mortgage banks by way of direct loans or by purchases of their marketable debentures, and

(iii) to allow medium term loans.

(b) National Agricultural Credit (Stabilisation) Fund and Agricultural Credit (Stabilisation) Fund—to convert short-term loans into medium-term loans, if the former could not be realised at any time owing to draught, famine etc.

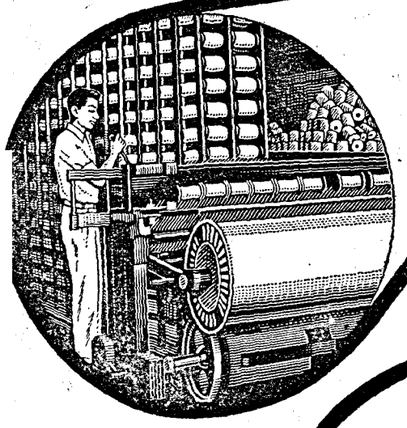
Short-term accommodation will be supplemented by the Reserve Bank of India as usual. The long-term and medium-term loans will be granted by the Reserve Bank of India out of the above funds, against guarantee by State Governments. Government have accepted these suggestions, and have implemented some of them.

With these measures, Government will install a forceful competitor to the private money-lenders, and there is no doubt that they will yield successful results if all the recommendations of the Committee are implemented.

Criticisms

Two questions were asked in the press about the above new, and almost revolutionary suggestions, namely:

1. When the Reserve Bank has been supplying the necessary credit to the co-operatives through the State co-operative banks, why set up the State Bank of India?



2. When the State Bank will in due course have about 1,200 branches all over the country, why not allow it to make advances to agriculturists?

Whatever theoretical merits these criticisms may have, they have no practical weight. The Reserve Bank is a Central Bank and as such it has to discharge many important functions, like the management of currency and credit, public debt and foreign exchange etc. In addition to all these, it is doing much more in respect of agricultural credit than any other Central Bank. It would not be advisable to divert more of its energies towards agricultural credit alone. Again, the question is not only of the supply of credit, but also of its proper guidance and control.

SAVED...
Rs. 21,000
a year on
LUBRICATION
COSTS alone!

A PROMINENT
textile mill in Ahmedabad
is saving Rs 21,000 a year —
because its management asked for
our free advice!

After careful study, our lubrication expert found that the mill was over-lubricating its machinery — with the wrong grades of oil. Now, every month, the mill uses three thousand pounds fewer; thirty-six thousand pounds of industrial lubricants saved every year!

Choosing
the right grade

Our experts are backed by the world's greatest lubrication experience, 90 years of it. Besides, they have the right oils to work with — a full range of MOBIL Industrial Lubricants! No wonder they can give you correct lubrication, with the right grade of oil.

MOBIL Lubricants have been developed over many years of scientific research, and they are constantly being improved. When our expert says: 'Use MOBIL Lubricants,' he is offering your machinery the finest protection that science can devise, or money can buy.

Correct lubrication is a matter for experts. Our advisory service is free — why not ask us to help you ?

STANDARD-VACUUM OIL COMPANY
(Incorporated in the U.S.A. The Liability of the Members of the Company is Limited)

V-3502

Central cooperative banks are the main links between the apex banks and the societies, and the right type of credit expansion depends on good management of these banks. Their present structure in most of the States appears to be weak. They, therefore, require expert guidance in the new set-up. In this respect, the following suggestions of the Committee of Direction are relevant: (i) The central bank's office should be in the premises of the local State Bank of India; (ii) The State Bank should be the sole banker of such banks and (iii) The local agent of the State Bank of India should invariably be nominated on the Board of the central bank. The State Bank of India, therefore, with its numerous branches would be in a better position than the Reserve Bank to guide the activities of the central banks.

Regarding the second criticism, it should not be overlooked that the cooperative societies know the requirements of the local agriculturists and so they are in a better position to grant loans without much delay. Besides, they can conveniently follow up the loans as regards their uses and repayments in time. For the State Bank of India, this will be a costly affair. Besides, the cooperative societies have prior rights, under the various State Cooperative Acts, to recover their dues from the crops, and in certain cases from lands, of their members, which the State Bank has not. It is, therefore, more economical, convenient and safe to make advances through cooperatives.

Moneylenders and Rural Credit

One more important question remains to be discussed. Would it be possible for all the agriculturists to join the cooperative movement, no one borrowing from the private money lenders? That is impracticable. Institutional credit, with all its liberal attitude, will be available only according to certain principles and procedures. Most agriculturists are so poor that they cannot be regular and systematic borrowers from an institutional agency. Consequently, most of them will go to moneylenders, who will continue to exploit them, if government does not take the right type of protective measures.

Besides providing institutional credit, it is necessary to create healthy competition between good and rapacious moneylenders as well as between moneylenders and other well-placed persons in rural areas who may invest their money in financing agriculture. This can only be done by reducing the risks of agricultural finance. For this, the recovery of agricultural loans, if made at rates of interest prescribed by law, should be assured by giving prior charge to the licensed moneylenders in the Money Lenders Act, as has been given to the cooperative societies. It is perfectly justified to safeguard the interests of the moneylenders against dishonest borrowers.

During the early part of this century, it was difficult at one time to supply seeds to agriculturists for raising crops in the Kota State. Most moneylenders refused to make advances as they were not certain of their recovery. Government had a prior charge on the crops to recover the land revenue. Agricultural prices were so low that the land revenue was absorbing most of the sale proceeds. The then Kota Government, therefore, recognised the prior right of the moneylenders to recover their advances made in the form of seeds and food plus 25 per cent interest. In addition, the revenue collectors were required to see, before recovery of land revenue, that the dues of moneylenders had already been paid by the cultivators. This measure encouraged the moneylenders to make seed and grain advances.

In this respect, the Committee of Direction of the All-India Rural Credit Survey recommended: "The remaining problem will be that of devising a scheme of control over the moneylenders' activities. This will have to be more realistic than can be said to be the case with the prevailing scheme of control under the moneylending legislation of different States. Only under a proper scheme will the better type of moneylender have a chance to perform his function without having recourse to evasion of law and black market moneylending."

Further to guide and control both the borrower and lender, and to maintain a fair relation between them, a separate and independent agency should be established in each State viz a Registrar of Moneylenders, who should have all necessary powers and facilities like the Registrar of Cooperative Societies. The posts of Registrar of Cooperative Societies and of Moneylenders should not be combined as one person would not be able to discharge effectively these two functions particularly when the cooperative movement is to be reorganised and vastly expanded under the Second Five Year Plan.

Business Manager

Around Bombay Markets

Selective Rise on Bonus Issue

Thursday, Morning

ALTHOUGH the week opened on a steady if not a firm note, the subsequent performance was disappointing. The leading bulls were indifferent with the result that excepting for occasional spurts in individual scrips, the general trend was cheerless. Due to the lack of follow-up support, especially at higher levels, particularly in steels and cotton mill shares, higher levels could not be sustained. In the event, the stock exchange suffered an all round recession towards the close of the week on tired bull liquidation and scattered bear selling. It appeared in retrospect that the pronounced weakness of Indian Iron had adversely affected the general market sentiment.

There were, however, some exceptions. Thus, for the greater part of the week, automobile shares were in demand in anticipation of favourable results following the Tariff Commission enquiry. There was also sustained and influential buying in Premier Construction in view of the report that the capital structure of the Company would soon undergo some changes. The shareholders are reported to have already put up a proposal before the directors to that effect. The promoters' shares, it has been proposed, should be converted into ordinary shares and that directors should recommend, after conversion, a bonus issue at the rate of two bonus shares for every ordinary share. The present capital of the Company consists of 17,500 ordinary shares of Rs 30 each. The number of promoters' shares is 35,000 of the face value of Rs 3-8 each. The idea is to convert the promoters' shares to 11,666 ordinary shares, drawing the necessary sum from the reserves. If the bonus issue is to be made in the ratio of two shares for every share held, it would result in the creation of 173,320 new ordinary shares of Rs 30 each. In other words, after reconstruction, the share capital of the company would amount to just a little over Rs 51 lakhs as against the company's reserves exceeding Rs 80 lakhs.

Bombay Burma also firmed up towards the close of the week on sustained and informed buying. Here also, the prospects of reconstruction of the company's capital structure, besides those of an early announcement of a higher interim dividend, were contributory factors accounting for the strength.

The recent rise in prices of Tata Oil had been initiated by anticipations of higher dividends. These anticipations were realised when the company announced a dividend of Rs 3 per share for the year, as against Rs 2 per share last year. The directors also announced their decision to capitalise a part of the amount standing to the credit of the premium account of the company and to utilise the same for the issue of fully paid ordinary shares of Rs 25 each in the ratio of one bonus share for every five shares held. The bonus issue awaits finalisation, pending the sanction of the Controller of capital issues.

Towards the close of the week, the general trend of the market improved and leading textile issues benefitted materially. The closing quotations recorded fair gains over the week.

Cotton

Import Prospects Restrain Activity

THE week opened with the announcement by the Government of India inviting applications from importers and mills for the import of 40,000 bales of American cotton length 1 1|16" and above. It was stated that licences against these applications would be issued under Public Law 480 at the appropriate time. Thereby hangs a tale.

Public Law 480 is only another name for the Agricultural Trade Development and Assistance Act of 1954 administered by the Department of Agriculture in the USA. Title II of this Act, to be administered by the Foreign Operations Administration, authorizes the use of Commodity Credit Corporation stocks of agricultural commodities for relief assistance to friendly foreign countries up to a maximum of 300 million dollars.

The reason for inviting import of American cotton of the specified staple length is obviously to offset the rising tendency in prices of cotton which might well prove embarrassing, if the present scarcity of quality cottons is any indication. In fact, readers of this column will easily recall the consequences that followed a steep rise in the price of cotton futures towards the end of last year. The Government, in its anxiety to stop any further speculative rise in prices, has decided upon importing US cotton under Public Law 480. While officially India is to import only 40,000 bales of US cotton, according to US shipping circles, it is probable that India may in fact go in for large scale imports of American cotton. US shipping interests report that India has requested for $300 million assistance under Public Law 480 for the purchase of commodities chiefly cotton and wheat.

Although there is no official confirmation, according to some market observers here, the proposal for importing US cotton has arisen from the reported triangular deal in cotton textiles between India, Burma and the USA. In this connection, it is authoritatively learnt that a four-member delegation consisting of top officials is already in Rangoon for discussing the terms and conditions of the deal whereby India is expected to receive 37,000 bales of American cotton from Burma (who would have received a sizable quantum of it in the first instance) for being processed by cotton mills in this country.

Marketwise, ever since the announcement of American cotton imports, there has been a distinctly bearish trend which has been further accentuated by good rains and the prospects of better crops. However, towards the close of the week, cotton futures tended to firm up a bit on reports that rains had been rather heavy in the cotton growing belts giving room for fears of some damage to the crop.

In the spot market at Sewri, hardly any business of note passed during the week, though occasional deals in quality growth were reported off and on.

Around Calcutta Markets

Prices and Equities

Wednesday Evening

EQUITIES continue to drift lower. On settlement days, prices go up slightly on technical grounds. But the spurt proves short-lived. Investors remain away from the market. In the absence of support, equities climb down gradually. Fluctuations in clearing shares may have aggravated the recent downward trend. But speculation in clearing shares is no longer responsible for the consistent decline in equities. Deeper influences are at work.

It is clear that the proposals included in the last budget are having belated effects. Many companies have since declared dividend in excess of six per cent of the capital. But companies are not likely to continue this practice which involves payment of a dividend tax. As the indirect limitation on dividend payments takes effect, investors will, naturally, be unwilling to make fresh investments unless equity prices go down further. This is one of the main influences which is depressing stock markets.

Price Trend

No less intriguing is the rising trend of prices. From the last quarter of 1953 to the last quarter of 1955: equities were booming. One of the explanations for this boom was the falling trend in the prices of food and of industrial raw materials. By the third quarter of 1955, Tea shares toppled down as average auction prices fell sharply. This had a temporary effect on equities in general. But there are other reasons why equities have failed to resume the upward trend confidently.

By the end of 1955, it became evident that food prices were rising. This trend became pronounced during the first quarter of the current year. It was during this period that stock markets became conscious of the effects of the rising trend in food prices. Dearness allowance is related to working class living costs. As the rising trend in food prices raised dearness allowances, industry's wage costs started spiralling up. This is a development which continues to plague industry, and, hence, stock markets.

Coal Prices

Possible effects of uniform prices for steel and the higher uniform prices for cement have been discussed in these columns last week. Though only the distribution aspect of the cement industry is now to be controlled by the State, fears persist that major industries like cement and iron and steel may be either taken over or so strictly controlled and supervised by the State as to make the difference between State and private ownership a distinction without a difference. There is, besides, the price aspect of recent Government policies.

Iron and steel prices are now uniform throughout the country. This affects the existing industries around Calcutta and Bombay. Higher uniform cement prices affects industry throughout the country. And now coal prices have also been raised. Higher coal prices will raise further industrial costs of production. Industry in eastern India is coal-based. Thus, higher coal prices will impose a relatively higher burden on industry in this part of the country. Equities continue to be hesitant as production costs tend to rise.

Coal Shares

While coal prices will raise production costs for the major industries, the coal industry, apparently, remains unsatisfied with the increase in prices announced by the Government. It claims that the rise in prices now allowed will not offset the higher wage burden as a sequel to the recent award of the Industrial Tribunal. This is one of the reasons why Coal shares continue to fall. Incidentally, the industry has been promised a further review of the price question in the near future. Nor is it without significance that a responsible section of the industry is optimistic that the Second Plan offers ample scope for development in the private sector of the industry.

As the settlement expired today, Indian Iron developed a steadier trend. It was partly due to settlement considerations. But recent experience suggests that speculative investors are interested in entering the market for Indian Iron around Rs 35. With the proposed right issue at a premium of Rs 3½ per share, it is, certainly, worthwhile to accumulate Indian Iron at around Rs 35. There has been interested support to Indian Iron in the last two days. Along with Indian Iron, other clearing shares have also steadied-up.

Trend Changing

But cash scrips remain hesitant. If clearing shares continue to move up, cash scrips may respond some days later. For one thing, Miscellaneous and Engineering shares are now well below the best levels touched in the latter half of last year. Any change in the market sentiment will certainly be reflected in revived demand for Paper shares. It is encouraging to note that recent weekly tea auction prices are registering a gradually higher trend. As these shares look up, investors may be tempted to re-enter the market for Coal shares.

Even then, Jute shares may remain depressed. Re-sealing of 2½ per cent of jute looms has had no effect on Jute shares. Jute goods have tended to steady up mainly due to recent buying orders firm Argentina and Australia. Even so, jute goods remain depressed. Meanwhile, raw jute prices continue to be steady. Re-sealing of looms should have had a softening effect on raw jute. But prices remain steady as doubts spread about the extent of the recent flood damage to the crop. As the spinner's margin continues to be unfavourable, Jute shares refuse to move up.

Dead-wood and Danger

THE Bill for amending the Reserve Bank Act which passed its first reading in the Lok Sabha and was referred to a Select Committee falls broadly into three parts. The first relates to foreign currency reserves as a backing against note issue, re-valuation of the gold held by the Bank at the current official rate being a part of it. The second relates to the reserves maintained by the scheduled banks in cash or in interest free balances with the Reserve Bank against their deposit liabilities. The third is concerned with the abolition of Local Boards which have for so long functioned in an advisory capacity. Of minor importance, and largely technical, is the amendment relating to Reserve Bank advances from the National Agricultural Credit Fund to enable co-operative banks to lend to cultivators for acquiring shares in co-operatives.

The first two are major changes which should normally deserve the most careful consideration. The issues, however, are not being threshed out de novo on the floor of Parliament. In fact, so far as the backing against the note issue is concerned, the Government and the Parliament had taken a firm decision long ago. This they did when they approved of the basic principles of the Plan which included not only deficit financing but also the broad pattern of the balance of payments of the country for the next five years. The Bill largely makes de jure what is de facto; it implements the decisions on policy which have already been taken.

As instruments for carrying out these broad policy decisions, however, the amendments invite certain criticisms. To take the foreign exchange and gold reserves first. It has been decided that resources for development to the extent of Rs 1200 crores in the next five years will have to be found from budgetary deficits. This will mean currency expansion of a certain magnitude against which it is neither possible nor desirable to maintain proportionate reserves as laid down under the present Act. Far from expanding such reserves against the currency expansion that is contemplated, it has further been decided to draw down the sterling balances and utilise the surplus above a minimum that may still be maintained for meeting the foreign exchange requirements of the Plan.

The question that arises is, therefore, the narrower one of the amount of the minimum reserve and the manner in which it should be held. The Bill provides that the minimum should be Rs 400 crores in foreign securities and Rs 115 crores in gold (which would be the value of the present holding of gold after re-valuation). This minimum, however, can be reduced by a hundred crores with the previous sanction of the Central Government for a period not exceeding six months in the first instance, and subsequently for periods not exceeding three months at a time, with similar sanction. This concession to convention is unmeaning. After all, what are reserves for, if they cannot be touched when they are needed most? By making it obligatory for the Reserve Bank to obtain previous permission from the Central Government, when the reserves have to be touched, the Bill implicitly assumes a separation between the Finance Ministry and the Reserve Bank and the independence of the one from the other which is just not there. Again, by making the reserves of Rs 300 crores of foreign security 'untouchable' except with the legislative sanction of Parliament, the Bill assumes that the relationship between legislature and executive is quite different from what it is today or what it is likely

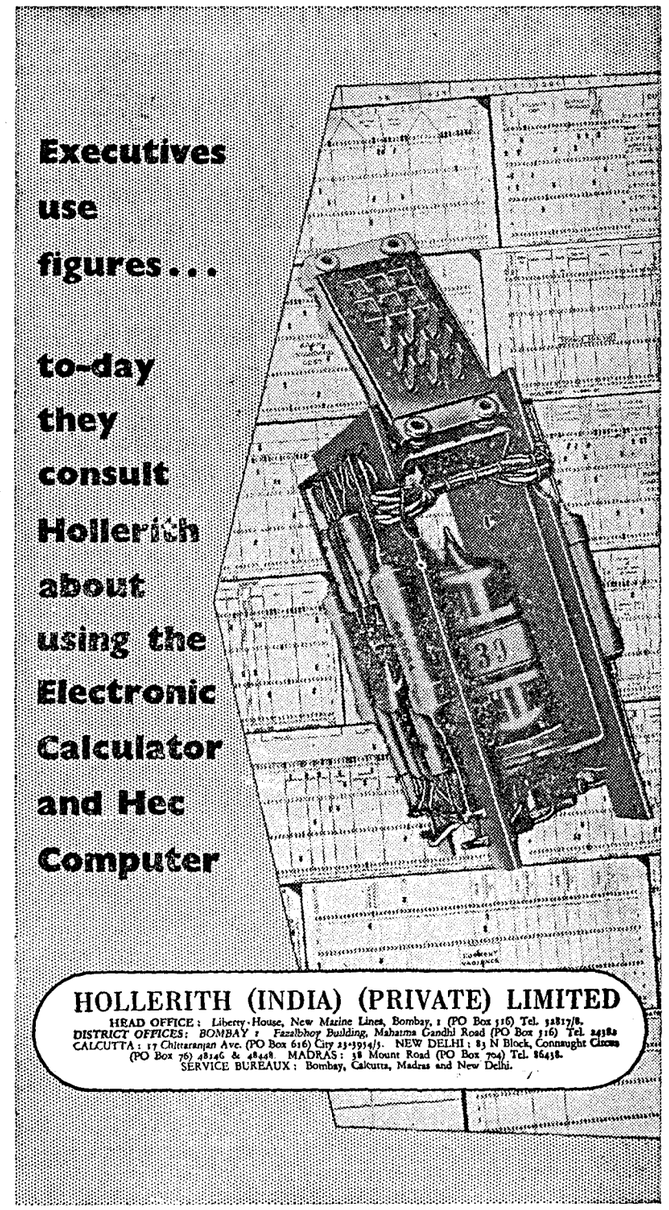
to be in the near future. True, the ultimate restraint against executive excesses lies with Parliament. But surely the latter need no special powers to exercise it? Abolition of proportional reserves it has been complained, will undermine the strength of the rupee by weakening the confidence of the outside world. If this is sheer nonsense, it is equally nonsensical to maintain outmoded currency reserves when the latter no longer serve the function of restraining or regulating the volume of currency in any way. It is high time that such dead-wood were removed from our statutes.

More important for the future of monetary policy is the provision relating to reserve ratios of scheduled banks. Central Banking has developed in this country on the British model of fixed minimum reserve ratios. Indian banks have not, however, been able to keep to these minimum ratios because we did not, and do not, have a short term money market with infinitely elastic demand for credit. Cash ratios, however, have lately come down and with the increasing demand for bank credit, scheduled banks have been able to reduce their excess reserves to a large extent. How far the demand for credit arises from the needs of planned development and has therefore to be met, and how far it arises from speculative holding of stocks which has to be prevented in the interest of planned development, it is not possible to decide at sight. The Banking Companies Act, however, gives wide powers to the Reserve Bank to keep a close watch on all banking activities and check those activities which go against 'stability' and planned development.

Amendments to the Reserve Bank Act would be justified only if they help the Reserve Bank to implement the broad policies that have already been decided upon. The policy in respect of foreign exchange is reasonably clear; but no monetary policy for planned development has been laid down yet beyond what is supposed to be conveyed by the blessed word 'stability' which at least needs to be defined and brought down to earth. Have the larger powers that the Reserve Bank is now seeking been suggested by its own experience of monetary control? If they have it should be possible to check up against the Report on Currency and Finance for 1955-56 which has been published during the week.

The Report does not end on a hote of cautious optimism as is usual with Government publications. It is honest enough to point out that though, taking the First Plan period as a whole, progress has been satisfactory in that money supply with the public has risen by 10 per cent (along with a 25-30 per cent rise in industrial and 20 per cent rise in agricultural production) while wholesale prices have declined by 13 per cent, the symptoms of inflation which appeared towards the close of 1955-56 "require careful watching" and that "the considerable inflationary potential arising from developmental expenditure" should be held in restraint. Now, which of the developments are inflationary that should be restrained and how best can they be restrained? The Bank has to see that adequate credit for desirable developments is maintained. How to separate the chaff from the grain? Is qualitative control, which the Bank is in a position to exercise, not adequate for the purpose? Variable reserve ratios came into fashion in the thirties. They are now respectable and have found a place in text books. But instruments cannot be dissociated from the purpose for which they are used. The Reserve Bank report shows no awareness of the purposes of control. Whether credit control can be satisfactorily enforced or not, and credit apportioned to right places and in right proportions without completely changing the present system of trade and exchange have not been answered. Experience, however, should suggest future lines of development and action. As bank credit is largely for trade and the requirements of trade have hardly been integrated into the Plan, a big gap remains in the thinking on the subject.

There may be harm in arming the Reserve Bank with powers for varying reserve proportions, when it is difficult to say how this is going to help the Bank. The kind of situation that arose at the time of the Korean boom could be met more easily by impounding foreign exchange earnings or their rupee equivalent for the time being. This could be done by requiring scheduled banks to lodge in a special account such sums as the Reserve Bank may consider necessary in the light of current credit conditions. In less exceptional circumstances, further powers, if at all necessary, should be an extension of those which the Reserve Bank already possesses under section 21 of the Banking Companies Act for controlling advances. If the wide differences among the scheduled banks are borne in mind, particularly the conditions under which they work and the nature of their business, road-roller methods of control would hardly appear to be warranted. So why not wait, and let the Reserve Bank gain some experience in qualitative control which should suggest the lines of further extensions in the direction of rationing of credit? To arm the Bank at this stage with powers of varying the reserve ratios will only impede progress in the right direction but will not help the Bank in any way.



Disarmament

DISARMAMENT is an essential condition of world peace. Both Russia and the Western Powers have reached an understanding not to start an atomic war. On the basis of this understanding, it should have been comparatively easy to reach an agreement on disarmament. In the absence of such an agreement, the "cold war" continues. Political developments in Russia since the death of Stalin combine with the nuclear stalemate to make the continuation of the "cold war" illogical. Why, then, is an agreement on disarmament not yet in sight? Can it be because the Western Powers, and particularly America, are aware that, in the absence of thermo-nuclear weapons, the balance of power must continue to shift to the Communist bloc? This gradual shift in the world balance of power is inevitable on the assumption made above. This may explain Washington's insistence on perfecting nuclear weapons as a perpetual deterrent to aggression. But such a policy can, at best, perpetuate nuclear stalemate. It cannot ensure world peace.

Mutual jealousies and suspicions obstruct any agreement on disarmament. Russia is opposed to President Eisenhower's plan for "open skies" as she suspects that the plan will be exploited, in the absence of an agreement on disarmament, for a surprise attack. President Eisenhower, in his turn, proposed the "open skies" plan in order to minimise the chances of any surprise attack. M Gromyko is logical in his argument that aerial inspection cannot lead to any reduction either in armed forces or in armaments without a prior agreement on disarmament.

There are reasons why the Western Powers are interested in limiting armed forces as a first step to an agreement on Disarmament. Three years ago, the Western Powers proposed a plan for reduction of armed forces in the sure knowledge that they had gained superiority in nuclear weapons while Russia continued to enjoy an advantage in ground forces. To-day, the West is proposing a plan for limitation of armed forces for entirely different reasons. Russia has now made phenomenal progress in the race for nuclear weapons. Therefore, the superiority of her armed forces has again assumed significance. There is another reason why the Western Powers are now anxious to reduce the armed forces of the major Powers. For them, a reduction in armed forces and conventional weapons has become an economic necessity. Defence expenditure not only hampers their internal economic progress. It limits their capacity to aid economic development in underdeveloped areas. Russia and America alone can maintain the current level of defence expenditure, and yet offer aid to underdeveloped countries. Equally understandable is Russia's prompt acceptance of the West's plan for limitation of armed forces of the major Powers. She is now economically strong but not as strong as America. She has every interest, as have Britain and France, to curtail her military expenditure so that more resources can be available for her internal economic development as well as for aiding progress in poorer countries, in which she has an ultimate and abiding interest.

Meanwhile, recent discussions of the Disarmament Commission indicate some progress towards limitation of nuclear weapons. Though Shri Krishna Menon has not succeeded in convincing the Disarmament Commission of the urgent need of banning tests of nuclear weapons, there is growing support to the move for regulating and limiting these tests. Available scientific information supports Shri Menon's passionate plea for banning nuclear tests. It is clear that the regulation and limitation of nuclear tests must be a step towards disarmament. But this preliminary step does not necessarily require a control organ, as, under the present scientific and technical conditions, nuclear tests can be detected. It is wrong to suggest that Russia is opposed to any system of control and inspection of phased disarmament, though she is opposed to the "open skies" plan. When Russia proposed that the ban on nuclear weapons must be the first step towards disarmament, the Western Powers opposed the suggestion. To-day, Britain concedes that prohibition and limitation of nuclear weapons should be the first essential step, and is prepared to discuss this aspect of disarmament separately. "No nation", the American representative to the Disarmament Commission endorsed Shri Menon's challenge, "has the right to blight the genetic heritage of man". Therein lies hope that Russia and the Western Powers will reach an agreement on disarmament soon. Not only underdeveloped countries, but the whole world will welcome such an agreement as a prelude to lasting peaceful co-existence.

Weekly Notes

No Protection to Authors

THE Copyright Bill, which was referred to a Select Committee by the Lok Sabha this week, contains so many objectionable features that one wonders whether the Education Ministry, which sponsors the bill, is aware that the primary purpose of copyright legislation is to protect the producer of artistic works and to assist him in asserting his rights.

The bill, which is intended to replace existing legislation, provides for instance, for the registration with a special Copyright Registrar of material in which copyright is claimed and makes such registration compulsory before any legal action can be taken by the holder in case of infringement. This is obviously a needless burden which will make enforcement of his rights so much more difficult for the poor author.

A particularly obnoxious feature of the bill is the provision that when permission for the publication of a translation of a copyright work is refused by the holder, the Registrar of Copyright may grant such permission, though a fee to be fixed by the Registrar will be payable to the rightholder. In what sense this provision can be considered to be an additional protection to the producers of artistic works, it is difficult to imagine. Besides, this would make the Registrar a judge of literary merit, both with regard to the standard of translation and the value of the original work!

Under the provisions of the bill, it will be necessary for the author or artist to contract out when assigning his copyright, if he wishes to make an assignment for any specific purpose only. Similarly, copyright in any material produced by an employed person outside his employment will vest in his employer, unless the employee deliberately contracts out. Here is a highly dangerous provision affecting thousands of free-lance writers who might hardly like to demand from their employers a written release from the operation of this provision. The right of the author to the fruits of his own work are thus denied by the bill.

Flying in the face of the international conventions to which this country is a signatory, the bill reduces the term of copyright from 50 to 25 years after the death of the author and further makes this term, in the case of a joint work, operative from the death of the first co-author to die. It also gives confiscatory power to the Registrar by way of the right to grant permission for publication or performance against the copyright holder's wishes. In its provisions regarding enforcement of rights, again, it allows for presumptions of law not in favour of but against the author.

The only favourable feature of the bill is one which extends the period of protection against translation to the full term of the original copyright. The Select Committee will have to eliminate many objectionable features of the bill, if it is to be acceptable.

Transport Bottleneck

Our Delhi correspondent writes:

THE edifice of the Second Five Year Plan has been constructed on admittedly an inadequate and, therefore, insecure transport base. Shri K C Neogy and the railway authorities believe that the expansion of transport facilities will be directly related to the financial allocations for the railways and the phasing of traffic at the ports; there is nothing else to it. Some economists, however, feel that a more scientific or rather utilitarian application of the limited funds at strategic points in the railway system will yield better results than the railway technicians, with their natural desire to acquire the best, care to concede. They have been advocating a thorough scrutiny of the railway plan with a view to establishing investment—output, norms on the lines of the surveys to which some of the bigger hydel projects are being currently subjected.

There is another group, however, which sees the solution of the transport problem in the diversion of rail traffic to coastal shipping. Pressure on rail transport compelled Government to move several million tons of coal by sea during the war but the experiment was short-lived. The reason is that shipping is more expensive than rail transport.

The cost of transport not merely determines the comparative demand on shipping and the railways but also the development of the economy generally. To give an impetus to industrialisation in the less developed areas of the country, Government has instituted freight pools for fertilisers, cement and steel. But that is merely the beginning. Two expert committees are dealing with the related issues of radically revising the freight structure of the rail-sea transport. The institution of freight pools is understood to be under the active consideration of both.

Postage Stamp Rate for Coal Also?

The Railway Freight Structure Enquiry Committee is studying the desirability of pooling the transport cost of coal so that the basic raw materials—cement, steel and fuel—may be available in every part of the country at standard prices. The Committee for the coordination of rail-sea transport is examining the possibility of pooling rail and sea freights so as to subsidise the quantum of traffic that may be diverted to shipping by raising the charges for goods moved by rail. It is believed to be of the view that a part of the rail traffic in cement, steel, coal, mineral oils and salt could be earmarked for coastal shipping. Freight equalisation has been tentatively recommended, but the final report of the committee is not likely to be available in less than a month. The railways are presently estimated to be moving goods at the annual rate of about 130 million tons of which a little less than half is coal traffic. Coal diverted to coastal shipping during the war years amounted to some 6 million tons, it is stated, and this figure can be reached again without difficulty.

There is little doubt that the proposition, if seriously mooted, would mark a radical departure from the existing modes of thinking on the transport problem. It is also likely to meet with stiff resistance from the Finance and the Railway Ministries which may fear a dimunition in the total demand, as a result of higher transport charges. The producing States, particularly Bengal and Bihar, have already served notice that they would resist freight equalisation of coal as the industrial belt in the eastern region would be the worst victim of the move. The fact that price pooling of cement would benefit the Bengal-Bihar region and reduce the strain on transport by making rationalisation of movement possible may however be increasingly appreciated in time.

Competitive Co-existence

BOTH the political and economic implications of the communique issued after the talks between Pandit Nehru and Dr Adenauer deserve emphasis. It is not quite clear from the communique itself whether the West German Chancellor now admits that unification of Germany must follow, and not precede, an agreement on world peace. But the reference in the communique to disarmament as one of the most urgent world issues is not without significance. Reports of talks between the two Heads of State indicate, according to versions supplied by news agencies, that there has been a shift in Bonn's approach to the two related problems of German unity and European security. Dr Adenauer is reported to have expressed the opinion that any reconciliation of East-West conflict could hasten re-unification of Germany. This is what Moscow has been arguing for a long time. There has never been any doubt that Paris endorses Moscow. If Pandit Nehru has succeeded in impressing on Dr Adenauer the wisdom of such a policy, the Indian Prime Minister has achieved much in his mission of peace. Only Washington now seems to insist on a different approach to these two related issues.

India's foreign policy is based on the fundamental assumption that there can be no global prosperity without world peace. For poor, under-developed countries, peace is an essential condition of plenty. Though the Western Powers and the Communist bloc have not yet reached an agreement on peaceful co-existence, some of its beneficial consequences are already in evidence. Economic co-operation between India and West Germany started before Russian economic overtures to under-developed countries. But Russian offers of economic help have provoked West Germany to outbid the former. India's first steel plant within the public sector is being built through West German co-operation in men and money. West Germany has now proposed to build and equip, besides supplying the teaching staff, a technological institute in India. Bonn has also offered scholarships and other monetary facilities for "a greater number" of Indian students to attend German colleges.

Russia and West Germany are keenly competing with each other to help economic development in south-east Asian and West Asian countries. India, along with all poor Asian countries, will welcome such evidences of competitive co-existence. This was one of the issues discussed recently during the Commonwealth Prime Ministers' Conference in London. They agreed about the need for increased economic intercourse between Commonwealth countries. America has not been ungenerous in aiding economic improvement in backward areas. But the current debate in America on the Foreign Aid Bill emphasises her political approach to economic problems. Washington's lack of response to developing political and economic events within Russia only lends weight to Pandit Nehru's fears that its policy could split the world into two hostile camps.

Too Little, Too Late

RECENTLY, Commonwealth Prime Ministers proclaimed to the world their respect for aspirations of self-government in all parts of the Commonwealth. If Sir Anthony Eden's announcement of his Government's plans for Cyprus is a direct sequel to the recent London Conference, it is a poor reflection of Britain's, as well as of the Commonwealth's, respect for self-government. Lord Radcliffe has been appointed as Constitutional Commissioner. His task is "to consider the framework of a new liberal constitution for Cyprus . . ." This new constitution will not come into effect until law and order has been restored. Lord Radcliffe is now on a preliminary visit to Cyprus. This proposal has had a hostile reception in Cyprus. Cypriots have announced their decision to boycott Lord Radcliffe. Informed opinion even in Britain concedes that the offer means too little, and has come too late.

There are complexities in the situation. But suspicions deepen that Sir Anthony and his Government are pleading the safeguard of minorities and the prevailing disorder as excuses for delaying the grant of self-government to Cyprus. London is evidently eager to woo Ankara. It will be conceded that the problem of the Turkish minority in the island will have to be harmoniously reconciled. But the right of Cypriots to self-determination cannot be denied. Strategic considerations can be overemphasised. Both Ankara and London are suspicious of the future political leanings of Athens. Moscow's overtures to West Asia deepen these suspicions. Strategic considerations may not be ruled out altogether. But, as the international tension eases gradually, these considerations should not be allowed to override the basic issue of self-government for Cyprus.

Letter to the Editor

The Choice of Technique

MRS ROBINSON would like to know how much of the surplus accruing to the capitalist in the form of profit can be expected to be reinvested. In my opinion, however, it is not a question of expecting but of making decisions. It is upto the planner to decide what share of the profit should go into reinvestment and then ensure that the decision is carried out. If the planner means business, neither export of capital nor speculatary activities should be allowed and luxury consumption by the capitalist should be severely restricted.

But we need not discuss these questions in the context of the problem of technological choice. Mrs Robinson assumes that factory production must necessarily mean production in the private sector. But what prevents it being in the public sector? I am not suggesting nationalisation of existing industries—only that the additional production of items of essential consumption (e g cotton textiles) might be obtained through factories to be established in the public sector. Two birds, then, could be killed with the same stone: a large amount of surplus going straight back into investment; and complete control over the supply of essential consumer commodities in the hands of the planner. This second consideration alone should dispose of the alternative suggestion of relegating the task of supplying the essential consumer commodities to the as yet unorganised small scale industries.

What can be the objections to such a plan? The cost will not by any means exceed Rs 200 crores— the sum earmarked for the small scale industries in the Second Plan, a substantial part of which will go to cover the expenditure on organisational and administrative activities. Objections can only be based upon the principle that all profitable light industries must be left to the private sector, the State undertaking only such enterprises as may be necessary for the development of the country but not sufficiently profitable for the private sector to take interest in.

A Calcutta Diary

Personality Cult: Calcutta Style

MOSCOW is not the only city in the world to have seen the cult of personality in action, and those of us in this country who commented glibly on the noisy end of the phenomenon in the Soviet Union do well to take a closer look at ourselves. Perhaps we are idolaters all; that elusive thing called national character — the Germans are thorough, the Americans are efficient, the French are emotional, and so on — manifests itself only in the forms idolatry takes under different skies. They made quite a cult of Churchill during the war, but the British, being British, knew when to retire a war leader—just before the war is over. The record of the Germans and the Italians in this department is too recent to need recalling. We Indians are not bad at it either; nor is the practice restricted to the Right. Of an undying element in Indian behaviour my most vivid recollection is the sight of Communist procession taken out a day after Stalin's death. Near Hazra Park in the south some fifty students, unmistakably Bengali Hindu middle-class, carried a photograph of the dead leader, and sang what sounded like a kirtan, the traditional tune for funeral processions. Deputy Minister Tarun Kanti Ghosh, a devout kirtaniya, could not have sung more dolefully. Not all the Marxist doctrination had succeeded in exorcising the Bengali of his innate vaishnava streak.

It is of another kirtan soiree that I have to speak today. This was held two Sundays ago at Writers' Buildings, the West Bengal secretariat. The occasion? Dr Roy's birthday; he was 75 on July 1st. Amongst those present were Dr H C Mookerjee, Governor, Dr Roy himself, and a number of high officials. The Governor is a Christian, the Chief Minister a Brahmo. Not a few of the officials, who thought of this birthday present to the Chief Minister, are also Brahmos. Details of the life of Krishna, which were the subject of the intensely religious opera sung that evening, cannot possibly have the same appeal to a non-Hindu as they have to a Hindu believer, and the purely aesthetic approach to religious music is ruled out. What then brought Dr Roy to this function? What made the organisers think of this piece? Lord Krishna, it must be admitted, was an irrelevance in Writers' Buildings on that Sunday. The worshippers who foregathered there were offering their homage to a living deity, Dr Bidhan Chandra Roy.

This is as it always has been. I, who saw vaishnavism at Indian Communists' mourning of the death of Stalin, should have seen nothing noteworthy in this further manifestation of the Indian character. I should have dismissed it as only natural. I would have done, except for one thing. It is not the Congress Parliamentary Party which organised the kirtan in the secretariat; nor was it the largely non-Bengali business community which had earlier donated considerable funds to the West Bengal Congress Committee so that the latter could present a cheque for Rs 1 lakh to the Chief Minister. It is the permanent officials who organised this evening, and this they would not have done even a few years ago. The present writer knows an ICS man who, when in charge of a district, declined to receive a Minister who had gone thither for electioneering, and thus earned the politician's everlasting enmity. A year or two ago the Calcutta newspapers published photographs of a meeting held at Congress Bhavan on Dr Roy's birthday, and in the first row was seated the Chief Secretary of West Bengal. None of his predecessors would have been seen there dead.

It is not so much the political contamination which should worry us. I do not think that has yet taken place on a serious scale. (And a permanent official's politics is, generally, very impermanent.) There must be exceptions. One has heard of recent appointments, at the village and district levels, which were made with an eye to the coming elections. At the higher level, I think, the bureaucrat's contempt for politics and politician's is still real. No, I cannot see West Bengal Chief Secretary overnight turning a devout Congressman or the Home Secretary becoming a secret member of the Communist Party of India. If an official today wrongly favours a Congressman, it is not because the former is partial towards the latter's party; in nine cases out of ten, that favouritism will be found to have been initiated by pressure from a Minister. Only, in saying all this in defence of the West Bengal bureaucracy, I am not sure that I am not damning it the more. For, in deviating from his standards of fairness, a bureaucrat may be actuated by motives more reprehensible than personal political convictions.

Mark you, I am not repeating the usual moan on the loss of idealism in our civil service. I prefer my bureaucrat without idealistic dressing. Personal advancement is an important consideration with him, and should be. It is not his business to become vastly popular so that he may be elected to Parliament and then to power. He is in power, by virtue of his academic and other qualifications. It is this basic requisite of a bureaucratic career which does not obtain in West Bengal today. It is no longer enough to be efficient and honest; these qualities may even be handicaps; what is required for assured advance is to be in the good books of one person, Dr Roy. Which brings us back to the personality cult.

You could trust India's tried civil service to devise precise formulae for pleasing the newcomers to power. Work they do not want, and they must not be bothered with it. Flattery they like, and oodles and lashings of that shall be arranged. Perhaps it is the same story in most State capitals; in Calcutta the bureaucracy's task has been made easier by the fact that there is only one man to be pleased. (Not even the Public Service Commission can remove you if Dr Roy is happy. When he is short of higher posts, he can help you in the matter of going to the Centre.) Hence the assembly of twenty to thirty people, all senior civil servants, every morning at Writers' Buildings round the Chief Minister's horse-shoe table. Business is discussed, but there is time for such exchange of compliments as that Dr Roy is extraordinarily well preserved for a man of 75, which is true, or that Dr Roy is a master of English prose, which is less true. The morning's prayer done, the civil servant can go to the Indian Coffee House for the rest of the day. He often does.

Book Review

Analytical Framework

Planning for an Expanding Economy. By C N Vakil and P R Brahmanand. Vora & Co., Bombay. Pages 399. Price Rs 8.

SAVYA SACHI sometime back complained in this Weekly that the Indian economists were too much obsessed with authority and as a result did not display a creative attitude of mind. The authors of this excellent book, however, have tried to analyse the Indian problems regardless of the eminent authorities in the field of economics and have succeeded in a large measure in developing an analytical framework suited to the needs of the economic reality in India.

As is natural, they start with the peculiar characteristic of the Indian economy, namely, disguised unemployment. A large part of the work force in India is just redundant, if some organisational changes are made. These disguised unemployed, however, consume, though they do not contribute to output. (This is Nurkse's 'savings potential' of the disguised unemployed.) The obvious question that arises is: Why not make these unproductive consumers work in output producing activities?

This is not possible. For the consumption of the unemployed is less than what is necessary for working efficiency. Given the wage goods output, therefore, it is not possible to increase employment, even though there is an abundance of population of working age. And this state arises entirely on account of the wage goods deficiency. An unemployed could be converted into a worker, only if his additional necessary consumption could be provided for. At this stage, the authors develop the concept of an **employable unit.** A worker with his necessary consumption 'labour plus wage goods' forms an employable unit. If the wage goods output is given, the number of employable units is determined. In an underdeveloped economy, like India, though there is an abundance of people of working age, there is no corresponding abundance of employable units because of the wage goods deficiency.

But then there is a certain advantage in this situation too. Supposing wage goods necessary for one worker are somehow made available. With this, it would be possible to employ one person, from among the unemployed. This would release wage goods (to the extent that real wages are held at the subsistence level) that he was so far consuming. Assuming that the consumption of a worker is twice that of the unemployed, it would be possible now with the help of the released wage goods to provide for the additional consumption necessary for employing another unemployed. Thus if one worker's consumption could be provided for, it would be possible to give employment not merely to one person but to two persons. Thus the total increase in employment is a multiple of the initial employment. This relationship between the initial employment and the final employment is described by the **consumption goods multiplier,** which is by far the most significant concept developed by the authors. Thus if consumption necessary for one worker is provided for, this increase in wage goods would enable the economy to release potentially enough wage goods to employ finally not one but two persons. The consumption goods multiplier here is 2 and is defined as the inverse of the difference between the consumption of a worker and that of the unemployed, divided by the consumption of a worker.

Thus then the existence of the unemployed or the unproductive consumers enable the economy to expand employment and investment at an accelerated rate provided, of course, the initial increase in wage goods is somehow obtained. These multiplier effects of an increase in wage goods, it may be noted, depend upon the difference in the consumption of a worker and that of the unemployed.

To obtain these multiplier effects in employment and investment, it is necessary to have an initial increase in the wage goods output. If population is growing, this increase in the wage goods output should be greater than the population increase to avail of these multiplier effects.

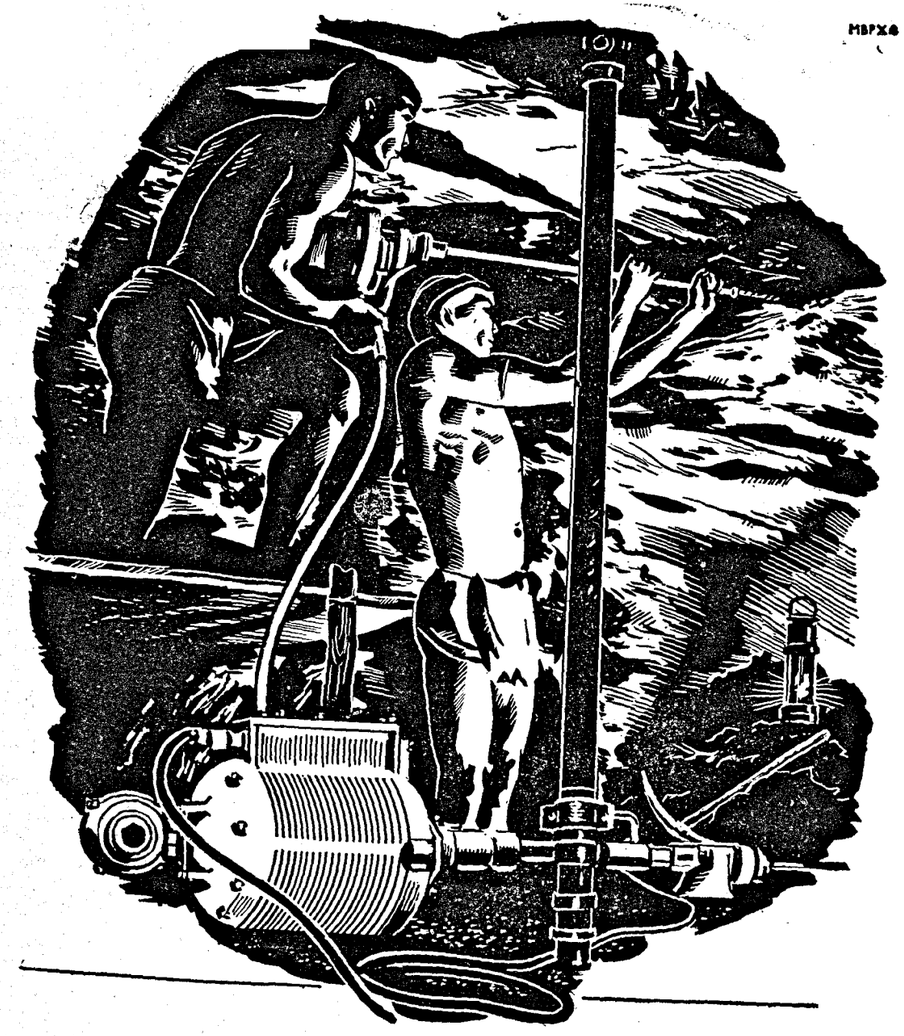
From this analytical framework, the authors draw the following important conclusions:

1) For the cumulative process of development, it is necessary to have some forced savings in terms of wage goods in the beginning.

2) For speeding up the process the surplus per worker in the consumption goods sector should be maximised. Therefore, the present inefficient labour incentive methods should be replaced by more capital incentive methods.

3) Initial investment and employment should be concentrated on producing capital goods which are necessary for the wage goods industries.

4) Production of other types of capital goods should be deferred to the later stages of planning.



5) Autonomous forces may prove to be very weak in initiating this process and therefore the motive power will have to be supplied by the State.

In the light of this analytical framework and these conclusions, the authors examine the Second Plan. They find that the Plan is not based on the right analysis of the economic situation in India. There is no integrated thought structure behind the Plan. As a result, the priorities with regard to the various projects are not properly assigned. Further, the authors point out that there does not seem to be any real resource planning. The Second Plan in their opinion is not a Plan at all. It has been more like an exercise in which manipulations of a few ratios have played an important part. The authors question the appropriateness of the values of these ratios and find that they have no real basis. The aggregative model on which the Second Plan is based has also been subjected to a lot of criticism.

But what alternative priorities do the authors suggest? A more 'balanced' model of growth pitched on a lower key, though the authors, as mentioned later, do not seem to be aware of the social choice involved in this.

In a note appended to the volume, there is an interesting discussion on the models of Ricardo, Marx, Marshall and Keynes and the relevance

Non-ferrous Metals in Underdeveloped Countries. Department of Economics and Social Affairs, United Nations, New York, 1956. Pages 124. Price 10 sh 6d. Available from Oxford Book and Stationery Company, Scindia House, New Delhi.

HOW can underdeveloped countries exploit their mineral resources to the best advantage? While the exploitation of minerals could assist these countries to raise their standards of living, this could also be done in such a way that they would be deprived of an wasting asset without having developed themselves in any way . The non-ferrous metals form one of the most important groups of minerals in these countries.

The present report forms one of a number of studies connected with minerals which have been issued during recent years by the United Nations. It is not, however, concerned with geology, metallurgy or engineering, or with the measurement of reserves or with the standardisation of terminology. It attempts a general analysis of the economic aspects of the non-ferrous metals industry and is of particular interest to under-developed countries, because "much of the report is concerned with the manner in which the mining and smelting of the ore — as distinct from the export or local fabrication of the metal — may stimulate other economic activities". The report covers the five major non-ferrous metals — copper, lead, zinc, tin and aluminium— as well as some of the minor ones such as colombium, vanadium, molybdenum, tungsten, chromium, nickel and cobalt, which are used chiefly for the production of iron and steel alloys. The inclusion of five maps showing the locality of mines and smelters of the major non-ferrous metals in underdeveloped countries adds considerably to the utility of the publication.

It is well-known that while the underdeveloped countries are important sources of many non-ferrous metals, they do not consume these metals internally in any substantial quantity. In fact, even if these countries industrialise themselves rapidly, most of them are unlikely to consume more than a small proportion of their output in the foreseeable future. This is so not merely because these countries are rich in mineral resources, but because in their search for supplies of raw materials for their own highly developed industries, the advanced countries have concentrated their capital flows into these countries in the past in these fields of activity.

This means that the major portion of the mineral output of these countries will continue to be exported in one form or another and therefore the study concludes that the direct physical effect of the minerals industry will continue to be less important than the benefits derived from its role as an earner of foreign exchange. Granted this, the question still remains: in what form should the metals be exported? The study does insist on the desirability of smelting and refining the ore within the country. It stops at that stage, however, and does not examine the possibility of using the metal for fabrication within the countries concerned even if it be for the purpose of export. This may perhaps be considered the principal limitation of the study, though it appears to be a self-imposed limitation which does not imply any judgement about the possibility of developing fabricating industries within the underdeveloped countries.

As already indicated, the work is concerned primarily with the developmental effects of the process of mineral exploitation on an underdeveloped country's economy. These depend upon a number of conditions. The report points out:

"Among these conditions, the most significant are the nature and location of the mineral and the method of mining; the stage to which processing is carried within the producing country; the extent to which the industry yields raw materials that can be used in local production, the extent to which it provides a field of employment and training for local labour which might otherwise be unemployed or less productively engaged; the extent to which it brings into being ancillary facilities, such as transport and power, which are capable of serving sectors and purposes other than mining; the extent to which it creates an internal market for various types of goods and services and thus promotes diversification in the economy; the extent to which it yields a saleable export product (or the replacement of a previous import) and hence a source of foreign exchange available for financing other imports; the extent to which it provides funds for private investment; and not the least, the extent to which it contributes to public revenue, directly or indirectly, furnishing the Government with funds for the financing of its development programmes."

These determinants of the developmental effects of the mining industry are then classified into two broad groups: (1) the direct and indirect physical outgrowths of the mine itself and (2) the results of the various monetary flows generated by the industry. The analysis of each of these involves a more detailed examination of the various factors listed above.

The monetary flow is based on an examination of the effects of various types of taxation on minerals and mining, and the foreign exchange aspects of the problem. Different methods of collecting the revenue have different effects Thus a royalty payable on the volume of ore removed is likely to discourage the extraction of low grade ore; an export tax on concentrates will encourage domestic smelting; insistence on a mining company handing over the foreign currency equivalent of its local costs is likely to bring about a reduction in its local expenditure; a tax on mining income which allows rapid writing off of capital expenditure tends to encourage new investment. The most common tax is on profits and while it is generally the best from the point of view of its effect on the economy, it has the disadvantage that the revenue from it is subject to the greatest fluctuation.

The study stresses the significant role of mining as a foreign exchange earner. "The more such foreign exchange proceeds are used to import capital goods," says the report, "the greater is likely to be the benefit in the long run for the resource country".

Summing up its examination of the various physical and monetary factors in operation, the report says, "the process of maximizing the de-

velopment potential of the non-ferrous metals industry to the mutual benefit of both the resource country and the mining company is essentially a problem of making as fruitful as possible the various income flows generated by sale of the output, chiefly in external markets, while at the same time ensuring not only that the ore bodies are worked with the greatest efficiency, but also that the most effective use is made of those products and by-products of the mining process which are consumed internally".

To bring this rather general analysis down to earth, the report makes a detailed study of the production, consumption and supply of specific non-ferrous metals. Since the greater part of the output of these metals goes into durable goods, the demand for these metals depends largely on the activities of the industries producing such goods, in particular the electric, transport and building industries. Again, as a large proportion of these goods is used in the process of investment, the demand depends upon and varies with the rate of new investment. This, in turn, tends to fluctuate far more violently than total consumption. A high degree of instability is thus introduced into the market for the non-ferrous metals. Demand for these metals is also generated by armament production and stockpiling, which tend to distort the pattern of consumption according to changes in the international situation.

Lastly, demand is influenced by substitution and technological change which are continuously and erratically affecting the situation. The study illustrates the influence of substitution and technological change by a number of examples. The relationship between technological progress, demand and price is very close and mutually interacting. In the short run, technology probably exerts a dominating influence on substitution between metals. In the long run, however, even though the demand for non-ferrous metals as a whole is fairly inelastic, the fact that substitution of one metal for another is technically possible, tends to throw the emphasis on relative price as a determinant of demand for a particular metal.

These facts are of great significance from the viewpoint of the underdeveloped countries, for the advanced countries which provide most of the demand for the non-ferrous metals have abundant supplies of the four "new" metals, aluminium, titanium magnesium and zinc. Magnesium and silicon are generally available. The possibility of using low-grade clay for the extraction of aluminium will reduce the demand for bauxite. Similarly, technical developments in the production and utilisation of plastics are likely to reduce the international demand for the non-ferrous metals. It is true, of course, that technical developments are constantly affecting utilisation possibilities of different metals as well as relative ratios of costs of production.

An important feature of the production of non-ferrous metals is the high degree of concentration of the output amongst different countries. The degree of concentration for the different metals is examined in detail in the study. The pattern of trade in these metals is determined by the fact that consumption is concentrated among the advanced countries, few of which are significant producers. One chapter of the report is devoted to careful studies of the working of international control schemes in aluminium, copper, lead, tin and zinc.

This is a useful report, which could be further supplemented by a study of the possibilities of developing the metal fabricating industries within the underdeveloped countries. A more detailed analysis of the movement away from the non-ferrous metals to which the present report draws attention should also prove of interest to the latter.

MANAGING DIRECTOR.

On Choosing One's Technique

Amartya Kumar Sen

THE discussion on technological choice in the **Economic Weekly** initiated by Dr K N Raj (April 7 and 14) has been very successful in drawing our attention to certain problems connected with the choice,—in particular that of including in the costs of a more mechanised technique, expenditures necessary to maintain workers displaced by it (emphasised by Dr Raj himself), that of the necessity of balance in the inter-commodity structure (tackled by Dr A Rudra, May 12), and that of the important distinction between the rate of profit and what we may call the rate of re-investment per unit of capital (discussed by Mrs Joan Robinson, June 23).

A problem which has however been rather neglected in the discussion so far is that of the valuation of capital from the point of view of growth. Money costs have so far been used to calculate the rate of surplus. Now, the maximum rate of investible surplus valued that way would give the maximum rate of growth only if the amount of investment that can be undertaken is fixed in terms of direct money outlay. That this need not necessarily be so can be realized with ease if we make the simple assumption of different propensities to consume of the factors contributing to the capital investment. Let there be two techniques involving investments worth Rs 100 and Rs 110 respectively. If the income receivers in the first case consume three-fourths of their incomes and those in the second, half of their incomes, the additional supplies of consumer goods necessary to meet the demand of the income receivers must be Rs 75 in the first case and Rs 55 in the second. Thus the amount of investment that can be made in any given situation may not be fixed in terms of direct money outlay. Hence the maximum rate of surplus on the money investment outlay need not give us the maximum rate of growth for the economy.

Secondly, money costs are normally calculated at the existing prices. But the supply conditions may change with a changing amount of production. Hence calculation of the rates of surplus on the money costs calculated at the present level of prices may be very deceptive. The point is of more than academic interest. Most of the treatments of this question tend to give one the impression that either one technique or the other is preferable for any amount of production, as the factual tables are constructed at constant factor prices. In reality however in most of the development plans different techniques are utilised to produce the same goods, and the Indian Plan is no exception. This is because, among other reasons, the amounts of different inputs available are limited and with increased production some get scarce earlier than others. To tackle this sort of problem what one needs is not an estimation of money costs at fixed prices, but application to this problem of some thing like the Soviet Commodities Balances approach, or its Western counterpart in the shape of alternative combinations of "fixed-capital-stock" and "current-input-flow" technology matrices along with estimates of the amounts of various goods and services available at the initial moment. (This is of course not to deny the value of the illustrative purpose of Dr Raj's table specially in clarifying the important distinction between maximising the rate of output and maximising the rate of surplus.)

Finally, the importance of varying import contents of various techniques have so far been rather neglected, as it has been customary to deal with models of closed economies. But foreign exchange requirements have very important implications on the choice. Let us for the time being forget our objections to the use of money costs and look at the following table.

In Rupees

	Technique (I)	Technique (II)
Capital per worker	100	200
Surplus per worker	100	250
Rate of Surplus per unit of capital	1	1.25

One prefers technique II following the rate of surplus criterion. Now let us assume that the capital goods required for technique I can be produced in the home economy, but those for technique II have to be imported from abroad. Unless we have a surplus of foreign exchange, we have to expand our exports to pay for this extra amount of imports. And unless the elasticity of foreign demand for our exports is infinity, an expansion of exports, will lead to a fall in the price of our exports, and the cost of the foreign machinery in terms of home resources will be more than Rs 200. If $\triangle M$ is the amount of additional foreign currency required to purchase the machinery, then the additional exports necessary to earn that amount of foreign currency is given at constant prices by $\triangle E$,

$$\triangle E = \triangle M \frac{e}{e-1},$$

where e is the elasticity of foreign demand. If the elasticity is such that for Rs 200 worth of foreign machinery, we

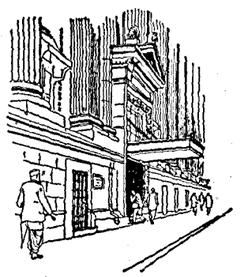
have to export an extra Rs 300 at home prices, the real rate of surplus becomes 0.83 for technique II, and technique I turns out to be really more economic. (Again, if instead of expanding our exports, imports are cut to meet the additional foreign resource requirements of technique II, we have to take its social costs into account.)

Some observations can be made on this question. First, the breakdown of total costs into home costs and foreign costs tends to go against the more mechanised techniques, since they generally have a higher foreign-resource content, because of the lack of a developed capital goods sector in the underdeveloped economy. Secondly, how important this factor will be depends, among other things, on the elasticity of foreign demand. The less elastic the foreign demand, the greater ceteris paribus the weight against the more mechanised techniques. Thirdly, the value of the foreign-demand elasticity depends upon the absolute amount of extra foreign currency needed. Hence there is a sort of "diminishing returns" with increased production (and corresponding increased imports), thanks to the falling elasticity. Thus even if technique II is preferable up to a certain point, beyond that it may become less economic. This also tends to lead to the choice of a combination of diverse techniques.

Lastly, if at a certain level of production, handicrafts are preferred because of their lower import content, it does not necessarily follow that we should not build heavy industries to produce machinery for factory production of the same goods in future, since that would replace import content by hand production. (In our illustration the relevant rate of surplus with technique II is 0.83 when the capital goods are imported and 1.25 when they are made at home, assuming the same cost at home and abroad.) Thus we may, for example, find that on the one hand it is economic to build heavy industries to produce textile machinery and on the other it is also economic to produce some textile goods by handicrafts for the time being. The Mahalanobis thesis of very light light-industries along with the development of heavy industries may have its justification not merely on the level of employment in the immediate future, but on that of long run growth with due regards to foreign exchange.

STATE BANK OF INDIA



Successors to the Imperial Bank

The need of the day

Our country's economy is expanding rapidly and with the Second Five Year Plan in sight it will gather further momentum. The need for a strong and efficient banking system has never been greater than today as the nation's savings require to be pooled and managed in a resourceful, confident and prudent manner.

The State Bank fulfils these expectations. It has started upon a programme of opening 400 additional branches throughout the country within the next five years.

The State Bank of India offers to serve you efficiently in many ways. It takes care of your savings and valuables, lends moneys against goods, produce and other approved securities and assists you by accepting appointment as executor and/or trustee of your will or trust. Its wide and varied services are at your disposal. Why not talk things over with your nearest bank agent, or write for information?

The State Bank's local head office at Bombay, one of more than four hundred offices waiting to serve you throughout India

Profile of a Southern State—Mysore

(From a Correspondent)

IN the thirties the legend flourished that Mysore was a 'model state', and legends die hard. Sir Mirza Ismail, who was then the Dewan of Mysore, had a flair for publicity which would have done credit to a Hollywood actress. He was an able administrator, and he enjoyed the confidence of Shri Krishnarajendra Wodeyar, the then Maharaja. He did not have to be responsible to a volatile party as Sri Hanumanthayya has to be. Autocracy sometimes makes for efficiency and Sir Mirza was an efficient and benevolent autocrat. It is true that he did a good deal for Mysore, but it is often forgotten that a firm foundation was laid for Sir Mirza's achievements firstly, by the efficient administrative structure which the British rulers built during the years 1831-1881 when they ruled the State directly, and secondly, by a series of able Dewans like Rangacharlu, Seshadri Iyer (under whom the first hydro-electric project in India came into existence in 1902), and that grand old man of Mysore, Mokshagundam Visweswarayya. A sound foundation is never seen while minarets and cupolas—for which Sir Mirza had an inordinate fondness—are.

In one respect, however, Sir Mirza was unique—he loved gardens and beautiful cities. He contributed a great deal to the beauty of Mysore State, and especially to its two capitals, Bangalore and Mysore. In Krishnarajasagar he designed an illuminated garden with flowing water and coloured lights, which is the pride of every Mysorean except a few cranky souls who prefer the dark and majestic beauty of the vast man-made lake to the tawdry magnficence of multi-coloured bulbs. There was another thing which Sir Mirza did—he sold the idea of Mysore being a 'model state' even to the people of that State. They came to believe that their state was **Ram Rajya**—did not the great Mahatma himself bestow the title? Good Mysoreans believed that Mysore was the best of all places on this earth. Incomparable climate, a potentially rich State greatly diversified in its beauty, cheap living conditions, and many State-owned industries—not only iron and steel, but paper, cement, sugar, sandalwood oil, soaps, fertilisers and several others. Mysoreans loved—and still continue to—their land so much that they preferred a bare living within their State to affluence outside.

Mysore University

Things have changed, however, over the years. And not for the better. The same people who were so irritatingly smug about Mysore a few years ago are now bitterly critical. Such talk is particularly common among the teachers in the University of Mysore. It should not be interpreted, however, that the quinine in their talk is due to a greater altruism or insight into the forces working in the State today. The University is not exactly a nest for brilliant minds. In fact, it is well-known that over the last three or four decades the University has been systematically trying to blow its brains out, and has succeeded in its task. Once upon a time the University boasted of such scholars as Radhakrishnan, Radhakumud Mukherji, K T Shah, A R Wadia, M Hiriyanna and several others less well-known but still very able. Today there are only two all-India names, Prof K V Puttappa, and B R Seshachar the Zoologist. The former, a distinguished Kannada poet, has just (15th June 1956) been posted as the Vice-Chancellor. That Prof Puttappa is an academic man to his finger tips is not denied by his worst detractors—but why should he be condemned to run the immensely-complicated affairs of an elephantine university? But then poets are not always content to remain unacknowledged legislators. Cleaning the Augean Stables should be child's play, comparatively speaking. It is as corrupt as a Chinese Heaven, and what it needs is a man who has a deep sense of academic values as well as the administrative ability of one of the abler ministers in the Union Cabinet. And, of course, power—which a Vice-Chancellor in Mysore does not have today. He does not have the power even to appoint on his own a lecturer on Rs 100 per month. Such an appointment, if the vacancy is of more than six months' duration, must be made by the members of the Public Service Commission.

Mysore University is one hundred percent a limb of the Government. There is no difference between it and, for instance, the Public Works Department. Vacancies are classified into 'A' and 'B' categories and advertised in the Mysore Government Gazette. Brahmins are not eligible to apply for 'B' jobs and Non-Brahmins include besides Non-Brahmins, Jains, Christians, Muslims, Parsis. Only one in five jobs is an 'A' vacancy—this does not mean, however, that every fifth job is one for which Brahmins may apply. That is what the simple-minded would think. Mysoreans are subtle. It is enough if the one-in-five ratio is realised over all the appointments made during a certain period. This often means that the classification of any particular vacancy as 'A' or 'B' is determined by a clerk—especially, if the officer is not alert. It is more likely, however, that the clerk in course of time coaches the officer to co-operate with him. Clerks are static while officers are mobile. And clerks can intrigue. A good officer listens to his clerks—if he wants to be happy and prosperous.

Falling Standards

If a man has enough influence with a high official or influential politician or minister, he tries to get a thing done through the latter. But then only a favoured few who belong to the right castes and, who are, in addition, related to important people, are able to get things done at that level. The rest have to cultivate clerks. Not an easy job as clerks are temperamental as well as poorly paid.

The candidates go before the Public Service Commission in which the non-official members are active as they regard themselves to be the watchdogs of the "backward castes". All non-Brahmin castes are "backward" including the powerful Lingayats and Okkaligas. Even in an 'A' vacancy, a better-qualified Brahmin may be turned down in favour of a non-Brahmin who has the minimum qualifications necessary for the post. A third class pass in the BA Honours gives a candidate 'minimum qualification' for a University lecturer's post. In brief, the mode of selection has ensured the weeding out of the brighter in favour of the duller. Yet, recently, a committee of the University Council went into

the question of falling standards, and reported that nothing was wrong with the staff!

The opinions of outside 'experts' are taken into consideration in the appointment of professors. But in India in 1956 AD experts are accommodating people. (And two non-official members are also included in Selection Committees for professors.) The things work in such a way that only local candidates apply for professorships. Let me explain. A candidate who has the necessary 'minimum qualification' becomes an assistant professor. (There is constant complaint that seniority is overlooked, but very few complain that ability is overlooked.) Assistant professors apply for professorships and the latter carry such low salaries that properly qualified non-Mysoreans are not tempted to apply. A professor's salary is Rs 400 p m and goes up eventually to Rs 700. Thus only local horses run for the local Derby.

The Pilgrim's Progress

Progress from a temporary lecturership to a professorship is indeed a difficult journey, though many people, not remarkable for their intellectual attainments, but possessing other qualifications, have arrived at the summit. Caste is of course the first qualification in this journey. If a candidate does not belong to the right caste, his confirmation may be delayed by several years and this handicaps him for ever in the race. Seniority dates from confirmation and not from appointment. From confirmation to assistant professorship is another long journey marked by visits to one's boss—who is at best neutral except when he thinks he can secure a benefit by supporting an influential candidate—and to one's politician-patron who is either a member of the University Council, or a Congressman whom the Chief Minister has to keep pleased because he commands four or five votes which may be crucial in a periodic vote of no-confidence against the Chief Minister from members of his own party.

The politicians who are members of the University Council have to be propitiated like the less gentle members of the Hindu pantheon. When they visit Mysore or Bangalore for a Council meeting, candidates (lecturers, assistant professors and occasionally, even professors) meet them at the station and accompany them to their hotel or friend's house ridding them of all the minor worries of dealing with porters and finding transport. The Council Members can never be seen without a little bunch of obvious admirers who keep them posted on the less publicised affairs of the University. Every matter comes under the scrutiny of this Council—appointments, promotions, examinerships, tabulatorships, increments, scholarships, transfers, leave, deputations, etc. A Lingayat member becomes the self-appointed promoter of Lingayat interests, a Brahmin member of Brahmin interests, and an Okkaliga of Okkaligas. Deals are struck between members, and a Vice-Chancellor usually tries to see that he keeps out of trouble and that his interests are not affected adversely. If the Council is meeting at Bangalore, he uses such leisure as he has in seeing ministers, and higher officials in the secretariat. They keep relationships oiled. His path is indeed a razor's edge.

Poor man, his lot has become unenviable after the advent of democracy. How greatly does it contrast with the position of the leonine and patriarchal Sir Brajendranath Seal, the only distinguished Vice-Chancellor in the history of Mysore University! But then he had prodigious learning, character and age, and functioned before the era of small-town politicians, and democracy. Nowadays, any departmental decision supported by the Vice-Chancellor might have to be reconsidered because a minister picks up the phone and talks to the Vice-Chancellor. And they are said to pick up the phone very often. But then how can they be blamed? They do want to get re-elected, and possibly have hopes of becoming even Chief Minister. When they go to their constituencies, they will naturally be asked, 'Did you help so-and-so?' Each favour refused means an enemy for life. When it comes to election, caste and local area are key factors especially caste.

The Lingayats

The Lingayats are in a special position—their strength is less than that of the Okkaligas in the present Mysore State but is expected to be greater in the New Mysore State. According to the States Reorganisation Committee Report, in the New Mysore, Lingayats will be about 20 per cent of the total population, Okkaligas about 13-16 per cent, and the Harijans 17-18 per cent. The Lingayats are better educated than the Okkaligas, and probably quite close to the Brahmins in the proportion of the educated to the non-educated. (But both Lingayats and Okkaligas rank as 'backward castes' and would fight to the last to retain their privileged position.) But while Brahmin dominance is a thing of the past and the immediate future for Brahmins is certainly bleak, Lingayat power and influence are waxing strong. They seem to have deeper roots in the soil than Brahmins, and many of them are wealthy landlords, traders and officials. They wield a great deal of political power. They have a reputation for great unity—it is said that no Lingayat will ever vote for a non-Lingayat. There is probably more poetic than literal truth in that statement. But in one respect the Lingayats are unique: they have a strong monastic organization, and the heads of the monastic orders not only look after the welfare of Lingayat souls but also after the political and economic interests of their flock. The head of one particular monastic organization figures largely in the conversation of University teachers—how he sends chits to Principals and Vice-Chancellors recommending Lingayat boys for free-studentships and scholarships, and about how in every election he whips up Lingayat votes in favour of Lingayat candidates.

Divisisons among Lingayats

Lingayats may be more united than the others, but this does not prevent the existence of sub-divisions among them. The sub-divisions usually occur on the basis of monastic affiliation, and there are several Lingayat monasteries in Mysore. Besides, the Lingayats of north-west Mysore belong culturally more to North Karnatak than to Mysore unlike their co-sectarians in Nanjanagud and Chamarajanagar. The Lingayats are also split up into sub-castes and this has political consequences. Again, some pride themselves on earlier conversion to Lingayatism than others. One very intelligent Lingayat teacher told your correspondent, "It is not every Lingayat who is in a favoured position, but only those who happen to be related to the few powerful families." He was, however, from north-west Mysore, and he seemed to think that power was unduly concentrated in a few related families from Nanjanagud and Chamarajanagar. (One Lingayat Minister hails from this area while the other comes from Shimoga.) But, by and large, Lingayats are in a favoured

Several hundred million years ago

position, though the success of any individual Lingayat depends, if he is not from one of the powerful families, on his securing the patronship of a Lingayat politician. This can be had by persistent flattery and helpfulness. Allegations of graft are, of course, there, but they cannot be verified.

Supersession of Brahmins

To come back to the University. Everyone agrees that there is too much politics in the University, and 'politics' is used in two senses—one, in the sense of intrigue, and another, in the sense of the intrusion of the politics of the larger world into academic life. (That the same people who complain of 'politics' resort to it to further their interests is a widely-recognized truth.) Students divide themselves caste-wise, and a few years ago this became so marked during elections to the Unions that the University authorities had to 'kill' the latter by making their membership voluntary. A student is heard occasionally complaining that his low marks are due to the fact that the teacher wishes to favour a student of his (teacher's) own caste. This is very probably a rationalization of the student's frustration but it is true that teachers are very caste-conscious. Until recently the Brahmin teachers were probably the worst in this respect: they howled with self-pity at the injustices and humiliations they felt had been inflicted upon them.

The supersession of Brahmin teachers was common in the past and occurs even today. A young non-Brahmin with not even five years of service frequently supersedes his Brahmin teacher with a teaching experience of 10-15 years. (This does not, however, happen in the other departments of the Government.) The superseded teachers were cut up as both their purse as well as their pride were injured. And having put in so many years in the University they found that they had left local roots too deep to be easily uprooted. Also not everyone was wanted outside. Each instance of supersession added to the collective demoralisation of the Brahmins. Slowly the group came to be what they are today—embittered, self-centered and negative. The comparative success of those Brahmins who had quit the State fed their pride as a group and emphasised their defeat as individuals.

Demoralisation among Teachers

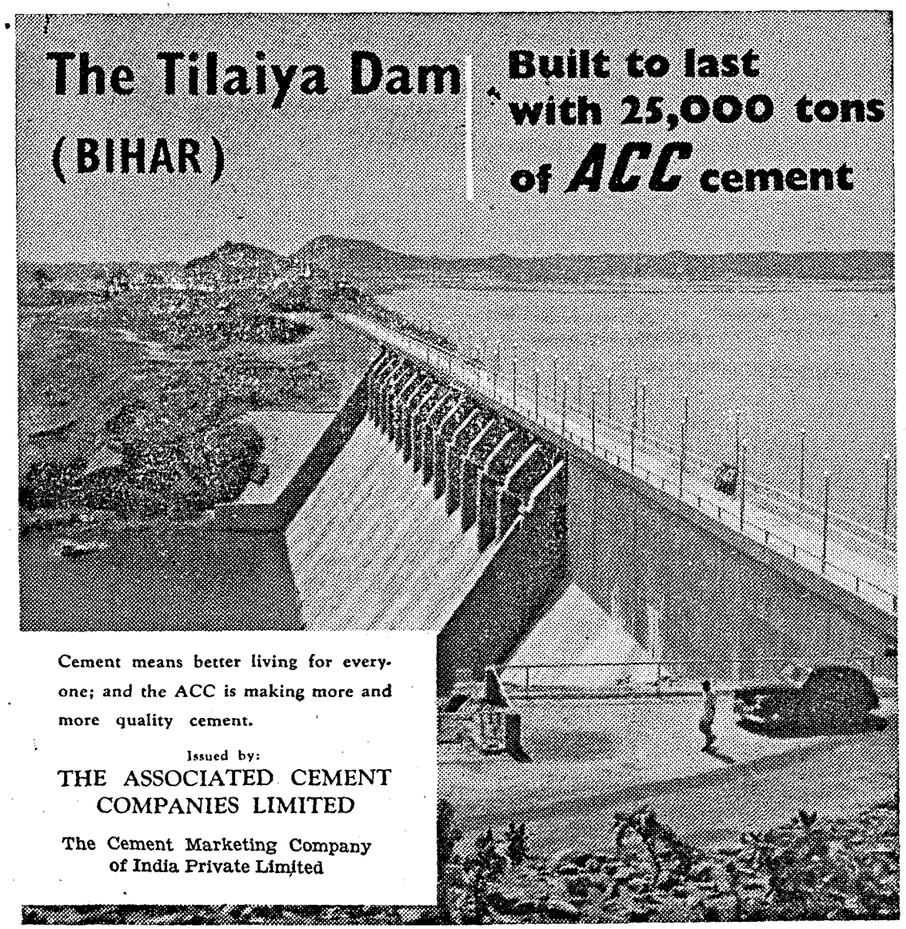
Only a few years ago the non-Brahmin teachers were pleasanter company than the Brahmins. They were up and coming, and hopeful. Some of them went outside Mysore, and even abroad, to enhance their academic qualifications. But soon troubles came their way also. The Muslims whose morale was high when Sir Mirza was Dewan, and the Christians when the late Sir T Thambu Chetty was Private Secretary to the Maharaja of Mysore, began harking back nostalgically to the past in their off-the-record talks. The years since Independence have made it abundantly clear that there are only three groups which are going to count directly in the State and the rest can only hope, at best, to count indirectly. They are the Lingayats, Okkaligas and Harijans. As I said before, the Lingayats as a group are more educated than the other two, and this means that more Lingayats, are teachers in the University than either Okkaligas or Harijans. Now Lingayats, Okkaligas and Harijans have started superseding everyone else including the many small non-Brahminical castes. It is necessary to explain here that there are Okkaligas and Okkaligas. During the 'thirties, the Kunchatigas, Telugu Reddis and several others were considered as Okkaligas. Nowadays the term is used in a purer sense which excludes the Reddis. Formerly, certain Tamil and Telugu non-Brahmin groups like the Mudaliar and Naidu, Syrian Christians from Kerala, Catholics from Mangalore and other heterogeneous groups, all sought shelter under the hospitable non-Brahmin umbrella. (Two of the leaders of the 'non-Brahmins' in the 'twenties and early 'thirties were Hamsa Hussain and Mathan.) Today, all such groups feel lost. Even the indigenous and economically backward groups like the Nayinda, Agasa, Beda and Bestha feel that to get on in modern Mysore one should be either a Lingayat or an Okkaliga. In the University especially, the self-pity which once characterised the Brahmins is now widespread. People who superseded Brahmins less than a decade ago are now themselves wailing about supersessions in which they are the victims and not the beneficiaries. Their sudden concern for falling standards is amusing, but what is more significant today is the widespread demoralisation among the teachers. An afternoon spent with them can be most depressing.

Selection of Students

No account of Mysore University, however brief, can afford to leave out the mode of recruitment of students to the technical colleges and to the more popular courses in arts and science. Until recently, the principals had to be guided in admissions by a council of non-official members and this meant again that candidates were chosen on the basis of caste. (Nowadays, however, the principals are assisted by a committee of senior teachers: a little less than a third of the seats are open to merit and the rest are decided on the basis of caste.) This mode of recruitment had certain consequences. Firstly, it led to the founding of private engineering and medical colleges where seats could be booked by paying an advance of so much per seat. (A newly-started medical college in Bangalore charged Rs 5000 per seat.) It meant that the poor people, except from certain castes, could not become engineers and doctors if they were not outstanding, whereas the rich parents of a mediocre boy could buy him a seat. The Avadi spirit is very much in evidence in Mysore.

Caste in Government

Fortunately, however, the situation outside the University is not as bleak. Government officials, in the Secretariat or elsewhere, do not wail as much as University teachers. Seniority does not seem to be disregarded there though in the initial recruitment of candidates to the Government posts, the caste of a candidate and his connections are not irrelevant. In an article published sometime ago in the **Economic Weekly** it was pointed out that in the Reddy Ministry each minister had a private secretary from his own sub-caste. What is surprising to a Mysorean is that this should be deemed worthy of being commented upon. Mysoreans have so completely accepted this principle that when a number of posts are filled they accept certain important castes to be represented in them and they are not disappointed. In the present cabinet, there are two Lingayats, two Okkaligas, one Harijan, one Brahmin and one Kuruba. The Okkaligas and Lingayats have two each because they are the "majority" castes. It is surprising that nobody has as yet given a



theoretical form to this idea—that the castes should be represented in the various departments of the Government in proportion to their number in the State. It would be a contribution from Mysore to Indian political thought.

How is it that the University has become such an important focus for forces of caste? This is a difficult question to answer. In one sense it is only natural that a University should give formulation to ideas current in the immediate environment. But that is not the case here. It is only in Tamilnad that the non-Brahmin movement has an ideology. During the 'forties a few young non-Brahmins in the university talked of 'social justice' by which they meant that the castes which had not had a chance till then because of Brahmin dominance, should be given a chance to come up at the expense of the Brahmin. But this idea was not developed sufficiently to merit being called an ideology. There was no need for it, however. The injection of non-teachers into academic life in the name of democracy, and the rules of recruitment, frequently unpublished, observed by the Public Service Commission and by other recruiting agencies, both ensured that Brahmins quickly lost their dominance in the government to the Okkaliga and Lingayat. Some of the younger Brahmins from the middle-class and poor families left Mysore of their own accord for jobs in Bombay, Delhi, Calcutta and elsewhere. This also helped.

Those Brahmins who were not able to leave the State, continue to complain whether they are in government service or not. For instance, lawyers complain that clients choose lawyers belonging to their own caste, and doctors (private practitioners) say the same thing about patients. There is probably a good deal of exaggeration in this—it may again be only a rationalization of the complainant's failure. Success even in modern Mysore is dependent upon such qualities as efficiency and honesty, and perhaps Brahmins are not yet reconciled to the fact that other groups too possess these virtues. One impressive fact in this connection—impressive because one hears exactly the opposite—is that personal friendship cuts across caste. Friends from the same village often help each other irrespective of caste. In fact, two friends from different castes exploit their respective caste connections to help each other. The Old School Tie and the sharing of common experiences bind together people. If this did not happen, and happen frequently, life would be intolerable.

Social Forces in New Mysore

Mysore is going to enlarge its boundaries pretty soon—certain parts of Bombay, Hyderabad and

Cement means better living for everyone; and the ACC is making more and more quality cement.

Issued by:
THE ASSOCIATED CEMENT COMPANIES LIMITED

The Cement Marketing Company of India Private Limited

Madras are going to be included, and the entire State of Coorg is going to be merged in it. And, naturally enough, Mysoreans are given to frequent speculation on the shape of things to come in the New State. It may be recalled in this connection that Mysore showed a great reluctance to unite with north Karnatak, and one of the chief obstacles in the way of the union was the fear of the Okkaligas that they would be dominated by Lingayats. This fear was so prominent that it finds mention in the SRC Report. Even after the SRC had recommended the union of Mysore, Coorg and parts of Bombay, Hyderabad and Madras States, into a single State, Mysore continued to express its desire to remain separate. It was Shri Hanumanthayya's espousal of the cause of the new State which led to the eventual acceptance of the SRC recommendations. By his espousal Shri Hanumanthayya found new friends inside and outside Mysore but within his own party there was—and still is —a hard core of people uncompromisingly opposed to the enlargement of Mysore. Their opposition was so great that as an alternative they proposed the creation of Dakshina Pradesh. Here were people who, while straining at the gnat of Karnatak, were prepared to swallow the camel of Dakshina Pradesh, including new Mysore, Andhra, Madras and Kerala. The situation was indeed Gilbertian. But it is not really as absurd as it seems. In Dakshina Pradesh the Lingayats would be one of the many powerful groups whereas in the new Mysore they would be the largest single group. Stray remarks by people are quoted to 'prove' how Lingayats want to run the new State to their own advantage and to the disadvantage of everyone else. Poor Lingayats, they are now as unpopular as the Brahmins were formerly. The wielders of power inspire not love but the opposite sentiment.

The Chief Minister who at first supported the New Mysore later said that he was also in favour of Dakshina Pradesh but that he thought it was a bit immature. He even argued that new Mysore was the first step in the creation of Dakshina pardesh. Charges of opportunism have been levelled at him from members of his own party. It is well-known that there is a solid group in the Congress who wish to oust him, and newspapers report that there is at present a move to pass a vote of no confidence against him. It looks as though their efforts will succeed. And if they do, Shri Hanumanthayya might not even find a place in the new Mysore Cabinet. His chances of being 'kicked upstairs' like Shri K C Reddy, his predecessor, whom he displaced with undue haste, are slender indeed. (It is ironical to recall that Shri Hanumanthayya initiated three no-confidence moves against Shri K C Reddy.) Shri Reddy had tactfully cultivated friends in high places whereas even his best friends do not accuse Shri Hanumanthayya of tact.

Envy of Lingayats is widespread nowadays as many people believe that the raj will be theirs in the new set up. They are the subjects of much myth-making by the others. They are credited with unbelievable unity and deep cunning. They are even said to be trying to win over the Harijans to their side in an effort to ensure their dominance. This has naturally made the Okkaligas jittery—in fact, jitteriness is widespread. It is so bad that to many, even Brahmin dominance appears less horrible in retrospect. The statement, "The Brahmin had 2,000 years of culture which made him see right and wrong," is often heard. It is indeed surprising how quickly the Lingayats have roused the fears of everyone. If they do not do something to restore the confidence of the other castes, the pattern of allegiances to come in the New Mysore seems fairly clear. The Okkaliga will be leading an opposition consisting of all non-Lingayats. An interesting feature of the recent elections to the Mysore University Senate was the attempt of a few 'progressive' Okkaliga candidates to support a few 'progressive' Brahmin candidates in the hope of defeating Lingayats. This is a shrewd move, and shows that Okkaligas are also thinking ahead. The Brahmins as a group are educated and intelligent, and an Okkaliga-Brahmin combination might provide the answer to Lingayat dominance. But Brahmins will be numerically insignificant in the new Mysore, and unless the Okkaliga-Brahmin axis can win the support of a number of small castes, they are doomed to failure. It is very likely then that both Okkaligas and Lingayats will try to get the support of the minority castes. This means that the latter will not be swamped by the two dominant castes. The cause of 'democracy' will be saved, even if it be a new concept of democracy, the safeguarding of the rights of hereditary minorities.

But neither the Okkaliga nor the Lingayat seems to be sufficiently aware that a 'third force' might emerge and that its emergence might upset all their present calculations. The Harijans will be numerically one of the three most powerful groups, and are rapidly coming up in every way. They will support whosoever will offer them the most advantageous terms though their memories of the treatment received at the hands of the locally dominant castes, and the existence of sub-divisions among themselves might come in the way of their acting rationally in the interests of their caste. Anyway, they will be a power to be reckoned with, and their emergence will come as a surprise because all the important high caste groups, used as they are to think in a caste idiom, have been unable to envisage the possibility of Harijans becoming a power in the very near future.

A Study in the Financial Problems of Small Industries

S K. Basu

SMALL scale industries do not refer to the size of the industries but to the size of the firms which constitute them. There has been a great deal of controversy as to what should constitute their distinguishing criterion—whether it should be the amount of capital assets, or the number of workers employed or the use of power. If any one of these criteria were used as the measuring rod, it might produce misleading results. A highly mechanised large-scale factory may appear small when judged solely on the basis of the number of workers employed.

The application of the 'number of workers' criterion has to be tempered by the stage of economic development attained by a country. In an industrially advanced country having an abundant supply of capital resources and employing capital intensive methods of production, the average size of factories on the basis of numbers of work people alone would appear to be smaller than that in backward underdeveloped countries, where scarcity of capital and large supplies of labour make for labour intensive methods. The application of a composite criterion—number of persons employed together with the amount of capital assets possessed by the individual units—may be a more reliable guide in distinguishing between the three broad groups of small, medium and large-scale plants. If figures of horse power per worker were available, the average horsepower per worker could clearly indicate the technical size of an average factory of a particular country.

Criterion of Capital Assets

The Board of the Bombay State Financial Corporation has defined, as a working formula, a small scale industry as a unit having capital assets upto Rs 5 lakhs and a medium scale enterprise as one having capital assets of more than Rs 5 lakhs but less than Rs 20 lakhs. In adopting this definition the Bombay Corporation has been guided mainly by the desire to demarcate the frontiers between the Directorate of Industries and itself on the one hand and the Central Corporation and itself on the other. The criterion of capital assets has, however, been coupled with number employed in relation to the grant of some loans by the State Governments. Thus small industries have been taken to be those industries which have a capital investment of less than Rs 5 lakhs and employ less than 50 persons when using power and less than 100 persons when not using power. A research worker has also combined the criterion of capital assets with that of number of workers employed but has argued in favour of units having capital assets upto Rs 1 lakh and employing upto 20 labourers as constituting small scale industries.

Whichever of the above definitions may be accepted, it is clear that in the industrial structure of India three more or less related sections of a particular industry may be broadly distinguished—an organised sector represented by the large scale factories, a sector of small factories and a third sector of widely dispersed cottage industries. It is the second group of industries whose financial problems are the subject-matter of this study. Within this group some industries are run on factory scale and even fall within the purview of the Indian Factories Act; some are worked as small entrepreneurial enterprises; and yet others are smaller still. These units mostly operate in urban centres and some of them are even ancillary to large industries, supplying their products against occasional orders. The existence of this category has also been recognised by the Karve Committee which, inspite of its main preoccupation with the village industries, has recommended an allocation of Rs 65 crores for the development of such industries out of a total of nearly Rs 260 crores. This is undoubtedly a very small sum and indicates a lack of awareness of the significant role these industries can play in the Second Plan period.

Proprietary Concerns Predominate

The types and sources of credit and capital utilised by small industries are largely determined by their basic characteristics and have to be sharply distinguished from those of large industries. Small industries are typically unincorporated concerns under owner-management, mostly proprietary or partnership establishments. A recent survey of small engineering industries of Howrah where 75% of small industries of West Bengal are located has clearly revealed the predominance of proprietary concerns. Out of 153 firms surveyed 77.1% are proprietary concerns, 19.0% are partnerships and only 3.9% are found to be either private or public limited concerns. (Problems of Small Engineering Industries—Bureau of Industrial Statistics p 10 (Statistical Survey Report). It was found from a survey of 49 firms in West Bengal that the majority of the plants with invested capital upto Rs 1 lakh are proprietary or partnership concerns. 50% of the firms are partnership concerns and 35.7% are proprietary ones. These small businesses are generally limited to a single locality and as such are not known outside the community in which they operate. The success of such concerns hinges on the efficiency of one or a few persons; in the event of personnel changes, continuity of efficient management can hardly be guaranteed. Detailed information is not readily available about their past financial performance nor about their present earnings potential. In short, the conventional standards for the proper appraisal of an investment project are not readily available to would-be investors. In such circumstances small localized concerns are unable to obtain their requirements of long-term loan capital or equity capital through the organized securities market. Hence they usually rely for such funds upon friends, relatives, local investors or financial institutions.

The preponderance of owned capital and the insignificance of loan capital are clearly revealed by the surveys of small industries that have been recently carried out in India. In the case of the small engineering industries in Howrah, among the 153 firms surveyed, owned capital comprised 50.5%, share capital 45.8% and loan capital only 3.7%, equity capital thus accounting for 96.3% of their total assets. (ibid). The same predominance of equity capital is to be witnessed in the case of the small industries of Calcutta. In the case of 28 firms surveyed, having capital assets of not more than Rs 1 lakh, equity capital comprised 86% of the total of business assets. In the case of 22 medium sized concerns with capital assets between Rs 100,001 and Rs 15 lakhs it was 72%. For the small concerns loan capital accounted for 8% of the total raised capital; while for

the medium sized enterprises it was 25.6%. Some of the 22 medium sized concerns surveyed were public limited companies but even then none of them raised its capital through sale of stocks and shares to the general public.

Equity vs Debt Funds

The size of a business has generally been an important factor determining the relative use of equity and debt financing. Large sized concerns have greater accessibility to equity funds than small businesses. They can make public offerings of "equities" far more readily than smaller concerns. They can also build up equity through retention of earnings for they have a higher and steadier profitability. But the small concerns have high proportions of equity capital for entirely different reasons. Their inability and reluctance to borrow on the terms currently quoted generally account for the insignificance of loan capital in such businesses. Various factors govern the nature of financing an enterprise and therefore the equity-dept relationship. The choice between equity and debt funds is influenced not only by the degree of accessibility to the securities markets but also by taxation policy and entrepreneurial expectations regarding the future earnings of the enterprise. The wide range of options available to large concerns with respect to the adjustment of their financial structure is inevitably denied to the small industries. (Jacoby and Saulnier, **Business Finance and Banking** pp. 33-37.)

The type of credit obtained by the small businesses is also determined by their ability or otherwise to satisfy the standards of creditworthiness as conceived by the lenders. Unsecured bank credit is easily available to customers who are considered by the banks to be the best credit risks. Large companies with their detailed balance sheets, frequent income statements and country-wide basis of operations are sometimes able to obtain bank loans without any security. Lenders may not insist upon collateral because they realize that too much insistence will drive the valued customer into the arms of a rival source of credit. With inadequate financial statements, limited sources of credit and no extended record of successful working, small industrial concerns are in a difficult position in this respect. They find it impossible to secure a loan of the desired amount without sufficient collateral. Hence otherwise sound and profitable concerns are unable to obtain their requirements from banks on as favourable terms as their conditions may warrant. They have to depend on more expensive types of secured bank loans, while the large concerns are often able to obtain low cost unsecured loans.

The degree of risk is not the only, or necessarily the major factor in determining the interest cost of bank loans to small industry. Higher lending cost rather than greater lending risk is often the crucial factor in this interest differential. The cost of keeping track of small loans or small investments in small business is very high. The cost of investigating and servicing many small loans is greater than that of a single large loan.

Bank Loans in USA

In our country the available data relating to business loans of commercial banks throw no light on the amount or number of such loans to various sizes of business. In the USA interesting studies have been made with reference to the business loans of member banks where breakdown figures in respect of various sizes of industry have been obtained. According to a survey carried out in 1946 it is found that advances to small business accounted for ¾ ths of the number and 1/5th of the amount of all business loans of member banks. In the case of the smaller banks 92% of the number and 82% of all outstanding business loans represented advances to small business. (C H Schmidt, Member Bank Loans to Small Business **Federal Reserve Bulletin**, August 1947.)

An important aspect of bank lending to business as revealed by these studies in the USA is that the character of business lending of banks of different sizes is related to the size of the business of the borrower. Large banks are inclined to lend to large industrial companies while small banks have the small concerns as their principal customers. The different economic and geographical characteristics of small and large lenders and borrowers account to a considerable extent for this direct variation of size of bank with size of business.

The credit needs of small local enterprises are best met by the smaller banks in the particular localities; while the larger banks located in the metropolitan areas have the necessary equipment to handle the credit needs of large companies operating throughout the country. More than 70% of the dollar volume of loans of banks with total deposits of less than $2 million each was made to business enterprises with assets of less than $50,000, while 75% of the dollar volume of loans of banks with total deposits of $500 million went to business concerns with total assets of $5 million or more. The size factor is also found to affect the industrial distribution of the loans of different size banks. Smaller banks generally lend to small manufacturers of food, tobacco etc., small service establishments and small retailers, while large manufacturers in the food, liquor, automobile, tobacco, petroleum industries and public utilities are serviced by the larger banks. (A R Koch, Business Loans by Member Banks, **Federal Reserve Bulletin**, March, 1947.).

Term Loans

A very large portion of bank loans to American small business was payable on demand or had an original maturity of less than one year. In the early post-war years, term loans to small business had achieved considerable importance, comprising 20 per cent of all member bank loans to small business. While term loans were generally secured by plant, equipment or real estate, 50 per cent of the short-term loans to small business had for security a cosignature or endorsement, 6 per cent was secured by pledge of inventories and another 6 per cent by plant or real estate. The small concerns frequently do not own any plant or marketable securities and their inventories are not of the volume or type which permit financing with standard warehouse receipts. The survey also showed that the interest rate charged by banks on each type of credit increased as the size of the concern declined.

The use of term loans for financing

UNITED ASIA

International magazine of Asian affairs, 12, Rampart Row, Bombay 1, India.

Rs 10 (£1 or $3.00) a year postfree back volumes 1948-1955 available

the credit and capital needs of business has been an important development in American banking in recent years. Although term loans have grown to be an accepted type of credit for both small and large business, the vast majority of term loans have been extended to small and medium sized enterprises. (Duncan M C Halthahusen, Term Lending to Business by Commercial Banks in 1946, **Federal Reserve Bulletin**, May, 1947.) A relatively large proportion of the term loans is found to have been made to businesses with assets of less than $50,000. Term loans also comprised an important part of the total loans of small business, real estate constituting the security in many cases. (A R Koch, *op. cit.*)

An important type of short-term credit for small business in the USA is that extended by the suppliers known as accounts receivables. The use of this type of credit became important after the depression of the thirties. Non-bank lending agencies had developed financial methods based on this type of collateral earlier than the banks, which had to adapt their lending practices so as to include a wider range of collateral in an effort to meet the competition of the former in the sphere of business credit. The difficulty with this type of collateral is that the lender is inevitably involved in some cost in handling and supervising it. He has to pay considerable attention to the accounts pledged and see that accounts paid off are replaced by other receivables, unless the loan is correspondingly reduced. All this explains the higher average rate of interest on these types of loans as compared with most other secured types. Such loans mature within 90 days and have been used by the manufacturing, mining, wholesale and retail groups most of which were small, and by very small enterprises with assets below $250,000.

Credit Sources in India

The sources of short-term credit for the small and medium sized industries in India as revealed in recent surveys are (1) banks, (2) private money lenders and (3) "others", which term includes friends, relatives, customers and dealers. The small engineering industries of Howrah obtained 50.7 per cent of their credit from money-lenders, while others provided 30.4 per cent, and banks only 18 per cent. In the case of small lamp holder concerns 83.22 per cent of short-term credit was provided by private money lenders and only 16.78 per cent by banks. For hosiery concerns and saw mills surveyed, 100 per cent was provided by customers and dealers. Other sources have played a more significant part than banks in the provision of short-term credit to medium sized concerns also. The very low percentage of bank loans is accounted for by the banker's reluctance to consider most of these firms as creditworthy. (According to the results of a survey by Miss Sabita Banerjee.) Belting, chemical and electric lamp manufacturing concerns in the medium group in Calcutta appear to be important exceptions for they have obtained a considerable portion of their working capital from banks.

(To be continued)

Focus on Tea

TO the people who have imbibed it longest, tea is both a ritual and a social ceremony, the correct observance of which calls for a great deal of refinement. The Chinese have been cultivating the tea habit since the days of Mohenjodaro civilisation—its history goes back to 3000 years before Christ. To sell tea, therefore, is to propagate a certain attitude towards life, if not an entire philosophy. The manner in which tea is prepared, the delicacy with which it is served, the shape and texture of the tray and the eggshell China that is displayed on it, the light amber colour of the liquor, all these are so carefully guided by convention that sloppiness or the slightest deviation from it is regarded as shameless gaucherie. All this can be read in a book of tea which belongs to a genre of literature, and is a world of its own, the access to which is open only to the discerning who have the delicate sensibility and the cultivated taste for such things.

Tea caters to a variety of tastes. According to the way it is made and taken and depending of course also on the kind of tea, the effect it produces differs. Tea can refresh and be warmly filling. It can also stimulate and sharpen ones sensibilities. It is cooling in hot weather even when drunk hot and it warms one up, in the bitterest cold. All this even the novices know. But how many of those who drink tea know the different varieties of tea, each with its distinctive flavour, taste and aroma—Darjeeling tea grown within the sight of the snowy ranges, the varieties grown in the damp, moist Dooars, the thick liquoring varieties that grow in the highlands of Assam or in the undulating hills in the South? How many different ways there are of making tea and serving it, each appropriate to its own time and environment. The tea bricks that are exported to Tibet are made into a drink that few will relish, specially when it is served with blocks of rancid butter. But read the testimony of those who have drunk this strange decoction in cold, snow covered Tibet after a long and exhausting trek. They find it more stimulating than any spirit or the hottest punch; many travellers in travail have owed their life to this resusciating drink.

Tea as a cold drink, not drunk hot and found cooling in its effect, but served with ice and lemon, is largely America's contribution to the popularity of tea. By popularising iced tea, Americans have made some amends for the injury they have inflicted on tea by always preparing it in the wrong way. Light tea, of the right kind of course, drunk without milk or sugar, is the special contribution of the Chinese and Japanese who were the first to establish that this is the only stimulant which can be imbibed in any quantity without any apparent ill-effects. Tea alone among drinks leaves no hang-over.

To publicise and propagate tea, which is the function of the Tea Board, it is necessary therefore to acquaint people with the varied charms of tea to begin with and also to teach them how to make tea properly and how to drink it.

The opening of the Tea Centre in Bombay last month marked only a stage in the many-sided campaign of the Tea Board. It is one of the primary functions of the Board to conduct propaganda both in India and abroad to increase the consumption of Indian tea. Efforts to increase exports of Indian tea have yielded substantial results, with exports increasing from 354 million lbs in 1938 for undivided India to 450 million lbs in 1954 for the Indian Union alone. While internal consumption has also increased during the same period, the position still is that roughly over two-thirds of the total production is exported.

For no industry does the cultivation of the home market require any special justification. The Tea Board, however, has a special interest in promoting domestic consumption. The industry is convinced that while foreign markets are vital to its growth, it cannot attain stability until internal demand picks up and absorbs a substantial proportion of the total output. India is not, of course, the only producer of tea, though she is the largest producer in the world. Changes in production in the other countries also affect India's position. Foreign demand may fluctuate due to various reasons, such as changes in income and tastes, as well as in the prices of competing beverages, particularly coffee. Besides, as an agricultural product, the output of tea in India often changes in an unpredictable manner. A substantial market within the country, the industry fondly believes, will act as a kind of buffer and absorb the shock of fluctuating exports.

One may question the implied assumption in this reasoning, namely, that if internal consumption could absorb a greater share of the output, the industry would attain a greater degree of stability. What do we mean by stability? Is it stability of the price of tea per lb in years of good and bad yield from gardens, or of the total returns that gardens receive from the sale of their output, or of their profits? Different lines of policy could be prescribed for attaining these several objectives. Lastly, not even the Tea Board knows for certain the level of internal consumption of tea, though in the latest issue of "Tea Statistics," figures have been given correct upto the nearest lb! It has yet to explain the fall in internal consumption by over 7 per cent between 1953-54 and 1954-55. But these perhaps detract from the main issue which is to increase the per capita consumption of tea from the present absurdly low figure of approximately 0.5 lbs a year, so that it can in time stand comparison with the per capita consumption in UK or New Zealand which is today almost twenty times as high.

The campaign that the Tea Board has to carry on, as has already been remarked, is many sided indeed. For a decade or more, during the war and post-war inflation, selling had been no problem and propaganda for increasing domestic consumption had been rather neglected. This has led to a distinct deterioration in the quality of the tea that is ordinarily available outside the principal distribution centres. While a few high-priced branded teas have maintained their quality, cheaper teas have consistently lost in quality. To this has been added adulteration, though to what precise extent, it may be difficult to say. To keep up quality and fight adulteration form part of the Board's campaign. Another aspect of the campaign is its stress on the correct method of preparing tea. If the tea habit is to catch on, obviously, it is necessary to ensure not only that the tea is of good quality, but that it is also prepared in the correct method—so few even of habitual or inveterate tea drinkers know how to make a really good cup of tea!

The Tea Board has a number of field units operating in more than 100 towns scattered throughout the country whose functions are:

1) To demonstrate to the public how tea should be prepared correctly in order to enjoy its full benefits,
2) To educate
   i) Tea-shops on the need of preparing and serving tea hygienically.
   ii) retailers how dry tea should be stored correctly,
   iii) railway tea-stall owners on the need of preparing and serving tea correctly,
3) To help the municipal authorities in their drive against adulterated and bad teas.

Besides, the Tea Board has to

i) educate the public on the importance of the Tea Industry in the National Economy of the country.

ii) give group demonstrations at hats or shandies, for which the Board has its own mobile tea vans.

The Tea Centre in Bombay is not a tea shop or even a fashionable restaurant, though it also sells snacks and offers all the attractions of a luxurious and exclusive entertainment centre. Here the Board focusses on its principal activity viz to initiate people into the varied charms of tea, and to tell them all about tea in the most engaging manner possible. It is not just a good cup of tea that one gets here but wide choice, a choice which is available nowhere else, of the different blends of tea grown in Assam, Dooars, Darjeeling, Kangra, Nilgiris or Travancore-Cochin. It takes time to make a good cup of tea, for each cup has to be freshly made and so one cannot just gulp ones tea at the Tea Centre and run away. Having served you the tea of your choice, steaming hot or ice cold, the Centre gently leads you on and tempts you to explore the facts about tea through charts and diagrams, demonstrations and educational films, which are regularly shown in a small auditorium which is part of the Centre. Only when you have been initiated into the charms of tea, your curiosity has been awakened and you want to find out more about tea that the work of the Centre has properly begun.

After this ceremonial initiation in the popular and posh locality of Churchgate Reclamation, the Tea Board, it is to be hoped, will consider opening similar centres in the other parts of the city and gradually cover the country with a net work of centres through which it will popularise good tea, and help to raise the quality of tea as well as inculcate the habit of preparing it properly. When this is done, gradually and systematically, only then will the purpose of the Tea Board will have been fulfilled.

Bombay Office for Rajasthan Bank

THE Bank of Rajasthan, alone among the Rajasthan banks, does not yet have an office in Bombay or any other money market centre outside the State. It has struggled valiantly all these years to utilise its funds profitably within the State by confining its branches to the rural areas in the States. After five years of hard struggle, it finds that it has to toe the line of other Rajasthan banks and seek an outlet in Bombay for a more profitable utilisation of its funds. The Bank of Jaipur and the Bank of Bikaner both have branches in Bombay through which they utilise the deposits collected in the State more profitably, taking advantage of the opportunities which Bombay offers for making advances.

By confining its activities within the State and trying to develop business through its rural branches, the Bank of Rajasthan had been vainly struggling to resist the tide. It finds itself in the unhappy position of paying more for its deposits because of the active competition not only among Rajasthan banks, but also the branches of other banks operating in the State. This is today a universal phenomena in the banking world and needs no elaboration. The competition for deposits has resulted in the major portion, if not the whole, of current accounts being converted into call deposits carrying interest. So cost of deposits has gone up. What about opportunities of earnings by lending out its funds? Such opportunities are extremely limited within the State for the simple reason that there is hardly any scope for making advances, which form the most remunerative of all banking assets.

At the end of 1955, according to the Trend and Progress of Banking published by the Reserve Bank of India, the total deposits of scheduled banks and their branches in Rajasthan amounted to Rs 20,67 lakhs while bank advances in Rajasthan amounted to Rs 15,68 lakhs. These figures are misleading, however, for the advances include those made by the State Bank of India to the Rajasthan Government against Government securities which amounted to Rs 13,32 lakhs at the end of 1954 and presumably were not very different at the end of 1955. So, since commercial advances were relatively low, it is clear that the savings of the people of Rajasthan were being mobilised by the banks alright, but mobilised for more profitable employment outside the State, largely in Bombay.

While commenting on the Annual Report of the Bank of Rajasthan for 1955, it was remarked in these columns that the decision of the Directors to open branches at big commercial centres outside the State would mean a drain of funds from Rajasthan. While not refuting the latter, the bank has explained the circumstances which forces it to take this decision. In our comment we did not contest, however, the fairness of the bank's case; in fact we had conceded that the opening of a branch in Bombay "may no doubt be desirable from the immediate point of view of the bank".

As it is, it appears that a portion of the excess funds of the bank is made available to other banks in the region, which presumably shift them to the commercial centres through their own organisations. Another portion is also made available to borrowers in Bombay through correspondents, which only results in higher costs to the bank, through the need to pay commission. No impediment should, therefore, be put in the path of the Bank of Rajasthan if it wants to open an office in Bombay.

One thing is clear. The reversal of the flow of wealth from urban to rural areas calls for much more than the institutionalisation of agricultural credit by the State Bank. Similarly the programme for rural credit now launched by the Government, will be one of the means for effecting the transformation of the economy. But it cannot succeed by itself nor be the principal means.

Around Calcutta Markets

Hesitant Trend

Wednesday, Evening

BEHAVIOUR of equities in the last few weeks has been a puzzle to many operators as well as to market commentators. Equities continue to drift lower. Not only investors, but even speculators are unwilling to accumulate lines. There is no aggressive selling pressure. But, in the absence of buying support, equities continue to sag. More than once, equities started moving up in recent weeks, only to sag after an irregular upward movement.

Some are now arguing that the quiet trend in equities reflects paucity of surplus funds. Impressive evidence can be adduced in favour of this argument. Even Tata Steel had to extend the time-limit for subscriptions to its new issue. Some time ago, a Calcutta Company issued new issues to the extent of Rs 5 crores in the shape of high-yielding redeemable preference shares. This issue evoked unsatisfactory response from the general public. A thriving cotton mill company had similar difficulties about its new issue. This explains the irregularly lower trend in Indian Iron since the announcement of the prospective right issue.

Tight Money

Unlike Bombay, Calcutta is pessimistic about the new Union Government loan. Last week, one of the big scheduled banks raised its deposit rates. That such a defensive measure had to be adopted by an influential scheduled bank during the customary slack season, was not a little surprising. Admittedly, short-term money rates remain unduly firm. But it should not be ignored that, in recent years, there has been a change in the structure of money rates. For some years, the financial slack season has been of short duration.

This is a reasonable explanation of the continued stringency in the money market. But it also emphasises the growing demand for funds from industrial quarters. From the actual happenings in the money market, investors conclude that deficit financing is not keeping pace with the rising financial needs of industry. In this context, the consistent loss of foreign exhange resources of the Reserve Bank and its possible deflationary effects are being emphasised.

New Loan

This raises the problem of the Union Government's new Loan. Its technical success is a foregone conclusion. While the target is for Rs 150 crores, the outstanding amount of the Victory Loan comes up to Rs 114 crores. As this Loan can be converted into the new Loan, the latter's success is assured; the more so, as the major portion of the outstanding amount of the Victory Loan is held by the Reserve Bank and the State Bank. In the circumstances, even the success of the new Loan will not have a "bullish" effect on the stock market.

Details of subscriptions to the new Loan are not available at the time of this writing. But, on the assumption that the Victory Loan will be converted fully, the new Loan will not mop up more than Rs 36 crores of new money. In the last budget speech, the Finance Minister estimated the current year's borrowings at Rs 100 crores. This discrepancy between estimates and actuals is liable to more than one interpretation. But, at the moment, stock markets are in a mood to stress the pessimistic inferences.

Corporate news is encouraging. But investors are doubtful whether dividend payments will continue to be satisfactory, though industrial production is mounting. Meanwhile, some of the effects of the new Company Law are gradually being realised. Moreover, there are fears that some new taxes may be imposed both by the Centre and by the States. On top of all this, there is concern about the growing lack of surplus cash. This is the wider background against which the current market apathy has to be viewed.

Tea Shares

There are many favourable developments relating to Tea shares. Russia is a prospective buyer of Indian tea. She is reported to have been occasionally in the market. Auction prices have been rising in recent weeks. It is widely believed that the industry has seen the worst. Yet, Tea shares are not moving up. For one thing, tea company reports and dividents for the 1955-56 season are not yet available. Many tea companies have announced that they will, hereafter, publish only annual reports, as required by the new Company Law. Meanwhile, there is controversy as to how poor the last season has been. These doubts will continue until the relevant tea reports and dividends are announced.

Coal Shares

When Coal shares started going down as a sequel to the Tribunal award, there was hope that these shares would revive as the Government announced the expected price increase. Controlled selling price for coal have been raised by Rs 3 per ton. New Delhi has promised to re-examine the question of selling prices in the near future. But Coal shares continue to be neglected. It may be of interest to note that some holding companies are moderately optimistic about the coal industry for the next four years.

(continued from page 853)

of each of these to the economic reality which it tried to analyse is very well brought out.

There are some unfortunate blemishes in this otherwise important book. The argument is prolix and not always clear. Sometimes unconventional words are used to convey conventional concepts. The conclusion about technical change in the consumption goods industries is a little too categorical; the need for a social choice between a state with a larger initial level of income and employment and a small rate of growth and a state with a lower initial level of income and employment and a higher rate of growth, is not mentioned at all. Output is defined in a sense different from the conventional one but the special definition is not used consistently either.

All these shortcomings, however are of no consequence as compared to the constructive parts of this book. The analytical frame work developed here represents probably the first systematic attempt at analysing the economic reality in India. Separate problems have been analysed in this country but till now nobody has developed an integrated system of thought, suited for the analysis of an underdeveloped country like India. The authors should be congratulated for accomplishing this admirable task.

Around Bombay Markets

Sustained Business

Thursday, Morning.

IN contrast to the patchy trading during the previous week, sustained business was reported during the week under review thanks to the bulls taking advantage of the market's oversold position. The decline in budla rates encouraged bulls to go ahead, with the result that rates were pushed up and the market was in good shape throughout the week.

Tata Steel Ordinary, which had encountered selling pressure during the previous week unmistakably showed an overbought position right from the beginning of this week. After declining to about Rs 198 at one time last week, Tata Steel steadily firmed up, especially after the budla rate came down from 10 annas to 6 annas and a further rise is by no means ruled out. Indian Iron also improved from Rs 34-15 to Rs 36, though the budla rate for them remained unchanged at 2 annas. Despite continuous selling from Calcutta, which in fact depressed sentiment in the previous week, very good buying has been reported in Indian Iron from Bombay.

Monday's trading in general reflected a healthy undertone and industrials recorded handsome gains. Even the opening rates were substantially higher, profit taking was well absorbed and remained fairly firm at around the best levels of the day.

A notable development was the decision of the directors of the Tata Iron and Steel Company Ltd to recommend a dividend of Rs 10-8 per share on the Ordinary stock—the same as last year—for the year ended March 1956. The dividend announcement, however, was not followed by hectic activity witnessed in the past on such occasions as the dividend has been correctly anticipated and discounted in advance.

Cotton mill shares were also in the limelight. Bombay Dyeing, after a firm start, closed at around the highest level recorded during the week. More or less in line were the price movements of other textile scrips like Gokak, Khatau, Kohinoor, Standard, Simplex, Swadeshi and Nagpur.

In the miscellaneous section, Tata Oils registered spectacular gains on the announcement of a bonus issue and a higher dividend of Rs 3 per share. Bombay Burmah, old and new, continued to flourish under influential support while Tata Chemicals found buyers at as high as Rs 20-2-6. Associated Cement were supported up to Rs 195, the lowest for the week being Rs 188.

The rise in Bombay Burmah has been inspired by general expectation of at least a modest rise in the interim dividend. Meanwhile, it appears that the directors are in favour of the scheme for the conversion of 100 founder shares of Rs. 2,500 each into ordinary stock. These shares are entitled to an extra or preferential dividend equal to one-third of the surplus profits remaining in any year after paying a dividend of 12 per cent per annum on all shares in the company and after setting aside any sums to the credit of the reserve funds as the Directors may decide. As soon as the conversion scheme is put through, it is hinted that bonus shares would be issued to the existing holders of ordinary stock.

The list for the new Government of India loans, which opened on Monday, July 16, were closed on Wednesday, July 18, and have been fully subscribed. It is now the turn of the States. The market anticipates State loans totalling about Rs 50 crores, at 4 per cent, 12 to 13 years' maturity, to be issued at a slight discount for States other than Bombay and West Bengal. It may be recalled that last year the States successfully floated a 12 year loan at issue prices ranging from Rs 99 to Rs 100-4 and got in all about Rs 55 crores from the market. A feature of last year's State loans was the competitive bidding by insurance companies for the issues of their respective States. What will the custodians of insurance do this year? Would they act in concert and give their support only to the Central loans in preference to State loans? Or would they go by yield and maturity considerations?

Cotton

Warning by EICA

COTTON futures opened on a promising note, thanks to the active interest taken by the bulls. There were reports that heavy rains in the cotton growing areas had caused some damage to crops. The monsoon has been generous to a fault in certain strategic areas. The bulls naturally took the cue and both Jarilla and Vijay contracts registered noticeable increases in prices. If there was not the same enthusiasm throughout the week, it was because of the brake applied by the Board of the East India Cotton Association which made it known that it would not tolerate option dealings.

The Board was seriously concerned over this issue and at its meeting on Friday July 13, it was reported, the Board had decided to take very serious steps against offenders. This apart, operators were not able to decide one way or the other about crop prospects and preferred to wait for a clearer picture to emerge before entering into fresh commitments. In the event, prices towards the close of the week were in marked contrast to the earlier trend and were distinctly on the downgrade, although the market could by no means be described as definitely bearish.

The Textile delegation which went to Rangoon to negotiate a deal with Burma has signed an agreement according to which India would supply cotton textiles worth Rs 163 lakhs to Burma against cotton received from the US. For some weeks past, the market has been flooded with rumours about a triangular deal involving Burma, India and the USA. It now remains for the Government of India to clarify, in the light of this agreement, the licensing procedure for the import of 40,000 bales of American cotton about which an announcement was made last week.

Oilseeds

Fluctuating Market

OILSEEDS and oils experienced see-saw price movements during the week. After a sizeable decline earlier in the week, castor ready and futures rallied, despite absence of any business on foreign account. Towards the close of the week, however, some foreign business was reported. With a favourable statistical position, castor September futures closed on an improved tone.

The event of the week was the commencement of futures trading in castor new crop, May 1957. The new crop contract was quoted at a discount of Rs 15. September was placed around Rs 132 per candy.

There was fair turnover in groundnuts, ready and delivery. Vanaspati manufacturers showed interest in quality and bold seeds.

TEA
IN INDIA'S ECONOMY

HOME CONSUMPTION

The people of India consume about 200 million pounds of tea yearly or at the rate of a little over 1/2 lb. per head per annum.

ACREAGE & PRODUCTION

There are more than 6,300 tea gardens in India covering nearly 7,89,000 acres. Their total yearly production is over 640 million pounds of tea.

ALLIED INDUSTRIES

The Indian Tea Industry assists other industries like plywood, ceramics, coal, cement, fertilisers, tea machinery and transport.

EXPORT

During 1954 India exported 450 million pounds of tea. This is more than 2/3 of her total production. Exports were directed to Great Britain, United States, Eire, Canada, Egypt, Continental Ports, Turkey, Sudan, Australia, New Zealand, Iran and other countries.

EMPLOYMENT

The tea gardens of India alone employ well over one million workers - thus our Tea Industry is the largest single employer of labour in India. Besides, with the tea trade it provides additional employment for a very large number of persons.

REVENUE

The Indian Tea Industry contributed to the National Exchequer about Rs. 19 crores as export duty, and about Rs. 3 crores as central excise duty in 1954-55. Besides, it contributed large sums by way of State income tax, agricultural tax, road tax and certain imposts.

FOREIGN EXCHANGE

Indian Tea earned over Rs. 147 crores in terms of foreign exchange during 1954-55.

WORLD CONSUMPTION

India meets over 50% of the world demand for tea which is estimated at over 1,200 million pounds a year, excluding China, Japan, and the U. S. S. R.

INVESTMENT

Capital invested in the Indian Tea Industry is estimated at nearly Rs. 90 crores.

I am Tea – the wealth of India

Finance Minister Resigns

WHY is it that the Congress has not yet been able to produce a Finance Minister from its own ranks? Is it because the present leaders had been so busy going to jail and running the party that they had no time to study finance? This cannot be the explanation, for even the ablest Finance Minister need not be a financial expert. Amateurs at the top is the recognised principle of parliamentary Government. All the three Finance Ministers whom the Congress put up since it assumed office had to be recruited from outside the party. The circumstances under which the first two of them left raised the obvious question how any Finance Minister could possibly fill the bill unless he held such a commanding position in the party as to be able to over-ride others, not excluding the Prime Minister, if the occasion demanded it. In the case of Shri Chintaman Deshmukh, however, this does not apply to the same extent as it did in the case of his predecessors.

In the second term of his office, he was a Congress member and however aloof he might have been intellectually, he was accepted by the party. But with what reservations, has always been a subject of considerable speculation. Was Shri Chintaman the architect of the First Five-Year Plan? How far was he responsible for the Second Plan? These are idle questions today for though Shri Chintaman was already a Member of the Planning Commission before he was invited to take up the Finance portfolio and therefore continues to be a member after surrendering that portfolio, his break with the Cabinet and the Government looks so complete that his association with the Planning Commission can no longer be taken for granted. Which is a pity, since it would certainly have meant that he would have continued to shape economic policy to a larger extent than any other member that one can think of at this stage.

Shri Chintaman's interpretation of the duty of a representative to his own constituency may not be accepted by all. Burke's dictum is still as good as any other, but if Shri Chintaman feels the same way about the separation of Bombay City as the people of his constituency, resigning from the Cabinet is as honourable a course as any, to register his protest. Purists may complain only about the propriety of continuing his membership of Lok Sabha on a Congress ticket when Shri Chintaman differs so fundamentally from his party on this particular issue. But he is not clinging to his seat on false pretences. Had it been open to him to seek re-election, he would certainly have done it to vindicate his stand. The only criticism to which he has exposed himself is that while indicting violence on one side, he has kept silent about the violence on the other. But he has the justification that the other side did not need him to defend its case.

The issue on which India's so far the ablest Finance Minister has resigned had nothing to do with finance. Yet Shri Chintaman had his differences with the Congress Parliamentary Party as also with the Prime Minister which had led him to tender his resignation on two occasions though the differences were made up in the end. Going entirely by newspaper reports, the occasions were his piloting of the Companies Bill and the question of revising the financial procedure. The first

brought out the difficulty of a Finance Minister who did not have the feel of the party and therefore needed the personal intervention of the Prime Minister to persuade Parliament to toe his line. The second arose from one of Pandit Nehru's minor foibles, his careless disregard of good form in asking some body else to look into the financial procedure which, the party complained, was unduly dilatory. On both occasions Shri Chintaman displayed a love of order, system and propriety which is undoubtedly, a virtue for the civil servant but not for a politician. He lacked elasticity and capacity for accommodation, even if he did not take up the wooden attitude that existing procedures were the best conceivable and admitted of no improvement. But no one accused Shri Chintaman of lack of objectivity to the extent that when the case was fairly presented to him, he refused to see where secretarial practice was too rigid and capable of being made more flexible, without necessarily sacrificing prudence.

In his handling of the Company Bill, Shri Chintaman was accused by the rank and file of the Congress party in Parliament of being too partial to vested interests. But now that he is gone, the same members will discover that no one is in sight who can resist pressure of the wrong sort to the same degree as he. No greater tribute could be paid to a guardian of national finances who has also to shoulder the responsibility for framing and implementing economic policies that necessarily conflict with various sectional interests. It may not be a mere coincidence that a forum for one of these sectional interests is being launched just after his resignation from the Cabinet.

The severe indignance of the retiring Finance Minister is not however on the issue of Maharashtra and Bombay but the Prime Minister's disregard of the principle of joint responsibility. On this Shri Chintaman has no new light to throw. Others who left the Cabinet in the past had made the same indictment, forgetting that the Cabinet Ministers pull their weight not according to their intelligence and ability but according to their standing and position in the party as also in Parliament. If those who later resigned had cared to remember this elementary principle before joining the Cabinet, they would have been spared much frustration. They could also, perhaps, then pay greater respect to Cabinet responsibility by keeping to themselves what had been discussed in the secrecy of Cabinet meetings. The unreserved acceptance of this political convention is a condition precedent to the successful working of the Cabinet.

Towards Co-existence

EVEN as America's Secretary of State has yet failed to make a reappraisal of the international situation because, presumably, the effort is proving too agonising for him, he does not yet seem to have realised that neutralism is an inappropriate definition of foreign policies pursued by India, Egypt and Yugoslavia. By the time this appears in print, Pandit Nehru's personal impressions of his one-month tour of foreign countries will be available to the public. It may be presumed that he will reiterate the advantages of personal contacts and exchanges of views between the leaders of countries following different policies. It was unfortunate that President Eisenhower's illness prevented intimate personal talks between him and Pandit Nehru. Even so, it is to be assumed that Pandit Nehru's analysis of the world situation will indicate a gradual lessening of the international tension.

Mr Dulles may still be suspicious of the morality of neutralism. But many of America's allies are now convinced that the Bandung countries and Yugoslavia are not neutralists so much as advocates of "peaceful and active co-existence". One clear fact emerges from the statements and communiques issued by leaders of various countries in the last few weeks. Commonwealth Prime Ministers, the West German Chancellor, the French Premier and the Presidents of Yugoslavia and of Egypt are agreed that developments within Russia since the death of Stalin call for a reappraisal of the world situation. As Bandung Powers. India and Egypt have always endorsed the principle of peaceful co-existence. Yugoslavia has long been a convert to the Bandung principles of peace. Britain and many other Commonwealth countries now concede the need for a changed attitude to the Communist bloc. America alone persists in pursuing a policy which can only perpetuate the "cold war".

From the moment the Heads of State reached an understanding not to start an atomic war, the policy of building positions of strength became obsolete. Immediately, Russia reoriented her military policy. Among the Western Powers, the Socialist French Premier and his Foreign Minister were prompt in appreciating the need for military re-thinking. They were vocal in their criticism of the Western Powers' foreign policy. They were emphatic in rejecting a foreign policy based exclusively on security. Their urgent appeal for efforts towards greater economic co-operation among nations was widely endorsed.

India, along with other Bandung countries, welcomed the shift in emphasis in the foreign policy of the Western Powers in the hope that America will in due time be convinced of the need for adjusting her foreign policy to the changing world situation. That hope has yet to be fulfilled. But India, Egypt and Yugoslavia can take comfort that Britain, West Germany and France are now converts to the principle of peaceful co-existence.

Much has happened in Russia since Stalin's death to provoke a conciliatory attitude to the Communist bloc. Rejection of the personality cult in Russia and the gradual process of democratisation in Russia and in the neighbouring Communist States are events which should facilitate an understanding between the Western Powers and the Communist bloc. But there has been a danger that the lack of response from the Western Powers may hamper the encouraging developments within the Communist bloc. Such fears have been openly expressed by India and some other peace-loving nations.

It is a welcome sign of the times that Britain is aware of this possible danger. "We in the West would make a mistake", Sir Anthony Eden has now warned Britain's allies, "if we did not accept this and understood it (rejection of Stalinism by Russia)". Sir Anthony is prepared to reorient his Government's foreign

and military policies in such a way as to encourage Russia to speed up the process of democratisation. In seeking "a reappraisal of the strategic needs of to-day", he has appealed to the Powers concerned to reach an agreement to limit and control nuclear tests. Such an agreement is an essential first step which should be followed soon by a total ban on nuclear tests. Simultaneously, sincere efforts should be made to reach an agreement on overall disarmament.

Prospects for such an agreement on disarmament are brighter to-day. Suspicions prevail that the Western Powers are reluctant to conclude an agreement on disarmament because they are disturbed about the implications of peaceful co-existence. It will be futile to deny that their newfound emphasis on economic co-operation has been provoked by the spectacular Russian initiative on the economic front since the Geneva "summit Conference".

Sir Anthony has shown statesmanship in declaring openly his preference for "the menace of Soviet competition to the threat of a world war". By his bountiful offers of help to India, the West German Chancellor has disclosed West Germany's determination to outbid Russia in her efforts to win friends through economic co-operation. There must first be an agreement on disarmament so that the Western Powers and the Communist bloc can accept the principle of peaceful co-existence. Even then, the menace of economic rivalry among the Big Powers will continue to plague the world.

Economic prosperity of undeveloped areas is one of the conditions of world peace, even as amity among nations is a condition of global prosperity. These aims are likely to be endangered by economic warfare among the rival power blocs, even as the "cold war" is jeopardising world peace. There is, therefore, need for co-ordinating economic policies and efforts of the Big Powers through the United Nations. This need is emphasised in the communique issued after the Brioni talks between President Tito, Pandit Nehru and President Nasser. Russia has repeatedly expressed her willingness to co-operate with the United Nations in spheres of international economic co-operation. France is in favour of such an extension of the economic functions of the United Nations. There is nothing to suggest that Britain is opposed to such a policy.

There are reasons why America is reluctant to endorse any such plan for international economic co-operation through the United Nations. Under such a plan, America will lose her influence over, or domination of the economies of other countries. As long as she does not accept such a plan for world economic co-operation, the functions of the United Nations cannot be enlarged. On the political as well as on the economic front America's allies have a responsibility to convince America of the need for changing her foreign policy.

Weekly Notes

Too Ambitious

THE World Bank Mission, it appears from press reports, has submitted a memorandum to the Finance Minister which contains its preliminary assessment of the country's economic progress. This is not its final report, which will be submitted after the Mission goes back to Washington. It is not clear, however, whether the memorandum was intended for publication. Anyway, as the Mission's assessment will matter when and if India approaches the Bank for loans, it is of interest, particularly the Mission's assessment of the Second Plan.

The Mission considers the Second Plan to be over-ambitious but does not want its size to be reduced. Like many others, the Mission is sceptical about the programme for cottage industries, though it appreciates the Government's motive behind it of increasing employment opportunities. It thinks that the difficulties inherent in the expansion of small enterprises were 'considerably underestimated'. It appears to take the view that demand for cloth has been put too low while the scope for expanding cloth production in the handloom sector has been rated too high. The expansion of capacity in the mill sector 'for export only', which condition is being whittled down anyway, it finds impracticable.

Of particular interest is the Mission's suggested solution for the enlarging transport bottle-neck, the severity of which it has noted with concern. But "the temptation to meet the developing transport problem by still greater investment", says the memorandum, "should be resisted"; means of improving efficiency should be exhausted first. It is very emphatic in its suggestion that all means of transport, by road, sea and waterways, should be explored and fully utilised.

The Mission's recommendations with regard to foreign capital, particularly foreign private investment, however, do not suggest either that it has cared to understand the basic objectives of planning in this country, or understood the political compulsions that prompted the country—why India? in other underdeveloped countries also, the situation is no different—to go in for a plan, or that it has benefited from the past experience of the World Bank. From the tone of these recommendations one is even apt to forget that the World Bank is an organ of the United Nations which is not commited, at least not officially, to making the world safe for free enterprise, but to help economic development in the member countries of the United Nations by the means best suited to the nationals of the countries concerned. That it should openly side with world oil interests is not a little surprising. None of the underdeveloped countries have an excess of capital to invest in oil companies. If they still want to have a share in such companies, it is not in order to assist the latter but to look after their own interests better.

The choice for the underdeveloped countries is not between free and freer private enterprise in their respective countries for the western or other investors. Perhaps the members do not read Walter Lippmann's columns and they certainly do not yet realise that "But for Nehru's India, backward countries would have no practical alternative model to that provided for them by Soviet Russia and Red China".

No Kutcha Reed !

THE homage that not only Maharashtra but the whole of India paid to the memory of Bal Gangadhar Tilak on the occasion of the centenary of his birth bore eloquent testimony to the nation's love and reverence for the great leader. But it did not bring out very clearly the role that this self-respecting Maharashtrian Brahmin played in the regeneration of his country. This was, of course, no occasion for a fresh political assessment or dissertation in history. Those who paid homage naturally sought to bring out one or other aspects of Tilak's character, personality or contribution, according to their own particular preference or predilection. But appropriately enough, at the crest of this wave of enthusiasm were his stirring words "Swaraj is my birthright". Into this slogan he breathed such life that it completely changed the political climate of the age and routed eventually the moderates from the arena who were prepared to accept good Government as the better alternative.

About the same time as Tilak, Bankimchandra had also placed before his countrymen the gospel of nationalism as the new religion of the age. Tilak lived this religion all his life, made it concrete and thus helped to restore self-respect to the English educated who had little faith in their country's thought and culture. Tilak was so captivated by the glory of his country's past that he certainly saw no trace of Heaven's benevolent will in British rule.

The first upstanding Indian who was not ashamed of his country or his people, that is how Tilak is remembered to day.

Looms and Spindles for Export

NOT so long ago the present Minister of Commerce and Industry had complained on the floor of Parliament that private enterprise had not been enterprising in the matter of expanding the production of yarn and that he could easily make a fortune by starting new spinning mills. Indeed, he was contemplating at one stage, and an earlier stage of the long drawn out controversy on cotton textile policy, of setting up 10 spinning mills in the public sector for supplying yarn to handlooms, for the expanded programme of cloth production in the country.

Licenses for textile mills, even though the production from them are for export only, are in demand. His Ministry had invited applications for 14,600 automatic looms and 2.1 million spindles; actual applications have exceeded these figures. Not much time was needed to coax private enterprise to take up the job. The demand at the moment is for more than 300 million spindles and 16,000 automatic looms, mostly from Bombay and Ahmedabad. All the applicants, however, may not satisfy eligibility conditions and Government may also have to make further concessions to make the mills swallow the 'penal duty' condition. It will be recalled that the Ministry had suggested earlier that the automatic looms and spindles sanctioned under this scheme of expansion would be for export only and that no more than 12½ per cent of the output from them would be allowed to be sold in the home market. If production beyond 12½ per cent from these looms and spindles is sold internally, a penal duty of as 2 per square yard was to be charged on sales in excess of the free quota. The penal duty, it is now proposed, will be reduced to 1 anna per square yard on the next 10 per cent of the output, and 1½ as on the subsequent 10 per cent. The as 2 duty will then apply only to the production in excess of 32½ per cent. It is not an easy scheme to work out and the sanctioning procedure is going to be complicated. Mills which have surplus spinning capacity will be given preference in the matter of looms while in keeping with the Government's general policy the latter will rank high in order of priorities.

The policy of going ahead fast with improving the technique of handloom production by free licensing of power looms, however, appears to have slackened down before it got started. Go slow is being forced by the handloom interests who complain, and not altogether without legitimate ground, that licensing of power looms will hit them hard. The licensing procedure will therefore, take note of displacement. But if this point is pushed hard, introduction of power looms may prove much more difficult than the ministry thought it to be. All told, the present mood is for reconciling existing interests whether in the organised or the decentralised section of the industry. It is difficult to say what exactly would be the resultant of all these jolts in the new textile policy which somehow never seems to get started. Perhaps the situation would be made a little more clear when it comes to be reviewed in Parliament by the middle of next month.

Revised Price Index Issued

A NEW price index has been promised for many years. The one that is now being published, if not being used by the Government for its policy making, has the pre-war year (year ended August, 1939) as its base and everybody agreed long ago that it was a very defective index, that partition and post-independence changes have made it completely out of date and that it should be scrapped. Other price indices have come and gone e g The All India Sensitive Index or the General Purposes Index. A third, the All India Cost of Living Index which should never have seen the light of the day but had a forced birth because the Pay Commission had to have an All India basis for its wage recommendations dropped out, but has again reappeared, this time to meet the exigencies of our international obligations, in this particular case to the ILO. This is however, a statistical absurdity to which the Labour Ministry alone can subscribe. A revised series has been running underground also for some years. But the old and never trusted wholesale index of the Economic Adviser's Office is still going strong.

The one that is to replace it has started moving after a long period of hibernation. A committee was appointed to advise on the collection of the agricultural prices that are to go in the new index. It submitted its report in April 1954. After a lapse of full two years, another committee has been appointed to recommend what non-agricultural prices should go into the new index. Unlike the earlier committee, however, it is not composed entirely of officials. At least one non-official, Shri Y S Pandit, Director, Department of Economics and Statistics, Tata Sons Ltd., has made the grade and been given a place on it. The official resolution which announced the appointment of the committee threatened that the new index, based on the recommendation of the "Collection of Agricultural Prices Committee" was shortly to be issued.

According to newspaper reports, it has actually been published. When the Committee on Agricultural Prices reported in 1954, the base period that was proposed for the revised index was the year ended August 1949. Of course, there is never perfect stability at any time and the idea is to choose as base a year which was reasonably free from disturbances. But 1948-49 was the year in which food control was reimposed and which immediately preceded devaluation of the rupee. What of that? It is the year chosen by the IMF for most of its indices. Naturally our foreign trained experts, some of whom had served their term on the IMF, could not be accused of bad form. But something must have happened in between, for the notification announces that the revised index which has been issued this week has 1952-53 as its base.

Non-Agricultural Prices

WELL, if the revised index has already been decided upon, what is the necessity of examining non-agricultural prices at this stage? This is puzzling only to those who do not know that price collection and computation of price indices run on several rails at the same time, so that new prices can be added, old ones dropped and many other changes can be effected without stopping the current series of starting new ones. The only difficulty is that comparable price series or the data for fixing or changing weights may not be available over a period of time. The later, usually, is an enormous job. The more fastidious among statisticians do not touch a price, unless there is a weight attached to it! Now just think what it means. The revised index is based on more than 500 price quotations for about 110 commodities instead of 215 price quotations for 78 commodities covered by the present index. For rice, for example, which is the staple food for the bulk of the population, the old index takes only three price quotations, at least two of which were, during many years of the index, largely fictitious, being the statutory price at which few could buy rice. Now there are to be some 50 quotations for rice alone. For there are different varieties and different centres. The uncompromising statisticians would insist that for each of these quotations, he must first know how much was the quantity actually sold on the market so that he could work out a proper weight for it, in order to give the quotation its proper importance in the official index. Not to speak of sales of individual varieties in different markets, nobody knows for certain in this country what proportion of the crops marketed even of a commodity as important as rice and how the marketable surplus varies from year to year.

Even for rough weights, however, some data are necessary. They may be available for some other year but not for the base year. The weights, again would be substantially different, when planned development actually takes place. Are they to be varied from year to year? How the experts solve the problem of weighting is going to be the most intriguing part of the new index. The revised index has fixed the weight according to the value of the commodities marketed in 1948-49 and not in the base year. This decision must have been forced by necessity but is puzzling nevertheless, since data for 1952-53 is likely to be fuller than for 1948-49.

Aswan Dam

TWO reasons are advanced for the withdrawal of the joint Anglo-American offer to finance the Aswan Dam project. One is that the States of the Nile have failed to reach an agreement on the division of the waters of the Nile. Disagreement between Egypt and the Sudan on the distribution of the Nile waters complicates the problem of financing the project. But these differences were known to both Britain and America at the time the negotiations started for financing the project. It is, therefore, rather surprising that America has withdrawn her offer of aid immediately after the announcement of the Egyptian Ambassador to America that Egypt is willing to accept the joint offer of help.

More intriguing is the second reason for withdrawing the offer of aid to Egypt. Of the aggregate finance needed for completing the Aswan Dam, the Anglo-American offer forms only a part. Negotiations are going on with the World Bank for a substantial loan for financing the project. Cairo is committed to supplying a portion of the needed resources. London and Washington have now informed Cairo that Egypt's ability to fulfil her part of the commitment has become "more uncertain than at the time the offer was made." A spokesman of the British Foreign Office adds a foot-note that Egypt's commitment under the arms deal with Czechoslovakia is "a factor in the Egyptian economy". This deepens the suspicion that the continuing "cold war" has influenced the withdrawal of the joint Anglo-American offer of help to Egypt.

As was only to be expected, Moscow seems eager to exploit the financial vacuum created by the withdrawal of the Anglo-American offer. Aswan Dam is a major project on which Egypt's future prosperity depends. It is to be deplored that East-West conflicts should jeopardise the completion of projects on which the progress of some under developed countries, including Egypt, depends.

Gold Coast

ELECTION results in the Gold Coast will be welcomed because of their implications about the territory's future status. For over a year now, opposition to Dr Nkrumah and his Convention People's Party has been gathering momentum. Ashanti Chiefs resent their loss of power and prestige. Farmers as well as cocoa planters have their grievances. Some politically conscious elements accuse the Nkrumah Government of "incipient dictatorship". Many elements in the country reject the constitutional plan formulated by the ruling party as a preliminary to an independent status within the Commonwealth. There is a strong feeling against CPP's plan for a unitary type of government. Regional interests favour a federal State.

Because of the growing controversy over the future constitution, London suggested that a general election should be held on this issue. Dr Nkrumah and his CPP have won a decisive majority in the elections. It should, therefore, be possible for him and his Government to secure "a reasonable majority" in the newly-elected legislature for the plan demanding independence within the Commonwealth in 1957. Dr Nkrumah's victory in the elections ends the constitutional dispute. His opponents have the democratic right to continue efforts to win the people over to their plan for a federal State. They must await the next elections to fight CPP on this issue. Meanwhile, Britain is committed to accept Dr Nkrumah's proposal for independence within the Commonwealth in 1957. There will be hope that Dr Nkrumah's political opponents, as well as London, will abide by the election results.

Drawback from Steel Pool

MAY we refer you to your concluding remarks in the paragraph captioned 'Drawback from Steel Pool' in your issue of July 14th. May we elucidate.

During the year reviewed by our Chairman, we were forced, largely due to the inadequacy of internal production, to import some 50 per cent of our requirements of tinplate.

The high price we paid for our purchases of Indian tinplate included a substantial contribution to the Steel Equalization Fund; but because the Steel Equalization Fund does not equalize the price of tinplate imports, as it does the price of other categories of steel, we had to pay the still higher world exports prices for our tinplate imports. It is the basic principle of the Steel Equalization Fund that where the levy is imposed on internal production, a corresponding benefit is provided by equalizing the import price. This principle is ignored in the case of tinplate.

One of the implications of this unsatisfactory arrangement is that Indian tinplate manufactures are priced out of export markets. The Steel Equalization levy inflates the price of tinplate to the extent that we currently pay Rs 1,151 per ton for Indian tinplate in Bombay and higher prices for imported tinplate. We have to compete in the export trade, with manufacturers who receive tinplate at prices significantly below this. For example, British manufacturers, with whose exports India has to compete in South East Asia, buy their tinplate at the domestic price of Rs 890 per ton. There are good export prospects if a draw back on the Steel Equalization Fund levy were introduced.

We would also point out, that while our cost of holding stocks increased, this was not passed on to our customers, but absorbed by production economies made possible by the high level of activity.

Flibbertigibbet

I HAVE watched with great interest the emergence in your columns of a new Kingsley Martin from Calcutta. We who have learnt well the lesson that Lord Macaulay had a hundred years back sought to drive home to us, what surer road to the heart of the London-Cambridge economic coterie can we have than to take over on ourselves Beatrice Webb's once disdainful dubbing of young Kingsley Martin? I am sure Kingsley Martin must be happy to find that the title he rejected in his youth has emerged at last in the columns of the Economic Weekly. And there must surely be jubilation at the Great Turnstile Press that with the passing away of Laski, the task of sowing the intellectual seed in the erstwhile colonies is not altogether denied to the Briton in the Welfare State. One encouraging feature of the entire episode is that the time-lag in intellectualism as between Britain and India, which used to be 10-15 years in the past, has now been reduced to the time taken by an airplane to reach Bombay from London.

We, Sir, are a nation of sturdy archaeologists. While some of us are busy digging away, and unearthing a Chambal valley civilisation some 3000 years old, the literate amongst us are quick to re-discover ourselves from a new angle. But the angle of vision, I regret to say, remains constricted by the narrowness (and shortness) of our grey bags, and by the colour of our light blue (sic) tie, even when the former is tattered and worn out and the latter faded to a jaded grey.

AKG

New Delhi,
17th July 1956.

Uniform Steel Prices

ON 10th June, 1956 Government introduced uniform prices for all controlled categories of steel and pig-iron at all rail-head destinations in the country. The average uniform price for steel was fixed at Rs. 525 and for pig-iron at Rs 225 per ton.

While fixing the average uniform price for pig-iron, Government raised it from Rs 163 to Rs 225 per ton. This increase is necessitated by the large amount of pig-iron that will have to be imported at substantially higher prices and both indigenous and imported products will have to be sold at a uniform price. Imports will amount to about 500,000 tons pig-iron, i.e. almost the same quantity as is produced within the country.

Prices in ports like Bombay and Calcutta rose by about Rs 25 per ton and prices at centres like Kanpur and Amritsar fell by nearly Rs 35 per ton. As the Government communique points out, "The basic consideration underlying this change is the desire of Government to encourage decentralisation of industries and to reduce disparities in levels of development between different regions." Mr. Cleetus, Chairman of the Indian Engineering Association, accepts the need for equalisation of prices in a big country like India. But the advantage of uniform prices to the interior areas is largely neutralised by the big increase in the price of pig-iron. And at a time when the transport bottleneck is a serious problem, the change in the pattern of distribution will create a fresh problem for the railways.

A Bombay daily has charged Government with favouritism because, in its view, Government is subsidising the engineering industry in U P and Punjab by imposing fresh burdens on its counterparts located more suitably. Critics who resent higher prices at ports forget that steel used to be sold at cheaper rates in ports in order to compete with imported steel. India has now become one of the cheapest producers of steel. Hence the need to sell steel cheaper to port markets had ceased quite some time ago. Unfortunately this invidious distinction which continued so long naturally gave a fillip to the engineering industry in port areas. This wrong has now been righted.

There are no two opinions on the point that the country needs balanced regional development. Government action is in the right direction. It is quite wrong to say that the engineering industry in UP and Punjab is being subsidised by imposing a burden on their counterparts located more suitably. Government action did not result in any increase in prices of several categories in the free market, because import prices were somewhat higher. It has been decided to eliminate this limited free market in near future.

Our Delhi Letter

Trade We Must

PREJUDICES die hard and political prejudices harder. That is why the species of doubting Thomases who deny the possibility of expanding trade with Communist countries have not become extinct yet. They were only lying low for some time. Now with reports of U S sale of steel to Russia they have become active again. They are triumphantly pointing their finger at this projected deal as a confirmation of a steel shortage in Russia. And if Russia has no exportable surplus, the offer to sell steel she made to India must have been prompted by fleeting political considerations. As such it would be foolhardy to depend on such uncertain sources of supply—thus runs the thread of their argument.

Exportable surplus, to be sure, does not imply the balance left over after meeting home requirements in full. If this were the case, very few countries could have engaged in foreign trade and international division of labour and specialisation would not have been possible. For export purposes, it is enough for a country to have a surplus in some of the lines. Thus Britain imports certain varieties of steel while she exports others. This two-way traffic in steel is not conditioned by her position as a net exporter of steel, but by comparative costs.

Similarly, the import by Russia of light-weight steel customarily used in making motor cars does not necessarily imply Russian inability to export steel. It is quite conceivable that Russia has a surplus of heavy-weight steel though she may be deficient in the lighter variety. Anyway, such a hypothesis fits in with the over-emphasis on heavy industry Russia has all these years been accused of. And if this criticism is valid—which probably it is—what is the difficulty in assuming that in Russia light-weight steel is in short supply in the same way as are consumer goods and agricultural commodities, while she may yet export other varieties of steel.

This is not to deny that Russia wants to derive some advantage out of this expanded trade. Surely she does. Trade with under-developed countries helps her find markets for heavy equipment and maybe even steel and thus arrange for the import of the commodities in which she is deficient. Besides, such trade helps Russia to get back into the stream of world trade from which she was cut off as much because of Stalin's economic theories as the Western embargo on trade with Communist countries. There is nothing wrong with such calculations. If the Russians have their calculations, so have we.

We have to supplement whatever foreign aid we can get from the West with as much of foreign exchange earning as possible. It should be clear by now even to the meanest intelligence that no underdeveloped country should expect fully to meet her foreign exchange requirements for development work with external aid. And today there is not much scope for increasing our exports to the West. But in the case of Communist countries such scope exists. Whether trade with them would actually expand, however, depends on decisions of the Communist Governments and not directly and may be even primarily on market considerations. So what?

Even the direction and quantum of U S aid are not determined altogether by altruistic motives. Had they been so, the USA would not have withdrawn the offer of help for the Aswan dam in Egypt. We need foreign exchange and we must have it, if necessary from the Devil and his grandmother. Trade relations with Communist countries imply as much endorsement of their totalitarian practices as commerce with imperialistic Countries do of their colonial or racial policies. Neither more, nor less.

Effectiveness of Monetary Policy

"Under the present economic conditions bank rate policy and open market operations may not prove quite effective or feasible means for credit control", said Shri A C Guha moving consideration of the Reserve Bank of India (Amendment) Bill in the Lok Sabha. One should have liked the Minister for Revenue and Defence Expenditure to go into the matter a little more closely. If Ministers have been reticent on the value of dear money as a means of holding in check inflationary pressures, the Reserve Bank has not proved more helpful in assessing the efficacy of this monetary policy. True, the bank rate in India was not raised in 1955 and this may be due to the realisation of its extremely limited value as a regulator of inflationary forces. But the RBI fell into line with the Bank of England in 1951 and even today the RBI boasts of the "success of the monetary instruments of control in the post Korean phase".

In the absence of adequate statistical evidence regarding the precise impact of dear money on inflationary situations, it was till very recently possible to hedge and say; the 1955 experience has shown that "orthodox monetary policy by itself may not be enough." But now some statistical evidence has come from Sweden. The results of a recent survey of the reaction of Swedish business concerns to last year's disinflationary measures confirm that in a modern industrial economy, dear money has little value as an economic regulator. Industrial companies participating in the investigation were asked about the effects on their capital development plans of the three main components of Sweden's disinflation drive in 1955. These were a 12 per cent levy imposed by the Government on industrial investment, a one per cent rise in Bank rate from 2-3/4 to 3-3/4, and the tightening of official restrictions on bank lending. It is to be remembered that by Swedish standards a Bank rate of 3-3/4 per cent is exceptionally high.

About 2,200 companies with total investment plans of Kr 1,550 m for the year sent their replies. These revealed that some 60 per cent carried out their plans for investment despite the restrictions. Of the 40 per cent that cut down the size of their investment, about 42 per cent were obliged to do so by the investment levy and 30 per cent by increased difficulties of obtaining credit. A combination of all the anti-inflationary measures influenced the decisions of 20 per cent and only 8 per cent were persuaded by the rise in interest rates. The conclusion is clear. Bank rate to be effective as an anti-inflationary measure must have some correspondence with the rate of expected profit and if the latter is high, Bank rate has to be stepped up commensurately. In other words, Bank rate has to be raised to heights that would be considered impracticable because of the impact on debt financing and other matters.

In the olden days,
soldiers used to wear armour
before going into battle.

The armour had joints in the knees,
shoulders, elbows and ankles.
If any of these joints got stuck
then the soldier inside
would not be able to move.

With oil, all these joints could be
oiled and the soldier could run.

New Lamps for Old!

IN preparation for its annual conference this year the Labour Party has been issuing a series of policy statements outlining Labour's "new" views on a number of old problems. Pertinent among these policy pronouncements are the statements on 'Personal Freedom', 'Equality' and what is called 'Plural Societies in the Colonies'. The first two by the very nature of the questions touched raise some fundamental aspects of Labour's philosophy and the last (on the colonies) puts to test the party's integrity and sincerity. Some commentators have hailed these statements, particularly the one on equality, as "testaments" of the new Labour leadership. Further "testaments" are to be issued on questions of public ownership and education.

The statement on personal freedom is neither fundamental nor new in ideas. It attempts to examine the best ways in which civil liberties may be preserved in an increasingly collectivist environment. It does so without suggesting that the broader, more basic freedom to live and to live well was in the eyes of the fathers of British socialism, a function of the extent to which public ownership of the means of production was achieved. Instead it believes in the sufficiency of the "mixed economy": full employment and the welfare State has widened personal freedom. And that is all. In this sense the statement typifies the outlook of the Right trend in the Labour movement—the trend that goes under the name of Socialist Union and whose views are said to be shared by Mr Hugh Gaitskill.

The largely pedestrian examination of the question of personal freedom looks very much like having been inspired by some contemporary textbook on public administration or government. It relates what it calls the "dilemma" of advancing majority rights without infringing minority rights, and goes on to show the extent to which infringements of civil liberties have taken place from administrative tribunes, delegated legislation and the growth of a state bureaucracy. The "dilemma" is however a peculiar and almost unexpected one for Labour; for in another of the statements (viz 'On Equality') it is shown that the minority in British society constitute that "one per cent of the population who own something like half the nation's wealth". And it is here that the indubitable impression is obtained that Labour's present conceptions of freedom have strong **bourgeois** characteristics and may be this is not without explicit design. After all the "twentieth century socialism" group believe very firmly that the "mixed economy" should be the limit of public ownership and thus of their socialism; hence their now new cry—"liberty, equality, mixed economy".

On Equality

This outlook of Labour is possibly more clearly brought out in the statement 'On Equality'. Here the impression is given that the State must be the instrument, not for effecting a social transformation, but for containing the trend towards economic and social inequality. Unlike the fathers of British Socialist thought who believed that inequality was an inherent feature of capitalism and that equality in all its aspects was only a practical feasibility after the social transformation, the contemporary belief envisages "full employment" and the "welfare state" as having what it termed "the corrective influence" on Capitalism's consequences. The statement observes that "left by itself the Capitalist system distributes incomes in a manner that is manifestly unjust—a capitalist income structure stretches from well below the poverty line at the bottom to the high and excessive rewards on top". But, says the statement, the correct influences brought about by State action via progressive taxation and the social services have to all intents and purposes been sufficient. Thus in the event of Labour's return to power, these same corrective influences will be employed to stem the inevitable inequalities of Capitalism. And having said that, the statement goes on to lay an undue amount of stress on the social inequalities that emerge from the present education system—a system, which it says promotes the gravest degree of inequality in British society. Actual proposals on the reform of the education system is apparently being worked out in another statement to be issued. The inequalities that arise from capital gains and inherited income are to be largely contained by the proposal for an expenditure tax.

An interesting **rationale** for this estimation of the problem of equality is given by the Labourite C A R Crosland in the current issue of **Encounter.** He distinguishes between "economic politics" and "social politics". The former describes a situation in which a Marxist analysis would be plausible—growing pauperisation and mass unemployment. The latter covers the situation of prosperity and rising incomes when attention is diverted from economic to social issues. Mr Crosland explains that in circumstances of prosperity the income hierarchy gets out of alignment with the class or social hierarchy. The latter are based on socially recognized evaluations that have deep roots. The existence of a social hierarchy which fails to admit into its ranks those newcomers who have entered the income hierarchy is a principal cause of class tensions in periods like the present. Hence there is a profound need for reform of those institutions which give vent to social differences. The most important of such institutions at the present time is the system of education.

This type of reasoning breathes wholly of opportunism. Does it mean that when the slump comes back (as the U N World Economic Survey thinks is likely) the Labour Party will revert to Marxism? Or does it mean that the Labour Party is in that eminently pleasurable situation of possessing a flexible philosophy determined completely by the exigencies of each situation? Thus the Labour Party raises more questions than it answers by these statements.

Double Subjection of the African

Personal freedom and equality are, at least in the circumstances of present-day democracy in Britain, relatively less urgent issues. Wide areas of the globe, where the British flag flies, with a population many times greater than in Britain, the matter of freedom and equality are urgent and most important. The Labour Party has issued now the first of a series of policy statements on Colonial problems. This statement outlines policies for those colonies in which many races reside—the plural societies in the Empire. It is a most welcome contribution from so important a Party on so important a question. The vast

areas of East and Central Africa where conflicts of considerable dimension have or are emerging possess features in many respects different from that of Britain's other colonies. In these plural society territories reside a sizeable group of white settlers who, as a group, occupy positions of class homogenity very much similar to the capitalist classes found in the industrialized countries. As a group or class the white settlers have obtained a wide area of self rule in these territories and the time is approaching when in Central Africa the pattern of South African race relationship is to be fully duplicated. Conceptionally, therefore, the African in these areas is subject to two stages or processes of imperialist rule: that of the Colonial Office in London and secondly, of the class of white settlers. The statement correctly observes that "an essential difference between the history of Britain and that of the colonies is that in the colonies the colour identifies the class". The African is under a double subjection: as a national group and as a class.

Unholy Compromise

And yet when it comes to applying the consequences of this fundamental recognition the Labour Party reflects an alarming insincerity tantamount to an abdication of responsibility and of policy. In East and Central Africa the fundamental rights of citizenship, of land ownership and of economic and educational opportunities are denied to the African people. It is here that the question of freedom and equality are most urgent. The statement sees here the need for laying the "foundation of democracy" (and that remarkable term "foundations" so often used in these contexts, is not defined). But it says the "main problem" is to work out a "reasonable balance in political representation" but this will make the white minority very "determined to fight this prospect". And so in the concrete case of East and Central Africa the Labour Party resigns itself to the inevitable—the adoption of the South African pattern. The Party accepts the aim of "parity of franchise" and then as an after thought of "parity of representation", thus loading and confirming the franchise and established privileges of the white minorities. It is these modification and qualifications which make the prospect of democracy in Africa, even with a Labour Government in Britain, difficult to see. The "transition" to democracy in plural societies occupy so fundamental a place in Labour's policy that the actual prospect of free democracy is dimmed into virtual darkness.

When you have a journey to make, *think first of flying.* It's the fastest way to travel, and often the only way to get there in time. You escape all the tedium of a long journey – flying is so quick, convenient, and wonderfully comfortable.

A Calcutta Diary

Graduates Galore

LET us, since at least some will have recalled the title of Sir Compton Mackenzie's work already, use the same analogy for describing a process the University of Calcutta goes through every year. About this time, June and July that is, the University, like a man who has drunk too much and is being sick, throws out a large number of students. "Throws out" is right; for, in the first instance, the University had no business to take the students in, and, in the second, it chucked them out for no better reason than that it could hold them no longer. During the two or four years that the students were in the bowels of the University, very little took place by way of absorption. The economic emaciation of the University grows worse with the passage of every year, and there is no evidence of sustenance in the other departments. As for the students, they remained in the stomach of the University like so much foreign matter, and all they acquire during their stay is a foul smell. Calcutta is stinking now with a vast quantity of this expectorated matter.

The schools, which provide the raw material which later goes into the sausage-machine we call the University, sent up 70,949 students for what is called the school final examination; 55.1 per cent of the regular students passed, mostly in the third division, and the percentage for "private" students was 36.6. The number of examinees for I.A. (Intermediate in Arts) was 21,700, and that for I.Sc. (the same in science) was 15,100. Roughly about 53 per cent passed in both these examinations. About 12,000 sat for their B.A. or B.Sc.; 45.7 percent passed in the former, and 47.4 in the latter. Such then are the figures which, while exposing the magnitude of West Bengal's problem, conceals a heap of broken backs and an ocean of tears.

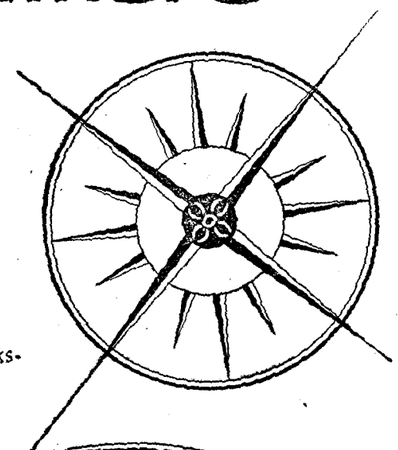
* * *

There is not much point in making a distinction between the students who passed and those who failed. Against the dubious and exceedingly short-lived pleasure of those who got through, the unlucky ones can set the at least equally satisfying fact that they do not have to join the queue at the employment exchange for another year yet. This then is the basic fact about education in India today, especially in West Bengal and perhaps in the south. Success and failure are merely two names for about the same thing. One relieves the congestion at colleges only to add to the crowd before offices displaying the notice that there is no vacancy. And yet, and this is what has to be enquired into, there are more students every year at the examinations which open no door to employment. Everyone is agreed that a degree is useless, but to acquire this useless thing there are more aspirants than the existing colleges can make room for. There is a persistent demand for more colleges, and the Government of West Bengal is toying with the idea of setting up a string of universities in the mofussil. The idea is to disperse education, to send the boys outside the overpopulated city. Much less attention is paid to the more fundamental facts that (a) this education is useless for even the limited requirements of securing employment, and (b) although an expansion of the present educational set-up has undoubtedly provided some employment to some graduates, these latter are in fact being employed only to create a larger army of the employment-hungry.

Solutions to the problem are two an anna. A few theoreticians still remain loyal to the view that education and employment are two independent problems, and our thinking on both is bound to be bedevilled until they are separated. This is not a wholly untenable point of view; treating the two as one has certainly led to a deplorable decline in educational standards, for many have been going for a degree only to apply for a job and they are not really interested in education at all. On the other hand there is an element of unreality in the view, for jobs are needed, and, in any event, it is a pertinent question that an education which does not equip its recipient even to earn a living may not be worth much by any standard. This lofty view apart, there are two other extreme theories. One holds that educational facilities be contracted; one of the medical colleges in Calcutta has actually stopped admitting students because there is said to be a glut of doctors in the market. The other, chiefly representing interested parties (and education can be good business), recommends further expansion with a little orientation here and there in the curriculum.

* * *

In between one hears references to technical education, the urgent need for. As it happens, unemployment is not unknown among technicians either. The search for a solution (and, let us admit it, there is no quick one) has been made the more difficult by an inability in high places to take unpleasant decisions, for the present Government has neither the moral right nor the political popularity to make them acceptable. A matriculate can be asked to desist from going to college only if (a) the man who says it enforces it on every student of the same calibre, and (b) if there is something for him to do immediately instead of going to college. Neither condition obtains in West Bengal. There are parents who have the means to send their wards to college although the latter are perhaps good for nothing but manual labour. And, of course, the Government or industry has no more jobs to offer to matriculates than it has for graduates. The Bengali's famous aversion to manual labour and his lack of initiative in business are two of the other factors making a solution immensely difficult.



Analysis, however, is easier than devising a remedy, and still more difficult may be its application. But even a beginning cannot be made until some illusions are left behind, and the Government decides to be slightly harsh to some people in the present so that the future may not be worse. Not a little of the available employment in West Bengal is today enjoyed by men from neighbouring States; there are trades which are the monopolies of men from Bihar and Orissa. This generosity the genesis of which really is that the Bengalis could once do without these jobs, may have to be brought to an end; if the operation is not done in a planned way, it will be effected painfully. There are several States which debar Bengalis from employment, and this is a process which is sure to recoil on its initiators. Appointing 30,000 teachers for primary schools which are not yet in existence, recruiting social welfare workers by the thousand, and similar palliatives as are being tried now cannot go very far in solving the real problem. Education is an investment all right, but a long-term one. Social welfare, whatever that may mean, is needed too, perhaps; but it is in economic activity, money-making, in which the Bengali will now have to engage himself instead of getting by heart Shakespeare's birthday and Keats' odes. This will be possible only after there has been a revolutionary change in the Bengali outlook on life—which, perhaps, is a long shot, Watson. The Bengali might, however, try it. Was it not that very worldly-wise man, Somerset Maugham, who said that it was better to be a first-rate plumber than to be a second-rate artist? Nor is passing the school final examination in the third division much of an artistic activity.

Land Reform in Uttar Pradesh

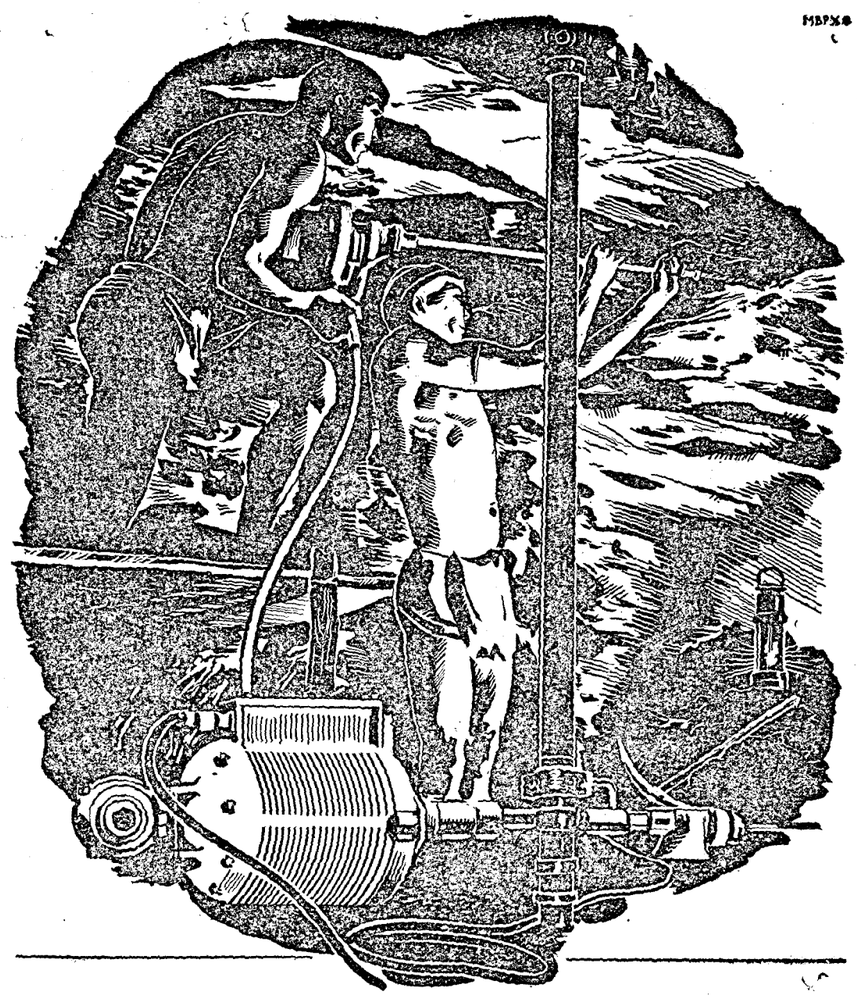
Walter C Neale

IN the present struggle for economic development it has become axiomatic that land reform is a prerequisite to any advance. The reforms which are considered essential are the abolition of landlords and other intermediaries between the state and the actual cultivator. The concept of land reform is a legal one—a matter of titles—and land reform legislation in India since independence has generally been directed towards the abolition of certain titles to land and the transfer of title from landlords to tenants. It is certainly believed that such reforms are necessary before progress can be achieved, and there also seems to be a widespread feeling that the reforms will lead to progress.

The history of land tenure and an analysis of modern agricultural conditions in Uttar Pradesh lend little support to proponents of reform; insecurity of tenure, harshness of legal administration, and exploitation of the cultivator were all well on the way to being taken care of fifty years ago.* Present reform programmes, despite their revolutionary phrasing, continue the policies developed by the British administration.

Pre-British System

Before the British came to India the economy was organized in self-sufficient villages, which in turn were groupings of large families. Economic relations were governed by caste and custom. Above the village, but not essential to its life, were kingdoms and empires taking a share from the grain heap and trying as best they could to maintain law and order. There was no buying and selling; the order of economic life had no place for a price mechanism. The great change in Indian economic organization occurred when the British introduced the concepts of ownership, sale, and the rental market. The old Indian system did not clearly differentiate between economic and political power, nor between such power and social status. Everyone had rights in the produce of the land, obligations to the village, and a greater or lesser ability to enforce his will upon others. The zamindar was orginally a collector of taxes, but this statment is misleading by itself. Unlike the tax collector of today the zamindar might also be the leader of the highest caste in the village, headman of the village, and senior member of clan with hereditary rights over the village. Who can say how many of these characteristics make a man an owner in our sense? The question never arose.



The complexity of rights in land and to the produce of land was so great as to make reasonable any one of several different distributions of titles and rights. Every member of Indian society had some sort of claim upon the land from the raja's right to land revenue down to the ploughmen's right to a share in the village grain heap.

Assumption of Market Economy

The British thought that the maximum of material welfare and economic progress would be achieved by leaving decisions to those who produced for sale on the market. This was a mistake of crucial importance: a failure to realize that rational market behaviour occurs only when the owner of land is producing for a market. In U P neither the landlord nor the cultivator were doing so. Markets only allocate resources to their most productive uses when the factors of land, labour, and capital are intimately connected through working mechanisms. Pressures in one sector must set up self-correcting changes in other sectors. Real connections between markets were lacking and the most important market for economic progress, the capital market, did not exist in any useful form. The nature of the error has never been appreciated by the reformers who believed and still believe that the error lay in some mistake in the distribution of rights among the various claimants. An analysis of the problem shows that true reform lies in another direction.

The history of ownership in U P during the first half of the nineteenth century shows the British moving into a society disrupted by rajas, talukdars, and zamindars competing for power. For each piece of land the British recognized one person or group as "owner," and much land was given to the wrong persons. When the "right" person got the land he received with his title more power than he had ever enjoyed, while the sale of land for arrears of revenue created a new class of owners. About 1820 the British realized that many cultivating tenants had justifiable claims to a special position on the land and the revenue officers set about recording these customary rights. Cultivators of twelve year's standing were given an inalienable but heritable interest in the land, including permission to hold at a reduced rent. So began the gradual encroachment of tenants upon the rights of owners. The policy of increasing tenant rights at the expense of landlords received a set-back with the annexation of Oudh and the "Mutiny", for virtually absolute ownership was given to rebellious talukdars who would submit peacefully. In the seventies and eighties Land Revenue and Rent Acts transferred more of the powers and profits of ownership to the tenants. In the early part of this century tenants were guaranteed seven years at the same rent, and twenty years later all tenants received a life interest in their land with rents fixed by a Rent Officer. In 1939 these tenancies were made heritable. The two outstanding characteristics of land policy in U P were the transference of the attributes of ownership to tenants, and the persistence of a land market as the framework for agricultural organization. While it is true that the owners lost rights which we associate with ownership, landlords and tenants could jointly exercise all the rights of ownership by combining.

*So far as law is concerned, there is in addition to the content of the legislation the question of how effectively the law is enforced. It was probably true that many rights were never properly enforced; but this was a result of the family, caste, and social system existing in UP(and not a result of the legislation itself. It was a case where the hierarchical and family oriented social structure often served to defeat the aims of legislation. The point here is that, in so far as legislation can grant rights, the legislation on the books in UP before the First War had granted nearly all the rights which are considered essential for good tenancy conditions. The reader is invited to compare 19th century legislation in UP with post-independence legislation in Punjab and Bombay. I think he will find the UP legislation more thoroughgoing and progressive than that in the Punjab and as advanced as that in Bombay.

Limitations on the Market

Limitations on the market did exist in a number of cases. Special legislation for the Bundelkhand area prohibited non-agriculturists from holding land, and other acts limited mortgagees-in-possession to twenty years and created procedures for making some lands inalienable at the option of the owner. Debt reduction and stay of execution legislation prevented the market from operating in the ordinary fashion in the thirties. The British were willing to tinker with the sale market, but they never gave it up.

While the British were increasingly regulating the market, Indians were changing their attitudes. Whereas Indians at first simply did not play the market game, the landlords after a time began to seek ways around the regulations, and in the end we find the population trying to maximize on a market while the originators of the market were trying to prevent this behaviour because they had found that under Indian conditions it did not bring desirable results.

Criterion of Past Collections

In the course of these developments, the revenue officers became the focus of an artificial market. In the beginning they tried to levy the revenue upon the economic rent, but, as markets did not exist, it was impossible to compute either the value of produce or the costs of production. Then the officers began with a "fair" sum for a district and apportioned the total among the villages and then among the landlords. Although not recognized as such, this change was in fact a very significant one, for the system replaced the concept of economic rent by the criterion of past collections. The system was gradually modified to take account of the rents which tenants actually paid, but it was always necessary to adjust the recorded rents to allow for fraud and peculiarities of local custom. A series of circulars instructed revenue officers to use as a basis for corrections, and computations of value and rents, the prices of agricultural produce, of similar land recently sold, rents freely arrived at elsewhere in the district, and, in effect, all of the elements which rational men on a market would take into account. The revenue officers were trying to arrive at those rents and values which a properly functioning market would reach automatically, but which the Indian market did not achieve.

The market for land was a failure. Contrary to expectations the market system did not bring with it a huge increase in material wellbeing. It is often said that there has even been a decline under British rule, but the evidence points to a rise in living standards during the nineteenth century, although stagnation and perhaps some decline has since occurred. But in fact Indian progress has been insufficient to satisfy anyone.

Causes of Stagnation

The arguments that are commonly put forward to explain the stagnation of agriculture in UP are that the laws were harsh and "tricky"; the laws were evaded; the administration was biased against the peasants; the assessments of revenue were too high; the level of rents was too high; and that price fluctuations destroyed incentive and ruined the peasantry. Do any of these stand up to the evidence?

The procedural provisions of the law were straightforward, there were ample opportunities to protect one's rights, the nullifying effect of public attitudes are beyond the scope of legislation, and from the middle of the nineteenth century onward sales for arrears of revenue were rare. While there were abuses and evasions of the law, the figures for acreage and numbers of tenants protected by the laws increased steadily, as did the figures for owner-cultivated land. Unfair treatment of cultivators occurred in the early thirties, but the cause—agitation by the Congress Party—was political. During the earlier period of British rule, the bias was in favour of the tenant.

The charge that revenue assessments were too high does not fit the evidence, for agricultural stagnation and reductions in the revenue burden coincide. Furthermore, a reduction in the revenue burden would lead to development only on the unlikely assumption that the poor landlord would use the increase in retained income for capital improvements. These same criticisms apply to the popular charge that rents were too high. Also, the high rent argument puts the cart before the horse. In a market system the returns to a factor tend to approximate the marginal productivity of that factor, and in Indian agriculture the marginal productivity of labour is close to zero. Rent and interest eat up the earnings of agriculture because the productivity of land and capital is high relative to the productivity of labour. In evidence submitted to the Royal Commission on Agriculture, the UP Government said that a reduction of five per cent in rents would increase the tenants' standard of living by two or three per cent, while an increase of five per cent in acreage or output (e.g. from better seeds) would make the peasant twelve to forty per cent better off.

There can be no doubt that fluctuations in price were a cause of distress during the depression of the thirties, but prior to this time the trend of prices was upward. In UP prices did not show a downward trend before 1929 although agricultural prices in world markets did. The cultivators were hard hit by the fall in prices. They were immune in so far as they produced for their own consumption, but the amounts to be paid for rent and interest on loans had to be raised by selling their produce. However, rents were shortly reduced to the 1900 level by government order. Landlords were less affected except by the fall in rents. Sale values of land were maintained during the thirties and so could meet their obligations in the last resort. While the depression of the thirties was a disaster, it cannot explain the failure over the preceding hundred years.

Why the Market Failed

The market failed because the market organization was not complete. Changes in relative values should shift factors from less to more productive employment. In UP there was little accumulation of capital and consequently labour had no place to go but to the land. During the thirties the standard of living in the urban centres rose, but there were not nearly enough industrial establishments to absorb the excess labour. Such savings as there were tended to go into higher land values for reasons of security and prestige. In addition, much agricultural production was consumed on the holding and so market prices had no effect on output. Price and production series clearly show that relative prices had no effect on the management of land. Without real choice, the market system cannot achieve optimum allocation.

On the other hand living standards failed to rise because there was a failure of capital accumulation. Under any system the ratio of land and capital to men must be raised if India is to progress economically. This is a matter of technology. No change in titles to land can solve

it, but the places where more capital would revolutionize agriculture are legion.

For instance, "overpopulation" is not a shortage of land, for capital can always substitute for land, bring new land into cultivation, and increase the productivity of old land. The ability of land to support population depends upon irrigation, reclamation, fertilizers, seeds and breeds, education, equipment, buildings, farm layout, drainage, and choice of crops and rotations. Change and improvement in all these require capital and there will be no major increase in the output of agriculture until measures such as these are taken, no matter who owns the land or receives the return from the productivity of the soil.

Capital Alone Can Raise Productivity

The uses of capital to raise the productivity of Indian agriculture and and the standards of living of the ryots are not limited to agriculture. Increased productivity in other fields will improve the purchasing power of the ryot, but even more important, there must be capital investment in industry and services to provide the materials and power for the improvements in agriculture. The technological improvement of agriculture rests as much on the capital development in other spheres as it does on the capital development in agriculture itself.

Beyond the technological considerations, there are matters of organization. If the market is to be used to regulate the economy and distribute its produce—and for the time being such will be the case in India—then the market must be so organized as to fulfill its functions. We have already seen that during the period of British occupation the various markets were not integrated, and that in particular the capital market was underdeveloped. If this difficulty is to be overcome, there must be a great increase in the capital resources of the nation. I am speaking here not of the obvious technological need for capital, but of the need for capital in order to develop a market which provides a real alternative to land as a form of investment and a field of economic effort.

The Real Issues

Discussion of the future of Indian agriculture has centred on the questions of large mechanized vs small peasant farms; and of co-operative vs collective vs State farms. But these are not real questions. The only alternatives which are possible at present are small peasant farms and peasant co-operative farms, and here the Government's desire for co-operatives comes up against the cultivator's desire for his own plot. The real problems of development are capital accumulation and the size of holdings. It is foolish to cast the

The importance of banking to the COFFEE INDUSTRY

COMMERCIAL cultivation of coffee in India dates from about 1830, and is still almost entirely confined to South India. The yearly crop varies between 20,000 and 30,000 tons, most of which is consumed in India. When a surplus of Indian coffee is available for export, it finds ready buyers in fastidious foreign markets.

Without banking, the growth of the coffee industry would have been impossible. The availability of ready funds when needed, the collection of dues in any part of the country, and the other facilities and guidance offered by a good bank—these are an integral part of the structure of the coffee industry.

We at Palai are proud that so many leading coffee plantations, and indeed important firms in every field of business and industry in South India, employ the complete banking service we offer.

Current Accounts—Demand Drafts—Telegraphic Transfers—Investment—Letters of Credit—Bill Collection—Deposits—Loans & Overdrafts—Confidential Credit Reports, etc.

* * * *

If you have business interests in the South, it will pay you to open an account with us. Our 25 branches are strategically located, 23 in important South Indian business centres and two in Delhi and New Delhi; and we have correspondents in all important Indian cities. We offer a fully comprehensive banking service at each office.

Our clients can make deposits at any of our correspondent banks, situated in all important Indian towns, and have the amounts credited to their accounts at any of our branches.

problem of capital development in terms of large mechanized farms. Capital improvements are divisible down to the spadeful of manure. Small peasant holdings need steel tipped ploughs, iron harrows and water rather than tractors. The only source of capital is agriculture: industry and commerce need all the resources they can raise and then more. Thus the conclusion is that the burden of revenue and rent, far from being decreased, should be increased in order to finance capital improvements.

The failure of the land market and the zamindari system of the nineteenth and first half of the twentieth century can be attributed to the rudimentary or partial state of development of complementary markets and the lack of capital development to support those markets and to provide the wherewithal of agricultural improvement. It remains to be seen what the land reform legislation of UP has done towards remedying the situation.

The zamindars have been abolished. In the process the wealthier ones suffered an appreciable degree of expropriation. Alongside of the general objective of eliminating "an obstacle to economic development," the zamindars were abolished in order to equalize wealth. So far as this secondary objective goes, there can be no objection to the zamindari abolition. Expropriation, total or partial, direct or through the mechanism of low compensation and differential rates of rehabilitation grant, is as good a way as any to equalize wealth. (Although why the same results could not have been achieved by a capital levy and estate duties this writer does not understand.)

No Direct Assault

It is on the major count, the stimulus to development, that the merits of the land reform legislation looks so questionable. At no point does the reform legislation make a direct assault upon the basic problem.

Land reform gave all titles to land to the state, which in turn has made the village governments trustees. However, the situation of those on the land has not changed appreciably. Landlords have lost the land which they formerly rented, and have received in exchange only partial compensation, but they hold the rest of their old land as bhumidars with most of the rights of ownership. Most tenants have become sirdars, which is merely to say that they are now privileged tenants of the state rather than of a landlord, and they continue to pay the same rent.

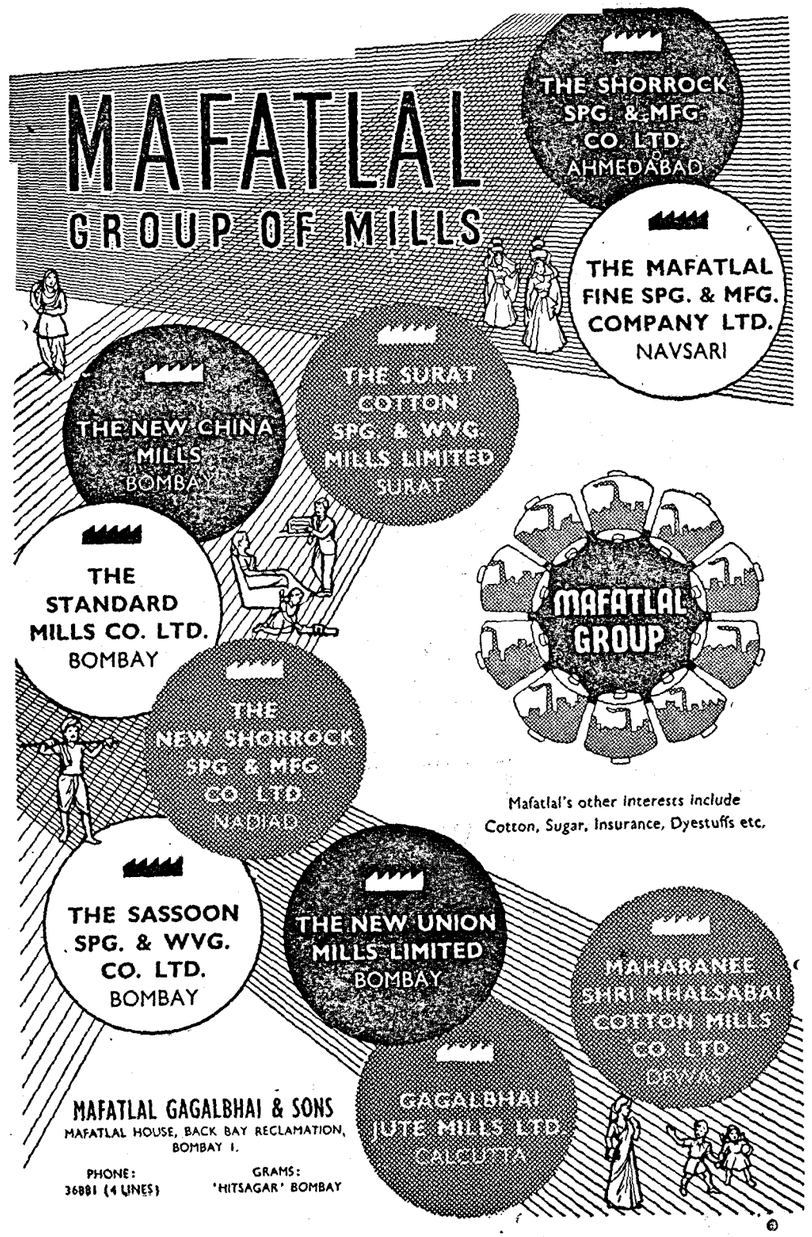
Far from a small minority of zamindars exploiting the vast majority of tenants, perhaps a quarter of the agriculturalists were zamindars. All but one or two thousand were middle or small zamindars, so the expropriatory measures did not affect many landholders. In addition to expropriating the larger zamindars, land reform abolished the rental market, dealt a death blow to the mortgage market, gave occupancy rights to a few more of the fringe of unprotected tenants, and allowed the tenant to make any desired improvement on the land. All four changes could have been achieved by four amendments to existing legislation at much less cost and with much less social upheaval.

Strongest Case for Legislation

Perhaps the strongest case for legislative reform of the rural areas can be made in the fields of fragmentation and subdivision of holdings. It is here that the organizational structure of agriculture needs to be changed, and it is here that matters of right and title stand in the way of change, or rather that people hold title to the wrong plots of land. But the trouble is not at the level of the landlords. The fragmentation problem occurs at the level of the tenants. Changes in the possession of rights and titles as between landlords, state, and tenant do not affect the actual distribution of plots. What is important is to change the layout of the operating farms. It has been argued that change in the system of titles is necessary before consolidation of holdings can be undertaken, but this seems doubtful since the Punjab has gone much farther in consolidating holdings than UP although its tenancy laws are by UP standards very backward.

Since the passage of the land reform bill the government has undertaken to force the consolidation of fragmented holdings. This is all to the good, but even with consolidation, holdings will be too small. What is needed is a movement from the land into industry. To achieve economic size for each holding more than six million cultivators will have to move—a staggering prospect. But much can be done if only a million to a million and a half would move, provided those that move are the "right" ones. The "right" ones are those with holdings of two to four acres and of more than ten acres. People with less than two acres are really labourers with garden plots, and not dependent on their land. People with more than four acres can make ends meet, and even achieve economic holdings if they acquire the land of those who have left. The crisis group is made up of those holding two to four acres, which is not enough land to be cultivated efficiently, and requires a doubling in size to reach efficiency. Cultivators with more than ten acres are efficient, but if they move they will release far more land for others than departing small holders. If a million or more of the groups with two to four acres and those with more than ten acres left the land, there would be enough to bring the remaining cultivators over the six acre minimum needed for economic efficiency. A labour draft system might be avoided by the use of subsidies and penalties.

Ratio of Capital to Men



Because there were no alternative uses for the factors of production, the market mechanism failed to achieve the rapid progress which was hoped for. The solution to present poverty must then lie either in making the market function properly or in substituting another system which will increase the ratio of capital to men. Land reform in UP did neither. The market remains, but so do the gaps between the land market and the other factor markets. Since nothing was done to correct the basic faults of the old zamindari system, there is no reason to expect that the new bhumidari-sirdari system will be any more effective in alleviating poverty in rural UP.

Under the stimulus of the Five Year Plan and with the development of resources undertaken by the States, the lot of the cultivator should improve. If this happens it will not be because the zamindari system was bad or because the new system is good, but because capital resources have been developed and alternate employments with higher productivities have been provided.

Agricultural Output in the First Plan—A Rejoinder

S Naqvi

IN the course of his article 'Agricultural Output in the First Plan', in our Second Five Year Plan Number, Mr Malenbaum says:

"The following conclusion may be drawn for residual India, i.e., excluding Bihar and Bombay.

1. There has been a reasonably steady upward movement in the output of foodgrains in India throughout the past six years."

(pp 752)

Mr Malenbaum has sought to support his conclusion from the following Table:

Production (in million tons)

Year	All India	India (minus Bihar & Bombay)
1949-50 ..	54.0	42.5
1950-51 ..	50.0	41.6
1951-52 ..	51.1	42.4
1952-53 ..	57.5	47.9
1953-54 ..	65.4	53.8
1954-55 ..	65.8	52.2

In the first instance, it is to be noted that even Mr Malenbaum's own table does not give us a picture of a "steady upward movement... throughout the past six years". From 54.0 million tons in 1949-50, there was an actual decline of 4.0 million tons in 1950-51 and it is only from 1951-52 that the table shows an upward movement. Mr Malenbaum's table, however, contains a serious error.

According to his table, production of food-grains and pulses for All India rose from 57.5 million tons in 1952-53 to 65.4 million tons in 1953-54 and further rose to 65.8 million tons in 1954-55. In actual fact, however, the position is different. According to the figures supplied by the Union Government, production of food-grains rose from 57.5 million tons in 1952-53 to 68.1 million tons in 1953-54, as correctly quoted by Mr P R Rao in his article 'Agricultural Targets in the Second Five Year Plan' in your Second Five Year Plan Number, and not to 65.4 million as Mr Malenbaum's table indicates. What is still more important, in 1954-55, production instead of rising beyond the 1953-54 figures, actually declined by as much as 2.4 million tons to 65.8 million tons.

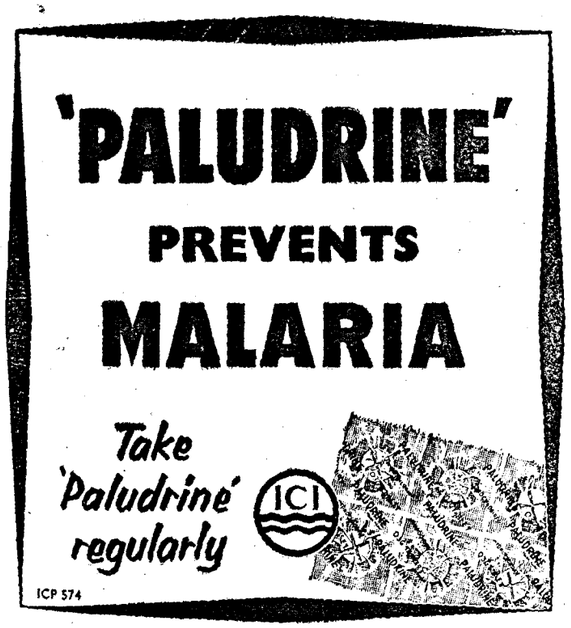
Thus Mr Malenbaum's table, as reconstructed, would be something like this:

Production (in million tons)

Year	All India	India minus Bihar & Bombay	Bihar & Bombay
1949-50 ..	54.0	42.5	9.5
1950-51 ..	50.0	41.6	8.4
1951-52 ..	51.1	42.4	8.7
1952-53 ..	57.5	47.9	9.6
1953-54 ..	68.1	56.6	11.5
1954-55 ..	65.8	55.2	10.6

Source: Agricultural Situation in India—monthly issues 1949-50 to 1955-56.

The reconstructed table shows the incorrectness of Mr Malenbaum's dictum that if we exclude Bihar and Bombay, we find a steady upward movement, for residual India. It tells us, on the contrary, that the output of residual India which had fallen from 42.5 million tons in 1949-50 to 41.6 million tons in 1950-51 and had again risen to 56.6 million tons in 1953-54, fell to 55.2 million tons i.e. by 1.4 million tons in 1954-55. It is difficult to see how Mr Malenbaum could ignore the fact that even his own figure showed a fall in residual production in 1954-55.



Thus, we find that beside the decline in All India output due to the fall in production in Bihar and Bombay, there has also been an absolute decline in the output of residual India by 1.4 million tons in 1954-55.

No wonder, basing himself on incorrect data, Mr Malenbaum reached the conclusion that we had recorded a steady upward movement in the output of food-grains. Indeed, the current crop estimates threaten a further decline in foodgrains output during 1955-56.

Mr Rao gave a more realistic picture of the situation. It seems that Mr Malenbaum began by persuading himself that "The expansion through 1954-55 does not reflect any particular and concentrated benefit of favourable monsoon in 1952-53 or 1953-54" and that:

"Of the total expansion of some 29%—some 40% was due to the steady upward movement in acreage, the residual to increase in yield per acre." (Our emphasis)

After this it was not difficult for him to step on the "additional input factors" and their effect on "additional output". One hopes that Mr Malenbaum would check-up his data and reconsider his position.

A Study in the Financial Problems of Small Industries

S K Basu

(Continued from Last Issue)

IN the provision of long-term finance, organized security markets cannot be used by small localised companies. Not only are owners of such businesses generally reluctant to relax their control through sales of securities to the outside public, but the localised nature of most of these enterprises proves to be an important obstacle. The initial cost of flotation is relatively higher for a small stock or debenture issue than for large flotations of nationally known firms. Data collected by the Securities and Exchange Commission in the USA show that of 1035 public flotations of registered securities during 1945-49, there were only 85 companies with assets below $1 million and the cost of flotation, whether of bonds, preference stock or ordinary stock was the highest in their case. The following table is revealing.

Cost of Flotation of New Issues

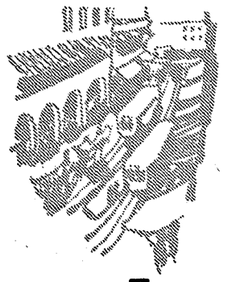
Under 1 ..	10.0	14.7	17.5
1 to 5 ..	5.7	13.3	14.3
5 to 10 ..	3.4	7.9	10.8
20 to 50 ..	2.6	5.4	9.9
50 to 100 ..	2.0	3.9	6.9

Source: Securities and Exchange Commission, February 1951.

Retained Earnings

A Department of Commerce Study in the USA covering 1,100 manufacturing concerns shows that in the case of small manufacturing companies only 2 per cent of the initial capital was raised through sale of stock to the general public. In the case of such concerns nearly two-thirds of the capital was supplied by officers and directors and one-third consisted of bank loans and mortgages. The initial investment in the case of the small concerns is likely to exhaust the owner's stock of available funds and the finance required for development, maintenance and expansion has to be sought elsewhere. The most important source of supply in their case is to be found in retained earnings. Small concerns whether unincorporated or not are generally wedded to the practice of declaring low rates of dividends and ploughing back a substantial part of their earnings. This characteristic of business financing peculiar to small concerns exists primarily because of the absence of an alternative source of equity capital.

A potential source of long-term credit for small business in the USA is the life insurance company. In recent years there has been an increase in the business of long-term lending by American insurance companies to small concerns. Direct placements with insurance companies are less costly for small industries than an appeal to the investment market. But a number of small direct loans which involve costs of investigation, negotiation and serviceability do not appeal to insurance companies, which would generally prefer to invest their funds in large publicly traded issues. There is undoubtedly a case for insurance companies providing loans to finance companies which can relend the proceeds to small industries. Now that insurance companies have been nationalised in India, they can be effectively employed by the Government to finance both large scale and small scale industries by providing funds to finance corporations.



Limited Fixed Assets

Though direct borrowing by small industrial concerns generally takes the form of mortgage loans, such concerns have hardly any tangible collateral security to offer. The fixed assets, particularly land and buildings, which they require, are generally rented and not owned. Recent surveys in West Bengal have clearly brought out the fact that small industrial units do not have adequate tangible and unencumbered assets to offer as security. In the case of the small engineering industries of Howrah the ratio of investment in land and buildings is only one-ninth as against 2/3rd in the more organised and large-scale sector of general and electrical engineering. 86 per cent of the firms operate in rented work places. The West Bengal State Finance Corporation also reports that it is unable to provide mortgage loans to small and medium sized industries mainly because they cannot offer any tangible security in the shape of land and buildings as most of the industries operate in rented premises.

Even in the USA, where the growth of non-banking institutions and the development of new techniques of lending by both bank and non-bank lenders have increased the availability of both short and intermediate term credit and reduced the cost thereof for small concerns, there are several situations where credit requirements of such concerns are not fully met. At the same time, it appears that existing financial sources are often unutilised because of inadequate knowledge or lack of initiative on the part of either lenders or borrowers. Yet in some cases existing local sources are much too inadequate to meet the growing needs of small industries in the particular area. Without complete and accurate financial reporting, such industries are obviously unable to establish banking contacts in an outside and larger community. (Staff Report to the Board of Governors, Federal Reserve System, 1952.)

Scope for Small-Scale Industries

Small firms do not necessarily suffer from technological inefficiency. The extent to which small-scale production, if adapted to the lines in which it has special advantages, can be carried on with a high degree of technological efficiency, has been amply demonstrated in Japan. Where small firms are supported by co-operatives and other specialised agencies, providing them with facilities of finance, research and marketing, they can hold their own against large-scale producers. As the Second Five Year Plan has laid particular emphasis on the development of small-scale industries, a comprehensive scheme has to be formulated for meeting the financial and various other needs of such industries. The State Finance Corporations which have been established in different States are expected to play a significant part in financing a planned programme for their development. But their scope will be somewhat limited owing to the statutory ban on the provision of equity capital by them. Besides the State Finance Corporations, the Central and State Governments, the State Bank of India and commercial and co-operative banks have a part to play in the financing of these industries. The relative roles which they should play in an integrated credit scheme for the development of small industries have to be carefully de-

termined. The entry of public agencies into the market for industrial credit has also raised the important question of the relations between public and private lending agencies. It will be difficult at this early stage to weigh the effects of the operations of public agencies on the credit market and on the private agencies hitherto serving the market. In some respects the relations will probably be competitive but in most cases it is to be hoped they will be complementary and co-operative.

Some Suggestions

The following suggestions are offered for improving the present position in regard to the availability of banking facilities for small industries.

1. Commercial banks may establish small business loan departments and publicise the financial services they render.

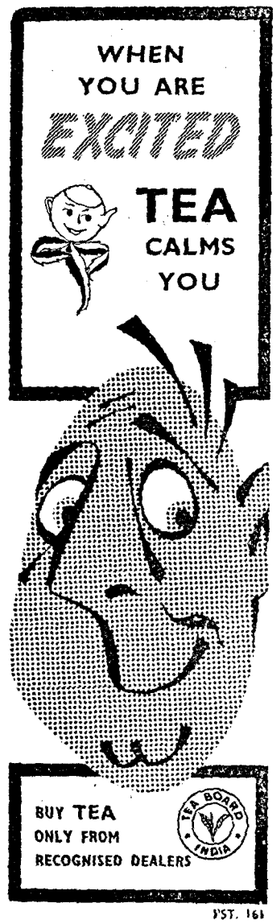
2. Steps may be taken to provide for the insurance of banks and other financial institutions by Government against loss of principal or interest on loans made to small concerns upto a certain size and upto a prescribed aggregate amount. A small beginning has recently been made in this direction.

3. The possibilities of establishing "credit pools" by banks, insurance companies and other lenders with a view to provide short and medium term credit to small industries may be explored.

4. On the lines of American commercial banks, Indian banks may develop the practice of lending to small borrowers on the security of an assignment of accounts receivables. Their value as collateral is a very high fraction of their face value and if the borrowers' trade customers fail to pay their accounts, the banks can always have recourse to the borrowers themselves. The cost of such credit to borrowers would, however, be rather high.

5. The practice of bank lending against receipts of field warehouses established by specialist concerns on the premises of a borrower is a new development in credit techniques in the USA much to the advantage of small and medium-sized enterprises. The technique of financing inventory on field warehousing receipts may be developed by banks in India in collaboration with the State Bank. But it involves complex problems of appraisal for bankers and calls for development of special methods of controlling risks.

6. Banks are unwilling to lend to small industrialists against Government bills, because of the delay involved in collecting payments. As the Shroff Committee suggested, the locking up of the slender resources of the small-scale industries can be avoided if letters of credit are opened by Government in favour of suppliers stipulating for payments on the presentation of inspection notes by a duly authorised officer of the indenting department.



In view of the difficulties of institutional methods of increasing the availability of equity capital for small concerns which have been stressed above, their main reliance would inevitably have to be placed on earnings ploughed back into the industry. A very pertinent question that arises in this connection is that of increasing the amount of earnings available for investment. Obviously a plausible method of augmenting such earnings is by providing tax relief. But most of the small concerns happen to be unincorporated and are subject to individual income-tax. Provision of tax relief for such concerns may call for major changes in the existing structure of personal and corporate income-tax. But it is worthwhile exploring the possibilities of granting suitable tax exemptions to small industrialists so that a larger proportion of the earnings could be ploughed back into the business.

Non-Financial Problems

Financial problems are not the only problems of small industries; the non-financial ones are sometimes as important and as acute as financial ones. Though the discussion of such problems is outside the purview of our study, a few of them may be briefly indicated. Lack of technical and managerial know-how is perhaps the greatest of these problems. A small concern obviously cannot employ specialists who would give engineering, technical and accounting advice of various kinds—production scheduling inventory control, financial planning and marketing research. Financial assistance would not be of much avail unless it was accompanied by the provision of suitable managerial and technical assistance.

To meet these technical problems of small-scale industries, four regional Institutes, one each at Bombay, Calcutta, Faridabad and Madurai, have been established. A National Small Industries Corporation has been set up for the purpose of assisting, promoting and financing small industrites. Finally a Small-scale Industries Board has been constituted with the object of framing and implementing programmes for the development of small-scale industries and co-ordinating the activities of the regional Institutes of Technology and the National Small Industries Corporation.

The activities of these various organizations in the sphere of promotion and development of small industries will be watched with keen interest. It is hoped that they will not be mainly preoccupied with the problems of village and cottage industries alone but will evince the same interest in the problems of the small and middle sized industries in the urban centres which use power and some simple modern tools and implements and have capital assets upto Rs 15-20 lakhs.

VST. 161

"SWARAJ IS MY BIRTHRIGHT"

thundered Lokmanya Bal Gangadhar Tilak to inspire a new sense of freedom in the minds of the people of India.

On the hundredth birth anniversary of Lokmanya Tilak, we join the millions of our countrymen to pay homage to the memory of this great son of India.

"His vast learning, his immense sacrifices and his life-long service have won for him a unique place in the hearts of the people." (***Mahatma Gandhi***)

On this memorable occasion let us, on our part, resolve to secure the right to enjoy financial independence through life insurance.

Employment Technology and the Plan

Ashoke Mitra

THE basic objective of planning in our country may be stated as the attainment of true economic independence perfectly matching our economic independence built on the Panch Shila, and as the most rapid increase in the material and cultural standard of living of the people possible under existing circumstances. Employment is but a symbol of material and cultural well being; apart from the self-respect it bestows in the social and cultural sphere it makes possible in concrete ways, in the form of labour, and improvement in material standards. There, again, we would not agree that the best form of employment is good ten hours' hard labour with the spade or the axe every day, but to be employed in situations for which one has been trained and educated. There is also the implied suggestion that my labour should be able to produce the maximum results, that is, my muscles should not do what a machine can do. Employment really means a gradual transition from the philosophy of the dirty hand to the philosophy of the clean hand, at least, the opportunity of soaping it after you have had to dirty it in field or factory. In short when we are thinking of employment and the Plan, we are not thinking of bread alone but a lot more besides, although bread is the first and most crucial problem to be solved before others can arise.

Economic planning is not done by solution of an **a priori** system of equations of input-output and national product, but is done in an historical way based on the current availability of cadres in every field of economic activity. Any plan which is not realistically formulated on current and probable resources is bound to be reduced to pious wishes. For instance, the Bombay Plan of the 1940's, while it was such good stick to beat a foreign Government with, was after 1947 found to have been pitched too high. Not much mention of it was made thereafter and the First Five Year Plan did not start a priori an entirely new system of input-output and consumption relations but to introduce certain changes in the relations already existing. Thus in a realistic plan each year's plan revises to a certain extent the relations of the last year and a solution is found by successive approximation. In any national plan this is chiefly determined by the availability of physical resources which largely means the availability of suitable cadres, that is, the suitable ways in which the entire human resources of the nation may be engaged; in short employment. This makes the task manageable in practice.

But then it is possible to take either a static or dynamic point of view. The static point of view is one which takes the currently available ratio of cadres in the various fields of employment as unalterable and seeks to distribute the net annual addition to the labour force—supposed to be 1.8 million for India—according to the old ratios. In spite of much talk about an expanding economy, this kind of static view still prevails in many quarters. Fundamentally, it assumes an ossification of the present balances in society and seeks to strengthen them. In this static view, employment is considered chiefly in terms of bread alone and not much more besides. But there is the other really worthwhile point of view of continuous planning in a wide time horizon, which views employment not in terms of bread alone, but in a continuous translation of cadres from low material and cultural output to higher and better outputs. But here again planning is constantly exposed to the risk of two possible errors. One error is an under-estimate of possibilities and of fixing too low targets, so that the available resources and the willingness of the workers concerned to undertake an effort are not fully utilised. Thus, in the hands of those planners, who under their skin are really adherents of the static point of view, continuous planning in a wide time horizon can easily be reduced to making haste very slowly. The other error is to shout at every truly prudent step as sabotage, overestimate the possibilities and draw up plans that cannot possibly be realized. Recent history is strewn with errors of either kind at home and abroad. But History may be servitude, History may be freedom.

There is, it seems to us,
At best, only a limited value
In the knowledge derived from experience.
The knowledge imposes a pattern, and falsifies,
For the pattern is new in every moment,
And every moment is a new and shocking
Valuation of all we have been
It depends on how we make use of our experience.

The best way to look at the problem of unemployment and the Second Plan would be to put myself successively in the bare feet of the agricultural labourer, in the cobbler-made chappals of the village or small town artisan, and in the well-made Bata, not imported, shoes of the engineer or the scientific worker and survey the prospects of my elevation from bare feet under a thinning thatch roof to well made Bata shoes under a prestressed concrete roof within a manageable time horizon. For such is fairly the range of employment which a common man, neither a poet nor a musician nor a scientist, is within his rights to contemplate and legitimately regard as the most rapid increase in the material and cultural standard of living possible under existing circumstances. This would also illustrate how unemployment in the rural and agricultural sector is intimately linked up with unemployment in the technical and scientific sector.

The objective or general purpose of the Second Plan may be stated as:

(1) Rapid industrialization of the country,
(2) Modernization of agriculture, and
(3) Establishment of the economic foundations of a socialistic pattern of society.

These three objectives are interrelated among each other; one cannot be realized without the other two, and employment runs through and through all the three as the cementing bond which holds them together and pushes them forward.

It is but natural that on the conclusion of the First Plan we should realize that rapid industrialization is of the utmost importance because we do not yet produce enough steel or all the ingredients of motor transport, an aeroplane or even photographic films. But industrialization requires a substantial increase in marketable agricultural output in order to feed

the increasing non-agricultural and strengthen the agricultural population. This requires modernisation of the methods of agricultural production. These must be produced by industry. Thus industrialization requires modernization of agriculture and, conversely, modernization of agriculture requires industrialization. A similar cycle can be readily discovered between basic and consumer goods industries.

In the Indian context, modernization of agriculture implies the full utilization of the productive possibilities of private peasant farming, that is to say, the full utilisation of labour intensive farming before industry begins to produce conditions favourable to capital-intensive cultivation. In order that full utilization of labour-intensive farming may be possible, the first principles of agrarian reform have to be put into practice and a serious handicap of economic progress removed. This will consist in removing the built-in depressor in the agricultural sector in the shape of rent and share-earning interests who take the cream off the land and leave the actual cultivators with little sustenance. A great controversy has raged over the country for nearly a century but this essential reform still remains to be carried through. Three very simple definitions of **malik, kisan** and **mazdoor** have been clouded over with all manner of legalistic niceties in order to preserve the indefensible claim of the **malik** in a thousand ways, and these niceties have now further sought the shelter of all forms statistical inquiries to stave off the evil day. But all of us are pretty certain that the most unbiased, randomized, quantitative, qualitative statistical surveys, repeated over and over again, will still reveal that almost half of the land is held by **maliks** constituting less than one per cent of the agricultural population, and almost two thirds of the land-owning **kisans** hold no more than 15 per cent of all the land. Approximately this ratio is bound to prevail in any semi-feudal agrarian structure, whether in India or any other part of the world. Let us briefly spell out why it is thought that its abolition will not only remove the built-in depressors in our rural economy but boost both our rural and urban sectors.

Apart from the purely rent-receiving interests who do not work at all and whose numerical strength is less than 2 per cent of the rural population, there is also the large section called occupancy tenants who by law hold the most valuable right in land, but almost 50 per cent of whom do not primarily work themselves. Together they account for not more than twenty per cent of the rural population. Those occupancy tenants, however, who work themselves may be called **kisans**. Thus the remaining eighty per cent should properly be called **kisans** and agricultural **mazdoors**. The effect of giving land to the **kisan** and **mazdoor** and reducing their heavy indebtedness will be immediately to raise their standard of living and to give them a new incentive to increase production. In short the removal of the 20 per cent depressor layer will result in a sudden and extensive expansion of the area of operation of consumer goods, improvement in rural housing and village workers, increased absorption of agricultural produce (for the diet of the 80 per cent is woefully subnormal and unnourishing), and full application of labour-intensive practice.

The immediate effect will be on the one hand not only a wiping out of the dreaded technological unemployment among artisans but fuller employment of them resulting in their asking for more machinery, and on the other hand a very effective halting of the descending spiral of agricultural prices owing to the fact that more food will be held for consumption by the producers themselves. Thus a big consumption area which has so long been artificially depressed in a state of dormancy will operate freely and absorb the artisan's handicraft and the peasant's produce to quite an indefinite extent. Thus on the one hand agrarian reform will considerably reduce the large agricultural surplus population by distributing land to unemployed **kisans** and underemployed **mazdoors** and, on the other hand, by raising the peasants' incomes will create a market for industrial and technological expansion in the place, by abolishing unearned profits which are now largely spent either on luxuries, or at best, in maintaining an unproductive class in relative comfort. Moreover, it will increase the resources disposable for purposes of accumulation. Only when such a reform is achieved is it possible to introduce cooperative farming, the truth being that the more prosperous the working peasant (as distinguished from the rich non-working tenant owning occupancy rights but not working himself) becomes on his individual farm, the more amenable he becomes to the idea of co-operation. By developing fully the possibilities of individual farming, he realizes its limitations and comes to understand that a further increase in his prosperity requires the adoption of cooperation.

The present extent and trend of land reform, however, falls short of these objectives.

We have seen how in the absence of further reforms the temporary progress in agriculture may bring about a descending price spiral which will have the effect of ultimately retarding agricultural production. If such a condition prevails in the rural areas, it automatically means a restriction in the use of consumer goods. This in turn demands that the production of certain consumer goods be frozen at the existing levels of production in factories, that labour intensive methods be embedded in the sector of hand industries, and more and more money be pumped into this sector which, composed as it is of the small producer, the independent worker, the craftsman and even co-operatives, is naturally enough the most vociferous, and audible.

It might be possible under such conditions for a time to increase the national product by employing more labour and proportionately more means of production on the basis of unchanged methods of production only in the same proportion as the output of consumer goods for the additional labour force employed. The moment, however, labour is fully employed any further increase in national product requires increased productivity of labour and hence adoption of progressive methods of production. This results in the necessity of increasing the output of means of production faster than the output of consumer goods.

In a similar way industrialization implies a faster rate of increase of industrial output as compared with the rate of increase of agricultural output, in the first stages of planning. Thus though the objective of "rapid industrialization with particular emphasis on the development of basic industries" is fundamentally incompatible with the fear of technological unemployment requiring "regulation of the pace of technical progress in selected industries," yet, if the rate of increase of agricultural output is restrained the whole chain is bound to kick back violently in reverse, which leads us to the enormous difficulty of not only absorbing what technical and scientific skill that already exists but of further absorbing fresh annual additions in the cadres.

Around Calcutta Markets

Marking Time

Wednesday, Evening

IN the absence of investment support, equities continue to remain stagnant. For the last fortnight, speculative scrips have been marking time. There is hardly any business in cash scrips. Not due to selling pressure, but on occasional liquidation, equities are gradually losing ground. Investors may not be lending support to the market. But they are not liquidating their holdings. Occasional liquidation comes from weak "bulls". Along with investors, speculators are reluctant to enter into fresh commitments.

This explains why equities are stagnant. But the recent behaviour of stock markets is not entirely discouraging. Equities are no longer sagging. Even speculators are unwilling to sell "short". Weak "bulls" have been gradually eliminated. Some time may elapse before the market starts moving up. But there are some indications that the process of digestion is nearing completion. At the current phase of stock markets, it may be risky to sell "short".

Loan Effects

In retrospect, it is evident that fears about the consequences of the Union Government's loans are exaggerated. Apprehensions have not materialised. Available details indicate that cash subscriptions to the loans have been satisfactory. As the net withdrawal from the money market will not exceed Rs 40 crores, it is now realised that the loans will not extend the resources of the banking system. It is not merely a coincidence that equities have found a bottom since the announcement of the details of loan subscriptions.

There are, however, other borrowers waiting for opportunities to float loans. Loans by States will be floated soon. Some Corporations are likely to enter the market. These public and semi-public borrowings will mop up funds from the money market. But these borrowings are not likely to be heavy. As deficit financing continues and bank deposits expand, it should not be difficult for the money market to respond to these demands easily. This aspect of the stock market situation is now better appreciated.

There are other influences which are impeding stock market activity. For about a year now, prices have been rising. Food prices are moving up. So are the prices of industrial raw materials. In consequence, industrial production costs are mounting. But as the prices of manufactured goods remain comparatively stable, industrial profits are being affected. Production has not yet suffered. But output may fall if industrial profits continue to decline.

Dividend Trend

As industry functions with a lower level of profits, investors become suspicious of the future trend of dividend payments. If the recent trend of the various groups of prices continues, dividend payments are likely to be slashed. This is what is discouraging investors from taking interest in equities. It is, however, a reasonable assumption that if the prices of food and industrial raw materials move up further, manufactured goods will become dearer. Inflation may have some undesirable consequences. But price inflation is likely to be followed, with a time lag, by profit inflation.

Meanwhile, there is the problem of growing industrial demand for funds. Rising prices for food and for industrial raw materials are swelling production costs. Simultaneously, declining profits are depleting industry's surplus cash resources. So, demand for bank accommodation from industrial quarters is expanding. This, coupled with the Reserve Bank's directives against speculative lendings, is affecting the normal sources of supply of credit for financing stock market transactions. This is one of the main reasons why cash scrips remain idle.

Stock Market Bill

New Delhi's determined drive to discourage speculation is another factor which is hampering stock market activity. Soon, the Bill to regulate trading in stock markets will be discussed by Parliament. This Bill seeks to control and supervise trading in stock markets so that overactivity is discouraged. In the management of stock exchanges, the Government proposes to have a voice. This Bill and its aims are, naturally, having a disturbing effect on stock markets.

Despite the consistently upward trend in tea auction prices, tea shares continue to remain depressed. Soon, tea company reports and dividends for the 1955 season will be available. That these dividends will be far below those of 1954 are known. But investors do not yet know how poor the 1955 dividends will be. These doubts and uncertainties are crippling activity in Tea shares.

Cements Up

During the current week, Jute shares experienced some selective buying support for a day. But the demand for Jute shares could not be sustained. Miscellaneous and Engineering shares remain depressed due to the irregularly downward trend in clearing scrips. But one of the features of recent trading on Lyons Range has been the consistent demand for cement shares. These shares are moving up. Even after the recent rise, these shares are being "talked" up further.

"One has no protecting power save prudence."

Juvenal.

Around Bombay Markets

Scrappy Trading

Thursday, Morning.

IN addition to Bakri-Id on Thursday and Tilak Centenary on Monday, the Stock Exchange remained closed on Tuesday also, to express sympathy for the unfortunate victims of the earthquake tragedy in Kutch. Therefore trading was scrappy, during the week but the undertone was one of quiet confidence. There was some profit-taking on Saturday when most of the scrips shed a few points from the highest touched during the previous week. But while market leaders like Tata Steel and Associated Cement declined on alternate bouts of profit-taking and selling pressure, there was notable demand both for National Rayon and Bombay Burmah. Evidence was not wanting that bulls had not relaxed their grip and that anticipation of inflationary pressure was a good standby for the stock markets these days.

Operators were jubilant about the outlook of cotton textiles. This led to a sizeable appreciation in selected mill shares like Kohinoor, Bombay Dyeing, Century and Finlay.

In the miscellaneous section, ACC closed a rupee lower at Rs. 192. Orissa Cement made a gross profit of over Rs. 59,60,000 in 1955 and the Directors have recommended a rise in dividend from 7½ per cent paid last year to 12½ per cent both tax free. Further, the Directors have decided to offer one share at par for every two held. Looking to the prospects and the capital issue on bonus terms, i.e. at par, Orissa Cement should prove to be an active scrip in the Bombay market.

Cotton

Threat of U S Surplus

IN the three days of trading during the week, cotton futures remained subdued with a slightly bearish trend. Jarilla lost six points on Saturday and closed at Rs. 664-12 as against Friday's closing of Rs. 671-4. A similar trend was noticed in the Vijay which closed at Rs. 819 as against Rs. 810. On Wednesday the trend was lower, and both Jarilla and Vijay declined further to Rs. 663-8 and Rs. 805-8 respectively, on fair weather reports.

The further scaling down by the U S Commodity Credit Corporation of its sales prices from 25.20 cents to 25.12 cents per lb. has caused much concern to local cotton circles. Where would the CCC, then, draw the line? Backed up by the mandatory power given to it by the Farm Act, there is nothing to prevent the CCC from quoting lower and lower sales prices. In the circumstances, cotton markets the world over will have to absorb large volumes of U S cotton at steadily lower prices.

In fact, latest reports from Washington suggest that the U S Congress has already enlarged the scope of Public Law 480 and increased its authorisation by as much as 1.5 billion dollars. Simultaneously, the U S Senate has also announced that it would permit the sale of cotton and other surplus commodities to Iron Curtain countries for dollars at competitive prices. It is interesting to note that barter arrangements against strategic materials also figure in this scheme.

Oilseeds

Futures Trading in Linseed

A NOTABLE development in the oilseeds market during the week was the commencement of futures trading in linseed after an interval of 12 years. The first transaction in linseed May 1957 delivery under the auspices of the Bombay Oilseeds Exchange was put through at Rs. 25-4 on July 20. The basic variety for the linseed contract is Bombay bold, and the unit of trading is 25 tons. There will be two delivery contracts for May and September.

In general, the oilseeds market was in better form and traders were able to make good their earlier losses. The undertone was quiet in the beginning but rates slowly picked up under the leadership of castors which gained strength from steadiness in the upcountry markets. True, no fresh export business has been reported in castor oil. But the fact that America is prepared to buy our oil has weighed heavily with the bulls who have gradually gained control of the market and have pushed out the bears. This apart, reports of a poor Brazilian crop also strengthened the hands of the bulls, who know that both Britain and Japan are also potential buyers of castor oil. With Japan, however, pending settlement of the foreign exchange position, no deals are possible at the moment.

The steady trend in castorseeds helped groundnuts and other seeds to close on a note of sober optimism.

Bullion

Bull Bias

THOUGH it is the slack season, the bulls in the bullion market have contrived to gain a firm grip on the market and have successfully exploited the paucity of stocks. Following sustained bull buying coupled with heavy short-covering, the Ashad delivery contract for gold improved during the course of the week to as high as Rs. 102-4 on Tuesday while the Shravan delivery was no less strong at Rs. 100-11.

The precise stock position, it is always difficult to know. A conservative estimate puts it at around 20,000 tolas of gold. With such low stocks the bears find it difficult to arrange delivery. The bulls, on their part, are in no position to take delivery, either. But they also know that they will not be asked to and have thus the upper hand. For stock, the market has to depend entirely on arrivals from upcountry as the only other source of supply, viz. smuggled gold, has been becoming increasingly weak, thanks to stricter vigilance on the part of the authorities.

Company Notes

Tata Oil Raises Dividend

THE raising of the dividend on ordinary shares from Rs 2 to Rs. 3 tax-free and a proposal to issue bonus shares at the rate of one ordinary share for every five shares held, form the highlights of the report of the Tata Oil Mills Company Limited for the year ending March 31, 1956. There has been considerable improvement in the position of the company during the year. Gross revenue rose from Rs 4.63 crores to Rs. 5.74 crores, while gross profits prior to depreciation, Managing Agents Commission, taxes and reserves, were higher than last year by Rs 25 lakhs.

The directors have taken this opportunity to allocate Rs 11.75 lakhs to depreciation including about Rs 3 lakhs towards inadequate provision in past years. This year's provision compares with Rs. 9.70 lakhs provided last year. The directors have also credited one lakh of rupees saved in taxation as a result of the special development rebate instituted last year to a special development fund created for the purpose. A deferred taxation reserve has been initiated with Rs. 3 lakhs "to provide for increased tax liabilities in the future".

After allocating Rs. 0.5 lakh to the reserve for bad and doubtful debts and Rs. 1.5 lakhs to the sales promotion reserve, a balance of Rs. 9.87 lakhs is available for distribution. The directors have recommended a dividend of Rs. 4-8 on the 4½ per cent Cumulative Deferred Shares, and a higher dividend of Rs 3 per share on the ordinary shares to absorb over Rs 2.80 lakhs more than were absorbed by dividend payments last year.

It is undeniable that the allocations to various reserves appear to be on the cautious side, justifying the payment of a higher dividend. It is worth noting, however, that while the dividend payment absorbs an additional Rs. 2.80 lakhs as compared with last year, the Profit and Loss Account notes that, "Change in mode of valuation of the closing stocks in process this year has resulted in an increase in the gross profit of about Rs. 3 lakhs." Gross profit before taxes was Rs 25 lakhs higher than last year. Provision for taxation is higher by roughly Rs. 11 lakhs. In other words, after tax the directors had roughly an additional Rs 12 lakhs to work with, of which Rs. 3 lakhs were the result of the change in the mode of valuation of stocks. Clearly, this does not reflect in any way on the financial propriety of raising the dividend, which is now at the highest level in recent years.

The Report indicates that the company is expanding its activities in various ways. A small soap factory in Calcutta has been purchased at a cost of Rs. 3 lakhs and additional equipment is being installed therein, after which it is expected to go into production. Modifications are being made in the company's plant at Bombay to enable it to compress oxygen produced as a by-product which is being sold to the Indian Oxygen and Acetylene Company. A new packet making machine has been ordered for the Calcutta factory.

The current year's report includes the report of the Lakme Private Limited, which is a wholly owned subsidiary of Tata Oil Mills. This company suffered a loss of Rs 77,200. The loss has been carried forward in the balance sheet of that company and no adjustment for it has been made in the accounts of the Tata Oil Mills Company Limited.

LEIPZIG FAIR

AUTUMN 1956

SAMPLE FAIR

Including Technical Consumer Goods 2nd - 9th September

(Indian Pavilion at the Leipzig Spring Fair 1956)

The Leipzig Autumn Fair 1956 will show to World buyers a range of consumer goods wider than any previously brought together. The leading manufacturers of the German Democratic Republic, the German Federal Republic, and more than 30 foreign countries will be showing on more than 1,200,000 square feet floor space.

TRADE GROUPS :

Arts and Crafts, Chemical, Pharmaceutical and Cosmetic products, Hairdresser's requisites. Fancy goods, Travel Goods, Souvenirs, Foodstuffs and Stimulants, Beverages, Tobacco, Furniture. Jewellery and goods of precious metal, Watches and Clocks, Lamps, Fittings, Lampshades and accessories, Leather Goods. Paper, Cardboard, Printing products, Bookbinding products, Paper and Stationery for offices, Mechanical Teaching Aids, Porcelain, Earthenware and Pottery, Shoes and accessories, textile goods and Clothing, Toys. etc.

TECHNICAL CONSUMER GOODS :

Electrical appliances — radios — cameras — optical articles —typewriters and calculating machines — all kinds of technical commodities — all kinds of vehicles and accessories — motorcycles — bicycles.

OFFICIAL FAIR IDENTITY CARDS WILL BE AVAILABLE FROM :

LEIPZIG FAIR AGENCY,

3rd Floor, Mustafa Building, Sir Pherozshah Mehta Road, Bombay-1.

A FAIR VISA WILL ALSO BE REQUIRED :

Exhibitors and visitors can obtain a Fair Visa by presenting their passport and official Fair identity card at the Berlin Office of the Leipzig Fair Administration, Berlin NW-77, Unter den Linden 54 or at Airport Leipzig of the Deutsche Lufthansa or at any of the recognised control points on the borders of the German Democratic Republic.

INFORMATION MAY BE OBTAINED FROM THE

Trade Representation of the Foreign Trade Organisations of the German Democratic Republic,

23, CURZON ROAD, NEW DELHI.

Branch Offices :

Bombay : Mistry Bhavan, 122, Dinshaw Wacha Road. Calcutta : Faraday House, P-17, Mission Row Extension.

Opportunist Solution

DELHI is the capital of the Republic of India. But Delhi is far away from Bombay or Poona or Nagpur. Even as Delhi does not record faithfully all the feelings of Poona or Nagpur or Ahmedabad, the Congress Government and Parliament do not always mirror the wishes of the people. On the question of re-organisation of States on the linguistic basis, the Congress Government and the nation speak with two voices. Because Parliament has accepted a proposal for a composite bilingual Bombay State, it does not necessarily mean that either Gujeratis or Maharashtrians have abandoned their demand for separate linguistic States. New Delhi is jubilant about the plan. Neither Bombay nor Ahmedabad is. Pandit Pant has welcomed it as "a national solution to a national problem". Because on this issue Parliament does not reflect the wishes of the people, the solution evolved and accepted by Parliament is not a true "national" verdict. That is why the "national" problem of linguistic States remains unsolved.

Congress alone is responsible for creating the "vexed" problem of Bombay. It has heaved a sigh of relief that non-Congress leaders like Shri Ashoka Mehta and Mr Frank Anthony have initiated a plan for Bombay which is supposed to be a just solution of the dilemma of its own creation. Pandit Nehru, who has never been able to appreciate the logic or the need of the demand for linguistic States, may take comfort that the new plan for Bombay will help Congress to re-discover its national moorings. Parliament may feel proud that it has soared above alleged parochial or partisan interests to function as a national, representative legislative organ. But the new Bombay plan, initiated by some members of Parliament, endorsed by the Nehru Government and accepted by Parliament, can only widen the gulf between the people and their chosen leaders and institutions. Despite the Speaker's ruling, there are many who will endorse the argument that, as the new plan for bilingual Bombay is different from that incorporated in the States Reorganisation Bill, the new proposal should be first considered by the four State Assemblies concerned before Parliament can vote on it. Parliament and the Congress Government may have the constitutional right, but no moral authority to impose their plan against the wishes of the people without seeking a fresh mandate on the issue in dispute.

For a proper appreciation of the new Bombay plan, it is necessary to recall the history of the controversy about the proposed Bombay State. SRC was in favour of a bilingual Bombay State, though it conceded the Maharashtrian claim for a linguistic State by proposing Vidarbha. Neither Gujeratis nor Maharashtrians accepted the proposal. Though the Gujerat Pradesh Congress Committee was insistent on its demand for a separate Gujerati State, the Maharashtra Pradesh Congress Committee suggested certain amendments which anticipated the present new plan for a bigger, bilingual Bombay State. Such plan was not accepted then mainly because of opposition from Ahmedabad. Only then Poona revived the demand for Samyukta Maharashtra, including Bombay City. In return for a separate Gujerati State, Ahmedabad became reconciled to Samyukta Maharashtra, but hotly contested the

Maharashtrian demand for inclusion of Bombay City in Maharashtra. As a result of negotiations, New Delhi accepted the demands for a separate Gujerati State and for Samyukta Maharashtra, but rejected the Maharashtrian claims over Bombay City. This provoked widespread violence. Confronted with the ugly situation, New Delhi decided to enforce Central administration over Bombay City for, say, five years, after which Bombay City was to be allowed free choice to settle its future status. This solution was unacceptable to Maharashtrians. While this provision of the States Reorganisation Bill was under discussion, some members of Parliament, mostly from the States not directly affected, sponsored the plan for a bigger, bilingual Bombay. This new plan was accepted by the Union Cabinet, and passed by Parliament.

There are reasons why Ahmedabad is more hostile than Poona to the new plan. In such a bigger Bombay State, Gujeratis will be in a minority. This explains why influential Gujerati political and industrial interests are lukewarm about the new proposal. Even the Gujerat Pradesh Congress Committee is opposed to it. Though some Congress members of Parliament and of Bombay Assembly from Maharashtra have accepted the new plan, the Maharashtra Pradesh Congress Committee is sceptical about it. Differences between the Congress party and the Congress Government pose issues which are not without significance. More relevant is the popular resentment against the bigger Bombay plan. Pandit Pant has admonished Hindu Mahasabha and CPI, the two parties who are stoutly opposed to the formation of bilingual States, for their subversive tactics. But there are many thinking persons who are convinced that a bigger bilingual Bombay is no solution to the problem, though they are neither Communists nor communalists.

Demand for linguistic States has no irredentist implications. Some Maharashtrian Congress leaders may find it politic to exploit the inexplicable Congress attitude to linguistic States by endorsing the new Bombay plan so that Maharashtrians can dominate the new State. But the people of Maharashtra may yet foil the attempts of these political opportunists. If the bigger bilingual Bombay plan is finally forced on the people, it may revive the idea of bigger regional States. Such a redrawing of the map of India into four or five large group States has the support of Pandit Pant and Rajaji. Kaka Saheb Kalelkar's hope that the new Bombay plan will evoke a sympathetic response in Bihar and West Bengal for the merger of these two States is not likely to materialise. If the bigger Bombay plan is finally accepted, there will be two unwieldy States which must inevitably overshadow the other smaller States. This may win popular support for large regional States. There are obvious dangers to such a re-grouping of States. Congress is dishonest in not recognising this major threat to the territorial integrity and cohesion of the Republic of India.

Wise Decision

IF Cairo was peeved at New Delhi's diplomatic silence. Egypt now has the assurance that India can never be a party to any decision or action which prejudices the sovereignty or dignity of Egypt. India's acceptance of the Three-Power invitation to attend London Conference to discuss the issues arising out of Egypt's decision to nationalise the Suez Canal Company will be welcomed in the wider interests of world peace. But Pandit Nehru has made it abundantly clear that India's decision to attend the London Conference is conditional. Pandit Nehru is emphatic that India's participation in the Conference does not imply her approval of the Western Powers' policy to Egypt. New Delhi does not accept the Western Powers' accusation that President Nasser's action is "arbitrary and unilateral". India is not attending the London Conference to "consider the establishment of international control over the Suez Canal". Her acceptance of the Three-Power invitation does not mean her endorsement of the agenda, aims and composition of the London Conference, as formulated unilaterally by Britain, France and America. Only after Britain's assurances on these vital issues has India agreed to attend the London Conference.

Even as Pandit Nehru's statement is an implied admonition to the Western Powers for their arrogant behaviour, the Prime Minister is emphatic that no solution of the Suez Canal issue is acceptable which does not assure the sovereignty of Egypt. It is clear from the Prime Minister's statement that India's participation in the London Conference is not meant to be a reflection on Egypt's dignity and sovereign rights. India has accepted the Three-Power invitation in the sure knowledge that no final decision can be reached by the London Conference. India is aware that Egypt could not and would not attend the London Conference to which she is merely an invitee. Without Egypt's participation and agreement, the London Conference can arrive at no final decision. India's decision to attend the London Conference with this explicit reservation is a positive assurance to Cairo that she will not endorse any plan for solving the dispute which injures Egypt's dignity and sovereign rights.

Despite the provocative solution incorporated in the Three-Power communique, the issues arising out of President Nasser's decision to nationalise the Suez Canal Company are now better appreciated. Egypt's sovereign right to nationalise the Company has never been seriously questioned. That the Suez Canal is an international water way, is emphasised in the relevant Conventions and Agreements. President Nasser has nationalised the Canal Company. But he has never denied or disowned the international character of the Suez Canal. He has guaranteed freedom of navigation in the Canal. He will uphold the Constantinople Convention of 1888. Terms of the Canal concession are embodied in the original Charter of 1956. This Charter will expire in 1968. President Nasser and his predecessor governments have openly announced that the concession of the Suez Canal Company will not be renewed after 1968. This is what Sir Anthony Eden ignores when he declares that Britain will accept no solution which leaves the Canal under a single Power. Much has been sought to be made of the international character of the Canal. The case for international control or administration of the Suez Canal is supposed to rest on the argument that it is a major international waterway. President Nasser has now done what he would be entitled to do twelve years hence. Could Britain or France or America insist on international control and administration of the Suez Canal after 1968? What they would not be in a position to propose in 1968, they cannot demand as of right now.

India is interested in the freedom of navigation through the Suez Canal. But this is not the main reason behind her decision to attend the London Conference. A grave crisis has arisen as a sequel to Egypt's decision to nationalise the Suez Canal Company. There is a distinct danger that, in the absence of an amicable agreement, the dispute between Egypt and the Western Powers may hasten a world conflict. To avert this danger, it is first necessary to create a congenial atmosphere so that the issue in dispute can be discussed without passion. Both sides in the dispute have a responsibility not to adopt measures which are likely to intensify the tension. Pandit Nehru's appeal to both sides to refrain from pursuing hostile measures and actions will be widely echoed. India's foreign policy is based on the principle of reconciliation of disputes through negotiation. She is "passionately interested in averting a conflict". She is attending the London Conference in the hope that she, in consultation with the other participants, will succeed in evolving a formula which will be accepted by both parties as an honourable solution. Such a compromise plan must necessarily be based on the recognition of Egypt's full sovereign rights. Egypt's behaviour since nationalisation of the Canal Company indicates that apprehensions about the continued freedom of navigation through the Canal are exaggerated. This encourages the hope that the efforts of peacemakers, including India, will succeed in evolving a solution for the crisis, which all parties in the dispute can accept without prejudice to their legitimate rights and interests.

Weekly Notes

Lower Rate for Nepali Rupee

THE news agency message that the State Bank of Nepal has lowered the exchange rate for the Nepali rupee from 128 to 145 for 100 Indian rupees, will puzzle only those who have not been following currency developments in Nepal. The official rate now lowered was fixed only on April 16, along with the inauguration of the State Bank. It was announced then that Nepali currency would be exchanged at all Government Treasuries (mainly for the payment of land revenue) in the Tarai, but Indian currency would also continue to be accepted freely. The Nepali rupee has been going down for some years. A couple of years ago, the free market rate was around rupees 200 Nepali for 100 Indian rupees. For some years now, some sort of control has been attempted but it has never been complete or successful.

In April last year, Nepal Government accepted the responsibility of supplying Indian currency at a fixed rate for essential imports; it also put a ban on non-essential imports. In practice, however, it appears to have operated or allowed a system of multiple exchange rates, exchange at a more favourable rate being allowed for certain approved purposes. The agency message adds that exchange at the rate now fixed will be made available to Nepali merchants needing Indian money to export essential commodities from India. Obviously it follows that the free market rate for the Nepali rupee must be much more unfavourable. Otherwise one can make no sense of the other news that passengers travelling by air from Khatmandu to India will also have the 'privilege' of the new exchange rate. That is to say, air travel is now included among the essential purposes for which exchange at the official rate is allowed.

A special feature of the currency system of Nepal has been the circulation side by side of both Nepali and Indian rupee. This has gone on all along. In the more prosperous Terai in the Indian plain, not only does the Indian rupee circulate freely; it is also legal tender. In fact, it is the only currency in which land revenue is collected in Terai. In the poorer mountainous regions as also in the Khatmandu Valley, however, the Nepali rupee is still the customary means of payment. The Indian rupee area seems to be gradually expanding and of late, with the opening up of Nepal through the construction of roads and operation of air lines, its expansion has been vigorous. Gresham's Law has been at work. As the Nepali rupee is now entirely a fiduciary circulation, its retention and limited use should present no difficulty, once the changeover is completed. There is little doubt about the flight of the Nepali rupee and the process is bound to be accelerated, with the opening up of the country in the period of development which Nepal has now entered.

Multi-purpose Projects

LITTLE originality and too much of slap-dash American methods, this is the impression of most foreign observers who visit our multipurpose projects which were our most important show-pieces, until the Village Industries Emporia and the Handloom Board set up counter-attractions by taking up prominent and more easily accessible sites and displayed their wares. This impression may be erroneous and merely superficial, because one sees more or less the same things—bulldozers, trucks, pneumatic drills, heavy earth moving machinery, batching plants and concrete being poured into dam sites. There may be some features perhaps in the structure and design in which Indian engineers have contributed some thing of real value and from which others may learn and benefit. But what these special points of excellence are can be brought out only by experts. For a time, the labour intensive methods tried out on the Kosi project were much publicised. Surely the experience must be worth analysing and if, as is reported, the various methods of construction through voluntary labour, village co-operation, contract labour etc. produced strikingly different results, the lessons learnt should be of immense interest and of great value in planning construction projects during the Second Plan period.

But a cursory view of the projects does not, at sight, indicate much scope for varying the proportions of labour and capital, or of much flexibility in the choice of equipment, considering that the projects are planned as a whole, and are to be completed according to schedule. This is inevitable when heavy and expensive equipment is used and the different jobs have to be synchronised. Had the projects been planned over a much longer time, perhaps the scope for using more labour intensive methods could be greater, provided the much bigger problem of organisation which the latter involves could be successfully tackled. It is not often realised how difficult these problems are and how inevitably they restrict the choice of techniques.

Concrete vs Masonry Dams

TAKE the question of the relative place of concrete and masonry in construction of dams. This is a subject which crops up every year at the annual Seminar of Engineers organised by the Ministry of Irrigation and Power. At the last Seminar which was held in Srinagar in July, for which the proceedings are now available, the position was given out as follows:

"The choice of construction material for dams and the River Valley Projects in India has been a subject of great controversy. There are two schools of thought, one, which believes that stone masonry is better and cheaper construction material for building dams in India, while the other school thinks that concrete is safer and a superior material for construction of dams. Due to a great difference in unit rates it has become increasingly important to know the relative place of these two materials in construction of dams."

"This subject was, therefore, introduced at the last Seminar but discussions could not be held for want of relevant data. It was then agreed that the Rates & Cost Committee which was already dealing with the allied subject of unit rates should also go into the question of unit rates for concrete and masonry and give its recommendations for discussion at the next Seminar".

Naturally, rates and costs is another subject on which engineers devote a lot of time at their conferences but the issue cannot be decided entirely in terms of relative costs for the simple reason that a high degree of standardisation can be ensured in the case of concrete but not when brick and mortar is used. The question remains in the latter case, of choosing the right bricks—it is a matter of eye examination, no foolproof standardisation is practicable—neither can the composition of mortar be standardised. This might sound absurd but a moment's reflection will show the catch in the argument. The proportion of the various constituents of mortar can be laid down all right. But to ensure exactness when large numbers of workers are involved and supervision has necessarily to be left to a proportionately large number of not too highly paid or responsible staff is not easy. In fact the risk involved is so great as to deter construction engineers who have a reputation to lose to fight shy of it. True enough, the entire length of the dam need not have the same strength and therefore various combinations of materials may meet the requirements, subject to standards being followed but standards are so difficult to enforce, except under controlled conditions. Suppose a masonry dam develops a crack or leaks, what then?

To the general question of the proper organisation for the execution of such projects, departmental construction vs construction companies, a sharp edge was given by the proposal for forming a National Construction Corporation in the public sector. The proposal is supposed to have been blessed by the Ministry but has not made any progress and the latest of the larger projects, Koyna, has been entrusted to a firm of contractors.

Standardisation of Equipment

AMONG the other hardy perennials in the Engineer's Seminar besides requirements, training and phasing of technical personnel, has figured prominently the question of standardisation of plant and machinery used on such projects. A Committee was set up for the purpose years ago. Subsequently, the matter has been looked into by the Standing Committee of the Ministry and later by the Co-ordination Board of Ministers who accepted a most important recommendation of the Committee to the effect that the machinery on River Valley Projects should be standardised. Finally, last week, the Government announced that it had accepted the proposal in principle but subject to one important proviso, namely that in view of the danger that a monopoly may be created in selecting a limited range of equipment, standardisation will not preclude Government from considering other makes and designs. The use of the word standardisation in this context calls for an explanation, however, as the equipment, used for the projects are all standard equipment in the sense of being patented machinery manufactured by established manufacturers. The point is to choose the ones which have been found by experience to be the most suitable. The choice has been found in practice to be infinitely difficult. The questions to be considered were:

(a) Performance.

(b) After-sales service and availability of spare parts.

(c) Definite indication of manufacture in the country of spares and machines will be an added consideration.

If these are satisfactory, then alone should the question of initial cost be considered.

The present decision is confined only to certain types of heavy earth moving machinery. It may be supposed that when the question of proper equipment is considered, it should be possible to pool purchases as also to set up a central store for spares, so that the equipment could be utilised to the maximum advantage and the cost of servicing reduced to a minimum. It does not appear, however, that this was ever seriously considered. The proposal was not found feasible at all, though the Committee felt that "Investment on equipment will be on the increase in the future and the earlier a positive planning in this direction is done, the better will it be". The Committee recommended, instead, that the States should individually organise a pool for spares for their major irrigation projects as Bombay has done.

Servicing and Manufacturing

APART from the difficulty of selections of proper equipment on the basis of their past performance, current practice in respect of spares appears to be chaotic in the extreme. At the Engineers' Seminar at Nangal (January 1954) it was disclosed that according to the present practice when ordering any machines, indent is placed for spare parts of the value of about 10 per cent. In U. S, the normal practice, to quote the same source, is to provide spares of the value of 12½ per cent of the cost of the equipment annually. At Bhakra, parts worth about 40 per cent of the cost of the machine are ordered with the machine and at Nangal, 25 per cent for two years consumption, etc. When servicing is done by the commercial suppliers of equipment, further complications arise over the pricing of spares, as fast selling spares are sold cheap while prices of other spares are often heavily loaded by the cost of servicing. At the Nangal Seminar, the position regarding manufacture of spares within the country was given out as follows:

"At present each project makes an indifferent job of trying to manufacture some of the spare parts. If the requirements of all the projects in the country in respect of spare parts could be pooled, it should be possible to suitably equip one or two workshops for the manufacture of some of these parts. The Punjab Government's workshop at Amritsar may be in a position to initiate work in this respect".

But why single out any one workshop?

Electoral Marriage

NEITHER the Communists nor the Praja Socialists are strong enough to form a government in any of the States. Even as a United Front, they may not capture more than one or two States. But, with an alliance, they may succeed not only in forming governments in one or two States, but may also emerge as a strong opposition in some States as well as in Parliament. Political tactics, therefore, dictate an electoral alliance between the parties of the

Left. There are possibilities of such an alliance in Travancore-Cochin, West Bengal and Maharashtra. Jayaprakash Narain has shown statesmanship in favouring such an alliance. None of the parties of the Left can oust Congress from power. But together, they can form a strong powerful Opposition in all State Assemblies and in Parliament. Thus alone can the parties of the Left influence the Congress Government, as Jayaprakash argues rightly, to implement Avadi.

There are obstacles to forming a United Front. PSP and some other parties of the Left are not likely to combine with Communists in formulating a common minimum programme. Coalition governments may not be ruled out of consideration in some States where the combined parties of the Left may emerge victorious in the elections. But a United Front is not necessarily an essential condition for an electoral alliance among parties of the Left. In West Bengal, PSP and CPI are discussing prospects of pooling their resources and candidates for contesting Congress more effectively in the elections. Even such a fluid alliance has some advantages. For obvious reasons, Congress has started a campaign against such electioneering tactics. But the parties of the Left would be unwise in being influenced by such campaign by Congress. In the wider interests of a robust party system of government, there will be hope that Jayaprakash's realistic suggestion will be endorsed by the national executive of PSP.

Debts Annulled

INDONESIA'S refusal to recognise debts to Holland may have been inspired and timed by Colonel Nasser's decision to nationalise the Suez Canal Company. But Djakarta's action is not comparable to that of Cairo. Egypt has agreed to pay compensation to the foreign stock-holders of the Canal Company on a basis which is widely accepted as just. Indonesia's case is different. Of her total debt of 4,081 million guilders, 3,000 million guilders represent the cost of Holland's "war against the Republic of Indonesia". Djakarta has some justification in regarding this part of the debt as questionable. With the exception of Finland, there are not many countries who has a clean record in relation to war debts. Should Indonesia pay the cost of keeping in subjection beyond all that she has paid so dearly? This aspect of the problem must be taken into consideration in assessing Indonesia's action.

Djakarta has announced that it will honour debts contracted by the NEI administration with 'third parties". This is meant to reflect Djakarta's intention to discharge international obligations except to her former oppressors. It is clear that Djakarta's decision to disown debts to Holland springs from the abrogation of the Dutch-Indonesian Agreement in 1948. Holland is reconciled to this abrogation of the Agreement, though there is still dispute over the West Indies. Under this Agreement, Indonesia agreed to accept the outstanding obligations of the NEI administration as well as to continue special guarantees and privileges held by Dutch interests in Indonesia. With the abrogation of the 1948 Agreement, these financial and economic undertakings by Indonesia also ceased to be operative. This is the legal defence behind Djakarta's present decision to disown debts to Holland.

Egyptian Jute Mills

PAKISTAN has been active, not only in developing and planning the development of jute manufactures within her own borders but in assisting manufacturers abroad. A striking example of it is Pakistan's collaboration in the establishment of a jute mill in Egypt. Not being in a position to subscribe to the capital of this mill—her balance of payments rule out the possibility—Pakistan has offered to pay her subscription of capital in kind and has agreed to supply raw jute over a period of years in lieu of cash. An important aspect of recent developments in Egypt is her eagerness to establish closer economic relations not only with the Communist bloc but also with South East Asian countries. Egypt has been keenly interested in importing any kind of manufactures and machinery from India, but her explorations have not been very successful so far. She needs everything that a country needs for industrialization—light engineering products, diesel engines, telephone equipment, machine tools, yes, even India-made machine tools, if India can spare.

This throws an interesting sidelight on the present Egyptian imbroglio and pre-dates the refusal of the exchange banks to open letters of credit on Egypt. Egypt is not doctrinaire socialist and invites active collaboration of Indian and other industrialists to participate in her development, on her own terms. But so far response has been poor, except from the Birlas who are investigating possibilities for setting up a rayon plant in Egypt. Birlas are already committed to two such propositions in West Asia.

The latest issue of the **Jute Bulletin** published by the Indian Central Jute Committee mentions two jute mills in Egypt. One is the mill at Shubra-el-Kheima, Cairo, which has been taken over by a new company which is installing new equipment in the mill in order to raise its production capacity from 2,500 tons to 8,000 tons a year. The other jute mill is under construction and will have double the capacity of the first mill. Pakistan's capital is presumably in the second mill.

Our Delhi Letter

South Block Changes Its Tactics

MANIFESTATIONS of New Delhi's interest in the Suez question, culminating in Pandit Nehru's statement to Parliament, are important not merely because of the contribution they might make to the relaxation of international tension, they also mark a slight but significant departure in Indian diplomacy. India's mediatory role in Korea and later in Indo-China was preceded by activity wrapped up in a thick shroud of secrecy; similarly Indian proposals to end the crisis in Algeria came something like a surprise. But South Block's reactions to developments following the nationalisation of the Suez Canal periodically leaked to the press and Pandit Nehru hardly told Lok Sabha anything more than what had been said before by newspapermen some time or the other. The External Affairs Ministry thus did use publicity, to a certain extent, to create a favourable climate for the Prime Minister's considered pronouncement—and employed a method that was hitherto considered too subtle for application to situations of such delicacy.

The Prime Minister's statement was also remarkable for its powerful advocacy of the Egyptian case; its partisan tenor was clearly intended to disillusion the West that India would try to hold the balance even by giving up the emphasis on what she considered to be right. In fact so close seemed to be the identity of approach between India and Egypt that the only element of hard "news" in the Prime Minister's pronouncement disclosed not New Delhi's but Cairo's intentions. It was through Pandit Nehru that the world first learnt of Egypt's inability to attend the 24-nation conference convened by U K, France and the U S. Pandit Nehru referred as many as eight times to the "sovereignty" of Egypt. In contrast, the Western viewpoint was deliberately soft-pedalled.

India is trying to bring about a settlement in Algeria by playing up the French. The opposite technique is being adopted in regard to Egypt. The objective in either case is to create suitable conditions for a negotiated deal with Arab nationalist aspirations. It is being hoped that the hesitating manner in which India has accepted an invitation that Egypt will reject might have a sobering effect on the sponsors of the meeting. In any case, India is unlikely to accede to anything beyond the proposal that an international advisory body, preferably under the auspices of the United Nations, might be created to help the organisation established by the Egyptian Government for administering the canal. The international body would have a strictly advisory role and no mandatory powers to detract from the sovereignty of Egypt over the Canal.

Pandit Nehru's denunciation of "postures of strength" adopted by Britain and France stems from something more than India's passion for peace in the customary sense. New Delhi has reason to believe that the Western powers have been deliberately provoking Egypt to close the Suez Canal so as to justify a subsequent use of force; the paradox is that those who are ostensibly trying to keep the canal free and open would be delighted if, at the moment, the Nasser Government held up ships passing through it. Ships of Britain and France as well as of many other countries have instructions to pay Canal dues to the account of the defunct Company in London or Paris where these funds get automatically "frozen". Thus the nationalisation law of the Nasser Government is being flagrantly and provocatively flouted. Cairo, conscious of the Anglo-French intentions, is ignoring the breach but cannot publicise the fact for obvious reasons. India would naturally take up the question of releasing the sterling assets of Egypt at the appropriate time. India's objections to the list of invitees to the Conference will also be pursued. It is doubtful if anything positive and very favourable for the sponsors would emerge from a conference where at least 5 of the participants, including the U S S R, would strongly side with Egypt.

* * *

The Government of India have ordered investigations likely to cost Rs 5 lakhs for constructing a channel between India and Ceylon to obviate the 300-mile trip that large ships have now to make round the island.

Hydrographic surveys and deep drilling will be undertaken to collect data about soil conditions between the Gulf of Mannar and Palk Strait. A site near Pamban Channel is being contemplated for constructing a canal through shallow and reef-strewn waters that cannot otherwise be negotiated by all but tiny crafts.

The Canal will be 5,400 yards long, 32 feet deep and 150 feet wide at the bottom. In addition, the construction of five approach channels and a canal lock and the development of the port of Tuticorin are major parts of the project.

The Government of India appointed a Committee to draw up the project which has been urged by national shipping interests to speed up transport facilities both for coastal and foreign trade. The Committee's recommendations, now available to the Government, involve an outlay of about Rs. 10 crores. Official circles however believe that this sum is an under-estimate and therefore detailed investigations have been ordered.

The Committee considered that the Sethusamudran route, as it is called, would not be a complete alternative to the longer round-Ceylon route unless port facilities equivalent to those at the Colombo harbour are developed. Tuticorin, which handles 460,000 tons of cargo annually, is the obvious choice.

A lock is necessary in the Canal because during the northeast monsoon the sea level in the Palk Strait is higher than in the Gulf of Mannar and reverse is the case during the southwest monsoon. In the absence of a lock, strong currents might erode the banks of the canal and hinder navigation.

The results of the investigations now ordered are likely to be available in about 6 months.

Letters to the Editor

Demand for Food Grains

—Its Statistical Measurement

IN his article "Consumer Goods and Disposable Income—Do they balance in the Second Plan" in your Second Five Year Plan number (p 735) Shri A Rudra, you say in the introduction, "attempts a statistical estimate of the demand for foodgrains likely to arise in the Plan period. The results suggest that the target has been fixed rather on the high side and this leads him to the conclusion that the disposable income in the last plan year may be made larger without any fear of foodgrains prices rising in consequence".

The burden of the proof of the conclusion is in the following two paras:

"The target of foodgrains is to increase production by 15 per cent over the 1955-56 level. As the national consumption is targetted to rise only by 20 per cent, it implies that elasticity (with respect to total consumption) of foodgrains consumption has got to be 0.75 if production is assumed to equal consumption both in 1955-56 and 1960-61. For the population goes up by 6.5 per cent during the five years, so that the increase in the per capita total consumption of foodgrains is 8 per cent. This of course means .... that the elasticity is about 0.75. But this is a fantastically high figure for foodgrains.

"Experience suggests that the elasticity of the foodgrains cannot be so high. It cannot exceed 0.3 or 0.4 for the whole of India" (p 738).

The author, has not given any data showing that such elasticity is less than 0.4. The data collected by Agricultural Labour Enquiry, however, leads one to expect a much higher value as will be seen from the food expenditure data, according to the economic level of living (expenditure per consumption unit), given in Agricultural Labour Enquiry. Report on Intensive Survey Vol I All India, Table No 10, p 230.

Economic level of living	Total Expenditure per consumption unit	Food Expenditure per consumption unit
	Rs.	Rs
0 - 50	44.7	37.3
51 - 100	79.8	68.1
101 - 150	122.2	104.4
151 - 200	170.3	144.5
201 - 250	216.3	184.1
251 - 300	261.7	220.4
301 - 350	306.6	256.6
351 and above	411.8	347.6

Elasticity of food consumption with respect to total consumption=0.996

It will be seen from the table that the food elasticity with respect to total expenditure for agricultural labour was about 1.00 in the year 1950-51. The elasticity at the present time and for total population may be slightly different; nevertheless, in view of the above the estimate 0.75 for the elasticity does not seem to be a "fantastically high figure". If the increased national income goes largely to raise the economic level of living of the poorest sections, the above estimate may well prove to be too low.

In the conclusion of his article Shri A Rudra has made an appeal for the collection of "very detailed data about consumption habits of different classes of consumers." In fact such data are being collected on a sufficiently large scale by the National Sample Survey in its various rounds. But the findings are not being presented in a form in which they can be readily used for the above purpose.

Profile of a Southern State

WILL you permit me to offer some comments (though belated) by way of a footnote to the discerning article, "Profile of a Southern State—Mysore," published in your issue of July 21?

Sometime ago I met a prosperous Mysore businessman. He was the old type, obviously traditionalist and conservative with a healthy respect for the Ruling house, wealth, position, authority, titles and decorations. He was the type who considered it a privilege to attend the Dassarah durbar decked in a lace turban, cummerband and all.

There were others concerned with business in the company and the conversation was generally about banking, insurance and allied subjects in which it was difficult for me even to pretend to take an interest. But I sat up and began to take notice when I found the businessman exploding with vehemence and declaring, "He is a fool, he is a fool," in relation to the Rajpramukh of Mysore.

I gathered from the conversation that there was an election for a directorship of the Mysore Bank. There was a Lingayat and a non-Lingayat in the running. It seems that the Murghee Muth of Chithaldurg, one of the important religious seats of the Lingayats, held a biggish block of shares in the bank. So did the Rajpramukh. Between them they helped to get the Lingayat elected instead of someone else, whose caste I did not inquire, but from the context, he may have been an Okkaliga.

I do not personally vouch for these facts. As facts they are not relevant in this context. What is important is that it was accepted as a norm of correct social conduct that voting for a bank directorship must go by caste. The unwritten rule was apparently so rigid and so universally accepted that it was assumed that even the Maharaja was bound by it. And apparently because he behaved differently, his conduct was felt to justify severe condemnation, without provoking even faint dissent, let alone a protest from a group of business-minded people.

That is an illustration of the new and fearful extension of the caste spirit in Mysore and maybe in other parts of India too.

Flibbertigibbet

AKG'S letter in your issue of July 28 was welcome recognition of the emergence of "Flibbertigibbet" in the **Economic Weekly**. That the welcome is not uncritical, although not all the criticism is characterised by clarity, is a tribute to AKG's intellectual alertness; perhaps it is also a measure of the provocative quality of your new columnist.

Preoccupation with civilizations of 3,000 years ago has, however, prevented AKG from getting some more recent facts right. What Kingsley Martin wrote in the **New Statesman and Nation** of May 12, 1956, was;

"No wonder that Beatrice Webb, who thought that the New Statesman should be a serious organ of Socialism, decided to dub me a 'flibbertigibbet.' She was quite right, and if I had known that she had so christened me in her diary , I would have signed my Diary Flibbertigibbet instead of Critic. This does not suggest —does it?—that Mr Martin rejected the name. AKG may also have exaggerated the "disdain" in Beatrice Webb's description.

As AKG does not criticise Flibbertigibbet on any concrete point I take it that he only disapproves the choice of this pen-name. It had never occurred to me, when I suggested this name to the writer, who already has three other pen-names, that so much significance attached to it!

By the way, are we a nation of sturdy archaeologists? Who ever heard of it before Lord Curzon? What interest did we ever take in our ancient civilisation before the German Indologists went to work? Jubilation at Great Turnstile is their business; what we need is a little less complacency. It is in this respect that I find Flibbertigibbet most stimulating; he irritates me as often as he makes me think.

Economics of Ambar Charka

ADDENDUM

PROFESSOR CHARLES BETTELHEIM and Dr A Rudra have kindly pointed out a serious mistake which has crept in my brief note on 'The Economics of Ambar Charka' in your issue of July 14, 1956. After defining 'the surplus effect of investment I said: 'It is obvious that it would be economically indefensible to invest in those techniques which require greater volume of capital for securing the same output'. This statement is incomplete, and in this form definitely incorrect. I should have added '..... unless it has a higher surplus effect.'

The implications of the word 'higher' in this addendum cannot be explained here. The significance of the surplus effect of investment for the choice of techniques would be discussed in greater detail in a paper under preparation, where an attempt will be made to lay down economic criteria for the choice of techniques. It will also be shown in that paper that under certain conditions it is necessary to invest in those techniques which require greater volume of capital for securing the same output from the point of view of the long-term rate of growth of an economy.

A Calcutta Diary

How Much Land Does A State Need?

THE dead are easy to deal with; burn them, bury them, or just let them go down the Hooghly. (There is a story, perhaps apocryphal, that a district magistrate, angered by his Chief Secretary's silence over repeated requests for instructions as to what he was expected to do with the refugees coming into his district, finally urged the sanction of only nine annas per refugee, that being the cost of a 303 bullet.) It is the dying who suffer and make others suffer. It begins quite well; everyone is full of sympathy, and some of them send flowers; the patient almost enjoys being the object of so much attention. Tensions begin to develop as time goes on. We are all capable of only a very limited amount of love, and the heart rebels against long leases. Affection, let us assume, remains. But attention begins to sag. No more flowers. Those who used to visit every other day now only leave a card, once a fortnight and then twice a year. As the patient languishes on, his craving for attention increases in the same proportion as the interest of friends and relations wanes. In the latter's minds then an unstated wish gets a lodgment: the patient has been unconscionably long a-dying. The dying man complains of indifference, of callousness, of cruelty. Anyone who has been through the experience of such protracted illness will understand that the indictment is only partially merited. The sick man of my analogy are the 2,890,400 refugees from East Pakistan. They have been in West Bengal since Independence, and the strain on them is now reaching a dangerous point—even as the not so healthy relation, West Bengal, is now sorely tried. The thing one must not do is to blame either party lightly; they are like a loveless couple locked in indissoluble marriage.

Last week the Government of West Bengal published the report of a survey of the conditions in which her displaced persons live. Conducted by the Government's statistical bureau, the survey confirms what has long been known to those familiar with the State: no country has faced a problem quite like this before. This fact must be remembered as often as the fact of the Government's nearly total failure to solve the problem. In April-May, 1955, when the survey took place, 2,723,900 displaced persons were living outside Government camps. Deaths among the migrants up to that time are estimated at 175,000. About 66,000 are said to have been settled in other States. "A large percentage of the refugees was in distress," says the report, and this is not an exaggeration. The loss to the host has also to be taken into account. The per capita income of migrants fell much below the average per capita income in India as a whole. "The shortage of income as a result of this low earning totalled about Rs 21.9 crores a year. To this extent the State's economic standard had been lowered." Add to this the fact that about 20,000 refugees are still coming every month.

* * *

The survey brings out several interesting facts about the refugees, not all of them equally depressing. If the birth rate among them is high, so also is the rate of literacy. If only a few care for manual labour, they are many more than they used to be. If the majority of the employment seekers are without any skill, some at least have shown not a little initiative in small industry. If only a few families have settled down outside the State, there is now increasing awareness of the fact that, however reconstituted, West Bengal cannot possibly make room for all the refugees. This lining up of credits and debits can go no further, for now has to be set down the plain fact that no serious dent has yet been made on the problem. Sadder, neither the Government of India nor the Government of West Bengal has even started moving in the direction of a solution.

The difficulties of the problem are incapable of exaggeration, but they are enhanced by the refusal of the Government and the refugees to face a few basic truths. The latter have shown altogether too little initiative; they are wrong in thinking that the Punjabi and the Sindhi have fared better only because they had received greater help. As for the Government, it still does not know the size of the problem on its hands. Is there any hope of the refugees going back to East Pakistan? Is rehabilitation to be planned on the basis that the last Hindu in East Bengal will eventually be squeezed out? When is relief to stop, and rehabilitation begin? To what extent is the Centre prepared to ensure help from neighbouring States? These are only a few of the questions which have not even been asked squarely, let alone answered.

* * *

It is impossible to prove that the West Bengal Relief and Rehabilitation Department is corrupt; it is not even necessary to prove that it is badly led. The Minister, a charming woman, has not got a clue of the magnitude of her task. She should ask for another portfolio. Would another Minister be up to the job? It is doubtful. Is the West Bengal administration itself inadequate? Very probably. Can the Centre take over? There will be political difficulties, and even for the Centre the charge may be too big. What is happening now is that between the Centre and the State Government they are providing some relief and just about no rehabilitation. The waste thus is twofold. Resources, inadequate in all conscience, are being wasted; men, women and children are suffering; and an eventual abiding solution is receding further because of the steady dissipation of funds. The unrehabilitated will soon be unrehabilitable. There are men who profit from the present situation, and soon they will be powerful enough to resist an end of the problem. The honest officers of the Department privately confess to a sense of despair.

How about making the confession public? The problem is too big for India to handle, and it has several international aspects. Whether or not it is Pakistan's deliberate policy to make it impossible for Hindus to live in East Bengal, the fact is that they cannot live there. Again, only the price of rice has to rise in East Pakistan to send a larger number of refugees to India. Only a United Nations agency can do anything about conditions inside Pakistan, India cannot. It is futile to enquire who is more responsible for the failure to resettle the refugees, the Centre or the State. But what objection can there be to inviting an international organisation to handle the problem—something on the lines

of UNRRA? Less serious problems have been referred to the United Nations. It would be an admission of failure, admittedly. Can the failure be denied? A UN agency will be above the stresses of domestic politics, a notorious bedeviller of the best laid schemes. It may even secure some additional help from other countries. It may have a chastening influence on the behaviour of Pakistan. The only thing a UN agency cannot change is the character of the refugees. But, with an impartial and efficient rehabilitation administration, it will be for the refugees to prove that their character needs no changing. At the moment there are too many scapegoats, too many convenient excuses. Have I made a fantastic suggestion? Well, the problem is fantastic. Why is the man with a better answer keeping quiet?

—Flibbertigibbet

A copy a minute!

Save time and money by using the Agfa Copyrapid Process to get photo-copies of anything from typed or handwritten letters and documents to intricate drawings, maps and plans.

Copyrapid Process is an Agfa invention and Agfa Copyrapid papers will give you Flash copies—a copy a minute—yet they can be handled in average room light; no dark-room is necessary for taking bright, clean, sharp copies. So simple is the process that even an office boy can do all your copying. Another advantage is that you yourself can photo-copy confidential documents without help from a member of your staff.

Whatever photo-copying machine you use, insist on world-famous Agfa Copyrapid papers. Various types of Positive Papers are available to suit individual requirements, including TRANSPARENT positives which can be used as master positives for blueprinting.

Their 'safe' sensitivity enables you to use them in average room light with real convenience.

10 TIMES FASTER THAN COPY TYPING and dead accurate too!

Agfa-Copyrapid paper Saves time and money!

Suez: Anglo-French Reaction in Perspective

"Madam, it's yours."

Disraeli in a memorandum to Queen Victoria.

THE frenzy and noise with which the Anglo-French counter-weight has been organised since the Egyptian nationalisation of the Suez Canal offers an interesting interpretation of history. One is reminded how in the less subtle years of late 19th Century international politics, Disraeli made British influence in Egypt paramount by buying up the Egyptian interest in the Canal from the bankrupt Khedive, thus checkmating France, then a serious contender in the general expansion of Europe. One is further reminded how having secured this paramountcy Britain still found French participation a necessity in the face of Bismarck's designs in the Near East. In the words of Lord Salisbury:

> "You may renounce or monopolize or share. Renouncing would have been to place the French across our road to India. Monopolizing would have been to risk an antagonistic alliance. So we resolved to share."

And so what was at the end of the last century a European expansionist rivalry as the causus belli for a French junior partnership in Britain's Near Eastern policy, has today become the popular forces of nationalism and self-determination.

The **Times**, which has always had the distinction of being a stickler for clear reasoning and for definition, called Egypt an "aggressor"—an epithet utterly improper from every point of view. Sabre-rattling coupled with the wildest provocation to patriotic and chauvinist fervour has been the feature of British politics since the Egyptian action. It is difficult to discern how far the French public were swayed in like manner, though the statements of the French Government at times bordered on insult reflecting a total lack of diplomatic finesse and observance of etiquette for which France is supposed to be reputed. And yet, behind the clamour — the call for some "action" and the mobilisation of troops and warships—there could be perceived an underlying recognition that nothing could be done which would alter the Egyptian decision. Indeed, the convening of an international conference can only be regarded as the last honourable device for burying what the **Times** called the "clearest of policies and the firmest of resolutions."

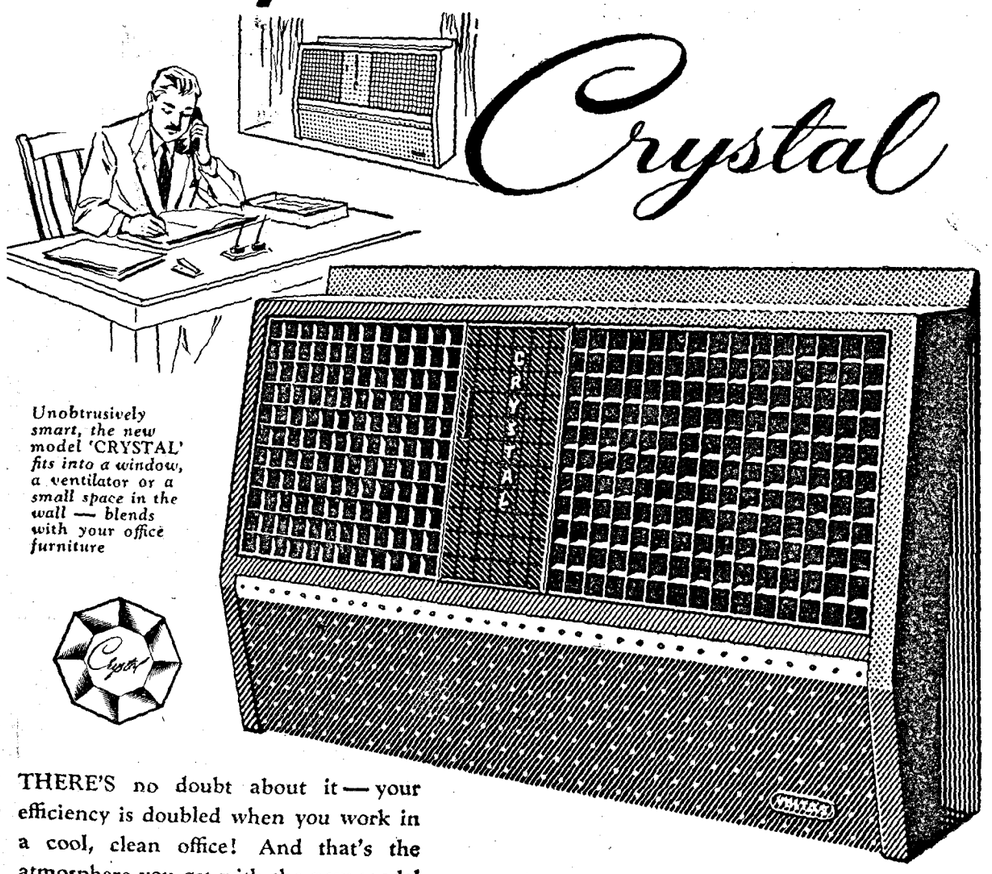
The House of Commons debate, widely publicised as "symbolising the unity of the nation" on the Suez question was the occasion for a remarkable flamboyancy in oration and jargon. From both sides of the House, one heard the Suez Canal being described variously as "our jugular vein", "Britain's Achille Heel" etc. and yet even the Suez Group of Tories were unable to prescribe a clear cut set of measures which would wipe off the Egyptian nationalisation decree. It is true that many of them spoke of "force, if necessary" but the vagueness of these threats was patent.

The use of force carries with it a set of consequences which is certainly understood in British thinking circles. But what these consequences are has not been publicised for obvious reasons. There has so far been only one exception to this and a remarkable one at that. The **Manchester Guardian** is the only journal which has espoused moderation in the light of the consequences of any employment of force. In a sharp comment on the **2nd August**, the **Guardian** declared that "there is no possible warrant for using force." The Egyptians have not committed any breach of international law and this was so in spite of the Prime Minister's fantastic view that the Universal Suez Company was in the "nature of an international agency." The **Guardian** attacked the **Times** for suggesting that British troops should occupy the Suez on the ground that the nationalisation of the Suez Canal Co "would destroy the UN and would land Britain in an appalling embroilment with at least three-fifths of the world ranged against her." And here emerges the one single flash of reason in the whole British debate. In direct contrast to the views of the **Times** (and this contrast is one of the most remarkable, if not unprecedented, in the history of British Public opinion) the **Guardian** says that any British military action would mean the naming of Britain as an "aggressor".

In France, the talk about alerting the Navy at Toulon and of other military measures is generally being treated with some amusement. French military power has still to live down its reputation at Dienbienphu and by the manner in which the French people are rebuffing the fiscal and military call-ups for the Algerian war, it now looks as if France faces a total military eclipse in the wastes of its once colonial empire.

The fundamental questions arising from the Suez nationalisation measures do not include what has certainly been the most publicised question so far: the free passage of all vessels through the canal. The Egyptians have not, and their assurances on this have to be accepted, committed a breach of the 1888 convention. The questions really basic in the dispute are the consequences to British influence in the entire Middle East of the acceptance of the Egyptian decision; in a word, the fate of British colonialism in that part of the world. In the words of Mr Gaitskell "the fact is that this episode must be regarded as part of the struggle for the mastery of the Middle East." There is a naked fear that the Arabs may one by one come to believe that after all the oil installations and oil transport undertakings should henceforth be used for their own profit and benefit. And as the **Guardian** put it, this realisation of social ownership will grow: "we may try to influence these processes by reason, but we cannot prevent them." The colonial feature of the question has been patent all along—it has been blurred somewhat by British Labour leaders supporting the Government, thus giving the very Tory organ **The Daily Telegraph** the cue:

> "Any attempt to describe the Western Powers' firm stand over Suez as further evidence of British Imperialism has been nipped in the bud by Mr Gaitskell's courageous support."



This only reflects the direction of Labour's view—a direction which has over the years contributed to the consummation of non-partisan British colonial policy.

Consumption Function and Development Finance

In an Underdeveloped Economy

J Bandyopadhaya

IN so far as capital formation is the most vital of all the problems confronting an underdeveloped economy bent on quick industrialisation, the national economic surplus, and hence, the proportion of national income that is saved, is the most fundamental variable on which attention should be focussed.

Economists and planners in economically underdeveloped countries have assumed up till now that the Keynesian analysis of income-consumption behaviour is equally applicable in developed as well as underdeveloped economies. In this respect, an underdeveloped economy is supposed to be distinguished by the fact that the marginal propensity to consume in such an economy is relatively high because of the relatively low level of national income—a fact that is entirely consistent with the Keynesian version of the consumption function. But it would appear on careful analysis that the assumption of the universal applicability of the Keynesian consumption function is not always acceptable, and that in fact it may lead to bad planning in the underdeveloped countries.

It is necessary to discuss the Keynesian consumption function in its essence before we pass on to consider why a different consumption function is required for the underdeveloped economies. According to Keynes, "short period changes in consumption largely depend on changes in the rate at which income (measured in wage units) is being earned." Short period has been defined as that covering "cyclical fluctuations in employment during which habits, as distinct from more permanent psychological propensities, are not given time enough to adapt themselves to changed objective circumstances". Thus changes within a cycle are taken into account, not changes through cycles. Keynes then states his theory thus:

> "Men are disposed to increase their consumption as their income increases, but not by as much as the increase in their income. That is to say, if Cw is the amount of consumption and Yw is income (both measured in wage units), ΔCw has the same sign as ΔYw, but is smaller in amount, i.e., dCw/dYw is positive and less than unity."

Similarly, when income falls, consumption also falls, but not by as much as the fall in income. This is usually represented as in Diagram A.

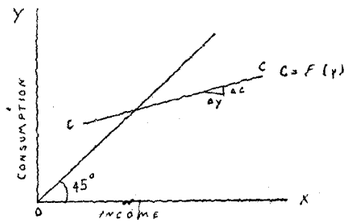

Diagram A

The slope of the consumption function schedule in Diagram A indicates that a rise or fall in income is associated with a smaller rise or fall in consumption.

Now a realistic approach to the characteristic problems of an underdeveloped economy would show that neither the assumptions nor the analysis of this income-consumption relationship are likely to be applicable in the initial stages of development when the economy is taking off into a process of self-sustained growth.

The type of underdeveloped country that we have in view is assumed to have a government which plans for what is generally known as a "welfare state". In other words, it plans for greater production and fairer distribution and so long as these objectives are not achieved, would not allow anyone to die of starvation. It is probable that in such a country, during the period of the take-off into a process of self sustained growth, marginal increments in consumption will be greater than marginal increments in income. The reasons are as follows:

(1) The sub-normal level of consumption by itself brings the marginal propensity to consume very near to unity.

(2) Population is likely to increase at a very rapid rate, with the result that additional consumption during the period concerned is likely to be greater than the additional income generated in the same period. A general lowering of the per capita income and a corresponding decline in the level of consumption are ruled out, because these will bring forth Malthus' "positive checks", and we have assumed that they cannot be effective in the type of state envisaged. The result will be that whereas net increase in per capita income may be zero or negative, net increase in per capita consumption must be positive.

(3) Since the economy is preponderantly agricultural, a considerable proportion of the increased output will be retained by the cultivators for private consumtion, thus increasing real consumption to a considerable extent.

(4) Income redistribution through social services will increase real consumption.

(5) The migration of a part of the population from the rural to the urban sector will raise consumption still further.

(6) Assuming that the consumer moves from one structure of consumption to another, an increase in income will shift the consumer's preferences from a lower to a higher structure of consumption, for which the increased income will be insufficient until the lag works itself out. This tendency will be accentuated because of the well known demonstration effect (the Duesenberry thesis that the savings ratio is a function of the consumer's percentile position in the income distribution, rather than the absolute level of income.)

(7) An improvement in the liquidity position of the consumer resulting from an increased cash circulation and deficit spending may bring forth an upward shift of the consumption function —(as happened in the U S A in the post-war period even after the war-time pent-up demand had evaporated.

(8) In a developing economy, the consumer expectations are likely to be favourable, and an anticipated increase in income coupled with the general good cheer brought about by developmental activities may favourably influence present consumption decisions.

No single factor is by itself sufficient to prove the contention of this article. But all of them taken to-

gether seem to drive one to the conclusion that in the period of take-off in an underdeveloped economy, the consumption function schedule will rise more steeply than the 45 degree line, as shown in Diagram B.

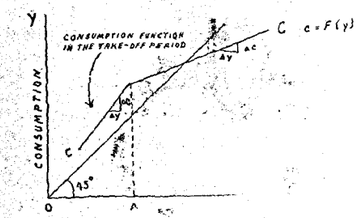

Diagram B

Time-series data regarding the income-consumption relationship for underdeveloped countries are not available. But it would appear that there is a reasonable chance of consumption rising steeply, if the above analysis is correct.

Needless to say, all the above mentioned factors will not come into operation all of a sudden as soon as industrialisation begins, and the income-consumption relationship portrayed here may not appear in the initial years of the take-off, although it is likely to appear sooner or later.

Once, however, the forces responsible for the marginal bursts of activity during the take-off period—investment and innovations—gather momentum and assume quantitative significance, all the factors mentioned above will gradually lose their strength, and the normal Keynesian consumption function will come into operation. In Diagram B the Keynesian consumption function begins to operate after national income exceeds OA.

It should now be pointed out that in a take-off economy, marginal consumption cannot be allowed to exceed marginal income, because if this is done, it will lead to a depreciation of savings and capital, and each marginal dose of investment will tend to be explosive. The government has of necessity to hold the economy under tight control, and a certain minimum percentage of national income has to be invested compulsorily. The above analysis suggests that in the absence of extraordinary measures for curtailing consumption, the marginal increment of consumption in the take-off period may, except in the initial years, tend to be greater than the marginal increment of income, and thus there is a serious danger that the economy may be thrown out of gear. This is a possibility which, as has been stated at the outset, has not been recognised up till now. It has generally been assumed that the marginal propensity to consume in a take-off economy will be very near to unity—that it may be equal to or greater than unity has not been recognised hitherto. The difficulties of development finance in a take-off economy have thus been seriously underestimated.

The conclusions that the above analysis may warrant are that:

In an underdeveloped economy during the take-off period rigorous measures for curtailing consumption will have to be adopted in the middle and high income brackets;

A vigorous drive will have to be launched for tapping idle savings in the different sectors of the economy;

A far greater reliance will have to be placed on deficit finance and foreign capital than is usually done;

The danger of inflation, even if there are time-lags and sectoral rigidities, will be far greater than is usually supposed; and

A persistent deficit in the balance of payments with all its implications will have to be accepted as inevitable.

Social Effects of Industrialization

Walter C Neale

IN discussions of economic growth perhaps most attention is paid to measurable quantities, and the problem, quite rightly, is treated as one of creating more of the material means of satisfying human wants. The great aim of programmes of industrial development is to provide more and more of the goods and the good things of life. While this aim is quite proper, in fact essential to national well-being and social stability in the modern world, the process of industrialization has side-effects, by-products which change the whole tenor of life and thought. Industrial society is inevitably different from pre-industrial society, and the differences are not merely differences in the quantities and kinds of goods and services available. The citizens of an industrialized community will have different values, different ways of thought, and different ways of living their everyday lives.

Generally, these non-economic effects of development cannot be measured in a meaningful way, although it is possible that some aspects or trends can be measured, such as the number of people in a new social class, the disappearance of an old group in the society, or the number of people living permanently in an area other than the area in which they were born. It is not possible, however, to attach quantities to new modes of thought or new attitudes toward the family, yet such changes are of the greatest importance to the people involved and can give—in the west, have given—rise to tensions and conflict.

Often Regretted

These changes in the ways of life and thought are often unforeseen and as often regretted. People who were born and bred in a different atmosphere will never be completely happy in a changed society, and there is much harking back to the "good old days". In its extreme form this harking back takes the form of romanticizing the past until the reactionary picture of the "good old days" would never be recognized by those who lived them. A danger to, and a measure of the success of, planned industrial development is the society's ability to adjust to and accept the qualitative changes which follow in the wake of a new economic system, and to relieve and control the tensions and conflicts which arise because of these changes.

The world's experience of industrialization has been rather limited, and so one hesitates to read the past of Christian Europe into the future of civilizations resting upon a very different past. There are enough differences between the societies of the United States, Great Britain, and Germany to warn us that an industrialized India will look very different from an industrialized Britain. However, despite our expectation that the process of industrialization will affect different societies differently, one can perceive in the process certain essential elements which must have similar effects, no matter what the social context in which they operate.

Way of Thinking

These common effects will stem from the scientific and mechanistic character of industrial operations, from the technical requirements of organizational techniques used to keep an industrial society running.

Let us take first the effect of industrial development on the way of thinking. The industrial process is mechanical, and the thinking needed to set up and manage a factory is scientific. It has been said that the man who works in an industrial establishment lives in a "world of matter-of-fact" or of cause and effect. His daily activity, whether on a fairly simple level of manual operations or on a much higher level of design and organization, puts him face to face at all times with the results of his actions. Frequently almost no time elapses between the taking of an action and the result. Even when the time lapse is appreciable, there are not likely to be many extraneous circumstances interrupting the process. This constant realization that certain actions lead inevitably to particular results, and that particular results cannot be achieved except by specific actions creates a habit of thought which can be called scientific, mechanistic, or matter-of-fact, and this habit of thought is naturally carried over to other spheres of life. In fact, the man who has run a die press or set up a production line will never think in the same manner again.

The point can be made by comparing the industrial process with the kind of life led by men engaged in agricultural pursuits. Whereas the cycle of events in a factory may take only moments, the cycle of events in the countryside takes at least a season, and in some respects extends over the years. In the factory most elements of the productive process are directly under the control of the people working in the factory. In farming very few of the processes are completely controlled by the farmer. The growth of plants is a botanical matter. The farmer can help nature along, but much of the burden is hers, not his. Furthermore, many events can intervene to upset expectations. In India the quantity and timing of rainfall is extremely important. Other elements, such as the fertility of the soil, are partly under the control of the farmer, but the period over which fertility deteriorates may be so long that cause and effect are never brought home to the farmer. It is easy to understand why the industrial man says that "this causes that" while the farmer regards events as the will of God.

Industrial Worker Vs Rural Craftsman

One may ask why the attitude of the industrial worker is not also the attitude of the rural craftsman, and to an extent they no doubt have something in common. The craftsman knows his materials and controls them directly, so that he knows when he starts the product which he will have when he is finished. Nevertheless, it remains true that the craftsman is not made so fully conscious of the cause and effect character of his work. The craftsman goes through a series of operations which could make him look at the world as all cause and effect but for two facets of his life. On the one hand he lives among a vast majority which do not have the immediate matter-of-fact experience of controlled production—and neighbour's thoughts are our thoughts, and on the other hand his craft is apt to be traditional and highly stable. This stability means that he does not have to worry about what he does; he knows all about it to begin with. But the industrial worker is constantly seeing changes in the productive process taking place. This used to be done with such-and-such results. Now a new process is introduced, and

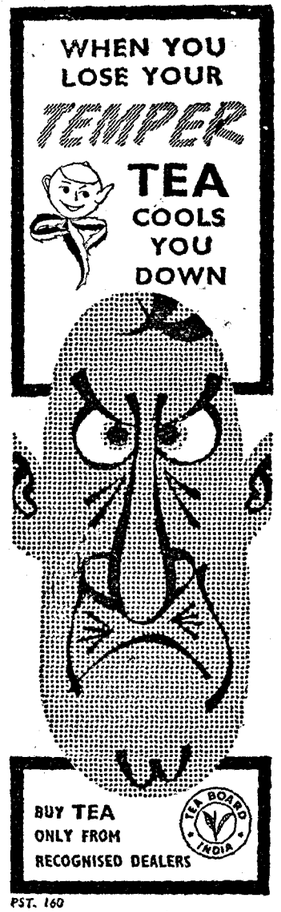
DRAG-32

the results are somewhat different, or he is called upon to do a somewhat different job. In consequence he is made aware that the world-of-matter-of-fact can be changed and directed. Of course, if he is a technologist much of his effort is devoted to just this problem of scientific control and change.

Matter-of-fact Attitude



In pre-industrial society the dominant mode of thought is that of the agriculturist—a world in which prayer may seem as efficacious as fencing, and in some years more efficacious, in which the cycle of the seasons and the mysteries of nature are always before him. In industrial society the dominant mode of thought is that of the technologist—a world in which prayer is obviously less effective than lubrication and tensile strength; in which each day is much like any other and in which there are far fewer mysteries and he knows how to manage them.

Now, this mode of matter-of-fact thought carries over into the rest of the industrial workers life. He is apt to become un-religious. By this I do not mean that he becomes irreligious. Rather, he no longer regards religious observances as important in many of the things he undertakes. He develops in the social sphere attitudes of doubt and inquiry which are satisfied only by a mechanistic answer. As he shapes a part with his machine, so he begins to feel that he can shape his life. As he asks "why" about the amount of power used for an industrial operation, so he asks why about the rest of his life: why should he support his ne'er-do-well brother, or why should he not smoke. Answers like duty and moral obligation carry less weight, unless he can be shown that there is a practical advantage, or that his acts of omission or commission will have effects he does not want. And the breakdown of the old standards comes when he says to himself that he doesn't care about that brother, and doesn't in the least mind the results of his own withholding of help.

Class and family Structure

The technical requirements of industry also affect the class and family structure of a pre-industrial society. In each branch and in each job industry requires technical competence. There is no substitute for knowing how to do your job well. This means that there is constant pressure on the managers of industrial establishments to find the right man for the job regardless of his status in society. In India today there is still a strong tendency to hire a man of ones own family or caste, and one would hardly expect the traditional values to break down and disappear as soon as factories are erected. However, there must be constant pressure on managers to pass over brothers-in-law who know nothing of the technology in favour of strangers who can get the job done properly, and one expects that these pressures will become more acute as the need for technical competence becomes increasingly clear.

The size and complexity of factory establishments also tend to break down the lines of family and caste. When only a few people are needed, it is a fairly simple matter to keep the establishment in the hands of the "in-group", but when hundreds are needed it becomes increasingly difficult. In industrial establishments the margin between efficiency and inefficiency is narrow, and the extra cost of maintaining traditional standards does not seem worthwhile. The industrial manager who wants to hire only members of his own community may find that there are not enough of them to man his plant, and so perforce the old values pass. Once the break is made it becomes difficult to re-establish the old forms.

PST. 160

Demarcation Blurred

In a fairly stable society clear lines of demarcation can be drawn between various functions, and these functions assigned to specific social groups. In industrial society the lines are not so clear; the content of jobs fluctuates; new functions arise and old ones disappear. If the process takes long enough the class structure can adapt, but it is commonly the case in an industrial society that the changes take place too rapidly to allow for such adjustment. Locomotive firemen are displaced by diesels; airline hostesses and chemical engineers suddenly arise; a decade or two can eliminate the wheelwright. Jurisdictional disputes among unions in the west may be in part efforts to maintain stability in the structure of the work force (they are certainly efforts to gain monopoly returns), but no union has maintained its character against changes in productive techniques.

Perhaps the most important organizational technique, so far as this discussion is concerned, is the payment of wages. Regular payment of wages in cash can be expected to have definite effects in breaking down the traditional family structure. It is not that twelve chips a week makes a man more selfish, or causes him to love his mother less. Rather, it is that it gives him new opportunities to be independent. In a closely knit agricultural society the son is dependent upon the father, the brothers upon each other. The women of the family have no means of support except in the cooperative venture of the family. But wages end these dependencies. The son is as capable of earning a living as the father; the sister as the brother. An unmarried or childless woman can leave home to work if she doesn't like the home atmosphere. The obverse of the coin is that the family dependent upon earnings in industry is no more secure than its individual members. On an agricultural holding there is, barring disasters, always work and food for the family, but if father loses his job at the mill, the family's

means of support is gone and the family will very likely look with favour on those of its members who decide to move out and off.

Greater Mobility

An industrial society requires greater mobility, both occupational and spatial. As people move up and down and across the frame of occupations and skills, the lines demarcating caste or community begin to go. It becomes harder and harder to keep track of a man's social position. Furthermore, the social position begins to correspond less and less with a man's income and his importance in the economy. As incomes and economic status become scrambled, it becomes increasingly difficult to take seriously the ancestral position of the citizens of the industrial world.

When movement from place to place is slow or infrequent, the society can keep track of each person's traditional position, but when movement is rapid and widespread the fine gradations tend to disappear. In India today in the large cities the caste postion of each person is still definitely recognized, but I have the definite impression that the caste blocks in the cities are far larger and more inclusive than they are in the villages, and the importance of sub-castes much less. In addition, the castes are to a large extent local. The process of industrialization jumbles castes from different localities together so that it is not easy to establish the essential hierarchy among them. When it is impossible to establish the hierarchical relationships among the castes one of their major functions in organizing the social relationships between people ceases, and there is that much less purpose in maintaining the distinctions.

Smaller Family Unit

It can also be seen that movement about the country will tend to break down the larger family units. With each man living in a different locality and receiving his own pay packet, the natural unit becomes the biological family of man, woman, and minor children. By no means does this imply that that there will be any lessening of the bonds of love between parents and childen and brothers and sisters (perhaps it will be easier to love, domestic tensions being less), nor that mutual support and aid will die out. When I say that it is likely that the larger family will break down, I mean that with separate means of maintenance and separate households the daily and in fact most of the major decisions will come to be taken in the smaller households of man and wife. Certainly today one can see this happening in the cities among professional and business people whose parents' and grand parents' families were not so broken up into smaller units.

The policy of the Government of India is to eliminate the differentials based upon hereditary caste, so that it is encouraging to feel that the movement towards an industrial society will of its own accord move in step with the policy of the government. It is not so clear that the other effects of industrialization upon the attitudes and ways of living will be so widely welcomed. But changes of the kinds outlined above seem likely to occur simply as a result of the creation of an industrial society.

Food Prices

M G Bokare

THE conferences of experts have not yet resolved the perplexing problem of food, the changing character of which has not been grasped properly. Before the First Five Year Plan, the vital consideration was to produce more food in order to relieve the food shortage and high prices, resulting from such shortage. The Plan has been successful to the limited extent of increasing the total production of foodgrains from 54 million tons to 68 million tons. With the increase in food production, the fear of soaring prices changed into that of falling prices, and there were consultations and committees for price support.

The problem has now assumed a different character. A poorer monsoon and a lower level of production in the 1955-56 season have resulted in rising prices. The following table indicates the position.

Index of Prices

(Aug 1939 = 100)

	All food articles	Jowar	Rice	Wheat	Gram
April 1954	381.6	208	486	547	321
April 1955	283.6	100	412	402	181
Jan. 1956	333.4	181	449	529	265
April 1956	360.9	235	547	501	293
June 30, '56	374.0	—	—	—	—

Rice and Jowar which form the main staple food show significant rise; the food group as a whole also is reaching the pre-plan days figure (414.1 on March 31, 1951).

During the months January to May 1956, the rise of prices of food grains in particular and of agricultural produce in general has been strikingly high. Explanations usually given by different people emphasise a particular point of view. They may be summarised as under:-

On the part of the Government, it is explained that the rise is to a large extent a reaction of the abnormally low prices in the previous season. To the extent that the rise is corrective, Government does not view the situation seriously.

The year being the closing one of the First Five Year Plan, there was a rush to complete the projects and use up in full the allotments made under the Plan. This stepping up of expenditure led to fresh issue of currency. During the first four months of the year average addition to the currency issued was one crore per day. This helped to push up prices .

Production of foodgrains declined while better wages and larger employment in industry and in the tertiary sections led to higher prices of food grains.

The arguments outlined above do throw some light on the problem, but this is not the full explanation of the situation. Prices of agricultural produce are not determined by total production of individual crops, but by the marketable surplus. This distinction may not be very clear in the first instance, because in the case of most industrial crops e.g. oilseeds, jute, cotton, tobacco, tea etc, the marketable surplus hardly differs from the total production. In the case of food crops, however, it differs very significantly through the percentage of marketable surplus to total production remains fairly constant over a long period, unless there are significant changes in the national economy, particularly in the rural sector.

The marketable surplus may not always be a normal or proper surplus, it may be inflated by distress sales. Under the former category, belongs the excess quantity of foodgrains which the peasant sells after meeting his household needs. Under the latter category belongs the sale under compulsion of foodgrain which the peasant needs to meet his household requirements, but which he is forced to sell in order to meet money payments for rent, taxes and essential consumer articles. The small holdings so predominant in our country would fully justify the assertion that for most farmers, the market sales are of the latter type. Though individually the quantity so marketed might be small, in the aggregate, the quantity is higher. Moreover, it is the small, subsistence farmer who sticks to food crops, while big farmers normally have a tendency to develop additional acreage to cash crops which yield higher money income both per unit of production and per acre of cultivation.

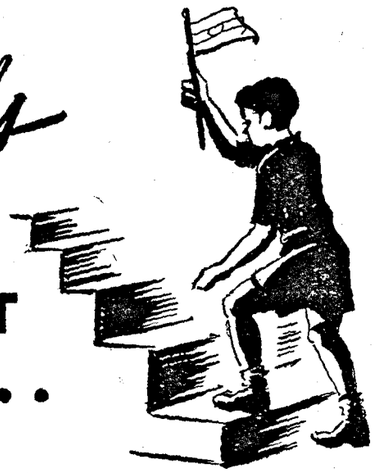
Thus the total available supply of foodgrains in the market is influenced by the marketable surplus of farmers, particularly small scale farmers. Further, it is this marketable supply which determines the price of food crops.

"The large scale investment and development programme in non-agricultural sectors results in not only an increase in money income of the population as a result of industrial employment, but in all probability also some increase in the spendable income of the population." The transfer of labour from agriculture to industry and constructional work, in which earnings are higher than what such labour was earning in the village also adds to the demand for consumption goods. The priority of the half starved people, under the above circumstances, needless to say, is food, of which in the initial stage the absolute intake increases. The income elasticity of demand is prominent for food particularly cereals and pulses, over a fairly long period. The 11 per cent increase in per capita national income, and 9 per cent increase in per capita consumers expenditure, over the five years of the First Plan, with enthusiastic emphasis upon wide diffusion at the bottom, can be relied upon to have increased the demand for cereals and pulses in the country.

Against this background, let us examine the rural sector, predominantly comprised of 'subsistence' farmers. The quantity of marketable surplus which goes to meet the demand of non-farm population, is conditioned by the following.

The degree of monetization. The NSS in their second and third rounds have found that our rural sector is not fully monetized.

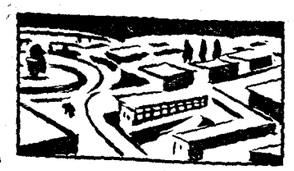
The demand and supply for consumer goods and cash, to meet expenditure, say, for education, travel, tax etc. The availability of such articles and facilities is equally important in view of the fact that most of the surplus food grain is sold in villages.



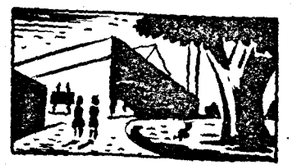
The relative prices of consumer goods which farmers need, and the quantity of food grain they have to dispose off. The demand for consumer goods is comparatively elastic; and due to absence of urban tastes and social urges, the demand for such goods can be postponed if relative prices are unattractive.

The low degree of monetization of our rural economy, explains the large reserves of foodgrains with well-to-do farmers, both to meet the wage demand of farm labour and to make

PLANNING FOR PROGRESS



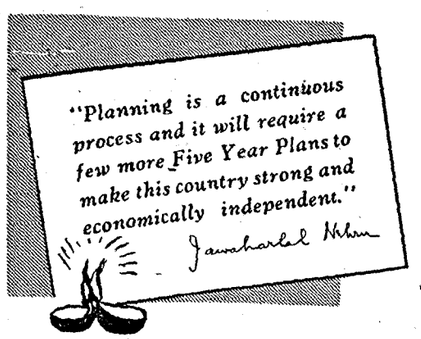
Towards



A SOCIALIST SOCIETY....

The central objective of planning in our country is to raise the standard of living of the people and to open out to them opportunities for a richer and more varied life.

THE FIRST FIVE YEAR PLAN (1951-56)



has resulted in

- More Food
- More Goods
- Better Social Services
- Greater E loyment
- Higher Standards of Living

THE SECOND FIVE YEAR PLAN (1956-61)

aims at

- Greater increase in national income
- Rapid industrialisation
- Expansion of employment opportunities
- Reduction of inequalities in income and wealth
- A more even distribution of economic power

our SECOND FIVE YEAR PLAN for National Prosperity

DA 56/52

profitable bargains in grain loans which have moral sanction in the poor man's philosophy and which are in most places out of the bounds of the Usurious Loans Act. Further, the well-to-do farmers, usually go in for cash crops, in the production of which farm labour is employed and such labour is paid partly in kind which accounts for the related attraction of holding stocks of grain.

For the subsistence farmer, any improvement in the yield of food crop does not necessarily increase his marketable surplus. Economic progress connoting agricultural prosperity in general, brings about a peculiar change i.e. in the initial period from farming for market (distress sale of grain) to farming for subsistence. A freer use of his crop or even a larger yield means first of all a higher consumption for the peasant who formerly had gone short of food or had been living on poor food. "Peasants in an economically stronger position satisfy first their own needs before they start producing for the market." Prof. Paul Sweezy said this with reference to development of agriculture in Soviet Union. Immediately after the introduction of elementary reform upto 1927, the marketable surplus of foodgrains in Soviet Russia fell from 26 percent to 13 percent of the total production, and then again with the progress in agriculture the marketable surplus increased to 28 per cent during the post-collectivisation period."

Community Controls Committee expressed similar views. "A small increase in production does not necessarily mean a corresponding increase in procurement. A large percentage of farmers do not ordinarily produce sufficient grains for their own needs, and the small extra production is likely to be utilised for personal consumption in the first instance". In a note to the Planning Commission for the Second Five Year Plan Prof C N Vakil and P R Brahmananda observe:

"It is not correct to assume that a larger aggregate produce must always imply a larger absolute quantity of marketable surplus. Very often expansion of output may be brought about on marginal farms which yields no "surplus" whatsoever. Even though the total output of the economy is increasing the quantity marketed may increase very slowly, or may not do so at all or may even decrease".

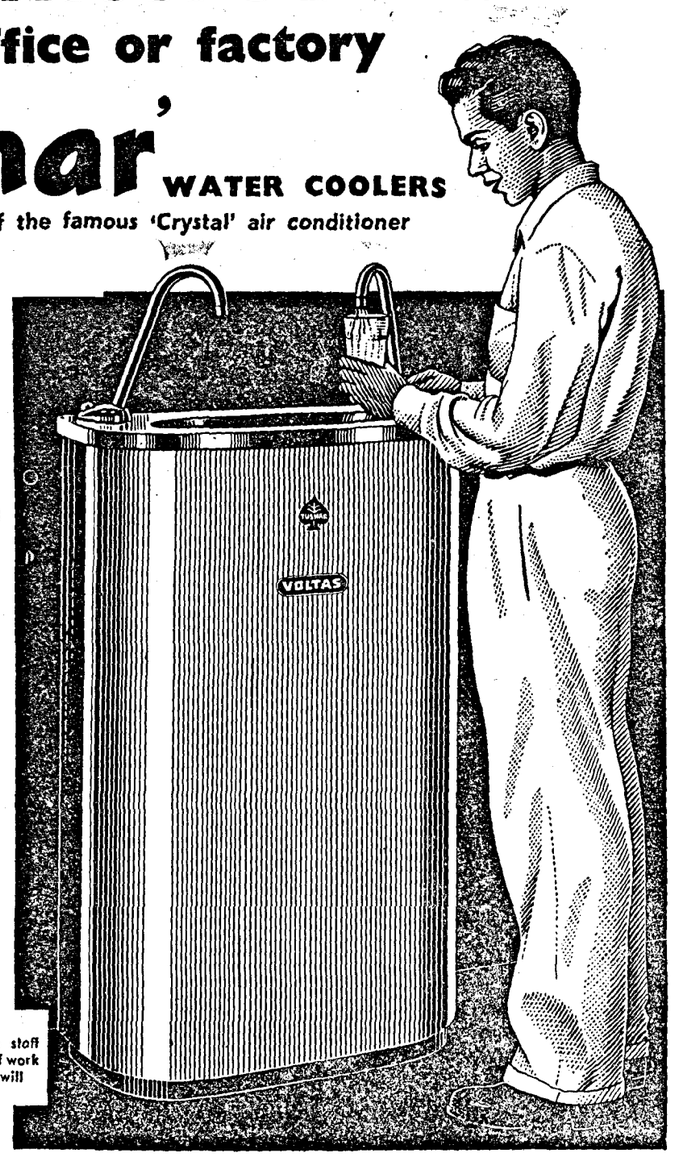
A rise in prices of agricultural produce, therefore, does not bring about increased marketable surplus of the food grains. It simply increases the retention of foodgrain to meet the demand of farm labour and home consumption, and encourages speculative holding of the marketed surplus on the part of the trading classes.

An initial rise in prices of food grains actually starts a vicious circle—less the marketable surplus, steeper the rise in price. The traders as a class have got their peculiar reactions in such conditions. "There is a tendency to hold back stocks in the hope that price may still rise further". Most of our trade in foodgrains is financed by private funds, and as such the Reserve Bank's attempt to control movements and stocks proves more or less futile. The past experience of traders that there is a comfortable gap between declaration of policies and ability to execute declared policies encourages them to play freely.

On the part of the farmers, there is perhaps even less reason than there is in the case of the trader to suppose that rising prices will evoke an automatic response in the shape of increasing supplies. The fallacy of the argument that they will is becoming increasingly apparent. The cultivator is asked to sell his grain for cash and his cash needs are never very large, and most of them such as rent and land revenue are constant. So that in fact, higher the price, the less the grain he has to sell in order to meet his inescapable cash needs. With the hope of rising prices, he still has the option of holding the stock which may rise in value still more; at worst, he can consume more of his own produce. His optional cash needs, for consumers goods, educational expenditure etc are such that unless an urge for higher standard of living is created, he would prefer to go without them. His desire to sell can be stimulated by increasing the supply of consumer goods at reasonable prices and at proper places. His demand for such goods is elastic both for price and easy availability and at present we find that there is no particular attempt to plan the supply of consumer goods in the village markets. Being located disadvantageously, the cost of transport adds heavily to the price of such goods. In the First Plan, the emphasis was on producing more food and other agricultural produce, but there was no corresponding attempt to siphon off the additional production. This could have been done by providing avenues of spending e g road and travel facilities, education, entertainments and by connecting the village markets with the town markets to facilitate flow of consumers articles.

Here, a little divergion to the policy of supply of consumers article will not be out of place. The reference is to the proposal that cottage industries should supply the needs of the rural economy. Their low level of efficiency will raise the cost and price of the products and as stated earlier, the demand for consumer goods being elastic, they will not stimulate purchase by farmers. The variety and finish of cottage industry products being inferior to that of factory produced goods, the preference for and consequently the tendency to wait for the latter type of goods, will only worsen the situation.

The discussion leads us to the conclusion that in a planned economy the Government should have increasing control over the deliveries of food-grains and other agricultural produce to the cities and towns, and over the flow of consumers articles to the village. In the face of the probable size of deficit financing, inflation-psychology tends to rule the minds of speculators and producers alike. Prof Galbraith, in his Hyderabad lectures, warned that cloth and food which form nearly two third of a family budget, should be protected from price vagaries, if inflationary pressure is to be kept under control. Needles to add that the surplus should be increased by rearrangement of production and that the surplus should be under State control through the manipulation of market mechanism.



Waste Land

WHAT colossal waste can result from overenthusiasm is amply brought out in a review undertaken by the U P Agricultural Board. According to press reports, the Board found that cultivators who were persuaded to adopt the Japanese method of rice cultivation in Uttar Pradesh, probably wasted about 50 per cent of the total outlay on chemical fertilisers; their money going down the drain due to no fault of theirs, but to the fact that they were asked to use 100 lbs. of nitrogen fertiliser per acre, when all that was needed was half the quantity. And this despite the fact that the Uttar Pradesh Government disregarding the Union Agriculture Ministry's instructions, had specified the use of a quantity smaller than that prescribed by the latter.

Cool filtered water
for office or factory

'Tushar' WATER COOLERS
— by the makers of the famous 'Crystal' air conditioner

TUSHAR

A 'Tushar' water cooler increases staff efficiency, helps to improve quality of work — quickly pays for itself in goodwill

- **Instantaneous cooling:** Continuous supply of instantly cooled water at the touch of a button — no unhygienic refilling or storing
- **Two models available:** Model R-10, capacity 10 gallons per hour (180 cupfuls per hour); and Model R-40, capacity 40 gallons per hour (720 cupfuls per hour)
- **Easy to install:** Needs only a water supply, a drainpipe and an electric plug point
- **Economical to run:** Cools to the temperature you choose, then switches off automatically

Silent working-Anti-splash construction-Handsome design

Continued Recovery

Wednesday, Evening

SUFFICIENT time has elapsed since the start of the upswing in equities to indicate that the improvement in equity prices is not due to any war psychosis. Had it been so, it would not have sustained so long. Though fears of possible war-like actions arising out of Cairo's decision to nationalise the Suez Canal Company initiated the upswing, the continued spurt in equities suggested that economic factors started making their influences felt. This does not mean that equities will continue to move up. Corrective set-backs are only to be expected.

But there are growing indications of a gradual revival of confidence. No fresh "bullish" factor may have emerged. But the adverse influences are either becoming inoperative or are gradually being discredited. For instance, it is now realised that the proposed legislation about regulation of futures trading is not likely to prevent any legitimate spurt in equities. Gone also are undue fears about the possible effects of loans. Soon, the States will enter the long-term money market. But neither investors nor speculators are unduly worried about the effects of the forthcoming State loans.

Market Factors

It was not as much the rising trend of prices for food and industrial raw materials, but the stagnant behaviour of manufactures' prices which was causing anxiety to industry. Investors were worried that the trend of industrial profits may continue to be unfavourable. In the last month, manufactures' prices have also started moving up. It was not without significance that the falling trend in equities was halted as the index of prices disclosed this chain effect. This may or may not aggravate inflationary pressures on the economy. But stock markets are not interested or worried about that aspect of the problem.

Some peculiar developments have helped the recent spurt in equities. Cotton mill shares have been consistently buoyant in Dalal Street. Working results of Tata Steel are satisfactory. This has had a sustaining influence on Dalal Street. Consistent strength in clearing shares was the main sustaining factor behind the upswing in equities on Lyons Range. As cash scrips started moving up, investors started the hunt for low-priced, dividend-paying, sound cash scrips. This latter influence was a significant development on Lyons Range in the last few days.

Make-up

How did this influence emerge? To explain this, it would be necessary to understand why equities were slumping. There were reasons why Lyons Range were depressed for long. Prospects for its popular counters were bleak. For more than a year, the jute industry has been suffering from declining profits. Even the most confirmed "bull" is pessimistic about the immediate outlook for Tea shares. Lyons Range has always been in two minds about Coal shares. It has not yet been able to decide whether Coal shares should be completely neglected, or whether these shares could be "talked" up for the duration of the Second Plan.

As these three groups of shares lost popularity, Engineering shares became the most active counter on Lyons Range. But in the last six months, these shares also ceased to be popular. This was partly because the cornering activity subsided gradually. In part, the recent inactivity in Engineering shares was due to the fact that these shares were bid up to such high levels as to fetch unremunerative yields. That was why investors kept away from Engineering shares in recent months.

Shifting Trend

Some of these adverse influences are gradually being eliminated. One of the most interesting developments in recent days is the revived demand for Jute shares. There are reasons for the revival of demand for Jute shares. From the middle of last month 2½ per cent of jute loomage has been re-sealed. There are reports that a further 2½ per cent of loomage may be re-sealed. These are "bullish" developments for Jute shares. If the steps already taken and under contemplation lead to a relative rise in the prices of jute goods, the upward trend in Jute shares may continue.

Rising stocks of jute goods — mills' data disclose an increase of stocks of jute goods during July —lend weight to reports that IJMA has proposed to the Union Government that a further 2½ per cent of loomage should be re-sealed. Steps to curtail output should have had an adverse effect on raw jute. Though jute goods declined as data disclosed higher stocks with mills over July, raw jute prices were unaffected by reports of a further resealing of loomage. This is the main trouble with the jute industry. Will the spurt in Jute shares, persist if the spinner's margin continues to be unfavourable?

Miscellaneous

Doubts still prevail whether the revival of demand for Jute shares will continue. But Lyons Range seems to be optimistic about the prospects for Miscellaneous shares. In recent days, this group has been notably active. Cement, Rayon and Tobacco shares have been prominent. Many low-priced, sound Miscellaneous shares have met with consistent investment support. There is no cornering activity in this group of shares. Current and prospective yields are the main considerations. This is a redeeming feature.

Tea auction results continue to be satisfactory. But Tea shares remain relatively inactive. This is because current dividend payments for the 1955-56 season are disappointing. Investors have burnt their fingers badly in Tea shares. They remain cautious. By the beginning of the current week, Coal shares evinced some activity. This was mainly in sympathy with the upward trend in equities in general. But the belief is gaining ground that, at current levels, Coal shares are good purchases for capital gains in the immediate future.

UNITED ASIA

International magazine of Asian affairs, 12, Rampart Row, Bombay 1, India.

4 Per Cent State Governments Loans

(1)	Government of Andhra ..	Rs. 600 lakhs	Issue price Rs.	99- 8	per cent
(2)	Government of Bihar ..	Rs. 200 lakhs	Issue price Rs.	99- 4	per cent
(3)	Government of Bombay ..	Rs. 750 lakhs	Issue price Rs.	100- 0	per cent
(4)	Government of Hyderabad ..	Rs. 200 lakhs	Issue price Rs.	99- 8	per cent
(5)	Government of Madhya Bharat ..	Rs. 100 lakhs	Issue price Rs.	99- 4	per cent
(6)	Government of Madhya Pradesh ..	Rs. 150 lakhs	Issue price Rs.	99- 4	per cent
(7)	Government of Madras ..	Rs. 1250 lakhs	Issue price Rs.	99-12	per cent
(8)	Government of Mysore ..	Rs. 400 lakhs	Issue price Rs.	99- 8	per cent
(9)	Government of Orissa ..	Rs. 300 lakhs	Issue price Rs.	99- 4	per cent
(10)	Government of Punjab ..	Rs. 200 lakhs	Issue price Rs.	99- 4	per cent
(11)	Government of Rajasthan ..	Rs. 300 lakhs	Issue price Rs.	99- 8	per cent
(12)	Government of Saurashtra ..	Rs. 250 lakhs	Issue price Rs.	99- 8	per cent
(13)	Government of Travancore-Cochin ..	Rs. 200 lakhs	Issue price Rs.	99- 4	per cent
(14)	Government of Uttar Pradesh ..	Rs. 800 lakhs	Issue price Rs.	99- 8	per cent
(15)	Government of West Bengal ..	Rs. 700 lakhs	Issue price Rs.	100- 0	per cent

All the State Governments reserve the right to retain subscriptions upto ten per cent in excess of the notified amount.

All the above loans will be repaid at PAR on 3rd September 1968 except that of the Government of Bombay which will be repaid at PAR on 3rd September 1970.

The loans will open for subscription on 3rd September 1956 and close on 10th September 1956 or earlier without notice as soon as subscriptions approximate to the amount of each issue.

All the loans will bear interest from 3rd September 1956.

Subscriptions may be in the form of CASH/CHEQUE in respect of all the loans.

3% BOMBAY GOVERNMENT LOAN 1956, 3% MADHYA PRADESH LOAN 1956, and 3% MADRAS GOVERNMENT LOAN 1956 will be accepted at PAR for conversion into the new loan of the Government concerned; interest on the securities of the respective loans tendered for conversion will be paid upto and including 2nd September 1956.

3½% TRAVANCORE GOVERNMENT LOAN, 1956 will be accepted at PAR for conversion into the new loan of that Government. In addition to the interest due on securities of that loan tendered for conversion, tenderers will be paid interest at the rate of 4 per cent per annum on the amount of the principal of such securities from 16th August 1956 to 2nd September 1956 inclusive.

Applications for all the loans will be received at the Offices of the Reserve Bank of India at Bombay, Calcutta, Delhi, Madras and Bangalore.

APPLICATIONS will also be received at PLACES WITHIN THE RESPECTIVE STATES as follows:—

(i) At the branches of the State Bank of India and at Treasuries and Sub-treasuries in the case of Andhra, Bihar, Bombay, Madhya Pradesh, Madras, Orissa, Punjab, Rajasthan, Saurashtra and Uttar Pradesh loans.

(ii) At the branches of the State Bank of India in the case of West Bengal loan.

(iii) At the branches of the State Bank of India and at District Treasuries only in the case of Madhya Bharat loan.

(iv) At the branches and treasury pay offices of the Hyderabad State Bank and at Treasuries and Sub-treasuries in the Hyderabad State in the case of Hyderabad loan.

(v) At the branches of the Bank of Mysore Ltd., in the Mysore State except at Bangalore and at Taluk Treasuries in the Mysore State at places where there is no branch of the Bank of Mysore Ltd., in the case of Mysore loan.

(vi) At Treasuries and Sub-treasuries only in the case of Travancore-Cochin loan.

Copies of Notifications and Application Forms may be obtained at any Receiving Office.

Around Bombay Markets

In Fine Fettle

Thursday Morning

IF trading was marked by 'no lack of confidence' during the previous week, it was sustained investment support which characterised trading on the stock exchange during the week under review. Technically also, the market was set for a rise. When operators found that the usual liquidation which follows a rising trend did not materialise, they were quick to take the cue and act.

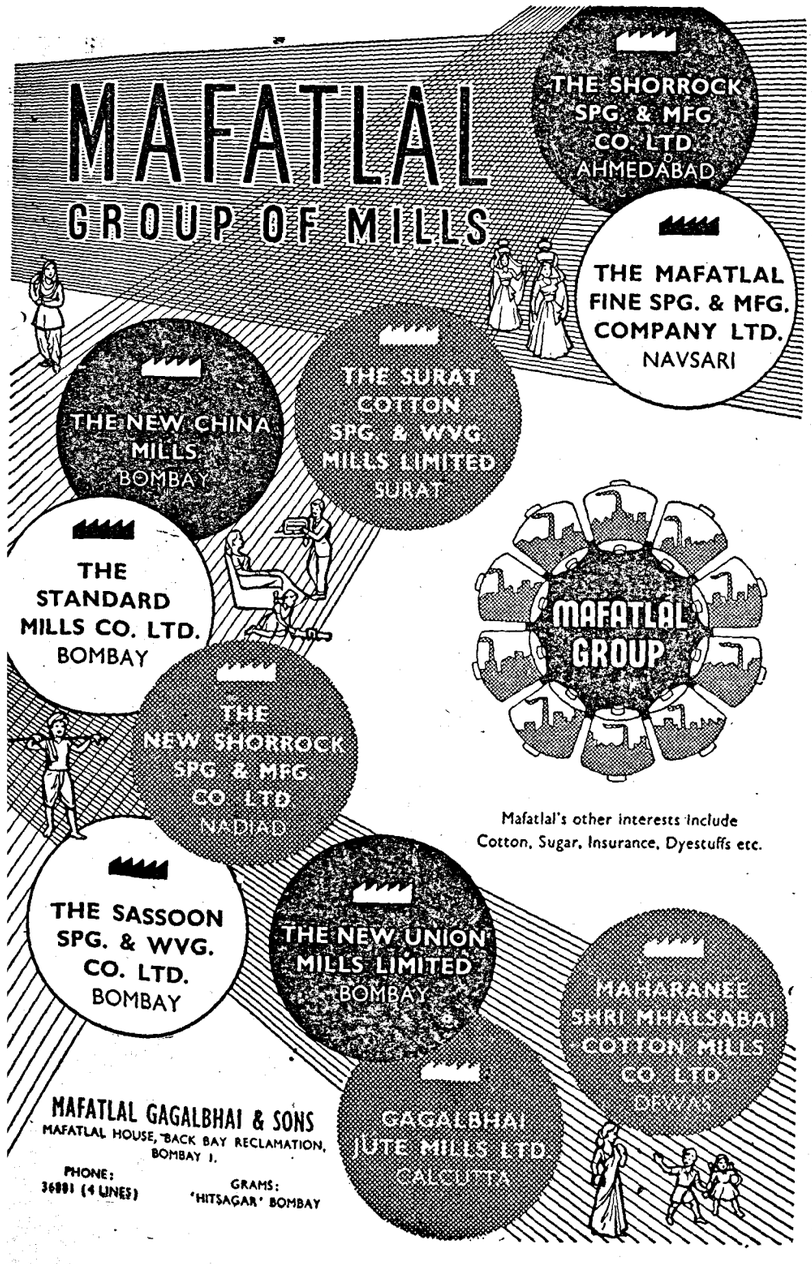
Even at the outset, on prospects of a dramatic reversal in favour of a bigger bilingual State including Bombay city, operators gave enthusiastic and unstinted support to the market. In fact, besides the market favourites, many other scrips, like Mahendra, Sen Raleigh, Kamanis, Ashok Cement, Dharangadara which are scarcely known to Dalal Street, attracted enquiry and participated in the bullish movement. Speculative elements had no doubt expected much from the near-war hysteria that led Britain to set the stage for a 'little war' on the Suez issue, but the comic opera character of Britain's threat became apparent so soon that even speculators could not bank on the outcome. Of course, wiseacres were not lacking to remind others that the two world wars broke out early in the months of August and September, but without much effect. Whatever be the immediate outcome of the 24 nation conference scheduled in London on the 16th, one hopes that saner counsel will prevail. Though Suez is the last place where one could risk 'sparks' by sending out air craft carriers or bomber squadrons, and the gravity of the situation could not be denied, it was home affairs which crowded out everything else. Bombay was presented with a surprise packet when the Central Cabinet accepted the proposal of a bilingual state for Bombay, including the city. This news evoked genuine investment support, and led to a rise in prices. Thus Tata Ordinary opening at Rs 207 reached Rs. 209 and closed slightly lower at Rs 208-4. Indian Iron similarly closed at around the peak level of the week.

In the textile section, there was a revival of activity, following the removal of fears of the imposition of a fresh excise duty. A notable feature was the keen attention bestowed on cash scrips like Swan, Finlay and others. Needless to say, market leaders like Bombay Dyeing, Century, Kohinoor, etc. also moved up.

In the miscellaneous section, Bombay Burmah, National Rayon, Tata Chemical and Shivrajpur ruled steady to firm. ACC after touching Rs 197-4 closed at Rs 196-4, while National Rayon closed firm at Rs 269-8. Cash scrips were quiet.

Cotton

Fresh Exports Quota and Revalidation



IN line with the bullish phase in the stock markets, the trading in cotton futures was also active. The anticipated damage to the cotton crop from recent heavy rains in Gujerat, Saurashtra and other cotton growing belts continued to exert an upward pressure and prices moved up. The firm sentiment thus initiated was well sustained at the close of the week when Government announced its decision to lift the ban on the import of sterling area cotton. This is perhaps the first time that the authorities have admitted their short-sightedness and promptly redressed the legitimate grievances of the trade. It was only last week that a protest was lodged in these columns against the 'preferential treatment' sought to be meted out to US cotton.

Another important decision taken by the authorities during the week was the release of an export quota for Bengal Deshi. It has been announced that exports of 20,000 bales of Bengal Deshi will be licensed. Licences will be issued on the usual basis. Meanwhile, it is also relevant to note, that the authorities have decided to revalidate shipment of the quantity remaining unshipped against export licences for Indian cotton issued during the current season. The period of revalidation will be up to December 31, 1956. Export licenses for around 91,000 bales have remained unutilised; the licenses for some 45,000 bales may, therefore, be revalidated for shipment before the end of the year.

A word about Egyptian cotton. Almost all cotton consuming countries go in for Egyptian cotton. India for a time headed the list of importers of Egyptian cotton, closely followed by France, Czechoslovakia, and others, the latter including UK and USA. If following the Suez issue, Britain, France and America do not care to take their usual quota of Egyptian cotton, countries like India who already account for a sizeable offtake of Egyptian cotton should benefit while others, who have just begun to appreciate the quality of Egyptian cotton, especially for the manufacture of fine and superfine cotton goods, may be able to take more of this cotton. The freezing of Egypt's sterling balances by Britain will not stand in the way

of much business being done between India and Egypt. As India has targetted for annual imports of raw cotton worth Rs 54 crores in the Second Plan period, an early solution of the Suez issue is of prime importance.

In the case of cotton, the extent of the damage to the crop from heavy rains may be a matter of speculation; heavy rains, however, invariably spell a bullish phase for the oils and oilseeds market. Oilseeds, especialy castor, need a dry bed for a good crop. In the circumstances, it is no wonder that groundnut, castor, as also linseed and kardiseeds should hit new high levels on hectic bull activity. It was generally apprehended that rains had done considerable damage to the groundnut crop and this aggravated the situation as the market has been notoriously short of floating stock. In castorseeds, the sentiment was favourably influenced by sustained overseas enquiry, especially from the US, for castor oil, commercial. Shippers in Bombay, it was reported, were arranging to charter a steamer for the export of castor oil to US. They are confident that their offers for the sale of oil at around 14.50 to 14.75 cents would not be turned down as US buyers are eager to get castor oil.

Tata Iron and Steel 1955-56

AFTER considerable hesitation and delay, early in 1955 Government allowed the Tata Iron and Steel Company to expand its capacity to 2 million tons of steel ingot. This will enable the Company to continue as the largest single producer of steel in the country. The latest annual report of the Company for the year to March 31, 1956 shows the steps taken by the Company to carry out its expansion programme. The Company has been able to procure the necessary finances, partly from the World Bank, partly from raising its own share capital and partly from the increases allowed in the retention prices.

The revised retention prices of steel for five years from 1st April, 1955, were announced by Government only on 1st February, 1956, on the basis of the Tariff Commission's recommendations. The revised prices which now apply uniformly to this company and the Indian Iron and Steel Company, average Rs. 393 per ton, an increase of Rs. 61 per ton over the prices which applied to this Company in the former price period.

The retention prices are subject to revision to the extent that manufacturing costs may alter owing to changes in railway freight, in the prices of raw materials and stores, and in wages due to adjudication or conciliation.

The strong financial position of the company is revealed by the fact that the first instalment of $2,355,000 due in 1960 towards the repayment of the World Bank Loan has been taken over by three commercial banks in the U S A at an interest rate of 4½ per cent, which is ½ per cent less than the World Bank Rate. If everything works according to plan, particularly if the foreign suppliers of plant and machinery, keep to their delivery dates the entire project will be completed by May 31, 1958.

The two million ton programme comprises the following items:

A new battery of 26 Coke Ovens,

A new Blast Furnace with a capacity of 1,650 tons of pig iron per day,

Ore crushing, screening and sintering plant,

Two 200-ton Basic Open Hearth Furnaces,

A 46" Blooming Mill,

A Sheet Bar and Billet Mill,

A Medium and Light Structural Mill,

Expansion of the water, steam and power supply facilities,

Modifications to existing plant,

Improvements to the plant transportation system, and

Development of the Collieries, Ore mines and quarries and the steel town of Tatanagar.

The Company's modernisation and expansion programme which had been undertaken earlier has also progressed satisfactorily. A project for the installation of a seamless tube plant for the manufacture of boiler, industrial, gas list and other seamless tubes estimated to cost about Rs. 2.5 crores, is proposed to be undertaken by the Indian Tube Company, for which the necessary licence from Government has been applied for.

Steel output of the Company in 1955-56 was the highest achieved in the post-war period. The shutdown of No. 1 Coke Oven Battery from November, 1955, for rebuilding reduced the total coke output by 8 per cent from 1,096,000 tons in 1954-55 to 1,005,000 tons in the year under review. No ferro-manganese was produced during the year.

The entire increase in the production of saleable steel was in semi-finished material, such as blooms, billets and tinbars, the output of which increased by 33,000 tons from 190,000 tons in 1954-55 to 223,000 tons in 1955-56. The output of finished steel products, such as bars, structurals and plates declined by 16,000 tons from 593,000 tons in 1954-55 to 577,000 tons in 1955-56.

There were several reasons for the decline in the production of finished steel. The 10" mill in the Bar Mills was closed down from January 11, 1956 in accordance with the plan for the two million ton programme. The Merchant Mill's output was limited by the higher proportion of lighter sections rolled. At the Plate Mill, the unsatisfactory condition of the tilting tables and shears, which are to be replaced under the Modernisation and Expansion Programme, caused a fall in the production of plates.

The Skelp Mill, projected under the Modernisation and expansion Programme to produce skelp and strip for the manufacture of tubes at the new tube-making plant of the Indian Tube Co. (1953) Ltd., had originally been scheduled to be completed by December, 1955, but did not start operation till March 28, 1956, owing to a strike of dock workers in the U K, which delayed the shipment of equipment.

The Agrico factory produced 2,371,000 implements and edged tools, bettering the previous year's output by 16 per cent. Coal cutting picks were added to Agrico's range of products.

An important event of the year was the agreement entered into with the Tata Workers Union. The agreement sets out the basic rights and obligations of the parties and provides measures for union security, closer association of employees with management in the working of the industry, revision of the wages of lower paid employees and increase in gratuity payments, fixation of a standard force, increased productivity and the rationalisation of the Company's wage structures on the basis of a job evaluation programme undertaken jointly with the Union.

Financial Control and Delegation

IT is not the present incumbent of the high office of the Comptroller and Auditor-General but his predecessor who impugned the private limited companies formed under the Companies Act, for the management of Government enterprises or enterprises in which the Government had a controlling share, as "a fraud on the Companies Act" (the credit for coining this phrase should really go to Shri K C Neogy) and "also on the Constitution". This was because the Comptroller and Auditor-General had no automatic right to audit such companies and therefore had no means of discharging the responsibilities imposed upon him under the Constitution of ensuring Parliamentary control over public expenditure.

Actually, the powers and responsibilities of this high office are not as wide as this particular allegation might suggest. Article 149 of the Constitution, however, merely says "The Comptroller and Auditor-General shall perform such duties and exercise such powers in relation to the accounts of the Union and of the States and of any other authority or body as may be prescribed by or under any law made by Parliament ....". So the right does not flow from the Constitution: Parliament prescribes the Auditor-General's functions.

The Parliament had not prescribed what his functions would be in regard to the so called Government companies, when Shri Nanahari Rau made this complaint before the Public Accounts Committee. It has since done so, in the amended Companies Act, section 619 of which says that not only would the Auditor of a Government company be appointed by the Central Government on the advice of the Comptroller and Auditor-General but the latter shall have power (a) to direct the manner in which the accounts shall be audited and (b) to conduct a supplementary test audit, if he considers it necessary to do so.

The present ebullient incumbent of this high office lost no time in exercising these powers and issued instructions to the companies concerned and to the State Governments that "This audit by the Comptroller and Auditor-General will be generally directed towards a review of the decision taken by the Board of Directors to ascertain to what extent their powers have been exercised in the best interest of the undertakings and to see whether the powers delegated to the chief executives have been exercised properly.' '

To this, Professor Appleby, the American expert on public administration, has taken strong exception. Drawing pointed attention to the above instructions, he has said that "nothing could be more calculated to stop the Plan in its tracks, to undermine responsible Government and to establish Government of, by and for auditors." In fact, he has gone farther and criticised the function of the Comptroller and Auditor-General as "an inheritance from colonial rule." The district officer is one (credit to Dr. Lohia) and the Auditor-General is another who, according to Professor Appleby is "today a primary cause of a widespread and paralysing unwillingness to decide and to act."

To this, the Comptroller and Auditor-General, breaking the polite convention of Parliamentary Government that Civil servants should take no part in public controversy and that like women and children under the code of Mahabharata warfare, they should be inviolate, has replied in a press interview. Challenging Prof. Appleby's main thesis that audit saps initiative, he has said that "it is only incompetent officers or officers afraid to take responsibility who urge in extenuation that they are afraid of what audit would say".

While being thus subjected to public attack, the Comptroller and Auditor-General however has also scored a signal victory. Breaking the rule of not participating in public controversy, this watch-dog of Parliamentary control over public expenditure had alerted members of the Parliament about the impending loss of their right to control expenditure at the time when the Life Insurance Corporation Bill was before the Lok Sabha. The Bill, and the subsequent Act, it will be recalled, did not authorise the Comptroller and Auditor-General to audit the accounts of the Corporation. The then Finance Minister had been hard put to it to defend his position. True, the Life Insurance Corporation would be an autonomous body, but so were the D V C, the Industrial Finance Corporation and the Air Lines Corporation as also the Government sponsored companies, all of which were subject to the scrutiny of the Comptroller and Auditor General. It was only in the case of the State Bank of India that an exception had been made. Similar exception was made for the Life Insurance Corporation on the ground that Government Officers lacked experience of the work in such enterprises and Government would not like the success of these recently nationalised ventures to be jeopardized by some violent change in the system. "Such institutions", said Shri Chintaman Deshmukh on the floor of the Parliament, while introducing the Bill, cannot be run without the exercise of a large measure of discretion by the higher executives, and any system which makes it possible for audit to raise objections to the exercise of such discretion is bound to paralyse their working." He also explained that this would not affect the accountability to Parliament of the Corporation, since "Clause 20 requires the report of the auditors to be placed before Parliament, and when this is done, the House will be able to discuss the report fully and freely." For precedent, the ex-Finance Minister referred to the practice in the U K where the Comptroller and Auditor-General does not audit the accounts of the nationalised concerns nor has he claimed any inherent right to audit them.

On this question, however, there were differences of opinion, even in the Select Committee and in the subsequent debate, Shri Chintaman Deshmukh let it be known not only that the Comptroller and Auditor-General did not agree with him on this question but also made some remarks about the latter's part in the controversy. The Speaker of the Lok Sabha, on a representation by the Auditor-General, has ordered that some of the remarks of Shri Chintaman Deshmukh criticising the conduct of the Comptroller and Auditor-General be expunged from the minutes.

This may be only a minor scoring point on the part of the Auditor-General. But it pinpoints the paradoxical situation that has now arisen in regard to the vexed question of control over expenditure in general and the delay, frustration and stalemate that raises from the present unsatisfactory method of exercising this control. It is no secret that the financial procedure is wholly out of date and has been a drag on the implementation of the Plan. In fact, the Parliament was so agitated over it that sensing the discontent and strong resentment in the Parliamentary party, the Prime Minister had appointed the present Comptroller and Auditor-General, before he had assumed this high office to report on the matter and recommend a more efficient and less dilatory system to replace the present out-moded one.

The series of developments in regard to audit noted above suggests that the Finance Ministry has now come to realise that Government audit tends to weaken initiative and inhibit the exercise of discretion on the part of those who are charged with the conduct of economic undertakings. This appears to be a belated realisation, for the ex-Finance Minister certainly did not think so when he piloted the Companies Bill which expressly conferred on the Comptroller and Auditor-General powers of supervision over Government companies, powers which he did not possess before this Act was passed.

There are many obstacles on the path to decentralization of public enterprises, not all of which can be removed by procedural changes. But even about those procedural changes which can remove some of these obstacles, there is clearly no unanimity of opinion, even within the Government. There is agreement, however, that decentralisation is desirable and that it is implicit in the pattern of development that the country has in mind. To what extent Parliament realises the full implications of this principle to which it pays lip service, however, is not so clear. In the case of the State Bank, to cite a recent instance, there was no question of the Comptroller and Auditor General sitting in judgement over the manner in which the Board of the State Bank exercised its discretion or interpreted its functions. (The bank was to be administered as a commercial concern with 'due regard' to public interest). But neither the Finance Ministry nor Parliament (the former more specially, since in this matter it guides the latter), through questions in Parliament and through its officials nominated on the Board, has exercised a degree of control and interference which corroborates the reluctant judgement of another visiting expert that "the need for such delegation is not yet accepted in India". In fact, the following observations of Professor Galbraith made long before the particular instance cited here came up could be a most appropriate comment on these unfortunate developments.

"Even after it (the need for delegation of authority) is accepted vigilance will be necessary on the part of all concerned to see that what is accepted in principle is not modified in practice. One obvious danger is through the Board of Directors of the new corporations. The high public officials on these boards could easily become a channel for approving and checking management decision. In the end the public official could become a link in a chain of command running from the management of the corporation, so called, to the Minister. The corporate form would be merely a facade for an autonomy that had ceased to exist".

Financial procedures have to be changed, but before that Parliament and the Secretariat must accept the principle of delegation. The conversion of both is now overdue.

Statesmanship

PRESIDENT NASSER has emerged out of the Suez Canal crisis with an enhanced reputation for statesmanship. He has been firm on the basic issue of Egypt's sovereign right to nationalise the Suez Canal company. He has been equally adamant about Egypt's sovereign right to own, operate and manage the Canal as an international waterway. He emphasises that the crisis—"can be and must be solved by negotiation". His first announcement of Egypt's decision to nationalise the Suez Canal Company may have been indignant in tone. But his later gestures and actions have been commendably moderate. He has been diplomatic in not being provoked by the joint Anglo-French militant postures and attitudes. He has meticulously observed the principle of freedom of navigation through the Canal.

France's militant mood stems from the sinister implications of Egypt's control of the Canal. She is as much interested as Britain in west Asian oil. But Egypt's sovereign control over the Canal is an indirect threat to France's empire in Africa. This may explain, but not justify, France's bellicose attitude. M Mollet may find it politic to exploit the Suez Canal crisis to mobilise the nation's support to his hostile policy to Africa. He seems to have succeeded in diverting the people's attention away from his barren Algerian policy. But Sir Anthony Eden has fallen into a trap laid by the combative Suez Lobby. He has emphasised that Britain and France are prepared "to go it alone", to impose a dictated solution of the Canal crisis. He has informed the people and Parliament that his Government will never accept Egyptian control over the Suez Canal. As Egypt is determined to own, control and operate the Canal, Britain and France can enforce their solution only through military action. Strategists doubt whether Britain and France can wage a successful war against Egypt. But more relevant is Pandit Nehru's friendly warning to Britain and France that force and threats of force "do not belong to this age". As long as freedom of navigation in the Canal is maintained, Britain and France can have no cause or justification to use force. In the event of Anglo-French aggression, or even threats of aggression, Egypt will be entitled to appeal to the United Nations for help and protection against disturbance of peace.

While Britain and France are seemingly blind to this international aspect of the Canal problem, Egypt is secure in the knowledge that she can invoke the aid of the United Nations against aggressors or potential aggressors. That being so, Cairo could have ignored combined Anglo-French threat to use force as a policy of diplomatic bluff. President Nasser has informed Britain, France and America that Egypt will not attend the London Conference on the Suez Canal. Cairo's refusal to accept the three-power invitation was anticipated by New Delhi, and should cause no surprise. But President Nasser has shown diplomacy by reaffirming Egypt's determination to seek a peaceful and negotiated settlement of the crisis even while rejecting the Three-Power invitation. Reasons for Egypt's decision not to attend the London Conference are just. But President Nasser has emphasised Egypt's willingness to conclude an Agreement with the signatories of the 1888 Convention and other concerned Powers re-affirming and guaranteeing freedom of navigation in the Suez Canal. In agreeing to register such an Agreement with the United Nations, President Nasser has furnished clues as to the essential ingredients of a negotiated solution of the crisis.

As the London Conference deliberates the issue to devise an agreed solution of the Canal crisis, the world as a whole, including the Powers attending the London Conference, will welcome President Nasser's conciliatory gestures. There will be appreciation for Egypt's sincere intention to such a peaceful solution of the crisis through negotiation. Increasingly it becomes obvious that the solution formulated by Britain and France cannot be acceptable to Egypt or to any sovereign State. No rigid formula for international control of the Suez Canal can be accepted by Cairo, as it would mean that Egypt would have no decisive voice in controlling and operating the Canal. But President Nasser's conciliatory attitude encourages the hope that Egypt may, in the interests of global peace and world trade, concede some form of international supervision of the Suez Canal by an advisory body under the auspices of the United Nations. Some such solution would have been easier had Britain and France not adopted a militant and aggressive attitude. Both Britain and France should be wiser by the unfavourable world reaction to their hostile postures and actions. It is to be presumed that Shri Krishna Menon, India's representative to the London Conference, has been fully briefed by President Nasser about the essential conditions of any solution which can be acceptable to Egypt. Shri Menon will have valuable support from Russia and America in his efforts to reach an agreed solution. India will join other peace-loving nations in hoping that the London Conference will succeed in devising a plan which can be the basis of negotiations with Egypt for an agreed solution of the Suez Canal crisis.

"One has no protecting power save prudence."

Juvenal.

Weekly Notes

Finance for the Private Sector

THE Company Law Administrator has been doing a sizeable public relations job in Calcutta. When he met the Bharat Chamber of Commerce, he was confronted with a formidable list of difficulties which the companies were experiencing in adjusting themselves to the new Act. The President of the Chamber sought to bring the point home by quoting the figures of new floatations which had declined during 1955 as compared to 1954. He referred pointedly to the depressing effect of the Act on medium and small scale companies and stressed the need for establishing new issue houses and investment trusts as well as for underwriting, to help stimulate new floatations, which had gone down so perilously.

Shri D L Mazumdar sprang a pleasant surprise on the Chamber by announcing that not only was the Government already seized of the problem but that it accepted the responsibility in principle of helping private enterprise to obtain adequate finance. "The Reserve Bank", he said, to quote a newspaper report, "was studying the organisation and working of the New Issue Market in post-war Western Germany, Japan, and other countries in order to find out which of the institutions could be adapted to the conditions prevailing in India today". The idea was to ensure that the new entrepreneures could obtain a fair proportion of the community's savings to provide them with risk capital. He hoped that within a year or so something might be done in the matter.

This should be a fresh provocation for the economists and statisticians engaged by the various chambers of commerce to undertake a fresh exploration of the problem of estimating aggregate savings and of their possible distribution between the two sectors. It is a widely held belief in the market circles that there is no dearth of funds for investment. What is lacking is adequate incentive to make these funds to flow into the desired investment channels. There would be no harm however, in having a fresh probe at the expert level. It is a challenge to private enterprise which should be met.

Parliament's Verdict on Bombay

A correspondent violently assails the "Opportunist Solution" which was held up as the 'Verdict of Parliament' in the last issue. He writes—

THE bilingual solution for Bombay will stand. Bombay Gujerati's have welcomed it. Ahmedabad opposition is not supported by leaders and money bags; it will blow off. Maharashtra leaders, crestfallen and afraid to leave Congress, have accepted it because it saves their face. What appears significant is the manner of reaching the decision. It was not the verdict of the Congress but 'fixing' of party members. The High Command figured out that now that Maharashtra Congress leaders are willing to cooperate, Congress majority would be assured in the bi-lingual State and Gujerat should be able to exercise the same over the affairs of the proposed state that it had exercised hitherto over the Bombay State. The Karnatak Members had been the balancing factor in the past and had generally supported Congress. Gujerat-Kanara combination had kept the Maharashtra bloc in its proper place. Now the Vidharbha group, pitted against Poona, will repeat the same balancing feat on the side of Gujerat.

When the High Command felt sure of this, it managed the rest. Signatures of M P's were canvassed by the Congress whip and Minister for Parliamentary Affairs. So it is not because Delhi is far away from Poona or Ahmedabad, but because it is in close touch with Congress representatives (present and to be) that this solution came up and was put through.

"What was the net gain or result of referring the S R Bill to Bihar and West Bengal assemblies?"

To the above, there is this angry rejoinder:

"May be, the Ahmedabad campaign will fizzle out. May be, Bombay Gujeraties and Maharashtrian Congress leaders welcome the larger bilingual Bombay plan. But, don't forget that the Ahmedabad Mill-owners' Association was one of the first organisations to reject the plan; Dalal Street has been closed thrice, since the beginning of the Ahmedabad troubles.

Your correspondent's interpretation of party politics and of Maharashtrian Congress leaders may be correct. Your editorial repeatedly stated that the new plan was not sponsored by Congress but by some parliamentarians. I don't know whether your correspondent's reference to Karnatak is correct. I doubt whether Nagpur will side with Gujrat merely to spite Poona. Treatment to Vidarbha has always been cavalier. Pandit Nehru admits that much in his Lok Sabaha speech.

Sequence of events in New Delhi, as suggested by your correspondent, may be correct. But neither Feroze Gandhi nor Jaypal Singh is either the Congress whip or the Minister for Parliamentary Affairs. According to reports, these two members took an energetic part in collecting signatures. Pant praised Asoka Mehta, Acharya Kripalani and Frank Anthony for blessing and for initiating the new plan.

Congress and the Congress Parliamentary Party (or the Congress members of Parliament) are different entities. It is not that Congress initiated or sponsored the thing. The distinction between Congress and its Parliamentary Party has potential significance. But why ignore the explicit emphasis on the people, as opposed to opportunist Maharashtrian Congress leaders?

Except the possible beneficial implication to all Bombayites of a bigger Bombay, there is every reason to believe that the whole of Gujerat will be sullen and that the solution will be finally rejected in five year's time by Poona. It will be surprising if Poona remains satisfied without Samyukta Maharashtra. Chintaman Deshmukh is not a political animal. S K Patil is a typical party boss. Kaka Sahib may not be subtle or sagacious, but he may yet prove to be a true prophet and representative of the people of Maharashtra.

No one would care to risk ones reputation by predicting the political behaviour of Gujeratis. But those who pooh pooh Ahmedabad's soda water bottle collective behaviour, ignore Sardar Patel's efforts to popularise Maha Gujerat".

All this by way of comment on Pandit Nehru's latest dictum that Congress is not for linguistic states. All the worse for Congress, then.

Assembly Prorogued

WHAT would have happened had the over-exuberance of Mr Toha Khan, a member of the East Pakistani Awami League, not baulked the combined Opposition in the East Pakistan Assembly of its achievement, is easy to gusess. Despite the confusion and uproar that prevailed for a few minutes as the Assembly re-opened at long last, Sheik Majibur Rahaman, an Awami League leader, managed to read out his no-confidence motion against the Sarkar Ministry. According to reports, the requisite number of members signified their consent to admitting the motion. It was at this point that the uproar started as Mr Toha Khan tried to prevent Mr Golam Sarwar, an Independent supporter of the Sarkar Ministry, from speaking. A tussle followed, and Mr Sarwar was forced out of the House. This provided the opportunity to the Speaker to announce the Governor's order to prorogue the Assembly under the advice of his Chief Minister.

Developing events clearly demonstrate that neither Mr Sarkar nor his Ministry has the confidence of the House. Almost all the parties are united in their opposition to the United Front Ministry of Mr Sarkar. Some days ago, the Assembly Procedure Rules were changed to enlarge the number of members who must agree before a no-confidence motion could be considered by the House. Under this changed procedure, it would not have been possible for the Awami League alone to muster sufficient strength to get a no-confidence motion admitted by the House. In the last few days, almost all other political parties, including Congress, had combined with the Awami League in its efforts to unseat the Sarkar Ministry. This combined effort has now been foiled by the Governor's order proroguing the Assembly.

Immediately after prorogation of the Assembly, the Opposition held a meeting which passed two resolutions. Under one resolution, the Sarkar Ministry's action in advising the Governor to prorogue the Assembly was condemned as unconstitutional. A second resolution was passed urging the Pakistani President to recall Mr Fazlul Huq, the Governor, for "gross misconduct in the discharge of his duty". Mr Sarkar is naive in his defence that he would have been within his rights to advise dissolution, but has chosen the less drastic course of advising prorogation of the Assembly in order to give time and opportunity to some members to make up their minds. Personal jealousies and rivalries may have worsened the situation. But recent political events leave no room for doubt that the Sarkar Ministry has lost the confidence of the House. If Mr Sarkar had reached the conclusion that, in the prevailing political chaos, dissolution was the only remedy, he should have been honest to his convictions. Many would have welcomed dissolution of the Assembly so that fresh elections could be held in Eastern Pakistan.

Mr. Sarkar and his Ministry have few sympathisers. For a long time, he has ruled Eastern Pakistan without the consent and support of the Assembly. From political groupings, it is evident that even those who do not support the Awami League are in favour of ousting the Sarkar Ministry. In the wider interest of democracy, a fresh election is desirable. Eastern Pakistan has shown commendable political consciousness. This explains the gradual loss of prestige of the United Front. Under the present grouping of political parties, the Awami League has emerged as the strongest single party. This is not as much a danger as the machinations of Mr Suhrawardy. There will be hope that Maulana Bhasani will have the courage and statesmanship to rid the Eastern Pakistani Awami League of the baneful influence of Mr Suhrawardy. Only then can the Maulana succeed in grouping all the progressive elements under the banner of his Awami League so that a stable, democratic government can be established in Eastern Pakistan in the near future.

The New Line in China

(From A London Correspondent)

WITHIN the last six months there has been a most startling relaxation of tension both within China and in China's foreign affairs. The meek and mild language used by China to describe Britain's attitude towards the Suez Canal question contrasts sharply with that of the Soviet Union, for example. Although the overthrow of Stalin has undoubtedly had some effect in emphasising this new Chinese policy, it would be a mistake to think that there have not been signs of the loosening of controls over a much longer period. Two years ago it was almost impossible for any scientist trained in America or Britain to be promoted in Government service over the heads of Russian, French or German trained scientists. Today the emphasis is on being trained overseas and not in which country one acquired the training. There is an increasing number of new technical and scientific magazines being published in English and the previous policy of trying to translate all medical terms into Chinese has been abandoned for a more middle-of-the-road policy in medical schools. Some medical journals are published in English. This reasonableness seems to have permeated into all fields. In the recent English "dried egg scandal" in which the British Government had bought several million pounds of eggs from China, which were subsequently found to be carriers of typhoid, the Peoples' Government of China showed the utmost willingness to introduce new machinery into China to prevent this happening again.

During the last month, London has been visited by Bishop K H Ting of the Shen Kung Hwei, the Chinese equivalent of the Anglican Church. The Chinese Peoples' Government Charge D'affaires in London invited various prominent churchmen of the Church of England to meet him, including the Archbishop of Canterbury and the Chinese Foreign Secretary of the Church Missionary Society (which formerly worked in this part of China). An absentee was the Dean of Canterbury although whether deliberately or accidentally I am unable to say. The banquet in honour of Bishop Ting was held in one of the biggest London hotels and was presumably paid for by the Chinese Government. Shortly afterwards Bishop Ting departed for Galyateto, Hungary, where the World Council of Churches was due to meet. Bishop Ting's appearance at the World Council meeting marked the first occasion since 1948 when churches in China have been represented at a World Council Meeting. Although your correspondent did not have the opportunity of meeting Bishop Ting on this occasion he recalls the first meeting of the executive committee of the World Student Christian Federation in Switzerland after the war, when Bishop Ting, then a YMCA Secretary, was also present. At that time your correspondent was greatly impressed by his sound theological knowledge and his all round ability. He returned to China after the Communists had captured Nanking and has been consecrated since the new Government in China. He thus did not pass through the very difficult period after the Liberation as a Bishop.

Bishop Ting said in the course of his speech:

"In the early days of the Revolution Christians thought, it their mission because of the apparently sound historical analysis and moral positivism of the revolution to establish a theological synthesis between Marxism and Christianity, to go beyond the level of action in which Christians act with others in the same concerns. We have this danger in China. But in China, there is another sense in which the danger is less than in other countries because we are under an openly atheistic and non-religious government. This open atheism is a sort of guarantee that the communists' attitude to the church is not that of using it. All through history those who have used the church have done so under the guise of religiosity".

"Are we Christians in China too naive?" he asked. "Are we going deeply enough into the essence of the Communist? . . . We think we know the essence of the Communist. He is a child of God and in him there is something God regards as worth saving".

This speech was of course an extremely pleasant speech but it did not bear the slightest trace of any theological thinking. To argue that an atheistic government is the best way of guaranteeing that the State will not use the church (or any other religion for that matter) for its own ends really insults the intelligence of the members of the World Council of Churches listening to this speech. One of the best examples in the world of this happening at the present time is the Moslem minorities Peoples' Commission in the Peoples' Republic.

Bishop Ting stated that the fact that the Chinese churches, divorced from missionary funds, had developed a programme of self-administration, self-support and self-propagation was important but went on to say that "self-support is first a spiritual and theological experience".

The whole of Bishop Ting's speech was of this type, full of apparent information but in reality saying very little. After Bishop Ting had sat down, Bishop Manikam, Lutheran Bishop of Tranquebar, India, reported on his recent visit to China. During his speech he made the following points:

"My impression of the Three Self Movements (self-administration, self-support and self-propagation) is that a remarkable degree of self-support has been reached. But we must not forget four points. First, the churches do not any longer have to support schools and hospitals, which have been taken over by the Government, only churches and theological institutions. Second, all taxes on church property have been completely wiped out by the government. Third, the sense that the church is now 'our church' makes the will to give greater. Fourth, income from church property helps considerably, and this property is not originally the property of the churches but of western missions.

"Is there freedom of worship in China? Yes. But the question is how far the churches may say what is fundamentally against the government in power".

I am not so much concerned here with whether there is or is not freedom of religion in China. What puzzles me is that a Bishop of the Chinese church with a first class mind and an extremely able theological background who had deliberately sacrified many opportunities to go into occupations other than the Church, which are much better paid is prepared to go overseas as a semi-government representative and give a public lecture which is far inferior to his real capabilities. On the other hand an Indian Bishop, who, I think, speaks no Chinese, is able to give a much more powerful talk on the Church in China after a short visit lasting a few weeks. Since I am completely unable to accept the view that Bishop Ting is either a Government puppet or is intellectually inferior in any way to Bishop Manikam, I am forced to the conclusion that this Chinese thaw is still very much on the surface, whatever the actual attendance of the Chinese church at the World Council of Churches may portend.

It also happens that within the last few weeks, an article has appeared in ***People's China***, the foreign language monthly published by the Foreign Publishing House, Peking, by Prof Fei Hsiao Tung. Prof Fei is the Principal of the Minorities' College at Peking and holds an important Government position. He was a Vice-President of the defunct Democratic League. He is well known in the west as a lecturer and author, especially in economics and anthropology. His best book in English is **Earthbound China**, published by Kegan Paul, after the war. I have had the good fortune to meet him while he was on a visit to Oxford in 1947. Ever since the Red Army liberated China, it has become almost impossible to communicate with former colleagues in China except by subterfuge. Prof. Fei had a wide circle of foreign friends who respected him greatly. Some of these friends published a book of his called **China's Gentry** in the United States derived from various notes which he had left behind. Several times they tried to communicate with him but without success; so they published the book without his permission. During the six or seven years that he has been in China, overseas anthropologists and economists have been desperately eager to obtain news of any work which he might have written, but again without success. Suddenly Prof. Fei, like a bolt from the blue, publishes this article in English stating that he has been principal of this college for the last few years. During this period he has not published anything from pressure of other work. And then instead of describing the problems of new China as he sees them, he launches out into a bitter attack against his American friends who have published **China's Gentry** and against Kingsley Martin, the editor of the **New Statesman**, for not being able to "understand" each other when they recently met in Peking. The same problem puzzles me as in the case of Bishop Ting. In both cases, they sacrifice about 90% of the ability of which they are capable in order to prduce speeches and articles which are in an insult to the intelligence of their listeners and readers.

Under these conditions, it appears that even if the Chinese Peoples' Republic thaws out more than it shows signs of doing, little real understanding can be found between East and West (and here as part of the West I include India) until the intelligent and clever people in China are able to use their whole intellect and ability in communicating with their foreign friends. And until this comes about, China may be treated with respect but not friendship.

Our Delhi Letter

Green Signal for Saurashtra Refinery

THE green signal may be given at last to the Rs 20 crore project for the establishment of a refinery at Bhavnagar. The scheme, which has been hanging fire for more than a year, envisages the construction of works for processing 1.2 million tons of crude oil to begin with. The capacity of the refinery is to be expanded eventually to 2 million tons. Crude oil will be obtained from the National Iranian Oil Company which has the right to dispose of 12½ per cent of Iran's oil production, independently of the international consortium which controls Iran's oil industry. The NIOC is understood to have indicated its willingness to sell crude oil to the Bhavnagar refinery on a long-term basis at 12½ per cent below the international kerb prices. The NIOC also appears to be willing to subscribe as much as Rs 3 crores towards the share capital of the venture. Representatives of the NIOC are expected to be invited to India in a month or two to discuss the details. Iran's collaboration is likely to be eager and effective as the Shah of Iran himself is interested in the project and is understood to have discussed it with the Government representatives in New Delhi during his recent visit to India.

A series of important decisions are understood to have been taken at a conference in New Delhi last week between officials of the Ministry of National Resources and Scientific Research, and of the Ministry of Production and Mr. Nusserwanji H C Dinshaw, the sponsor of the project. A representative of the Birla Brothers, who are likely to finance the scheme substantially, was also present. The entrepreneurs appear to have agreed firstly not to insist on a guarantee against nationalisation of the project within twentyfive years which was demanded by them earlier; secondly, to give preference to the Indian oil, if available; and lastly, not to insist on exporting the refined products, even if better prices can be obtained abroad.

The Government in return may allow the construction of the refinery entirely in the private sector; Messers Birla Brothers and their friends might subscribe the entire working capital which may amount to about Rs 10 crores, in view of the fact that the refinery is to be constructed with the technical collaboration of Messers Krebs et Cie, a French company, willing to give export credits for equipment worth Rs 6 crores. One of the representatives of the Birla Brothers is likely to visit France shortly to discuss the subject with Messers Krebs et Cie with whom the Atlantic group of refineries in France are associated. Meanwhile the Ministries of NR & SR and Production will finalise departmental details and seek the approval of the Cabinet.

* * *

Perhaps no one has spoken recently with greater candour and accuracy on the role of Indian and British capital in the development of the Indian economy than Rt Hon John Strachey, the British Labour MP. In his report to the Government after a two-month survey of the Indian scene, Mr Strachey says:

"I was greatly impressed by the extreme relative weakness of Indian capitalism compared with western capitalism. It can exercise relatively little political leverage. Indian capitalists take short views. They are not really concerned about the fact that the Government's announced policies, if they are carried through, must mean that India will be a socialist country in which they will have little future as capitalists within, say 15 years' time. Indeed the main resistance to the new socialist policy seemed to come more from the older members of the civil service and from some of the older generation of Congress political leaders themselves than from capitalists as such. But this struggle within the Governmental apparatus seems to have been won, for the present at any rate, largely thanks to the Prime Minister's own predominant influence, by the pro-socialist elements".

Mr Strachey is convinced that it is immensely to the interest of Britain that India's Second Five Year Plan should succeed. It would offer Britain by far the best commercial opportunities in India. But Britain should be under no illusions as to the effect of the Plan on the older and more traditional types of British commercial interests in India. These are:

(a) The sale of consumer goods, chiefly Lancashire textiles, to India. The Plan will lead to acute shortage of foreign exchange and India will drastically limit the import of consumer goods. There is little or no future for the export of cotton textiles to India. However this is not a serious matter. Lancashire last year exported 3 million yards of cotton piecegoods to India whereas immediately before the second world war, she was still exporting 300 million yards. The bitterness of death is, in this case, almost past. Nor in the short run, is there much future for the export of other British consumer goods to India.

(b) The long established British business in India — manufacturing, mining and generally producing concerns—usually conducted by managing agents with mixed British and Indian shareholders, are not particularly or immediately threatened by the Plan. Nevertheless it would be foolish to suppose that they will survive any longer than any other part of Indian capitalism. They will be permitted to continue for years and even decades, but they will become less and less significant in the Indian economy and will be in the end absorbed into the major publicly-owned industries.

(c) The really important opportunity for British trade with India lies in the export of capital goods of every sort and description. India's demands for such goods will be literally limitless. The only limiting factor to India's ability to purchase them will be the shortage of foreign exchange. Britain will have to stretch herself to the utmost to provide India with foreign exchange by new loans, by credits and by "as generous treatment as we can afford in the drawing down of the sterling balances."

Letters to the Editor

Human Relations in Industry

J R D Tata's Address at Oxford

I HAVE just read with much interest what is presumably a summary of Sri J R D Tata's address at the Duke of Edinburgh's Study Conference on the human problems of industrial communities in the Commonwealth. It would be excellent if the entire address were to be printed in your esteemed journal as the subject of Sri Tata's address is of interest to economists, sociologists, welfare workers and citizens in general. I hope this will be possible, and soon.

In the summary which I have read, Sri Tata has referred to the results of certain social surveys of Jamshedpur and the townships which have grown around the other Tata enterprises. I am naturally curious to know when and by whom these surveys were conducted, and whether they are available to the interested public for consultation? In case they have not been published already, I hope they will be published soon and made available to all those interested.

Sri Tata is reported to have stated (according to the British Information Services' summary of his address) that "These surveys had revealed the following general trends: loosening of family ties; an improvement in the position of women; weakening of the barriers of caste and untouchability ....." These conclusions about the social effects of industrialization in India are pretty generally held. In fact, one might say that they are very nearly axiomatic and anyone who doubts their validity is regarded as either extremely stupid or as one who wants to be different from everyone else. At the risk of being dubbed either, I must state that I have my doubts about their validity. My own guess is that family ties do not loosen, but their character changes. In fact, a case might be made out for exactly the opposite conclusion. Subsistence agriculture in a context of rapidly increasing population becomes more and more uneconomic, and industrialization and urbanization by opening up new channels of employment preserve not only the integrity of agriculture but the family system which goes with it. Let me make it more concrete by taking a hypothetical example: four brothers find that the patrimony of two acres of dry land does not support them. In the traditional economy two or three of them become part or whole-time agricultural labourers and they should consider themselves lucky if they earn enough to keep their body and soul together. What is more probable is that in a few years' time they will be forced to mortgage or sell the patrimony. If, however, two of the four brothers find employment in government service, or in a tea or coffee estate, or become workers in a nearby industrial town, their patrimony is less likely to be mortgaged or sold. The brothers staying in the towns usually send sums of money periodically to their homes. And one of the distinctive features of the Indian worker is his attachment to his ancestral land and village. In fact he frequently looks upon his life in the town as only a preparation for eventually settling down in his ancestral village. **My own hunch is that urbanization increases the strength of kinship bonds both at the worker as well as the white-collar levels.** The tensions generated by staying in a single small house are no longer there, and conflicts over small sums of money are also less. This, however, has to be tested in the field.

Regarding caste and untouchability—it is quite true that the more irritating and apparent features of caste exclusiveness decrease in urban areas. For instance, the buses which carry the workers to the factory do not pay heed to untouchability, and the workers' canteen ignores food taboos. But does caste consciousness decrease in other respects? Do marriages among urban workers ignore the barriers of caste and region? In fact, a certain continuity is traceable between caste and factory labour, and this is specially true in the case of the artisan castes. I learn, Sir, that one of the chief difficulties in the way of organizing workers in Jute mills stemmed from caste. As a sociologist, a study to which I would give high priority would be the forms which caste takes among industrial workers and in trade union activities. So far studies of the trade union movement have paid no attention to caste. There is no need here to go into the reasons for this.

I have deliberately kept the question of position of women to the last. It was the fashion among anthropologists of an earlier generation to have a chapter or section on the position of women in the particular society they were dealing with, but present day anthropologists find the concept is too vague and general to be very useful. What is done nowadays is to break this concept down to smaller and more manageable ones. One certainly does not expect a non-anthropologist to be aware of all this, but even at the level of ordinary observation, I wonder if it could be said that the position of women improves with urbanization. An urban woman worker earns her livelihood and this certainly makes for independence. And women in the rural areas may not earn a cash wage but they are indispensable to the domestic and agricultural economy of the peasant.

In the area which I know best viz., villages near Mysore, a woman cooks food for all the members of the family and carries the midday meal to the field where her husband and his brother or son are working. She does all other household work including carrying cattle-shed manure to the family manure heap, milking the cows, making and selling buttermilk and butter, and selling fowls and eggs. The income from the above activities belong to her alone, and it is not surprising to find that within the elementary family there is a certain amount of book-keeping. A wife lends money to her husband and a son to his father. (One of the disputes in my notebooks refers to a father's attempt to deprive his young son of his legitimate half-share in the money which the sale of a sheep fetched.) Besides, most women work in the fields at certain seasons, and the work is such that the men themselves admit it to be very arduous. They stand for hours in the paddy fields in the rains transplanting paddy shoots, they weed, they cut the grain stalks, and they winnow the grain. The value of women is recognised by everyone.

It is true that men regard themselves as superior to women in some ways but I have seen in disputes before the village elders, women standing up for themselves in a most vigorous fashion. (I once saw a Tamil Kallan wife tear the tali which her husband had given her at marriage and threw it in his face because he was unreasonably jealous. She was a mother of three, and she did

not go back to her husband till he had expressed his regret before the elders of her caste, and promised to behave in future).

I have gone on too long and I shall stop now. I hope Sri Tata's speech and the surveys he refers to will both be available to the public at an early date.

BOOK BANK AND LOAN FUND

I HAVE read with interest your comments on our loan scholarship scheme (Weekly Notes, issue of August 4). I feel rather encouraged by your appreciative remarks and give my sincere thanks to you. With the goodwill of the public, I hope the fund will be able to do its bit towards solving this problem of such a magnitude.

Your comments on "Book Bank" has attracted my attention. I may here tell you of a little experience I had in running such a service to High School students. While the Administrative Office of the Canara Bank was at Mangalore, the Staff Club of the Bank arranged this by collecting small donations from members. But lending was arranged through a teacher who undertook the responsibility to see that the book was returned. Students also gave such an undertaking. The scheme was successfully worked for 4 to 5 years when we were there. Not a single book was lost and all the books were handled neatly and carefully, to our great surprise.

If High School students could display such a high sense of responsibility towards books entrusted, certainly such a scheme should work well with college students.

S R Prabhu
Secretary,
Canara Bank Jubilee
Education Fund.

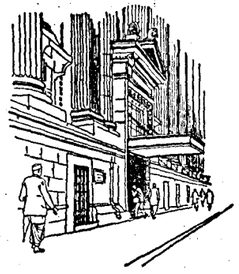
STATE BANK OF INDIA



Successors to the Imperial Bank

The need of the day

Our country's economy is expanding rapidly and with the Second Five Year Plan in sight it will gather further momentum. The need for a strong and efficient banking system has never been greater than today as the nation's savings require to be pooled and managed in a resourceful, confident and prudent manner.

The State Bank fulfils these expectations. It has started upon a programme of opening 400 additional branches throughout the country within the next five years.

The State Bank of India offers to serve you efficiently in many ways. It takes care of your savings and valuables, lends moneys against goods, produce and other approved securities and assists you by accepting appointment as executor and/or trustee of your will or trust. Its wide and varied services are at your disposal. Why not talk things over with your nearest bank agent, or write for information?

The State Bank's **local head** office at Bombay, one of more than four hundred offices waiting to serve you throughout India

STATE BANK OF INDIA

Largest of the Indian Joint Stock Banks

A Calcutta Diary

How To Be Very Very Popular

SORROW at the death, last week, of Dr H C Mookerjee, Governor of West Bengal, was both sincere and widespread. He was a lovable man, respected by generations of students. As a teacher of English literature he was able in his quiet way; as a donor he has left considerable funds with the University of Calcutta; and as a leader of the Christian community his services were rewarded when he was elected vice-President of the Constituent Assembly. It is however as a Governor that he died, and and one of the obituaries in a Calcutta daily affords an opportunity of discussing what, in free India, are the functions of a State Governor. Lost in the ill-defined elasticity of these, the newspaper wrote: "What are we to say of Dr Mookerjee as a Governor? Perhaps the truest thing would be to say that he never seemed one." Obviously intended as a compliment, it still remains a rather ambiguous statement. The Governor's office is what its holder makes of it, and what has been made of the office in West Bengal since the midnight of August 14-15, 1947, may tell us a thing or two about the political climate of the State.

The present writer was in Government House when C Rajagopalachari, the first Governor, was sworn in. The solemnity of the occasion is still vividly remembered, also the discordant noise floating on the midnight air. For reasons which seemed important to some at the time, there was an agitation against the new Governor. He, it was believed, was anti-Bengali; and there were strident cries in the streets: Go Back Rajagopalachari. The agitation was stupid, and C R's very considerable wits were taxed but slightly in getting the better of the argument. In doing so, however, the initially unpopular Governor resorted to methods which have since been acting as precedents—with results of questionable merit. As Governor, C Rajagopalachari "never seemed one;" he was to be seen anywhere, presiding over everything from public meetings to private ceremonies of christening babies. The method paid handsomely; he was a very popular man when the time came for him to leave West Bengal. At the numerous farewell ceremonies preceding his departure, one almost heard a cry: Don't Go Rajaji.

* * *

What confronted C R in mid-August, 1947, was a personal problem; his personal solution has since set the pattern of gubernatorial behaviour in the State. Rajaji had to show how to be very very popular with the Bengalis; he had his previous anti-Subhas orations to live down. His successor, another non-Bengali but with no great primary unpopularity to win over, just followed his highly successful predecessor. In the event, Dr Katju too was enormously popular, for popularity again was his sole objective, with less reason as has been suggested than C R. Once again the chief quality of a Governor was supposed to be his ready availability for presiding over sundry occasions of no moment. It is rumoured that C R occasionally tried to influence his Chief Ministers, that he resisted some of the Government's more partisan decisions, that he even met some of the members of the opposition within the Congress Parliamentary Party with a view to bringing pressure on the Government. Rajaji may well have enjoyed these manouevres, if he indeed indulged in them (which cannot of course be proved), but his successors had neither his taste for this game nor his talent. It is not surprising, therefore, that the office of Governor soon became something like an appendix, noticed only when there were suggestions of possible appendicitis.

It is indeed difficult for a Governor to be functional, for the Constitution is silent on what he is expected to do. The role given him, therefore, is an exceedingly difficult one, and nine years have gone by since Independence without the country (or the incumbents, present and prospective) getting anywhere near a definition. As has been suggested, the lack of a Constitutional definition is being made good by precedents, some of them bad ones. If the Governor is a strong man, he comes in conflict with his Government which promptly reminds him that he is nominated and has no authority to speak for the people. If he is a feeble personality, he just does not bother about what his Government is doing which he cannot restrain anyway. If he is neither strong nor feeble but only a good man, he does not press for a definition, he does not project himself on the Government; he just goes his own way, seeing that it does not cross his Chief Minister's. It is a tribute to Dr H C Mookerjee that, faced with the prospect of trouble or paralysis, he devoted himself to raising funds for hospitals and memorials. A little good must have been done in consequence, but these activities of Dr Mookerjee's (which some found to be inconsistent with what they conceived to be the dignity of the office) certainly do not add up to anything like a complete justification of the continuance of the office.

* * *

Several Raj Bhawans will shortly be looking for new tenants, and discussion should begin whether we want Governors and, secondly, if we do, what we expect them to do. It is by no means certain that the first part of the question will inevitably return an answer in the affirmative. If the Governors are given nothing useful to do—and there are valid arguments against giving them any power at all—we are bound to see some Governors behaving like buffoons. This, however, is less of a risk than certain other possibilities. In the absence of something to do, some Governors will only demonstrate how to be very very popular (a la C R, and how the Bengalis walked into his parlour!) and others will act in a manner which will rob the office of such dignity as may still be associated with it. It is not necessarily a criticism of the late Dr Mookerjee that it took him years to raise a meagre Rs 5 lakhs for his after-care colony whilst it takes no more than a two-minute for Dr Roy to secure Rs 17 lakhs for a hospital. Charity in a money-based society flows in strange channels; those that do not eventually flow into the sea(t) of power and patronage sadly dry up in no time. Those, therefore, who are inclined to assign to the Governor the role of a charity-tapper or art-patron should think again; whenever he is not totally ineffective he will, sometimes without his knowing it,

encourage certain forms of corruption.

A case can be made out for investing the Governors with certain powers. The States Reorganisation Commission wants them to take charge of linguistic minorities, although it is far from clear how, destitute of all authority, they can do much to right wrongs inflicted by popularly elected Governments. A more useful function for a Governor may be to act as "the eyes and the ears" of the Centre, which now may be more dependent on the State Governments than is good for the security of the country. (A non-Congress Government in any State will bring to the surface this real problem which escapes attention now.) Again, there are arguments against making the Governor a virtual spy on the State Government; that the idea may be dubbed undemocratic will leave others less cold than it does me. What is indicated is immediate discussion on the Governor's role. There is much to be said for effective Governors, almost as much for no Governors—nothing whatever for Governors as they are.

—Flibbertigibbet

The Technique of Production and Employment

In an Underdeveloped Economy

D Ghosh

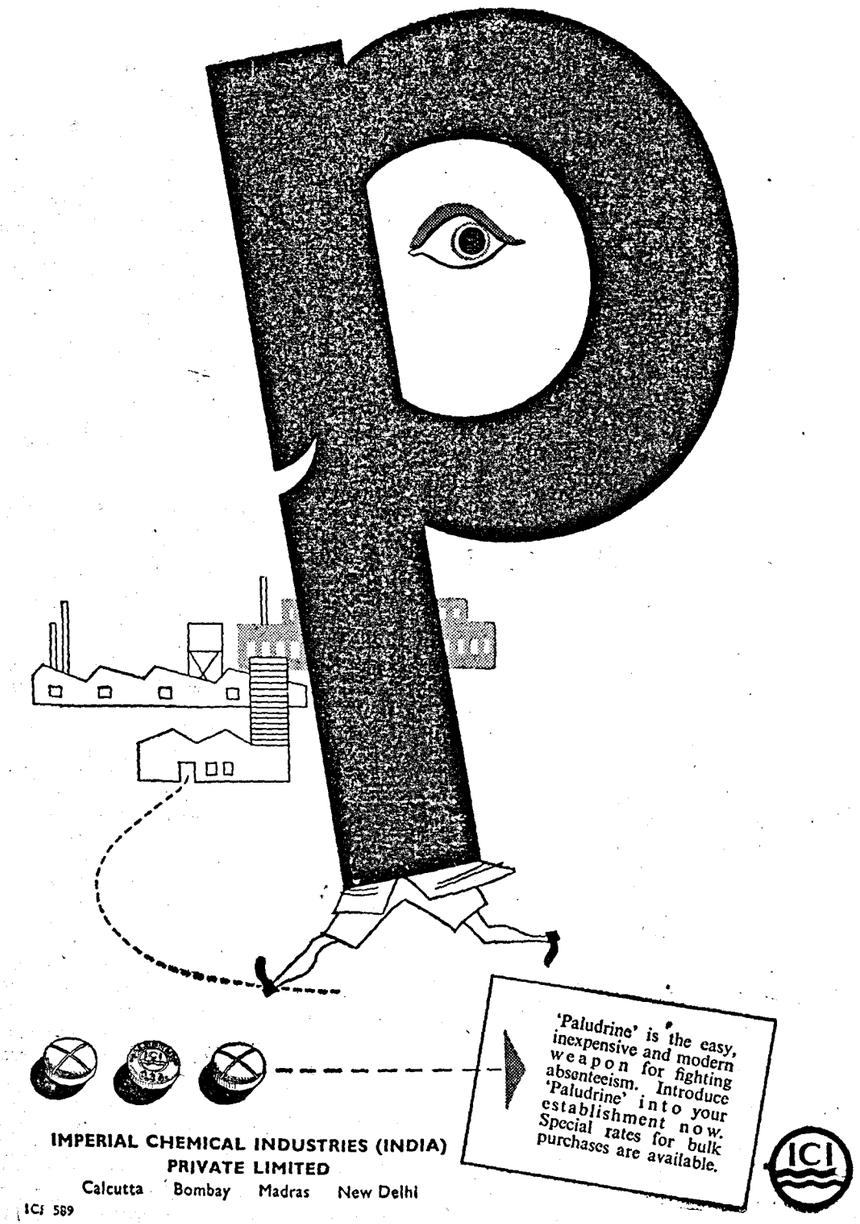
The previous note on this subject which appeared in our issue of August 4 stated the conclusion or the choice of technique in the barest terms. The purpose of this note is to re-examine that conclusion in relation to the assumptions on which it is based.

THE long-term superiority of capital-intensive technique rest on the assumption that the larger producer's surplus that accrues from it is re-invested quickly enough by the entrepreneur-capitalist. In fact, however, a portion of the surplus is likely to be spent on consumption by him, and to the extent that this happens, the expansion of total output and of total employment will slow down*. Moreover, the market for the commodity in the production of which the first investment is made may have been fully exploited, while the entrepreneur-capitalist may not be active enough in exploring new fields of investment**. A part of the surplus would then be held in liquid form for a short or long period, with effects on the expansion of output and employment more unfavourable than if the surplus were consumed.

Secondly, it is assumed tacitly that the entrepreneur-capitalist extends production to the point at which marginal cost of the commodity is equal to price. But in an underdeveloped country, he has strong temptations to maintain or raise his total profits by restricting output. His competitors are few, while more often than not, he produces some commodity of basic importance for which demand is inelastic. Total employment is

Thirdly, the argument in favour of capital-intensive technique starts with the assumption that the market is wide enough for the product of the industry which adopts the technique. Now the "extent" of the market is a matter of its geographic reach as well as of the income of the buyer. But since the average buyer in an underdeveloped country is poor and can buy only a few units of the commodity, the number of buyers who must be reached to make large-scale production worth-while must be correspondingly large. For some underdeveloped countries, at least, this implies a geographic spread of the market and heavy investment in transport. But the minimum modern transport organisation may be bigger than is needed for the transport requirements of a single industry, so that either the development of transport is put off and the market for the single industry cramped, or the modern transport facilities that are set up are inadequately utilized or finally, a comprehensive programme of investment, including the creation of several industries and of a modern transport organisation has to be undertaken. The first alternative inhibits the expansion of employment; the second facilitates some expansion but at a disproportionately high capital cost to the community, while the third is not within the means of a poor economy.

As the third alternative is out of court, only the first two need be compared. In the first case, the total economy is broken up into a number of regional economies and the resources available for development are invested in a wide range of labour-intensive regional industries and a restricted inter-regional transport system. In the second case, only a single industry using capital-intensive technique and a developed transport organization are built on the national scale. The single national industry has still a potentially greater employment creating capacity than the multitude of less efficient regional industries. Moreover, the nation-wide transport network will promote exchange of goods and services that are already produced and the rise in their values through exchange will cover part of the higher cost of the national transport organization. But this may not reduce transport costs for the single capital intensive industry sufficiently to enable it to expand its market to the full extent. Total employment may in consequence be less than under a plan of regional labour-intensive industries.



Finally, the argument in the previous note has reference only to closed economies. This is a restrictive assumption for it rules out the gains from international trade and from capital assistance from abroad. The main service of international commerce is to enable a country to obtain some commodities more cheaply by exchange than by domestic production, the gain being larger in the case of commodities in the making of which it has the greatest comparative disadvantage. For an under-developed country, capital goods belong to this category and it is in its interest to import them rather than manufacture them at home. But this may not be possible; for the economy must not only undertake the necessary volume of saving, that saving must take the form of an export-balance large enough to cover the cost of imported capital goods. Now this is often hard to manage; to convert a given percentage of the national income into the requisite export balance would require a much larger percentage expansion of exports or contraction of imports or of both. But the demand for the exports may not be elastic enough and the need for import of essential consumer's goods may be too rigid to permit the creation of such a balance.

This note and the previous one have sought to set out the framework of general economic considerations within which decisions have to be taken by any under-developed country that is faced with the pro-

* The income of the entrepreneur-capitalist too will rise less rapidly, but he will still improve his current level of living relatively to that of the mass of the people among whom he lives. After all, there is some pleasure in riding even an old car in a place where everybody else is walking.

** A distinction should be drawn between different degrees of enterprise. More enterprise is required to start a new industry than to establish a new unit in an old industry. then less than effective competition would create.

blem of choosing the right technique for development. But these considerations do not cover all aspects of development even within the economic field; for the economic advance of a country is influenced not only by the quantity of its capital and labour, but also by its natural resources, the skill, ingenuity and enterprise of its people, the efficiency of its government and the stability of its political life. There are, besides, serious non-economic considerations which must be taken into account in deciding the technique of production. For the technique of production has a direct and important effect upon the pattern of social life in a country. The widespread adoption of a new technique will almost certainly destroy old relationships and the old way of life. But these may, in the opinion of the people, embody ultimate values superior to any gain in material possessions that the new technique may bring. It is for the people itself, to decide where to give up the prospects of economic advance in the interest of "higher" values of life.

Changing Contours of Visakhapatnam

Caltex Refinery Coming Up

THAT the economic development of Andhra had been systematically neglected was one of the grounds, perhaps the strongest ground, for the separation of Andhra from Madras. Blessed with the Krishna and Godavari, rich with minerals, the deposits of which have not been fully surveyed yet, Andhra is still very backward, judged by any of the usual criteria. It has been fortunate, however, in having the third of the new refineries to be located in the State. The Caltex Refinery at Visakhapatnam is expected to come on stream early next year. Will it initiate a process of development which will gather strength as it goes along? Will its influence be powerful enough to sustain this process of change and eventually transform this potentially rich but hitherto underdeveloped State and set it firmly on the path of industrial advancement? Andhra is having some visible proof that it well may. Visakhapatnam was intended to develop into a big port, even in the inter-war period. Many years ago when the port was connected by rail directly to the then Central Provinces, great expectations were raised about the development of maritime trade. But for one reason or other, it did not come off. When the ship building yard came to be established in Visakhapatnam, the hopes were revived. The shipyard, however, experienced many vicissitudes; its rate of development has not been such as to lead to the establishment of many subsidiary industries. But a budding township has come up and its landscape has been gradually changing. The impact on the placid life of Visakhapatnam of the refinery is something quite different from what this part of the country has experienced before. For along with the refinery, the hydro-electric scheme which will supply power to it has also been coming up apace. The port is feeling the impact and will in turn release a powerful impact, for it is being considerably expanded to cope with the requirements of the refinery. So is the port town.

Power is to be provided by the Machkund Hydro-Electric Scheme, the completion of which is one of Andhra's major tasks under the Second Five-Year Plan. When complete, the project will generate over 1,00,000 KW of power. The Refinery will need 7,000 KVA for running the installation. This energy will be supplied by the Machkund Project and power will be carried from Machkund over a distance of 90 miles in three stages. The first stage is a 132,000 volt dual feeder line from Machkund to Simhachalam Supply Station. The second stage will consist of a 33,000 volt dual feeder line from Simhachalam to Visakhapatnam. Finally, the Visakhapatnam supply station, which will be adjacent to the refinery site, will step down the voltage from 33,000 to 11,000 volts. The refinery will use 11,000 volts and a number of small stations located within the refinery will reduce the voltage still further to suit various requirements. A shortage of power has so far impeded the industrial development of the State but with the opening of the Machkund Project, a new era opens for Andhra.

The choice of Visakhapatnam for the Caltex Refinery was partly influenced by the natural advantages of this port, both in point of location and weather conditions. It is mid-way between Calcutta and Madras. Hooghly is silting up and Calcutta harbour cannot accommodate ships with the required drought which will carry the crude oil and the port in Madras is closed for shipments of inflamable products for several months in the year. And since the crude oil for the refinery will come from Indonesia, the advantage of having the refinery in the east coast is obvious.

But however suitable the location, the same cannot be said about the existing facilities of the Visakhapatnam port which handles currently no more than a million tons of imports and a smaller volume of exports. As the capacity of the refinery was raised from 500,000 tons of crude as proposed earlier to 675,000 tons, considerable expansion of the harbour has been undertaken in order to enable it to meet the needs of the refinery. To begin with, the entrance channel as well as the harbour had to be widened and deepened so that ships upto 650 ft long and 30 ft draft may come in. To accommodate oil tankers continuous berths of 600 ft each have to be constructed, in addition to the various other improvements to the facilities of the port.

Besides the expansion of the port and large scale supply of power from the Machkund project, Visakhapatnam will enjoy another important facility which it has lacked all these years—an adequate water supply. Caltex has now joined the Navy and the Shipyard to help the municipality to finance the expansion of the water supply from a million gallon a day to four million gallons. Needless to say, the refinery will itself consume a substantial part of this increased supply.

Work on the refinery started a little over a year ago. Masses of equipment continue to arrive at the refinery site. Some of these have been purchased in India or rented from contractors and some, the heavy construction equipment, have been drawn from Caltex's worldwide pool to be shipped to construction projects in some other part of the world, when they have completed, their work in Visakhapatnam. This will enable a large saving in capital cost.

Though naturally the installation and equipments have to conform to the highest international standard, an interesting feature of the construction is the utilization of local materials where the latter can be used with advantage. Several thousands of tons of earth have been moved for the refinery site, the whole area has been drained and cleared of trees and even the contours of the landscape are taking on an industrial look. Around the site has been erected a 6 ft high stone wall two miles long. Stone is being used, where in America galvanized wire would be used for fencing. And yet, the cost is no higher, maintenance will be so much cheaper and replacement hardly necessary at all. Similarly, rubble stone walls with asbestos sheeting and cement flooring are replacing pre-fabricated frame works with ply-wood sheeting. The substitution is obviously indicated as a successful adaptation, for resisting heat, heavy monsoon and termites.

RUMANIAN FOREIGN TRADE

ORGANISATION PRINCIPLES

In the Rumanian People's Republic the entire operative activity of foreign trade is concentrated in a framework made up of a number of state enterprises (shown alongside), each one being specialized in the exportation and importation of a certain category of commodities. In the Rumanian P. R. transit operations, as well as chartering, loading, unloading, etc. are also carried out by a state enterprise for international transports and forwarding —"Romtrans". These are the only Rumanian enterprises which may enter into trade agreements with foreign countries.

With regard to financial and currency problems, the transactions of the Rumanian enterprises for foreign trade are being handled through the "State Bank" of the Rumanian People's Republic in Bucharest.

The fact that the foreign commercial exchanges of our country are entrusted to state enterprises constitutes an undeniable advantage for the commercial partners of the R. P. R. Being state enterprises any foreign trade engagement entered into by them is characterized by full guarantees of solvency.

Making a large scale use of both imports and exports, our foreign trade enterprises are called upon—within the sphere of their activity—to carry out the measures taken by the Rumanian State with a view to constantly developing the national economy and satisfying to an ever larger extent the continuously growing material and cultural needs of the population in towns and village.

As regards imports, the growing purchasing power of the R.P.R. population makes our country a potential market for foreign companies, while on the other hand as far as exports are concerned, due to the continuity in the Rumanian economy, a reliable source of supply is ensured to our foreign customers. From this point of view, another advantage for our commercial partners is the fact that the Rumanian enterprises often practise exchange of commodities of equal economic importance on the basis of compensation which does away with the consequences of the fluctuation of prices. The fact that the Rumanian enterprises carry out certain operations on the basis of consolidated prices constitutes another advantage for our commercial partners.

These are some of the practical advantages resulting from cooperation with the Rumanian State enterprises for foreign trade.

Connections with the Rumanian State enterprises for foreign trade may be established either directly (their addresses are shown alongside) or through the intermediary of the Chamber of Commerce of the R. P. R.

Since its inception in 1949 the Chamber of Commerce of the Rumanian People's Republic has carried on such correspondence with thousands of firms or economic organizations from all over the world. The connections thus established between foreign firms and Rumanian State enterprises for foreign trade have been lasting and the subsequent agreements resulted in real advantages for both parties.

Attached to the Chamber of Commerce of the R. P. R. are the "Goods Control Office" (O.C.M.) and a "Bureau for Foreign Patents and Inventions" which registers authors' certificates and inventors' patents, sees that these are kept in force and the rights deriving from them observed both in the R.P.R. and abroad. At the same time the "Bureau for Foreign Patents and Inventions" is assigned the task of registering and renewing the registration of Rumanian industrial and trade marks in foreign countries, as well as of the foreign ones in the R.P.R.

Furthermore, attached to the Chamber of Commerce of the R.P.R. an Arbitration Commission is acting, which is called upon to settle patrimonial disputes which may arise from foreign trade transactions between the Rumanian enterprises, and foreign persons or corporate bodies abroad, or between foreign parties.

The foreign economic policy of the R.P.R. is a policy of peace and of strengthening friendship among nations by means of a free exchange of commodities. That is why the R.P.R. stands for normalizing and extending economic relations with any country, on the basis of the principle of equality of the parties and of mutual advantage. The implementation of this policy has a strong material basis guaranteed by the constant development of the Rumanian industry and agriculture, the upsurge of which creates increasing possibilities for both exports and imports.

Agricultural Output in the First Plan – A Revision

Wilfred Malenbaum

I AM thankful to Mr S Naqvi for discovering the fact that the basic data used in my note on this subject (**Economic Weekly**, June 23, 1956) were incorrect. The sources which provided data on a state basis gave national totals which were *"revised estimates"* through 1952-53 only. It is now possible to have such estimates through 1953-54, and *"partially revised" for 1954-55, as* well as "final estimates" for 1955-56. Mr Naqvi's rejoinder (**Economic Weekly**, July 28, 1956) does in fact provide a welcome *opportunity to re*consider the position in the light of more recent data.

I wish first to point out that the major objective of my original note was to highlight the need for analysis of variations in crop output in India over recent years. ". . .no one has yet presented a convincing set of relationships between the additional output or even half of it. (i.e. the part which the Planning Commission suggests was not due to favourable monsoons) and the changes in irrigation, in seeding, in manuring or in other farm management practices. The need for such analysis is clear, both for current planning in India and for a more complete *understanding of the* developments of the past." (my article p 751)

The out-dated data which I used *did make* a rather dramatic case for further study. They seemed to show that yields per acre (not total yields as Mr Naqvi says) were moving steadily upward in most of India, at least since 1950-51. The very favourable monsoons, generally considered the major reasons for the large increases in grain output, thus appeared as rather localized phenomena, and in regions where weather conditions have long brought about large year-to-year variations in grain output. While this seemingly regular improvement in yields per acre did suggest the systematic operation of some in-put factors, the final paragraph of my article expressed the need for analysis both for the areas of highly variable yield and for those where the data suggested a steady upward movement.

Mr Naqvi is perfectly correct in doubting that *the more* recent data would make so convenient a case. The following table, based upon the latest official data, should replace Table III of the original article (ibid p 752). The highest yield per acre for both total India and residual India is in 1953-54, the very favourable monsoon year. Furthermore, there have been important declines in 1955-56 in both residual India and in Bihar and Bombay. Detailed comparisons still show that there is greater variability in the per acre yields for all India than in the residual. But the point again is not nearly so dramatic as it appeared to be on the basis of the earlier data.

There statistics for separate regions in India still reveal markedly different patterns, as was illustrated by Tables I and II of my article. In particular, West and East India show very irregular year-to-year movements and the two states of Bombay and Bihar are primarily responsible for these. Analysis of yield variations must proceed on data which are as localized as possible. Happily, *the systematic effort to uncover the* pertinent input-output relationships over this period which has now been initiated by the Directorate of Economics and Statistics, Ministry of Food & Agriculture, makes use of data on a district basis. All of us interested in the past patterns of agricultural output, to say nothing of future possibilities, await eagerly the results of this basic investigation.

Acreage and Yield Variation

	India			India minus Bihar and Bombay		
	Prod. (million tons)	Acreage (million acres)	Yield (tons/ acre)	Prod. (million tons)	Acreage (million acres)	Yield tons/ acre)
1948/49	51.8	233.0	.223	41.4	181.2	.228
1949/50	54.1	245.3	.220	42.6	188.4	.226
1950/51	50.0	240.5	.208	41.6	189.3	.220
1951/52	51.2	239.6	.214	42.5	188.5	.225
1952/53	58.3	252.3	.231	48.7	200.0	.243
1953/54	68.7	269.5	.255	56.7	214.5	.264
1954/55	66.6	267.3	.249	55.9	214.0	.261
1955/56	63.5	266.1	.238	53.6	215.0	.249

Development of Chemical Industry in the Rumanian People's Republic

RUMANIA is one of the very few countries in Europe which are rich in natural resources. It has got the raw materials required for the development of a wide range of industrial products, especially of the chemical industry. Large deposits of oil and methane gas, reserves of coal ranging from brown coal to anthracite, the luxuriant growth of reeds on the Danube Delta, wood and wood waste suitable for chemical processing, deposits of pure salt and of non-ferrous as well as non-metallic ores—all these have endowed Rumania richly with raw materials for the development of its chemical industry.

In recent years, planning has given a tremendous impetus to this development. In the First Five Year Plan, large funds were allotted for investments in this sector and a great number of new factories were built and commissioned, while most of the old ones were modernized and new sections were added to them.

Among others, the new plants and factories that have come up are:

A big coal chemistry plant,

An antibiotics factory,

Two factories for manufacturing azotic fertilizers,

A plant for phosphatic fertilizers,

An urea factory,

A plant for ceramics and sandstone acid-proof articles,

A ferro-manganese factory,

Two factories for production of acetylene from methane gas,

A carbon black factory,

A plant for manufacture of electrodes and grinding wheels,

A factory for vegetable and extraction tannants,

A plastics factory,

A plant for extraction of copper from pyrites ores,

A factory for producing soap from synthetic fat acids obtained by oxidization of paraffin, etc.

Among old products, those tha are being manufactured in much larger quantities are soda ash and caustic soda, acids, alcohols, carbon black, etc.

The new branches of productior include dyestuffs, fine chemicals and pharmaceutical products grinding wheels, electrodes for electric steel ovens, vegetable tannants required by the leather industry and plastics, chemical fertilizers and various insecticides required in agriculture were also set up.

Of the new lines of production developed during the First Five Year Plan the chemical-pharmaceutical industry and dyestuff industry have made enormous strides. The drugs now manufactured include a number of heavy synthetic products such as aspirin, paramino-salicylic acid, phenacetin, hydrazide of isonicotinic acid, tebezone, etc. The dyestuffs industry manufactures various kinds of azoic dyestuffs, triphenyl methane and basic dyestuffs, sulphur dyestuffs, indantren and dyestuffs of the napthol A S type.

Not only did the output of Rumania's chemical industry in 1955 increase eightfold compared to 1938, the increased production, the wider range and improved quality of the products have made it possible for Rumania to occupy a preponderant position among the countries exporting chemicals. Thus in recent years Rumania has supplied the international markets with important quantities of soda ash, caustic soda, sodium, silicate, aluminium sulphate technical 15%, edible and industrial salt, ultramarine paradichlor benzen, salicylic acid, lactic acid, pharmaceutical lead acetate, butylic alcohol, organic dyestuffs, carbon black, varnish and paint, bone meal, anodic mass for aluminium ovens, etc.

In the Second Five Year Plan, the development of chemical processing of natural gases, of methane gas, oil-well and cracking gasses, etc. will receive special attention. Of particular interest in the developments projected in this period are the plant for synthetic rubber with a capacity of 50,000 tons and factories for high quality synthetic fibres. The production of dyestuffs will be stepped up by 60 to 80 per cent and the range of dyes will be simultaneously widened. A new factory for organic synthesis will increase the production of drugs, the output of antibiotics will be raised and extraction from medicinal herbs will be developed. The utilization of the reed in the Danube Delta will substantially increase the production of cellulose. A new plant will be set up in order to raise the production of chlor and chlorurated products required for fighting pests in agriculture.

The output of sulphuric acid will increase 2.3 times and that of ammonia from methane gas will be 7 times greater during the Second Five Year Plan compared to the First Five Year Plan. As a result of all these, the total output of the chemical industry is estimated to rise by 150 to 200 per cent by 1960 compared to the production in 1955. The export potential of this sector of the Rumanian People's Republic, both as regards quantity and types of products, will therefore go up correspondingly in the Second Plan period.

4%

BOMBAY STATE DEVELOPMENT LOAN, 1970

ISSUE PRICE Rs. 100 PER CENT.
OPEN ON THE 3rd SEPT. 1956

The loan will be closed as soon as a total of approximately Rs. 750 lakhs has been subscribed, and in any case not later than the close of business on the 10th September 1956.

The applications will be received at the offices of the Reserve Bank of India, Bombay, Calcutta, Delhi, Madras and Bangalore, at the branches of the State Bank of India in the State of Bombay and at the treasuries and sub-treasuries in the State of Bombay.

Full particulars can be obtained at any of the offices of the Reserve Bank of India or branches of the State Bank of India or at any treasury or sub-treasury in the State of Bombay.

The Warp of Ideology

R K Hazari

THE ambitious programme for the Ambar Charkha announced by the All India Khadi and Village Industries Board some months back called for the appointment of a technical committee to study and evaluate the possibilities of this ingenuous spinning device. The *Khera Report** is an essay in the fulfilment of this objective. It has recommended the introduction of 75,000 of these charkhas during the current year and of possibly up to 200,000 charkhas during 1957-58. The expenditure recommended for the current year amounts to Rs 3 crores in grants and about Rs 4.6 crores in loans. The charkhas distributed this year should produce, it is expected, sufficient yarn to weave 50 million yards of average count 18s, with a conversion ratio of 3.6 yds of cloth to one lb of yarn. The textile policy recently announced by the Government, it may be recalled, allocated a quota of 300 m yds for Ambar cloth during the Second Five Year Period.

Recommendations

The main recommendations of the committee may be briefly summed up as follows:

1) Further experiments are required to test the efficiency of the Ambar Charkha and of the yarn spun on it. The only reliable data available to the committee were the results of the tests carried out by the Ahmedabad Textile Industry Research Association (ATIRA) at their laboratory on 5 charkhas (20 spindles) and only one loom for three weeks, and the results of the test on a single charkha (4 spindles) carried out at the Technological Laboratory at Matunga, Bombay. The data from Khadi centres were neither conclusive nor perhaps reliable.

2) Research and experimentation are essential to improve the productivity and design of the charkha. Charkhas should be adequately tested for quality and performance before delivery. Government should immediately set up a Textile Research Centre for decentralised spinning and weaving, and set up regional centres in due course.

3) Manufacture of charkhas should be on a decentralised basis but precision parts should be made by a central agency. Yarn production should be up to count 24s. Cotton of staples ¾″ to⅞″ suitable for these counts should be grown in all villages as part of a drive for regional self-sufficiency and this programme should be integrated with Community Projects and allied projects.

4) Daily wages for Ambar Charkha workers should be fixed 1½ as per hank for counts 16s to 32s. Since the average output per working day is estimated for the present at 6 hanks per spinner, this would give a daily income of 9 as. If the production rises to 8 hanks, the daily income at this rate will go up to 12 as.

5) The cost of Ambar Charkhas may be recovered in 5 years, without interest and in deserving cases, half the cost may be treated as a subsidy. All overheads like the cost of training, depreciation, maintenance, subsidy on purchase of charkhas, waiving of interest, working capital (which would amount to 6 months' production value) maintenance of sample looms, finishing and stocking centres, quality control, servicing workshops (together with the expenditure of the Khadi Board itself, etc), should be left out from the cost calculation of Ambar yarn. Since the cost of Ambar yarn, even without overheads, would be Rs 2-14 per lb of 18s as against the mill yarn price of about 1-11, a subsidy of 4 annas in the rupee on Ambar cloth is recommended in order to equalise the price of handloom fabrics made from mill yarn and Ambar yarn.

6) At least 75 per cent of the spinners under the programme should be from weavers' families and the aim should be to have a charkha in each weaver's family "subject to organisational problems being solved in a possible manner". Subject to the same qualifications, spinning should be done at home and not at spinning centres.

7) As the success of the programme hinges on adequacy of organisation, special attention should be paid to training of personnel, study of markets and decentralisation of functions. A directorate should be set up to watch and assess the progress of the scheme for two years.

8) The technical progress and efficiency of organisation should be such as to remove eventually the need for subsidy. The proposal for a cess on mill cloth to bring up the price of mill cloth to that of Ambar cloth has been rejected.

The Committee deserves credit for frankly admitting that the programme it recommends is based on very slender experience. It also merits praise for sobering down the Khadi Board's proposals which **inter alia** demanded a ban on further extension of spinning mills as also for rejecting the proposal for further cess on mill cloth. What astonishes the present writer, however, is the Committee's apparently inadequate grasp of the technical and economic aspects of the Ambar Charkha. Alternatively, if the Committee really did grasp these matters, they must have been under severe political or other pressure to make some of the statements which they probably did against their better judgement

Technical Aspects

To deal with the specific technical points of the Report first.

(i) Tests on productivity have given a production range on the charkha of 4 to 8 hanks of 18s per 8 hours The average is taken for the present at 6 hanks This gives a production of 2.67 oz per spindle shift, as compared to the Khadi Board's estimate of 3.2 oz. This difference indicates that production on the Ambar Charkha is not such a simple matter as the Khadi Board had led us to believe.

(ii) Tests at the Technological Laboratory at Matunga, Bombay, indicate that the lea strength pressure in lbs required to break 80 threads of 1½ yards each) of Ambar yarn counts below 20s is lower than the required minimum (pp 153-55) The more detailed tests at ATIRA confirm that Ambar yarn suffers from greater irregularity, unevenness and neppiness than mill yarn and that its breakage in wind-

STANVAC

STANDARD-VACUUM OIL COMPANY (INCORPORATED IN THE U.S.A., MEMBERS' LIABILITY LIMITED.)

PSSVOC-6/A/56

ing and on the loom is also higher (pp 136-139). On account of these factors, handloom production from Ambar yarn is estimated to be 5 to 25 per cent lower than that from mill yarn.

While no test has been made on Ambar yarn and cloth for dyeing and bleaching, it is obvious that due to its lack of uniformity, Ambar yarn cannot go through these processes satisfactorily. While some or all of these defects may be removed in the long run through technical improvements (ATIRA has already suggested quite a few), the problem in the immediate future is whether handloom weavers would be prepared to purchase Ambar yarn in preference to mill yarn. Mere equalisation of prices through subsidies will not ensure demand.

(iii) The Committee proposes a flat rate of 1½ as per hank to spinners and trusts that proper inspection and modification of piece rates in future, if necessary, will prevent spinners from producing lower counts. Yet human nature and the organisational difficulties of quality control being what they are, it is difficult to believe that yarn of the requisite count and consistency would be delivered at the proper time to keep up a regular supply for the handlooms. A flat rate of payment for yarn irrespective of count is particularly dangerous when textile statistics suggest that handlooms are changing over to finer counts and higher construction.

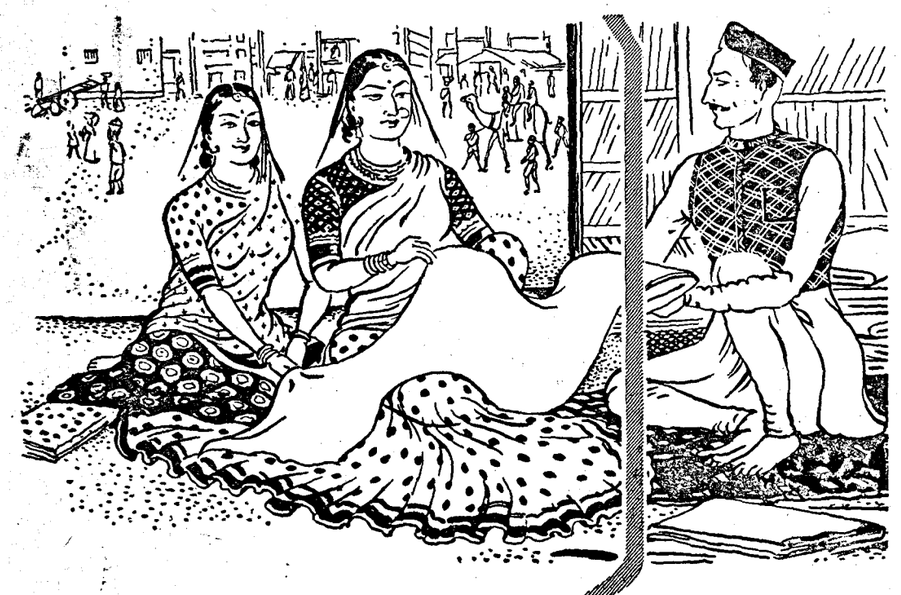
The production programme for the Ambar Charkha is restricted for the present to the count range 16s to 20s. If the counts produced are even lower, Ambar yarn will be less and less suitable for handloom weavers.

(iv) As part of its self-inflicted philosophy of regional self-sufficiency, the Committee makes the fantastic recommendation that at least 75 per cent of the spinners should be from weavers' families so as to make the family a self-sufficient cotton manufacuring unit. The Committee forgets that at least one-half of the commercial handlooms are devoted to the weaving of dhotis and saris which cannot be made from counts less than 25s* —counts which are outside the programme for the Ambar Charkhas. This is surprising since the Committee knows it full well that Ambar yarn is not suitable for the high reed/pick combinations which are necessary for weaving dhotis and saris.

Cottage weaving is a family occupation and all members of a weaving family are generally engaged in some preparatory or finishing job or other. At most, some leisure may be available during the rains when sizing and warping cannot be done but yarn spun during this period can provide only a seasonal supply and can hardly be depended upon. Why make the assumption then that weavers' families are (a) willing to take up spinning and (b) able to spin just the varieties which the weaver (and the market) demands?

A few other specific technical points may now be taken up. It has been found in various tests that cotton wastage in Ambar Charkha ranges from 4 to 25 per cent. In cost calculations, the wastage is taken at an average of 12½ per cent. This figure would, however, differ from one cotton to another and from one spinner to another. The writer expects this percentage to be higher on account of storage of cotton in godowns of all sorts, calling of bulk tenders by government or Khadi Centres and storage in spinners' huts. The dilemma would be that if the wastage is higher than 12½ per cent, it would upset the cost calculations of Ambar Yarn, and if wastage is as low or lower, it would worsen the quality of the yarn!

Any one acquainted with the elements of cotton spinning would find it hard to believe that the technical part of the report has nothing to say on the subject of mixing of cottons, or on the influence of climate and humidity. These of course, could be discussed as matters of detail by a committee ordered to submit its conclusions and recommendations within four months, without the benefit of adequate test reports, but what about any reflection on the need for the production of different yarns for warp and weft? Further, in recommending an inspectorate for imposing quality control, the Committee has shown no adequate comprehension of what this process involves. Even organised industry has found it a strain on management in a number of ways. For a technical committee to suggest that an inspectorate should be set up to check on the quality of yarn delivered and on the purity of Ambar cloth, without mentioning how this is to be carried out and enforced for a cottage industry hardly justifies faith in its technical competence.



Economic Aspects

To come to the economic aspects of the Report. The pricing formula recommended by the committee is akin to the marginal cost principle i.e., that commodities should be sold at the level of current costs and that all overheads should be borne by the state which can recover them from taxes. The admission of this pricing principle into Government policy—for the Report has been accepted by Government—is an innovation which would have justified publicity as well as the presentation of some cogent arguments in its favour. Will this be taken as a precedent for price fixation in other spheres as well, or is it a special favour for the industry producing the livery of power alone? Has the Planning Commission or the Ministry of Finance investigated how these overheads should be recovered? And has the Khadi Board, with its penchant for statistical acrobatics, cared to estimate the relative "social costs and net benefits" of this policy? This formula is merely a device to cover up the essentially uneconomic nature of the whole Ambar Charkha programme and to conceal its true costs from the taxpayer.

The Committee estimate the cost of Ambar yarn (excluding overheads) at Rs. 2-14-0 per lb. of 18's and consider that a subsidy on Ambar cloth to the extent of 4 annas in the rupee would place it at the same (or higher) level of preference that the consumer has for mill cloth. Even assuming that handlooms will take up Ambar yarn, the further implied assumption that this yarn would sell at the same price as mill yarn and, therefore, require a uniform subsidy is likely to be belied because, at present, yarn of the same count from different mills is sold at markedly different prices.

Moreover, the yarn market is notorious for price fluctuations. In the light of these two factors, on what precise principle will the subsidy be fixed so as to neutralise the handloom preference for mill yarn? I consider the first of the two factors to be of great importance since Ambar yarn will be made with a hand-driven device by thousands

*In their original programme, the Khadi Board's technicians and economists completely ignored this inconvenient fact.

IS IT WORTHY OF ITS SALT?

Most people choose cloth by its finish. Sizing, bleaching, mercerizing.... all contribute to the fine finish of cloth. And it is here that salt enters in various forms.

Salt, taken from the sea, is the basic raw material from which many chemicals are made. Of these, Caustic Soda, for example, is used in mercerizing, Chlorine and Bleaching Powder are used in bleaching, Epsom Salt in sizing, and many other chemicals derived from salt are used in textile manufacture and dyeing.

Therefore you may well ask: is the cloth I buy worthy of its salt?—because the quality of cloth depends to a great extent on the quality of chemicals used. With the sea as the basic reservoir of our raw materials, we make these heavy chemicals to serve the textile and many other industries:

SODA ASH - SODIUM BICARBONATE CAUSTIC SODA - CHLORINE - HYDROCHLORIC ACID - ZINC CHLORIDE - BLEACHING POWDER-POTASSIUM BROMIDE SODIUM BROMIDE - AMMONIUM BROMIDE - EPSOM SALT - POTASSIUM CHLORIDE - MAGNESIUM CHLORIDE

BENZENE HEXACHLORIDE, the "wonder insecticide" for use against crop, livestock and dairy pests, is available for use in a wide variety of ways.

(and later, one believes lakhs) of spinners with varying skills, training and aptitudes, and who will, therefore, turn out yarn of different prices to handloom weavers, thus necessitating a scale of subsidies rather than a subsidy as such. A further complication would be that, in a large number of cases, the supply of yarn would at best be seasonal and at worst spasmodic, so that quality will vary all the more according to the state of maintenance of the **charkha**, storage of cotton and the skill of the spinners.

The Committee (as well as the Khadi Board) assume that a sufficient number of spinners would be forthcoming at 12 annas a day, though according to present estimates the daily income would be only 9 annas on the basis of 6 hanks per 8 effective hours. In its typical slipshod manner, the Committee presumes that "regular work at 12 annas for 300 days would be preferred to Rs. 1-4 or Rs. 1-8 (a day) for half the year." Now, Rs. 1-8 per day for 150 days provides the same annual income as 12 annas a day for 300 days, besides leaving one-half of the working year free for seeking work elsewhere. Moreover, why should a person, who is not a nitwit, not work 150 days at Rs. 1-8 or 1-4 per day and then ply the **Charkha** for the rest of the year? The logic of the facts of the Indian rural situation makes it doubtful if many whole-time spinners would be forthcoming at 9 annas or 12 annas per day. It is only during the agricultural off-season that one can expect a spinner to devote himself wholeheartedly to the charkha. Women may have more spare time than men, but would all or the larger portion of it be available for spinning for the greater portion of the year?

Story of Ambar Centres

It is always unwise and often illegitimate to generalise from limited data. But the experience of Ambar training centres mentioned in the report may be related here. Of the 4,700 persons who joined the various training centres only 3,600 completed the course (many of them joined during the course). The reported low productivity rate during tests is explained by the Khadi Board as follows:

"Owing to severe heat in most regions of the country during the months of March and April a very large number of spinners were disabled by diseases such as dysentry, smallpox, chicken-pox and other diseases. Moreover, as these months coincided with the occurrence of the new year, several religious festivities and also the marriage season, attendance of the **Parishramalayas** as well as regularity of work was poor." We are, therefore, expected to believe, **inter alia** that (1) severe heat in most regions of this country is experienced only in March and April, as against the prevalent feeling that these months are only the beginning of the hot season, (ii) the susceptibility of our rural folk to the above mentioned diseases is abnormal, that such diseases burst in suddenly during spinning tests and that they will disappear once the programme is under way, and that (iii) religious and marriage festivities occur only once in a blue moon and shall not affect either the training or production programme later on. While lesser men may not be convinced by these suggestions, the Khadi Board is obviously not to be discouraged by such "abnormal" events and its economic analyst, after having a look at the classification of men and women spinners by their age groups, finds that it "conclusively proves, that handspinning on the Ambar Charkha is attractive to the bulk of the labour force in the rural areas" and that "the Ambar Charkha can attract a sizeable number from among young men and engage them in productive activity". Comment is superfluous in the face of such overpowering faith.

The Committee recommends that Charkhas should be distributed near intensive handloom centres, in cotton-growing areas and where the employment situation is highly unsatisfactory. Nothing is said about how these conflicting criteria are to be reconciled. If Ambar yarn is to be used on existing looms and not on new looms (as the Committee suggests), then how can charkhas be located at a great distance from handlooms? And if yarn is to be transported from, say, a cotton growing area where there are no looms to a distance of 100 miles or more, how is it that the cost estimates in the report have not mentioned transport cost and said nothing about equalisation of possible regional disparities of costs? Actually, we were so long under the impression that the main argument in favour of the Ambar Charkha was its employment potential in the rural areas and that implied the location of the programme primarily in distress areas, regardless of the proximity of handlooms or cotton. It appears now that in trying to make (or pass off) the charkha as a commercial proposition, the Committee and the Khadi Board have diverted their attention from the principal objective of providing employment in those rural areas which need it most. So far as the environs of the handloom centres are concerned, the Ministry of Commerce and Industry has already expressed its preference in giving licenses for installation of spindles to be located near handloom centres. The fact that this policy is resented by the Khadi Board in one of its pamphlets 'Textile Policy X-rayed' indicates the confusion in which that Board has involved itself—and which unfortunately, it has imposed on the Khera Committee as well. It should be clear to all that the Ambar Charkha is essentially a means to provide employment in distress areas like Bengal, Bihar, Eastern U. P., Telengana and Malabar, together with a few other pockets. Since it cannot compete with mill yarn, even though its overheads are borne by the general tax-payer, it should be clearly recognised as a non-commercial proposition and be treated as such. To integrate this programme with the CPA and or NES, as the Report recommends, would be inadvisable, since these projects are required to propagate only those technical and other devices which are of proved efficacy and which bring about the best possible use of national resources, especially technical knowledge and available funds. In any case, the CPA projects are confined to the better off areas while the scope for the Ambar Charkha lies in the areas which are the worst off.

Conclusion

There is a place for the Ambar Charkha in the rural economy. In its own limited way, it could make a useful contribution by providing gainful employment and by raising the level of incomes of the unemployed. But if it is to make that contribution, all concerned must come down to brass tacks. Ambar cloth woven from the warp of ideology and the weft of wishful thinking is no contribution to the national product. From which may be drawn the trivial deduction that it should be made from good quality yarn!

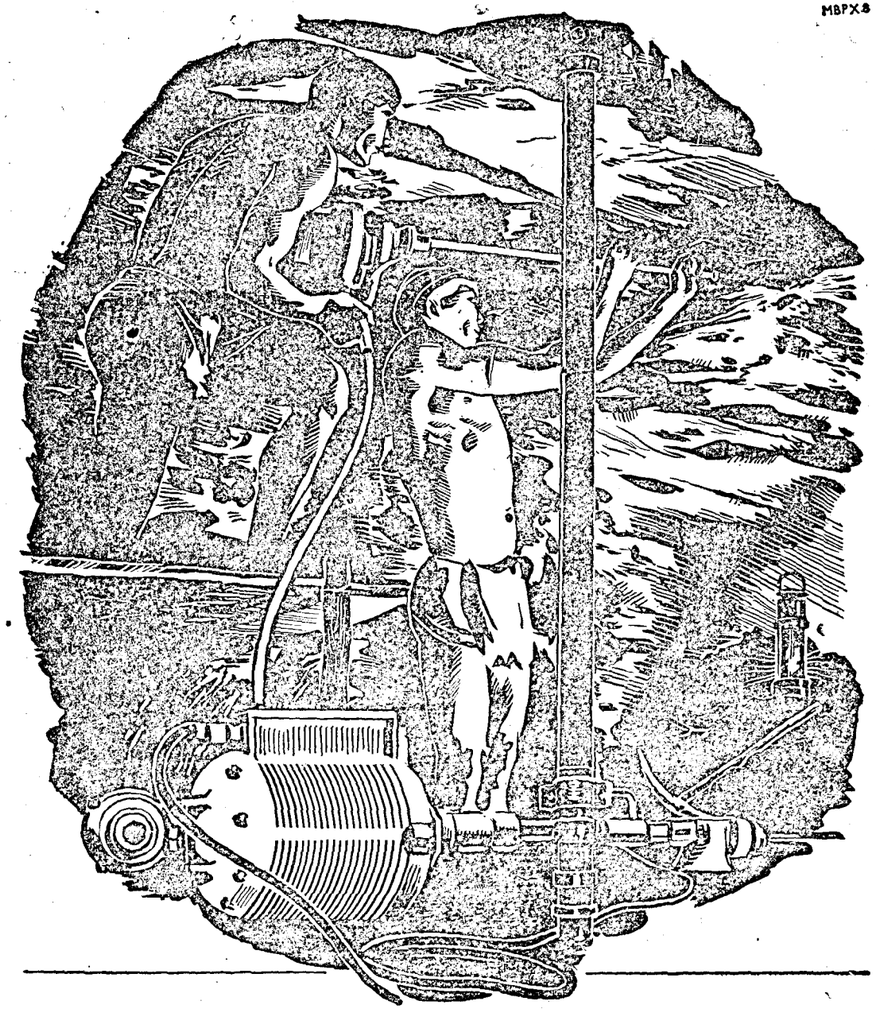
Around Bombay Markets

Continued Buoyancy

Thursday, Morning

DESPITE only two working days during the week, conditions continued to be favourable for trading on the stock exchange and equities ruled buoyant for the third week in succession. Budla charges for the last fortnightly settlement did not indicate a heavy long position and professional operators were quick to exploit the position by accumulating lines. In spite of occasional profit taking, leading equities forged ahead and closed at peak levels. Intervening holidays and closures on account of the firing in Ahmedabad failed to affect the buoyant tendency.

The announcement of the borrowing programme of the State Governments for a total amount of Rs 64 crores could not produce any bearish effect on equity values, despite the already tight conditions obtaining in the money market. According to market observers, the return of funds from the moffusil is satisfactory but demand from trade circles, however, continues to be brisk. The support for the States' loans under the circumstances is mainly expected from institutional investors. The insurance companies are likely to go in for these loans, but, as these investors have only last month invested their surplus funds in the Central loan it is to be seen to what extent they would be able to help the State Governments. The terms of the new State loans, however, will ensure their success as they are medium dated and offer an yield of four or a little over four per cent. Meanwhile, 3 per cent 1986 conversion loan has declined to Rs 75-2 from Rs 75-8 in the previous week. Other plan loans and medium loans were also quiet for want of support.



Though little or no interest was shown in securities and loans during the week, there was increased tempo of activity by professional operators as also investors in selected equities on continued encouraging company reports and hopes of a still brighter outlook for industries during the current year.

With the revival of activity in the cloth market, and with prospects of increased demand for cloth both from Calcutta and locally, operators extended increased support to selected textile shares which recorded handsome gains. Even equities hitherto neglected also gained prominence, some recording fancy gains. Shares like Bombay Dyeing, Century, Finlay, Swan, Swadeshi, Tata Mills, India United Ordinary and Deferred attracted investment enquiry. On hints of three shift working and higher profit, Bombay Dyeing shot up by fifteen points during the week and have gained more than thirty rupees over the last fortnight. Century jumped twenty points on reports that the company's new rayon plant was expected to go into production shortly. Revival of rumours regarding the amalgamation of Tata group of textile mills and considerably improved working took up Tata Mill to a new peak while Swadeshi scored seven points from the week's low. Finlay and Swan hardened by five to eight points. Indu Ordinary, even after being quoted ex-dividend (five annas per share), shot up on sustained support from Rs 14-3 to Rs 14-10 on conversion rumours. Indore Malwa, Shrinivas and other cash shares also received support.

In the engineering sector, there have been persistent support for the shares which have recently been listed on the exchange. Engineering industries have been prospering. They will further prosper during the Second Five Year Plan period. With satisfactory working results of Tata Steel Company, and with the shares quoting cum-dividend, there have been sustained support which pushed the rate to a new high level. Indian Iron were very firm. Small priced shares like Larsen & Toubro attracted considerable investment enquiry on better yield consideraions and on reports that the company had secured a contract for about Rs one crore worth of Caterpillar manufactured equipment. The shares shot up by three points to Rs 19. Mahindra and Mahindra were also sought at higher levels.

Cash shares like banks and insurance were comparatively quiet. Electrics, however, were easy, and attracted more sellers than buyers. Electric companies have undoubtedly been doing well. But the scope for increased yield being limited, they lack support when market rates are getting adjusted to a higher yield basis. There were sellers in Bombay Suburban, Ahmedabad, Electric and Tata Group of shares all of which closed lower.

In the miscellaneous section, Associated Cement, Digvijay Cement and Asoka Cement received fresh enquiry from investors. There was selective buying in sugar shares also. Shipping shares attracted influential speculative support. On revived hopes that the Founders' shares will be eliminated on terms favourable to ordinary share holders, and that the company's reorganisation scheme will get through, there was heavy buying and short covering in Bombay Burma, Old. They jumped by more tahn thirty points.

On reports of fresh capital issue shortly, National Rayon were also in the limelight, and, advanced more than six points. On expectation of maiden dividend of Rs 6 per share, Tata Loco rallied by ten points to Rs 175. The company having acquired a soap factory at Calcutta, which is expected to go into production as revealed by the Chairman, Mr J R D Tata at its annual meeting, Tata Oil received investment support. The company is also to instal a second solvent extraction plant in the South for de-oiling oilseed cake and is also considering plans for modernising the crushing and oil expelling plants at Bombay and Tatapuram. Tata Chemical, and other small priced shares closed firm.

Cotton

Export Duty Abolition Rumour

COTTON, both spot and futures, ruled strong during the week under review. Sentiment was influenced by persistent rumours about the abolition of export duty and further export quota. Towards the close of the week, there was a spate of buying both in futures and spot on reports of rains in the Punjab and some parts of Uttar Pradesh.

Jarilla futures shot up fifteen points per candy and were done at one time at the new high level of the season at Rs 705 per candy. Vijay April futures also advanced from Rs 825 to as Rs 837 on the last working day of the week.

In th spot section ,there was brisk mill demand for popular varieties like Surati, Vijay, Jarilla, Laxmi and Hubli Jaydhar. Bombay's prominent group of mills purchased fairly good lots of Hubli Jaydhar, Kapadvanj, Amraoti and Vijay. Rates, therefore, improved by ten to fifteen rupees per candy. Specific delivery contracts also ruled very firm. Khandesh, Berar, Khamgam, Morvi, Punjab 320F and 216F, and Punjab-American moved up by ten to sixteen rupees per candy.

In the export section, there was keen demand from shippers. Main varieties in demand were Bengal, Wagad, and Zoda cotton.

Local and upcountry mills bought Sudan X G 6S and Sudan G 4L.

In continuation of the announcement of the export of 20,000 bales of Bengal Deshi, it has been notified during the week that:

(1) licenses will be granted to established exporters and registered dealers, also to displaced cotton traders from Pakistan,

(2) a small quantity has been reserved for co-operative societies, and

(3) the percentage for allocation of individual quota to established exporters is 1.36 per cent (with minimum of 4 bales) and dealer 0.16 per cent (subject to a maximum of 24 and minimum of 3 bales).

Oilseeds

Export Demand for Castor

OILSEEDS and oils ruled buoyant during the week. With small floating stock and higher overseas advices, ready castor and oil were bid up to new high levels. America accepted Indian offers for oil up to 15.00 cents per lb as against 14.50 cents per lb in the previous week. Business was also reported with Britain and the continent for about 250 tons at higher rates. Indian shippers appeared hopeful about further deals with America in the next week.

Supported by the firmness in the ready section and in cotton and other forward markets, operators went long in castor and groundnut futures. With increased bull support and heavy bear covering, castor September futures shot up further by nearly seven points per candy.

Company Note

Birla Jute

For about two years now, the jute industry has been plagued by an unfavourable spinner's margin. Production has moved up. Sales have improved. But profits are not higher. This is reflected in the working results of the Birla Jute Manufacturing Company, Ltd., for the year to March last. Sales of the Company's Jute mills department were higher, but profits were lower. Even so, the ordinary dividend has been maintained at ten per cent.

During the year under review, the calcium carbide factory reached full production. Permission of the Central Government has been sought to raise the plant's installed capacity from ten to twenty tons per day. This factory worked at a loss during the year. A cement factory is to be installed at Satna. It will have the capacity to produce 800 tons of cement per day. Orders for the necessary plant and machinery have already been placed. A staple fibre spinning plant is to be erected at Birlapur. Machinery for this plant has also been ordered. The factory is expected to go into production from March next.

To secure additional finance for these projects, the authorised capital of the Company was raised from Rs 1.45 crores to Rs 4 crores by the creation of 800,000 ordinary shares of Rs 10 each and 175,000 second preference shares of Rs 100 each. Second preference shares for Rs 75 lakhs were issued. This issue was fully subscribed.

Power for Employment

NO loan has so far been sanctioned by the Government of India for the current year to any State for the expansion of power facilities. A provision of Rs 4 crores has been made during the current financial year for schemes of expansion of power facilities for increasing employment opportunities. So far requests for loans have been received only from the Governments of Rajasthan and Andhra and these are under consideration. No great was sanctioned during the First Five-Year Plan to any State Government, but loans totalling Rs 827.523 lakhs were made during the First Plan period to various State Governments.

Around Calcutta Markets

Spurt in Jute Shares

Thursday, Evening

BOTH cash scrips and speculative shares have moved up in the last three weeks. It started with the spurt in clearing shares. Strength in speculative scrips had a sustaining influence on equities in general. But, in the last few days, it has been the other way about. Activity in cash scrips has encouraged confidence about the immediate outlook for equities. This is a healthy development. For, it indicates the gradual re-entry of investors in stock markets. Initiated by the Suez Canal crisis, the spurt in equities has continued as investors have taken interest in the market.

Certain background factors have been discussed in these columns in the last few weeks. Manufactured prices have now started moving up. This has encouraged hopes that industrial profits will not suffer. Effects of public loans on stock markets are now better appreciated. In the main, these loans are taken up by institutional investors. Individual subscriptions are negligible. So, the flow of investment is not likely to be affected. Meanwhile ,there are growing doubts whether the Kaldor tax proposals will be introduced in the next budget.

These basic economic influences have combined with technical factors to hasten a spurt in equities. When the Indian Iron and Steel Co's proposal for issuing eight shares at a premium of Rs 3½ per share was first announced, it had a depressing effect on Indian Iron. It was then argued that investors have no surplus fund to invest. Now that the time for the right issue is approaching, there are some indications that investors are picking up this share at low prices so as to reap the maximum advantage of the offer. That was how the upswing in Indian Iron started a few weeks ago. It continues, however, because, even at current prices, Indian Iron is worth accumulating on the terms of the proposed right issue.

Along with Indian Iron, all other clearing shares are moving up. But the spurt in Burrakur Coal is worth emphasis. Coal shares still continue to be neglected. But the only coal share which is on the forward list is moving up because the impression is gaining ground that coal shares are speculative "buys" for, at least, the duration of the Second Plan. Rising labour costs have been partially, if not wholly, offset by higher controlled prices for coal. Even the pessimist concedes that the scope for expansion in the private sector of the industry is ample in the next few years.

Besides the revival of demand for jute shares, the sustained improvement in miscellaneous shares is the most encouraging feature of recent trading on Lyons Range. Spurt in these shares is mainly due to investment support. It is not influenced by speculative activities like cornering or buying in anticipation of right issues. Yield considerations, at current low levels, are the main motive behind the continued investment buying of miscellaneous shares. These same influences are responsible for the slow, but steady, improvement in Paper shares as well as in sound Engineering shares. Evidently, investors are interested in accumulating shares at bargain prices.

By far the most dependable event in recent weeks is the revival of demand for jute shares. For the last eighteen months, these shares have remained depressed. Investors have been the victims of false hopes and promises. Some time ago, the industry unsealed looms to raise output. This was interpreted by the market to mean that the demand for jute goods was expanding. But Russian purchases have not materialised in expected volumes. Despite lower prices, exports of jute goods have fallen, though internal despatches continue to be satisfactory. Meanwhile, the spinner's margin has been consistently unfavourable.

Stocks of jute goods with the mills have been rising every month since the industry started expanding output. In the first seven months of this year, mill stocks have doubled. Some time ago, IJMA decided to reseal 2½ per cent of loomage. This was effected in the middle of last month. IJMA has now announced its decision to reseal a further 5 per cent of loomage from the middle of next month. For the last few days, reports have been current that a further 2½ per cent of loomage will be re-sealed. IJMA's decisin to re-seal as much as a further 5 per cent of coverage has had a "bullish" effect on jute shares.

IJMA was not in favour of un-sealing looms. With its present decision, the industry will be functioning, as in recent years, with 12½ per cent of loomage sealed. It is emphasised by IJMA that the aim is to adjust supplies to demand, and that sealing and un-sealing will be effected according to changing circumstances. Compared with the earlier Government move to fix minimum prices of jute goods, the process of adjusting supplies to demand through controlling output may be a better device. Jute goods have hardened in the last few days. This is reflected in the revised demand for jute shares.

There is a fly in the ointment. Strange as it may seem, raw jute prices have not softened since the move to re-seal loomage. Mills are short of stocks of raw jute. In the last two months, mills have been active buyers of raw jute for immediate delivery. This may be the reason for the continued strength in raw jute. But soon this season's crop movement will gather momentum. Re-sealing of 7½ per cent of loomage will curtail mill consumption. If raw jute prices develop a downward trend, the improvement in jute shares is likely to be sustained.

No Mandate from the People

BOMBAY was, until recently, the most disciplined State in the Indian Union. Honesty, integrity and administrative ability of Bombay's Chief Minister are beyond dispute. Shri Morarji Desai is a respected Congress leader. His services for the country are widely appreciated. He is a strict disciplinarian. His mortification over the prevailing atmosphere of violence in Gujerat is sincere. There will be sympathy for his austere decision to undertake a fast "till I am able to address a public meeting and people hear me patiently". Even those who may question the means pursued by him will devoutly hope that his laudable aim will be achieved. Projection of morality into politics is not new or novel in this country. In undertaking a fast, he has emulated Mahatmaji. All sane persons will wish that his self-purifying gesture will shock the people of Gujerat to sobriety. Mob violence must be condemned. There are welcome signs that Shri Morarji's spartan action has already had the intended effect.

To condemn violence, however, is not to minimise the grave issues involved in New Delhi's attitude to the problem of re-organisation of States. It would be uncharitable to dilate on the ethics of Shri Morarji's political decision to undertake a fast. But the political problems posed by the people's reaction to New Delhi's policy to linguistic States must be properly appreciated. There will be no quarrel with Pandit Nehru's emphatic assertion that Parliament's decision cannot be challenged in the streets. That would be negation of democracy. Whether supreme sovereignty vests in Parliament or with the people, is an academic political issue which is not in question here. But political pundits will not deny that not even Parliament can impose a solution on the people against their wishes. In a democracy, both the Government and Parliament have a moral as well as a constitutional obligation to seek a fresh mandate on an issue on which the people are visibly and demonstrably opposed to the verdict of the Government and of Parliament. Developments in Bombay and in Ahmedabad prove beyond the shadow of a doubt that neither the earlier nor the present plan for Bombay has the support and consent of the people concerned. In the circumstances, Pandit Nehru disowns the fundamental principles of democracy by his over-emphasis on sovereign, constitutional status of Parliament.

Those who deplore violence and intimidation by the citizens of Ahmedabad will hope that the shock therapy administered by Shri Morarji will hasten the return of normal conditions in that city so that the inhabitants "are able to follow their ordinary avocations of life without let or hindrance". Passions have been aroused in Gujerat over the Government's imposed decision to form a bigger, bilingual Bombay State. No sane person will, or can, encourage or endorse mob violence. But the circumstances which directly provoked Shri Morarji to undertake a fast were not manifestly outbursts of violence. It was a self-imposed "Janata curfew" which deprived Shri Morarji of an audience in Ahmedabad on Sunday last. It would be absurd to maintain that the "people's curfew" was enforced without any intimidation. Such an essentially Gandhian technique can hardly be implemented on a mass scale without some coercion and intimidation. But it was a unique demonstration by the people of Ahmedabad that they would ignore leaders who had ignored their wishes and aspirations. It was a supreme manifestation of democracy.

One false step leads to another. Developments in Gujerat are poignant reminders of the Congress Government's mistaken policy of reorganisation of States. Not only is Congress wrong in its policy of readjustment of State boundaries. Frequent changes in its policy have created additional complications. A revered Andhra leader had to fast unto death before New Delhi conceded the principle of linguistic States. For some time, New Delhi fostered the impression that, though forced by coercive tactics to concede Andhra, it was reluctant to implement the principle of linguistic States. Later events compelled it to change its policy. With certain mental reservations, it accepted the principle of linguistic States. This hesitant attitude was, to some extent, shared by the States Reorganisation Commission, though its proposals conceded, in effect, the principle of linguistic States. Trouble arose over the conflicting claims over Bombay City. New Delhi's decision to run the City as an area administered by the Centre was rejected by Maharashtrians. To appease the advocates of Samyukta Maharashtra, the bigger, bilingual Bombay plan was proposed. This plan was endorsed by Parliament. Gujerat is angry at the reversal of the former decision to form a separate linguistic Gujerat State.

During and since the formation of SRC, the Congress party and the Government have seemed to speak with two voices on the issue of reorganisation of States. At the Centre and in the States, Congress governments have been hesitant in their support to linguistic States. But the Pradesh Congress Committee and Congress members of Parliament and of State Assemblies have been vocal in their demands for linguistic States. To avert the growing conflict between the party and the Government, Congress decided at Amritsar to streamline the organisation. On the issue of the bigger, bilingual Bombay, most of the Congress members of Parliament of the States directly concerned seemed to be in agreement with the decision of the Union Cabinet. This plan has been endorsed by the Gujerat Pradesh Congress Committee. As was to be expected, the Maharashtra Pradesh Congress Committee is not opposed to the proposal. But the popular revolt in Gujerat is convincing proof that not only the Congress Government, but Congress as a political party is completely out of touch with the people.

It is natural that both Pandit Nehru and Shri Morarji Desai will blame the opponents of Congress for instigating and fanning the popular agitation against Parliament's decision to create a bigger Bombay State. Insinuations have been made that the disturbances in Ahmedabad have been instigated by vested interests. Impartial observers will reject the implication that the people of Gujerat are not opposed to the plan for a bigger, bilingual Bombay. Such distorted interpretations are serious reflections not only of the political sense of prominent Congress leaders, but of their political integrity.

On the issue of linguistic States, both the Congress party and the Government have ceased to represent the aspirations of the people. Either Parliament must initiate a procedure which enables it to reverse its decision relating to the plan for a bigger, bilingual Bombay. Or, the Bombay issue must be postponed so that Gujeratis and Maharashtrians can express their wishes in a decisive and democratic manner during the forthcoming general elections. Some of Pandit Nehru's observations in his Lok Sabha speech during the debate on the bigger Bombay proposal emphasises the need for Congress to seek a fresh mandate on the issue of linguistic States. In his Lok Sabha speech, the Prime Minister made the categorical statement that Congress was not for linguistic States, and that he was in favour of redrawing the map of India by creating a few, big States. If Pandit Nehru represents the views of Congress, it is imperative for Congress to make the problem of linguistic States an issue in the next elections. Thus alone can Congress acquire the democratic right to decide the problem of linguistic States in the name of the people. Certainly, Pandit Nehru is entitled to his personal views on the issue of re-organisation of States. But his preference for a few large regional States is not shared by those who claim political maturity or familiarity with the political history of this vast country.

Export Credit Insurance

IN view of the anticipated foreign exchange difficulties that the Second Plan is likely to encounter, export promotion to increase foreign exchange earnings has been rightly given a high priority. The proposal for an export credit guarantee scheme stems from it. Exporters have to face a variety of risks and if some of these are adequately covered, it should help to promote exports. Superficially, therefore, any such scheme has much to recommend it. Difficulties begin to appear when one looks at the problem a little more closely. And the moment one does that, one runs up against odds. The bulk of our exports are very well organised and flow along established channels through foreign firms who have arranged the whole thing fairly satisfactorily from their own point of view. The established exporters, therefore, need little assistance from the Government and would rather be left alone.

Looking at the matter from a different angle, 60 per cent of our exports move under the cover of letters of credit; banks take over all the credit risks on such exports. So any scheme that may be devised for covering credit risk would apply only to 40 per cent of the exports and would presumably appeal only to the exporter who is not so firmly established. If export promotion and substantial increase of export earnings are to depend on the energy and enterprise of this minority, can special assistance be extended to them in the form of risk cover without dragging in the others who do not need such cover? It might be an oversimplification to suggest that the situation is not unlike that in the textile industry where the organised sector is well able to take care of itself, but there is another sector, which cannot do without assistance. The solution boils down to one of taxing the one in order to subsidise the other.

In pursuance of its policy of promoting exports, the Government of India appointed an Export Credit Guarantee Committee to report on the feasibility of establishing an organisation for providing the exporter insurance cover against credit risks which he has to carry at present. (This report will be reviewed in our columns next week). The Committee has recommended that an Export Credit Insurance should be set up without delay, as an important export promotion measure and an Export Risk Insurance Corporation be floated with an authorised capital of Rs 5 crores, wholly subscribed by the State. The

Corporation is to cover both the pre-shipment risks which start as soon as the exporter enters into a commitment with the foreign buyer and post-shipment risks which become operative after the goods are despatched from India.

The risks borne by the exporter are many and they vary in degree. To offer cover against every such risk is neither feasible nor desirable. The Committee has therefore followed the usual practice abroad, and recommended that only those risks should be covered, except some pre-shipment risks, which are beyond the control of the exporter and occur outside the exporter's country. It toyed with a variation on this theme: If covering of a certain risk does not lead to larger exports, it asks, what good is such cover? Thus, if the Government imposes a ban on the export of a certain commodity, compensation to the exporter for his inability to comply with his obligation will not increase exports. On the other hand, insurance against export control risk will lead to one Government organisation to suffer losses (while paying compensation) for the action of the Government. The Committee, however, did not carry the argument any further and agreed to cover such loss provided the exporter had a valid export licence when entering into contract with the over-seas buyer.

The crucial problem in insurance business of any kind is the spread of risk. Export credit risk, however cannot be spread wide because the range of our exports, the number of foreign buyers and the countries which import from us are all very limited. Under such circumstances, the scope for the spread of risk will necessarily be narrow. This scope will be further narrowed—to an extent which will militate against the successful operation of the scheme, according to a dissenting member of the committee—if exporters are allowed to take such cover only if and when they desire. This may result in the proposed organisation being left with too many unwanted babies to carry. The established exporters in India are mostly foreign firms with global net work of branches and agencies and they will keep away a large share of their business from such coverage. The organisation may then have to be an asylum for bad risks only and will not be able to offer a reasonably cheap rate for coverage of risks. The rate, in that case can be lowered only if the Government subsidises the organisation heavily. The opposition of big firms established in the export business to compulsion to get all evports except those which are effected under letters of credit, insured, may be overcome to some extent, if such exporters are allowed a substantial rebate for 'no claims' made during the period fixed for the purpose. The committee, however, has fought shy of recommending compulsory insurance, because the business community does not like compulsion. If spread of risk is the cardinal principle of insurance, the principle cannot be sacrificed, without sacrificing the benefits of insurance at the same time.

The committee estimates that about 60 per cent of our export is covered by letters of credit. Financing of such export does not put any strain on the exporters as the banks purchase or advance against bills drawn under letters of credit, provided the terms have been properly complied with. The committee, however, has not estimated how much of the remaining exports bills are purchased by the banks or against

Industrial Finance Corporation of India

(Established under the Industrial Finance Corporation Act of 1948.)

HEAD OFFICE : Keeling Road, (P.B. 363) New Delhi

THE Corporation provides finance in the form of medium and long-term loans on liberal terms to Public Limited Companies and Co-operative Societies engaged in industrial enterprises. Repayment of principal and interest arranged in easy instalments spread over 15 to 20 years.

ASK for our FREE booklet which gives further particulars or apply to our branch Offices at

what proportion of such bills advances are given. It is exports which are not covered by letters of credit which confront the exporter with the problem of finance. Credit risk insurance can play a significant part in reducing the difficulties of financing exports by offering insurance cover, as the position of the exporter will be strengthened by export credit guarantees. When such gurantees are endorsed by them, banks will certainly be willing to advance against exports which in normal case they would never do.

The banks, however, are already fully extended. Any further increase in advances towards export will be possible only if the banks are offered facilities to rediscount export bills in their portfolio. No spectacular increase in export financing by banks is possible without such rediscounting facilities. The Reserve Bank has had considerable experience of rediscounting through the bill market scheme. The mechanism can certainly be extended to cover this new field of financing. The proposition appears only as a suggestion in the report, being outside the terms of reference of the committee. But it is, nevertheless, an integral part of the scheme, if the latter is to help export promotion.

Weekly Notes

Best of Both Worlds

OF the import licences that are issued in any half year, how many are actually utilised? This, of course, no one knows for certain, because revalidation of licences and licences brought forward are difficult to relate to the imports which actually reach our stores in a particular half year. The general barometer of the import situation are therefore two-fold: lines for which licensing is stiff and lines for which licensing is easy and free and and both can be measured reasonably well by the premium offered in the free market and the enquiries for such licences. Of late both the latter have shown a distinct slackness. This time, Import Control Organisation has released somewhat fuller data than usual, from which the situation may be gauged roughly. The number of licences issued has steadily been on the increase in the last three half-years, having risen from a little over a lakh in the first half of 1955 to 1.14 lakhs in the second half, and 1.30 in the first half of the current year. An achievement of this organization for which it may take legitimate pride is the quick disposal of applications and the progressive reduction of the number of applications awaiting disposal from 2,500 to less than 200 in the last three half years.

Along with the increase in the number of licences issued, the total value of these licences has also gone up from Rs 304 crores in the first half of 1955 to Rs 344 crores in the second half and then sharply to Rs 517 crores in the first half of the current year. The actual imports for these three half years, not the imports corresponding to these licences, however, did not show much of a change between the first and the second half of 1955; in the first half of 1956, however, there was a big jump, the value of licences issued having risen from around Rs 309 crores to Rs 381 crores.

The above figures of licences issued obviously include those for import on Government account also, for the press note ascribes the increase "almost entirely" to the imports of capital goods for steel plants, expansion of Rayon plants, railway requirements and purchases by the Directorate General of Stores and Disposals.

The general impression fostered by authoritative pronouncements is that the bulk of the imports nowadays is capital goods and that barring a limited range of everyday necessities like drugs and books, only token imports of luxury consumer goods are allowed and that, too, for very special reasons. How correct is this impression? No breakdown is given either of imports or of the import licences issued in terms of capital goods not to speak of a further division of the latter into utilities and luxuries.

British business interests, as doubtless others, however, have noted that over a series of years the ceiling on imports of consumer goods has not been lowered; on the contrary, it has been raised. In an article contributed to the **Financial Times** Survey on India, Shri H V R Iengar, Secretary, Ministry of Commerce and Industry, gives the breakdown of our imports as shown below.

Breakdown of Indian Imports

(Each group show as percentage of total)

	1954-5	1953-4	1952-3	1951-2
Capital goods	15	17	15	13
Producers' goods	54	49	48	47
Foodgrains	7	12	17	22
Other consumer goods	24	22	20	18
	100	100	100	100

Without pausing to ask how are capital goods defined and distinguished from producers' goods, one may still note that the table confirms both the popular impression that imports of consumer goods is being progressively reduced—this will be apparent from the steady decline of the percentage share of 'foodgrains' and 'other consumer goods' in the total of imports from 40 to 37, 34 and 31 in the last four years ending 1954-5—and the fact that the percentage share of 'other consumer goods' has steadily risen during the four years from 18 to 20, 22 and 24.

So we can really have the best of both worlds, reduce non-essential imports and yet increase imports of *consumers goods to foster foreign* trade and attract foreign capital.

Fluid Situation

WITH the budget provision lapsing at the end of the month, President's rule in East Pakistan was a foregone conclusion, but for how long?

The prospects of a general election, which, it might be hoped, would clear the air and bring about a more stable order, however, are dim. In East Pakistan, the prospects are dimmer because the legislature, which is not allowed to meet or function, has first to decide whether electorate will be joint or separate, before the elections can take place under the new constitution of the Islamic Republic.

The situation is fluid by any count, but it is no fluider than it was before.

Welcome Slant on Operational Efficiency

THERE is a commendable shift of emphasis in railway publicity from passenger amenities to operational efficiency. Good wine needs no bush and when passengers find railway travel so much more comfortable, they do not have to be coaxed; the new amenities are talked about and the news travels from lip to lip. But operational efficiency which can be measured by increase in ton miles of goods moved or wagon miles per wagon day are not so easily grasped by the public. The Railway Board, it is good to see, has not been impervious to the barrage of criticism and is taking some pains to prove that it is steadily improving utilisation of its rolling stock and is moving more goods and passengers with the same equipment. The carping critics may complain, what had the railways been waiting for? But better late than never, the shift in emphasis is to be welcomed, not for what it has already achieved but for the promise it holds for the future.

It is also welcome news that General Managers of Railways held a three day conference at New Delhi to discuss improvements of operation. The Deputy Minister, Railways, concluding the conference, struck the right note when he said that:

> "the railways must develop a genius for improvisation to secure the maximum immediate results from existing assets, pending the procurement of more modern equipment through additional investment. With the help of better planning, the railways could obtain more satisfactory results".

That the Minister officially admitted that railways could obtain more satisfactory results was itself a gain. It is wise to concede what must be pretty obvious to all and has been repeatedly pointed out by experts. A concrete achievement of the conference was the target of performance laid down for the next busy season, higher than in the past season, which is to be attained largely through speeding up goods operation and by improving the present carrying capacity through better methods of work.

A bright little brochure brought out by the Central Railways appropriately called 'Facts and Figures' brings out the improvement that has already been achieved, mainly through intensive use of existing resources. It gives the number of new trains, passenger trains, that had been put on the lines. By the end of the First Plan period, the Central Railways has been able to carry 25 per cent more gross ton miles with only 16.4 per cent increase in the number locomotives. Similarly, the freight ton miles carried has shown an increase of 43 per cent and this has been possible 'only by making an intensive use of goods wagons and engines'.

An appreciable increase to rolling stock has been made possible on the Central Railway by keeping on the line overage passenger coaches, which had run their normal life and were thus due for replacement by carrying out repairs on them. By overhauling arrangements for repairing wagons, the proportion of wagons in sick sidings to wagons on lines was cut down from 7 per cent to less than 4 per cent, thus releasing almost a thousand wagons for goods traffic. Again, time spent by wagons in workshops undergoing periodic overhaul was also reduced. Working hours in goods sheds were increased to enable unloading and reloading to be completed in a single day. Work in marshalling yards was speeded up to shorten the period of detention to through loaded wagons. Express goods trains reduced by half the time spent in transit, thereby increasing availability of wagons. A "wagon chasing unit" was set up to minimise delays to through loaded wagons at terminals and at intermediate marshalling yards and stations. All this resulted in speeding up the movement of wagons and cutting down delays in transit. The cumulative effect of these measures has been an appreciable increase in the quantum of goods traffic carried on the Central Railway during the last busy season. The freight ton miles of goods traffic carried during 1955-56 busy season stood at 8,448 million against 7,532 million carried during the previous season, showing an improvement of 12 per cent.

Progress on Western Railway

A SIMILAR story is related in the brochure "A bird's-eye-view" issued by the Western Railway. In 1952-53 1,183 wagons were loaded daily on the Western Railway; in 1955-56 the average was raised to 1,400 wagons on the broad gauge, an improvement of 18.4 per cent in three years. On the metre gauge, there was a 15.2 per cent improvement, the number of wagons loaded being 1,939 in 1952-53 and 2,234 in 1955-56. Net ton miles rose from 3,430 mn. in 1952-53 to 4,658 mn. in 1955-56 an increase of 35.8 per cent! As in the Central Railway, by cutting down detention at terminal points, junctions and marshalling yards, reducing the time between unloading and reloading, increasing the working hours in goods sheds—transhipment by night helped a great deal, at Viramgam, transhipment was stepped up by nearly 80 per cent—and other measures, the Western Railway was able to carry 20 per cent more on the broad gauge and 30 per cent more on the metre gauge during the last busy season, as compared with the previous one.

Between rows and columns of figures, percentage changes from varying base years, one is apt to get lost somewhat. This effect is perhaps not quite unintended; what is publicity if it does not hit the eye and daze the reader, if only for a moment? But all this is to the good, if it makes the Railway Board also take note and ponder. All the world over railway men love to run trains. They also love to use more and more and better and better equipment and to expand. This proclivity is sometimes expressed by the proposition that the elasticity of demand for capital in railways is infinite. This insatiable appetite for capital has unfortunately to be held in check for the Second Plan period and yet more goods have to be moved. To say this, is not to expect the railways to perform the rope trick. It is pleasing to note that the railways do not think so any longer.

Oil Statistics, DGCI Lends a Hand

AMONG the functions of the Oil and Natural Gas Commission, the constitution of which has been announced by a Gazette Notification, will be to supply correct information about oil. This is now sorely needed, after the Directorate of Commercial Intelligence and Statistics has taken a hand in further mystifying even the routine statistics of oil which one would normally expect to be able to look up, say, from the monthly Accounts relating to Foreign Trade and Navigation. In the March issue of the Accounts, which also gives the returns for all the 12 months of the financial year 1955-56, imports of crude for the year have been lumped together in the March 1956 figure, though a note says that "imports of petroleum, crude or partly refined for

further refining have been separately specified from April 1955." They have certainly not been separately specified in this particular issue.

With two of the refineries using imported crude as raw material and working full steam, one would naturally like to know the volume of these imports, to have a rough check on oil refining in the country. While the import of crude has been put at 296 million gallons, export of mineral oils, apart from petrol lifted in air-crafts for the outward journey or oil fuel taken by steamers which are "not an export in the ordinary acceptation (sic) of the term and the value thereof is, accordingly, not included in these Accounts", are put at the sizeable figure of 58 million gallons, of which a third is petrol and the balance mineral oils of other kinds. Now the Production Ministry's latest report had mentioned "The production of existing refineries has made the country surplus in motor spirit and furnace oil. The surplus is being exported to other countries. There is, however, still deficiency of kerosene, diesel oils and bitumen."

Strong Points in Saurashtra Refinery

DESPITE such high authority, however, it would be misleading in the extreme to infer from all this that we are already surplus in some of the oil products and deficit in others, though the deficiency in kerosene, diesel and fuel oils is not only large but growing, with the increase in demand for all three. There is a lot of cross haul in oil products; this is because the storage and transport available is not always adequate to cope with the stream of oil flowing continuously from the refineries and exports have often to be allowed, just because the refined products' storage capacity is exhausted and transport may not be available as and when it is needed. One of the strong points for the proposed Saurashtra refinery is just this: its willingness to meet the deficiency, particularly in Saurashtra. Gujarat and Rajasthan, of kerosene, diesel and fuel oils. The Government of Saurashtra which sponsored this scheme has been very keen on having the refinery at Bhavnagar and has offered not only port facilities but the other services required by the refinery—water supply and electricity. The metre gauge rail line which connects this port with the area that the refinery is especially to serve already offers the minimum of transport needed, supplemented by water transport which can be readily pressed into service. The broad gauge line to connect Bhavnagar via Tarapore with the main line, projected in the Second Plan period, can well be depended upon to take care of the expanded transport needs, when the refinery develops its scale of operations more fully.

Now that Saurashtra will cease to be a State, it might be feared that local patriotism may not be as effective as in the past in pushing through the proposal and getting Delhi's acceptance for it. On the other hand, with Pandit Nehru in charge of Finance, the Ministry of Natural Resources is now less cramped in its style and freer to move. So the green signal might very well mean a move forward. Foreign participants in the scheme, who have committed themselves to every kind of assistance, from the regular supply of crude, transport by oil tankers, supply of equipment on long term credit and even finance, if need be, may not be able to stomach Delhi's dilatory methods indefinitely; after all, no offers can be made without some time limit.

The sponsors are willing enough to hand over the project to the public sector, if the Government of India wants to have it. The Ministry of Natural Resources, however, is at the moment keen on investing all the money it can get in oil prospecting to have any surplus left to take over this project. Malaviyaji has, therefore, nothing to ask from the present Finance Minister; he has only to guide the Prime Minister gently over the ideological hurdle. No objection to nationalization, here and now, or at any time later, is a good formula with which the sponsors should be able to get their project through. They are willing enough to have Government directors on the board, too, with or without capital participation by the Government and why not? Government fixes prices of petroleum products. Government Directors may be useful also in helping with transport and in dealing with the Secretariat.

There is one point, however, in our Delhi letter in the last issue which requires a slight modification viz. the role of Messrs Birla Bros. in the project. "The project has been assured association of Shri G. D. Birla" but Birlas are not the prime movers behind the Saurashtra refinery. Nasserwanji Dinshaw is the main pillar and the moving spirits behind are quite humble folks, an economic consultant and a consulting chemist!

Birla Paper on Free Enterprise Forum

"WHETHER the Forum of Free Enterprise will turn out to be a great crusader or a whimpering protestant it is too early to say. It is easy, of course, to write up a high-sounding manifesto; it is easier still to buy advertisement space for it in the Press. But where does the Forum go from here?

Its success will naturally depend very much on the energy, enthusiasm and above all the technical efficiency with which it does its job of educating public opinion on the worthiness of what it calls free enterprise. But it will depend even more on the faith it has in its own cause.

Has it got this faith? If so, why do not the men who are sponsoring it come boldly out into the open and say that they are speaking for a cause they believe in? The Forum stands behind a Bombay address, but why should not its personalities take their stand proudly in front of it? It must, in any case, be apparent even to the most ordinary intelligence that the Forum must have been organized by leaders of the business community and it ought not to be difficult for informed opinion to make intelligent guesses at identification. What would have been lost, then, had the Forum dispensed with the device of anonymity? On the contrary, much might have been gained and may still be gained if the Forum is given its due local habitation and name. After all ghost voices can hardly inspire us and while shadow gestures may amuse us in patomime, they only irritate us in real life."

Et tu Brute ?

IRON ORE

The production of iron ore reached a new peak of 4.64 million tons in 1955 valued at Rs. 3.24 crores. It was 10 per cent higher than in 1954 and 27 per cent higher than in 1951.

Employment in iron mines increased by 11 per cent from 30,772 in 1954 to 34,218 in 1955.

Letters to the Editor

Profile of A Southern State—Mysore

IN his letter published in the **Economic Weekly,** Vol VIII-32, 11th August 1956, Shri G N Acharya narrates an incident which shows how even among those sections of the population of Mysore which are noted for their respect for the Royal House of Mysore, the issue of caste rouses fierce passions. Shri G N Acharya's implicit distinction between facts as they really are and facts as they are seen by the people, is very important. It is nowadays common for every action of an important political figure to be interpreted in terms of caste. The outsider is bewildered at the ease with which accusations of caste favouritism are hurled at everyone, and the people who do this are the so-called educated.

The Rajpramukh of Mysore has a Private Secretary and an ADC, who are both Lingayats, and are popularly believed to exercise a considerable amount of influence with the Rajpramukh. (I am neither agreeing with this view nor disagreeing with it. I am only stating that such an impression exists.) Under the prevailing circumstances the incident narrated by Shri G N Acharya is likely to be interpreted as providing further evidence of the influence of the Lingayats on the Rajpramukh. The political atmosphere of Mysore is so polluted nowadays that every event is seen through caste spectacles. Very few bother to inquire whether they are right in doing so.

Under the circumstances, Sir, I wonder whether it would not be better all round to have for New Mysore a non-Mysorean as Governor. The Rajpramukh of Mysore is too intimately bound up with the local situation, and there is a distinct possibility that his personality will be drawn into the caste politics of the State. Caste animosities are likely to be, if anything, sharper soon after the formation of the New State, and it will take some time for conditions to achieve a new stability. The services of the Rajpramukh of Mysore could still be made use of outside Mysore as Governor or Ambassador.

In the last few days we have learnt of the election of Shri Kadidal Manjappa in place of Shri K Hanumanthayya as the leader of the Congress Legislature Party in Mysore. One wonders why the MPCC could not listen to the suggestion of the Congress High Command and hold an election after the formation of the New State on 1st November 56? Why did they insist on going through two elections in the course of eight weeks?

Students of Mysore politics are aware of a keen struggle within the Mysore Provincial Congress Committee between Shri K Hanumanthayya and Shri S Channayya, the present President of the MPCC. Shri K C Reddy and Shri Channayya were good friends, and the latter was piqued at the unceremonious way in which the former was relieved of party leadership and Chief Ministership. The supporters of Shri K C Reddy formed a 'Reddy Group' inside the Legislature, and it is common knowledge that a struggle for supremacy has been going on between the Reddy and Hanumanthayya Groups for the last four and half years. In the pattern of political allegiances prevailing in the State today, anyone who is in power is bound to be not very popular, and this is specially so when the ruling party is deeply split by faction. Each supporter of Shri Hanumanthayya who was refused a favour joined the 'Reddy Group'. And Shri Hanumanthayya's sudden espousal of the cause of union of Mysore with north Karnatak lost to him the support of many of his followers in Mysore. For let it not be forgotten that Okkaligas are not yet quite reconciled to a State in which the Lingayats, and not themselves, will be the largest single group.

It is possible that had the election of a new leader been postponed till the New Mysore State had been formed, Shri Hanumanthayya would have been able to secure the support of enough north Karnatak Congressmen to assure him of the leadership of the Congress Party in the Legislature. For the Karnatakis have been far more keen on a Kannada-speaking State than Mysoreans. In fact, the unwillingness of Mysore to become part of a large Kannada-speaking State, and the enthusiasm of Karnatak for the same, placed the latter in a disadvantageous position vis-a-vis the former.

The 'Reddy Group' has therefore forced the election of a new leader when circumstances have been most unfavourable to Shri Hanumanthayya. The latter has been clearly outmanoeuvered, and it is not unlikely that he will now seek friends in Karnatak and S Canara to wrest the Chief Ministership once again.

There is another aspect to the election of Shri Kadidal Manjappa: the latter is an Okkaliga but from the Western, Malnad Part of Mysore State. His election at this juncture will make it difficult to choose someone else as leader after 1st November when the New State will be formed. If the Karnatak Congressmen propose a Lingayat for leadership, they will then be liable to be accused of naked casteism and the 'Reddy Group' will say that this is just what they had feared. If, however, they propose Shri Hanumanthayya's name, the latter will be dubbed as a stooge of the Lingayats of north Karnatak, and this may lose him more support in Mysore. Shri S Channayya, the astute leader of the MPCC, now has the double satisfaction of disposing of Shri Hanumanthayya as well as ensuring that a Mysore Okkaliga will lead the New State.

Astuteness is not, however, synonymous with statesmanship. Shri Channayya must be knowing that Karnatak leaders are meeting in small groups in Dharwar and Hubli to discuss how to win power in the New State. The election of Shri K Manjappa might be interpreted by them as a clear sign that mildness does not pay. It might force them to take a regionalist as well as a casteist line. And Shri Hanumanthayya will have plenty of time to brood on how best to avenge his defeat.

I must make amends for a lapse in my article. In it, towards the end, there is the suggestion that in New Mysore there will be three major groups, Lingayats, Okkaligas and Harijans, and that the Okkaligas are currently seeking friends amongst the other castes in order to build up an opposition to the Lingayats. This suggestion of mine was clearly anticipated by the States Reorganisation Commis-

sion and unequivocally stated by them:

"In the United Karnataka it has been estimated that a little more than 20 per cent of the population may be Lingayats, between 13 and 14 per cent Okkaligas, and about 17 to 18 per cent Harijans. It is clear that no one community will, therefore, be dominant, and any one section can be reduced to the status of a minority if other groups combine against it. These estimates of the communal composition of the new State are naturally not firm, because the figures which have been quoted vary considerably. They serve, however, to illustrate the Problem."

SRC Report, p 91 para 324.

It must be said to the credit of the SRC that they are in no doubt about the fact that the principal pressure groups will be the three caste groups, and they point out that in the arrangement suggested by them no one caste will rule the roost. Their argument is a direct tribute to the strength of caste in Mysore, and I regret that I forgot to acknowledge that my analysis of the future trend of events in Mysore was borrowed from that august Report. This was also recognised in an article published in the **Economic Weekly** (VII-49, 3rd December '55, p 1421) entitled "Karnataka in Sight."

Demand in Food Grains —Its Statistical Measure

A Reply

IF the statistician from Poona (Letter to the Editor, in your issue of August 11) were a little bit more careful in reading my article, he would have noticed that I was talking about food-grains (i e cereals and pulses) and not of food items all taken together. The table he supplies and the figure for elasticity he quotes both refer to expenditure on food.

I need not add that they do not have any bearing at all on my statements regarding demand for foodgrains.

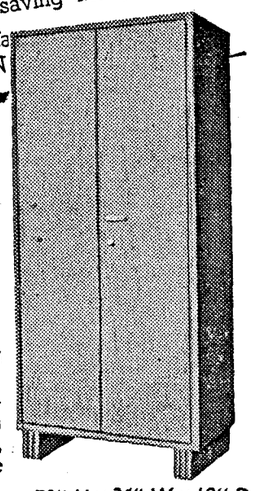
Burglars Baffled!



Dr. K. N. TANDON,
M.D., D.T.D., (P.M.S.)
M.O. I/C. Moti Lal Nehru Hospital,
Allahabad.

Dear Sir,

Although my heart is heavy due to the losses on account of the burglary at my house last night, I take this occasion to congratulate Godrej.

The burglars broke open everything in the house but failed to open Storwel ... They also tried to lever the doors from the top, bottom and the sides but failed. Storwel has been responsible for saving many valuables.

Yours fa
sd./- K. N

Godrej
PATENT
STORWEL

Handsome, sturdy inside-hinges, of Godrej's own patented manufacture, enhance the beauty of these steel cupboards.

78" H x 36" W x 19" D

To their prized possession of innumerable tributes has been added this further proof of gratitude to India's popular cupboard—STORWEL.

STORWELs are also known to have preserved their contents intact in fires when outmoded wooden cupboards and their contents were destroyed.

You can't do better than STORWEL

Model I. Mirror, Locker, Hanging-rod, Tie-bar, 1 Adjustable Shelf.
Model II. Locker, Hanging-rod, Tie-bar, 1 Adjustable Shelf.
Model III. Locker, 2 Adjustable Shelves.
Model IV. Hanging-rod, Tie-bar, 2 Adjustable Shelves.
Also Patent STORWEL Minor 50" H x 30" W x 17" D

A Calcutta Diary

Honours Easy

THE heart of the city of Calcutta, a common enough description of the central area, is perhaps inapt inasmuch as this is not where one can hear Calcutta throbbing. In the north live the largest number of Bengalis; some of the families came and settled down as the East India Company came. In the south live relative newcomers, the lower-upper middle class Bengalis who are mostly dependent upon jobs in the Government or in the mercantile offices. The centre is inhabited by Anglo-Indians, non-Bengali Muslims (or refugees from East Bengal who have occupied Muslim property) and the Europeans—these last on the south of Park Street, needless to say. There are a few Bengalis too, but they know that for reasons of their own they have torn themselves from their original milieu; they do not influence Bengali life and are influenced by it but slightly. This is not perhaps the nicest way of proving the northerly-and-southerly location of the heart of Calcutta, but it will do as corroborative evidence that, whenever something happens to stir Bengali emotions, it is at the two extremes that buses are burnt and trams are stoned. Even on Holi day it is not altogether impossible to go out in a clean shirt in and around Chowringhee and come back with no more than a drop or two of coloured water on it. The heart of Calcutta, to close this long preamble, beats in the north and the south of the centre.

It is to this centre, Chowringhee itself where the Congress Party has its offices now, and the shift may be more than physical. Whatever the position in the other States, whatever the majority of the Congress in the State Assembly, the incontrovertible fact is that the Congress and the people of Bengal have been falling apart since the day Independence came. A part of this was inevitable; nothing fails like success in political movements, at least in terms of obvious popularity. In West Bengal the natural process was accelerated by several other factors. The Administration's failure was, quite properly, attributed to the Party, and the Party itself became the plaything of political opportunists. A large number of Congress leaders before Independence came from East Bengal; after partition the local boys seized the Party, and what is left of the Party has been in their keeping for some years now. Congress Bhawan is an impressive building today—as impressive as the temple in Kalighat would be after the deity has departed from it.

With the elections approaching, the Congress could scarcely be unaware of the vacuum inside. The leadership knows that the Party today is deficient in that one thing without which a political party is not a party at all: popular enthusiasm. With more money and fewer volunteers than ever before, the Party is now safely situated on Chowringhee. Even on Holi day its leaders can go to that office in their white khadi; they are also spared the spit which would have been on them when passions rose over, say, the increase in the tram fare or States reorganisation. It is to be doubted whether the Congress leaders count these as unmixed blessings. It is possible that they sometimes feel rather lonesome, forlorn in their unbearable immunity from popular excesses.

Except for Independence Day in August and Republic Day in January, the hibernation of the Congress in West Bengal would have been disturbed only quinquennially. As in recent years—the years of affluence, the years of unpopularity—there has been an Independence Week Festival. The first evening was dedicated to The Buddha; there were speeches and there was a play. The second went to honouring Pandit Bidhu Sekhar Sastri, an eminent Sanscrit scholar. The third was caught by Rev S K Chatterjee, a footballer of 1911 vintage, when winning the IFA shield was considered a nail in the coffin of British imperialism. (This is perhaps the nearest the festival got to politics.) A novelist, a musician, and the girl students who got Firsts in the last degree examinations came next — and every evening there was music to attract crowds, to regulate which there were policemen. Rows of lamps ("a riot of colour," said a newspaper) adorned the large pandal, and there were automobiles outside to indicate that there were men inside. "People" has become an extremely imprecise term, but they were not there to take part in the festival organised by India's foremost political party. There was a touch of pathos in all its glamour, even as one finds on the plastered cheek of an ageing woman raucously declaiming poems of passion that nobody wants to hear.

All this, of course, is no more ridiculous than churches of certain denominations organising cinema shows in order to draw crowds of believers. Worse things, one may be sure, happen in the American Conventions. As for taking notice of culture for political ends, the Communists did it long ago; and there is no reason at all why the Congress should be debarred from adopting similar tactics. The fact, however, that they are not original takes away something from their political efficacy. There is a further difference of some import. Those who chose to be honoured by the Communists—and those were the days when neither the Government nor the Congress had any time for artists and such folk—did so as much for the well-known infirmity of artists, a craving for recognition, as for the other craving of the sensitive mind, being a martyr. The thing stands devalued now. There are State awards of various vargs, and whatever other rewards may come with the felicitations of the Congress martyrdom is not among them. Few artists and acrobats are averse to money, but they are performing fleas too; and the hazards of honour by the Communists may have been missed by some of the men and women who recently received Ashok Chakras in ivory from the hands of the ruling party.

These sudden gusts of windy honour are capable of creating disturbances in the minds of sensitive men, unused as they are to any kind of recognition for the rest of the year. Individuals apart, it is the dissentient voice for which Bengal was known when she was known. Too intimate an association with the ruling party is a deterrent to the dissentient mind. And there is a whole lot of things —in West Bengal and in India—to which some people should be left to say NO.

From the London End

Britain's Trade in the First Half of 1956

THE Suez dispute has tended to divert attention from the problems of the British economy and in particular, from the no less significant war against inflation in Britain. The Board of Trade and the Treasury, under instructions from the Chancellor of the Exchequer, have been compiling statistics of a more fundamental character which, the Government hopes, will enable a quicker and more adequate assessment of the impact of financial and monetary policy on economic developments. Statistics on industry's investment intentions and on new hire-purchase transactions are already being published. The Board of Trade has now brought out a detailed statistical analysis of Britain's foreign trade in the first six months of this year.

These statistics show a considerable improvement in Britain's foreign trade. Indeed the deficit in the first half of this year has been the lowest for some years. British exports shot up by 14 per cent in value to £1,591 million compared to the first half of 1955. In volume, exports rose by 10 per cent, though here account has to be taken of the exceptional export to the U S A of £6½ million of silver (in repayment of a past loan). The Board of Trade calculates a net increase of 6 per cent in the volume of exports which is not unusually high (having regard to an annual increase of 5 per cent in volume over the past five years). Nevertheless, the increase in exports is noteworthy. It indicates the bouyancy of world trade and of Britain's ability to maintain its share in all the world markets.

The more remarkable feature of the trade figures and which in the view of your correspondent, explains to a great extent the sharp fall in the deficit, is the low level of imports in this period. According to the trade figures, imports in the first half of 1956 amounted to £1,956 million which was about £72.5 million more than that of the first half of 1955. In terms of volume, imports had increased by only 4 per cent. To appreciate the significance of this low level of imports it is necessary to note the correlation in the rates of increase in exports and imports over the past 5 years. This correlation suggests that U K exports can be increased only by a more than corresponding increase in the level of imports. Since 1951 for every one unit increase in exports, an average increase of between 1½ and 2 units of imports had to be made by the U K. There have been various fluctuations in the volume rate but on an average it has been between 1½ to 2 units of imports against every 1 unit of exports. It is, of course impossible to establish this correlation on any permanent basis —the historical evidence is partially lacking.

The exceptional feature of the first half of 1956 is the fact that (with regard to the increases in the volume of exports and imports) for every one extra unit of exports, there was only an extra 2/3rds of a unit of imports. It would appear that this exceptional position was achieved by the conscious attempt on the part of industry and the Government to keep down the level of imports and to maintain a high level of exports by working seriously into their stocks of raw material. The favourable position achieved in the first half of the year must be explained by the high rate of stock liquidation in the United Kingdom.

This explanation possesses some degree of validity when account is taken of the impact of the credit squeeze. The most prominent effect of U K's monetary policy has been to make it difficult for merchants and importers to finance their stock-holdings. And in the past six months the running down of stocks for lack of bank credit has been a visible feature of every commodity market in London.

If we are to forecast what the likely consequences of this position will be, then it is certain that a time will soon appear when the U K economy will be forced to replenish its stocks and so again to build-up its import volume to compensate for the very heavy running-down of commercial stocks.

A favourable factor which has assisted Britain in the past year has been the movement of international prices or the terms of trade. We can discern three tendencies over the past year: a decline in the general level of commodity prices, a remarkable stability in the prices of manufactured goods and thirdly high level of world trade in manufactured goods. This situation has certainly assisted the United Kingdom. To what extent it has contributed to a possible deterioration in the earning power of the overseas sterling area is not yet clear. There is however the possibility that this favourable movement in U K's terms of trade may cause a future fall in British exports to the primary producing countries (unless of course production in these countries has increased sufficiently to explain the fall in raw material prices and which would not lead to their import demands being depressed). It is however to be noted that the GATT Survey on **International Trade 1955** published recently shows that between 1954 and 1955 trade between the industrialized regions increased by 15 per cent while that between the industrial and non-industrial regions increased by only 7 per cent. The relative importance of the primary producing areas both as importers and exporters continued to fall. This does suggest that the favourable terms of trade for the U K can still lead to decline in export earnings, especially where exports to the primary producing areas are concerned.

"One has no protecting power save prudence."

Finances of Jammu and Kashmir State

P N Kaul

PUBLIC revenue and expenditure in the Jammu and Kashmir State have had a slow rate of growth throughout the last half century. The rate of growth has been slow in comparison to Mysore and Hyderabad and other States of the country. From Rs 21 lakhs in 1871, the total revenue of the State increased to Rs 107 lakhs in 1906-07, Rs 229 lakhs in 1914-15, Rs 314 lakhs in 1942-43 and Rs 557 lakhs in 1945-46. While the ordinary revenues of the Government of India (for undivided India) increased by 4½ times and that of nine part A States by a little over 4 times between 1938-39 and 1953-54, (Taxation Enquiry Commission Report, Vol I, p 15), in the case of Kashmir State the increase has been only two times. In real terms, making allowance for the increase in prices from the pre-war level, the public revenue of the State seems to have fallen during the war and post-war period and the position of Kashmir in this respect has been worse than that of any other major Indian State.

The financial structure of the State has undergone some changes since 1947-48, in that revenue and expenditure in 1954-55 or even in 1953-54, remained almost the same as in 1945-46, though one-third of the area of the State went to Pakistan! Again, since 1947-48, public debt and expenditure on capital account have increased by more than three and five times, respectively. In 1954-55 (revised estimate) the total revenue of the State was estimated at Rs 542 lakhs and the total expenditure at Rs 539 lakhs, showing a surplus of Rs 3 lakhs. The total public debt, mostly from the Government of India, amounted to Rs 3 crores. During this year, expenditure on capital account was estimated at Rs 3.91 crores, as against Rs 1.56 crores in the preceding year. Taking the capital and revenue accounts together, both net receipts and expenditure stood at Rs 9.66 crores—an increase of Rs 2.14 crores over that of 1945-46.

Per capita revenue and expenditure in Jammu and Kashmir has risen from Rs 12.8 and Rs 13.8 respectively in 1945-46 to Rs 17.5 and Rs 17.7 in 1953-54 and Rs 18.4 and Rs 19.0 in 1954-55. While the revenue and expenditure of the State are so much less than those of U P, Bombay, Hyderabad. Mysore and PEPSU, Jammu and Kashmir do not lag much behind the other States of the Union as regards per capita revenue and expenditure as can be seen from Table I. There has been a deterioration, however, if we take into account the population in Pakistan-occupied areas of the State the inclusion of which would not make any significant difference to the total revenues of the State.

Before April 1954, Jammu and Kashmir had one of the most regressive systems of taxation as 95 per cent of the tax revenue came from consumption taxes covering about 20 - 25 per cent of annual public revenue. Although the most regressive of taxes, customs duty, has now been abolished, the present tax structure continues to be regressive, though its incidence has been considerably softened. The major portion of revenues still comes from non-tax sources, particularly since 1953-54. Tax revenue has gone down by Rs 127 lakhs since 1954-55 in comparison to the preceding year. After the financial integration of the State with India and abolition of State transit duties, the State gets about Rs 250 lakhs as a block grant from the Centre which forms about half of its total revenue. Under the financial agreement with other Part B States, this block grant is to be progressively reduced and stopped after 10 years; consequently, the financial position of the State will become precarious in the future unless new sources of revenue are tapped. One of these sources, obviously, is the sales tax which has proved so fruitful in other States, both A and B.

Of the total revenue of Rs. 557.30 lakhs, in 1945-46, tax and non-tax revenue amounted to Rs 222.62 and Rs 334.68 lakhs i e 39.8 per cent and 60.2 per cent of the total. Of the total tax revenue of Rs 22.62 lakhs in that year, Rs 209.48 or 94.1 per cent was from tax on consumption and Rs 13.14 lakhs or 5.9 per cent were direct taxes. The tax and non-tax revenue in 1953-54 show that the percentage share of former increased by about 10 per cent and that of non-tax revenue decreased to almost the same extent. The respective shares of direct and consumption taxes (94.64 per cent and 5.36 per cent) however remained almost the same.

Since 1954-55, the tax structure has undergone a significant change after the abolition of customs duty which accounted for about 25 per cent of the total revenue. With income-tax and central excise duties going to the centre, the share of tax-revenue has gone down. After taking into account the 60 per cent of total income-tax to be refunded to the State by the centre, out of a total revenue of Rs 542 lakhs, only Rs 95 lakhs or 17.53 per cent were covered by tax revenue in that year and the rest (Rs 447 lakhs or 82.47 per cent) was non-tax revenue. Again, of the total tax revenue, even now 95 per cent comes from indirect taxes.

The pattern of expenditure has also undergone a change. It shows a progressive increase in the share of developmental expenditure and social services and a corresponding fall in non-developmental expenditure. Thus, while in 1945-46 of the total expenditure of Rs 518 lakhs, the respective percentage shares of non-developmental, developmental and social service expenditure were 64.4, 23.9 and 10.7, in 1953-54 and 1954-55 these percentages changed to 57.0, 28.5 and 14.5 and 54.5 30.4 and 15.1 respectively. This change

TABLE I

Revenue and Expenditure in 1953-54

	REVENUE		EXPENDITURE	
	Total Rs lakhs	Per capita Rs	Total Rs lakhs	Per capita Rs
Hyderabad	25,92	13.7	27,44	14.5
Mysore	20,62	22.1	22,20	23.8
Travancore-Cochin	17,04	17.9	16,15	16.2
PEPSU	6,96	19.9	7,26	20.7
Jammu & Kashmir	5,24	17.7	5,21	17.5

Source: R N Bhargava, **Public Finance, In Theory and Practice.**

For the Kashmir State, the calculations are our own.

is discernible only after 1946-47; even in that year the percentage under these three heads 63, 24 and 13 was almost the same as in 1938-39. This change in the pattern of expenditure is commensurate with the change in other States. The Taxation Enquiry Commission estimates that in nine Part A States, between 1938-39 and 1953-54, non-developmental expenditure fell from 53 per cent of the total to 45 per cent while developmental and social services expenditure increased from 17 per cent to 26 per cent and 21.5 to 24 per cent of the total.

The revenue of the Government of Jammu and Kashmir is pretty low, compared to those of other States of India, though its expenditure would compare favourably with many other States. (See Table II) The big difference came after 1953-54. The burden of taxation per head of population in the State is now one of the lowest in India. The tax revenue per capita came down from Rs 8 in 1953-54 to only Rs 5 in 1954-55. Moreover, it is the only State in India among the bigger States in which tax revenue is less than 20 per cent of the total revenue; in the other States it is not less than 40 per cent and in some of them, it is as high as 75 per cent. Despite such low tax revenue, the financial position of the State continues to be stable because of the annual block grant of Rs 2.5 crores and other grants, subsidies and loans made by the Government of India after the accession of the State to the Indian Union. But for these grants and loans, the finances of the State would have been in a sorry state.

Disguised Unemployment and Economic Development

A K Dasgupta

ONE of the distinctive features of an under-developed economy is the prevalence of what our economists are in the habit of calling 'disguised unemployment'. Too many people subsist on agriculture. Seemingly they are employed. But their employment is not wholly productive. It is not wholly productive in the sense that production does not suffer even if some of the so-called employed are withdrawn. The ratio of labour to land and other resources is so large that the marginal productivity of labour is reduced to zero, although the average productivity remains positive. And, unlike in the organised sector, it is this average productivity and not the marginal productivity that determines the earnings, and hence consumption of the labourers. The result is that the marginal body of labourers consume, but they do not produce. They are employed physically, but not economically.

The organisational set-up (such as we have in a subsistence economy) is what makes for this. Farms consist of family holdings, and productive operations are done by the members of a family as a group. Labour is not dissociated from capital, and workers may be said to be self-employed. There are the landlords and the money lenders. But they get their rent and interest at stipulated rates; they do not perform the function of an employer. Whatever output is derived from productive operations therefore vests in the family and is enjoyed by all the members irrespective of their specific contribution; the redundant members are not just thrown away. The share of output that goes to the redundant units of labour is of the nature of transfer income. If, of ten persons working in a farm, four are redundant, in the sense that the farm could be managed equally efficiently with six persons, then, from the economic point of view, 40 per cent of the output of the farm can be viewed as being transferred to unproductive consumers. It is as if the entire output is the contribution of six persons who just 'save' a part of this contribution and hand it over to the remaining four. Prof Nurkse calls this the 'saving potential' of a subsistence economy.

It is on this concept of 'saving potential' as a concomitant of disguised unemployment' that Prof C N Vakil and his colleague have built a theory of economic growth.* Planning in an under-developed economy, if it is to be effective, must, according to our authors, take account of 'disguised unemployment' of the subsistence sector and make full use of the "saving potential" that is associated with it. The process can be initiated only if the increase in the volume of employment in the planned sector is made to exceed the addition to the labour force consequent on the growth of population. So long as our plan seeks just to absorb the additional labour force that comes into the market as a result of population growth, the disguised unemployment remains untouched and with it the saving potential. Once, however, our planned investment passes this limit, a cumulative process of expansion sets in. The argument in this context runs in terms of a theorem thus: Suppose that the value of wage-goods needed to employ an additional unit of labour in the planned sector is Rs 400 whereas the actual consumption of a corresponding unit in the subsistence sector is Rs 200. Then, if the planned sector can somehow secure an extra saving of Rs 400, the additional employment created will be two units instead of one. For, while with the saving of Rs 400 done in the planned sector one unit of labour is productively employed, the withdrawal of this unit from the subsistence sector is accompanied by a release of Rs 200 worth of wage-goods. This can now be added to another equivalent bundle of wage-goods to be released if one more unit of labour is withdrawn from the subsistence sector. The economy is therefore in a position to absorb altogether two units of labour in productive employment, although the initial dose of saving was just enough for one unit. Saving thus breeds saving, and we have a so-called 'multiplier effect' on employment, the value of the 'multiplier' depending upon the ratio of 'wage unit'** in the planned sector to what may be called the 'consumption unit'† in the subsistence sector. The lower this ratio, the higher is the value of the 'multiplier'.

So far, so good. The emphasis on the implications of 'disguised unemployment' for the economics of growth is commendable. The proposition that employment is limited by the flow of wage-goods that can be made available to labourers, though apparently commonplace, is worth emphasizing at a time when economic thinking, is so widely influenced by the Keynesian theory of effective demand. In an under-developed economy, the scope for expansion of the current output of wage-goods is limited, and the Keynesian investment multiplier is insufficiently operative. Yet an opportunity for a 'cumulative process' offers itself in such an economy if the 'disguised unemployed' is released from the subsistence sector and the 'saving potential' that it carries is used as a supplement to whatever additional savings can be drawn from the rest of the economy. For this to happen, the rate of growth of employment must pass the critical limit set by the growth of population. Our authors' crusade against India's Second Five Year Plan is based largely on this concept. The employment target set in the Plan is much too inadequate to draw in the 'disguised unemployed and to bring the cumulative process into play.

However, if our authors had reflected upon their hypothesis a little more closely they would perhaps realise that they had started from the wrong end. Not that their proposition is wrong; of course it is not, so far as the arithmetic is concerned. But the way it is presented suggests a certain lack of awareness of the obstacles to the growth of an under-developed economy. In their excitement at what they thought was a discovery they forgot to notice that if the proposition were put the other

* Vakil and Brahmananda: **Planning for an Expanding Economy.**

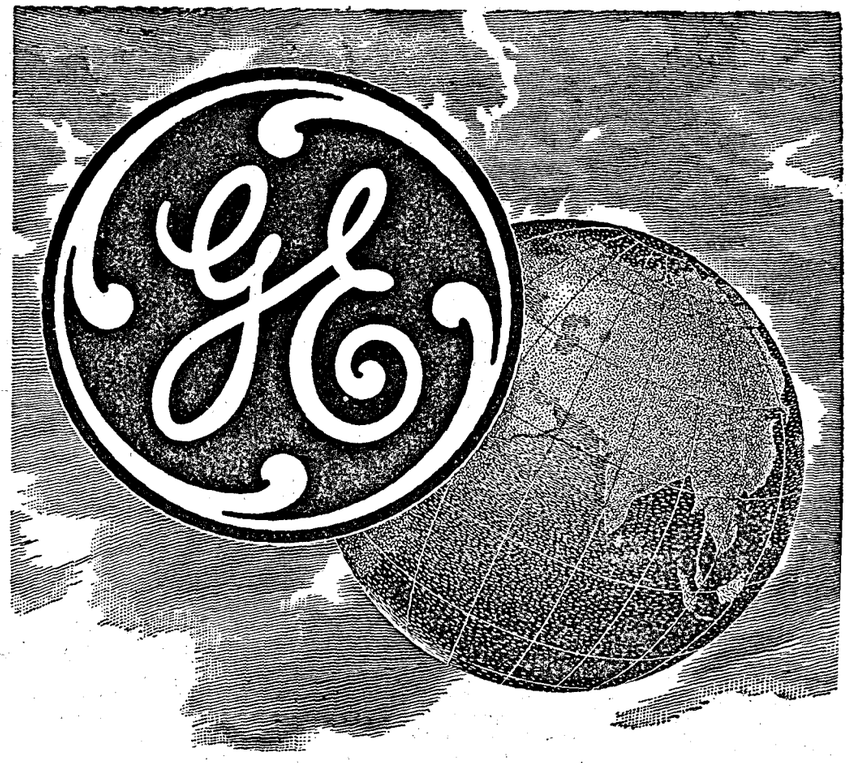
** The authors use a term 'employable unit' in this context which they define as 'labour plus wage goods', apparently forgetting that 'labour' and 'wage goods' are not additive. There are many such unpardonable lapses in the book against which the reader must guard himself.

† The term is used here to signify the actual consumption of a unit of labour.

way round, it would take a form which has been familiar to most of us most of the time. Let us revert to our authors' example. The 'consumption unit', as we have called it, is Rs 200 and the 'wage unit' is Rs 400. Assume, with our authors, that along with the transfer of the 'disguised unemployed', the goods that they used to consume in the subsistence sector are also transferred to the planned sector. The market is then provided with an additional Rs 200 worth of wage-goods for each extra unit of labour employed in the planned sector. It is true, then, that if an extra saving of Rs 400 is made available in the planned sector, possibilities will be opened up for the employment of two units of labour instead one which is the labour content of the extra savings, and the so-called multiplier effect will be operating. Now look at this same thing the other way round. A unit of labour is released from the subsistence sector and with it a bundle of goods worth Rs 200. The consumption unit thus released is not sufficient to provide employment to one additional unit of labour in the planned sector; the market has to somehow secure another Rs 200 worth of wage-goods by way of savings. The transfer of a unit of labour from the subsistence sector releases wage-goods whose value is only one-half of the actual wage that has to be paid if it is to be productively employed. If we look at the matter this way, which is the correct way, the 'consumption-goods multiplier' takes on an altogether strange complexion and turns out to be a myth.

One feels tempted, at this stage, to turn back and to see wherein our crucial problems lie. The problem of growth in an under-developed economy with a large and redundant population is basically a problem of capital formation. Employment in the investment goods sector needed for capital formation is no doubt limited at any moment by the availability of wage-goods. But the output of consumption goods in general and of wage-goods in particular is itself a function of the stock of capital. An increase in the stock of capital increases the scope for the employment of labour, although during any given period of investment needed for the production of capital goods, it is the current release of wage-goods that determines the extent to which employment can be increased‡.

The principal aim of economic planning in an under-developed country is to raise the rate of investment and hence of capital formation with a view to an increasing flow of consumption goods in the future. Since there is a plethora of unemployed in the economy, the speeding up of investment does not require curtailment of activities in the consumption goods sector; the economy can draw upon the reserve of unemployed. If concurrently with the increase of investment there is also increased production of consumption goods, as happens when there is excess capacity in the consumption goods sector, the wage-bill of the additional labourers can be met out of the additional output of consumption goods, and there is no pressure on the consumption goods market. We are, so to say, in the Keynesian world of plenty where an increment of investment leads by itself to an increment of consumption.



It is wrong to suppose that these Keynesian effects are altogether absent in an under-developed country such as India. The capacity in our organised sector does lend itself to fuller utilisation, as findings of competent statisticians indicate. Moreover the Plan period that we have in view is not exactly the Keynesian short period where resources and technique are given and fixed; certain investments may well be made to bear fruit during the Plan period. There is therefore some scope for the expansion of output of consumption goods to be set against the additional employment in the investment goods sector. But these possibilities are negligible in the context of the volume of investment that is needed to fully absorb the reserve of unemployed, when account is taken not only of the existing volume of 'disguised unemployment' but also of the addition to the labour force resulting from the normal growth of population.

Assume, then, to bring out the essence of the matter, that there is "full employment" in the organised sector. What happens if, as the need for economic development demands, more employment is to be provided in the investment goods sector towards the production of capital goods? We are in the Classical world of Scarcity, and an adequate volume of wage-goods has to be released from the rest of the economy to make provision for the additional labourers engaged in the investment goods sector during the investment period. The rest of the economy has to put up with reduced consumption, the extent of this reduction being determined by the wages-bill (assuming that wages are wholly spent on consumption) of the newly employed labourers. This is the raison detre of "saving" in the context of the economic development of under-developed countries. It is "saving" that makes possible an expansion of investment needed for the growth of the economy.

Now, the distinction between 'disguised unemployment' and new labour force generated in the process of population growth is often too sharply drawn. They are not necessarily distinct and separable entities. In practice, very substantially one merges into the other. The major impact of the growth of population in an under-developed economy is on agriculture. And there what happens, as population grows, is that an increasing degree of congestion occurs in the age group that call themselves 'occupied'. The 'saving potential' remains more or less the same, but the mouths to draw upon it increase in number. In fact, the distinction drawn here is not a distinction between two categories of unemployment; it is rather a distinction between two ways of looking at it. However, the distinction becomes analytically significant if we assume that the 'saving potential' gets released for use in the planned sector only at a level of employment beyond what would be needed for the full absorption of the newly emerging labour force. At any rate it is in this sense that the distinction is used here, although it is clear that there is no knowing in practice, at what level of employment this process of release of the 'saving potential' starts operating, if it does operate at all.

Since in the context of the situation that we are contemplating, additional employment is devoted entirely to investment and is unaccompanied by any expansion in the

‡ There is therefore no contradiction, as the authors imagine there is, between their theory of 'wage-goods gap' and the Planning Commission's 'logic' stressing the need for fixed capital. One refers to the short run and the other to the long run scope for employment.

Trusted around the world

Around the globe, General Electric people are working to make life better with the finest of electrical products and services. In India, the G. E. equipment, research and engineering experience have been employed in many power, industrial and educational projects... planned for the progress and prosperity of the country. Look for the G. E. monogram... a sign backed by 77 years of electrical skill and experience... a sign you can *trust*.

Progress Is Our Most Important Product

output of consumption goods, the wages-bill of the additional labourers has to be matched entirely by 'saving' done in the rest of the economy. In so far as these additional labourers are recruited from the newly emerging labour force, the entire saving needed for meeting their wages-bill has to be newly created. It is only when investment is pushed so far as to enable the economy to encroach on the 'disguised unemployed' that some relief is found, on our assumption, in the release of goods that the labourers drawn into the planned sector used to consume in the subsistence sector. Even here, the 'wage unit' in the planned sector being substantially higher than the 'consumption unit' in the subsistence sector, further new savings have to be created for covering the gap.

All this becomes familiar story, when put in terms of money-wages and prices. An under-developed economy with a reserve of unemployed embarks on a process of planned investment. Additional employment is created in the investment goods sector. Payment is made to the labourers newly employed at the current money rate of wages. These wages are spent on the purchase of wage-goods. There is an increase in the aggregate money demand for wage-goods. If, to start with, there is excess capacity in the consumption goods sector, output of wage-goods expands in response to the increase of demand, and there is no rise of prices, except to the extent warranted by the emergence of 'bottlenecks' here and there. If investment (and employment) is pushed beyond a level where excess capacity is fully exhausted, increased money demand presses on an inelastic supply of wage-goods, and prices start rising. The tendency is checked if the additional expenditure done by the newly employed labourers is offset by reduced expenditure elsewhere in the economy. The need for the offset is only lessened to the extent that there is transfer of wage-goods from the non-monetized sector to the monetized sector where the additional expenditure has its impact. If therefore prices of wage-goods are to be held constant in order for the real wage rate not to fall, the volume of additional (planned) savings needed in the monetized sector for the full absorption of the unemployed (disguised and undisguised) would be equal to the total money wages accruing to this entire body of newly employed labourers (assuming that wages are all spent) *minus* the money value at current prices of the increment of output of wage-goods, including the amount transferred from the non-monetized sector.

It is not difficult now to see the kind of hurdles that have to be got over in order for the economy to be able to utilise the 'disguised unemployed' for purposes of development. First, there is the problem, how to create conditions under which the disguised unemployed would get released from the subsistence sector and be drawn into the planned sector? Is wage incentive enough? If not, what 'organisational changes' would be necessary for the purpose? Secondly, supposing that men are transferred, what guarantee is there that the goods that they were consuming would be transferred, too, to the planned sector? Is it not probable that those who would stay back would choose to retain at least a part of the consumption of the group that are switched on to the planned sector? The exodus of the 'disguised unemployed' will no doubt leave the subsistence sector with a 'surplus' of wage-goods. But those who will be still there will in all probability be reluctant to part with this surplus. This is partly because they will now wish to improve their standard and partly because they will have perhaps some more mouths to feed in view of a possible increase in the number outside the employable age group, as is likely to happen as population grows during the Plan period. What steps could be taken to prevent them from behaving that way? Will the normal price incentive be enough? Above all, thirdly, how are the necessary savings to be created in the economy, so as to cover the gap between the 'wage unit' and the 'consumption unit'? In an economy where normal savings do not take care even of current additions to the labour force, this would appear to be the most serious obstacle to optimum growth, particularly when planning is conceived against the background of a democratic way of life.

Oppressed with these considerations, our Planning Commission has chosen to go slow and has contented itself with making provision in their Second Five Year Plan at best for the current additions to the labour force, having to rely even there largely on deficit financing and foreign aid. Nobody, not even the framers of the Plan, will say it is an ideal Plan. But one has to have a sense of realism. It is no good just contriving an arithmetical jugglery and indulging in gratuitous criticisms, when the big socio-economic questions that the Commission is confronted with remain unanswered. We have to show the way to the solution of these before we take up the cudgel. Prof Vakil and his colleague with their new-fangled 'consumption-goods multiplier' notwithstanding, we have not done that.

Indian Agriculture In Brief

A useful handy and pocket-size booklet has been recently brought out by the Economic and Statistical Adviser, Ministry of Food and Agriculture, Government of India, with a view to meeting primarily the need of those who wish to have a snap-shot picture of Indian Agricultural Economy as revealed by the current Agricultural Statistics. Certain essential data in allied spheres, e.g., population, national income etc. needed for an understanding of the agricultural economy in its broader perspective have also been included in this booklet.

Commerce Minister on World Capitalistic Development

Fredie A Mehta

IN his recent speech at Madurai, reported in "The Hindu" of 6th August, the Minister of Commerce and Industry let the capitalists of India have it. In effect, he seemed to say, Indian capitalists were a pretty unimaginative and uninspired lot who would never have been able to move an inch but for the magnificent support of his benign and benevolent government. Then the giant unleashed his tongue, and began to lash not merely "Indian capitalism" but "capitalism" the world over.

What sort of an animal was TTK flogging? A dead horse or a horse that was alive and kicking? From TTK's account, it would seem that world capitalism was not exactly dead but certainly it was dying. How many laughs must TTK have given good old Karl Marx in his grave by saying that but for "something or the other" the American economy would virtually collapse. For in the land of Holy Marxism itself, there has been recently a complete revaluation of the prowess and powers of capitalism: "the old dog is still kicking vigorously," now say the present priests of Russia about capitalism. But good old TTK begins his dreams of a "Capitalist collapse" where even pious Marxists have almost given up theirs. Perhaps, perhaps, we are all Communists now!

In any case, TTK has put economic historians in great debt by providing them with a classic case of complete confusion in the contemporary world. This is what "The Hindu" reports:

> "Mr. Krishnamachari pointed out that American newspapers now and again referred to the ghost of depression raising a boom in Wall Street followed by a collapse. Something or the other sustained the economy of the country with the surplus being diverted to other countries. Therefore, inherently, capitalism had proved to be a success only in countries where there were enormous resources, rich soil and where there was no over-population. There was no use, he said, of thinking of capitalism in a country like India which was terribly over-populated."

It would be most interesting to learn from this doubtless widely-read politician which leading economic papers in America keep on speaking of depression. Is it "The Wall Street Journal" or "The Daily Worker"? Seriously speaking, there is one word that has in recent years suffered a great depression, and that is the word "Depression." It may or may not be true that "the trade cycle is now a thing of the past"; likewise it may not be completely true that Keynesianism has proved to be the Waterloo of Marxian ideologues. What is certainly true is that the economy of the USA, as also that of nearly all the countries of Western Europe, particularly of Western Germany, gather greater and greater strength as each year rolls by. Everything booms but the guns! We now speak of a 'recession', of a 'rolling re-adjustment,' of 'an inventory rundown' and so on and so forth. But nobody seriously maintains that short of armament-manufacture or disposal-of-surpluses, there is going to be an acute depression in the USA. Such pessimists have been proved wrong again and again, and there is now a real danger that even when they have truths to tell and pointers to indicate, they will not be taken seriously. This, it is clear, is a wrong and unscientific attitude, but it does show in an unmistakable manner, how the body of "depression-economics" has been given a gorgeous funeral. The trouble is not that the "dying horse" of capitalism needs to be given water and fresh air: the trouble is, as the British have found to their regret, that "the old dog" of capitalism is kicking and barking aloud so much that it may even be necessary to have him caged for a while! Be that as it may, no one who has studied the post-war capitalist economies can fail to be struck by the confidence and capacity of these countries to control and counteract downswings in economic activity.

But if TTK was needlessly pessimistic about the present state of the capitalist economies, he was emphatically wrong in his assertion that capitalism had succeeded only in countries that had no population problem. What does TTK imagine Great Britain to have been when she stood on the threshold of the Industrial Revolution? An under-populated country? In fact, with the exception of the Utopian Socialists, there was almost major agreement then that Great Britain was grossly over-populated. In fact the tremendous influence and impact of Malthus' theory of over-population was largely due to the aura of pessimism that hung around the thinking of all the great contemporary minds of the time. Within a century of Malthus' death, however, the ghost of Malthusianism was definitely laid low, and the aura of pessimism gave way to an atmosphere of unbounded enthusiasm and energy, accompanied by a naive but profound belief in the ultimate triumph of humanity over poverty, disease and illiteracy.

In the sociology of history, there is seldom one single cause to which an entire chain of effects and events can be readily traced. Nevertheless if one particular system can be held as revolutionising the entire career of the world economy, it was the system of Industrial Capitalism, as it grew in all its variety in the different Western European countries. By creating a high volume of savings and canalising the savings into investments; by unleashing a vast and almost miraculous chain of inventions, innovations; by bringing more and more lands into the orbit of world trade —capitalism inaugurated a process of dynamisation of the world unprecedented in human history. Man dormant and docile awoke to the freshness of a new life bursting with independence and individuality; the sleep and stupor of the world was broken, and empty lands buzzed with the ham of men, money, machinery and markets.

It is not only possible, but it is absolutely necessary, to point out the disfigurations and disturbances that capitalism caused both at home and abroad in its process of world-dynamisation. Its high rate of capital-formation could not have been possible but for the sufferings of industrial labour and for the secular span in world prices in favour of industrial against agricultural products almost throughout the century from 1842 to 1939; its tremendous vitality and vigour involved grave waste of capital resources; its religion of success made "conspicuous consumption" a tragic feature of an acquisitive society; its

forcing of foreign lands into the orbit of world trade not merely saddled a number of countries with colonialism but cruelly destroyed the handicrafts of many peripheral countries. While all this is true, yet the fact remains that it was capitalism that not only laid the foundation of the material prosperity of the modern world but also initiated the concept of individual liberty as the major premise of the social syllogism*.

Far from capitalism being able to survive and succeed only in countries which are not over-populated, capitalism evolving in all its varied forms has been for the hitherto advanced countries of the world the best answer to, and the great solution of, the pressing problem of over-population. It was not the previous existence of rich resources and under-population that enabled capitalism to succeed; it was capitalism that discovered and dynamised hitherto poor and over-populated countries, and thus laid low the bogey of Malthusianism. Indeed, from these patent facts of economic history, a number of historians of capitalist economies, favourable or adverse, have actually seen in over-population one of the most essential conditions for the success of capitalism.

From the Marxist angle, over-population creates a large pool of labour which has a secular tendency to depress wages and this helps increase the rate of profit-accumulation of the capitalists. Over-population is thus a source of savings for the capitalists.

Non-Marxian writers who are favourable to capitalism also see in over-population a favourable condition for the success and survival of capitalism: for every expansion in population is a potential expansion in the markets, and hence in the profits, of the capitalists. Conditions of mass production and mass consumption required not only a rapidly expanding stream of incomes, but the spread of this stream into all the sectors of society; above all for the average run of commodities, and for the large scale construction of buildings and railways, it called for a rapidly growing population. Thus not only did capitalism convert existing "over-population" into a virtual stage of "under-population" relative to the demands of economic expansion, of income dispersion, of expansion of national frontiers, and of new inventions of products and processes; but the climate of over-population was in fact and in theory favourable to capitalistic development.

A very subtle, and doubtless unconscious, tribute to the population-sustaining capacity of Western capitalism was paid by one of its most severe critics, Rajani Palme Dutt in his 'India Today', 1947 when he said,

> "The decisive difference between India and the European countries is not in the rate of growth of population, which has been more rapid in European countries. What makes the difference between the conditions of India and Europe is that the economic development and expansion of production which have taken place in the European countries, and have facilitated a more rapid growth of population, have not taken place in India."

Finally, to clinch the issue between Western capitalism and population-pressure, it needs to be noted that these two are obviously not separate variables, revolving around economic growth. It is now almost a truism that increasing incomes, by changing psychological motivations and economic desires, tend to bring about small families. This tendency is strongly re-inforced by increasing urbanisation, rising cost of technical education, more facilities of recreation, availability of effective and clear contraceptives, etc etc. But it cannot be forgotten that in the early stages of capitalist development, particularly as the latter evolved in Great Britain (between 1820 and 1880), Germany (between 1865 and 1914), and Japan (between about 1885 and 1939), there was in fact a tremendous upsurge of population. Thus capitalism not only begins its innings in a general atmosphere of "over-population" but in its early stages it also tends to encourage an increase in population. Though this is historically true, there is no necessity however why in the changed conditions of the present day such a phenomenon should repeat itself. However it does put another nail in the coffin of the argument that capitalism in the past has been successful only where there has been under-population.

The argument has has also been used by TTK that rich resources together with under-population also played a part in ensuring the success of the capitalist system. This argument is on a par with and as fallacious as that of some critics of Soviet Russia who maintain that so rich in natural and mineral resources is the continental economy of Soviet Russia that any system other than communism would have given equally good, if not better, results. However, to this type of argument Schumpeter has a very relevant answer: "Objective opportunities — that is to say, opportunities that exist independently of any social arrangement—are always pre-requisites of progress, and each of them is historically unique. The presence of coal and iron ore in England or of petroleum in this and other countries is no less important and constitutes an opportunity that is no less unique. The whole capitalist process like any other economic process that is evolutionary, consists in nothing else but exploiting such opportunities as they enter the businessman's horizon and there is no point in trying to single out the one under discussion in order to construe it as an external factor. There is less reason for doing so because the opening up of these new countries was achieved step by step through business enterprise and because enterprise provided all the conditions for it (railroad and power plant construction, shipping, agricultural machinery and so on). Thus that process was part and parcel of capitalist achievement and on a par with the rest."

—"Capitalism, Socialism and Democracy", page 109.

I have tried not to draw any inferences from the above line of thinking either to buttress or to run down the Indian pattern of capitalism. Such inferences have little validity. What is required is a sincere non-partisan study inquiring why, if at all, Indian capitalism, as it has developed so far, has been different both in its spirit and in its structure from the type of western capitalism which we have broadly considered.

* The methods Soviet Russia used for economic growth were those of Planning: the technics and technology she used were those of capitalism. In this sense it is true to say with Schumpeter that the true architects of Socialism were neither the intellectuals nor the agitators who preached it, but the Vanderbilts, Carnegies and Rockfellers.

In India, at the present time, there are not enough healing hands... not enough trained doctors and nurses to bring skilled medical care to all who need it, especially to those who live in the villages. But in the Second Five Year Plan, the sum allotted for the improvement of rural medical and health care is twice that in the 1951/56 Plan. By 1961 it is proposed to establish over 3,000 'health units' in community project, national extension and other areas. Hospital accommodation will increase by about 26% and there will be 30,000 more hospital beds available throughout the country.

The healing hands are coming...

Burmah-Shell supply larvicidal oils and residual sprays in increasing quantities for the national malaria and filaria control programmes. We distribute petroleum based insecticides throughout the land. SHELL petroleum chemicals—aldrin dieldrin and endrin—protect the country's food supplies: chemicals derived from petroleum are also being used in the manufacture of antibiotics.

BURMAH-SHELL...

IN INDIA'S LIFE AND PART OF IT

Britain's Second Thoughts on Suez

(From Our London correspondent, delayed in transmission)

FOR the British thinking public, the second week of the Suez crisis has been very much like that crucial period when a hysteric patient gets over his delirium and asks "What is it all about?" And it is re-thinking—this somewhat embarrassing return to reason —which has been responsible for the considerable lack of sympathy on the part of Britain's more thinking public for some of the Prime Minister's assertions in his much-publicized radio and television speech. The talk of "plunder" which Sir Anthony indulged in was more in keeping with the charged atmosphere which was so all-pervading in the first week of the crisis. The breeze of reason which blew in from official Indian quarters was to an extent responsible for the rethinking in Britain.

Thought in Britain today is centred on the implications of all the military preparations that have taken place and more important, on the consequences of the Conference failing to agree on the suggested scheme for international control of the Canal. It is true that the British Government cannot pronounce on a possible failure of the Conference. But it is equally true that Sir Anthony's much repeated insistence on international control and that Britain can accept nothing less, carried with it possibilities of war on a decisive scale. The nature of India's acceptance (and certainly that of Russia's) makes it abundantly clear that the Conference cannot be unanimous in accepting the Western proposals. More important, very few of the Conference participants would wish to see a settlement imposed upon Egypt, that is, without Egypt having voluntarily agreed to such a settlement.

For Britain, all these possibilities carry problems of prestige. Is it now conceivable for the British Government to retreat from the positions they have taken? If not, how and by what means will Britain be able to inject the vital elements of morality and law in any military adventures she undertakes? It is thus that the **Economist** has significantly characterised the nature of the crisis to Britain:

> "The problem which Colonel Nasser has flung in our faces is a problem of politics and in the end it will have to find a political solution, whether or not the military adventure is tried first."

This description of the crisis, however, carries with it an implication which is certainly dangerous and which has become the subject of an unprecedently heated controversy in the columns of the **Times**. The problem is certainly a political one at the present time. It is, however, unlikely to lead to a political solution satisfactory in any form to Britain, if this solution is to be preceded by military sanctions. The **Manchester Guardian** has once again reiterated that "there is no ground for military action" and the **Daily Mirror**, sensitive to the opinions of its many-million readers, now says that "world opinion is against the use of force."

The most reasoned and sustained attack on military action has come from the influential letters appearing almost daily in the columns of the **Times**. And most of these letters are from well-known members and leaders of the Labour Party. Douglas Jay and Dennis Healy have argued cogently the patent insanity of a policy involving military action but, by a remarkably queer line of reasoning, they have suggested the legality and appropriateness of "economic sanctions." Similarly, Dr Edith Summerskill made a singularly strong protest against the position taken by the Government while others have expressed fears about the effects of military action on (a) the United Nations; (b) the Bagdad Pact and Britain's relations with the whole Arab world and (c) on the economic strains which such a policy would place on a dangerously poised British economy.

Most significant of all has been the re-thinking in the Labour Party. The first unqualified support of Mr Gaitskell to the Eden Government is now considered to have been a blunder of considerable magnitude. A movement sponsored by the once-Bevanite **Tribune** and by the **New Statesman** but more important, by a group of twenty-four Labour MP's has forced the deputy leader of the Labour Party, Mr James Griffiths, to acknowledge that "there is a growing concern of the British people at the prospects of being plunged into a bloody military adventure in the Middle East". Mr Gaitskell, whose position as a fully accepted leader is still to be established, has now cut short his holiday, called a meeting of of his shadow cabinet and, we hope, will retrieve the situation in the light of the new thinking in his party.

There have been some prominent commentators who have questioned military sanctions not from the view that such sanctions are wrong in principle, but by reference to the physical incapacity of the United Kingdom to undertake military action at the present. The **Economist** sees military action as nothing less than a "long haul"—a protracted war and military occupation inevitably of long duration. It asks:

> "Is Britain in fact prepared, having clamped a control by force on an actively unwilling Egypt, to sit on the lid for ever, while keeping further massive military strength handy to deal with inevitable wide repercussions in the Arab world?"

An informed writer in the **New Statesman** goes further. He suggests, with considerable evidence, that the present character of Britain's armed strength does not appear to be capable of military and armed conflict of the nature which the Egyptian situation involves. The situation in Cyprus, the limited accommodation in Malta and Libya's refusal to provide assistance, are all unfavourable to British adventures in Egypt. Above all, the entire Middle East is actively on the side of Egyptian Government.

The re-thinking in British public circles has been fundamental and, it is hoped, sufficiently influential to change the course of British official policy. The problems, however, are not solved. British prestige is in the melting pot. By some graceful retreat it may just be possible for some of this prestige to be salvaged. The great question is whether the Eden regime is capable of a graceful retreat.

Our Delhi Letter

Ominous Signs

PLANNERS and economists in New Delhi are in a grim mood. The buoyancy generated by the Second Five Year Plan has disappeared. Hope in the Government's *ability to bungle through somehow* is now tinged with misgivings; ominous signs, too clear to be ignored, are gathering on the horizon. Prices are rising; shortage of shipping and surface transport is getting acute, costs of projects are rising; internal resources remain inadequate; and a foreign exchange crisis is in prospect.

India has drawn on her sterling balances during the last four months at the rate of Rs. 276 crores a year. The Second Plan provided that the country could draw down the sterling assets by Rs. 200 crores during the entire Plan period, to leave just enough of foreign balances for currency cover. Yet many of the foreign exchange bills still remain to be paid. During the six months since March 1956, India's commitments for the imports of machinery involve payment of Rs. 164 crores, a sum which is presumably more than what India paid for machinery imports during the whole of the previous financial year. During his recent trip to Europe, Shri B. K. Nehru is believed to have discovered that Indian firms have entered into contracts for securing export credits from foreign concerns to the extent of a little less than Rs. 100 crores and the entire amount will have to be repaid during the next five years. Where will the foreign exchange come from?

The cost of industrial projects has risen in the meanwhile. One major item is steel plants. It is computed that the three steel plants in the public sector will cost nearly Rs. 500 crores all told, against a provision of Rs. 350 crores in the Plan. The former figure, however, includes the cost of three steel townships expected to amount to Rs. 45 crores. While the Ministry of Food and Agriculture has impliedly asked for another Rs. 116 crores to raise the target of additional food production to 25 per cent, the Ministry of Production is budgeting for an expenditure of nearly Rs. 300 crores for its own projects.

The cost of hydro-electric schemes is simultaneously going up and no one knows how much money would be required for building heavy industries. The Railways are claiming more money as usual. The Ministry of Commerce and Industry is however taking a chance on a Rs 140 crore plan for the establishment of heavy industries by sending it to the Cabinet in the hope that its claim for additional allocations would be recorded and it would receive first priority in case any other Ministry surrenders funds!

Not only is the rupee cost of projects going up, the foreign exchange component of these costs is going up even faster. This is partly because of a deliberate change of policy. In the contract with the Russians for the Bhilai project, for example, it had been provided that the maximum amount of equipment for the plant would be manufactured within the country; only essential machinery would be imported. The Government, however, has now changed its mind and the contract is likely to be expanded. For it is now considered more prudent to secure machinery in 'packets' from Russia and reserve the available surplus capacity with the country for other purposes. Partly the decision is also the result of technical considerations and experience. Bolts and nuts, brackets, pipes and such other ancilliary equipment fabricated in India do not often fit the heavy units obtained from the U S S R. The result is that the export credits expected from Russia have already increased from Rs. 55 crores to Rs. 63 crores and the figure is likely to mount higher, as equipment to lay the foundation of the Bokharo Steel Plant, contemplated under the Third Five Year Plan, is likely to be included in the Bhilai Deal. There is a similar tendency in the case of other projects also.

In the meantime the spectre of

spiralling food prices is looming large. The wholesale price index for cereals has risen from 364 to 486 within a year. Apologists of Government policies say that the rise is not so spectacular compared with 1954 but everyone concedes that the trend is alarming. A series of new measures, including further restrictions on bank advances and compulsory registration of stocks with tradesmen, may be instituted. Simultaneously a drive may be undertaken to increase food production by short-term measures. Hope is also pinned on the prospective 350 million dollar loan from the U S for the purchase of 3 million tons of surplus American wheat and 300,000 bales of cotton and other surplus agricultural commodities.

Official circles in New Delhi however realise that the problem is extremely complex. The priorities allotted in the Plan have already become out of date and the subject will have to be reopened soon, if the race for funds between warring ministries is to stop.

Knowledgeable opinion is not averse to the speediest possible completion of the industrial projects, despite their higher cost, because delays may indeed prove even more expensive. At the same time a caveat is often entered for staggering expenditure so that too much purchasing power is not pumped into the economy in the first two years of the Plan. Simultaneously measures for mopping up the circulating currency are being devised; a unit has been set up under Shri A C Bose, Joint Secretary in the Ministry of Finance, who has been shifted from the Central Board of Revenue to the Department of Economic Affairs for this purpose, to assess the feasibility of capital gains tax, expenditure tax and a tax on wealth.

Meanwhile the Government is increasingly realising that the fatal flaw of the First Five Year Plan was its preoccupation with agricultural production almost to the complete exclusion of heavy industry. During the past five years little or no attempt has been made to develop capacity for building machinery. Thus the country has still to spend precious foreign exchange to import immense quantities of capital goods for textile, jute, cement, paper, chemical, fertilizer, mining, power and other industries. A beginning is just being made towards the manufacture of complete sugar plants. But a good proportion of the requirements for the steel plants would be imported. Since establishment of machines to make machines requires perspective planning, Government has already drawn up the outlines of the Third Five Year Plan for industrial development. Targets have been tentatively fixed and the order of investment required to achieve them has been roughly worked out. The figures in the table on p 1019 have been suggested as the basis for discussion.

The new investment in industries will be of the order of Rs 2,250 crores. Adding another Rs 250 crores for renewals and replacements etc., the total outlay in major industries will be about Rs 2,500 crores during the Third Plan. The machinery element in this investment is estimated at Rs. 1,250 crores or an annual average of Rs 250 crores. The comparable figure at the end of the first plan is placed at Rs 50—60 crores. It is hoped that the capacity to manufacture most of the required machinery would be developed in India during the Second Plan.

Steady Undertone

Wednesday, Evening

BUOYANT conditions continued to prevail on the stock market here, despite occasional profit taking. But the behaviour of equities in the last few days indicated that investors were hesitant to lend fresh support to the market at the current high levels. Nor were speculators as active as in recent weeks. This hesitant trend was only to be expected after the non-stop rise in equity prices in the last few weeks. Even so, the undertone of the market remains steady.

Symptomatic of the "bullish" trend of the market is the spurt in new groups of shares on occasional days. Revival of demand for Miscellaneous shares has been noted in these columns before. Though Engineering shares of a particular group has always remained subdued, other shares in this group have gradually moved up. In the recent upswing, Paper shares have also firmed up. Only Tea shares have been rather subdued, while Coal shares continue to be neglected.

Near Favourites

In the last few days, two groups of shares have gained popularity. Spurt in Cement shares is not a new development. About two months ago, Cement shares started to move up. At that time, activity was influenced by attempts at cornering shares of a particular cement company. With the success of the cornering attempt, activity in Cement shares subsided. It has revived again. And the revived activity in Cement shares has been a sustaining influence on the whole market.

Improvement in Cement shares is fully justified. There has been a considerable increase in the output of cement in the last few years. Even so, there is a shortage in cement. Arrangements have been made to import cement. Imported prices are higher than internal prices. To adjust prices so as to encourage increased internal output, cement prices have been uniformly raised. Since then, Cement shares have been in demand. Latest reports of cement companies confirm the investors' preference for Cement shares as sound investments.

Aluminium Shares

A few days ago, shares of companies producing aluminium started moving up. Spurt in Aluminium shares is partly due to good working results of some aluminium-producing companies. To this extent, the activity in this group of shares reflects the hunt for good yields for the money invested. To some extent, the demand for Aluminium shares is a part reflection of possible dangers arising out of the Suez Canal crisis. If this is the main urge behind the recent spurt in Aluminium shares, the improvement may not be sustained.

But the market is likely to receive continued sustenance from the expected strength in Jute shares. These shares have a tendency to move up in the latter half of the year. This year has been no exception. But there is a solid basis behind the recent upswing in Jute shares. From the middle of next month, the industry would be functioning, as it was until the beginning of this year, with 12½ per cent. of loomage sealed. There is, therefore, **prima facie** reason to suppose that Jute shares should, at least, reach 1955 top levels.

Outlook Bright

In the first six months of this year, Jute shares were inactive. Despite the gradual unsealing of looms, in spite of hopes of heavy Russian purchases, Jute shares failed to move up. As mill stocks mounted, as company reports disclosed declining profits, Jute shares continued to fall. Only as reports circulated that New Delhi was in favour of fixing minimum prices for jute goods was the downward trend in Jute shares halted. These shares started to move up as the reverse process of unsealing of looms started.

In the last few days, Jute goods have moved up. This was only to be expected as a sequel to resealing of looms. Evidently, foreign buyers are entering the market on a big scale in order to purchase their requirements before jute goods firm up further. Simultaneously, raw jute has weakened in recent days. But for the temporary shortage of mill stocks of raw jute, fibre prices would have fallen further. As new crop arrivals continue, raw jute prices may fall further. In the circumstances, the outlook for Jute shares seems to be promising.

Market Factors

It is unfortunate that Tea shares have developed an irregularly downward trend. This is partly due to the poor dividend payments for the last season. In part, it is due to the behaviour of auction prices in the last three weeks. Some are, however, inclined to the view that the market is unduly pessimistic about Tea shares. Admittedly, the 1954-55 boom prices and profits are not likely to be repeated in the near future. But this season's auction prices are not so poor as to discourage investors from taking interest in the market.

At the current phase of the market, conjunctural factors will count. That being so, the immediate behaviour of clearing shares will be watched with interest. In the last few days, speculative shares have developed an irregular trend. Some scrips have consistently moved up, while others have improved occasionally only to slide back later. Profit-taking at higher levels is a healthy development. But, in the absence of any untoward development, clearing shares may remain steady.

Jute, Paper and some groups of Miscellaneous and Engineering shares continue to be firm. But if speculative scrips slide back considerably, cash scrips may be affected. A slight set-back, as a sequel to profit-taking, is widely expected. At the moment, market expectations are that, at lower levels, replacement buying will push equities up again. By next week, it will be known whether market expectations will materialise.

High Pressure Share Pushing

Thursday, Morning

TRADING on the stock exchange was scrappy, due to several holidays. Practically no business was transacted on Monday, on account of Shri Morarji Desai's purificatory fast. Nevertheless, the undertone remained firm, despite occasional profit-taking at the bulges.

Dalal Street has been witnessing for some time past what may be called high pressure 'share-pushing'. A campaign appears to have been instituted for pushing certain scrips, which have yet to be officially blessed by the Stock Exchange authorities. Thus, irrespective of their intrinsic investment value, these scrips have been bought and sold, and the transactions widely publicised in order to sedulously foster the impression that there would be a scarcity of stocks in respect of these shares. In actual fact, however, these scrips have yet to make the grade and win popular support. The consequence of such deliberate share-pushing, especially on sub-brokers and marginal operators may well be serious, since some one will be left to hold the baby. Big and influential operators may not find it difficult to make hay while the sun shines and then retreat leaving, in the event, the small men in the share business holding the baby as it were. In the interest of genuine investment, these questionable high pressure selling methods should be carefully watched and if need be, duly checked.

Among the many new comers Jaypur Udyog, Orissa Cement and Ashoka Cement and lately New Central Jute have come into limelight. Some of these issues, are not listed on the Bombay Stock Exchange. Despite this obvious drawback, they have been finding buyers on the kerb, even at higher levels, thanks to the feeling successfully created in the minds of operators by interested parties that they may not be able to get them so cheap, once they have missed the bus. There are, of course, expansion plans in the offing for these companies and the anticipation of higher dividend, following higher profits. It may be suggested here that operators would do well to take such reports with a pinch of salt, investigate the facts and act accordingly.

Steel section maintained a steady level throughout the week despite some scattered profit taking. Textile shares also ruled firm on sustained buying support.

In the miscellaneous counter, Bombay Burmah, ACC and Scindia were in the limelight with hectic buying. While some reaction followed profit-realising, in National Rayon, fresh interest lifted up prices again to maintain a more or less steady trend.

Investment buying in ACC appears to have been inspired by reports circulating in the market that the Company will shortly launch a new project in collaboration with Vickers and Babcock and Wilcox. The Government has been approached for sanction and negotiations between the interests concerned and the Government are expected to be consummated before the end of this year. The new project is for the manufacture of cement and mining machinery as also of water-tube boilers of high pressure.

The company will have an authorised capital of Rs 20 crores and the working capital of Rs 11½ crores, Rs 7½ crores of which will be subscribed and the balance will be raised as a loan. Vickers and Babcock & Wilcox combined and Associated Cement will have 49½ per cent each of the share capital while the remaining one per cent will be held by four companies, namely Tatas, Killick Industries, F E Dinshaw, Limited and Khatau Limited. The company will have eleven Directors, five representing ACC, four representing Vickers, and Babcock & Wilcox, and two representing the holders of the one per cent share capital.

Bombay Burmah and Mahindra & Mahindra continue to attract attention both from speculators and investors on bright future prospects even at their new high levels.

Cotton

Cotton

Prices Reach Danger Zone

THE bullish phase noticed during the previous week continued uninterrupted on the cotton futures market despite restricted trading during the week under review, due to the intervention of holidays. The quotation has crossed the Rs 700 mark; this has been causing some concern in trade quarters, as on an earlier occasion, Government had intervened and declared the then prevailing contract closed at Rs 700. It is not unlikely, that the authorities may decide on a similar course of action if cotton futures are pushed up far beyond

New India Assc	48- 4	49- 4	48- 4	49- 4

the Rs 700 level. This is one view. There is no reason why prices should not move up beyond a particular level if the statistical position of cotton dictates such a course. That is the other view. Those who incline to the latter view further add that if the Government are convinced that a particular appreciation in price has been brought about by the natural inter-play of supply and demand, there would be no necessity for Government to intervene. They reinforce their argument by pointing out that Government specifically stated early in December last year that it had to intervene because of the speculative rise in prices. As long as there is no speculative rise in prices, the authorities would not interfere with the day-to-day working of the market. In the circumstances, it would not be correct to say that cotton has entered the danger-zone just because the contract has reached Rs 700 mark.

Now it is very difficult, if not impossible, to decide whether or not a given price is speculative or warranted by the actual statistical position. However, if the authorities want to intervene, because they consider a given price, futures or spot, to be detrimental to the interests of the cultivator, or the mills (in the interest of cloth exports), that is a different matter. Such intervention would not be in the interest of regulating forward trading. In the interest of smooth trade, however, it is to be hoped that those responsible for the day-to-day conduct of the market would see to it that operators are safeguarded against possible or prospective official intervention.

The spot market at Sewri ruled fairly firm during the week with some varieties quoting a few points above the official ceilings. This underlined the paucity of quality cottons. It has been pertinently asked whether in view of the scarcity of good quality cotton, Government has been wise in allowing an export quota of Bengal Deshi for 20,000 bales. Even lower grade cotton is getting scarce, and with increasing demand from dealers and spinners, prices have considerably hardened during the week. It may be of interest to note that, since the announcement of the export quota a fortnight ago, the prices of several specific delivery contracts have moved up by about Rs 25 per candy.

Oilseeds

Nervous Tone in Castor

MUCH of the gains recorded in the previous week, were erased as a result of a severely bearish jolt that bears in the castor contract had to suffer. To this bearish onslaught was added nervous bull liquidation. Both bulls and bears had become jittery at the reported re-entry into the market in America of Brazilian competition despite the fact that, initially at any rate, Brazil was reported to have done only a modest business in castor oil.

Another reason that adversely affected trading in castor was the anxiety of operators to get out of the September position in time to escape heavy penalty that might fall on them at the end-of-account. Switch over from September to May was effected during the week on a large scale. As a result, castor September went down while May futures remained comparatively steady.

Company Note

Indian Copper Corporation

INDIAN COPPER have been one of the most buoyant scrips among clearing shares in recent months. Even while clearing shares were slumping, Indian Copper maintained the ground at a high level. Working results of the Indian Copper Corporation, Ltd., for the year to December last explain the firm behaviour of this scrip in recent months. Dividends were raised from 25 per cent to 45 per cent, including a final dividend of 10 per cent and a bonus of 25 per cent. Provisions to the various reserves were higher. Production of refined copper was the highest in the Corporation's history at 7,281 long tons. Exports of Kyanite were higher at 19,234 tons as there were no restrictions on exports.

Satisfactory working results of the Corporation were directly due to the consistent rise in the world price of copper. Maintenance of a high production standard and satisfactory despatches helped the Corporation to attain highly satisfactory working results. World copper prices continued to be high until early 1956. There has since been a considerable decline, and present world copper prices are about 33 per cent below the peak levels. "With the rapid decline in the world price of copper", the directors sound a note of warning", the results for the current year, although so far satisfactory, are unlikely to approach those for 1955".

During the year under review, there has been considerable development in depth in the existing Mosaboni mine through the utilisation of the newly-constructed circular shaft, Development in depth on the scale envisaged at present will permit of extensive lateral development, but only to the extent as will counteract the diminution of ore reserves at the adjoining Badia mine, whose life is limited. Any expansion of output will, therefore, have to come from other areas. That is why, extensive prospecting is in progress to the north of the present working area. Estimated ore reserves now stand at 3,330,090 short tons. In the circumstances of restricted lateral development, this is considered satisfactory. Good progress is being made with development in depth. This should ultimately provide extensive lateral development, ensuring a substantial increase in ore reserves.

In the Chairman's address, enclosed with the annual report, Mr J F E d' A Willis notes with satisfaction that, under the new industrial policy of the Government, existing industries in Schedule A, which includes copper, will be allowed to function within the private sector. Mr Willis concludes that such a policy does not preclude expansion in such industries. The management's confidence in the future is reflected in the capital expansion programme. To bring the issued capital in line with capital employed in business, the issued capital of the Corporation is being increased by a bonus issue on the basis of one for two shares held.

In his address, Mr Willis outlines the Corporation's expansion plans: "In conformity with the underlying principles of the Second Five Year Plan, an extensive programme of prospecting and development has been prepared, and is already well advanced. This expansion programme is aimed at increasing considerably the present output of the mines and whilst no immediate results can be anticipated, it is hoped, provided the results of the present exploitation are satisfactory, that by the end of the present Plan your Company will have substantially contributed towards making India less dependent on imports of this important metal".

Cool filtered water
for office or factory

Tushar' WATER COOLERS

— by the makers of the famous 'Crystal' air conditioner

A 'Tushar' water cooler increases staff efficiency, helps to improve quality of work — quickly pays for itself in goodwill

- **Instantaneous cooling:** Continuous supply of instantly cooled water at the touch of a button — no unhygienic refilling or storing
- **Two models available:** Model R-10, capacity 10 gallons per hour (180 cupfuls per hour); and Model R-40, capacity 40 gallons per hour (720 cupfuls per hour)
- **Easy to install:** Needs only a water supply, a drainpipe and an electric plug point

VOLTAS

Economical to run: Cools to the temperature you choose, then switches off automatically

Silent working–Anti-splash construction–Handsome design

'Tushar' WATER COOLERS

Price-Page Schedule

A GROWING democracy needs a lively press to cater to all sections of the people. This is a prime condition as much for establishing a democratic set-up as for the healthy development of the country and for the success of its Government. In what way the press can contribute more adequately than in the past in creating a healthy mental climate in which democratic values will be firmly established is a problem of great complexity. But the Press Commission which was appointed to examine the state of the press and recommend its future lines of development appears to have been much more perturbed by the economics of the Fourth Estate than by obstacles to its freedom. The latter could be removed by the repeal or amendment of laws, not so the former. How could the existing conditions be changed so that our growing democracy could have a lively Press catering to all sections of the people? The Commission found that in fact the Press in India does not meet these essential needs. The number of papers is wholly inadequate, judged by any criterion. The daily press catered mainly to the urban population and that, too, to the population of cities. Many of the towns with a population of a lakh or more did not have any daily paper.

Out of the total circulation of the daily papers, the Commission found, about 55 per cent was in the capital cities and major towns, which contained only 7 per cent of the country's total population. Out of the combined circulation of 13½ lakhs, 4.7 lakhs was the circulation of the English papers. Again, two-thirds of the circulation of the English papers, and two-fifths of the vernacular papers was confined to the larger cities and towns. Though the circulation was increasing as compared to the past, the daily paper had hardly penetrated into rural India.

The first step, therefore, is to increase the number of papers in the country and make it possible for papers to be started even in small towns, so that a substantial section of the rural population can be made to develop the habit of reading newspapers. How was this to be done? Not that the people were apathetic. The literate households, a sample survey showed, were interested in newspapers, if only they could get them. The Commission was impressed that there was an 'immediate potential' for a very large increase in readership, and this potential was much greater in the rural than in the urban areas. What prevented the rural population—that is such of them as are literate—was primarily the cost of papers and the lack of distribution facilities. To meet these difficulties the Commission did not suggest research in printing techniques in order to bring down the cost of printing, though it devoted some attention to the question of news print. It is the country's dependence on foreign supply in this regard that troubled the Commission more; it was strongly in favour of reducing this dependence by developing news print production in Madhya Pradesh and the solution it suggested for selling higher cost India made news print was State trading and a pool arrangement, to enable Indian news print to be sold with imported news print at equated prices.

For increasing the number of newspapers and the circulation of those which did not have much sale, the Commission looked closely into the means of augmenting the revenue of such papers. How to enable small papers to be started in towns which had none and how are these to pay

their way? The commission did not suggest a Financial Corporation to finance such new ventures perhaps for the good reason that the industry had not yet attained a degree of development where capital could be attracted to it purely as a commercial proposition. The press, taken as a whole did not make money. The estimated profit of investment, from the data that the Commission was able to collect, did not work out even to one per cent per annum. It did not mean, however, that profit earning capacity of newspapers was uniformly poor. Among the concerns making profit, a good proportion earned over 10 per cent on the capital investment.

This led the Commission to what it thought to be the hard core of the problem—the factors leading to and weighing heavily in favour of the large established units, the higher advertising rates still commanded by the English papers, the poor earnings of vernacular papers markedly disproportionate to their circulation. Because the established papers in the metropolitan cities cater to readers who have large purchasing power, they take away the cream of the advertising revenue. And because they have all the money, they can push their circulation by offering much more to the readers as also by very questionable means e.g. undue inducements to their selling agents and restrictive practices, particularly when they run or control a chain of papers, as they often do.

In this race between the big and the small, adequate handicaps have to be fixed for the strong, so that competition may be fair, this was the conclusion derived by the Commission from its study of newspaper economics. Not all units in any industry operate with the same advantages, but such differences cannot be allowed in the Fourth Estate which has special obligations to serve. Hence the recommendation for fixing a price-page schedule, which the Government is now empowered to do under the Bill that was passed by Parliament.

The price-page schedule, the Commission recommended, should prescribe not only the maximum number of pages that could be sold at a fixed price but also the minimum. The schedule remains to be determined. Dr Keskar, however rejected the suggestion that when ready, it should be placed before the Lok Sabha for discussion, and that smaller papers, selling at as 1½ or less per copy, should be regulated only in relation to their maximum and not their minimum number of pages. The powers taken by the Government are wide, but this is only the first round. In the second there is going to be a battle royal, though not necessarily a straight fight, between the haves and the have-nots.

There is little doubt that restriction on the number of pages must impose a severe cut on the advertisement revenue of newspapers. Before the war, the London dailes derived 53 per cent of the total revenue from advertisements; the percentage was even higher for provincial papers. Even after the war, as long as page restriction remained, this percentage did not rise above 25, in the case of London papers, though provincial papers continued to get 45 per cent of their revenue from this source. These figures may be compared to the situation found by the Press Commission in 1951—for the daily papers for which financial data was available—Rs 6 crores net revenue from circulation, and about Rs 5 crores from advertisement.

The unsavoury features of the high pressure competition for circulation in recent years have been the simultaneous publication of the same paper from different centres, largely to support their inflated claim for an all India circulation and the addition of frequent supplements. The Commission hoped that a price-page schedule would make the newspaper less dependent on advertisements and therefore more free. The section of the press which the Commission wanted to help devoutly hopes that it will increase its dependence on advertisements, by inducing some overflow from the bigger dailies to the smaller fry!

Scope for Diplomacy

PRESIDENT NASSER has been wise in his response to the invitation of the Five-Nation Suez Canal Committee. In agreeing to meet this committee, set up by the London Conference, President Nasser has shown his willingness to reach a negotiated settlement of the dispute. If the London Conference has had a restraining influence on Britain and France, credit is due to President Nasser for his diplomatic gestures despite occasional provocation. He has been firm on the basic issue of Egypt's sovereign rights to nationalise the Canal Company. He has repeatedly affirmed Egypt's supreme authority over the Canal. But he has been no less emphatic about his desire to reach a mediated solution of the problem in dispute. In pursuance of this policy, he has announced his willingness to meet the Menzies Committee. There need be no undue hitch over the time and place of the proposed meeting. Though the Committee has expressed its preference for Geneva or Rome, it is willing to go to Cairo to meet the Egyptian President. It should, therefore, not be difficult to fix the place for the meeting which should be acceptable to both sides.

President Nasser has agreed to discuss the Canal issue with the Menzies Committee. His statement makes it clear that he is not unwilling to discuss the plan formulated by the seventeen governments for the Suez Canal. But it would be optimistic to hope that his willingness to meet the Menzies Committee implies his acceptance of the proposals evolved by the majority of the London Conference. In certain essentials, the majority plan, based on the Dulles proposal, differs from that of the Menon formula. There is not any fundamental difference between the majority and the minority plans on the basis of compensation to the foreign owners of the nationalised Suez Canal Company. Nor is there any basic conflict between the two plans on the future profits that will accrue to Egypt from the Suez Canal. Both sides will have to modify their attitudes, but these issues will not prove obstacles to an agreed settlement.

Freedom of navigation through the Canal is an issue on which there is no disagreement in principle. Users of the Canal have the right to demand unrestricted freedom of navigation through the Canal. Egypt accepts this basic international character of the Suez Canal. But the majority of the nations participating in the London Conference demand an international authority for "the control of operation, maintenance and development" of the Canal. Maintenance and future development of the Canal are issues

in which Egypt is as much interested as the users. Unless the Canal is properly maintained and developed the traffic will suffer. This will cause inconvenience to the users, and will be equally harmful to Egypt's interests. Maintenance and development of the Canal raise problems of both men and money. Here, the majority plan's reservations on the future dues for the service of the Canal enter the picture. But the monetary aspect of these issues will not prove an obstacle. There will have to be international aid to enable Egypt to maintain and develop the Canal properly. Money is not the only consideration. Trained men are equally important. There is already a developing crisis over the pilots. Egyptianisation of the personnel of the Canal Company in gradual stages is not an unreasonable demand. Cairo has reasons to be wiser by the Abadan experience. On this issue, Egypt has the sympathy of all under-developed nations.

In the main, the problem is to reconcile Egypt's sovereign rights over the Canal and the Canal Company with the demand of the seventeen nations for an international authority for "control of operation, maintenance and development" of the Canal. It is on this point that the Menon formula differs from the Dulles plan in substance. While the majority plan insists on international control over the Canal, the Menon plan proposes "consideration . . . . . of the association of international user interests with 'the Egyptian Corporation for the Suez Canal'." There are provisions in the Menon plan to ensure freedom of navigation through the Canal without any discrimination against any nation by Egypt. These provisions are, in the ultimate analysis, no less effective than those envisaged in the majority plan. This is one of the main flaws of the majority plan. If Egypt fails to discharge her international obligations, the users will always have the right to appeal to the Hague Court or to the United Nations. Why, then, do the seventeen nations insist on international management of the Canal? Is not this demand a negation of Egypt's sovereign rights? Twelve years hence, the users of the Canal would have had to negotiate with Egypt an arrangement which would have to concede Egypt's sovereign rights while ensuring freedom of navigation, operating efficiency and economic rates for service. Egypt is not unwilling to ensure the future operation, maintenance and development of the Canal with the co-operation of an international advisory body to be formed under the auspices of the United Nations. There is no valid reason why the Canal's users cannot reach an agreed arrangement now on a plan which they will have to accept some years hence.

In demanding international "control" over operation, maintenance and development of the Canal, the seventeen maritime nations are trying to impose a solution which violates Egypt's sovereign rights and interests. This is the crux of the problem. By consenting to meet the Menzies Committee, President Nasser has indicated that he is in a mood to negotiate the major issues in dispute. This is one of the positive results of the London Conference for which America, Russia and India deserve credit. President Nasser's conciliatory behaviour should evoke response from the seventeen nations who have endorsed the majority plan. In the wider interests of peace, there will be hope that the Menzies Committee will not meet President Nasser for issuing an ultimatum, but will have authority to discuss alternative plans for the Suez Canal. There is bound to be stalemate unless the seventeen nations agree to some major modifications in their plan. America and India have a grave responsibility to pursuade both sides to be accommodative so that a compromise plan can be evolved during the forthcoming discussions between President Nasser and the Menzies Committee. Britain and France can remove the threat to world peace by accepting the realities of the situation in West Asia.

Weekly Notes

What Load for Roads?

NOT that some statistics, however phoney and questionable, are always better than none. But how could the Planning Commission think of co-ordinating transport without forming any conception of the magnitudes involved, except for railways? The Railway Board, of course, has always been ready with its figures. The Planning Commission, confronted with the colossal magnitude of the task imposed in the railways, skirted round it adroitly by confining itself strictly to the financial allocations. In the case of road transport or transport by sea—shipping, ports and harbours, not to speak of inland navigation—the physical magnitudes have been religiously excluded. And one can go through the chapter on transport in the Second Five-Year Plan without getting to know either what is the probable size of the total transport needed for the next five years or how this total is proposed to be distributed over the different means of transport. No one will deny the difficulty of making such an assessment, even a hypothetical assessment. But how else can one proceed to judge the country's transport needs and plan development, without some such idea in mind? And yet, the Planning Commission had the benefit of the investigation of the problems of road transport by a special study group.

The Commission has no doubt made some sensible recommendations e.g. that nationalisation of road transport should be suitably phased and that when the State Governments do not themselves propose to operate road transport services, they should not sit on the fence and keep others, who want to operate them, guessing all the time. It proposed that nationalisation of goods transport services, at least, should not be taken up during the Second Plan and that private operators should be assisted in forming 'viable units'. This is already having some effect, as can be seen from the sales and demand for trucks, which have shot up all of a sudden in the last few months.

There are some other useful recommendations also, long overdue, such as that restriction on inter-State services should be removed, that inter-State services should not be doubly taxed and so on. But the obstacles which retard the development of inter-State road transport viz. lack of uniformity in the weights of trucks allowed on roads and bridges, differences in the strength of bridges and culverts —these have not even been mentioned.

The result is some relaxation on carriage of goods by roads, a sudden release of the pent-up demand for trucks, all of which, it is to be presumed, have been reflected in the higher target set for manufacture of automobiles in the Second Plan. The production of trucks, for example, is to be stepped up to 40,000 at the end of the Second Plan from a mere 12,000 at the end of the First. Besides there is also a manufacturing programme for 5,000 jeeps.

Leaving aside some important questions of details, such as what would be the average size of trucks, whether they should run on diesel or petrol, and whether existing production capacity can be or will be adjusted according to needs, in order that the targets may be realised, if 40,000 trucks can be put on the roads at the end of the Second Plan, how much of the estimated traffic would they be able to carry? And to what extent, would the load on railways be taken up by them? To these questions, there is no answer. Planning is not just doing good, removing petty tyrannies on private operators or giving them tax relief, nor is it a matter of constructing new roads for the convenience of the people and general improvement of the country. It is supposed to set up specific tasks and suggest the means for attaining these tasks. Transport other than railways is obviously not being planned that way.

Natural Gas in East Pakistan

IF the natural gas in Sylhet turns out to be as lucky a find as Sui gas in Baluchistan, it should help to transform East Pakistan, which suffers from an acute shortage of power resources. The eastern wing of the State has no coal and its hydro-electric power potential is extremely limited. The Karnaphuli Project has been much publicised, but nothing much has been heard about any other. In the first Five Year Plan, power supply in East Pakistan is to be raised from 67,000 KW in 1955 to 215,500 KW in 1960. The latter may be compared to the present capacity of Bokaro alone of 150,000 KW. This projected increase is the combined total of the Karnaphuli hydro-electric project and of the two steam plants to be set up at Dacca and Khulna.

Welcoming the find of natural gas in East Pakistan as "a gift of God," Mr Zahid Hussain, Chairman, Pakistan Planning Board, said "this opens up the prospects of establishing a fertilizers industry in East Pakistan . . . Steps must be taken during the Plan period to exploit the newly discovered gas reserves . . . . financial considerations will not be permitted to hold up progress in this regard."

General Insurance Pool

WILL the 'pool' continue to distribute general insurance business fairly and impartially among all the Indian insurance companies? The question must be agitating the Indian insurance companies quite a lot, since the Vulcan Chairman thought of raising it pointedly in his speech at the Annual General Meeting of the company last week.

The pool distributes a considerable volume of business. All Government departments as well as semi-Government bodies have been passing on their general insurance business to the pool in the establishment of which the Vulcan played a signal part, the then Chairman of the company, the late J C Setalvad having been principally responsible for bringing it into existence.

There should be no room for doubt, but doubt has arisen, because after the nationalization of life insurance, the Government now owns through the newly set up Indian Life Insurance Corporation those general insurance companies which were subsidiary to the life companies that have been taken over. Is the doubt warranted that through these Government owned companies, the State may widen its hold on general insurance business? It can certainly do so. But if it does, it would virtually amount to nationalizing general insurance business also. The apprehension that it may, must be unwarranted, but since those vitally concerned entertain such apprehension, a clarification and reassurance are both overdue.

Handling Capacity of Ports

ABOUT the only component of transport, besides railways, for which capacities have been broadly sized up is the handling capacity of the ports. Strangely enough, though, no estimate has yet appeared anywhere of the probable volume of cargoes, our ports may be called upon to handle during the period of the Second Plan. There have been reports, of course, of so much cargo waiting to be moved, machinery, equipment and materials like steel and cement awaiting shipment from UK or ports in Western Europe which are not being moved, because shipping is not available. We have also had several cases of bad hold-ups, like the one in Bombay port some time ago of structural steel.

In a conference in Delhi with the Secretary of the Ministry of Transport in the Chair, Shri Ramaswami Mudaliar made the suggestion that the different Ministries should do something about it and phase their import programme in such a manner that imports may move in smoothly according to the shipping available and the capacity of the receiving ports. The difficulty here is not so much for the import of high freight rate cargo, for which shipping is easier to get but for low rated cargoes. This does not directly bother the Government so much as it hits the exporter, particularly the exporter of ores, for example. Now that Government is moving actively into the exports of ores, it should be making its own programme. The exports which move under prior agreement e g with communist countries would, of course, call for special shipping, which has been arranged but what about the rest?

Handling capacity of ports depends as much on the physical capacity as on the ability to utilise this capacity which largely depends on the organisation of dock labour and the efficiency with which loading and unloading is done. In regard to the latter, some improvement has been effected but the bulk of the expansion of the ports provided in the First Plan remains to be effected in the Second Plan period. The Calcutta port, it was officially reported some time ago, had not been able to carry out more than a third of the development projected in the First Plan.

The peak capacity of the major ports is rated at 24 million tons of imports cargo, based on their actual performance in their best years in the recent past, against actual traffic handled during 1954-55 of only 20 million tons. So without any additions or improvements, the ports should be able to handle another 4 million tons, which is the estimate of the average annual imports on Government account in the next five years. The only missing link in this argument is the actual cargo handled last year which is presumably the base year for estimating the additions to import requirements.

The plans of expansion of major ports including Kandla, is for handling 6.75 million tons of additional cargo. The expansion projected is the largest for Visakhapatnam and Kandla being 1.75 million tons each. next come Calcutta with a programme for 1.5 million tons, Cochin 1.25 million tons and Madras only half a million tons. When these expansions are carried out—they are hoped to be completed by 1958, which will be the peak year for traffic during the Second Plan period—the total capacity of the major ports would have increased to 30.75 million tons. If the piece-rate system works the same miracle in other ports as it is reported to be doing in Bombay, a substantial increase in efficiency may be reasonably expected and on this assumption, the Ministry of Transport estimates a total handling capacity for the Indian ports of something like 35 million tons. If this is really achieved, it should be an important contribution, for delay in handling of ships in the Indian ports and the slower turn round of ships which it entails have severely reduced in the past the volume of shipping actually made available to us.

Discordant Note

PRODUCTION on a mass scale being the pre-condition for successful manufacture of automobiles, the types of cars and trucks undertaken for manufacture had to be standardised and their numbers reduced to a minimum. This is what the Government is supposed to have done.

That's why production programmes submitted by so many manufacturers were rejected and licences were refused to those who could not or would not submit a production programme because they found the demand for cars in the country inadequate. The result of restricting production to only three manufacturers for passenger cars has been higher cost and poor quality. The prospective buyer has not much choice for the very good reason, entirely defensible in the larger interest of the country, that a variety of makes and types would not enable us to develop manufacturing in the country at all. Both the manufacturers and the Government have made the claim and given wide publicity to it that so much of the cars that are now being turned out, stated in terms of percentage of the full value, was being actually fabricated in India. This claim, it is not always so clearly explained, is valid only in respect of some and not all the cars and trucks which are supposed to be manufactured in the country. With casual abandon the Planning Commission has put "80 per cent Indian content" against automobiles in the 'Programme of Industrial Development' published as an annexure to the chapter under this caption in the Second Five-Year Plan.

How come then that full page advertisements appear in the daily papers of a 'prestige car', with full air conditioning and the latest and the most luxurious gadgets, which is the product of the recent Studebaker-Packard combine? It does help to assure the long suffering motoring public that we are making much progress in rationalising the production of automobiles, for which it is being called upon to pay, not only exorbitant prices, but is left with Hobson's choice. There is no reason to suppose that the Ministry of Commerce and Industry or its Development Wing would be wanting in casuistry any more than in knowledge of planning technique and if some MP is persistent, he will probably get a double dose of the best of both worlds. The ultimate benefits to the country in terms of foreign exchange, and of precious dollars, of such a minor sacrifice, he will be told—after all imports of latest prestige cars can account only for a microscopic fraction of the total as does the expenditure on amenities in railways or in air conditioning third class coaches—are immense. But if it is also a part of democratic planning that its rationale should be widely understood, so that people may put up with the hardship that planning entails, surely publicity to luxury cars must strike a discordant note?

U S Presidency

THAT Mr Eisenhower would be chosen as the Republican candidate for the presidential election, was never in doubt. Nomination of Mr Nixon as Mr Eisenhower's running mate was more in doubt. There was some opposition to Mr Nixon But he was finally chosen for two reasons. There was no better rival. His association with the Right-wing of the Republican Party may have helped his nomination. Mr Adlai Stevenson's decisive first ballot victory at the Democratic nominating convention is a greater personal triumph. He was not the only possible choice of the Democrats, as Mr Eisenhower is of the Republicans. Despite Mr Truman's opposition, Mr Stevenson has been chosen because the Democrats think that he alone has some chance against Mr Eisenhower. Senator Estes Kefauver is a dynamic personality. As Mr. Harriman refused to stand as a candidate for vice-presidentia nomination, the Senator was chosen as Mr Stevenson's running mate. In their choice, the Democrats have indicated that they are determined to give Mr Eisenhower a tough fight.

Gallup polls reflect Mr Eisenhower's continued popularity. Those who will vote for Mr Eisenhower will not necessarily vote for the Republican Party. It is this personal factor which is against Mr Stevenson. Unless Mr Eisenhower's health deteriorates in the meanwhile, his chances are not much in doubt. Neither Mr Stevenson nor the Democratic Party is unaware of Mr Eisenhower's magnetic personality. There is a possibility that the American voters are less hopeful about Mr Eisenhower's physical condition than his "political" doctors. This may, at the time of the election, tip the scale against Mr Eisenhower. His personal popularity remains. But this time he will be fighting under certain disadvantages. In 1952, his promise that he would bring the "boys" back home from Korea won him many votes. He can make no such promise this time. But his campaigners will surely exploit Washington's policy of restraint on the Suez Canal issue. Mr Dulles's foreign policy may not be popular. But there is wide appreciation of Mr Eisenhower's restraining influence on Mr Dulles.

No doubt the negro problem and the growing farm surpluses will be live election issues. But these issues will not have any decisive influence. There is nothing much to choose between the programmes of the two rival parties. That does not mean that the Democrats will not exploit the mistakes made by Mr Dulles. Also, the present Administration's foreign aid policy is likely to be under fire. But the Republicans will retort that the Eisenhower Administration's home and foreign policies have the general support of the Democrats, as both houses of the Congress have been dominated by the latter. This raises a major issue which may tilt the balance in favour of the Democrats. Achievements of the 84th Congress have been poor mainly because the Administration has been Republican while the Congress has been dominated by the Democrats. Even if Mr Eisenhower is chosen as the next President, the Republicans are not likely to capture the Congress. More intelligent voters may not remain unimpressed by the implications of such a state of affairs.

Ahmedabad

AHMEDABAD has lessons for the people, the Government and Parliament. No thinking person will blame Gujeratis for their demand for a separate, linguistic State. Advocates of Mahagujerat have the sympathy of all those who believe that linguistic States are necessary for the rapid social, cultural, political and economic development of the whole country. But the citizens of Ahmedabad must realise that endorsement of linguistic States does not mean encouragement of violence. It was most unfortunate that some hooligans were permitted to indulge in acts of violence during the meeting at which Shri Morarji Desai broke his fast. Neither Shri Morarji nor the Bombay Government seems to blame those who demand Mahagujerat for the violent demonstrations during the Ahmedabad meeting. But if the ugly happenings during that meeting hasten the realisation that violence can only harm the cause of linguistic States, Shri Morarji's fast will have achieved its moral purpose.

There will be hope that the lessons of Ahmedabad will be learnt so that the movement for linguistic States can be carried on peacefully and without violence. Despite the consent of both Houses of Parliament, Ahmedabad has proved conclusively that the people of Gujerat want a separate linguistic State. Both Houses of Parliament are dominated by Congress. It was, therefore, a foregone conclusion that both Houses would endorse a plan sponsored by Congress leaders and accepted by the Union Cabinet. Pandit Pant has been eloquent about the "fruit of collective wisdom of the two Houses of Parliament". He has hailed the consent of both Houses to the plan for a bigger, bilingual Bombay as a milestone reached in the country's progress towards the goal of an ideal State. But the people and the country hold different views.

Few endorse the Government's solution of the problem of linguistic States. If Ahmedabad is a warning to the people against violence, it has no less a lesson to the Government. There is nothing anti-social or anti-national in the demand for linguistic States. And the people have the right to expect that their legitimate aspirations are fulfilled by a popular, national Government.

Letters to the Editor

Ahmedabad Incidents

I COMPLETELY endorse your views about the Ahmedabad incidents expressed in your editorial 'No mandate from the people' in your last issue. While in Bombay, I was prejudiced against the Ahmedabad protest and from the information I got from the Bombay papers. I was led to believe, like Pandit Nehru, that the Ahmedabad protest was engineered by leftist parties and by those who were losers in land speculation.

However, when I went to Ahmedabad last week, I came in contact with some of the people who were responsible for this protest. And to my surprise, I found that most of them were pro-congress, pro-Nehru and pro-Morarji and that they came from all sections of the Ahmedabad population. They had to protest because they felt insulted and ignored, regarding what they considered to be a vital matter. Some of them therefore tried to give expression to this feeling by going to the Congress House on August 8, and showing their resentment to the local congress leaders. When a big angry crowd gathers at a place, some violent demonstration is to be expected. At the Congress House, too, there was some stone throwing but so far there has been no evidence of anybody having been seriously hurt by this stone-throwing. The Congress leaders, instead of coming out of the Congress House and listening to the people, probably got frightened and it is in the presence of these Congress leaders, if not at their instance, as is widely believed, that the police fired 27 rounds, without any previous attempt at dispersing the crowd by means of lathi-charge or tear gas or such other measure. The Collector and the district superintendent of Police, who were then on the spot, it is said, do not take any responsibility for this firing. The firing resulted in the deaths of about eight persons—all students between the ages of 14 and 22. These police excesses goaded the Ahmedabad people into some violent activity in the following days but on the whole, the entire movement was peaceful, restrained and non-violent. The Janata curfew of August 19 was in fact a very effective and ingenious non-violent device for protesting against the Government acts and decisions. Even Morarji Desai alleges that violence was used on that day in preventing people from going to his meeting. This is far from the truth. Of course, some moral coercion is inevitable in such public movements but there has been no evidence of violence on the part of the volunteers. In fact that the abstention from the meeting was voluntary is proved by the fact that on the very next day about a lakh of people went to the public meeting organised by the student-leaders in support of Maha-Gujarat.

There are two conclusions which emerge from the Ahmedabad incidents. Firstly, the local Congress leaders have no contact with the people and do not represent their views. Secondly, Government violence was absolutely unjustified and was worse than in the days of the British Raj. If both these conclusions be true, one wonders how far we have been successful in establishing a democratic regime in India.

Disguised Unemployment and Economic Development

—A Protest

PROF DASGUPTA in his article in the last issue of your weekly correctly states the thesis maintained by Vakil and Brahmananda in their book 'Planning for an Expanding Economy'. However, later on he goes on to say that the consumption goods multiplier is a myth. This conclusion is arrived at by taking a situation in which the authors' multiplier process is not applicable. Just as Keynesian multiplier does not operate in the absence of 'investment' expenditure, neither does this multiplier. The multiplier process would be non-existent in the absence of a similar increase in the surplus of wage goods. Prof Dasgupta does not prove by his example that the consumption goods multiplier is a myth.

The criticism that even if the unproductive consumers are employed, the wage goods may not be released, if the persons on whom they were dependent increase their consumption, is irrelevant as this case has already been considered by the authors. The consumption goods multiplier then would be zero. The authors' analytical framework is more general than that of Nurkse and with its help it is possible to analyse a situation when the consumption of the worker and that of the unemployed is equal (Nurkse's case) as well as a situation when they are not equal. The authors go a step further and point out what the savings potential would be in a situation when the consumption of a worker is higher than that of the unemployed,

I am surprised at the criticism of the concept of an employable unit by Prof. Dasgupta. A careful reader would have easily noticed that the authors do not add a worker and his consumption. An employable unit is not a sum of a worker and his consumption; a worker together with his necessary consumption forms one employable unit. The use of the word 'plus' is probably wrong; but that in no way justifies Prof Dasgupta's criticism that it is not understandable.

Diamonds in Cold Storage

MILADY would be more horrified than intrigued, if she were told that the shining diamonds resting so proudly on her bosom had been procured through the good offices of the smuggler! Her husband's money and moods are probably all that she knows of the complicated supply line. The chances, however, are 10 to 1 that illicit traffic has put the precious gems into her possession. This is roughly the proportion of all the diamonds that have come to India during the last seven years. The Bombay Diamond Merchants' Association in its memorandum to the Pichamuthu Committee last year testified to the startling magnitude of diamond smuggling. There is little evidence that the pattern of diamond trade has changed materially as a result of official policies announced since. Till 1947-48, India used to import between Rs 2 to 3 crores worth of industrial and ornamental diamonds every year. That year a blanket ban on the import of this "luxury" was imposed. But diamonds continued to flow through subterranean channels. In 1954, Government allowed import of about Rs 75 lakhs worth of uncut or raw diamonds. The import ceiling for polished stones was insignificant and would not exceed Rs 5 lakhs. Actual imports, according to the trade returns, amounted to only Rs 20 lakhs. The annual average has not been higher in subsequent years. Obviously it is more profitable to bring in diamonds without paying any duty at all.

The only known diamond mines in the country—at Panna—are in a state of neglect. "Diamond mining" has been included within the public sector in the new Industrial Policy Resolution and the Government of India has announced its acceptance of the principle of nationalising diamond mines. But nothing has been done to implement this policy.

This disregard of the country's potential wealth is particularly regrettable in view of the effort that the Government has already expended on the assessment of the Panna diamond reserves. The Pichamuthu Committee went thoroughly and ably into the question of the modernisation of the mines, their extension, the system of raising and security. Two Russian experts, again at Government's instance, made elaborate estimates of the reserves and suggested techniques of working them. True, the Panna diamond mines have nothing like the potential of Kemberley or other major diamond producing areas of the world; the proved reserves, however, amount to about 8 million carats in the conglomerate area and much more is expected in the alluvial and the piped zones. A Rs 3-crore scheme, with full scale mechanisation and all-out production, would pay for itself within three years. A more modest plan, costing about Rs 50 lakhs, would set up a number of cooperatives, absorb the 2,000 traditional workers, provide employment to another 4,000 labourers and increase output manifold. At present the production in Panna is worth no more than Rs 5 lakhs annually.

The two schemes are lying in cold storage while the smuggler has a field day.

India may have ceased to produce any diamonds for centuries but her diamond cutting industry had not languished for lack of domestic raw materials. The skill of diamond cutters, the low wages for which they work and the economy with which they carry out their operations constitute a comparative advantage of no mean order in international trade. But this potential source of earnings has been completely neglected, with disastrous consequences for the diamond trade and for a fairly large scale occupation of diamond setters and diamond cutters. Diamond cutters get no work at home—they are not allowed to go abroad. Some of them had migrated to US attracted by the high wages to be earned there. But visas are no longer issued.

This is well-nigh a tragedy. Many years ago, trading estates had been talked of where diamond or synthetic stones could be imported, polished and cut at a low cost for re-export, the entire operation confined to a free trade zone. But nothing came of it.

The difference in quality between an American cut and Indian cut diamond has to be set against the difference in price fetched by these two kinds of stones. And why should Indian cut diamonds always lack the lusture of the American cut stones? Why should native skill, patiently cultivated for generations, lack the aid of modern equipment, with which it can any day give as good an account of itself as that of any other country? But who cares?

* * *

A committee of secretaries of the various Ministries dealing with economic affairs is engaged in a revision of the resources, foreign exchange budget and the allocations made in the Second Plan. It has tentatively come to the conclusion that the foreign exchange requirements will be of the order of Rs 1,500 crores rather than Rs 1,100 crores envisaged in the Second Plan and that, after tapping all possible sources, a hard, unbridgeable "gap" of Rs 500 crores will remain. On the debit side, the cost of capital equipment and machinery to be purchased abroad is rising, the foreign exchange component of the outlay for various projects is expanding, and there is no sign of net private investment of the order of Rs 100 crores during the next five years for which the Plan took credit. On the other hand, India is to receive about Rs 170 crores from the agreement for the disposal of surplus agricultural commodities from US; another Rs 170 crores of American aid under the TCA and similar institutions, if such aid continues at the present rate; about Rs 50 crores from the Colombo Plan; Rs 200 crores from the World Bank and other international agencies; and Rs 100 crores as export credits. Even if, in addition, another Rs 100 crores can be obtained in the form of net private foreign investment, a foreign exchange gap of Rs 500 crores would still remain.

It has been suggested in this connection that India should make better use of the International Monetary Fund for short-term loans. India can apparently borrow upto 75 per cent of her quota in the Fund which amounts to 400 million dollars. She will be obliged to repurchase her drawing of dollars from the Fund when her foreign exchange assets permit; so far India's record has been very clean; we have wiped out all our liabilities to the Fund during the last few years.

A Calcutta Diary

Back Under the Banyan Tree?

THERE is much to be said against, and a little for, the way the Indian society is ordered today, after two hundred years of alien rule. Changes, fewer than we are asked to believe, have been effected since independence; more have been promised. Resistance to change has been feeble, for the assumption holds sway, understandably, that the fewer we have of the foreign importations of the bad old days the better. A less understandable assumption is that all the institutions of the good older days can also be revived, for this is based on an unnoticed contradiction. The imported institutions were able to take root because the older ones had either decayed of their own inanition or, if we must not miss an opportunity of blaming the British, because the foreign rulers had uprooted them. Whatever the cause, the fact is that the British introduced certain institutions in replacement of the old order. Those who want these changed—and this is the place to say that not everyone of them may be equally undesirable—are unlikely to hit upon the right changes without adequate recognition of the facts (a) that things like High Courts, Universities and a centralised administration are there, and (b) that some of the indigenous institutions believed to have preceded these supplanters are dead.

Not as though these phrases are always precise in their meaning, but a great debate has been going on for long whether Indian democracy should begin at the top and seep down to the botton or vice versa. Our knowledge of primitive societies is too little and too speculative for us to assert with any degree of academic honesty exactly how they were ordered; it should not be presumed too easily that power proceeded from the bottom and was not imposed from above. There is incontestable evidence, however, that in more recent times liberal ideas have usually issued initially from the top.

West Bengal, which passed the Panchayat Bill last week, is not the first State to have responded to a demand which had not been heard very distinctly before it was conceded by the legislature. To that extent the Bill conforms to what I have tentatively suggested is the way liberalism progresses; it is a gift from the power elite. The next question to ask must be whether the gift was made in answer to an inner conviction or to what was believed to be the unstated wish of the people. The difference is material, because one is the result of intellectual assertion whilst the other is a submission to what may, or may not, be the popular will. It is no longer necessary to hide the writer's belief that most attempts at democratisation or decentralisation in India have started at the wrong point, the point at which a surrender was considered necessary to an unknown public feeling.

All the deficiencies of the present system are well known. It encourages needless litigation; it delays justice, and justice delayed, we have heard, is justice denied. There is a fruitful field of enquiry as to the extent to which delays and expenses involved in the present judicial system may be eliminated. What the Panchayat Bill, in intent, seeks to do is to set up a system of judiciary which will be expeditious and inexpensive. It is in fact quite easy to ensure both, if not too fine a point is put on what justice is. The functions so far conceded to village panchayats are lacking in definition; we must be prepared for a series of test cases in the next few years; but the basic issue has not yet been faced, let alone answered. Even if it is true that in primitive societies justice was quicker and less expensive, it does not seem to have been established that what was meted out so briefly and inexpensively was in fact justice as we know it today. It can do us no harm to nourish some doubt on this score until there is more conclusive evidence at hand.

In case the basic assumption of this article is not at fault, in case it is true that good ideas usually come from the top, there may be some point in reconsidering our present progress to democracy from the bottom. That the right to do a few things for themselves is given to villagers by the legislature is proof that very many things do come down from the top, but let that pass. The fact is that certain functions hitherto discharged by other agencies are now going into the hands of panchayats. The composition of these bodies will be democratic. There is the very real possiblity that there actions will often be autocratic. There are, let us admit it, factors in Indian life which are not always in conformity with what remains of the concept of democracy. A caste-ridden society where authority tilts heavily on the side of landholders—the correlation between caste and landholding has been a favourite theme of all social anthropologists—has ideas, very sincerely accepted, which are the very negation of democracy. It is under the banyan tree that a village used to meet every evening to hear complaints from aggrieved parties. A sort of justice was done, we may be sure. But can that be the kind of justice we want today, even at the village level? Maybe we do, in which case we should say so and dissolve the High Courts and the Supreme Court. What we cannot afford, no country can, is the luxury of having both the superstructure imposed by the British and the indigenous system.

Although as ignorant as anyone else as to how the panchayats may work out, I have a few generalisations to put forward. I have come to believe that it is only at the higher levels of intellectual consciousness that an Indian feels as an Indian; lower down he is (I am) a Bengali, a Brahmin, an East Bengali and so forth. The same is true of any other man, a Caledonian or a Texan. But what, I hope, India has set out to do is the evolution of homo-Indian—the man who is not a Bengali or a Bihari or a Madrasi, but an Indian.

Have we started the search at the wrong end? Is it possible that, to put it very bluntly, we are good Indians only to the extent that we are not Indians at all? It was not always so; there are men in the Indian civil and police services still who are incapable of thinking in provincial terms. But they are the products of those bad old days of British imperialism. How to produce the free Indian, as distinct from the free Bengali or the free Uttar Pradeshian? Again, the search may have to begin at the top to be fruitful. The panchayats may well give new life, not to dead institutions but, to dormant divisive (let's coin a word) tendencies.

4 Per Cent State Governments Loans

(1)	Government of Andhra ..	Rs. 600 lakhs	Issue price Rs.	99- 8 per cent
(2)	Government of Bihar ..	Rs. 200 lakhs	Issue price Rs.	99- 4 per cent
(3)	Government of Bombay ..	Rs. 750 lakhs	Issue price Rs.	100- 0 per cent
(4)	Government of Hyderabad ..	Rs. 200 lakhs	Issue price Rs.	99- 8 per cent
(5)	Government of Madhya Bharat ..	Rs. 100 lakhs	Issue price Rs.	99- 4 per cent
(6)	Government of Madhya Pradesh ..	Rs. 150 lakhs	Issue price Rs.	99- 4 per cent
(7)	Government of Madras ..	Rs. 1250 lakhs	Issue price Rs.	99-12 per cent
(8)	Government of Mysore ..	Rs. 400 lakhs	Issue price Rs.	99- 8 per cent
(9)	Government of Orissa ..	Rs. 300 lakhs	Issue price Rs.	99- 4 per cent
(10)	Government of Punjab ..	Rs. 200 lakhs	Issue price Rs.	99- 4 per cent
(11)	Government of Rajasthan ..	Rs. 300 lakhs	Issue price Rs.	99- 8 per cent
(12)	Government of Saurashtra ..	Rs. 250 lakhs	Issue price Rs.	99- 8 per cent
(13)	Government of Travancore-Cochin ..	Rs. 200 lakhs	Issue price Rs.	99- 4 per cent
(14)	Government of Uttar Pradesh ..	Rs. 800 lakhs	Issue price Rs.	99- 8 per cent
(15)	Government of West Bengal ..	Rs. 700 lakhs	Issue price Rs.	100- 0 per cent

All the State Governments reserve the right to retain subscriptions upto ten per cent in excess of the notified amount.

All the above loans will be repaid at PAR on 3rd September 1968 except that of the Government of Bombay which will be repaid at PAR on 3rd September 1970.

The loans will open for subscription on 3rd September 1956 and close on 10th September 1956 or earlier without notice as soon as subscriptions approximate to the amount of each issue.

All the loans will bear interest from 3rd September 1956.

Subscriptions may be in the form of CASH/CHEQUE in respect of all the loans.

3% BOMBAY GOVERNMENT LOAN 1956, 3% MADHYA PRADESH LOAN 1956, and 3% MADRAS GOVERNMENT LOAN 1956 will be accepted at PAR for conversion into the new loan of the Government concerned; interest on the securities of the respective loans tendered for conversion will be paid upto and including 2nd September 1956.

3½% TRAVANCORE GOVERNMENT LOAN, 1956 will be accepted at PAR for conversion into the new loan of that Government. In addition to the interest due on securities of that loan tendered for conversion, tenderers will be paid interest at the rate of 4 per cent per annum on the amount of the principal of such securities from 16th August 1956 to 2nd September 1956 inclusive.

Applications for all the loans will be received at the Offices of the Reserve Bank of India at Bombay, Calcutta, Delhi, Madras and Bangalore.

APPLICATIONS will also be received at PLACES WITHIN THE RESPECTIVE STATES as follows:—

(i) At the branches of the State Bank of India and at Treasuries and Sub-treasuries in the case of Andhra, Bihar, Bombay, Madhya Pradesh, Madras, Orissa, Punjab, Rajasthan, Saurashtra and Uttar Pradesh loans.

(ii) At the branches of the State Bank of India in the case of West Bengal loan.

(iii) At the branches of the State Bank of India and at District Treasuries only in the case of Madhya Bharat loan.

(iv) At the branches and treasury pay offices of the Hyderabad State Bank and at Treasuries and Sub-treasuries in the Hyderabad State in the case of Hyderabad loan.

(v) At the branches of the Bank of Mysore Ltd., in the Mysore State except at Bangalore and at Taluk Treasuries in the Mysore State at places where there is no branch of the Bank of Mysore Ltd., in the case of Mysore loan.

(vi) At Treasuries and Sub-treasuries only in the case of Travancore-Cochin loan.

Copies of Notifications and Application Forms may be obtained at any Receiving Office.

From the London End

Capital Consumption and Net Investment

THE Central Statistical Office has now for the first time estimated the value of the nation's resources which are annually absorbed to cover depreciation and obsolescence of the stock of fixed capital. In the Blue Book on *National Income and Expenditure*, 1955 the C S O have been able to estimate what is termed "capital consumption" and *consequently of the movement of net* fixed investment in the country since 1938. These official estimates, though generally lower than those made in *the independent* surveys, are sufficiently large to drive home the view that in industrial societies a significant share of the national output is required even to maintain a static position.

The difficult problem of statistical method and derivation of data of *what constitutes the annual* value of capital consumption has been solved by making certain arbitrary assumptions and by adopting some *simple accounting* conventions. The length of life of fixed assets was assumed and resort was made to the "straight line" accounting method of calculating depreciation so as to apply a constant rate over the assumed life of various classes of *fixed assets.*

The Blue Book details the levels of capital consumption in various industries and goes a step further in introducing a new *concept in national* accounting — "productive net investment". This term covers the value of net investment excluding expenditure on house construction. The main conclusions that can be drawn from all these estimates can be summarised as follows:

(i) Total net investment in the *U K had recovered* to 93 per cent of 1938 by 1950; it fell in the next two years but passed the 1938 level in 1953. *In 1955 net investment* reached the peak—37 per cent above 1938 and 87 per cent above *1948.*

(ii) *Net investment in* plant and machinery was already 37 per cent above 1938 in 1948, and by 1955 was 152 per cent higher *than in* 1948.

(iii) *Net investment* in housing has not in any year been as high as in 1938. In 1955 it was some 88 per cent of the level reached in 1938.

(iv) As the stock of capital assets has grown, so too has capital consumption: in 1955 it was 40 per cent higher than in 1938 and 29 per cent higher than in 1948.

(v) Net fixed investment as a *proportion* of national income was 6 per cent in 1938 and in 1948-55 but rose to 8½ per cent *in* 1955.

While 46 per cent of the value of fixed investment constituted real growth in 1938, the position in the period 1948-55 is less satisfactory. In the last eight years, only 41 per cent of Britain's aggregate fixed investment covered *net additions* to the nation's stock of capital assets.

The Blue Book data give a somewhat greater sense of urgency to the concern that has been expressed *that the size of the* United Kingdom's net investments in recent years has not been large enough to allow British industry to effectively compete with West Germany, the United States and other industrial countries in the world markets. And here some of the severest critics of the current credit squeeze have used *these fears as* sufficient argument favouring their view. Mr R Harrod recently declared that the *maintainance* of the squeeze may result "in a marked slackening of investment decisions and eventually of *physical investment* itself". A similar view has been expressed by Professor Kahn. And yet both these economists recognise the dilemma which such a view presents in a situation which exhibits inflationary tendencies. The problem ultimately resolves itself into one of a choice of economic policy or more *particularly*, of selecting the sector of the economy which is to be squeezed for the purpose of diverting productive *resources* to investment. Macmillan s "pipe-dream" in the nature of a "sensational cut in defence expenditure" has now certainly been made to look like a pipe-dream by the Egyptian situation. The other sector, which in some people's eyes has just been touched (through the hire purchase restrictions) is consumption. And here, the wealth of *statistics provided* by the Blue Book does show the possibilities which exist for limiting consumption further.

The Treasury has used the National Income data to derive certain *indices of labour costs in industry* and of productivity. It shows that while wages and salaries rose by 10 per cent between 1954 and 1955, productivity (wages and salaries per unit of output) increased by only 4 per cent. When this rise in labour costs is assessed in relation to the general economic situation, two points stand out. *First, there exists* either more scope in industry for raising productivity or alternatively a levelling up can be achieved by cutting down on labour costs. In both cases a substantial addition of *capital equipment per worker in in*dustry is necessary. Secondly, there appears to have been no comparable increase in labour costs in Western Germany. A recent report by the Board of Trade suggests that between 1950 and 1955 labour costs in manufacturing industries rose by more than a quarter in the U K and *only about 2 per cent in* W Germany. From 1954 to 1955, while they rose substantially in the U K, in W Germany they appear not to have risen at all. And here again the answer seems to be disparity in the levels of capital investment in the two countries. Thus while net investment in the U K has been rising in *the post-war years*, it is clear that it has not been rising sufficiently fast to enable productivity to match labour costs. This remains the *most important* single problem in the British economy.

U K CAPITAL ACCOUNT

	1938	1948	1954	1955
	(£m at 1948 prices)			
Gross Investment	1,559	1,435	2,004	2,161
Less Capital Consumption	835	904	1,119	1,169
Net Investment	724	531	885	992
	Per cent of Gross Fixed Investment			
Capital Consumption	54	63	54	59
Net Investment	46	37	46	41

Book Review

Openings for British Capital in India

India—A Survey for British Industrial Firms By S Garvin: Federation of British Industries, July 1956. Pp. 49, Price 4s. 6d.

INDIA'S five year plans have made not only her own people conscious of economic development; it has made foreigners increasingly aware of the investment opportunities in this country. There are two changes, from the pre-independence days, pulling in opposite directions, which affect foreign investments. On the one hand, investment opportunities are perceptibly larger than in pre-independence days, making India a favourable field of investment, both Indian and foreign. On the other, investment is subject to much greater control and regulation than in the pre-war days.

India's requirements of foreign investment under the Second Plan are placed at Rs 800 crores. This is also the measure of its foreign exchange gap in the next five years. This requires, on the part of the Government of India, a vast public relations job in foreign countries to make known our requirements and the conditions subject to which they can be met. This task is partly eased by reports of foreign missions on Indian conditions. The one man survey by Mr S Garvin, formerly of the ICS, sponsored by the Federation of British Industries puts India's case for foreign investment more effectively than any Indian Government-sponsored publication could have done.

Mr Garvin says that the terms offered by India to foreign investors are fair—they have the right to remit profits and rapatriate capital, subject to the availability of exchange; they would be paid fair and equitable compensation on nationalisation; they would not be discriminated against in relation to Indian enterprises; and majority control by Indians would not always be insisted upon. He thinks that under these conditions investment should depend on the relative profitability of investment in foreign countries and in India.

The rate of foreign private investment, however, has been pretty low in recent years, compared to expectations and possibilities. There are many reasons for this. Firstly, conditions in the prospective capital exporting countries have been unusually favourable. Investment prospects in India do not offer the necessary premium to induce the foreign investor to run the additional risks inherent in exporting capital. Secondly, the balance of payments position of most of these countries has not allowed sizable capital exports. Thirdly, foreign entrepreneurs have not been enterprising enough to take advantage of the opportunities that India offers and to start production in India. Finally, the investment climate in India has not been very helpful in the past few years—despite the assurances of the Government, which Mr Garvin so assiduously enumerates. The Government of India's bite has been less bad than its bark. As Mr Garvin notes, Delhi has an empirical approach.

In the case of U K, many of these factors have operated with particular severity to restrict U K private investments in India. Though Britain has been trying for the last five years to attain a sizable export surplus, in fact she has been a net borrower from her colonies. Prices in U K have been comparatively high and Britain's salesmanship unaggressive, largely because of the cushioned home market. There have been complaints against British industry of non-supply of spare parts, long delivery dates, and inadequate technical help—complaints which Mr Garvin passes over. Britain's share in foreign investment in India is likely to be smaller, partly because in the past the British were the only investors in India and partly because they were India's rulers and an official discrimination always existed in their favour. The climate in India for U K investment would still remain favourable. U K enterprises still enjoy a preference, (even Pandit Nehru's 1949 statement devotes a special paragraph to British investment), the momentum of the past is likely to be carried over to the immediate future (for example, in replacement of machinery imported from the U K), the British have experience of investment in India and India has not discarded English yet. Thus, despite a relative setback in British investment in India, there are circumstances favouring it.

Mr. Garvin makes an important distinction between the successors of the past British investors in India with their old world outlook and entrepreneurs and managers with a more modern outlook. The former, concentrated mostly in jute and plantation industries, are out of touch not only with modern India but with modern Britain—they would be as uncomfortable in post-war Britain as they are in India today. On the other hand, the new entrepreneurial and managerial class coming to India understands the need for, even if it does not approve of, the restrictions on profits and entrepreneurial freedom and tries to work within them. Unfortunately, it is the feudal section of British entrepreneurs which is in control of the representative organisations of British trading interests. Their activities are likely not only to dissuade British entrepreneurs who are thinking of investing in India; they are also likely to lose the goodwill for British interests which Mr Garvin saw in abundance.

An aspect of foreign investment which has not received sufficient attention is its impact on Indian business interests. While foreign enterprises have been initially diffident in pioneering manufacturing activity in India, they have not hesitated to offer competition once Indian enterprises have been set up. It is significant that the cycle, sewing machine and typewriter industries were started in India by Indians, and the traditional foreign suppliers, with their inmensely superior resources, have come in later. Again, where foreign collaboration has taken place the price has been set more often at an amount equal to foreign price plus import duty, while prices of Indian products manufactured by Indian enterprises have generally been lower. Moreover, foreign collaboration has not always been wisely chosen. It should not be forgotten, however, that foreign investment in India, whatever its size, is only marginal. If it scares away Indian investors, the harm it will do is likely to over-shadow its beneficial effects. Any policy to encourage foreign investment in India must take account of these factors.

Official Papers

The Plan for Industry

Programmes of Industrial Development; GOI Planning Commission. Manager of Publications, Delhi. pp xxi 439.

THIS report on industrial planning for the Second Five Year Plan is essential for anyone interested in industrial development in India—the development that has occurred in the First Plan, and the development projected for the Second Plan. As such it fleshes out the general chapter in the "Second Five Year Plan" that deals with industrial growth, by analyzing in detail the major industries of India and the specific projects for the expansion of those industries.

The bulk of this report is a detailed analysis of 51 industries in India with both discussion and statistics summarizing the growth of each during the First Plan, and the plans for further expansion of each under the Second Plan. These chapters (each devoted to an industry) present estimates of consumption for each industry, targets of production and capacity, investment requirements for the projected expansion, requirements of raw material and labour for achievement of the industry plans, as well as discussion of current problems of each industry, obstacles in the path of expansion, and government policy towards each. It would be impossible to summarize these chapters further, and it need only be said that for anyone interested in any of these industries this is a basic source of information.

Apart from this detail, however, this document is also of general value in highlighting, far more clearly than the "Second Five Year Plan", the general framework of industrial achievements, industrial planning, and government policy with respect to industry in India. The concentration of this document upon industry makes far more clearer than the much more general discussion of the Second Five Year Plan what has been achieved by, and what is planned for, industry as a whole. This review will summarize these general highlights as they strike the reviewer.

(1) By and large, with a few relatively minor exceptions, Indian industry is operating at levels close to full capacity at the start of the Second Plan, in sharp contrast to the start of the First Plan.

(2) The private sector succeeded in achieving its overall investment targets with respect to new projects. The public sector however lagged behind. In both sectors however, where there was underfulfilment, the conditions which held back the fulfilment have apparently been successfully met.

(3) The level of exports achieved was well below projected targets in the First Plan and since foreign exchange availability is a major problem in the Second Plan the necessity of expanding exports and approaching the very approximate targets is clear. In connection with this the discussion of the cotton textile machinery industry brings out sharply the necessity for further modernization if costs are to be reduced in the competitive struggle for markets. Planning for expansion of this industry includes an annual replacement of 3,000 ordinary looms by automatic looms per year. This will bring the industry up to the level of automatization of weaving that existed in the United Kingdom in 1953—a level far below that of Western Europe, Japan, and the United States. Obviously this problem of automatization is a major one, not only to the cotton textile industry, but to the machinery industry and to the whole foreign exchange position of the economy.

(4) This report makes explicit the considerations that went into the fixing of consumer goods targets for the Second Plan Period and it is worth while quoting these specifically. These targets, except for those for rayon and staple fibre, have been fixed "solely with reference to estimated demand and have not been limited by the need, real or supposed, to place restraint on consumption so as to conserve resources for other purposes." At the end of the Second Plan, "with the possible exception of the cotton textile industry, policy in regard to which is still under consideration, there is at present no reason to doubt that the existing capacity.... will be fully adequate to meet all foreseeable demands" for consumer goods.

This is of crucial importance and interest. It makes it clear that in the planning in India, unlike the planning in the U S S R or China, or the planning that occurred in the West during the war, there is at present, at least for planning purposes, no question of the necessity of a choice between capital goods and consumer goods. Rather there is the feeling that both will be available to the required degree at the end of the next Plan period.

The question can be raised as to whether, with the anticipated shortfall of capital at the end of the Second Five Year Plan, some adjustment of targets to capital resources by reducing projected investment in less essential industries might not have been desirable in the planning process?

(5) This may however be achieved indirectly. It is made clear that the targets for industries "other than those for heavy industries like iron and steel requiring very large investments" and definite contract commitments; are extremely flexible. It is stated that they are subject to increase (and it must presumably mean to decrease also) depending upon the availability of other facilities "such as power and railway transport". This permits adjustment in consumer goods targets depending upon capital availabilities and the system of priorities stated in the Second Five Year Plan.

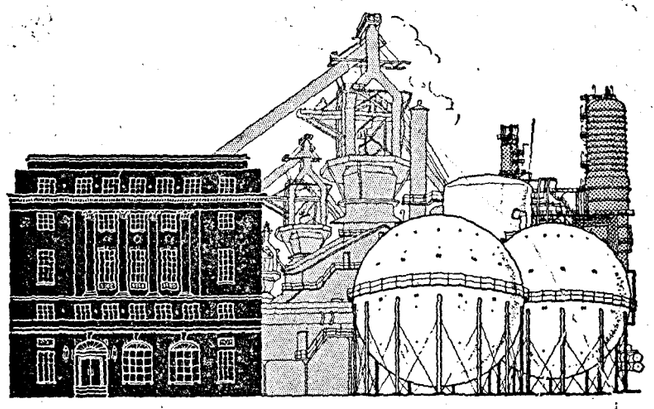
(6) It is of major interest to both India and other industrial countries that the Planning Commission envisages India as an exporter both of steel and of certain types of industrial machinery at the end of the Second Plan period.

(7) This report, with its detailed listing of projects by industries, brings out more clearly than other reports on the Second Five Year Plan, where discussion is in generalities, the character of the 'mixed economy'. While of the projected total investment in industry of

UNITED ASIA

International magazine of Asian affairs, 12, Rampart Row, Bombay 1, India.

about Rs 1100 crores, about 50 per cent is in the public sector and 50 per cent in the private sector, the greatest proportion of the public investment is only in a few of the 51 industries reviewed—by far the largest share in iron and steel and far smaller shares in fertilizer, lignite and several heavy machinery industries. In terms of number of industries, the consumer goods industries are left entirely to the private sector, while many of the capital goods industries will also see large expansions by the private sector.



Investment by the Government appears to be limited largely to fields where private investment could probably not supply the necessary funds (as in iron and steel), or as by-products of larger government multi-purpose projects (as the fertilizer works) or in a few industries considered strategic. In fact, the Government's approach to entering industry seems to be limited by highly pragmatic considerations which set bounds to the theoretical goal of a "socialistic pattern of society."

Up to now this review has been largely summary. However, one specific question may be raised concerning the discussion of individual industries. It is clear that in the approval of specific plans for expansion, the question of the "economic size of the unit" within an industry is an important consideration. While this is not defined, it is apparently a cost concept—i.e. at a certain size cost is at a minimum; and furthermore, a lower cost is often related directly to the increasing size of the unit. Apart from difficulties in estimating cost, it is questionable whether economic size has much meaning apart from the demand conditions existing at the time. For example, with present shortage and projected demand for cement and paper over the next 5-10 years, even relatively small mills may prove highly profitable and be able to recover their investments within a 5-10 year period.

The restriction of licenses to units of 'economic size' and frequently relating economic size directly to physical size makes it extremely difficult for new and smaller entrepreneurs to enter an industry. If only businessmen capable of financing the larger units are allowed to enter an industry, this will tend to restrict expansion of an industry either to existing firms within the industry or to a small group of entrepreneurs capable of raising the capital for the larger units. With the interest of the Indian Government in decentralization of industry and economic power, the question might be raised as to the applicability of the dubious criterion of "economic size" to the granting of licenses.

As a final statement, the reviewer would repeat that this is an essential document to anyone interested in the industrial growth of India during the period from 1950-1960, and provides basic data with respect to a large group of specific industries.

Arthur Lewis Looks at Economic Growth

Daya

THE central fact about economic growth, defined as the growth of output per head of population, lies, according to Prof Lewis, in an increase in investment from 4 or 5 per cent of the national income to 12 or 15 per cent per annum. (The Theory of Economic Growth. W Arthur Lewis. George Allen & Unwin 1955.) It is only such a stepping up of the rate of investment that can increase the national income by 3 per cent per annum, assuming the capital income ratio to lie between 3 to 1 and 4 to 1. The growth of output per head of population, however, is also a function of the rate at which these heads are growing. In many of the countries of Asia, this rate is between 2 and 3 per cent and, thus, such an increase in investment is necessary if these countries are to maintain even their already very low standards.

The increase in the rate of investment means a corresponding increase in the rate of savings. It is usually considered difficult for a poor country to achieve such rates of saving because of its poverty. But, according to Mr Lewis, the argument is generally gratuitous as there is always a substantial minority which, in these countries, receives a large share of the national income which it could use for productive investment instead of conspicuous consumption. In Puerto Rico or Ceylon, for example, the top 10 per cent of income-receivers squander 40 per cent or so of the national income, living luxuriously on rents. The trouble, therefore is the attitude of these rent-receivers who treat it not as capital for investment but as revenue for consumption. In short, it is the lack of the capitalist attitudes whether in the case of the private entrepreneurs or the governments of these countries which hampers the process of economic growth in them.

The stepping up of the rate of productive saving depends on an increase in the share of national income of those economic groups which have the highest propensities to productive investment. The landlords, the peasants, the labourers and the salaried middle classes do not share the propensity to any very large extent. It should be noted in this connection that savings have no very direct relation to the income that a particular person enjoys. It is more a function of the economic group to which one belongs rather than to the income that one receives. It is only the entrepreneurial capitalist class or the governments undertaking the capitalist function that remain as the groups which can do the most productive saving in an economy. It is, therefore, the share of profits in the national income that has to increase if we are to have economic growth in an under-developed economy.

The problem of the state vs the private entrepreneur in the field of economic development takes on a new aspect if we analyse the proportion of capital investment between various sectors of the economy. The gross fixed investment in advanced industrial countries is typically apportioned between the various sectors as follows:—

	(per cent, approximate)
Housing	25
Public works & utilities	35
Manufacturing & Agriculture	30
Other commerce	10
	100

The importance of public investment in relation to private investment will depend, therefore, on the fact whether the state assumes responsibility for providing public works and utilities on the one hand and housing on the other. It should be remembered that the less developed countries need, in fact, a higher percentage of investment in these fields as they require both an established framework of utilities and a housing programme for the increasing urbanisation that inevitably accompanies economic development. The investment, therefore, in these fields, would have to be more than 60 per cent in at least the first decades of development in these countries.

It is generally agreed that public works and utilities such as roads, docks, transport, water, electricity, schools, hospitals, government buildings etc. should be under public ownership whether at the municipal, state or central level. The responsibility for low-cost housing for labourers and the salaried employees of the state and central governments is also more and more accepted as a public responsibility. It, therefore, seems inevitable that a large proportion of investment has to be made in the public sector, whether anyone likes it or not.

The state, then, has to be the crucial investor and saver in the economic growth of under-developed countries. It can also create new investment out of deficit financing. In such a case, however, the government has to see that the inflationary process, which is the inevitable result of deficit financing, redistributes income in favour of the classes that save. Inflation, in fact, has such a tendency. It raises profits relatively to other incomes, and stimulates investment in fixed capital formation. A little inflation, thus, increases profits and speeds up the rate of capital formation. Inflation, however, is merely a substitute for taxation and the choice between them is mostly political in character. The effectivity of inflation for economic development would, however, depend on the relevant answers to the following questions:

(1) Who will get the inflationary profits, and what will they do with them; spend them on consumption, speculate in commodities, create new fixed capital, hoard them or buy government bonds?

(2) Can the output of consumer goods be expanded rapidly, or will the first stage of inflation be too long?

(3) Is it the kind of economy where prices of essential goods can be controlled easily, without a great growth of black markets?

(4) Is there a strong trade union movement, which will turn a demand inflation into a cost inflation?

(5) Can the foreign exchange situation be safe-guarded?

(6) Is there a high marginal rate of taxation mopping up fifty per cent of money income as fast as it is generated by inflation.

These six questions posed by Mr Lewis, in the context of considering inflation as an instrument of economic growth, are of special interest to India as it is embarking on a fairly high rate of deficit financing in its Second Five Year Plan.

The answers to most of them are in the negative and, thus, it becomes imperative that a positive answer be sought for the second question which, in fact, is the key to the whole problem. As Dr B V Krishnamurthy has argued in his paper on 'The Mahalanobis Plan' in Studies on the Plan Frame published by the Indian Committee for Cultural Freedom, active steps should be taken to step up the production of those consumer goods which do not involve the use of scarce resources in the economy.

The increase in the share of profits in the national income, which is the inevitable accompaniment of economic development, engenders economic inequality, at least, in the first instance. The governments committed to economic equality quickly realise that they cannot simultaneously have both, equality and economic development. The case of the USSR is the classic one in this connection. It is difficult to combine equality with incentives and with a high level of saving. Even if the State takes over completely the saving function, "the process of economic growth demands that there shall be adequate differentials for skill, for education, for risk bearing and for willingness to take responsibility". Whether it be the super-capitalistic economy of the USA or the super-socialistic economy of the USSR, the differential rewards as incentives for work remain the key motivations of the economy.

The pioneering role of the state, particularly in backward countries where the quantity, quality and the risk-bearing propensities of the private entrepreneurs are deficient, is recognised by Mr. Lewis. But he is quick to take notice of the fact that "governments may retard economic growth by showing excessive zeal for regulating the economy". Unless a large amount of initiative is left to the private people, the economy is bound to suffer. If, for example, "more initiative had been allowed in the U S S R, the quality of the services received by consumers would have been much better, for the same resources, and agricultural output would have been much larger". The contrast with Japan which achieved the same high level of capital formation without the Soviet level of inflation is illuminating in this respect.

In fact, the Soviet method has proved the most inefficient for raising the productivity in agricultural field. In spite of collectivisation, mechanisation and state farms, the yields per acre are miserably low and have not shown any significant increase over the Czarist times. The backward countries can increase their agricultural productivity by one per cent per annum, if they choose to do so. Japan, in fact, raised its productivity per acre between 1880 and 1920 at a cumulative annual rate of 1.3 per cent per annum. But such an increase would require, at least, an expenditure of one per cent of national income (not of government expenditure) per annum on agricultural and allied research. Mr Lewis not merely highlights the necessity for the allocation of such research funds, but shows that it will be an extremely productive investment, since it is almost equivalent to a return of fifty per cent per annum, assuming that the agricultural sector accounts for fifty per cent of the national income.

Mr Lewis exhaustively surveys the psychological, institutional, technological, demographical, political and economic factors governing the process of economic growth. However, he does not develop any unified theory and has a feeling that such a theory in the present circumstances cannot, perhaps, be developed at all. In spite of this distrust in a generalised theory, he singles out three crucial factors which are relevant to economic growth. These are:

(1) the will to economise,

(2) the increase in technological knowledge, and

(3) the accumulation of capital.

Any thing that favours either of these conditions will automatically function as a factor favouring economic growth. Leaving aside the Will to economise which is the foundational factor in economic development, the problem of technological knowledge is relatively less important for underdeveloped countries as they have mostly to take and adapt it from countries that have already discovered it. As for the third factor, the crucial point is the capital-output ratio which, if we are to believe Colin Clark's recent article in the **The Eastern Economist**, Mr Lewis has put rather too high. In fact, as a very large part of investment goes into the building industries and as the relative costs in this field are rather low in underdeveloped countries, the capital-output ratio may be lower than Mr Lewis has postulated. However, the repeated warning of Mr Lewis against the bottleneck arising from a shortage of skills in the building industries does not seem to have been substantiated by India's experience in the First Five Year Plan.

The limitations of Mr Lewis' book are the limitations of his definition. He is only concerned with growth as the increase of output per head of population, even if it is accompanied by the mass of the people becoming poorer or with an actual decline in the consumption levels of the people. The tacit assumption is that no relevant differences are made to the will to economise, the problem of saving, the capital-output ratio, the types of skills and the knowledge required in the two different cases where the ends of economic activity are so radically different. He is, of course, in good company in making such an assumption. Hardly any economist thinks otherwise. But we suspect that the assumption needs to be proved rather than assumed. Sociologically, the confusion is disastrous—particularly in the case of a person like Mr Lewis who cares equally for the wider perspective of philosophy and the practical need that makes men ask precisely what to do next. Both the philosophical perspective and the practical need, about which he has written so well in his 'Preface', demanded that a distinction should have been drawn on the very first page and the investigation carried on its terms. That Mr Lewis has not done so, shows the tight hold that traditional categories can exercise on even the finest minds of our times.

Financial Control
—No New Set-up Yet

(From A Delhi Correspondent)

WHILE the Comptroller and Auditor General's role in Government's financial and accounting set-up is likely to come in for increasing criticism in the near future, thanks to Paul Applebey's latest castigation of audit, the controversy over financial control set in motion by the Chanda Committee's report two years ago seems to have died down. The acrimony with which this subject was debated in the past is no longer there. The Finance Minister's exit from the Treasury bench, albeit on a different issue, has removed from the scene the stoutest defender of orthodoxy and precedent. The way is now clear for certain positive steps to be taken in reforming the outmoded system of financial control. It will be timely, therefore, to review broadly the steps taken by the Government in this respect and to see how the new machinery is working. In doing so one need not go into the theories of financial control and the points at issue between the old school and the new, but only examine the developments which have taken place of late.

It has now been decided that the system of financial control should be gradually made to conform to the British pattern, which, among other things, envisages a system of internal financial advice rather than advice from an external authority far removed from the needs and requirements of the Administrative Ministries. As there are not at present enough Finance Officers to bring internal Finance into existence, it has further been decided that as a first step, an officer of the Finance Ministry should be attached to every Spending Ministry, who will be provided with accommodation and other facilities by the Ministries concerned and not by the Ministry of Finance as at present. These Finance Officers have been designated as Deputy Financial Advisers instead of Deputy Secretaries in order to emphasise their new advisory role. They will, however, continue to be under the administrative control of the Finance Ministry and the only change which has taken place is in regard to their physical presence within the administrative Ministries. Expenditure schemes are submitted by spending Ministries to these Finance Officers for concurrence throughout the year. The Finance Officers in their turn have to submit important cases to higher officers in the Finance Ministry, such as, the Joint Secretary, the Secretary or the Finance Minister himself. Without the concurrence of the latter, no expenditure can be incurred by the spending Ministry except in certain matters for which powers have been delegated by the Finance Ministry. These delegated powers relate to the creation of temporary posts up to those of under Secretaries, expenditure on contingencies, expenditure on entertainment and write-off of losses on stores up to a certain limit. The delegation of financial powers, though only to a limited extent, removed the grouse of the administrative Ministry that even in petty matters like the recruitment of a peon, sanction had to be taken from Finance in the past.

The immediate consequence of attaching a Deputy Financial Adviser to each spending Ministry has been a reduction in the volume of work of that officer. Formerly, it was not uncommon for a Deputy Secretary of Finance to look after the expenditure of two or even three Ministries with the result that he was over-burdened with work. The situation is now entirely different and the Deputy Financial Advisers in some of the spending Ministries do not have enough work to keep themselves busy. This, however, may be a purely temporary phase. The idea behind attaching a Deputy Financial Adviser to each Ministry was that he should be associated with every expenditure scheme right from the inception, instead of being presented with the final scheme for financial concurrence. If this idea is put into practice and the Deputy Financial Adviser is increasingly associated with the formulation of schemes he will not have to remain idle for long. But as yet there is no manifestation of any willingness on the part of the administrative Ministries to associate the Financial Advisers with schemes at the stage of formulation, so that differences may be ironed out at the initial stage. Old habits die hard and unless the Ministries concerned show greater willingness and enthusiasm to take the Financial Advisers into confidence, merely attaching these officers to them is not going to achieve any positive results.

The Deputy Financial Advisers will, no doubt, ultimately become the internal Financial Advisers on the British model, the broad features of which are well known, thanks to the Chanda Committee's report and the controversy which followed. But how and through what stages the change over is to be effected, not much thought seems to have been given to these questions as yet. However, a Committee has been set up with the Finance Secretary on the Revenue and Expenditure side, the Cabinet Secretary and the Director of Organisation and Methods, as members and it has been entrusted with the task of finding out ways and means of establishing full-fledged internal finance. A period of two years has been fixed as the time limit within which this new set-up is to come into force.

Though the installation of Deputy Financial Advisers has not meant any substantial change yet the spending Ministries seem to have developed a superiority complex vis-a-vis Finance. They consider the Government's decision to establish internal finance as a signal victory for them and since no expenditure can be incurred by any Ministry, as of old, except with financial concurrence, they are agitating for a more thorough-going delegation of financial control than would be vouchsafed by internal finance under the British pattern. There are matters relating to establishment and services in which the spending Ministries have to deal with the Establishment Division of the Ministry of Finance directly and not via the Deputy Financial Advisers. The Ministries are now trying to bring Associated Finance into the picture even in these matters. Obviously these Ministries are ill-advised and in their eagerness to steal a march over Finance, they are now trying to go to the other extreme. They have to be reminded that in the British system there is a separate branch of the Treasury specialising in establishment work and studying questions of staff, etc. Obviously in service and establishment mat-

ters and in the interpretation of rules and regulations the Finance Ministry cannot afford to have any difference of opinion with Associated Finance. Even when a system of complete internal Finance is brought into being, the Establishment Division will remain as a separate Department within the Finance Ministry to deal with all establishment matters coming from the various Ministries. It is pointless to agitate for more powers to be given to Associated Finance in regard to these matters.

In a note appended to the Central Government Audit Report (civil) 1955 Part I, Shri A. K. Chanda has examined two inter-related issues: delay in the execution of projects and surrender of funds. While the latter problem, according to the Comptroller General, is not so serious and could be brought within control, the delay in the execution of projects is more fundamental and calls for a solution. Shri Chanda's contention is that delay in execution arises mainly in connection with new projects, for which financial requirements have to be submitted to the Finance Ministry sometime in October for the ensuing financial year. Schemes formulated are incomplete in detail for various reasons by the time the budget is prepared. Though the Finance Ministry is responsible for ensuring that the schemes for which allotments are made have no undesirable features from the financial point of view, such a complete scrutiny is not possible at that stage. Therefore, "the Administrative Ministry have, at various stages and in varying measures of detail, to approach the Finance Ministry again and again for sanctions." The scheme is badly held up for this reason and sometimes the appropriation given on the basis of the tentative scheme lapses.

This detailed examination by the Finance Ministry involving details of all kinds "generates unnecessary heat and controversy which results in avoidable delay in the execution of the projects." Shri Chanda's main proposal is for the elimination of this detailed financial examination by the Finance Ministry and its replacement by a system of dual financial control. "Overall financial control, with reference to financial policy and principles, should continue to vest in the Finance Ministry," says the Comptroller's note, "but detailed scrutiny of proposals at expert level should vest in the administrative Ministry by installing 'balancing personnel' within the Ministry." This is the genesis of the change in the financial set-up which has been outlined above.

To bring out the advantages of the new scheme, Shri Chanda gives three reasons why the present system is wasteful: (1) schemes are drawn up at present without sufficient technical advice and are therefore immature; (2) spending Ministries tend to feel that they should overpitch their demands since in any case they would be whittled down by the Finance Ministry; and (3) delay in obtaining sanctions adds to the cost of the project as overhead and standing charges have to be incurred during this period of comparative inactivity.

The other change proposed by the Comptroller and Auditor-General is to provide the Ministries with competent technical advice so that there may be a reasonable and accurate assessment of spending capacity, through possible changes in the industrial advisory set up and the Development Wing of the Ministry of Commerce and Industry. In this way, the technical soundness of the scheme can be tested before its submission to the Finance Ministry, which may be followed by a further check by technical experts of the Planning Commission. Once budgetory sanction has been accorded on this basis, a reference back to Finance should be necessary only if there is any appreciable change in the scope of the scheme or if the provision made is likely to be exceeded by more than 5 per cent. This will also mean a quicker disposal of schemes even at the initial stages. But no move has yet been initiated for closer association of technical advice.

Company Meeting

The Vulcan Insurance Company Ltd. Bombay

Abstracts of the Proceedings of the Thirty-sixth Annual General Meeting

THE following are abstracts of the proceedings of the Thirty-sixth Annual General Meeting of the shareholders of the Vulcan Insurance Co. Ltd., held on Friday the 24th August 1956.

The Chairman Sir Behram N. Karanjia Kt., before dealing with the Company's activities during the year referred to the great and irreparable loss suffered by the Company by the sad and untimely death of Shri Mangaldas B. Mehta in January last and paid a great tribute to the late Shri Mangaldas who was a Director of the Company for about 20 years and Chairman of the Company after the death of Shri J. C. Setalvad in 1951 and said that Shri Mangaldas was a tower of strength to all his colleagues on the board and his wise guidance was of great value and assistance in the presen growth of the Company.

Sir Behram N Karanjia thanked his colleagues on the Board for having elected him as the Chairman of the Company and hoped that the same confidence would be placed in him as had been done in the late Shri Mangaldas and Shri Setalvad in carrying out the responsible and onerous work of the Company.

Referring to the Nationalisation of Life Insurance business by Ordinance issued by the Government in January last he said it had been the most important event affecting the Insurance industry although it did not affect directly the Company's transacting General Insurance business.

Categorical Assurance Needed

While nationalising Life Insurance business Mr. C. D. Deshmukh, the then Finance Minister made it clear on behalf of Government that the Government had no intention to nationalise General Insurance industry. He however said that they were aware of the malpractices in the General Insurance business and if there was no significant improvement, the Government might have to reexamine the question. Such constant threat made it difficult for Companies to plan and organise their working ahead to meet their responsibilities of handling much larger business and cope up with the rapid industrialisation taking place under the second Five Year plan. Therefore Sir Karanjia urged the Government to make a categorical assurance that General Insurance industry will remain in private sector like many other industries so that the Companies can conserve their resources and go ahead with their future programme of expansion and development. He suggested that the Government through the Executive Committee can set standards with a view to prevent any unhealthy practice and requested all Insurers to co-operate in order to make the working clean and sound.

Reinsurance Corporation

He further referred to the Reinsurance Corporation which is shortly coming into being and said that it would be a source of strength to the national economy as it would save a lot of foreign exchange. He added that our Company would be one of its promoters having agreed to subscribe to the share capital Eighty per cent thereof would be in the hands of Indian Insurers and twenty per cent in the hands of foreign insurers. It will try to build up reinsurance relations in foreign countries.

He informed that the Head Office building under construction would be ready for occupation early next year if not by the end of the year.

While discussing the question of dissolution of the Indian Insurance Companies' Association Pool he said:

"Another question which has been seriously disturbing the Insurance trade as a whole is that Government intend to dissolve the Indian Insurance Companies' Association Pool and pass on that business to the three Companies which are subsidiaries of the newly established Life Insurance Corporation. You are aware that your late Chairman and Founder of the Company Shri J. C. Setalvad, played a very important part in the formation of the 'Pool' by which the insurance business emanating from the Government and semi-Government sources was secured for all Indian Insurance Companies through the 'Pool'. In view of the declared policy of the Government that whenever in an Industry where both the private and public sector bodies are functioning, the Government will, it is hoped, adopt a non-discriminatory attitude in its patronage because after all both are indigenous and deserve the support of Government irrespective of who owns it or manages it. The Central and States Government business which was catered for by the 'Pool' has been distributed in an equitable manner between all the Indian Companies. In fairness and equity, therefore, the Government should continue to distribute the 'Pool' business amongst those Companies as was done hithertofore instead of giving preference only to Companies which are now owned by the new Life Insurance Corporation and thus do justice to the insurers in the private sector as per their declared policy and I appeal to the Government not to exclude the Companies working under the private sector from getting the benefits of the Government business but to continue the present distribution of the said business of 'Pool' undisturbed".

Increase in Premium Income

Referring to the Accounts he said that there had been an all round increase in the premium income in all the departments; the expenses of management and commission however showed a slight increase which could not be avoided.

After providing the Reserves for unexpired risks at 50% in the Fire and Miscellaneous departments and 100% in the Marine department and additional reserves as shown in the department, the Company made a profit of Rs 4,07,448 in the fire department, Rs 17,533 in the Marine department and Rs 38,677 in the Miscellaneous department. He pointed out that a slight change was made in the presentation of the Balance Sheet as a result of eliminating some of the Reserves under various headings which had been transferred to one account as 'General Reserve' amounting to Rs 12,80,000 and departmental reserves aggregate Rs 22,85,246|-. The total profit in all departments amounted to Rs 4,63,678 which he said will be considered satisfactory.

The income from Investment showed steady increase as the market value thereof is well over book

value; however the Directors considered it prudent to write off Rs 24,733 as depreciation on investments that have actually depreciated. As already stated in the report the investments have been written down to book value or market value whichever is less and the amount standing to the credit of Investment Reserve is now transferred to General Reserve.

The total income from interest, dividends and rent after deduction of Income tax thereon amounted to Rs 2,23,775.

After making necessary provision for other expenses, loss on sale of investments etc., a sum of Rs. 6,78,470 has been transferred to Profit & Loss Appropriation Account subject to taxation. A provision of Rs 5,60,000 has been made in the Profit & Loss Appropriation account as Reserve for taxation for the assessment years 1955-56 and 1956-57.

Total net premium income from all the departments has increased to Rs 32,04,151 against Rs 30,09,583 in the previous year while the total Reserves of the Company including the departmental Reserves amounted to Rs 36,22,250 against Rs 34,14,614 in the previous year, that is about 113.04 per cent of the premium income of the company.

In response to the requests of several shareholders at the last Annual General Meeting, the Directors recommended an increase in dividend to Rs 1-4-0 per share from Re 1 in the past. The Chairman said that shareholders would find the working of the Company satisfactory showing and maintaining good results.

Bonus to Staff

In view of satisfactory results two months salary by way of Bonus was granted to the Officers and the members of the permanent administrative staff. He placed on record the appreciation of the work done by the General Manager, officials and staff both at the Head Office and Branches and by the agents and field workers.

Shri Gulabchand N. Shah a shareholder of the Company associated himself in expressing tribute paid to the late Shri Mangaldas who regarded the Company as his own. He congratulated the Company for maintaining good results and increasing dividend and said that this is one of the few Companies in India which can be regarded as a truly well established concern. He welcomed the new Chairman and hoped he would give fruitful service to the Company for years to come.

Shri Gulabchand made a request to consider issuing Bonus shares in view of the Company having built up General Reserve of Rs 12,80,000 apart from other Additional Reserves against Paid up Capital of Rs 15,99,270 and the Chairman replied that the suggestion would be considered by the Board.

In view of the hand bills handed over to some of the shareholders by some members of the Staff it was inquired of the Chairman as regards increase asked for in their emoluments. It was replied that it was already being considered and needful would be shortly done.

The report and accounts were adopted. Dividend of Rs 1-4-0 per share was sanctioned. Sir Behram N. Karanjia, Kt., and R. B. Seth Rajkumarsingh Hukamchandji were re-elected Directors. M/s N. M. Raiji & Co. were appointed Auditors and Bonus was sanctioned to the Officers and Administrative Staff.

From the Chair

The Tata Iron and Steel Company Limited

Speech of the Chairman, Mr J R D Tata

THE following is the speech of the Chairman, Mr. J. R. D. Tata to be delivered at the forty-ninth Annual General Meeting of the shareholders of the Tata Iron & Steel Company Limited, on Thursday, 30th August, 1956.

Ladies and Gentlemen,

Much has happened, since our last Annual Meeting, to confirm the views on economic trends to which I had given expression in previous speeches. You will recall that in these speeches I had, apart from dealing with events and problems directly concerning our Company, taken a great deal of your time in sharing with you my hopes, doubts and fears about some of the economic policies of our Government. In particular, I had sounded a note of warning against some developments which seemed to me to threaten the balance of the mixed economy to which I thought we were committed: for instance, the trend towards a highly centralised form of State "capitalism"; the nationalisation of Life Insurance; the use of ordinances as a means of implementing economic policies; the frequent recourse to constitutional amendments; and some of the provisions of the new Companies Act.

While pointing to the dangers inherent in such developments, I had consistently made it clear that free enterprise in India unreservedly accepted the national objectives of increased production and equitable distribution and was anxious to cooperate with Government in the building of a practical Welfare State in which state enterprise and free enterprise joined hands in the common task.

Concentration of Economic Power

If I took such pains to elaborate my views on these matters, it was not only because I felt that they were of vital interest to you as shareholders of this Company, but also because I hoped, that what I had to say might perhaps have a hearing in quarters where policy was fashioned. While I do not wish to waste your time in any repetition of views previously expressed, I feel I must reiterate the concern with which I and many others view the ever increasing centralisation of economic power in the hands of Government.

Nearly fifty years ago Woodrow Wilson said:

> "The history of liberty is the history of the limitations of governmental power, not the increase of it. When we resist ... concentration of power, we resist the powers of death, because concentration of power is what always precedes the destruction of human liberties."

We are witnessing in India an uninterrupted growth of Governmental power in the economic field and are already well on the way to a strange and unnatural combination of political democracy and economic autocracy. The question that should agitate the minds of all of us is whether our political freedoms can long survive if our economic freedoms continue to be whittled away. Once all economic power is centred in Government, will it not be found equally necessary to curtail other freedoms in the interests of the people? Although there may be no danger that the able men in power today, motivated as they are by democratic ideals, will abuse their powers, history shows that the danger lies in the very existence of unlimited power which may one day fall into less worthy hands.

Nationalisation of Life Insurance

The extent to which Government's economic powers can be exercised was strikingly demonstrated during the year by the sudden nationalisation of Life Insurance. Although spokesmen of Government have stated in the past that ideology played no part in the formulation of their economic policies, it is noteworthy that, during the debate in Parliament on the Life Insurance Corporation Bill, the then Finance Minister said:

> "There was no need for Government to make out a case that private enterprise had failed in order to effect nationalisation. Nationalisation could be justified on grounds of ideology and philosophy."

This statement, coupled with the fact that every practical object which the Government sought to achieve could have been secured without recourse to nationalisation, must lead to the conclusion that political or ideological considerations were largely responsible for the measure and that they are likely to motivate future economic decisions. The fact that in normal times Government should have invoked emergency powers to implement this decision by ordinance, without first consulting Parliament and sounding public opinion, cannot but add to one's uneasiness.

State Trading

Another cause for apprehension lies in the recent entry of the State into the field of trading. During the brief period of its existence, the State Trading Corporation has already taken over or entered trading in a number of important commodities and through its operations Government are in a position to exercise powers of control over the whole field of industry even more sweeping than those they already possess.

Private Sector's Performance

We are told that in India capitalism has failed to deliver the goods, that it has shown no initiative and that it cannot in an economically backward country like ours produce the dynamic results obtained in the highly developed economies of the West. So, it is argued, it must be replaced by socialism which, alone, can produce results. This view seems to overlook a number of facts such as that the Private Sector has fulfilled and in some cases exceeded its production quotas under the first Five-Year Plan; that private enterprise in India has not up to now had the freedom of action and the incentives it enjoys in the countries where it has proved so strikingly successful; and that there is enough evidence available that the introduction of socialism of the kind, and by the means, contemplated in India has not proved an unqualified success in other countries. Still, even if we accept the premise that the magnitude and urgency of the task in India render its

performance beyond the capacity of free enterprise alone, the correct solution, which until not so long ago seemed to have been accepted by Government, lies in a mixed economy in which both free enterprise and State Enterprise are harnessed to the country's needs.

I feel the charge that free enterprise in India has shown no initiative in recent years is particularly hard to take. I for one am in fact surprised at the amount of initiative displayed considering the discouragement and disincentives to which it has been subjected. While saying this, it is only fair that I should acknowledge the help and advice which industry in the private sector has received in recent years from our dynamic Minister for Commerce and Industry. It is a measure of the man that his socialistic views have not prevented him or his Ministry from extending assistance to industries in need of it for purposes of agreed schemes of development. Without his encouragement and quickness of decision, our Two Million Ton Project might not have come into being or would still be at the stage of discussion and correspondence. We are grateful to him for his support.

Indian industry needs no compulsion to induce it to collaborate with Government or to make its full contribution to the economic development of the country. It is prepared to take the necessary risks and to make the necessary sacrifices, but it asks to be left in reasonable peace to do his allotted job.

Indian Companies Act, 1956

Instead, the restrictions from which it suffered in the past have been aggravated by the new Companies Act. While the many wholesome provisions enacted for the protection of the investor are to be welcomed, the strait-jacket into which the Act places Management goes beyond all reasonable requirements. Those of you who have taken the trouble to study this Act will appreciate the waste of time and energy caused by a number of its provisions as illustrated by the thirteen pages of the notice and its annexure in this year's Report as compared to the one-page notice in previous years.

The Act has gone to extraordinary lengths in its attempt to regulate the operations of joint stock companies, including such provisions as those pertaining to family relationships, of which no less than eighty-six degrees, both legitimate and illegitimate, have been covered in the relevant section. The Act is not only the cause of much waste of time and enrgy but also of much avoidable expense. In a country in which there is such a dearth of administrative personnel—in some places a total absence of it—to care for the basic needs of the people in the countryside, it is sad to see so much administrative machinery and expenditure diverted to such relatively unproductive ends.

Agreement on National Objectives

To sum up this part of my speech, let me say that we all realise that since Independence our Government have performed a tremendous task. Faced with an unprecedented array of political, economic and social problems, they have discharged with ability, devotion and success an appalling burden of responsibility. We also realise that their task in the coming years will remain a formidable one; that the success of India's plans of economic development is essential to the future prosperity and happiness of our people. We in the industrial and business field are therefore at one with Government in their objective of a prosperous, democratic and happy nation emerging from the years of toil ahead. Where we differ is in the respective roles of the State and of the individual in the economic activity of the nation. We sincerely feel that some of the Government's policies are based on economic theories on capitalism and socialism which no longer fit the facts, if ever they did. They seem to ignore the lessons of the social and economic experiments undertaken elsewhere in the world during the last few decades; for instance, the fact that, apart from the U.S., countries in Europe which have relied largely on free enterprise and given it the necessary support and encouragement, have achieved not only economic prosperity but also, through realistic fiscal and administrative measures, the socialist dream of an equalitarian Welfare State.

Financial Results

Coming to matters of more direct and immediate concern to us, you may wish me to amplify the brief reference in the Report to the profits and to tell you something about the progress of our expansion scheme and also about the important understanding we have reached with the Tata Workers' Union which was widely publicised in the Press.

The financial results of the year's operations were characterised by a decrease of Rs 34 lakhs in disposable profit largely due to lower sales of ferro-manganese and by the large accretions—exceeding Rs 4 crores—to the Plant Rehabilitation and Development Fund and the Development Reserve under Government's new retention price scheme. No ferro-manganese was produced during the year under review and as a result the tonnage despatched was some 10,000 tons less than in the previous year. We have upto now been making ferro-manganese in our blast furnace plant and primarily for our own consumption, only the surplus being sold. For operational reasons, ferro-manganese is made intermittently and sales have therefore been themselves intermittent. Last year's sales were exceptionally large. Once the electric ferro-manganese plant which we are now in the process of building at our Joda manganese mines is completed and in operation in the latter half of 1958, ferro-manganese will no longer be made in the blast furnaces, the whole capacity of which will be reserved for the manufacture of pig iron. Some of the output of the Joda plant will be for sale, but in view of our greatly increased requirements for steel making, the tonnage available will be relatively small until the plant's capacity is increased.

As shareholders will have noticed, the amounts set aside this year for Plant Rehabilitation and Development and to the Development Reserve exceed the corresponding provisions of the previous year by nearly Rs 3 crores, of which Rs 2.28 crores represents the net increase in retention prices after taxes and Rs 68 lakhs the additional tax saving on the Development Rebate. The increase of about a crore in the provision for taxes is itself mainly in respect of the additional price element.

Ever since the war we have protested both to the Tariff Commission and to the Government of India against the excessively low retention prices enforced on the steel industry, which made it impossible for the industry to set aside monies for development or to attract fresh capital. We pointed out that the difference between the retention prices and the imported prices amounted

each year to a figure which far exceeded the total value of protection received by the industry during the whole of the seventeen years in which protective duties were imposed. We are happy that at long last Government have adopted a price policy which has enabled the industry to undertake a large-scale expansion.

The Development Rebate granted from last year for tax purposes, in accordance with the recommendation of the Taxation Inquiry Commission, will provide out of tax savings a further valuable source of development finance. We are grateful to Government for their realistic policies which will result in immense benefits to the country in the years to come.

Two Million Ton Programme

Our expansion scheme, although still largely at the preparatory stage, made considerable progress since the last Annual General Meeting. I then stated that the preliminary studies made of the proposal to increase our ingot capacity from 1.3 million tons per annum, which we expected to reach on the completion of the current Modernisation and Expansion Programme, to two million tons, indicated that the project was sound, could be completed within three years and would require about Rs 60 crores to be spent on the new plant.

Our main efforts in the subsequent months were directed at the two principal objectives of entering into the necessary engineering, construction and purchase contracts and of securing the funds required to finance the project.

Appointment of Kaiser Engineers

The technical preparations were completed in record time. It was clear from the start that to complete a project of this magnitude and complexity under three years would require a high degree of co-ordination of its various parts and phases for which it was essential to place under a single organisation the responsibility for all the engineering, procurement, construction and supervision services. We therefore entered into a contract with two Divisions of the Henry J. Kaiser Corporation of Oakland, California, known for their industrial and engineering experience and their ability to get things done quickly.

Even while the agreement with Kaiser's was being negotiated, much of the preliminary work was begun and worldwide inquiries sent out for the major items of plant and machinery included in the programme. The first orders for the principal items, such as the three main rolling mills and electrical equipment, were placed as early as March 1956. A group of Tata engineers were sent to Oakland, the headquarters of Kaiser's, and a Kaiser team began to be built up at Jamshedpur from February 1956. Today some 55 members of the Kaiser Organization are already at work in Jamshedpur and their number will grow to about 100 at the peak of construction activities. The Indian work force engaged on the project will similarly grow to a maximum of 6,000 men.

The completion of the entire project in a matter of two and a half years will be an unequalled achievement in the industrial field in India. While Kaiser's may have under-estimated some of the local problems and difficulties, we have every hope they will be able to adhere to their time-table.

Rail and road transport difficulties, bottlenecks in steel fabrication and congestion in the Calcutta Docks are amongst potential sources of delay which will require constant and sustained attention. On the other hand, our chances of completing the job in time are improved by the co-operation and assistance extended to us from the start by the Ministry of Commerce and Industry and also by the Finance Ministry in general and the Exchange Control Department of the Reserve Bank in particular, in the expeditious disposal of innumerable applications, requests and references submitted to them. We are grateful to them all for their assistance.

Project Cost

With the disposal of the main technical issues of the project, the procurement of the large funds required to finance it became the main subject of attention and effort on our part. In my speech last year, I mentioned a figure of approximately Rs 60 crores as the estimated cost of the new plant. This figure was based on rough estimates which proved commendably accurate, as the final figure including contingencies now comes to Rs 62 crores. This, however, represents only the estimated cost of the new plant itself, including the cost of all the work and services entrusted to Kaiser's. In addition, a certain amount of related work has to be undertaken departmentally b Company. This includes such t as site clearing, modification existing shops and mills to tie t into the Two Million Ton P gramme, the provision of roll stock and other items. These w cost a total of approximately Rs crores, spread over a period of fo years upto and including 1959-6 In addition, approximately Rs 2.6 crores will be spent on the collieries and ore mines and quarries to meet the added requirements of the expanded programme, and about Rs 2 crores on the electric ferro-manganese plant, to which I referred earlier in my speech. The total thus comes to Rs 75 crores, which, however, does not represent the full measure of the Company's estimated capital expenditure during the five years from April 1955 to March 1960, as it does not include such items as the cost of completing the current Modernisation and Expansion Programme, annual renewals and replacements, our investments in the Indian Tube Company and a new refractories company and other ancillary schemes.

World Bank Loan

I stated in my speech last year that a good part of the moneys to be spent on the new plant would have to be raised in the form of a loan from abroad. In consultation with the Government of India, who kindly agreed to sponsor an application to the International Bank for Reconstruction and Development popularly known as the World Bank discussions were initiated with the President and other officials of the Bank in February this year. These were followed by detailed negotiations and the presentation of a formidable mass of data, and finally by the signature, on the 26th June 1956, of an agreement for a loan of 75 million dollars, equivalent to Rs 36 crores, in various currencies and on the principal terms mentioned in the body of the Report. A striking aspect of this loan from which we may well derive satisfaction, is the fact that it is the largest loan granted upto now by the World Bank to an industrial undertaking anywhere in the world and also the largest single loan granted for any purpose to any country in Asia.

While it is true that the loan is guaranteed by the Government of India, the financial strength and credit-worthiness of the Company, painstakingly built up by the conservative financial policies followed

all these years, was a major factor in the Bank's ready acceptance of our proposals.

One aspect of the negotiations with the Bank which I should like to mention is the remarkable speed at which they were conducted and concluded. We are thankful to Mr Eugene Black, the distinguished President of the Bank, and to his associates for so kindly expediting, in response to our request, the detailed and complex procedures which the Bank normally follows in disposing of loan applications. Their co-operation was, I believe, another reflection of their confidence in the Company and its Management.

This loan and the additional share capital, for the issue of which you passed the necessary resolutions earlier this year, will provide us with about Rs 50 crores out of the Rs 75 crores required for the Two Million Ton Programme. The balance of about Rs 25 crores will be secured from retained earnings accruing to the Plant Rehabilitation Fund and the Development Reserve between 1955-56 and 1959-60 and, from further borrowings. The funds required to finance the other items of capital expenditure, to which I have referred earlier in my speech, will be met largely from internal resources and borrowings.

Agreement with the Union

A brief reference has been made in the Report to the conclusion during the past year of a comprehensive agreement between the Company and the Tata Workers' Union. This Agreement, which seeks to place the relationship between the two parties on a still firmer foundation of goodwill and mutual security, sets out the rights and obligations of the Company and the Union and records agreement on a number of outstanding issues. A special feature of this Agreement was that it contained an important declaration of intention to bring about a closer association of employees with Management in the working of the industry.

Association of Employees

In furtherance of that provision, the Company and the Union subsequently held further discussions and reached complete agreement on the subject. Under a Supplemental Agreement signed on August the 4th, the considerable machinery already in existence at Jamshedpur for joint consultation will be rationalised and, with the exclusion of matters concerned with collective bargaining or grievance procedures, will be brought within a three-tier structure of Consultative Councils. These will be set up for all departments of the plant, for the Works and the Town as a whole, and finally, at the top Management level where a Consultative Council of Management will provide a meeting ground for consultation and for an exchange of views on the general working of the Company and the industry. While the functions of these Councils will all be of an advisory character and Management will remain, as before, in control of the Company's affairs, due weight will naturally be given to the views and recommendations of the Councils.

The subject of associating employees with Management is admittedly a difficult and controversial one. It has been the subject of considerable attention and discussion on the part of Government and the Planning Commission who have expressed themselves in favour of the principle, and also of the Joint Consultative Board of Industry to whom the task of formulating specific proposals has been entrusted.

The question whether the Company should not have waited until an all-India policy had been evolved on the subject was discussed by the Company's Board who ultimately decided to ratify the draft agreement. This decision, which I am convinced was right, is in consonance with the accepted view that freely negotiated agreements are much to be preferred to imposed settlements. The Agreement was negotiated in a fine spirit of mutual frankness and co-operation and represents an honest attempt to devise means of understanding each other better and working closer together. I have every hope that it will prove workable in practice, provided both parties respect the intentions recorded in the Agreement and try to read into its provisions neither more nor less than they contain. This will apply particularly to the Joint Consultative Council of Management.

So far as we are concerned, we shall not seek to fetter the discretion of this Council in discussing such matters as will enable its members, and particularly those representing labour, to acquire a better understanding of the industry and its problems. At the same time, the Company has no intention of surrendering its managerial functions and responsibilities. I for one do not believe in the concept prevalent in some labour circles that factories, whether owned by the State or by shareholders, should ultimately be handed over to workers who would provide both the labour and management of the enterprise. In my opinion, such a view is both unsound and impractical, and its pursuit can only lead to barren disagreements and ultimate disillusion.

The Management of mechanised industries is becoming more and more complex and requires increasingly high standards of technical and administrative experience and competence. Any worker, however humble his beginnings may have been in the industry employing him, should have the opportunity of rising in the organisation, his progress being determined by merit and his ability to discharge his allotted responsibilities. But this obviously implies that at a certain stage such a worker leaves the ranks of labour and becomes part of Management. This is a very different proposition from that of handing over the management of a factory to the workers collectively.

I hope therefore that time and energy will not be wasted in a fruitless pursuit of the concept of workers' management which is unworkable, except possibly in very small-scale industries run on co-operative lines.

Having said that, I should perhaps mention that somewhat different considerations may apply to functions concerned primarily with the fulfilment of individual and social life within the industrial community as distinct from functions and activities directly concerned with production, sales, finance or administration. Jamshedpur is for our employees a place in which to live as well as to work. The Jamshedpur community is now nearly half a century old. Many of its members were born, have taken up jobs and founded families there, and I believe there is ample talent, interest and civic sense to be found among them which could be harnessed to constructive and responsible work of a civic nature. For instance, many of the activities of the city could well be guided by its own citizens within clearly laid down budgets and procedures. So long as the Steel Company furnishes the funds required for running the town, it would naturally retain financial control. Real democracy works from the roots up and we, as a Company, should welcome and encourage opportunities to develop

the democratic qualities involved in collective work selflessly undertaken in the interests of the community.

To sum up, I feel that in entering upon these agreements with the Union, we have crossed the threshold of a new era of co-operation and goodwill in our relations with our employees at Jamshedpur. We have not undertaken this experiment in a vainglorious desire to be pioneers or to set ourselves up as an example to others. We have done so in a spirit of humility.

We have already come a long way in developing sound industrial relations at Jamshedpur for which I feel both the Management and the leadership of the Union deserve credit. We have not by any means solved all our problems; discipline, morale and productivity are not yet what they should be. No doubt, our standards of management themselves can be further improved; but I think it can be said that the present Management of the Company and of the Union have the will to co-operate for the good of the industry and the country as a whole. I am confident that with this background the experiment is well worth trying. If we succeed, nothing but good can come of it for all concerned, including shareholders and employees. If we fail, little harm will have been done so long as the failure will not have been due to lack of goodwill.

We shall in the next few years have many difficult problems to face as a result of the expansion of our plant and operations. I believe the burden will be the lighter for its being shared by those who work for and with us.

Ending on this note, I should like on your behalf to thank all the members of our Management, staff and labour force throughout the Organisation for the excellent work they have put in during the past year.

Note: This is not a report of the proceedings at the above Annual Meeting, of which proceedings a separate report will be published.

Company Notes

Sen-Raleigh

WORKING results of Sen-Raleigh Industries of India, Ltd., for the year to September last were so satisfactory that it was possible for the Company to declare a maiden dividend of 6 per cent. on its ordinary shares. Profits for the year were higher. Besides the maiden dividend, provisions to reserves were also higher. Allocations to general reserves and for depreciation were appreciably higher. Even so, the amount carried forward was Rs 20,690 against a debit balance of over Rs 6 lakhs brought in.

Proposed expansion plans of the Company include the manufacture of freewheels and addition to production capacities. According to the directors, the amounts available from the paid up capital and borrowed funds would not be adequate to finance these development projects. Negotiations are in progress with the Industrial Finance Corporation of India for a further loan of Rs 15 lakhs. Means are under consideration for getting the remainder of the issued share capital subscribed.

In his address before the sixth annual general meeting of the Company, Mr S K Sen, the Chairman, expressed satisfaction over the production targets for the bicycle industry during the second Plan period. The development Council for Bicycles suggested a target of of 1.25 million bicycles to be made in India by 1961. This target has been accepted by the Planning Commission. Sen-Raleigh, the Chairman was confident, will play a prominent part in the fulfilment of the second Plan as it has done in the first.

To enable Sen-Raleigh to play its proper role, the Company has applied to the Government for increases in its production capacity. It is proposed to raise production in the bicycle wing to 200,000 bicycles and in the component wing to half a million sets of components. Plans for such expansion are under active preparation of the Company.

Welcoming the acceptance by the Indian market of Indian bicycles as the mainstay of the trade, Mr Sen was somewhat critical of the "fairly liberal" import policy of the Government. Liberalisation of imports did not affect the sales of home manufactures to any great extent, although the imports brought down the profit margins to the imported bicycle range. "If, however, the experiment is continued," Mr Sen issued a note of warning, "it may endanger production by the Indian industry, and care should be taken by the Government in framing future import policies so that the expanding industry is not affected adversely."

India Paper Pulp

WORKING results of the India Paper Pulp Company, Ltd., for the half-year to March last were good. Profits increased. So it was possible to allocate enlarged amounts to the various reserves. The dividend was maintained at 7 per cent. Half-yearly accounts have been issued by the Company hitherto. According to the provisions of the Companies Act, 1956, annual accounts will be issued in future. But, circumstances permitting, half-yearly dividends will continue to be declared. Payment of interim dividends will be considered in the light of the Company's working results up to September 30 each year.

In the report, the directors express regret that all work on the extension of factory buildings is at present held up due to a general shortage of steel and cement. By the middle of the next year, the shipment of the main plant under the mill expansion scheme is expected to start. No final decision has yet been taken about the proposed new paper pulp mill. It is proposed to be erected in Assam. Negotiations with the Government of Assam have reached an advanced stage, and the directors hope to be able to give shareholders further information about this project in the near future.

Downward Trend Arrested

The downward trend in the out put of mica recorded after 1951, was arrested during 1955 and a turn for the better was witnessed. At a little over 132 thousand Cwts. output of dressed mica in 1955 was nearly 27 per cent higher than in the preceding year, but was still 32 per cent below the 1951 level. The consignments of mica during the year were valued at Rs. 2.15 crores.

4%

BOMBAY STATE DEVELOPMENT LOAN, 1970

ISSUE PRICE Rs. 100 PER CENT.
OPEN ON THE 3rd SEPT. 1956

The loan will be closed as soon as a total of approximately Rs. 750 lakhs has been subscribed, and in any case not later than the close of business on the 10th September 1956.

The applications will be received at the offices of the Reserve Bank of India, Bombay, Calcutta, Delhi, Madras and Bangalore, at the branches of the State Bank of India in the State of Bombay and at the treasuries and sub-treasuries in the State of Bombay.

Full particulars can be obtained at any of the offices of the Reserve Bank of India or branches of the State Bank of India or at any treasury or sub-treasury in the State of Bombay.

Around Calcutta Markets

Consolidation of Gains

EQUITIES have been irregularly steady in the last few days. Speculative scrips have turned hesitant. Even so, cash scrips remain steady to firm. Jute shares have consistently moved up. Cement and some other miscellaneous shares have been gaining ground. There have been selective buying enquiries in coal shares. Paper and Engineering shares have been rather inactive, but steady. There is no selling pressure. But speculators have been anxious to book profits.

Despite occasional profit-taking, the market continues to be steady because of replacement buying at all set-backs. This is a healthy development. Since the start of the Suez crisis, equities have moved up appreciably. Corrective set-backs are necessary so that the market can consolidate the gains. But the events during the last fortnight suggest that the strength in equities has some basis. Current indications are that equities may remain steady in the absence of any sudden untoward development.

Jutes In Demand

Whether the spurt in equities initiated by the Suez Canal crisis would have continued without a simultaneous upswing in Jute shares is doubtful. Strength in Jute shares has been a sustaining influence on the market. There have been large foreign orders for jute goods in recent weeks. Evidently, foreign buyers are hastening their purchases of jute goods to avoid paying higher prices later. Jute goods flared up a few days ago. Despite speculative profit-taking, the gunny market remains firm. It is reasonable to assume that steadiness in Jute goods will continue.

Almost without exception, recently published reports of jute companies contain data which show how simultaneous business has been unprofitable in the last two years. Though the rising trend in jute goods is the main inspiration behind the spurt in Jute shares, there are other factors which explain the continued firmness in these shares. Shipping instructions are more encouraging. There are hopes that Russia will enter the market on a big scale.

Recurrence of political troubles in Argentina is a disturbing development for the Indian jute industry. Argentina has not been in the Calcutta market for some months. In any case, it will take some months before growing foreign orders can lift the mounting stocks of jute goods with the mills. But, as the monthly data show gradual decreases in stocks, the speculative interest in jute shares may continue. In the absence of a landslide in equities in general, the steady trend in Jute shares should continue.

There is one unfavourable factor which needs to be emphasised. With IJMA's decision to re-seal the looms unsealed some months ago, there can be no doubt that output of jute goods will be curtailed. This should have had a softening effect on raw jute. But raw jute prices have hardened in the last three weeks. This is mainly due to continued buying of raw jute by mills for spot delivery. Whatever be the reason, as long as raw jute prices remain relatively steady, Jute shares are not likely to move up as much as these shares should otherwise have.

Burrakur

Long before Coal shares started crawling up, Burrakur Coal began to firm up; simultaneously, Standard Coal started losing ground. By the time these lines appear in print, the fate of the amalgamation proposal between these two coal companies will be known. Directors of both companies favour amalgamation. Standard Coal have enough surplus cash. Burrakur Coal Company is one of the established concerns in the coal industry. Burrakur Coal have expansion plane. These projects cannot be financed out of the Company's own resources. It is difficult to raise capital in the open market. So the amalgamation will help Burrakur Coal.

What of the interests of the shareholders of Standard Coal? Directors of Standard Coal seem convinced that amalgamation with a first-class Company like Burrakur is to the interest of shareholders. According to the plan, each shareholder of Standard will receive two shares of Burrakur as a result of amalgamation. Since the amalgamation proposal, Standard Coal have been losing ground. There are reports that some shareholders are opposed to the amalgamation proposal. But, on the assumption that amalgamation will take place, the spurt in Burrakur is justified.

Tea Commission

Neither tea plantation workers nor shareholders nor managing agents are likely to be pleased with the recommendations of the Plantation Enquiry Commission. But the industry is likely to prosper if the major suggestions of the Commission are implemented. It recommends the abolition of the tax on tea imports into Calcutta and Howrah. It is opposed to the Assam Government's transport tax on tea. It is in favour of Central administration of sales taxes on tea by the States. Similarly, it recommends uniformity in agricultural income taxes. It has suggested a more scientific system of fixing the slab for export duty.

By far the most important recommendation of the Commission, however, relates to the formation of a Tea Replanting Fund. It is wise in urging the Government to arm itself with powers to carry out investigations and issue the necessary directives for the proper maintenance of fixed assets. Replanting and replacement and renewal of machinery and equipment are the major reforms that the industry must implement if it is to maintain its position as an earner of foreign exchange. There will be endorsement of the Commission's suggestion that a Tea Replanting Fund should be created in the Tea Board to which all tea estates should contribute Rs 50 per acre each year.

There will be a controversy about the Commission's suggestion that tea companies should try to raise capital by issuing debentures. But the Commission's detailed recommendations about the need for more banking aid to the industry will be welcomed. It suggests that the State Bank should include tea-growing areas in its plans for opening new branches. It recommends increased financial aid to the industry by the Industrial Finance Corporation and the State Finance Corporations concerned. Financial requirements for the modernisation of the tea industry are so vast that the recommended financial assistance will be urgently needed.

Around Bombay Markets

Modest Replacement Buying

Thursday, Morning

DESPITE occasional setbacks, the stock market maintained a distinctly firm trend during the week under review. The easiness brought about by precautionary end-account bull liquidation and by apprehensions about an increase in the excise duty on cloth, was offset by modest replacement buying and short-covering.

In the steel section, sentiment was favourably influenced by the approach of dividend announcement for Tata Steel. Tata Ordinary which opened around Rs 211-8 moved up to the highest for the week at Rs 216-8. Indian Iron, too, were firmly held at Rs 37-4.

Textile shares were generally steady on anticipation of a rising demand for cloth in the coming months on account of Puja and Divali festivals. This was reflected in the rise of Bombay Dyeing which were taken up to as high as Rs 702-8. But operators were often in two minds about textile shares, in view of the persistent rumour of an increase in excise duty on cloth. The latter naturally called for caution with the result that most scrips encountered realizing pressure. In the case of Bombay Dyeing, in particular, which had struck a new peak the setback was sharper because of the decision of the company to maintain its interim dividend unchanged. After declining by about 25 points, however, Bombay Dyeing later regained their peak level towards the close.

In the miscellaneous section, there was sustained buying in Bombay Burmah, Premier Construction and Premier Automobiles. Bombay Burmah benefited from the entry into the market of an influential operator who sedulously bought these shares at higher levels, which helped this script to attain a new peak level at Rs 800. Premier Construction attracted enquiry on the report that the capital of the company would be shortly reconstructed and that a final decision, in the matter would be taken in a week or two. In the event, the shares were taken up from Rs 209-8 to Rs 221-8.

Professional support for the miscellaneous section was renewed at the close of the week, and trading broadened with smart rises in Tata Locomotives, ACC, Belapur and Walchandnagar.

Cotton

'Operation Regimentation' Averted

THE way-wardness in price movement noticed in the previous week in cotton futures has been promptly corrected and the authorities might give themselves a pat on the back for having successfully brought about a 'reasonable' price level. The fear of an increase in the excise duty on cloth came to the latter's aid and became a blessing in disguise; it was one of the trend of cotton prices.

It may be asked why did the apprehension of a higher excise duty on cloth manifest itself at the time when cotton had reached the so called danger level? It may be that interested parties played it up as a shock treatment, in order to avert what would have meant 'operation main factors which reversed the regimentation'!

Be that as it may, one cannot help wondering why the Government prefers to keep silent over this issue. Whether they are well founded or not, apprehensions about an increase in the excise duty on cloth have affected not only the cotton futures market but also the textile section in the share market. This uncertainty about excise duty is not going to help textile exports from this country, which incidentally, are far from satisfactory. Whether it is due to a general shrinkage in world textile trade, or the establishment of textile mills by countries which have been India's traditional export markets, or to the increased competition from Japan, Hong Kong, Pakistan and Russia, or to competition from cheaper synthetics like rayon, the pace of exports has considerably slackened, in the past few months. The Government has only to thank itself, if there is a further deterioration in exports. For, it cannot be denied that any progress or expansion in a particular sphere of activity is dependent to a very large extent on the confidence of the operators, traders and industrialists concerned. This confidence is woefully lacking at present on account of the continued suspense over the question of excise duty on cloth.

Trading in cotton futures during the week under review was distinctly easier as compared to the previous week. Thus, the Jarilla contract, which opened on a very promising note at Rs 704-8 and improved to Rs 705-8 on the same day, steadily lost ground, point by point, and declined to Rs 685 at the close of the week. Although not to the same extent, the Vijay contract also declined and closed at Rs 815-8.

In the spot market, however, conditions were cheerful throughout the week. A prominent group of local spinners as also European managed mills showed continued interest in quality cottons like Surati, Bardoli and some others, but put off by the high rates prevailing in Sewri, they diverted purchase to growing areas. Business was reported on the lines at advanced rates.

There is good news for cotton in the world markets. According to the International Cotton Advisory Committee, the outlook for cotton consumption on the whole is favourable for the 1956-57 season. With the increase in population and demand for textiles, consumption of raw cotton should go up. Since stocks of cotton outside the US are at an extremely low level, provided that there is no sharp fall in consumption, world trade in cotton should move up. In fact, according to the ICAC, stocks outside America are the lowest on record at 7.4 million bales, compared to 8.4 million bales on hand on August 1, 1951 following the Korean crisis and the short US crop of 1950-51.

World cotton consumption outside the Soviet bloc, it has been estimated by the ICAC, reached an all time record in 1955-56 of 28.2 million bales, which is about 600,000 bales higher than that in 1954-55. US and Asia were mainly responsible for the rise in consumption; consumption in UK showed a decline.

Oilseeds

All-round Liquidation

WITH the September contract approaching maturity, it was natural for the trade to confine its interest to this contract. Trading in general reflected a bearish trend, for a variety of reasons. In the first place, the proximity of the maturity date induced longs to liquidate. Again, as weak bulls started selling in a falling market, there was an acceleration of the downward trend. Up country operators further depressed the market by making a hasty retreat while the going was good. On top of all these, there was the weakness in ready seeds and oils.

Underlying all these, was the fear of State intervention in the export trade in oilseeds. If the object of State trading is to augment its resources, this is a promising field, judging from the figures trotted out by Shri Murarji J Vaidya in the course of his address at the Indian Merchants Chamber!

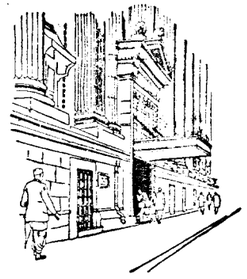
STATE BANK OF INDIA

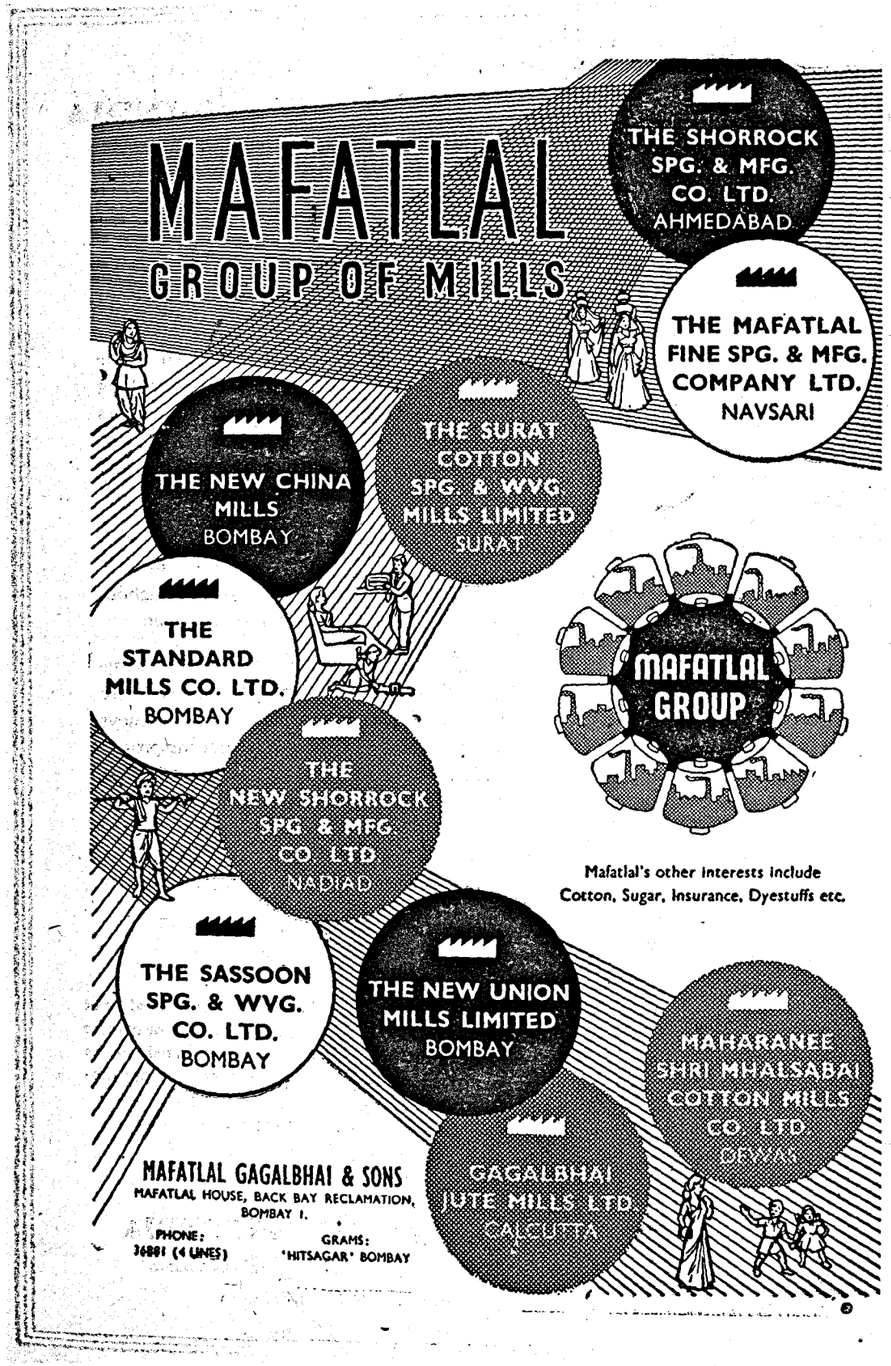


Successors to the Imperial Bank

The need of the day

Our country's economy is expanding rapidly and with the Second Five Year Plan in sight it will gather further momentum. The need for a strong and efficient banking system has never been greater than today as the nation's savings require to be pooled and managed in a resourceful, confident and prudent manner

The State Bank fulfils these expectations. It has started upon a programme of opening 400 additional branches throughout the country within the next five years.



The State Bank of India offers to serve you efficiently in many ways. It takes care of your savings and valuables, lends moneys against goods, produce and other approved securities and assists you by accepting appointment as executor and/or trustee of your will or trust. Its wide and varied services are at your disposal. Why not talk things over with your nearest bank agent, or write for information?

The State Bank's local head office at Bombay, one of more than four hundred offices waiting to serve you throughout India

The imposing new building of the Reserve Bank of India, New Delhi, is equipped with a 'Carrier' Air Conditioning Plant which provides summer cooling as well as winter heating — a system pioneered in India by Voltas

Air Conditioning
...a new force in
Industry and Business

WHEREVER men and machines work, air conditioning helps them to work better. It creates comfortable, hygienic working conditions and protects equipment from harmful dust and humidity. That is why more and more modern industrial houses are using air conditioning in their factories as well as in their offices.

VOLTAS have been the pioneers in the field of air conditioning and refrigeration in India. Backed by a wealth of accumulated experience, our engineers have made original and progressive contributions in projects of widely-differing natures, and scores of industries throughout the country have benefited by their efforts.

Air conditioning by VOLTAS can help your business, too! It's effective, economical . . . as a talk with a VOLTAS expert will prove. Contact VOLTAS today!

Cloth Excise—To Curb Demand?

RISING prices of foodgrains and cloth have been worrying the country and the Government for many months. At no time could the Government afford to ignore such developments; in the very first year of the Second Plan, they present a challenge that has to be met. For on the ability of the Government to assure a *minimum* of food and clothing to all sections of the people will depend the success of the Plan. To ensure this minimum, it is not enough to maintain production at a certain level, or even to step up the production of foodgrains and clothing well above that in the base year. Development expenditure on the scale that has been contemplated will inevitably increase the money demand for both; this demand is expected to be substantially augmented by the demand from receivers of new incomes whose number should also be substantial, as development gathers momentum.

To prevent food prices from going up any further, if not to bring them down to a reasonable level, the proposal of raising the target of foodgrains production is being actively pursued as a long term measure. Food imports have been arranged for building up strategic stocks and sales from Government stock are being resorted to increasingly, as an immediate check. In the case of cloth, prices of which have been going up over the last 12 months, what remedial action does the Government propose? The Bill to further amend the Central Excise and Salt Act, introduced in the Lok Sabha by the Minister of Commerce and Industry, has naturally to be viewed in this wider perspective.

The Bill authorises the Government to raise the excise duty upto four annas per square yard on coarse and medium cloth and six annas per square yard on fine and superfine cloth. Not that these maximum rates are to be enforced immediately. For the present, the increases are six pice on superfine, five pice on fine and one anna on medium and 6 pies on coarse cloth (excluding dhoties and sarees). This power is being taken, according to the statement of objects and reasons of the Bill, "as market conditions (in the textile industry) vary from time to time, it is desirable to have some flexibility in the hands of the Government to deal with the situation as it arises from time to time." It was further stated that a constant watch would be kept on the movement of prices and "to the extent that excessive profits are made in relation to the fair ex-mill price as worked out on the basis of the formula of the Tariff Commission, an increasing percentage of such profits may be taken away as excise duty. Correspondingly, if prices indicate a downward trend, necessary adjustments will be made in the excise duty."

As stated here, the objective is clearly that of taxing the extra profits which the mill industry is making as judged, for instance, by the wide spread between the cost of production of cloth as measured by fair price and the actual selling price.

There are many ways of taxing profits. The choice is between an excess profits tax which has some points of superiority in that it is less onerous to the marginal units in the industry and is less likely to be passed on, and a graduated excise duty. The Saurashtra Mill Owners' Association asked for this type of tax in preference to the one proposed. The Indian Chambers of Commerce has also done so, bearing

in mind the hardship of the ill-equipped mills in eastern India. Since it is the Government's policy not to allow a general expansion of the mill sector, large profits earned by the mills in the present situation lead to no social gain. They cannot be ploughed back into development of the units. On the other hand, there are well known difficulties, experienced in the past, of administering the excess profits tax and a real danger of weakening producers' incentive to economise and keep down costs. The question is, therefore, one of the right alternative.

Since the Plan cannot be implemented without resources and the size of the deficit has to be kept down within the 'limit of safety', purely revenue consideration may justify the increase. The Minister of Commerce and Industry in his support of the Bill (in his capacity as Finance Minister?) early this week need not have been so apologetic about the revenue aspect of the measure. True, excise calls for a justification in that indirect taxes are difficult to reconcile at sight with the professed aim of the Government to reduce inequalities and to spread the burden of development equitably among different sections of the population. But he need not have been so timid. After all even the poor are called upon to participate in this 'mighty adventure of building a new India". Why should they not contribute their bit in the shape of half anna more on coarse cloth?

But there's the rub. The impost on poor man's cloth by the Finance Minister was hard to justify on grounds of equity. So while moving the Bill in Lok Sabha on Monday, the Minister changed his line and tried, very ineffectively, to sell the idea that in some way, tax on cloth would help the Plan objective by restraining demand. While doing so, he tied himself into knots. Sentences like these from the official text of his speech—"If consumption of cloth rises beyond the availability of cloth (how can it?), then only inflationary trends gather momentum," or again that "Consumption is outrunning supply" (does it mean that stocks are being eaten into?), speak for themselves, and hardly call for any comment. But ignoring his verbal acrobatics and his "economic parlance"—"Prices reach a stage when the law of diminishing returns (utility?) operates and the consumer says 'No'"—what he meant to say appears to be that high prices restrict demand and therefore to the extent that excise duty raise prices further, (they may, a little, he agrees), one of the objectives of the Plan viz restriction of consumption, will be achieved. But why bother, since he is not interested primarily in revenue? The free market will do it by pricing out the poor and the lower middle class. But that is not what the Plan promises, or does it?

In fairness to the Finance Minister, it must be said that he is not very happy about the Government textile policy and is frank about it. He would like to have something corresponding to the Food Minister's strategic stocks in the shape of additional capacity in the mill sector which could be turned on to the domestic market, if need be, or turned off to exports. The Finance Minister is on firm ground in imposing this excise for furthering another Plan objective viz stimulating the handloom sector. Other things remaining the same, the duty may also help to divert some cloth to export markets which tax on excess profits will not do. This may also further a plan objective, by bringing in some foreign exchange. But why not be straightforward? After all the Government has to carry the people with it.

The power to raise the tax further is a threat directly aimed at the mills. Should the mills raise prices further, or should demand take up cloth prices higher, the rate of excise duty will be raised pari passu, in order to mop up the increase in excess profits of the mills. Consumers are not affected one way or the other whether mills earn profits for themselves or for the Government.

Not a Smooth Beginning

A WEEK ago to-day, the Life Insurance Corporation came into existence. Under the Life Insurance Corporation Act, the Government had to stipulate an "appointed day" on which the Corporation would start work. Delay in the formation of the Corporation was partly due to the resignation of Shri Chintaman Deshmukh as Finance Minister. Since the promulgation of the Ordinance, under which life insurance was nationalised, till the formation of the Corporation, the Government was in charge of administration of life insurance companies. Though New Delhi was prompt in announcing a further reduction in premium rates, transitional uncertainties were having an adverse effect on life insurance business. Until the establishment of the Corporation, Shri M G Shah, Union Minister for Revenue and Civil Expenditure, confessed in his Lok Sabha speech, "no basic change could be effected". With the formation of the Corporation, the incidental inconveniences of the take-over should now end.

In his Lok Sabha speech, Shri Shah anticipates the criticism against the delay in forming the Corporation. Before the Corporation could come into existence, its structure had to be devised, and its personnel had to be selected. These delicate and complex issues had to be carefully considered. Shri Shah is apologetic about the delay in forming the Corporation. But he is not apologetic about the Government's decision relating to the structure and personnel of the Corporation. Both Parliament and the people are critical of the Government's selection of the Corporation's personnel. Against the wishes of the Government, the Lok Sabha Speaker has allowed a request for a one-hour discussion of the Government's employment policy. There have been many complaints about the selection of personnel. Under the rules, the Corporation has the right to screen the personnel chosen by the Government. It is to be hoped that the Lok Sabha discussion will force the Corporation to scrutinise the personnel carefully, instead of merely rubber-stamping the Government's selection.

There are two aspects to the Corporation's employment policy. Since the announcement of the Government's decision to nationalise life insurance, many contradictory pronouncements have been made. Insurance employees have been assured that nationalisation will not involve retrenchment. Some official spokesmen have, however, repeatedly hinted that some retrenchment of insurance employees is inevitable. Even those who concede that some unemployment among insurance staff and field-workers cannot be avoided, will insist that the pruning will be done first at the sinecure and top executive levels. In banking as well as in insurance, there are too many sinecure and top executive jobs. Both banking and insurance need expert management. But banking and insurance managers and top executives earn too high salaries. In the make-up of the Corporation, there is not much scope for sinecure jobs. But the emoluments of the top executive members of the Corporation and of its lower tiers need to be carefully scrutinised. Only then can the retrenchment of lower-paid employees be justified. Equally crucial is the future of the entire field-force. There is need for a thorough revision of the set-up and the basis of payment for field-workers. This will be one of the immediate tasks of the Corporation. Whether salary or commission should be the main basis of remuneration, is a vexed problem. No doubt the Corporation will take some time before it can formulate its policy on such a basic issue. But the policy should be announced without any undue delay so that insurance business does not suffer.

There have been loud complaints about the Corporation's employment policy. It is also no secret that Calcutta resents the progressive concentration of monetary and financial authority in Bombay. But there are wider aspects of federal finance and economy which do not seem to be widely appreciated. Head offices of the Reserve Bank, the State Bank and the Life Insurance Corporation will be located in Bombay. All these are nationalised institutions. Each and all of these are separate wings of the Union Finance Ministry. New Delhi is the capital. Therefore, the head offices of all these nationalised institutions should be in New Delhi. The transfer of the head offices of all these nationalised institutions will not only end the unseemly quarrel between Bombay and Calcutta, it is also necessary in the interests of federal finance and administration. Independent India has a unitary but federal character of government and administration. It is a logical corollary that the financial make-up should follow the administrative set-up. This principle is reflected, to some extent, in the structure of the Life Insurance Corporation. The Corporation will have strong, representative zonal offices which, in turn, would be serviced by divisional and branch offices. There will be hope that the zonal offices will have freedom to conduct the day-to-day business as well as to invest life funds within the limitations of the overall national policy. But there is equal need for some such semi-autonomous regional institutions under the Reserve Bank and the State Bank.

If the creation of strong, semi-autonomous regional financial institutions is dictated by the principle of decentralisation, a closer integration of the activities of the Reserve Bank, the State Bank and the Life Insurance Corporation is no less necessary for the achievement of the major aims. Whatever be the reason or reasons for nationalisation of life insurance, the Government's experiment will be judged ultimately by results. Two years ago, the tax exemption limit for life insurance premium was raised. Since nationalisation, life insurance has been cheapened further. These factors will help insurance business. The Government is also committed to carrying the message of life insurance to the rural people. Its dual commitment is to make the rural community more banking-minded as well as insurance-minded so as to mobilise rural savings. Two organisations—the State Bank and the Life Insurance Corporation—have been created to fulfil its obligations. But there is nothing in the structure of the Corporation to suggest that it can function effectively in the rural areas. One of the major recommendations of the Gorwala Committee was that a policy of rural economic uplift should be pursued simultaneously with efforts to extend credit facilities in rural areas. There is urgent need for closer collaboration between the State Bank, the Corporation, the proposed warehousing and marketing organisations and the National Small Industries Corporation. These are institutions which have a common aim. That aim cannot be attained unless the related institutions are properly integrated. And the sooner New Delhi realises the need for integrated working of these institutions, the better for the people as well for the nationalised undertakings.

Shipping in the Public Sector

THERE is little doubt now that the Government is going to participate directly and in a big way, in the development of shipping. The programme which Shri Lal Bahadur Shastri, the Minister for Transport and Railways, outlined at the annual meeting of the Indian National Steamship Owners' Association in Bombay made it very clear.

The programme for shipping in the public sector is determined as much by administrative convenience and political considerations as by Government's trade policies, mainly in relation to trading with the Soviet bloc. The present organisation of shipping, the alignment of routes and services, continues to be oriented, as in the past, and is centred on Britain. India has fairly close relations with her neighbouring countries and it is her aspiration to develop and expand these contacts. The shipping services however are not oriented that way. When our Ministers go to Iraq, Iran or Saudi Arabia and appeal for closer economic ties, they have to face the complaint that shipping services with India stand in the way of deepening these ties. This explains some items in the shipping programme, particularly the decision to start passenger services based on India, even if the services may not pay.

The Calcutta|Madras|Andaman service clearly comes under the category of administrative convenience, so does the service between India|Laccadive|Maldive islands which is also under active consideration; the Madras|Rangoon service under that of closer political relations with our neighbouring country Burma while the India|Persian Gulf service and the India|Red Sea passenger and pilgrim traffic are obviously for developing ties with West Asia.

Do these impinge on the domain of the shipowners? We are told that Scindia's propose to discontinue their Indo-Burma Passenger service, which will now be taken over in the public sector and that Bharat Line similarly propose to withdraw from the Persian Gulf.

The provision of shipping in pursuance of our trade agreement with the Soviet bloc began in a big way, with the inauguration of the Indo-Soviet service. For this service, the Indian companies co-operated by supplying the required number of ships. They have not, however, come forward (or they have not been invited to, it is not quite clear from Shri Shastri's speech) to run the India—Poland service, which has been assigned to the Western Shipping Corporation. There were "difficulties for the private shipping companies being associated with this enterprise," so there could be no reproach of encroaching on their field, if the State stepped in. But what about picking up cargo from intermediate ports?

Weekly Notes

Cabinet Reshuffle

SHRI T T KRISHNAMACHARI, like his predecessor, fought and won a seat in Parliament on a Congress ticket. Both are, in this sense, Congress members of Parliament. But both are out of Congress. In his address to Parliament on the issue of his resignation, Shri Chintaman Deshmukh recalled his experience as Finance Minister in support of his cryptic comment that it would be safer for the Congress Government to have one of their party members as Finance Minister. In a party system of government, a key portfolio as the Finance Ministry should be held by a trusted member of the party in power. This is not only natural but desirable. Those who appreciated the former Finance Minister's oblique criticism will be amused at TTK's reply to the Lok Sabha debate on the Bill to enhance the excise duty on cloth. TTK made it clear that he did not, and does not, endorse the Congress policy to the organised sector of the cotton textile industry.

Congress has not yet learnt the lesson that Shri Deshmukh hopes it will learn. TTK's ability to be the Finance Minister is beyond question. It is possible that, after the next elections, Congress will have a pucca party member as the Union Finance Minister. There are many reasons to believe that the recent Cabinet reshuffle is a stop-gap arrangement. In the circumstances, the delay in announcing the Cabinet changes will cause surprise. It was known for a long time that Shri Deshmukh would resign. As the reshuffle does not involve the entry of any new member in the Cabinet, the rearrangement could be made the moment Shri Deshmukh's resignation was accepted. Selection of TTK as Finance Minister has been wise. But why did the Prime Minister take such a long time to unburden himself of his numerous responsibilities? Could it be that TTK was finally chosen because no veteran party member was deemed fit to be the Finance Minister. If nobody could be discovered now, the probability is that Congress would not find any party member suitable to become Finance Minister even if it were returned to power at the next elections.

Besides the Finance Ministry, TTK would be in charge of the Ministry of Iron and Steel. This would be an odd combination of portfolios but for the fact that TTK had been in charge of the latter Ministry for some time. It would be futile now to recall the circumstances in which the Ministry of Iron and Steel was carried out of the Ministry of Production as a separate Ministry. As Minister for Iron and Steel, TTK has been, from the beginning, associated with the Government's policy of developing the iron and steel industry within the public sector. He is familiar with the origin and nature of the complicated negotiations with foreign countries and groups for developing iron and steel industries within the public sector. His sympathetic treatment of the problems of expansion of the major private iron and steel industries has been duly appreciated by the Chairman of one of these concerns. It is as well that he remains in charge of the Ministry of Iron and Steel to ensure continuity in the Government's steel policy.

Commerce Ministry Split Up

BIFURCATION of the Commerce Ministry is not, perhaps, as strange as the bewildering rearrangement of this bifurcated Ministry. Some will argue that the division of the Commerce Ministry into two separate Ministries of Heavy Industry and Consumer Industries reflects the second Plan's overall industrial policy. Development of heavy industries is one of the major aims of the second Plan. A separate Ministry for Heavy Industry is, therefore, understandable. In due course, the Ministry of Iron and Steel may be fused with this Ministry. But it is difficult to appreciate the logic behind amalgamating the Ministry of Heavy Industry with the Home Ministry. There may be some sense in integrating the former with the Defence Ministry. Nor is the present arrangement justified on the ground that the Home Ministry is the main Ministry concerned with location of industries. No less surprising is the dovetailing of the Ministry of Commerce and Consumer Industries with the Works, Housing and Supply Ministry.

Neither the principle of mixed economy nor the second Plan's emphasis on heavy industries nor its concern over adequate supplies of consumer goods to combat inflation explains the queer rearrangement of the bisected Ministry of Commerce and Industry. But the regrouping of portfolios indicates a hidden pattern which deserves emphasis. Despite the formation of new portfolios and their regrouping, there is greater concentration of power and responsibility in the hands of a few Cabinet Ministers. Sardar Swaran Singh and Pandit Pant will be assisted by able lieutenants. But the economic policy of the Cabinet will be formulated by two Cabinet Ministers under the guidance of the Prime Minister. These three Ministers will function as the Economic Committee of the Cabinet. In all democratic countries, the Cabinet has such an inner Cabinet. Shri Chintaman Deshmukh's resentment at the existence of such an inner circle within the Union Cabinet has been widely commented upon. Some parliamentarians like Pandit Kunzru are opposed to this trend in the Cabinet system of government. This raises a major issue. But democracy has not yet discovered any solution to the problem that is posed by the issue under discussion.

Another International Lender

THE WORLD BANK has to work under a serious handicap; its loans made to the private sector must have a Government guarantee. This, according to the Bank, "has discouraged private borrowers who often fear that a Government guarantee might lead to State interference in their business" (IBRD Report for 1954-55). The Bank has tried to overcome this difficulty by sponsoring such institutions as the Industrial Credit and Investment Corporation of India (ICICI) in India and Industrial Development Bank in Turkey. Funds are originally made available to these institutions on the guarantee of the Governments, but their subsequent financial operations are free from Government control. This method has, however, been found to be inadequate to meet the needs of the private sector. Hence the International Finance Corporation which formally came into being in July last.

The Corporation has now published an outline of its functions and activities for the guidance of those who want to apply for assistance. It will extend financial assistance directly to private parties, without the guarantee of the Government

of the countries concerned. It will invest in productive private enterprise in association with private investors; it will serve as a clearing house to bring together investment opportunities, capital and managerial experience; and it will help to stimulate investment of both domestic and foreign capital.

The Corporation, however, is not completely dissociated from the Governments. For, in the first place, the membership of the IFC, which is an affiliate of the IBRD, is open only to member-countries of the IBRD and the initial capital has been subscribed for by the Governments of member countries who have joined the IFC. Not all members of the IBRD have joined the Corporation yet, but most of them will. The President of the World Bank is "ex-officio" the Chairman of the Corporation and the Offices of the Treasurer, Secretary and Directors of Administration and Information are held by the corresponding officers of the World Bank. Secondly, the IFC will not make an investment in a member country, if the Government of that country has any objection to it. This is in order to assure the Governments concerned that whatever planned development they may be contemplating, will not be interfered with, by expansions which they may not desire.

Another feature of the IFC's assistance is that it will not be restricted to payment for any specific goods and services and therefore to the foreign exchange requirements alone of the enterprise. The IFC funds can be freely used by the enterprise for its business purposes. This latitude in the matter of convertibility of currencies indicates considerable alleviation of the shortage of particular currencies.

The IFC, however, will make investments in any form except in capital stock or shares. Normally, its assistance will not be in the conventional form of loans carrying fixed interest; it will provide venture capital, with rights to be negotiated in the light of circumstances, which may include the right to participate in profits of successful projects. Security will not be always insisted upon. The IFC will, on the one hand, augment its funds by selling its bonds and on the other hand, revolve its funds by selling its investments when such sales are profitable. The lower limit of its investments will be of US $100,000 in a project of at least US $500,000. This is actually lower than the limits which the Indian Finance Corporation and the Industrial Credit and Investment Corporation of India have set for themselves. There is no upper limit, however, to its loans though the IFC would prefer a large number of moderate investments to a small number of big ones.

How do these functions compare with those of India's IFC and ICICI? The former makes only loans with fixed interest rates; the latter is meant mainly to under-write new issues and subscribe to shares of existing companies, thanks to the interest free loan given to it by the Government. The International Finance Corporation's form of assistance seems to lie somewhere between these two forms. Since it will neither give conventional loans nor invest in capital stock, it is not clear, from published literature, what exact form the Corporation's assistance will take.

The headquarters of the Corporation will be in the World Bank Offices. Robert, L Garner, Vice-President of the World Bank, and J G Beevor, former Managing Director of Commonwealth Development Corporation, are its President and Vice-President. The IFC Charter provided that a minimum of 30 members with $75 million subscription would be necessary before the Corporation came into existence; it has now 32 members together subscribing $78.4 million. The authorised capital is $100 million to be subscribed by members in proportions detailed in the Agreement. India's subscription amounts to $4.43 million.

Tea fare

WE are not amused, writes a Calcutta correspondent, commenting on the press release on the Report of the Plantation Enquiry Commission on Tea alone, which runs to 21 odd pages. The Commission was appointed early in 1954 to report on the main plantation industries—tea, coffee, rubber and cinchona, within six months! This was later extended from time to time, and now the Commission has submitted its report on tea only, after more than two years. The rest of the report covering the other plantation industries will presumably follow in due course. The questionnaire circulated by the Commission was very comprehensive, and it is understood that the response was encouraging. Many are eagerly waiting for the full report where the information collected from different sources—producers, brokers, shippers and agency houses—would prhaps figure for the first time.

Whatever your risk—

We will safeguard you against it!

NEW INDIA ASSURANCE ... *pioneers* in Indian insurance, respected and trusted throughout the East. We cover you against all kinds of risk from marine and fire to accident and burglary ... offer you prompt settlement of claims ... guidance and assistance in all matters ... security and service born of years of experience.

For *all* your General Insurance ... rely on New India!

THE NEW INDIA ASSURANCE COMPANY LIMITED

Mahatma Gandhi Road, Bombay

The press release on tea swarms with dozens of recommendations, and there is little to guide the reader in the way of presenting the broad picture to which they are to contribute. The responsibility rests to some extent on the wide terms of reference of the Commission. These were: to make a comprehensive enquiry into the economic conditions and problems of the tea, coffee and rubber plantation industries, and to make recommendations on the measures to secure a fair price both for the producer and the consumer, for the provision, if necessary, of finance for these industries, for suitable marketing arrangements and for the development and expansion of the plantation industry. The Government expects informed criticism, yet the press and the public have to comment on what has been handed out to them.

As far as can be ascertained, the main recommendations of the Commission are directed towards reducing the cost of tea to the ultimate consumer, as the future of the industry depends on this. At the garden level, two of the largest items of cost are "general charges" and "payments to labour". Regarding the former, the Commission has recommended a reduction in the remuneration paid to managing agents and secretaries, abolition of the commission paid to managers and others) it has suggested, instead, payment of a consolidated salary), and increasing Indianisation of the managerial cadre. Perhaps the new Companies' Act has taken care of some of these items of cost already.

Some cost data relating to Indian estates on the one hand and non-Indian—sterling as well as rupee—estates on the other are given, showing that the latter produce at a higher cost. Quite apart from the fact that the respective categories may have had exactly opposite motives to deflate and inflate their cost data submitted to the Commission, that they often have quite different practices regarding wages and labour amenities, and the maintenance of the garden and machinery, it would perhaps be accepted that the non-Indian estates produce, by and large, tea which fetches a better price than the tea from Indian gardens. But this will tend to be ignored in discussions in the Press and Parliament.

Estates are also to try to bring down costs by increasing labour productivity, and reducing absenteeism. The press summary does not say how this could be done, but the task bristles with difficulties, not a few of which arise from the labour laws and the Plantation Labour Act.

Next to production costs at the garden, marketing costs comprises a big slice of the cost of tea to the consumer. This latter has many components—transportation, auction, blending, packing etc., for some of which the Commission has made detailed recommendations. With regard to packing, it has recommended that the Tea Board should make a special study of the difficulties from which the smaller packing firms are suffering, so that positive steps could be taken to increase their competitive capacity. It has suggested that the production of existing concerns as well as of the units which may be set up hereafter should be freezed at the average of the last 3 years production or 6 million lbs, whichever is higher—a la mills vs handlooms. But more is to come. Since hygienic considerations demand that the consumption of loose tea should be reduced, if not altogether abolished, the Tea Board is to come into the field of marketing dust tea, with a distinguishing label. These are commendable ideas, if only they can be worked out. But how far do they square with the objective of reducing costs?

Package and Loose Tea

THE Commission has recommended the abolition of the differential excise on package and loose tea at four annas and one anna per lb respectively, and a reversal to the rates ruling before April 1953, when all teas paid 3 as a lb. Apart from the consideration that this will rob the gardens of the benefit they were enjoying at the lower rate of excise, this measure is certain to raise the price to the largest body of consumers. About one-half of the internal consumption is in the form of loose tea which will bear two annas more duty, if this recommendation is accepted. Government may explore the possibility of levying differential excise on low priced dust teas and higher priced leaf teas, instead of the specific duty of 3 annas a lb. irrespective of quality. There may be a partial relief, if Assam and West Bengal can be persuaded to accept the Commission's recommendation to remove the transport and entry taxes respectively of one-anna per lb. in each case. But persuation is going to be difficult as both taxes bring in quite a few crores.

What about Fair Price?

THE Commission has commented on the concentration of control of production and trading in the hands of a few large agency houses. But what exactly it proposes to do or how it views this concentration is not clear from the summary. Only with regard to blending and packing it has recommended a freezing of the level of the two large houses at the figure of last 3 years' output. Some references are also made to the relative position of the Indian and non-Indian groups with regard to assets and reserves. Without knowing how these were arrived at, it is not possible to understand the significance of these references. Perhaps, the report will throw light on this.

An important recommendation relates to the setting up of a Tea Replanting Fund, for the maintenance and replanting of tea bushes. Replanting has so far been tardy, and each garden, it is recommended, should be required to lay aside every year a sum provisionally estimated at Rs 50 an acre, assuming that it costs Rs 3000 in all to replant an acre, including cost of tending it for 5 years before plucking, and that the economic life of a tea bush is 60 years. This is put forward more as a notional figure, and the Tea Board is to work out the appropriate figure. The obligation to contribute to this fund would presumably take into account the contributions already made by gardens towards depreciation reserves, and areas already replanted by them since the last war. Actually replanting and replacement since the war have been in no small measure responsible for the increase in production witnessed in recent years. At an average yield of 1000 lbs an acre, the contribution to this fund will work out to very nearly an anna a lb of tea produced on the garden.

There are plenty more recommendations, e.g. for financial help to the industry, particularly bank finance, and regarding measures to improve the transportation system. But one searches in vain for the Commission's definition of what constitutes "fair" prices in relation to its findings on measures to secure a "fair" price for consumers and producers. This is not fair.

A Calcutta Diary

Bengal for Bengalis

ONE knew it was coming, and one said so in this diary. The West Bengal Government has now asked mercantile firms, almost all non-Bengali in ownership and management, that they should give preferential treatment to young Bengalis in the matter of employment. The Chambers of Commerce have been addressed in the politest terms, terms not wholly in tune with the temper of the State. The communication has issued from the Department of Labour, which suggests that the employment wanted is in lower rungs of commerce and industry where economic considerations usually dictate local recruitment. Again, it may be no more than good manners, but the Government says, "The State Government cannot counter it (the general feeling on the part of a large section of the people that Bengali claims to employment are not considered by all employers with the sympathy which they might expect as the children of the soil) effectively without an assurance from employers that this impression has been created more by a sense of frustration than by the general prejudice of any employer." It is not unfair to deduce from this a governmental disinclination to accept the grousers' case in toto. A more uncharitable, though not necessarily less correct, interpretation is that all the Government wants is some sort of an answer to the Bengali complaint. It is not difficult to see where the mercantile firms will put this letter: the waste paper basket.

A word, first, on the method. To be fair to Writers' Buildings, it is the Government of India which first went into this question of the employment of nationals in a strangely insincere manner. One remembers the first time Mr Nehru addressed the Associated Chambers of Commerce; to conceal his nervousness, he was smoking from a Marlene Dietrich holder all the time and some of the "No Smoking" notices could hardly be read for the smoke he emitted. The nervousness of the British business community was greater, and soon was launched a campaign to recruit Indians. (It may be no more than a coincidence that a number of boys with Ministerial or Secretarial connections got in.) In the years which followed the Government of India seemed steadily less tough, and in some of the secret circulars the managing agency houses started speaking of the need to maintain "the British character of British business". There were angry questions in Parliament, chiefly from the Communists, but it was by then clear to British business that the Commerce and Industry Ministry's questionnaire was meant more to "counter" (the Government of West Bengal's term) Opposition criticism than to enforce a change in the ways of British business.

The West Bengal Government's is a more difficult case; it wants the employment not of nationals but of Bengalis, of children not of the soil but of a particular State. Easily understandable is the note of diffidence. Hence the almost apologetic reference to the "impression" that there may be a prejudice against Bengali applicants. Hence the defensive reference to what certain other States have done in this matter. Hence the mention of the influx of refugees, of the State's own inability to provide more jobs. Hence, too, the rather mean reference that there may be "undesirable consequences and complications" if employers do not take steps to remedy "the growing resentment."

The resentment is real, based on the wholly inadequate share the Bengalis enjoy in the economic life of the State, in part the reciprocal of resentment elsewhere—and entirely useless. Left to itself, commercial employment flows into the lowest planes, drawn by the laws of economics. If local labour seems to us the natural thing, it is because it is cheap. If even manual labour is sometimes imported, as in the plantations in Assam and the factories in West Bengal, it is because the employers found local labour unavailable or uneconomic. Bengali labour was once the former; now it seems the latter, in terms of output, if only because existing labour has the advantage of having started early. Replacement cannot be a painless process, but the Bengali will be on strong ground only when he is able to apply the economic argument in his favour. Government compulsion will be resented, resisted, and finally revenged by Governments in affected States —thus starting over again the vicious process of which West Bengal's latest measure is an effect. Let the Bengalis offer themselves in larger numbers for factory work, and the employers will before long see the Bengali is not averse to mechanised work; while there is not a single Bengali rickshaw-puller in Calcutta, in the suburbs, where cycle-rickshaws are permitted, they are run mostly by Bengalis about whom the only thing non-Bengali is that they sing Hindi film songs.

It is perhaps true that of late there have been incursions into jobs hitherto held by Bengalis. Non-Bengali ownership of business was bound to place the higher levels of employment beyond the reach of the Bengali; the only answer to this is for Bengalis to get into independent business, which the Government can do much to asist by the provision of capital. There are scores of small trades now monopolised by non-Bengalis; pan shops are Bihari, sanitary plumbing is Oriya. It is not very dignified of a State Government to prostrate itself before business; worse, it can never be effective. If the Government were serious about the problem—and not merely about criticism—it would have directed its attention to the expansion of business possibilities for Bengalis. It is by competition the non-Bengalis came; it is by competition they can be sent back.

Forget this, bring irrelevances in, and you will neatly fall into one of the two common errors, both respectable and arguable up to a point. Immediately on the publication of the Government's circular to firms one lot of correspondents wrote to say it had "come none too soon," and another to say how "unfortunate" it all was. The former quoted the shocking figure, official, that mill workers alone were sending Rs 5.51 crores out of the State. The others' citing of the high principle that "employers recruit only those they consider best" disguises a deal of hypocrisy; both Bihar and Assam are bad discriminators. Pity, the Congress sanctioned this in 1938 through a committee presided over by Babu Rajendra Prasad, now Dr Prasad, President of the Republic of India.

Nobody, bar none, has a right to have half a brick at West Bengal for going the way of Bihar and

Assam and perhaps some other States—which is not to say that the Bengali's belated answer to some others' delayed response to the once natural Bengali predominance in the services is either morally right or economically adequate. The Centre, so vocally concerned about the unity of India as to see a threat to it behind every bush, seems strangely indifferent to the inter-State rancour this question of employment is creating. It is the Centre which can easily render it unnecessary for West Bengal to be restrictive, simply by making it clear to all its units that nobody can be discriminated against in any part of the country. And by seeing to it that no State in fact discriminates. All this, however, is a far cry from average Congress thinking; an interesting and typical instance of this is that the Kosi Project will not employ D V C's surplus staff, nor any old Bihari, but only North Biharis.

—Flibbertigibbet

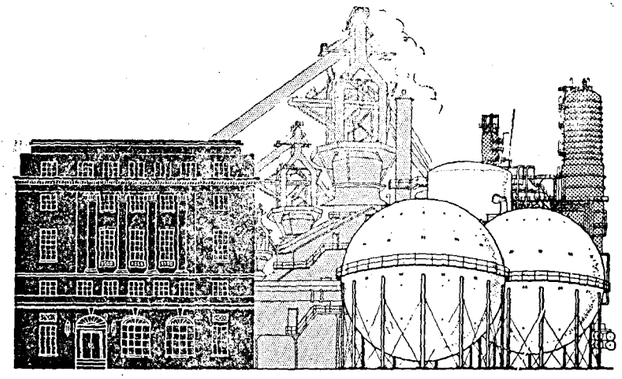
Letter to the Editor

DEMAND FOR FOODGRAINS

I WAS expecting Sri A Rudra to reply my letter (in your issue of August 11) by giving some factual data in support of his contention "that the elasticity of the foodgrains cannot exceed 0.3 or 0.4 for the whole of India". Instead, he has chosen (in your issue of August 25) to doubt the quality of the admittedly imperfect data that I could supply. The data given was only intended to give an idea of the magnitudes involved and not as an exact estimate of them.

However, I am giving below another table from the Agricultural Labour Enquiry (Vol 1—All India p 231).

Economic level of living	Expenditure per consumption unit	Quantity of cereals & pulses consumed per consumption unit
(in Rs.)	(in Rs.)	(in oz.)
0- 50	44.7	8.8
51-100	79.8	14.2
101-150	122.2	18.9
151-200	170.3	23.4
201-250	216.3	26.7
251-300	261.7	29.6
301-350	306.6	34.1
351 and above	411.8	47.9



Elasticity = 0.7

It gives the quantity in ounces of cereals and pulses consumed per consumption unit per day according to 'economic levels of living'. It excludes however the perquisites given to the Agricultural Labourers. As the quantity of the perquisites may be proportional to the total number of days worked and thus to the total wages earned in the year, the estimate of elasticity calculated below is expected to be an underestimate.

Would Sri A Rudra kindly let us know the data on which his statement regarding the demand elasticity of the food grains was based? It will be a matter of great satisfaction if his statement is more in tune with facts of the Indian situation than my pointers or the estimates of the Planning Commission, as that would make the task of planning so much the easier.

Off the Record

Assam Stakes its Claim

A COUPLE of incidents—this time unconnected with the Naga revolt and NEFA—have brought Assam again into the limelight. The one that got headlines in the press was about the disturbances in Gauhati when the Minister of Natural Resources visited it. The occasion of the Hon'ble Minister's visit was considered so important that the meeting of the Legislative Assembly at Shillong was postponed. Rarely, if ever, has such deference been shown to a Minister, and a minister without Cabinet rank at that. Shri K D Malaviya would have been happier had less attention been given to him. But who would leave him in peace? The location of the refinery for the newly found oil remained to be decided and Assam wanted him to know that it had made the decision. This was the culmination of an agitation which has hardly ever been reported in the papers outside the State. Assamese are naturally proud of their oil and for many months, meetings have been held all over Assam, in towns, big or small, and even in villages, protesting against the proposal of setting up the refinery in Calcutta for refining Assam oil. If a pipeline were to be laid for taking out oil from Assam to some other State, then the people would take the matter into their own hands and obstruct it by every possible means. It would be an unwarranted interference with the exploitation of the natural resources of the State meant for the benefit of the people of Assam. The threat has been held out that the pipeline would be torn up and destroyed.

About the refinery and the new finds of oil generally, the main controversy has been about the share of the Government in their working and exploitation, whether this share was going to be only a third or whether the Government was going to insist on holding 51 per cent of the capital in view of the revised Industrial policy which reserves refineries to the public sector. The only technical problem that has been discussed so far—it is really a question of the most advantageous form of organization—is that of separating production, transport by pipeline and refining and forming three different companies for the purpose, in the capital of which Government holding may differ. But the relative advantages of refining in Assam, or locating the refinery in Calcutta has never been seriously debated. This is for the very good reason that modern practice all the world over is to establish refineries in the consuming areas, instead of at the source of oil production. This tendency is sharply opposed to the general one of locating processing where the raw material is to be found, which is usual in the case of most industries. There is another consideration. A refinery involves heavy capital investment and it will be taking too big a risk to make it depend on the supply of oil from a single source. The reason is technical—oil wells sometimes dry up without giving advance notice. For, subterranean oil-flows are irregular and may change their course in an unexpected manner. This alone weighs the decision in favour of locating refineries in port towns which can draw their supply of crude from many sources, if need be, even if economic considerations, which also favour this decision, are ignored. But economic and technical considerations are in a world apart. They can hardly touch local feelings or sway popular movements. Malaviyaji promised the refinery provided there are no insurmountable technical difficulties. A technical committee has subsequently been announced to examine whether there are any!

The people of Assam, in this context, means, of course, primarily the people of the Brahmaputra valley. Surma Valley or Cachhar may also like to have the refinery located in Assam; so would perhaps the people of Khasi and Jayanti Hills and many other tribals who constitute not an inconsiderable proportion of the population of the State. They may also have a similar pride in their natural resources and may not be wanting in local patriotism but they have not come forward, so far, to challenge the proposal to establish the refinery elsewhere; neither have they threatened to tear up the pipeline, if such a decision is eventually taken.

The other incident that has come to light, though not in the limelight, has to be studied against this background. From the scanty attention given to it in the press, the incident reported a fortnight ago, from Cherrapunji colliery where the local Khasis objected to the stationing of a police force, would appear to be a very minor one. After all, a brush with the police, particularly in a mining area, is not an unusual occurrence in these days when people are naturally less hesitant than before in asserting their rights and are no longer, rightly again, overawed by authority. No police action is reported, no firing or no loss of life. Nevertheless, the circumstances which led to this incident are worth studying.

Coal occurs in many parts of Assam. In the Geological Survey map of Assam which, by the way, is many years out of date, as many as 14 coal fields are marked. Deposits have been located in the Garo hills as well as Khasi and Jayanti hills; besides, there are several fields in upper Assam. But the total output of coal in the State has not yet come up to a sizeable figure to merit its inclusion in the All-India returns of coal production published by the Chief Inspector of Coal Mines. This does not, of course, dispose of the problem of coal in Assam.

According to **India's Mineral Wealth**, coal has been known at Cherrapunji since 1815 and small scale mining has been carried on since 1834. Khasis, however, fondly believe that they have been using this 'stone charcoal' ever since they have been Khasis. There are several occurrences of coal in the Khasi hills. The area leased to Cherra Chattak Ropeway Company Limited at Cherrapunji covers only some 1600 acres. This company which has been mining this coal since 1935 used to transport its coal by ropeway to Bholagunj and thence by boat to Sylhet. The quality of coal is reported to be good, it is 'strongly caking' and has a low ash content. Gillanders resigned their managing agency of this company early this year. The company renewed its lease for 20 years in March 1953.

A dispute has been going on among the local tribals and this company over the ownership of the colliery and the High Court had passed an order before the police in-

cident, restraining both the company and the tribal villagers from working the colliery, pending adjudication of the dispute.

The mines are situated a few miles beyond Cherrapunji whose sole title to fame to the world outside rests on its record rainfall which is the highest in any part of the world. From Shillong there is a beautiful motorable road which runs alongside a deep ravine over a distance of some 20 miles to Cherrapunji from which one can get a magnificient view of the Sylhet plains, and of the Miasmi fall. There is a sheer drop of some 2,000 feet or more, a little beyond Cherrapunji. The road to Shillong runs along the plateau winding to the hills. By road and river, as also by railway, Cherrapunji had an outlet to Sylhet. But after partition this has been no longer of any use for the transport of lime stone and oranges in both of which this track abounds. A new road is now being constructed through the hills to connect this area with Shillong and from there to Gauhati. The old road from Shillong, however, goes upto the mine and connects it with the consuming centres for coal—Shillong, Gauhati and to the rest of Assam served by the Assam railway.

Now the people of Khasi and Jayanti Hills, that is to say, the highly civilised tribals, and not the population of the plains who now crowd to Shillong for its salubrious climate, for business and because Shillong happens to be the capital, have definite ideas about their place under the sun. And they are pretty firm in their own minds about it, though they may have not expressed it in the manner in which Nagas are doing, which would make the rest of India sit up and take notice. Among the Khasis, missionaries have done much successful work, large numbers of them have embraced Christianity, mission schools have given them education and Khasis have taken to it as much as anybody else in India. They have still got a Raja though not a very prosperous one, nor with the usual insignia of royalty. The tribal customs are not perhaps as binding on the higher educated and well placed members as they are on the rank and file of the population but by no means have they ceased to exert their influence on them. The Khasis do not accept that they had been conquered by the British. Shillong was given on lease to the British Government, and now that the British have withdrawn, the town should revert to the Khasis. This is the common belief of the tribe. It does not matter much, for there is no agitation for reclaiming this lost legacy but tribal customs have come in the way of the exploitation of the colliery, right from the beginning.

According to it, the local people are free to take as much coal for their own use as they want to. But if coal is to be mined for sale, then the matter requires sanction of the tribe. A licence may be issued to some party to work the mine. Road operators may also be licenced to carry coal from the mines to the consuming areas. All this makes no difference to the question, as the tribals understand it; their coal cannot be taken away without their consent. Not that Khasis, with all their education, do not understand that the coal is a thing the use of which can be confined to their own domestic fuel requirements, without detriment to the interests of their own people. This they realise and they are willing enough to meet the demand on them in a manner which should be welcome, if the framers of the Avadi resolution really believe in what they preach. The people of Khasi Hills would not object to the colliery being worked by their own co-operatives. May be they would not mind assistance in the matter of organising such co-operatives. May be they would also need finance. But the difficulties of organisation and finance will never convince them that their contention is untenable or that they have necessarily to change their conception of property to suit the modern times. There lies the danger. Khasis have not concealed their dislike of others coming to quarry their mines and carry away their coal. That's why an armed police battalion had to be stationed there, which led to the incident. Would they respond to the appeal of larger social interest and welcome State operation of the mine to the private exploitation of which they have protested in such an unmistakable manner?

How To Be Great?

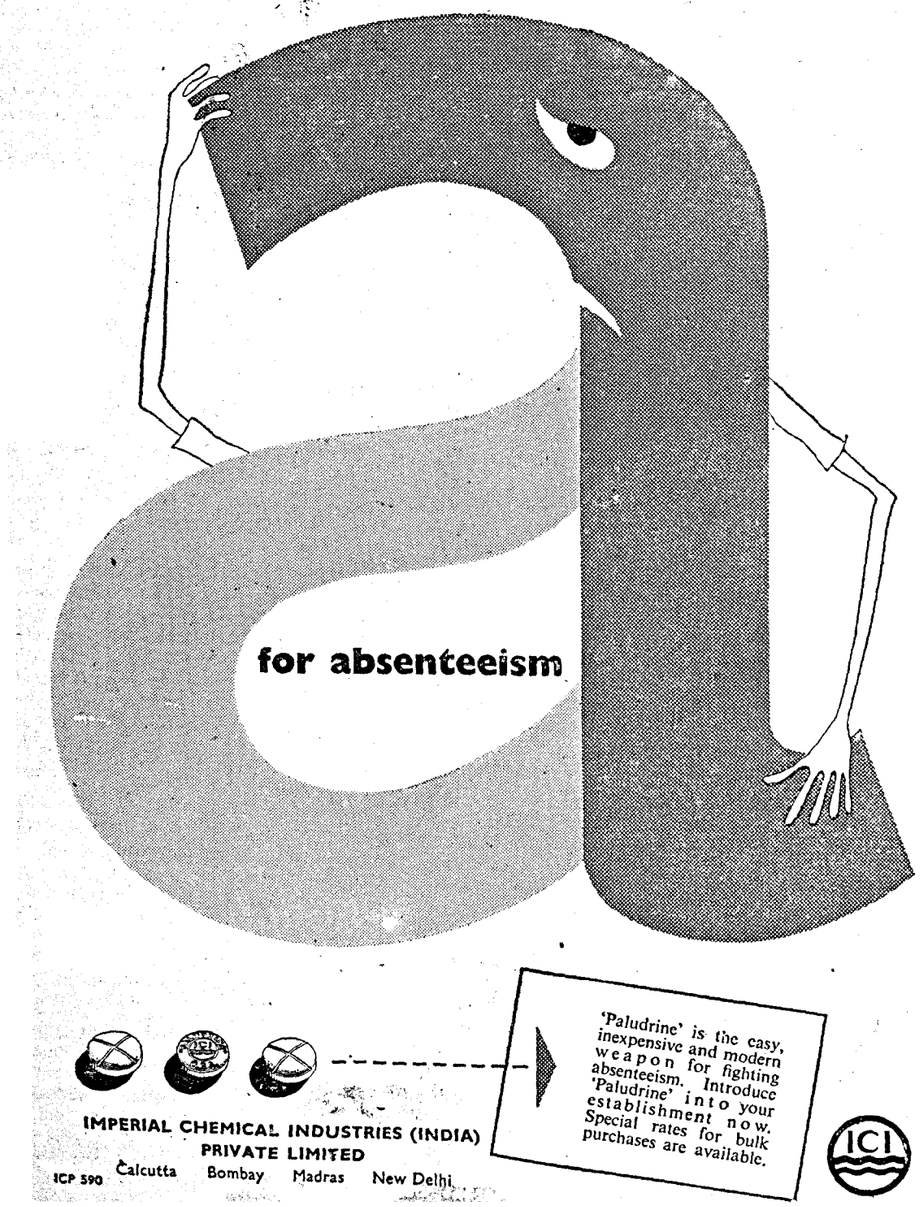
THE suddenness of President Nasser's Suez coup has precipitated in Britain a controversy which is certainly proving to be of the gravest significance to every Englishman and indeed for the whole world "How to be great?"... or more pertinently, how to stem the country's waning "greatness", is the vital question agitating every thinking Englishman today. The fact that the Government itself is not a silent participant and that the two giants of British opinion, **The Times** and the **Manchester Guardian** have adopted irreconcilable positions on how greatness is to be achieved, suggest the considerable possibilities that exist for this matter to be argued in the light of cold reason and calm. And yet the volume of emotion and sentimentality which the question has provoked in all these and other quarters has so clouded the vital issues involved that a new and more desperate crisis has now come to exist—a crisis of nerves and prestige. When the **Guardian** in a recent sharp comment asks whether the country is going to war, it is neither being irresponsible nor naive; the situation has deteriorated with a violent swing of official and influential opinion. And in the emotional build-up to this dangerous posture, bitterness and recrimination is being flung around with abandon: the **Times** went so far as to describe its opponents in terms just short of insult. It quipped at all those who hesitate and question the official line in the words of Disraeli as "cosmopolitan critics, men who are the friends of every country save their own".

The controversy goes much beyond Suez. Britain's whole approach to international and colonial questions is being scrutinised with a view to implementing what is termed a new "vigorous defence of our interests". But it was Suez which had started it all and it is around the question of Suez that the "vigorous defence" concept portends dangerous possibilities. The British Government has moved a large slice of its armed forces into the Mediterranean and has taken the unprecedented peace-time step of putting a blanket on all military information. As the **Guardian** puts it, "the Government seems to be preparing for war immediately if the Menzies' mission fails". And this course of action has been and is being subjected to a considerable degree of questioning among liberal and left-minded people. It has been this questioning that has called forth from the **Times** and the Government (through the Chancellor's recent speech on ostensibly economic problems) the blast that these opponents are guilty of decadent irresponsibility and of being the inmates of what is called the "escapers club". The "escapers" if they had their way, commented the **Times**, would reduce Britain to a "living corpse" as was the fate of Venice. By way of contrast, "greatness" comes when "nations live by the vigorous defence of their interests".

There is the assumption in all this that Britain possesses a preordained destiny to everlasting "greatness" and that any assault on this destiny by the currents of our time is merely extraneous and can therefore be rebuffed by resort to extra-political weapons. Basically it reflects an arrogance and the mentality of the herrenvolk. If this attitude spreads in British ruling circles it can make the British lion take a mad leap into the abyss in a desperate bid to defend what it conceives to be "its interests". Herein lies the tragedy and the danger in all what is being said and done in Britain. **The New Statesman** was quick to remind its readers that the historical lesson of Venice was irrelevant—what was relevant was the attempt of Athens to recover Syracuse resulting in the complete demolition of Athenian military power.

Moments like the present are not conducive to common-sense and reason. The irresponsible mouthing by Ministers and others of terms like "aggression", "fascist", "dictator", etc., had given a ready and immediate acceptance to a not so new jingoist spirit among the British people. The pressures of the Suez group under the leadership of the indefatiguable Captain Waterhouse and Mr. Amery (whose father was of India fame) drove the Eden regime to words and acts from which now emerge the greatest fears: that Britain is in so inflexible a position that she can only make a retreat by some considerable loss of prestige and as one journal put it, "Britain's only asset today is her prestige". There were signs of a return to reason in the second week of the Suez crisis but these signs have now been belied by a raging controversy in which the ruling opinion has come to favour the pursuit of jingoism—of letting loose the Colonel Blimps.

Now when there is some need (in view of the signs of opposition to jingoism) to give intellectual validity to the war preparations, a most searching effort is being made to find reasons which may convince. And the easiest so far has been to dub the opposition as "escapers"—as symbols of a "spirit of degeneracy". The **Times** finds the "escapers" betraying three "strands of irresponsibility". The first "quibbles" about the legalities of the Egyptian action. The next asks whether it would not have been better to raise the matter in the UN. The third strand of irresponsibility enquires whether "we will suffer, any way" by what has happened. To all these strands, Disraeli's quip is the ready answer. And so in what is nothing more than a negative line of reasoning, the call for greatness is made to be dependent on the employment of the ultimate of instruments—war and the threat of war.



The opposition to this brisk course of action is not so much based on a justification for the Egyptian coup but it takes the character of a questioning whether "greatness" is at all possible when the action canvassed so patently lacks the accepted canons of international morality and further whether the reality of the Middle East situation will not lead to Britain's ultimate demise should a military solution be sought. The arguments favouring these positions are familiar. What is not so familiar is the recognition that Britain's aim to be great is being made to depend on what has been called, "sand". A thoughtful writer in the letter columns in the **Times** recently put this cogently thus:

> "We are told that this is a matter of life and death, that European civilisation cannot continue without access to Middle Eastern oil. If this is true, our house is built on sand. Is it true? Does the character, the moral fibre, the genius of the British depend on a

strip of water....? Or is it the wealth, the ease and convenience that we have taken for granted and assumed to be our right?"

Indeed if history is to provide any lesson at all, it surely is that greatness cannot for long be the achievement of those who are overbearing and who do not serve, of nations who live by the power they exercise over others instead of confining themselves to their own resources.

The gravity of the choice being put to the British people is unfortunately not so widely understood as this. A gallup poll conducted by the **News Chronicle** showed that the majority of the people favoured the actions taken so far by the British Government. It reflects the extent to which the crucial issues have been clouded by the emotional bursts of the Beaverbrook press and the other organs of jingoist opinion. The leadership of the Labour opposition by contrast, present a spectacle of appalling apathy and pitiful dither. After days of warning from the truly great editorials of the **Manchester Guardian** Mr Gaitskell has only now demanded the early recall of Parliament. The apologists of Anglo-American union stand shocked and dismayed at the lack of concern for American opinion and the determination in official quarters to even "go it alone". The Suez question is certainly proving to be the pinnacle on which Britain's greatness is being made to depend.

Means *are* Ends

M L Dantwala

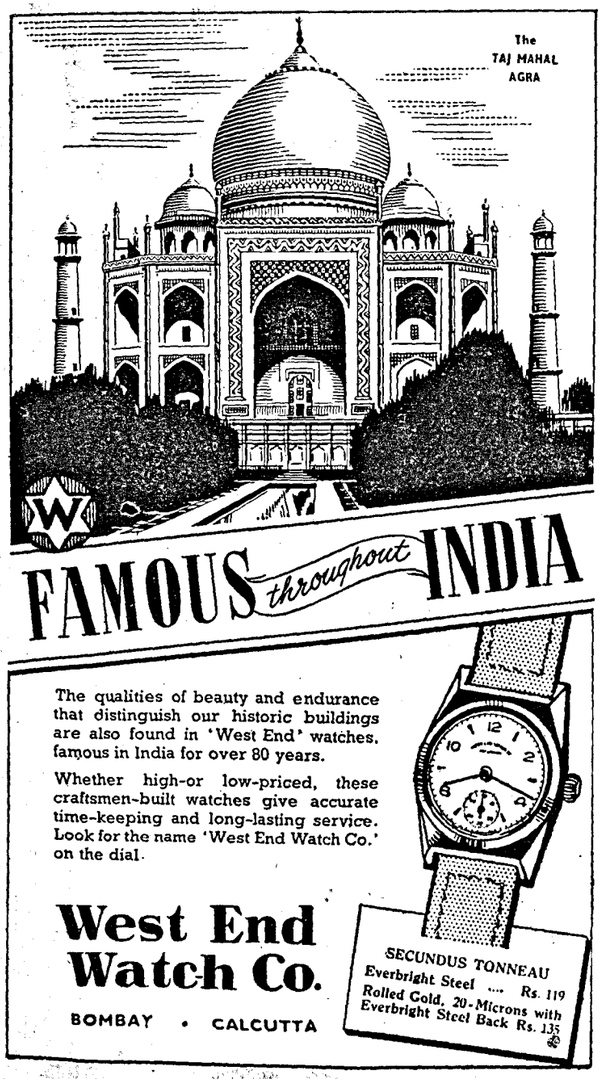
Vinoba and His Mission—Progress of a Pilgrimage—Suresh Ramabhai, Akhil Bharat Sarva Seva Sangh. **V for Vinoba**—B R Mishra, Orient Longman. Pp 78. Price Rs 3.

VOLUNTARY land gifts of more than four million acres and the gift of entire cultivated land of 1,200 villages is, by any token, an achievement which has few parallels not only in the history of land reforms but also in the annals of peaceful social change. Behind this achievement is a story of a Mission and a Pilgrimage whose meaning is much more epochal than is indicated by statistics of land collection and distribution. Shri Suresh Ramabhai has the right and the privilege of narrating the story, because he is not a mere distant observer but an active participant. Shri Ramabhai gives a faithful account of Vinobaji's almost solitary trek from the day the first donation was received in Telangana. The two books are replete with numerous extracts from the speeches and writings of Vinobaji, the philosopher and guide of the movement. No effort, however, has been made to arrange the narration in any logical sequence or pattern. The notings from the author's travel diary appear to have been conglomerated together without much discrimination; the sublime and the trivial have been intermingled. The grandeur of the theme and the sheer chastity of Vinobaji's thoughts, however, save the narration from these incongruities. However, when the author strays from the path of pilgrimage into the highways of politics and economics, he loses the sure touch and mouths only the most pedestrian prejudices. Interpreting the "Gloom" which encircles India, he writes: "In sober fact, the Government of India remains the executive instrument of the class and society which owns the means as well as the resources of production of wealth. The new Republic of India secured political freedom for India as a whole but not for the masses. It continues to be the exclusive preserve of a bureaucracy controlling the production resources .....". Such darkness under the lamp is, however, not unknown.

But, to revert to the Mission and the Pilgrimage, it would be wrong to equate it with a movement merely for redistribution of land. It is a movement for a revolutionary social change; revolutionary because it aims at a psychological revolution in the minds and hearts of the people, in their value system and in their attitudes. It aims at the establishment of a new society—a society based on the rule of love rather than that of law. It will be sustained not by a set of erudite doctrines or by some historical necessity, or by a rigid institutional pattern controlled and operated by a chosen few, whether they be politicians, administrators or technicians. A movement like this has no D-day, for, it is a continuous process: the means are ends, and there is no divorce between the immediate and the ultimate. How is it sought to be achieved? Through post-prayer discourses rather than flag-studded mass meetings; by treks through villages on foot and not by any high-powered propaganda machine. Persons qualify for its membership not by wearing a political uniform or by a ritualistic constructive work, but by an act of participation which in this case is an act of giving, silent and unadvertised. Its task is to end the acquisitive society.

The collection and redistribution of land are only an outward manifestation of a change within. Perhaps, statistics of donations even exaggerate the real change. They may reflect only a momentary onrush of charitable feelings. Vinobaji is conscious of this. He has, therefore, said: "I do not worry how much land I get. My only concern is that the right thought strikes deep root in the hearts of the people". Again, he writes: "The Bhoodan movement hopes to change not merely the outward form of society, but the very outlook of man—a radical change in human psychology". "I want to create an atmosphere of giving in this age of taking, so that non-possession and co-operation in place of ownership and competition may be the basis of life". Yet a philosophy, however good, has to be lived through certain institutional arrangements, the framing of which is the job of a technician acting within terms of reference set by the philosophy. When the philosopher takes up this job, it is likely—as History has amply shown—he may go wrong; and what is worse, the incidental may tend to become as absolute as the essential. Bhoodan is not free from this danger.

Both the books give some valuable facts and information in the Appendices. They give the resolutions passed at the Sevapuri, Chandil and Bodh Gaya sessions of the Sarva Seva Sangh, rules and regulations of land distribution, extracts from State legislations concerning Bhoodan Yajna, figures of land gifts obtained from various States. There are three interesting maps showing Vinobaji's Pada Yatra in Bihar.



Unlike Suresh Ramabhai who writes as a devotee, Dr Mishra claims to have viewed the Bhoodan Movement as a professional economist. A substantial portion of the book is devoted to the discussion or rather enumeration of land statistics, population and food supply and the livelihood pattern of India's population. The idea appears to be to assess the contribution of the Bhoodan Movement in the context of India's land problem. Apart from the assessment of Bhoodan's contribution, the diagnosis of the economic problem by the author is somewhat elementary and at places of doubtful quality. The author believes that "through voluntary land gifts .... an underveloped country can rapidly transform its economy with an unprecedented tempo, a transformation unaided by capital which is usually needed for payment of compensation". According to him, "the most arresting fact about India is that her soil is rich and her people poor. India possesses vast, potentially rich natural resources, but the masses are extremely poor". Having shown that "we cannot expect to get per capita more than a square plot of land, measuring a little more than 100 yards from north to south and from east to west", he comes to the rather strange conclusion that "the Bhoodan Movement offers a solution for the future agrarian revolution in India through an equitable land distribution".

One whole chapter is devoted to the "Livelihood Picture" in India.

Its relevance to Bhoodan is brought out in the last sentence of the Chapter which states: "This shows that quite a large number of people do not possess any land at all. The Bhoodan Movement aims to provide land to the landless labourers". Similarly, concluding the Chapter on Population and Food Supply, the author observes, "Self-sufficiency in food can only be attained through mechanised collective farming, the introduction of which depends upon an agrarian revolution through the Bhoodan Movement". The economic analysis given above and the contribution which the Bhoodan Movement is assumed to make to the solution of some of the problems mentioned therein appear to be somewhat dubious and may not be shared either by economists or Bhoodan workers.

The author appears to favour some sort of collective farming as practised in Russia, with the difference that it should be accomplished on a voluntary basis. He is convinced that "the agrarian revolution in Russia which remarkably increased the productivity of land is due to collective farming". Once again it is difficult to be sure whether the objective of the Bhoodan Movement is the establishment of mechanised collective farms of the Soviet variety, minus its violence.

The book is very well brought out and contains some very good photographs.

Unemployment in Urban Areas

Wilfred Malenbaum

TODAY there are about 2.5 million persons in Indian cities who are unemployed and are seeking work—almost 10 per cent of the employable population in urban areas. (**Second Five Year Plan, Draft Outline**). These estimate are based primarily upon the results of two National Sample Surveys made in 1953. The 'urban areas survey' dealt with Indian towns of 50,000 population or above, exbluding the four big cities of Bombay, Calcutta, Delhi and Madras. The *other* focused on Calcutta. The results of the first survey are generalized for the 59 million persons or so who are urban, but not living in these four large cities. The results of the Calcutta survey have been applied to the approximately 12 million persons now in these four cities. Finally, the estimates for 1953 have been brought up to date (beginning 1956) by the use of the 1953 relationship between the sample results and the number on the live registers of the Employment Exchanges.

Table I
Urban Unemployment, FEB., 1956

	Urban areas	Four large cities	Total
Total population (millions)	59	12	71
In labour force ..	20.55	4.75	25.3
Gainfully occupied	19.0	3.90	22.9
Unemployed	1.55	.85	2.4
Ratio of unemployed to labour force	7.5%	17.9%	9.5%

Survey ratios of gainfully occupied persons, of labour force and of total population have been brought together, on the current population basis, in Table I. The incidence of *unemployment is much greater in* the large cities of India. This is true, despite the fact that differences in the definition of unemployment in the two surveys make the two specific ratios non-coterminous. In the Calcutta survey, a somewhat less rigorous concept was applied than is advocated by the ILO. (1)

In the urban area survey, information was also obtained on the degree of employment. Thus the number of persons only partially employed was more than 3 times as great as the number actually unemployed. If persons who worked for not more than ¼ of the amount of time they were willing to work are added to the unemployed, the figures are more than doubled. It is probable that at least some of this group of underemployed would have been counted as unemployed in the Calcutta survey. In the discussion that follows, the "unemployed" will refer to the persons and ratios shown in Table I. More correct, however, would be the generalization that at least one out of five members of the urban labour force is today either fully unemployed or underemployed in the sense of having work for "a quarter or less" of the time he would be willing to work. For the larger cities taken alone—the urban areas with the highest rates of population growth—this ratio may be one in three or four.

Urban Labour Force

The bulk of the labour force is male, and in the 16-61 age bracket (Table II) there seems to be a somewhat large participation of young people (under 16 years of age) in the labour force in the smaller urban areas than in the four large cities —about 6 per cent as against less than 2 per cent. This may be a reflection of better, or at least stricter school arrangements in the large urban centers.

There is some evidence in both groups that somewhat larger percentages of the unemployed are below 16 years of age than is the case for the employed. This in part reflects the fact that about half of those seeking work in both areas are seeking work for the first time.

The industrial composition of the gainfully occupied labour force shows significant differences in the two urban areas (Table III). About 40 per cent of the gainfully occupied in urban areas find employment in distributive and other services, while in the four large cities this ratio is above 55 per cent. The large cities have not only much smaller percentages in agricultural and extractive industries (1.2 per cent as against 13.1 per cent), but also a smaller ratio of employment in manufactur-

Table II
Age and Sex Distribution of Labour Force

Age	Urban Areas		Four Large Cities	
	Employed	Unemployed	Employed	Unemployed
0-15 ..	5.7	7.2	1.6	2.8
16-61 ..	91.2	92.0	96.8	95.8
Above 61 ..	3.1	0.8	1.6	1.4
Total ..	100.0	100.0	100.0	100.0
Male ..			93.5	95.9
Female ..			6.5	4.1

Table III
***Industrial Composition* of Gainfully Occupied Labour Force**

	Urban Areas	Four large cities
Agriculture, etc.	11.3	9
Mining, etc.	1.8	.3
Manufactures	31.9	26.1
Construction	3.0	2.6
Transportation, Communication and other public facilities	11.4	15.0
Distributive services	17.8	25.4
Other services	22.8	29.7
	100.0	100.0

(1) A person was unemployed in the urban area survey if he was without work throughout the 30 day period preceding the date of enquiry. In the Calcutta survey he had simply to be unemployed on the date of enquiry. While the two definitions will give different results, and in a known direction, the degree of difference is probably small. (The NSS ninth round (Aug-Oct. 1955) has sample material which will provide some basis for measuring the difference. The results are not yet available.)

ing (26.1 per cent as compared to 31.9 per cent). The data do not permit a separation into factory and small manufacturing establishments —which might explain some of the latter difference. In the large cities, unemployment seems to be spread among all the industrial sectors. In any case, a classification of the unemployed (seeking work **not** for the first time) by their last type of employment gives essentially the same distribution as in Table III. For the rest of the urban areas, comparable unemployment data are not available. However, the under-employed component of the employed suggests the same type of distribution as for the employed alone; there is a somewhat higher incidence of under-employment in manufacturing industries and construction, a lower incidence in the various distributive services.

A large part of the labour force in urban India originates outside of their present place of residence. About 40 per cent of the labour force in the urban areas excluding the large cities came from outside with the intention of remaining for at least one year. In the large cities, this ratio is almost 70 per cent.(1) (Table IV) The figures bear out the strong pressures for migration to the larger cities. There is the same general pattern for the unemployed as for those gainfully occupied, the notable disparity being with respect to refugees from Pakistan. Thus 9 per cent of the employed in urban areas constitutes displaced persons from Pakistan, while 19 per cent of the unemployed are in this category. For the large cities (or at least for Calcutta), 22 per cent of the employed come from Pakistan, whereas 38 per cent of all unemployed are displaced persons. In general, for both urban groups, rural areas provide most of the migrants (apart from those from Pakistan). In general, too, a lower percentage of the unemployed are from rural areas than of the employed.

Worker incomes tend to be higher in the large cities. Thus about 61 per cent of the families in urban areas (Table V) have household expenditure which does not exceed Rs. 100 per month. The comparable ratio for the four large cities is 30 per cent. Only 14 per cent of the families in the smaller cities have total household expenditure in excess of Rs 200 monthly, while the comparable ratio for the four large cities (as shown by the Calcutta survey), places more than 43 per cent of the families in this expenditure groups. The situation is also borne out by the income distribution of gainfully occupied persons in the two groups of urban areas (Table VI). 86.5 per cent of all the gainfully employed in urban areas has a monthly average income not in excess of Rs 100/-. For the four large cities only 69 per cent of the gainfully occupied has a monthly income not in excess of Rs. 100/-. Tables V and VI also suggest that there is a larger number of workers per family in the large cities as compared with the rest of the urban area.

(1) It is not certain how typical are the Calcutta results on migration for the other three large cities. Calcutta has always attracted large migrations from neighbouring states. Also, the partition of Bengal may have resulted in an abnormally large influx from the East.

Table IV

Migration Status: Urban Labour Force

	Urban Areas		Four Large Cities	
	Employed	Unemployed	Employed	Unemployed
Non-migrants	59	57	31.5	38.6
Migrants	41	43	68.5	61.4
Rural area same state	19	14	11.6	7.2
Urban area same state	6	4	3.2	2.3
Rural area other states	5	3	25.2	10.0
Urban area other states	1	2	4.9	3.2
Pakistan	9	19	21.9	38.4
Elsewhere	1	1	1.7	.3

501-	.5	2.4
	100.0	100.0

Urban Unemployed

The unemployed seem to have a higher educational status than do the employed. (Table VII). There is some evidence too that the technical qualifications (on paper) of the unemployed is somewhat superior to that of the employed (Table VIII). A few figures will illustrate this: 48 per cent of the employed in urban areas is illiterate; 43.1 per cent is literate but below the matric level. Over 91 per cent is thus below matric. Only 21.6 per cent of the unemployed is illiterate and 60 per cent more (a total of 82 per cent) is below matric. Almost twice the percentage of the unemployed in the 'urban areas' has matriculated or has higher education than is the case for the employed.

Essentially the same is true for the large cities, although the general educational level seems somewhat higher. Thus, only 25 per cent of the employed is illiterate and 53.5 per cent more is literate below matric. Of the unemployed in these four large cities, some 10 per cent only is illiterate and 63 per cent more is literate below matric. In Calcutta, there seems also to be some evidence that the more educated have been longer unemployed. Thus, of the illiterate unemployed, some 57 per cent has been out of work for a year or more. The ratio is higher for the higher educational groups. In particular, among matriculates and people of intermediate level who are unemployed, more than 75 per cent have been unemployed

The harvest has indeed come home... for the First Five Year Plan's increase in agricultural production was estimated at 7.6 million, whereas the *actual* increase was about 11 million tons. These figures are a tribute to the achievement of Indian farmers. The Second Five Year Plan aims to diversify and increase further agricultural production. And once again, the success of the Plan will depend upon the capacity of India's farms to feed her growing population.

The harvest comes home ...as planned

Our distribution of fuel oils and lubricants to the remotest agricultural areas, helps India's farmers to do this vital job. Shell petroleum chemicals such as aldrin, dieldrin and endrin help to protect vital crops and so increase the effective yield per acre. 1,631 Burmah-Shell up-country storage depots and godowns, with a total capacity of 4,26,00,000 gallons, ensure that vital petroleum products can be made available wherever and whenever they are required.

BURMAH-SHELL...IN INDIA'S LIFE AND PART OF IT

TABLE VII

Educational Status: Employed and Unemployed

	Urban Areas		Four large cities	
	Employed	Unemployed	Employed	Unemployed
1. Illiterate ..	48.2	21.6	25.0	9.9
2 Literate below Matric	43.1	60.2	53.5	63.4
3. Matric ..	5.7	13.1	11.1	18.3
4. Intermediate ..	1.4	3.0	4.6	5.6
5. Graduate and above	1.5	1.9	5.8	2.8
6. (Not reported) ..	.1	.2	—	—
	100.0..	100.0	100.0	100.0

Technical Qualifications: Employed and Unemployed

	Urban Areas		Four large cities	
	Employed	Unemployed	Employed	Unemployed
1. Nil ..		61.3	71.4	67.4
2. Practical, no training		34.4	20.1	22.4
3. Certificate or diploma (in typing, midwifery, pharmacy, etc.) ..		2.9	2.3	4.4
4. Degree or equivalent in Engineering, etc ..		1.4	6.2	5.8
		100.0	100.0	100.0

TABLE X

Industrial States Labour Force

	Urban Areas	Four large cities
Employed:		
Employers ..	1.3	1.8
Employees ..	50.5	52.5
Own-account worker ..	32.8	24.5
Unpaid household labour	7.9	3.3
All gainfully employed	92.5	82.1
Unemployed:		
Seeking work for first time ..	3.4	9.6
Seeking work not for first time ..	4.1	8.3
Total unemployed ..	7.5	17.9
TOTAL	100.0	100.0

TABLE IX

Types of positions sought

	Urban Areas	Four large cities
Own business	25.4	14.5
1. Agriculture, etc	1.7	2.2
2. Manufacturing and handicrafts	7.5	2.8
3. Trans. service	2.4	2.9
4. Trade	8.9	5.6
5. Profess. financial	4.9	1.0
As Employee—		
Manual	39.6	43.4
1. Unskilled ..	25.0	29.4
2. Skilled ..	14.6	14.0
As Employee—		
Non-manual	35.0	42.1
1. Admn., Executive, Clerical ..	16.6	26.5
2. Technical ..	4.5	9.0
3. Medical ..	1.4	.6
4. Teaching, Law, *etc* ..	4.2	3.0
5. Others ..	8.3	3.0
	100.0	100.0

TABLE XI

Unemployed and Registration

	Urban Areas		Four large cities	
	Total	Matric & Above	Total	Matric & Above
Registered ..	27.0	43	23.0	34.4
Non-registered due to ..	73.0	57	77.0	65.6
Ignorance ..	37.9	8.3	27.3	3.8
Lack of faith ..	11.4	19.0	36.0	47.3
Indifference ..	4.6	7.2	4.2	5.3
Ineligiblity ..	2.5	—	2.6	1.1
	1.0	3.6	3.1	3.3
Other reasons ..	15.6	18.9	3.8	4.8

for at least a year. The ratio declines for graduates and above.

The unemployed seek jobs, rather than business opportunities of their own. This is particularly true in the four large cities. Here 85 per cent of the unemployed labour force seek employment, roughly half as manual workers, mostly unskilled, and half as non-manual workers, mostly in administrative, executive and clerical posts (Table IX). For the other urban areas 75 per cent of the unemployed seek employment—again, roughly the same kind as in the large cities. With respect to those seeking their own business opportunities, roughly a third in both cases wanted to establish their own trading business. As compared to the 42 per cent of all unemployed in the four large cities who sought white collar employment, 90 per cent of the educated unemployed (matriculates and above) sought work in this category. And 2/3rds of these are interested in administrative, executive or clerical positions.

To some extent, the difference in types of position sought as between the two urban groups is explainable by the difference in the employment status of all workers in the two areas. In general, 'own account' workers are a more important part of the working force in the smaller urban areas (Table X).

Finally, the two areas show roughly the same picture with respect to the registration of the unemployed on the employment registers. About ¼th of all the unemployed registered, while 50 per cent more of the educated unemployed registered. Ignorance of the registration procedure is by far the most important reason for non-registration in the urban areas. In the large cities it is lack of faith in the efficiency of this procedure, closely followed by ignorance. For the educated unemployed, the major reason for non-registration is lack of faith; this is particularly true in the four large cities (Table XI).

The Indian and Chinese Plans

Gyan Chand

IN pointing out the differences and similarities between the two plans, Dr K N Raj has some statements about the Chinese plan which need to be carefully examined in order to guard against erroneous conclusions ("The Indian and Chinese Plans', Economic Weekly, Second Five Year Plan Number, June 23, 1956). In order to understand the substance of the two plans it is necessary to take into account not only the statistics of investment, production and income but also their social content, the motive forces and the momentum which they have developed and are developing. Statistics of both the Chinese and Indian plans are in varying degrees based upon somewhat insecure foundations and the Chinese statistics are known to be even less satisfactory than the Indian statistics and it is not possible on the basis of the available data to evaluate their authenticity, validity or comparability. We have, however, to take them at their face value; and if we want to compare the targets or achievements of the two plans inspite of the wide margin of errors in their statistical framework, we have to use available statistics for whatever they are worth, without imputing to them a significance which is not inherent in the facts of the case.

China's Handicap Much Greater

In comparing the two plans we have to take the relative standpoint and realise the serious handicaps under which rehabilitation and development of the Chinese economy had to be undertaken. A complete derelict economy, grieveously damaged by twenty-two years of war and civil war and in a state of utter prostration owing to the after-effects of hyper-inflation, breakdown of the administrative apparatus and sheer material and moral exhaustion, has not only been rehabilitated, but has acquired capacity for rapid growth from within, has provided for almost entirely from its own resources large accumulations of capital and an impressive scale of investment and, what is far more important, has given its people self-confidence, resourcefulness and faith in their stability and future. This result has been achieved in spite of the Korean war, the necesssity for enormous defence expenditure owing to the serious dangers to which China is known to be still exposed and internal stresses due to the legacies of a completely corrupt regime.

We, too, have had our severe post-Independence strains and it is a matter of real satisfaction that we have been able to face and in a large measure overcome them with success. But it is undeniably true that China's ordeals have been much greater, and when we are looking for differences and similarities between the plans of the two countries, we should bear in mind the whole background of the programmes of the planned development of the two countries and take into account not merely its statistical plan-frame but its real meaning in relation to the nature and magnitude of efforts which have gone into its introduction and implementation and to their realized results.

Proportion of Investment

Dr Raj takes the first year expenditure to be Rs 1600 crores in Indian currency and outlay on capital construction Rs 960 crores; and on the assumption that the total national income of China in 1952 was Rs 15,000 crores (according to him calculated on 'somewhat heroic assumptions'), has concluded that the rate of investment of the Chinese economy was about 11 to 12 per cent, after making allowance for increase in investment in later years. Even the total estimate of prospective investments in India are based upon assumptions, which, though less heroic than those of the above estimate of the Chinese national income, are nevertheless speculative in a significant degree. We have no really authentic estimates of Chinese national income which can be taken as fairly valid, and it is not possible to work out independently the proportion of investment to national income.
