Mills and Hand-looms

LALA SHRI RAM does not join the great debate on productivity and employment, but to the most important sector of the controversy, namely, cotton textiles—how much of it is left, once this controversy has been settled?—he has two points to contribute. One is technical. Now, idle capacity anywhere, and not only in the textile industry, is a social waste. That such idle capacity, wherever it may exist, should be utilised is accepted on all hands. In fact this is what gives the strongest support to the case for hand-looms. The usual explanation for the existence of idle capacity is market imperfections of one sort or another—bottlenecks and non-availability of transport, labour and raw materials or deliberate restriction of output in order to maximize profits. So if there is unutilized capacity in the mills, economists would not be wanting who see in it an attempt to fleece the consumers. The relative movements of prices of raw cotton and cloth, particularly of the finer varieties, will support this interpretation, assuming the existence of idle capacity as real

Speaking at the Annual General Meeting of the Delhi Cloth Mills, Lala Shri Ram said that this was a mere figment of the imagination. To quote his exact words:

"May I, with whatever experience I have had during the last 50 years, say that there is a very big number of mills where the machinery is in such a bad state of repair, and so old and inefficient, that it would be impossible to increase the shifts, except, perhaps, in a mill or two here and there. In fact, if these had been in a position to run extra shifts, they certainly could have done so even now when the margin of profit is certainly above the average."

Further expansion of mill production, therefore, will involve heavy investment. To this extent, his case is prejudiced, once it is agreed that investment should be canalised to the maximum extent possible according to priorities that have been planned.

The case for hand-looms, Lala Shri Ram is willing to concede. In fact, he is on very firm ground in advising the country not to rely on the Ambar Charkha, at least not for the second Plan period, if we are really serious in our intention to rehabilitate hand-loom weaving. For the first casualty of shortage of 'free' yarn will not be consumers of cloth but the hand-loom weaver. The political pressure behind Ambar Charkha can hardly be exaggerated. The technical merits of this invention, which is expected to revolutionize spinning, however, remains to be established. The administrative feasibility of introducing the Ambar Charkha and organization of spinning on an India-wide scale is so formidable a task that even Pandit Nehru shrinks from it. But for the advocates that it has found in the Cabinet, the proposal is too fantastic to have deserved any serious consideration strictly on its merits.

There is much ignorance among economists and others about the actual working of the rural sector. This is frankly admitted, and until very recently, no systematic attempt has been made to study the facts and collect statistics. The hand-loom industry also, along with the rest of the rural economy, it may be justly complained, has suffered from neglect. But this neglect in its particular case is only in matters of rehabilitation, administrative and financial. It would be wrong to suggest

that the study of hand-looms has also been neglected. On the contrary, there has been a considerable volume of literature on this subject. Many careful and scientific enquiries have been carried out on its actual working. Though remedial measures may not have been taken, it would be idle to complain that ignorance lies at the root of this failure. All these studies, the general consensus of opinion and universal experience combine to support two propositions viz hand-loom weavers must have a steady supply of yarn at reasonable prices and they must also have a market. The latter will be taken care of, even without reservation of lines of production, whenever there is scarcity of cloth, and scarcity is a relative term, depending on the means of purchase put in the hands of consumers which means the entire population of the country. Anything, therefore, that jeopardises the supply of yarn, the vital requirement of hand-loom weavers, can bode no good to our largest cottage industry.

This is not to suggest that spinning has necessarily to be centralized. A measure of decentralisation is possible in spinning also, but that will take time and much effort, and can be taken up after some progress has been made in building up the industrial base of the economy. The experience of khadi during Gandhiji's life-time as well as in the last seven years of Congress Government should at least open the eyes of Congressmen who should to-day find a useful field of activity, instead of wasting their time and energy in chasing fancy solutions that run counter to both reason and experience. The one single measure which will help hand-looms most is the establishment, as expeditiously as possible, of ten spinning mills, preferably in the public sector.

Accepting the case for hand-looms, the controversy boils down to this: Should we watch and wait to see how hand-loom production comes up, after it is given all assistance short of a ban on mill production, and hold the ban in reserve, to be imposed only when it is found that hand-loom production can take up the slack? Or should we start with the ban and wait for hand-loom production to come up, leaving it to the future to relax restrictions on mill production if it is found necessary to do so at a later stage. The latter course, Lala Shri Ram contends, would be dangerous because, among other reasons, mill production cannot be controlled by traffic signals and made to stop and go at short notice. This puts an entirely different complexion on the problem, particularly when dependence on textile exports has been made so much greater by the yawning gap likely to be left in the balance of payments by the second Plan. True the Draft Plan-frame does not contemplate any restrictions on mill production for export, but expansion exclusively for export may not be a feasible proposition, administratively.

The controversy, it may be confidently believed, will lose its sharpness and edge pretty soon when expenditure on the scale now being planned begins to be incurred. The present demand for cloth is an indication which way the wind may blow. The country should be able to absorb comfortably the production both of the mill industry and of hand-looms. This optimistic view of the situation is not unwarranted by facts.

The hard core of the problem, however, is different—viz the saleability of mill cloth and hand-loom products, side by side, when consumer preference is decidedly for the former. Division of markets does not go very far in resolving this conflict. If the claims of employment and economic growth are to be reconciled via hand-looms, and division of markets, by which products of hand-looms can be made to complement mill production, proves inadequate in practice, the final solution will have to be some sort of controlled distribution. Consumer preference may have to be interfered with to the extent necessary for maintaining employment in an important sector of the rural economy, by rationing out cloth in some fixed proportions of mill and hand-loom products. The solution will not appeal to many, least of all to the present administration. But unless the Planning Commission is prepared to face the issue squarely and take the bull by the horns, so to say, it will have to modify its present attitude to the textile industry. To ensure a sheltered position to the mills by freezing competition and guaranteeing them a market far in excess of their current production capacity, would be offering them a reward without asking for a return. The possible impact of such a policy on textile exports is no less dangerous. This has been pointed out by many and very forcefully by Lala Shri Ram: "A home market in which supplies are short and prices are rising will necessarily divert supplies from the export to the national market".

The Draft Plan-frame was only a draft. Months have passed since it was presented. The Planning Commission has not made any progress even in working out the implication of what it wants to do. Flying in the face of logic and facts is no way of working out a Plan.

Dualism in Congress

FREEDOM without social and economic progress is a shadow without substance. To-day, for the first time since independence, there is awareness within the country that first things must come first. International developments have helped New Delhi to assess problems in their proper perspective. Peace has not yet dawned on the world. But the "Geneva spirit" persists. There are ominous implications of a "hydrogen stalemate". But hope lingers that disputes will not be settled through use of force, but by peaceful negotiation. As fears of a third world war have receded, undeveloped countries, including India, have gained hope that their efforts to ensure plenty will not be hampered by diversion of resources for war purposes. Gradual evolution of a "Point Four" Programme by Russia is the most tangible outcome of the "Geneva spirit". Under-developed countries are hopeful that they will be the major beneficiaries of competitive co-existence.

Once it is realised that world peace is an essential condition of economic progress in undeveloped countries, India's peaceful foreign policy will be better appreciated. Her foreign policy has helped the creation of a more congenial international political climate. Internal developments have emboldened New Delhi to frame a bolder second Plan. Achievements of the first Plan are impressive. Attainments of the last five years have deepened the conviction that much more can be achieved. When at the beginning of last year, Congress re-defined its aim at Avadi, it was hesitant in its approach. But the popular enthusiasm evoked by Avadi encouraged Congress to spell out its new policy. Industry was

162482
2
XM2.N49E N49-8

and is, combative. Economic experts warned New Delhi that the ambitious targets could not be reached. But the popular response and enthusiasm leaves no choice to New Delhi but to plan boldly.

Congress is not a Socialist Party. But the social and economic legislation during 1955 indicated the political pressures which were goading it to implement its avowed aim of ensuring a "Socialistic pattern of society". Zamindari had already been abolished. In the year, legislation was passed to restrict the rights and powers of managing agents. This attempt at industrial reform matched the aims of Congress to introduce agricultural reforms. Congress decided to expand heavy industries and mineral resources through the public sector. Plans for providing employment through development of village and small-scale industries were formulated.

Decentralisation, not only of the economy but also of the polity, is an essential principle of social issue. New Delhi's acceptance of the basic recommendations of the States Reorganisation Commission was the political counterpart of economic decentralisation. Congress was wise to acknowledge that the formation of linguistic States was not a threat to the unity of the Republic. Nor was it an obstacle to planned economic development. Both the sense of common citizenship and the popular response to the second Plan should be encouraged as the urgent social, political and cultural aspirations of the people are fulfilled. Even as New Delhi has got over its infant State bogey, the debate in Parliament on the reorganisation of States has dispelled fears about any threat to the territorial integrity of the Republic.

It is as well that India starts the second Plan with some of the basic social, political and economic implications of Socialism well under process of implementation. There are certain aspects of the second Plan which are not beyond controversy. In its emphasis on "household and hand" industries, it carries decentralisation to its illogical extreme. Estimates about the resources for the Plan reflect either the lack of conviction of Congress in its avowal of Socialism, or its confusion that it has not the prestige of a national, popular Government. Basic aspects of the second Plan are not directly under discussion here. But the inherent political contradictions within Congress have economic projections which are not without significance.

Congress has been accused of timidity in framing the first Plan. It is under no such political or economic limitations now. Unlike the first Plan, the second Plan has not been hastily prepared as a vote-catching device. Cynics may discover electioneering tactics in the Government's acceptance of the recommendations of the Karve Committee as well as of the Plan-frame's emphasis on "household and hand" industries. But there are deeper political compulsions behind the Congress policy on employment. Unemployment is a menace to social, political and economic stability. Elimination of unemployment is a desirable aim. But the means approved by Congress to achieve the end underline the wrong political and unrealistic economic approach to the problem. Congress equates itself with the country. But on all crucial issues since independence, it has been led by the people, instead of leading them.

It would be idle to pretend that the democratic inclinations of Congress compel it to behave as it does. Congress to-day has no political rival. Communists have been outmanouvred. Socialists are ridden by dissensions. Communal organisations like the Hindu Mahasabha have lost popular support. Congress, under the leadership of Pandit Jawaharlal Nehru, has not been unsuccessful in discrediting its political opponents. Congress is for a secular State. Both Communists and Socialists have lost popularity as Congress has enunciated its aim of implementing a "Socialistic pattern of society". Its negative achievements are impressive. But its inability as well as unwillingness to pursue a positive Socialistic policy reflects visibly the pronounced duality in the Congress Party. This may not prevent Congress from ruling the country for five more years. But unless Congress proves that it is sincere in its intention to ensure a "Socialistic pattern of society", it may not be returned to power in the elections after the coming general election. Within the next five years, Congress must demonstrate its sincerity by deeds, and not by words.

Is it Name that Matters?

ACCORDING to Professor M S Thacker, Director of the Council of Scientific and Industrial Research, Government of India has decided to establish in the quickest possible time a 'Scientific Civil Service'. The purpose of doing so, says the Professor, is to ensure that scientific talent in India is economically secured and absorbed in the field of science rather than be wasted in administrative services.

Few will dispute the urgency of utilising the scientific talent available in the country to the best possible advantage. There will also be general agreement on the need for provision of extension facilities to training and research institutes. But why a 'Scientific Civil Service'? Surely if the object is furtherance of scientific knowledge, it could be done by other ways than creating a hierachy of officers and assistants. If it is a question of guaranteeing an adequate and secure income to those who waste their time and energy for widening the frontiers of knowledge, it could and should be done converting them into a bureaucracy. But apparently, the term 'Civil Service' has a strange fascination to the elders in this country; and they can measure the adequacy of the apparatus for achieving desired objectives only by the extent to which it resembles the hoary Indian Civil Service of yore.

Annual Number 1956

THE next Annual Number of The Economic Weekly will be issued on January 26, 1956, and will contain a minimum of 120 pages bound neatly in art cover. It will be priced at Rs. 2|8|- per copy.

This bumper issue will highlight the major questions of policy and analysis that arise in connection with India's Second Five-Year Plan. The size of the investment budget, the widening gap in resources, policy in regard to large and small scale industries, the employment potential of the next Plan—these and many other related issues will be adequately covered.

For details regarding advertising space in the Annual Number, please contact the undersigned.

Business Manager

Weekly Notes

No Flouting of Bank Award

THE bank employees' dispute has dragged on for years and in the process it has assumed, quite without justification, a national importance which is the result of an accident. Had not the dispute been treated on an all-India basis right from the beginning, bank employees would not have attained the position which they now occupy. Apart from the inconvenience caused to the public and the disturbances to business and trade, the dispute is holding up one of the major nation building efforts in the shape of planned expansion of the State Bank. Even without the dispute, the State Bank would have found it not so easy to transform itself from a commercial bank into an effective instrument of social policy for decentralisation of the economy. It is difficult to take over a running institution and inject into it the Avadi spirit overnight. Old hands who had joined the bank for a good salary may not find the change congenial and volunteer readily for a life of plain living and high thinking. And yet the ceiling on personal incomes that it has in mind and the maximum salary that the Government of India has fixed for new entrants set a standard that has to be enforced, albeit gradually, in all State run institutions. The mixedness of the economy here presents a particularly knotty problem. Bank managers are bank managers; can they be expected to agree readily to different scales of remuneration for doing the same kind of job? Other joint stock banks feel no compulsion yet to conform to this standard; why should the employees of the State Bank alone do so? Disgruntled foremen and discontented workers are not the best material with which to launch the largest so far socialized institution in the country and the State Bank has a big bill to fill—opening of hundreds of branches and erecting the frame-work that will 'institutionalise' agricultural credit.

Turning to the lowlier situation, it may not be just as bad, for it does not hold up development, but it is bad enough, for it makes day-to-day working troublesome. The hope that the Industrial Disputes (Banking Companies) Decision Act passed last year and the subsequent Award would end the long drawn dispute between banks and their employees have now vanished. Employees of most of the banks all over India went on strike yesterday in protest against the 'cut' in their emoluments effected under the terms of the last Award. The situation in Calcutta has been quite alarming. Clearing of cheques has been suspended since the beginning of the year and cheques worth about Rs 52 crores remain uncleared as banks are unable to cope with cheques received by them due to "frequent strikes and shortage of clearing staff". The difficulties created to the public in general and small accounts holders in particular can be well imagined.

It is really surprising how such a situation was allowed to develop where bank employees can hold the entire community to ransom. There cannot be two opinions about the 'illegality' of the strike. If any point in the implementation of the Bank Award Commission Recommendations is disapproved by the employees, it can be referred to the Tribunal machinery already provided for. The decision of the employees to resort to 'direct action', instead, is unsupportable. The well wishers of the employees should advise them to keep to constitutional methods. They have lost public sympathy by going on pendown strikes. The banks had a prosperous year as forecast by the Bank Award Commission. So some of them can afford to be a little more liberal in their interpretation of the Commission's recommendation. But it does not follow that bank employees can flout the Award with impunity.

Distribution of Key Imports

THE import licensing policy announced for the first half of the year does not deviate from established lines. Changes, therefore, mostly minor, are in the direction of giving effect to principles introduced and established in the earlier licensing periods. Thus, substitution of imports by domestic production wherever possible has led to a reduction of quotas for a group of imports in pursuit of the principle of giving special attention to small-scale industries which was initiated in the second half of 1955, quotas for a number of small tools like milling and gear cutters, reamers, twist drills and carbide tipped drills have been raised and licensing for these items has been transferred to the ports.

Higher industrial production in the country has made larger imports necessary in the case of others, such as card cans, packing and wrapping paper and mutton tallow. Agricultural development has been maintained well enough to absorb the domestic production of diesel engines, and this has made it possible to license the imports of special types of 3-10 H.P. electric motors which are required for agricultural purposes.

The most notable feature of the new licensing policy, however, is the extension of the scheme of canalising imports through approved channels. The success of the experiment carried out last year with soda ash has encouraged this step. Auctioning of licences for imports for which the demand is so keen that re-sales at a premium are inevitable has often been suggested. The present situation is not favourable for trying it out. In any case, the experiment can be tried only in the case of luxury consumer goods and of these, we are not importing many. When the import in question is a raw material of industry, obviously this device would be of no use. Hence the scheme inaugurated last year of purchase by foreign tenders, that is, at the cheapest price and controlled distribution to actual users through approved agents. In the case of soda ash, which was selected for controlled distribution last year, I C I and TOMCO, the distributors for Tata Chemicals, agreed to act as agents. Purchase abroad was made through tenders. Curiously enough, East Germany got the order in the first half of the year, its tender being the lowest, and China succeeded in the second half. I C I was also given a small quota. As a result, actual consumers, mostly industrial users, got their soda ash at a reasonably fair price on the whole. And speculative holding of stocks was largely averted.

The Ministry of Commerce and Industry has decided to bring raw rubber, caustic soda and sodium bicarbonate under this scheme in the current licensing period. The basis on which the imports of these items will be canalised, however, still remains to be determined but it may be presumed that the same principle will be followed as in the case of soda ash.

India Steamship to Quit ?

THE two hardy perennials in Sir A Ramaswamy Mudaliar's address to the shareholders of India Steamship at the Annual General meeting are of course delay in ports and difficulties of membership of various conference lines. Of these two, the latter, it now seems, may drop off! Not that the conferences are going to accommodate India Steamship any better, India Steamship may drop out from the conferences. Referring to the ban on picking up cargo from intermediate ports, Sir Ramaswamy said:

"We have attempted time and again to get a reasonable settlement of this question but so far we have failed to get any results from several of these Conferences. I feel that the time has now come when with due regard to our convenience and interest we must make our entry into these routes irrespecttive of whether members of such Conferences desire it or not".

These words can mean nothing less than that if the India Steamship found entry into Conference lines difficult, continuance of membership appears to be even more difficult. The experience of India Steamship, as is well known, has been unfortunate. In the economics of shipping as it has come to be ordered out, economies of scale favour only the owners of large fleets who can deploy their fleet in a manner to profit from rather than be handicapped by the severe restrictions under which the Conference lines operate. The very same restrictions turn out to be baffling obstacles for the smaller companies who have yet to establish themselves and cannot get full load from terminus to terminus and are yet debarred by the rules from picking up cargo from intermediate ports. The result is perpetuation of idle capacity for some and dull loads for others. India Steamship, unfortunately, falls in the first category.

To be quite correct, all this is by no means implicit in the economics of shipping as such, but happens to be the features, and unchangeable features, of the arrangements made by the happy family to keep all the shipping to themselves.

Flag Discrimination

SIR RAMASWAMY has also grave misgivings about any eventual solution of the problem of dock labour that may be put in force on the recommendation of the Committee of which he was himself a member. The employers, he has no doubt, will abide by whatever decisions are made in this regard and will also loyally carry them out, but he is not equally sure that the present labour leadership will also do so. Therefore, the only solution, and that is also the most urgent need of the hour, is the right kind of leadership of labour. True, he closes this part of his address with the hope that "with a Minister of Labour so well aware of labour conditions, it will be possible to install such right leadership everywhere", but he does not seem to share the conviction that a change of leadership is in the offing.

There are conferences in which Indian shipping, and hence the Indian viewpoint, is not represented. "I trust", Sir Ramaswami concludes, "that the second Five-Year Plan will make adequate provisions to bring about a better balanced position for Indian shipping in the world picture of shipping." Frequently, false accusations and statements are made about flag discrimination by Governments anxious to promote the nascent shipping industry of their countries. Such accusations have been made against New Delhi. Sir Ramaswami suggests that these unreal allegations and statements should be ignored, and that Indian delegates, even if they attend such conferences, "should not take part in these futile and meaningless debates and discussions".

Two ships were added to the fleet of the Company in the year to March last. Two more ships have been ordered. During the next five years, the directors hope to add at least one ship a year to the Company's fleet to reach the target of 18 ships by 1960. Sir Ramaswami acknowledges that the Government is offering considerable aid by way of loans. Despite adverse factors, "the financial position of the Company remains heealthy". Sir Ramaswami expresses the hope that the additions to the Company's fleet "will improve the freight results substantially".

Malayan Talks Fail

IT would be hasty to blame the Malayan Communists for the failure of talks. Terms offered by the Chief Ministers of the Federation and of Singapore left no room for compromise. The attitude of the Chief Ministers would seem to suggest that they were not interested in reaching a just and honourable settlement. Atrocities committed by the Communists cannot be condoned. But it would be unrealistic to expect them to accept abject surrender. By inviting the Communist leader, Chin Peng, to discuss the terms for a settlement, the two Chief Ministers conceded, by implication, a political status to the Communists. Their outright refusal to recognise MCP was, therefore, a calculated diplomatic rebuff.

Two factors may have provoked the Chief Ministers to be uncompromising in their attitude. Britain strengthened their bargaining position by her announcement that continuation of the emergency will not be allowed to delay the promised transfer of power to the Federation of Malaya. With such an assurance, the Chief Ministers of Malaya and Singapore could afford to be unyielding in their demands. Both the Chief Ministers are heads of governments chosen by the people. During the talks, both made it evident that each represented the people. In agreeing to participate in talks, Chin Peng recognised the representative status of the Chief Ministers. Whether they were wise in not reciprocating Chin Peng's overtures, is a different matter.

It was the presence of the third party by proxy that caused the failure of the talks. Both Mr Marshall and Tengku Abdul Rahman bay be the chosen leaders of the people. But neither Singapore nor Malaya yet enjoys independence. In dicitating their terms to the Communists, the two Chief Ministers implied that they, as the peoples' representatives, had the right to demand acceptance of their conditions. Chin Peng's refusal to accept the terms was not unconditional. Confronted with the demand for surrender, Chin Peng was diplomatic in making a concession in his counter-proposal. He promised that the Communists would "lay down their arms and disband their forces" as and when the Tengku Government assumed control over internal security and the local armed forces. Evidently, the two Chief Ministers did not like to be reminded that neither Malaya nor Singapore was yet an independent entity.

Malaya is a multi-racial country. There is a huge Chinese population in the Federation. Though the Tengku Government was elected mainly by the vote of Malays, the Communists are mostly Chinese. This racial aspect of Malayan politics was implicit in the two Chief Ministers' categorical demand that

the Communists accept investigation of their loyalty. It will be recalled that Singapore's Chief Minister had accused the Communists that they were fighting for Communism, and not against colonialism. There is a distinct danger that the failure of talks may precipitate a racial conflict in Malaya. Whether the Malayan problem can be solved in a manner indicated by the two Chief Ministers is doubtful.

Tests for Selection

WITH the elections in view, and also perhaps with no little awareness of the jockeying for seats that has already begun, Pandit Nehru has suggested certain principles to guide the selection of candidates for the Congress party. He wants adequate representation to be given to minorities; and he would like women to be returned in 'as large a number as possible'. No one would be entitled to selection just because he had been a sitting member. He would be judged by the work he had been doing as a legislator. Communal, caste or sectional considerations are to be kept out, and the choice must fall on the best candidate available. The most important test prescribed by Pandit Nehru relates, of course, to the political outlook of the candidate seeking selection. "Only those persons, who believe as an article of faith in the Congress ideology and a socialistic pattern of society, should be given Congress tickets."

If one remembers aright, Pandit Nehru did speak of certain guiding principles before the last elections also; and though minority communities might not have been neglected, women got scant attention. As for the record of services rendered by the candidates selected, the period of their association with the Congress or the degree of their devotion to the organisation and its programme, one wonders whether it was these considerations rather than the appeal of the candidate to particular voting groups or the adequacy of his resources that finally decided the selection except in a few outstanding cases. History need not necessarily repeat itself; but the exigencies of election are such that the final verdict can come only after the event.

Some of the principles put forward by Pandit Nehru are easily workable no doubt. But are those in charge of the selection of candidates, particularly in the States, likely to be actuated by the same high motives as Pandit Nehru in the heat of electioneering and the anxiety to win as many seats as possible for the party? Apart from the supreme lure of being in a position to exercise power, there is also a sort of rivalry among the top State leaders to outdo one another in the wresting of electoral trophies, which was blatantly evident in the last elections.

There is one test, however, obviously the offspring of Avadi, suggested by Pandit Nehru this time, which challenges attention as to its practicability. It is no doubt a test which few Congressmen can cavil at if the Party's conversion to the Avadi resolution is as real as its frequent protestations make it out to be. And even though Congress may be taken to be irrevocably wedded to the ideal of promoting a socialistic pattern of society, it is questionable how many of the more prominent State leaders themselves, not to speak of the rank and file, have taken whole-heartedly to it. In these circumstances, it would be interesting to see whether it is only or largely those who have made the socialistic quest an article of faith or rather such as subscribe to that convenient version of the quest that commends itself to a particular regional boss or only such as just burn incense before him, innocent of all ideological inclinations—it would be interesting to see which of these will figure prominently in the selection.

In any case, there is no wholly dependable means of probing into the workings of a candidate's mind; and he would indeed be a most indiscreet candidate for selection who does not seemingly adapt himself to the prevailing wind, particularly on the eve of elections, whatever his inner feelings may be. Whether such easy conversions or superficial conformism will be a reliable factor in Pandit Nehru's drive for a substantial transformation of the present pattern of society and life in the country is a question that eludes immediate answer. Indeed, as in the past, it may be only his own insuperable will and the awe which his position and personality undoubtedly command that may well have to be the decisive factor in the years to come too. And that can hardly be a source of adequate solace to those who are in a hurry to spark a non-violent revolution in the land.

While the City Sinks

THERE is tragic irony in the fact that while politicians are at one another's throat, statesmen hardly get any sleep, constructive thinkers are at their wit's end and the whole country is not a little exercised over the future of Bombay, the City on its part should be sinking little by little into the sea. Anyway, that is what Dr W D West, Head of the Geology Department of Sagar University, thinks, and he should know a thing or two about the relative stability of the odd linguistic bits we have all been quarrelling over. According to him, there has already been some subsidence, thanks to geological changes around the Bombay island; and the process he thinks will be completed in a few thousand years. Maybe, at the rate at which the earth around has been lately registering tremors under the impact of linquistic fury and fusillade, the island will be put out of its misery even earlier. But this lacks the geological support of Dr West.

Living in Bombay, one had somehow come to feel that the City would not only live, but also keep on growing bigger and bigger, for ever—with only the sky as the limit, if any, in space, and the next deluge as the only possible limiting factor in time. And one should not be surprised if this overwhelming sense of stability and the exhilaration of never-ending growth and prosperity have had not a little to do with the mounting intensity of the desire in various quarters to cling to it at all costs. Now that Dr West has knocked the very bottom out of this fond illusion and given only a few thousand years for the island to exist through various stages of gradual descent into the sea, it may well be asked whether there will be a better sense of realism all round. There is no indication of it yet; but should it come, Dr West may yet be hailed as one who made the most tangible contribution to the solution of the dispute over Bombay. And he may even be thanked for saving the City from human wrath—in advance of its final dissolution in cold sea water.

Off the Record

More Light on Rural Economy

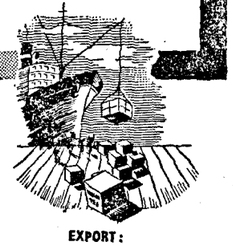
IF Lakshmi is inconstant and capricious in dispensing her favour, the Goddess of Learning also has her whims and can sometimes be ironical. Knowledge may spring from the most unexpected quarters and our economists may come to know more about the actual working of our rural economy—that inadequately mapped hinterland, variously described as pre-industrial, a-capitalistic or unorganised sector of subsistence economy—from Britain's dollar shortage. This is a plausible and permissible deduction from Professor Ganguli's address at the Economic Conference at Poona. The President called upon our economists to turn back home and get to grips with the reality around them. Prof. Ganguli himself went back to Ranade and Dadabhai Naoroji, to the first for perceiving clearly that the postulates of classical economics furnished "no suggestions" as to "dynamic progress or development" and to the latter, for grasping the basic truth about 'transfer loss' in his treatment of home charges as a drain on India's resources. Again from Ranade, he got the basic postulates of the Indian economy—the immobility of factors, partly for obvious social reasons and partly ordained by facts of geography. Cairnes had it long ago that exchange between non-competing groups could only be explained in terms of the theory of international trade and that theory, properly elaborated, can illuminate many obscure patches of our rural economy.

That Prof. Ganguli happens to hold the Chair of International Trade in the Delhi School of Economics has nothing to do with all this. He has no inhibitions against poaching on others' ground. Nor does he object to others doing so, in fact he invites others to help themselves and offers to them his own discipline as a key that will unlock many of the mysteries that have been baffling them. The concept of transfer costs, he suggests, will explain much of the stagnation of the rural economy. And the theory of protection to infant industries will put a powerful weapon in the hands of the supporters of hand and house-hold industries.

There is much more in Prof. Ganguli's address which began with an argument for the recognition of groups as units for explaining patterns of economic behaviour, to replace the present atomic structure of theoretical economics, aggregative thinking in terms of atoms being not only unrealistic, but unmeaning. In a serious rethinking of Indian economics, one has to begin with group behaviour on the one hand and significant orders or sectors on the other. Aggregation of atoms has definitely to be discarded. If this is done, it will be found that "the argument for protection on the basis of uneven economic development due to lack of diversification of occupations" can be extended to rural industry, with only this difference that we are considering in this case two broad sectors of a certain country, and not two countries, with a wide disparity in their standards of living. The concept of Terms of Trade applies neatly to the study of rural-urban economic relations.

"Lastly, a point that is made with regard to poor countries, viz., that freer trade causes an increase in their propensity to import and consume and leads to maldistribution of income, slows down progress and may also cause social tension and inflation, is also a valid point in the context of the economically depressed rural sector."

This is a powerful argument to reverse the prevailing currents of thought and turn them homewards but it is also a sad reflection that economists are wise only after the event. The owl of Minerva takes her flight only in the evening!



Of course, in a gathering of academicians, the learned professor naturally put all this in terms of approved methodology when he suggested the application of the principles of international trade to a study of our rural problems, commending as a model Hicks's latest formulation of the theory of value in similar terms.

No one would suspect that dollar shortage might be at the root of all this re-thinking but it might well be and probably it is. In his Drummond lectures, Prof. Hicks offered an explanation for Britain's dollar problems in terms of dissimilar rates of growth of the British and American economies. Prof. Williams had suggested it earlier in his Stamp Memorial Lectures. This is presumably also the economic theory behind the Colombo Plan.* It appears plausible enough that the concept of relative rates of growth might throw fresh light on the causes of the stagnation of our rural economy, of capital formation at the urban end and disinvestment at the rural end which have remained obscure.

This incursion into forbidden territory for non-academics may now be placed along-side the theory that has so long held the field based on Rosenstein-Roden's celebrated solution for the economic development by starting production along several lines so that a market may simultaneously be created for each line of

*Discriminatory Restrictions and the Dollar Gap. By A K Dasgupta. Essays in Honour of MacCall, Economic Weekly, June 1954.

India's Tea-India's Wealth

EXPORT:
During 1954 India exported 450 million pounds of tea. This is more than 2/3 of her total production. Exports were directed to Great Britain, United States, Eire, Canada, Egypt, Continental ports, Turkey, Sudan, Australia, New Zealand, Iran and other countries.

PST 134

production. The basic idea here is that of extension of markets; one can read it into Marshall's external economy. Allyn Young did that and one could of course trace it farther back to Adam Smith: "Division of labour is limited by the extent of the market".

All this is away from the aggregative thinking in which our younger economists have wallowed so long and points to the firmer ground of traditional analysis, but not in terms of its atomic structure and by no means to reach the same traditional conclusions.

* * * *

In his address to the Agricultural Economists' Conference, which also met in Poona at the same time, Prof. Anjaria served an entirely different kind of fare, which again was refreshingly different from what is usually served on such occasions. The President himself was an interesting study, not in split personality—I would not say that, his loyalties are beyond reproach—but in plural personality. There is nothing like leather and as an agricultural economist, he would like to grab as big a share of the Plan for the agricultural sector as he could get. But happily, he was not representing the Agricultural Ministry. In fact, as the Economic Adviser to the Ministry of Finance and even more, as the chief of the Finance Division of the Planning Commission, it is his job to hold the scales even between rival claimants and he could see, and was quite frank about it, that the development of agriculture needs larger and larger investment in the other sectors of the economy, particularly in the industrial sector, so that through the steadily increasing demand for agricultural produce and simultaneous withdrawal of labour into industry, smaller numbers should be left on land, with resulting improvements in the organisation of farming and productivity in agriculture.

Indeed, not being in the Agricultural Ministry, he could do more. And though still a Government Economist, as President of the Conference, Prof. Anjaria allowed himself the freedom to survey the agricultural scene and remarked on the "debacle" that tenancy reform had led to. True, legislation had been passed by many States to protect the tenant, but such legislation had woefully miscarried. At least the results were often the opposite of what the law had intended. Why be surprised? There had been a spate of legislation from the depression years of the early thirties onwards to restrict the rate of interest charged by money-lenders. Yet, the Rural Credit Survey carried out by the Reserve Bank of India reported that cultivators had usually to borrow at 30 per cent or more! If that was the state of affairs in money lending and if the peasant has still to pay these rates of interest for credit which he cannot do without, is it surprising that he would have to pay a heavy price for the right to cultivate? Where the legislation had miscarried was both in the right given to owners to resume land for self-cultivation—this is particularly troublesome to define—and in making the owner the direct recipient of rent, whether the rent be fixed in terms of money or of produce. It is useless to reduce the upper limit for rent by law, instead of conferring the right of collection of rent on the State. The Bombay Tenancy Act has done just that.

* * * *

We will soon be getting to know something about the actual state of affairs regarding the position of tenants. By this, I mean the tenant at will or the share cropper. The term means something very different in permanently settled areas where Zamindari has now been abolished. The Gokhale Institute has completed a survey of tenancy in the Bombay State. The National Sample Survey in its last round also included the status of tenants in its questionnaire. The results of both should be available in the near future.

This poses a question. The enquiry into the conditions of agricultural labour was conducted in 1950-51; many things have happened since then. What has been the impact of these changes on the conditions of agricultural labour? It is important to know, if the Second Plan has to fulfil what is expected of it by way of rural rehabilitation. There is, therefore, a clear case for another enquiry. This time, however, the mistake need not be repeated of isolating agricultural labour from the rest of the rural economy. After all rural economy is a complete whole in itself, and no enquiry would serve the purpose fully unless the whole of it is covered. If the theoretical explanation to which the President of the Economic Association pointed the way and further elaboration of which has been set for the next conference make some headway in the meanwhile, by the time the results for the fresh survey are in hand, we should get to know something about the workings of the rural economy.

The Autumn Crisis - New Facts

THE **National Income Blue Book** which is just out and the new estimates of savings and investments given in the current issue of the **London and Cambridge Bulletin** have brought out some new facts which explain the underlying causes of the Autumn economic crisis. The facts now brought out also show how inadequate are the measures proposed by Mr Butler in his Autumn Budget. The crisis, it would now appear, was due to the high level of internal investment, and not to what up to now has been regarded as the main cause viz the current level of consumer expenditure.

In the case of a crisis in the United Kingdom, the impact of a disequilibrium in the internal economy is quickly felt on the balance of payment front. The sharp increase in the trade deficit which in the months of April-September 1955 was running at a monthly average level of £74 million compared to £51 million in the same period a year earlier, is now seen to be largely due to the sharp increase of some 31 per cent in the import into the United Kingdom of manufactured and semi-manufactured goods, in particuar steel, steel products and non-ferrous metals. The increase in the import of foodstuffs has not been all that remarkable; neither has there been any considerable diversion of consumer goods exports to the domestic market. What is significant in the data given in the **Blue Book** and the **London and Cambridge Bulletin** is the sharp increase in the volume of investments that have taken place in the country. It is estimated that in 1955 the total investible resources made up of savings, depreciation, capital grants and transfers from overseas) will amount to £3,155 million at current market prices, or about £2,230 million at 1948 market prices. Of this, over £2,000 million (at 1948 prices) is going into fixed capital formation—the larger part into new plant and machinery and building. In other words, out of a total gross national income of just over £14,000 million, some 16 per cent is being made avaiable for fixed investment.

Domestic fixed capital formation is thus taking a large chunk of these investible resources and is leaving very little for the accumulation of stocks of material, foreign investment and addition to the gold reserves. In an article in the current issue of the **District Bank Review,** Mr Harrod, therefore, rightly comes to the conclusion that "It is difficult to see how any responsibility for current pressures can be attributed to the current level of consumption". On the other hand, he believes that what appears to have happened since 1954 was that Britain 'went into a strong boom in industrial investment of a type long familiar to students of the trade cycle."

Personal savings have been running at a remarkably high level in 1954 compared to 1952 when savings were running very high at £588 million. Savings in 1955, it is now estimated, may reach the peak figure of £610 million. Savings on the part of companies and public corporations, however, remain virtually unchanged at between £1,000 million and £1,200 million. With the sharp reductions in tax over the year as well as the increase in public expenditure, budgetary surpluses available for investment are now about £300 million compared to £580 million in 1950. On the whole, however, total national savings in real terms has since 1950 constituted a rising proportion of a rapidly rising real national income, and it is now estimated that the increase has been more than one third since 1951. By all measures, the extremely high level of personal savings, apart from the other sources of savings, is sufficient to maintain not only a steady volume of domestic capital formation, but a reasonable flow of foreign investments and accumulations in the gold reserve. In other words, the current level of savings can be considered as "adequate". It is adequate in that it can allow for an annual rate of growth of about 4 per cent to 5 per cent which is particularly good for a highly industrialised country like Britain.

Figures now available for the investment boom which commenced in 1954 show that of the increase of £817 million in gross savings between 1951 and 1954, a greater part i.e. £610 million went into augmenting domestic fixed investments, leaving the balance for increasing stock accumulation and foreign investments. The improvement in the foreign balance in this period was, however, largely compensated by the fall in the accumulation of stocks. Thus, already by 1954 far too much of the increase in savings had been absorbed in expanding domestic fixed investment, as F W Paish writes in the **London and Cambridge Bulletin** "to be compatible with the achievement of both a favourable balance of payments of £300 million a year and the maintenance of a stock accumulation at a rate proportionate to the increase in production". The trouble in 1955, he goes on to say, was due to "a further rise in the high level of domestic fixed investment".

Building in the public sector i.e. building by local authorities has been pruned by Government action. Local authorities have been subject to various pressures; in particular, the difficulty of obtaining loans from the Treasury's Public Works Loan Board; more than that, they are being called upon to pay interest rates which are as high as 5½ per cent. Thus, in the public sector fixed domestic capital formation is being reduced, but domestic fixed capital formation in the private sector of British industry continues unimpeded, and there can be little doubt that the reductions in the public sector are being compensated for by the investments undertaken in the private sector. It is estimated that in 1955 private domestic fixed capital formation will amount to just under £1,000 million (at 1948 prices), i.e. about half of the total estimated fixed capital investment in the country.

The crisis orginating from such a high level of investment must however be seen in a longer-term perspective. In 1951 and 1952 the Government had feared that the then low levels of investment in industry were likely to impinge upon production and so make British exports difficult to market. It was also then noticed that West Germany and other countries of Continental Europe and the United States were devoting a larger proportion of their national income towards the modernisation of their industries. In 1953 and 1954 the Government, therefore, made various tax concessions as a means of inducing industrialists to expand fixed investment, and at the same time relaxed restrictions on industrial and commercial buildings. For some time these measures had little apparent effect, but since the end of 1954, industrial and commercial investment has risen sharply and it is this increase which seems to have pushed up total fixed investment to the point where the inadequacy of resources for foreign investment brought a recurrence of balance of payments difficulties.

As against this, the remedial measures of the Chancellor aim not at restraining the tempo of investment activity even where such investment is not economic, but at curbing present consumption standards. The Autumn Budget lays particular emphasis on the purchase tax (which has now been widened to include virtually all consumer goods). The investment allowances given to industry in previous years have not been withdrawn and no significant official statement has emerged since which could restrain industrialists from maintaining the present level of fixed investment expansion. Nevertheless, there can be little doubt that the present crisis will be overcome. The overcoming of the crisis, however, is being made to depend upon Government measures which do not attack that sector of the economy which has more than any other contributed to the crisis. It is in this sense that the policy of the Government is discriminatory and inappropriate in the circumstances.

Economic Conference at Poona

(From Our Own Correspondent)

THE gathering of economists at Poona for the 38th Indian Economic Conference was one of the largest, it is said, in the history of this association. The academic tradition of Poona, to which Mr Jayakar referred in his welcome address, its cool bracing weather in this part of the year, the Silver Jubilee of the Gokhale Institute of Economics and the association of one of the most active senior economists with that Institute and Poona—these were probably the main attractions to most of the economists to attend this conference. The arrangements at Poona were simple and unostentatious, yet quite comfortable and suited to the needs of an academic conference. The conference was held in the newly built main hall of the Law College. With its spacious grounds, fine garden and a beautiful hill at the back, the surroundings were picturesque and pleasing, neither austere nor gorgeous.

The conference papers were, as usual, poor summaries of what their authors had read so far on their respective subjects. They were reproduced from published books and journals either with quotation marks or without them. There were about 26 papers on Economic Growth, six on Balance of Payments and about ten on Rural Credit. On Economic Growth, not a single paper presented even a good analysis of the subject, not to speak of contributing any original ideas. Some papers on Balance of Payments did not even give correct statistics. On Rural Credit, most papers drew heavily on the Rural Credit Survey Report.

The discussions on these topics were a little more lively than the papers. The discussion on Economic Growth centred mostly on the issues connected with the Second Five Year Plan and was linked up with the discussion on the general topic of Employment Potentialities of the Second Five-Year Plan. Opinions were sharply divided not so much with regard to the general scale of priorities accepted by the Planning Commission but with regard to the production techniques for the consumption goods industries. Prof VKRV Rao, Prof Paul Baran, Dr Madan and Prof Bettelheim argued in favour of highly capital-intensive techniques. Their case was very cogently put forward only by Prof Bettelheim, who argued that by adopting uptodate capital-intensive techniques, the marketable surplus of consumption goods would be larger, and hence the rate of growth, faster. Employment, though it may not increase very much immediately, is bound to increase at a later stage at a faster rate. Profs Karve and Gadgil defended more or less the Karve Committee approach to this problem. The main problem, according to Prof Gadgil, was to decide whether the present unemployment situation was tolerable. If it was not, and in his opinion it was acute, the only right thing to do was to adopt such production techniques as would give us a tolerable rate of increase of employment in the near future, and the highest rate of growth consistent with this rate of increase of employment.

Thus, Professor Gadgil implied, but did not quite put it that way that the main problem was that of choosing our primary objectives. If we want merely to maximise our rate of growth, then, of course, Prof Bettelheim is correct. However, if rate of growth and employment both be our primary objectives, we have a choice between a faster rate of growth and a little lower rate of increase of employment and a little lower rate of growth and a little higher rate of increase of employment. This choice will depend upon one's judgment regarding the tolerable rate of increase of employment. Once we fix this rate, we can also fix the maximum possible rate of growth consistent with that rate of increase of employment. The main controversy at the conference then turned, not on logical issues, but on issues regarding primary objectives. This, of course, is a matter of judgment and opinion and Prof Gadgil's judgment of the Indian situation is likely to be sounder than that of his opponents.

It was rather surprising to find those who had signed the Economists' Panel Report now openly repudiating it. Of course, one admires their regard for truth as against mere consistency. But then how can we expect governments to rely on judgments of persons, who change their minds, so often and so quickly? Of course, one can never expect twenty-one competent economists to agree on any issue. If they do, the agreement is absurd and meaningless, as we have found out now; if they do not, it is a question whether an Economists' Panel is necessary at all.

There was not much interest at the conference in the discussion on Balance of Payments. Dr V V Bhatt, of the Reserve Bank, however, made some important observations. He pointed out that the real measure of deficit financing was a deficit in the domestic budget and not an accounting deficit. Thus, when adjustments are made in the budget of the Government of India for the Government's foreign transactions, it will be found that not only there was no domestic budget deficit during the first three years of the Five-Year Plan, but on the contrary, there was a huge budget surplus. This is often neglected by economists in their discussion of deficit financing and it continually perplexes the students of the money market. Dr Bhatt also maintained that there was no longer any pressing necessity of maintaining sterling assets as currency reserves at the old conventional level.

During the discussion on Rural Credit, Prof Driver made an important point regarding the land system in India. He was of the view that though all the measures recommended by the Rural Credit Survey Committee were welcome, they, by themselves, would not solve India's agricultural problems, unless appropriate changes were made in the land system as such, so as to make agriculture a paying concern.

Quite in contrast to the level of the conference papers, the Presidential address was undoubtedly of a high standard. As compared to the presidential address of the last few years, this year's address broke new ground.

Prof Ganguli quite rightly held that there should be a harmonious development between theoretical and empirical work if economics was not to be sterile. He again rightly stressed the importance of 'group' as a unit of economic analysis, which should, according to him, try to explain economic change. In the second part of his speech, he dwelt at length on how international trade theory could be fruitfully applied to inter-sectoral and inter-regional re-

lations under certain circumstances and as an exercise, applied it to the urban-rural relations in India. That exchange between non-competing groups within the same economy can be treated only by international trade theory is one of those accepted and forgotten doctrines that are relegated to the domain of the classics. But its revival in the present context is certainly novel and the possibility it holds out of throwing light on our domestic economic relations prompted Prof V K R V Rao to suggest it as one of the subjects for the next year's conference. The suggestion was warmly accepted.

This year's Indian Economic Conference was on the whole a good social get-together. However, like the earlier ones, from the point of view of serious academic discussions, it was rather sterile. It appears that this sterility is partly the result of defective organisation. It is not at all understandable why the association should invite papers from all those who want to write, irrespective of their competence to do so. Instead of doing this, if the association invited two persons, who were working on a specific topic, to write papers and chose a select team to participate in the discussion, then permitting anybody else, if he wanted, to do so, the proceedings would become more fruitful. If such a scheme is adopted, the association could keep, say, about half a dozen such seminars, which only the persons interested would attend. Two to three such seminars could go on simultaneously. The American Economic Association's annual conferences follow this arrangement and we could adopt its procedure here.

In such seminars, only those should participate who are seriously interested in the respective topics. Excessive respect for age and status also mars the proceedings. Why, for example, should an economist be invited to participate in the discussions merely on account of his seniority or status? One had a feeling at this conference that seniority and status were given precedence; others who were eager to participate in the discussions because they were interested in the subject and might have something to contribute were often left out in consequence. The sooner we do away with some of these traits of the conference, the greater will be its success.

Always in the Forefront

In the forward march of Life Insurance in India, the HINDUSTHAN is, as it has always been in the forefront giving protection and security to millions of our people against possible hazards of life. The 48th Annual Report for 1954 once again reflects the soundness, integrity and strength which always have been so characteristic of the Society.

India Steamship Company Limited

Sir Ramaswami Mudaliar Reviews The Steady Progress Of The Company

ADDRESSING the Shareholders of India Steamship Company Limited at its Annual General Meeting held on 20th December 1955, Sir A Ramaswami Mudaliar, K C S I, D C L (Oxon), Chairman of the Company, said:

Gentlemen,

The Audited Accounts and Director's Report for the period ending March 31st, 1955 has been in your possession for some time. With your permission I shall take them as read.

Trading Experience

The Directors' Report shows that the freight earned during the year is Rs 4,01,00,132-3-4, about Rs 41 lakhs more than the freight of the previous year, but this is counterbalanced by increased port charges, stevedoring charges, transhipment charges and other expenditure. The time taken in the turn-round of ships materially affected the profit which the Company could have made. During the year the average time taken for a round voyage was 16 days more than in the previous year, the economic consequences of which do not require detailed explanation.

Despite these adverse factors your Company made a profit of about 24 lakhs before providing for depreciation. The year under review has been an even more anxious and disturbing year than the last and it required all the care and ingenuity of the various departments of the Company and of our Agents abroad to obtain this result.

Delay in Ports

I referred in my last Speech to the serious delays that occured in some of the Indian Ports owing to resort to a 'go-slow' movement by a section of the Dock Workers. The situation deteriorated further during the year, Calcutta being the worst affected and Bombay being not far behind. While the position in India was creating anxiety, a disastrous strike took place in London and in some of the other main British Ports like Liverpool, lasting over six weeks which further accentuated the situation. The Indian situation was to some extent due either to the desire of some of the leaders of labour unions to find employment for as much pool labour at a port as possible by spreading out their work or to shortage of labour. The British situation on the other hand had no justification either because wages and conditions of service were not satisfactory or because of want of employment. It was purely a result of a dispute between rival unions for which neither stevedores nor Shipowners were responsible nor had they any means of controlling or settling the disputes.

Remedial Measures

The Dock Labour situation towards the end of the year under review became so serious that a proposal to levy a surcharge in the ports of Bombay and Calcutta was put forward by the Conference Lines. The Government of India had, however, realised the situation a little earlier and had appointed a Committee called the Vasist Committee to examine the whole question and propose remedies to restore normal conditions at Indian Ports. I was invited by the Government to be a member of this Committee and, therefore, had opportunities of studying the situation in all its aspects. The Vasist Committee submitted its report to the Government and I understand practically all the recommendations of this Committee have been accepted. The most important of these recommendations is that special powers should be given to the Chairmen of the Dock Labour Boards on the lines of the emergency powers that have recently been given to the Chairman of the Calcutta Port Trust. The second recommendation which is even more important is that the piecerate system should be introduced in connection with work of stevedore labour and consequentially of port labour also. These two reforms have now been realised by those responsible at the highest level, the Transport Minister and the Labour Minister, to be essential, and I trust that they will be put into effect before the end of the year. I should like to take this opportunity of complimenting the Chairman of the Dock Labour Enquiry Committee, Mr S S Vasist, for the thoroughness with which he conducted the enquiry, for his patience and sense of fairness. It will now be for the Chairmen of the Dock Labour Boards to carry out their responsibilities firmly, fairly and equitably without being thwarted in their work either by the intransigence of certain sections of labour or by any unreasonable attitude which stevedores may take in connection with reasonable amenities required by labour.

Labour and Employers

The Second Five-Year Plan that the Government is contemplating, the expansion of Indian Shipping tonnage which Government is anxious to promote and the public eager to see, the industrialisation of the country which is the basis for that larger employment which is envisaged will all prove illusory, unless better relations prevail between the employer and the employees. It must be frankly stated that while the employer feels that he is bound to carry out the suggestions of Government or of labour tribunals or of conciliators, there is no such feeling amongst certain sections of labour that these decisions should be loyally accepted and carried out. The right kind of leadership of labour is the most urgent need of the hour and I trust that with a Minister of Labour so well aware of labour conditions, it will be possible to instal such right leadership everywhere.

Prospects

In spite of the adverse effects on trading results due to factors to which I have referred above, the financial position of the Company remains healthy. Your Directors are, therefore, contemplating the further addition of ships to your fleet at the rate of at least one ship every year during the next five years, so that by 1960, if not earlier, we may reach the goal of 18 ships.

Conference Membership

I need not refer to the hardy annual which has formed a feature of my annual speeches—membership of your Line in various Conferences from ports on the route between India, the U. K. and the Continent.

We have attempted time and again to get a reasonable settlement of this question but so far we have failed to get any results from several of these Conferences. I feel that the time has now come when with due regard to our convenience and interest we must make our entry into these routes irrespective of whether members of such Conferences desire it or not.

Flag Discrimination

I have repeatedly referred to the charge of 'flag-discrimination' which Shipping companies with strong vested interests, which have come into existence owing to the practice of extreme forms of flag discrimination, undiluted and uncontrolled, in the past, are now making in an attitude of self-righteousness and accusing Governments anxious to promote the nascent shipping industry of their countries. At the last session of the International Chamber of Commerce held at Tokyo in May of this year, this question was again raised and my esteemed colleague Sir Bijoy Prosad Singh Roy made a very carefully reasoned and firm speech on what really constitutes flag discrimination. In spite of this the vested interests have seen to it that such unreal allegations continue to be made. I feel that it is high time that we ignore these statements and I would suggest that the Indian delegates, even if they attend such Conference, do not take part in these futile and meaningless debates and discussions.

Tribute

I would like to emphasise the tribute that has been paid by your Directors to the Minister, S Lal Bahadur Shastri, the Deputy Minister, the Secretary and the officers of the Secretariat for the sustained interest that has been shown in the development and expansion of Indian Shipping. I would also like to thank the Minister of Labour who has courageously pointed out the path of duty to labour in general and to Dock labour in particular and I trust that in implementing various suggestions and recommendations the same courage and firmness will continue to be evinced so that National interest may be safeguarded and the Nations' progress assured. The Director General of Shipping and the Deputy Director General and other officers have shown keen solicitude towards Indian Shipping and have by their advice and encouragement greatly assisted your Company.

Hindusthan Insurance

DR. N N LAW, Chairman of Hindusthan Co-operative Insurance, confirms the implied argument of the Controller of Insurance that the better economic climate helped insurance business in 1954. "We (Hindusthan) profited by the same (improved economy)", Dr Law aptly emphasises, "as reflected by our increased new business figures". There were, however, certain limiting factors which hampered insurance business.

Agricultural prices were falling. This restricted the capacity of the farming community to take out life insurance policies. It is reassuring to be told by Dr Law that the agriculturist is becoming insurance-minded. Acute unemployment was another limiting factor. "This, coupled with the continuing high cost of living", Dr Law deplores, "considerably crippled what otherwise promised to be a rapidly expanding field catering by the life insurers".

The Hindusthan Chairman was ingenious in explaining away the unduly high management expenses of insurers in India. India is a land of vast distances. "Carrying the benefits to the interiors", Dr Law explains, "where means of conveyance, road facilities and other amenities were much too meagre, Indian insurers had naturally to incur rather high organisation expenses". Dr Law deplores that now, when the time is coming for the insurers to reap the benefit of their past endeavours, the Government is issuing the threat of nationalisation. His argument that the threat is hampering private initiative will be echoed by all insurers.

The Delhi Cloth & General Mills Co., Limited

Sir Shri Ram's Speech

SPEAKING to the share-holders of the Delhi Cloth & General Mills Co. Ltd., at their Annual General Meeting held on 29.12.1955, Sir Shri Ram, Chairman of the Company, stated that the profits for the year 1954-55 were comparable to some of the best years in the financial history of the Company. In keeping with their progressive policies the Company had carried out large programmes of modernisation and expansion, such as the new Textile Mill at Hissar, already gone into production, the Silk Mill, which would soon start working, and expansion of Caustic Soda and Sulphuric Acid Plants. Proceeding he said:—

The foremost among important events during the year was the publication of the tentative frame work of the Second Plan which will come into operation in a few months from now. The discussions have not yet reached a stage of finality but the broad contours of a Plan bigger and bolder than the First Five Year Plan are fairly clear, and this is as it should be. It is proposed to step up the tempo of economic development in such a manner that the national income in 1960-61, the last year of the Second Plan, will be 25% higher than it is in the current year, which is the last year of the First Plan period.

The Plan Frame, as you all know, is an extensive document dealing with numerous industries. But speaking to the share-holders of the Delhi Cloth & General Mills, I will confine my remarks to the industries in which we are directly interested.

I am happy to note that in the case of sugar the target has been kept quite high, and fortunately unlike Textiles, no curbs on output or expansion are proposed for the benefit of the Khandsari Cottage Industry.

In the case of Chemicals and Vanaspati, likewise, adequate scope is being afforded for growth and progress.

I am, however, sorry to say that in the matter of cotton textiles, there are very strong differences of opinion not only as regards the targets of the Second Five-Year Plan but also regarding the means of production. In offering my views on cotton textiles, I am deeply conscious of the urge to solve the problem of unemployment, which is regarded as the main inspiration for these suggestions.

There is a set of people—politicians and others who strongly believe that the requirements of cloth will increase by only 28%, and they calculate it on the basis of 18 yards per person as against the 15 yards consumed at present. There are others who equally strongly and honestly believe that the consumption of cloth, which is the next most important item of consumption next to cereals, could not be less than 22 yards per person. Personally I believe that definitely 18 yards is too low a figure. I place below the percentage of increase in production which Government themselves have set as the target for a few other commodities of common use:

Sugar	....	50%
Vanaspati	....	33%
Paper	....	43%
Bicycles	....	100%
Soap	....	43%

While there cannot, of course, be a uniform increase for all industries, the percentage of increase provided for Textiles, which, on the basis of 18 yards per capita consumption, comes to only 28%, contrasts with the higher percentages listed above, for items most of which are less important than cloth or cereals.

Even if 22 yards is considered to be a very generous figure—and I am confident that with the increasing purchasing power which Planned development should put into the hands of people, it is not a generous figure at all—even then at least 20 yards will not be too high a figure and will certainly be required.

The next and more important difference between the two schools of thought is with regard to the means of increased production. There is a school who honestly and strongly believe that all the extra cloth required could be produced by handloom workers. On the other hand, there are others who equally and strongly believe that even if 18 yards be the target, leave alone 20 yards or 22 yards per capita, the hand-loom workers will not be able to produce the required quantity.

I believe that neither those who believe that hand-looms could produce, nor those who believe that hand-looms could not produce, could be absolutely certain in their belief and definitely say that they are right. I, therefore, humbly suggest that a complete ban should not be placed on the increase in production of cloth by big scale industry. If at any time it is found that the hand-looms are producing what is required by the country in enough quantities, the restriction can be brought on the mill industry at that stage. Even in the Five-Year Plan, there could be no absolute rigidity, and as our Prime Minister has rightly expressed more than once, our approach has to be dynamic, changes may have to be made from time to time even after the Five-Year Plan has been accepted. And, in any case, we will have many more Five Year plans—all with the object of raising the standard of living—which will mean that not merely 18 yards, or 20 yards, or even 22 yards but perhaps we would like our people to use 30 yards per capita or even more. This mid course will, on the one hand, not stand in the way of all the help and subsidy that is proposed to be given to the cottage industry, and on the other hand, avoid the grave risk of heavy shortages, leading to controls and black-marketing.

There is a feeling among certain people that in case of shortage, whether of yarn or of cloth, certain mills, which are not running 2nd or 3rd shift, could be asked to do so and thus save the situation.

May I, with whatever experience I have had during the last 30 years, say that there is a very big number of mills where the machinery is in such a bad state of repair, and so old and inefficient, that it would not be possible to increase the shifts, except, perhaps, in a mill or two here and there. In fact, if these had been in a position to run extra shifts, they certainly could have done so even now when the margin of profit is certainly above the average.

There is a still more controversial and serious matter where there are even stronger differences than in the matter of cloth, and that is about increasing the spinning capacity of the mills or depending upon the Ambar Charkha. I am giving a few figures as regards the extra labour cost in the case of Ambar Charkha, and this has been taken from a recent Number of the A.I.C.C. Economic Review. (See Table below)

It is all too easy, in considering a matter of this kind, to make little of the problem of quality and cost of production, and I am therefore taking the liberty of quoting two paragraphs on this point from the University Education Commission's Report:

"For Government to try to manufacture and to distribute this vast variety of goods (i.e. consumer goods in general) on a non-competitive basis would result in a lack of technical progress. Such goods as a rule can best be supplied by the free play of private enterprise and initiative, with the public in effect voting on the need and worth of each article by buying or not buying."

"When the manufacture of a new product is considered, there is a final test of its practical worth which is equal to the decision of the public to buy or not to buy. If a new article is faulty or its cost too great, there is no greater incentive to its improvement than the desire of the manufacturer to make it acceptable to the buying public. To that end he will carry on research and try to improve this product, and to lower cost and prices."

Apart from these general effects, it has also to be remembered that these inevitable increases in prices, arising from higher cost of production, must affect seriously many whose incomes will not and cannot expand in proportion to the rise in prices.

Even, however, if all the claims made for the Ambar Charkha are proved to be correct, to be able to produce so many 'charkhas' —25 lakhs or so—to induce so many people to make it up and organise the whole thing, will probably be not achieved, in spite of all the good wishes of its protagonists, even in the whole period of the Second Five-Year Plan.

While in the case of shortage of cloth, it will be the consumer alone and not the mills that will suffer, in the case of shortage of yarn even those hand-loom weavers whom it is intended to help, will suffer. And if my fear of the Ambar Charkha not being able to produce sufficient quantity of yarn in time comes true, then even those, who believe that the hand-loom could produce all the cloth required, will find that, on the one hand, the increase in the mill production was banned, and, on the other, the hand-loom people, without the yarn, will not be able to produce, and there will be heavy shortage of cloth as a whole in the country with most deplorable results.

There is one other point, which I must mention, that the Finance Minister believes that deficit financing to the extent of 1,200 crores of rupees will be necessary to carry out the Plan. In the past, there has been deficit financing, but of a much smaller magnitude, and this has gone on without producing any evil effects, for the very simple reason that agricultural and industrial production had increased, if anything, at a faster rate, and it was due to this increase in agricultural and industrial production that there was no inflation.

With deficit financing of much bigger dimensions, it is absolutely necessary that we should not only not do anything by which production may be restricted but take all such steps as may be possible to increase production, so that inflation may be avoided.

There is yet another matter which is equally important and that is of earning extra foreign exchange to the tune of 800 crores of rupees. The commodities, which can earn exchange, are well-known. I do not think that the production or export of tea can be increased by a stroke of the pen. It will mainly be jute goods, cotton textiles, engineering goods and certain raw materials that will earn, and I am almost certain that the export of cotton textiles could certainly increase by something like 50% given certain conditions. I may as well say that exports can only be possible on commodity for which there is a good home market.

I would, therefore, again in all earnestness appeal to all those concerned that the increase in spindles and looms should not be completely banned but permitted in restricted numbers, and at any time, when it is found, even after a year, two years, or three years, that Ambar Charkha and the handlooms have come up to the expectations and demands, immediate steps could then be taken to stop further expansion of spindles and/or looms. What with the difficulties of Planning, Finance, obtainment of machines and so on, the possible increase in spindles and looms by the mill industry even without a ban during the waiting period could only be limited and hardly such as to impair the prospects of expansion in other sectors. What I fervently urge is that the matter should be approached with an open mind by all concerned, and not in a dogmatic spirit.

We industrialists are a much-maligned lot as some debates in Parliament during this year have shown. But I do wish to point out that most of us, at any rate, are not lesser patriots. Indian industrial enterprise has served the country well. Its achievements during the First Plan period are a testimony won in spite of numerous handicaps. And I am confident that given reasonable opportunity and a co-operative administrative environment, it can deliver the goods in the Second Plan. Let us have the tools, and we will do the job.

The need for greater participation on the part of labour in the management of industrial enterprises has been in the air for some time now. I think, in terms of providing a wide range of opportunities for participation in management functions, production committees and works committees are likely to be more useful

(Continued on Page 25)

I. No. of Man-hours required to produce 100 lbs of 20s yarn

On Ambar Charkha	By Mills
2,000 man-hours	35.84 man-hours

II. Ratio of Man-hours required for a given output:

1 : 55.56

III. Cost of Production per pound of 20s yarn

1 Raw Material	224 pies	224 pies
2 Wage Cost	30 pies	480 pies
3 Stores, Power & Light, Depreciation & Overheads	35 pies	17.5 pies
Cost per pound	289 pies	721.5 pies

Standard Batteries Limited

Speech of the Chairman Shri R D Char

THE following is the speech of the Chairman Shri R D Char at the Tenth Annual General Meeting of the Company held on January 5, 1955:—

Gentlemen:

On behalf of myself and my colleagues on the Board, I extend to you all a warm welcome at this Tenth Annual General Meeting of your Company, and have the pleasure in presenting to you the Directors' Report and the audited statement of accounts together with the Auditor's Report for the year ending 30th June 1955.

It has been the constant endeavour and policy of your Company to manage its business on the principle of Trusteeship with regard to the three primary factors which mainly contribute towards the strength and progress of the industry, namely:—

(a) Responsibility towards the consuming public;

(b) Responsibility towards you who have provided the risk capital, and

(c) Responsibility towards our employees and operatives.

You will be glad to hear that during the year under report, there has been a great spurt in the demand for your Company's products, especially the automobile batteries, throughout the country. The consuming public evidently have appreciated the persistent effort of your Company to build batteries to accepted standards under strict laboratory control from raw material right up to the finished products and maintain proper sales and service policy. This goodwill from the motoring public for your Company's products is reflected by 20,000 more car and truck owners using our battery as against the previous year. Your Directors are very much alive to quality control and with this end in view, laboratory and testing facilities are being further augmented with qualified personnel during the current year.

I have mentioned in my last year's report to you about the finalisation of our Technical Collaboration Agreement with Messrs. A.B. Tudor, Stockholm, Sweden. During the year under report, we have been able to implement several vital improvements in our manufacturing technique and orders have been placed for new equipment to rationalise and increase production to meet the increasing demand from the public. One of Messrs. Tudor's engineers and technicians is now employed in your Works to further the objects of our responsibilities towards the consuming public.

During the year, in spite of the incidence of higher wages, implementation of several welfare schemes for our operatives and the highly competitive internal market, the working of your Company has maintained satisfactory results. Your Directors have recommended the same rate of dividend of eight per cent as last year for your consideration and approval.

The properties of your company have been insured fully; and buildings, plant and machinery and stores have been kept in proper repair and storage. As you can see from the Balance Sheet, adequate depreciation has been provided from the working results of your Company.

The lead recovery and refining plant is now put in operation and it is expected that the Microporous Latex Rubber Separator Plant would be in production in the current year.

As already mentioned earlier, new equipment for rationalising production in the different sections of your factory has started arriving and provisions have been made for their installation. In the current year, it is hoped that all component parts that go into the making of a modern high quality battery would be manufactured under one roof and under strict control. This is a further great step to ensure a standardised quality product at reasonable prices.

I have mentioned in the previous year that development schemes for the manufacture of special batteries for aircraft and army requirements had been undertaken and I am glad to inform you that all the preliminaries have been completed and production of these special batteries have since been taken up. Production of new type of railway cells under Tudor's Patent has been taken up and the trials have been very satisfactory and your company looks forward with optimism to fulfil a substantial percentage of the requirements in train lighting batteries for Indian Railways.

During the year under report, Batteries came under Excise Duty which is now being charged on an ad valorem basis and is varying from centre to centre and sometimes from factory to factory in the same centre. We have made several representations to the Excise Authorities to charge a uniform specific duty throughout the country. Moreover, the present system puts organised industries like yours to great hardships and gives a premium to unorganised, small, back-room sweat shops, who escape completely the excise duty.

Our effort to export the products of your factory to Middle East and South East Asian countries has not proved fruitful. The reason for this being, as I expressed in my previous year's report to you, the low man-hour productive capacity in the industry. If inefficiency is thus protected and at the same time the country wants to export its products, some way will have to be found to neutralise this factor.

During the year, the incidence of higher wages and the implementation of several welfare schemes as detailed in the Profit & Loss Account have increased by 22% against the previous year. We have introduced during the year free milk distribution to the staff and operatives directly involved in the manufacturing processes and have also introduced a Life Insurance Scheme for all the monthly paid staff as a measure of compulsory saving and provision for their families. For your information, I am presenting to you the details of the percentage of increase over that of last year under the respective heads:—

(1) Salaries and wages.	21%
(2) Contribution to State Insurance.	64%
(3) Contribution to Provident Fund.	23%

Medical expenses have been absorbed in the State Insurance.

Your Company, during the current year, have bought land measuring about 50,000 square yards near your factory for implementing a scheme for housing our staff and operatives. Your Directors earnestly hope that sufficient funds could

be saved from the working of your Company in the years to come, to achieve their ambition to have comfortable homes for people who are working with us.

The Principle of participation of labour in the management which is now agitating the minds of our Parliamentarians, legislators and the labour leaders is a welcome sign and no progressive manufacturer should object to it in the present context. The only point for argument is the pace of implementing this scheme. Trade Unionism in our country is still in the stage of slogans and agitation. It is more or less working on the principle "that a crying child always gets more'. A period of apprenticeship in every walk of life is considered essential for progress. There is still a big gap between the present stage of trade unionism and the sober thinking and appreciation of the many problems of medium scale industries which is necessary for their development under existing conditions. Demand for greater and greater wages and other facilities for the few inside, without linking it up to: (a) the general standards of living prevailing all over the country (b) production per man hour and (c) finance required for expansion and modernising, is the greatest handicap, especially for organised medium scale industries like yours throughout the country.

Gentlemen, your industrial undertaking has passed through the formative and consolidating stages and is now on the threshold for greater expansion. Your Company has passed from adolescence to manhood and it has been the constant endeavour of your Directors and the management to conserve all possible earnings of the company, subject to the three responsibilities and obligations which I have already mentioned earlier, to expand and diversify its production in the various fields of lead acid battery application. With the completion of all the new schemes that have been now undertaken during the current year, I view the future of the Company with confidence.

I take this opportunity of thanking on your behalf all the officers, members of the staff and operatives of the Company for their co-operation and assistance in the development of the Company.

Around Calcutta Markets

Shake-out in Equities

Wednesday, Evening

DEVELOPMENTS in stock markets during the last fortnight indicate the Government's desire to curb speculation. It had been known that New Delhi had issued directives to both Calcutta and Bombay stock exchange authorities to introduce measures to check speculative activity in shares. Though the stock exchange authorities have taken no steps to curb speculation, some other intervening developments have caused a shake-out in equities.

Two weeks ago, the police in Calcutta made it clear that they were determined to stop kerb trading in and around the Calcutta Stock Exchange. These warnings had their effects. Kerb trading was less active. Clearing shares developed a downward trend. Some days ago, the police took drastic action against the unofficial futures market in jute goods. Many arrests were made. Police intervention has had a sobering effect on markets.

"Stags"

In the main, however, the recent fall in equities is a sequel to developments in Bombay. Tata Steels dived down as it became known that Government was in favour of issuing right shares by the Company at a premium. ACC were pushed up in anticipation of a new capital issue. But ACC also lost considerable ground on fears that Government may not permit the issue of new shares at par. It will be recalled that Indian Iron were bid up to dizzy heights in anticipation of a bonus issue.

This raises a peculiar market problem. In the last few months, many companies have issued right or bonus shares. Some companies have issued fresh capital. Stags have been busy. In anticipation of such issues, they have pushed the shares concerned to higher levels. Now the stags have taken fright. They are unloading their holdings. Hence the fall in equities. Drop in Tata Steels and in ACC is mainly due to unloading by stags. Setback in Indian iron is also an indirect consequence of similar speculative activities.

Two Factors

Two factors have helped the spurt in some equities in the last six months. For some months, cornerers were active. When the cornering activity subsided, hopes of bonus issues or issues of fresh capital for expansion sustained the spurt in Paper, Miscellaneous and Engineering shares. As both these influences have ceased to be in operation, these groups have developed an irregularly lower trend. Strength in these groups was sustaining the market as a whole. Weakness in these shares, coupled with the drop in Indian Iron, has aggravated the downward trend in equities in general.

Buoyancy in stock markets has certain advantages. It helps activity in the new issue market. It reflects the gradual increase in incomes and savings. But, beyond a certain limit, speculation is a menace. As more funds are employed for speculative purposes in stock markets, there is so much less available for investment for productive purposes. There is need for diverting the flow of funds away from stock market speculation to productive investment.

New Issue Market

Stock markets' response to Government's reported unwillingness to allow issues of right shares at par by Tata Steels and ACC is a rude reminder that unhealthy speculation in stock markets can damage the new issue market. Suggestions were made that Government could easily canalise the expanded money incomes and bank credits by raising its borrowing target. Its decision to setp up the original estimate for borrowings during the second Plan, justifies this criticism.

As deficit financing continues on an enlarged scale, money incomes and money supplies will expand. This necessitates a bolder borrowing programme to minimise the inflationary consequences of deficit financing. In the wider interest of the national economy, the Government's decision to raise borrowings will be welcomed. So will be the proposed legislation to regulate futures tradings in stocks and shares. These measures will minimise the danger of a run-away boom in equities, but will not prevent healthy expansion in stock market activities.

Technical Position

There has been a sharp recession in equities in the last few weeks. This has improved the technical position of the market. Even so, equities remain hesitant. A temporary improvement is not unlikely. But investment support may not be forthcoming until the budget uncertainties are over. There has been no New Year enthusiasm in stock markets. Bulls have been punished severely. And it will take some time before equities can move up confidently. This is the time of the year when stock markets usually suffer from budget uncertainties.

1955 was not a bad year for stock markets. But it was the year during which the Calcutta Stock Exchange witnessed certain basic structural adjustments. Tea shares were depressed for nine moths of the year. These shares started falling after the first quarter of the year. Tea shares are still losing ground, as auction results continue to be unsatisfactory. If the present position is gloomy, the immediate future seems to be equally bleak. Nor are prospects for Coal shares bright.

Market Leaders

During the general set-back, Paper, Engineering and Miscellaneous shares have lost considerable ground. These groups may yield some more ground. But the outlook for these shares is not unpromising. In 1956, as in 1955, and for the same reasons, Paper, Miscellaneous and Engineering shares are likely to be the dominating counters in the Calcutta Stock Exchange. Even at the current low level, the yield from Indian Iron is not attractive. It should not be difficult for the Company to maintain the devidend. But a higher dividend may be ruled out of consideration.

It is yet too early to asses the behaviour of Jute shares in the immediate future. There are abundant indications that the investor does not share the industry's confidence in the future. IJMA has unsealed 2½ per cent of the sealed looms. This reflects the industry's faith in the growing demand for its expanded output. But Jute shares have not responded to this gesture by IJMA. Fears of growing Pakistani competition persist. Raw jute prices remain relatively steady. Meanwhile, IJMA's decision to unseal 2½ per cent of the sealed looms has had a softening effect on the gunny market. These trends cannot be ignored. Even so, there is just a possibility that Jute shares may regain their popularity in the current year.

Around Bombay Markets

Depressed Sentiment

Thursday, Morning

IN line with the year-end kerb trading, which closed on a subdued note on the eve of Christmas holidays, the equity market entered the New Year with trepidation, sentiment being depressed by fears of a bearish Budget. On Tuesday, Dalal Street received a severe jolt from the reported proposal of the Planning Commission to tax individual wealth, impose a tax on capital gains, raise the corporation tax and excise levies and finally, to put a ceiling on incomes! This is a pretty packet in itself but that apart, Government's action in checking speculative activity in the commodity markets—the suspension of trading in cotton futures may be only an instance—has also disturbed the market. Dalal Street still looks askance at Securities Contracts (Regulation) Bill which continues to act as a damper. All told, Government policy, or rather the pre-view of it, has shaken the confidence of the investors which the Finance Minister had taken such pains to build up. This was reflected in the heavy losses sustained by the leading scrips. Tata Steel, which recorded a recent high of Rs 277-4, were quoted on Tuesday at Rs 243-8. Bombay Dyeing came down from Rs 628-12 to Rs 556-4, while Century dropped from Rs 528 to Rs 474.

The feeling is gaining ground that New Delhi may not allow the issue of fresh capital at par. This had its repercussions on the miscellaneous section. ACC which were at one time quoting as high as Rs 233 came down to Rs 210, while National Rayons lost 25 points at Rs 217-8.

Cotton

Continued Impasse

THE cotton futures market is passing through a crisis, following the suspension of trading from the 23rd of last month. The immediate provocation for Government to resort to this extreme step was the "rigging up of prices due to heavy speculation and option dealings". Although the East India Cotton Association took up the issue with the Forward Markets Commission, nothing tangible has resulted so far and the suspension has been extended till Friday, the 6th. The stalemate continues and the market is in a state of suspended animation.

It is hard to apportion praise or blame for the present state of affairs. Much can be said on both sides. Government considers that the rise in futures prices was unwarranted, and as being solely due to speculation. The trading community is convinced, on the other hand, that Government's action is wholly unjustified inasmuch as the rise was brought about by the normal forces of supply and demand, the shortage of tenderable cotton being the main factor in the situation. This view has been strongly supported by Sir Purshotamdas Thakurdas, President of the East India Cotton Association, who observed at the Association's Annual meeting last week, that the realities behind the recent rally in prices were the "higher prices realised for cloth by Indian Mills, change in the structure of the Contract from 25/32" to 13/16", the amendment of by-law 55 which lays down rather rigidly the manner of fixing tendering differences, damage to the quality of the crop—particularly Jarilla which forms the basis of the Contract—and reduction in the size of the crop".

The Forward Markets Commission and the EICA, however, agree on one point viz. the mischief done by

double option and Sir Purshotamdas politely returns the compliment by inviting the Commission to check this evil. Then, again, there is the matter of price ceiling. Government fixed it at Rs 840 and not the EICA, and speculation or no speculation, cotton futures had not come any where near the ceiling when the Commission took this extreme step. What about it? Well, on this point the Forward Markets Commission, it is understood, is willing enough to observe propriety, if that is what is bothering Sir Purshotamdas, by bringing down the ceiling.

As a way out, the Forward Markets Commission is actually reported to have suggested a reduction of the ceiling to one around Rs 700, and making it a pre-condition for the resumption of future trading. The sub-committtee of the East India Cotton Association, which was asked to go into this question, however, is reported to have held that the operative ceiling should be at least Rs 750. In view of this divergence of opinion, the stalemate continues. While going to press, it is learnt that forward trading will be resumed on the 7th, subject to a ceiling of Rs 700.

In the circumstances, the spot market has naturally been listless. Even export business remains virtually suspended, as shippers want to wait and see how the US programme of cotton disposal actually works in practice.

Oils and Oilseeds

Undeterred

UNLIKE the stock market which was heavily depressed and the cotton market, which did not function at all owing to suspension of futures trading, the oildseeds market presented an exceptionally firm front throughout the fortnight. True enough, suspension of cotton futures had its reaction on this market, too. There was some apprehension that the authorities might take similar measures as for cotton, to arrest the rising trend in oilseeds and oils. This resulted in margin operators and small holders liquidating their holdings. The buying by shrewd bulls however, was on such scale that the sales were more than offset. Prices of both oils and oilseeds in general maintained a rising trend.

In the castor section, although the May delivery declined initially from Rs. 116 to Rs. 111, it improved, on revival of confidence later in the week, to Rs. 122-14.

OILS AND OILSEEDS

	Jan. 4, 1956	Week's Range High	Week's Range Low	Dec. 28, 1955
Seeds :				
Castor May 1955 (per candy)	122- 0	122-14	111- 8	114- 8
Groundnut Dec.-Jan. (per cwt)	29- 4	29- 4	27- 4	28- 4
Linseed Feb.-Mar. ,,	31- 8	31- 8	29- 4	29- 8
Kardi Ready ,,	16- 8	16- 8	15-12	15-12
Nigerseed ,, ,,	24- 8	24- 8	23-12	24- 0
Oils :				
Castor Commercial (per quarter)	13- 2	13- 2	12- 6	12- 7
Groundnut RR ,,	15- 2	15- 2	14-12	14-10
Linseed ,,	18- 4	18- 4	17-12	17-14

Prices of ready castor also sustained some losses initially only to recover and improve towards the close. Thus, from Rs. 20-8 early week, it improved to Rs. 21-4 at the close.

In the groundnut section also, the pattern of trading was more or less similar, the earlier subdued tone being replaced at the close by a renewed optimism. February-March delivery which came down from Rs. 28-6 to Rs. 27-8 improved to Rs. 29-8 at the close. Groundnut oil prices also registered a smart rally. U. K. rate of groundnut oil remained steady at around £114 per ton c.i.f. Although this rate was considered unremunerative by shippers, groundnut oil improved in sympathy with the general bullish trend in the other sections of the oilseeds market. Arrivals in Bombay were more or less on the same scale as in recent weeks. The volume would have increased considerably, but for the shortage of wagons reported from some terminal markets.

Linseed was particularly firm throughout the fortnight. The main reason for this sustained firmness was the end-of-season paucity of ready stock and continued overseas demand for linseed oil, particularly from Australia. While linseed February-March was quoted as high as Rs. 31-8, linseed oil ruled firm at Rs. 18-4.

Bullion

Firm Tone

If the report of forthcoming tax on total wealth proved a bearish factor for the stock exchange, it certainly imparted strength to the bullion market which showed marked buoyancy. The reason is not far to seek. In fact for the past few days bullion has been ruling firm and but for the earlier improvement, the rise on Tuesday would have been much higher. The sustained advance in the last few days provoked heavy realisation the pressure of which cut into the gains on that day. Arrivals continued to be meagre, while there was no slackening of demand. The turnover was fairly high both in gold and silver, while rates for both tended to harden.

(A) **Posts and Scales of Pay :**

1) Research Officer, Department of Research & Statistics. 2) Assistant Accountant, Department of Banking Development. 3) Rural Credit Officers, Agricultural Credit Department.	Rs 375-55-815 E.B. 55-925-60-1045.
4) Probationary Assistants, Department of Banking Development/Agricultural Credit Department/ Legal Division.	Rs 250-25-450 E.B. 25-650.
5) Economic Assistants.	Rs 175-12½-300 E.B. 20-440.

Note : Candidates possessing exceptionally good qualifications and experience may be given a higher starting salary in the prescribed scales.

(B) **Additions to pay**

1) **Local Pay:** 10% of pay with a minimum of Rs. 10/- per mensem rounded up to next higher complete rupee to the staff working at Bombay, Calcutta, Madras, Delhi, Kanpur and Ahmedabad.

2) **House Rent Allowance:**

Research Officer, Assistant Accountant and Rural Credit Officers.	15% of pay with a minimum of Rs 60/- and a maximum of Rs 300/- per mensem.
Probationary Assistants.	10% of pay with a maximum of Rs 50/- per mensem.
Economic Assistants.	10% of pay with a maximum of Rs 20/- per mensem for pay upto Rs 400/- per mensem and thereafter at Rs 25/- per mensem for pay upto Rs 500/- while stationed in Bombay or Calcutta.

3) **Dearness Allowance:** At prescribed rates.

Research Officer, Assistant Accountant, Rural Credit Officers.	The present rate is 16-2|3% of pay with a maximum of Rs 125/- per mensem.
Probationary Assistants.	Rs 65/- per mensem for pay (including local pay) upto Rs 300/- per mensem.
Economic Assistants.	Rs 50/- per mensem for pay (including local pay) upto Rs 200/- per mensem.

(The rate of Dearness Allowance is subject to revision from time to time)

(C) **Age limit as on 1st January 1956**

Research Officer, Assistant Accountant, Rural Credit Officers.	Candidates should not ordinarily be over 30 years of age.
Probationary Assistants.	Candidates should not ordinarily be over 24 years of age except in regard to the posts of Probationary Assistants in Legal Division where the age limit would be extended upto 30 years.
Economic Assistants.	Candidates should not ordinarily be over 24 years of age. The maximum age limit may be extended but not beyond 30 years, in the case of (i) candidates with approved war service, (ii) ex-employees of Banking Institutions whose services have had to be terminated for reasons of economy or as consequence of the closure of unremunerative branches or as a result of the Bank going into liquidation, (iii) personnel retrenched from Government offices after at least one year's service, applying through the Employment Exchange, and (iv) candidates belonging to the Scheduled Castes or Scheduled Tribes.

(D) QUALIFICATIONS :

(1) Research Officer, Department of Research & Statistics.

First or high second class Master's degree in Economics of an Indian University, or first or high second class degree in Economics of a foreign University, or a Doctorate degree in Economics of an Indian or Foreign University and specialisation and research in Agricultural Economics.

(2) Assistant Accountant, Department of Banking Development.

Applicants should possess a first or high second class M.A. in Economics or M.Com. degree of a recognised University. **In addition,** the candidate should possess adequate experience of one or more aspects of Industrial Finance or, be a Chartered or Incorporated Accountant with experience of accountancy and audit in a firm of standing and repute.

(3) Rural Credit Officers, Agricultural Credit Department.

Applicants should possess very high academic qualifications of Indian or Foreign Universities, (preferably post-graduate) in Economics, Sociology or other Social Sciences, and possess degrees which are either first class or high second class. Special study or knowledge of rural economics or rural sociology will be an additional qualification; so also will be the experience gained in a responsible position in a Co-operative Department or in a Co-operative Institution.

(4) Probationary Assistants, Agricultural Credit Department and Department of Banking Development.

Applicants should possess a first or high second class Master's degree of an Indian or Foreign University in Economics, Sociology or other Social Sciences or in Commerce. Special study or knowledge of rural economics or rural sociology will be an additional qualification; so also will be the experience gained in a responsible position in a Co-operative Department or in a Co-operative Institution. Proficiency in drafting notes, memoranda, reports etc. is expected.

(5) Probationary Assistants, Legal Division.

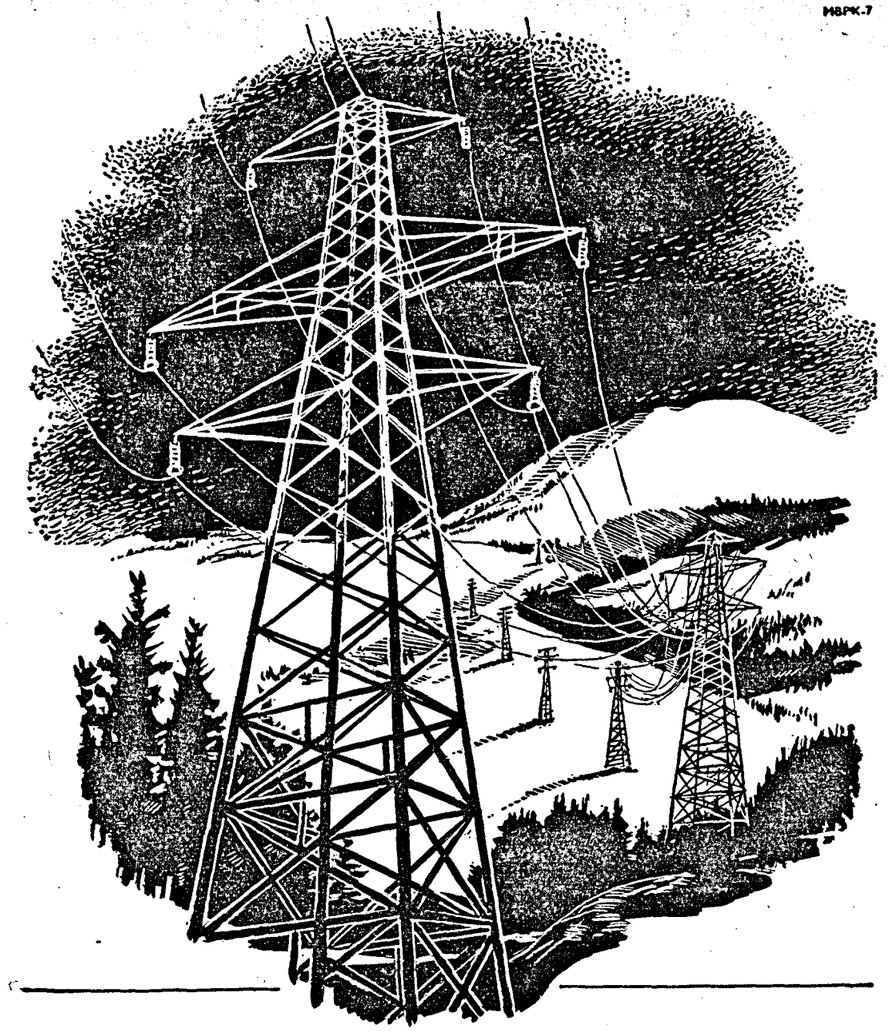
Applicants should be advocates or Solicitors and should possess in addition to high academic qualifications in Law, practical experience of work in an Advocate's or Solicitor's Office or have practised independently, for at least 5 years. Preference will be given to candidates having M.L. or LL.M. or other equivalent qualifications and special knowledge of banking and company law and to candidates who have passed the Advocates' (O.S.) examination held by the Bombay High Court or the Solicitors' examination held by the Calcutta High Court or by the Bombay Incorporated Law Society.

(6) Economic Assistants.

Applicants should possess a high second class Master's degree or a first class Bachelor's degree in Economics or Commerce of an Indian or Foreign University and have practical experience in the Co-operative Department of any State in India or abroad or in a Co-operative Institution of standing. Specialised study in Rural Sociology will be an additional qualification. Graduates who have passed out of any of the Training centres organised by the Central Committee for Co-operative Training or those run by State Governments may also apply.

The Board will insist on a very high standard of suitability in making selections for the above posts and only candidates who possess good academic qualifications and adequate experience of the type specified are advised to apply. Candidates who wish to apply for more than one category of posts must submit separate applications accompanied by separate application fees.

The selected candidates for the posts of Research Officer, Assistant Accountant, Rural Credit Officers and Probationary Assistants will ordinarily be on probation for a period of 3 years which may be reduced or extended at the Bank's discretion. Candidates selected for the posts of Economic Assistants will be on probation for a period of one year. Candidates selected for the posts in Department of Research & Statistics, Department of Banking Development and Legal Division will ordinarily be stationed in Bombay but those selected for the posts in the Agricultural Credit Department must be prepared to serve in any office of the Bank in India and to undertake tours when required.



Applications should be in a special form to be obtained from any office of the Reserve Bank. All the applications should be accompanied by copies of two testimonials (originals should not be sent; the Bank *does* **NOT** *accept responsibility for returning the originals* if sent through oversight) and forwarded to the Secretary, Central Recruitment Board, Reserve Bank of India, Central Office, Post Box No. 406, Bombay No. 1 so as to reach him on or before 31st January 1956. Candidates already in service must submit their applications through their employers. Candidates belonging to Scheduled Castes or Scheduled Tribes should mention this fact prominently on their applications.

Applicants for all the above posts except Economic Assistants must remit application fees of Rs 7|8|- per application by Postal Order, Cheque or Bank Draft on a **Scheduled Bank payable at Bombay** along with the application. Candidates for the posts of Economic Assistants must remit an application fee of Rs 2|- in a similar manner. The application fee is in no case refundable. Bonafide refugee candidates who are **not in employment** applying through any of the Government Empoyment Exchanges are exempted from payment of application fees while in the case of Scheduled Castes/ Scheduled Tribes candidates the fee will be reduced to ¼th.

Appointments will be subject to candidates being found medically fit for service in the Bank. If any candidate desires to have his application acknowledged he should enclose a stamped self-addressed envelope or a post-card. Apart from those who may be specially called, interviews will not be granted to candidates nor will the Bank enter into any correspondence with them.

Canvassing in any form will be regarded a disqualification.

Wage Earners During War & Post-war Boom

Ayodhia Singh

[This is the second of the two articles, the first of which appeared in the issue of December 24, 1955, in which the author examines the movement of wages, employment and cost of living during the war and post-war boom years]

THERE was a general psychology of depression in the country at the end of the hostilities in August 1945. It was believed that with the end of the hostilities, the inflationary pressure would come to an end. In actual practice, however, events turned to be different from what had been expected. There was a good *deal of repressed inflation* in the country, which burst out into an open inflation as soon as wartime controls came to be relaxed. During the war, labour had mostly failed to get its earnings increased in proportion to the rise in the cost of living. After the war, there was a wave of strikes and a good deal of industrial unrest. Industrial labour got belated relief after the war and wages showed a constant tendency to rise. All round rise in wages and scarcity of labour as also the difficulties arising out of the partition of the country in August 1947 resulted in an unprecedented rise of prices which created a good deal of discontent in the country.

During the early years of the post-war period, there was an almost continuous rise in cost of living in all the four industrial centres (Table I). *The year 1946 recorded* an increase against 1945 in all the centres except Calcutta, the increase being quite significant in Bombay and Kanpur. This upward trend in cost of living became more conspicuous during 1947 in all the four centres. The increase in 1947 compared to 1946 was the *highest in* the Kanpur (50 points) followed by Madras (37 points) and Calcutta (34 points), the smallest rise being in Bombay (19 points). The position of the wage-earners deteriorated in all the centres further in 1947, though the extent of deterioration differed from region to region. The wage-earners of Mad*ras were better off than those of UP* and Bengal. Bombay wage-earners, having suffered the least deterioration both relatively and absolutely, were *comparatively in a better position* than the wage-earners of the other three centres. Calcutta wage-earners, as in other years since 1953, were the worst sufferers in 1947, next only to the Kanpur workers whose condition was most miserable.

During 1948 the highest rise recorded was in the Kanpur cost of living index, viz 93 points, the rise at the other centres being moderate. This implies that the economic condition of Kanpur wage-earners, who were already in a worse condition in comparison with the other groups during 1947, and also before, underwent further deterioration during 1948. Bombay wage-earners suffered least, Madras which was in a better position than Bombay during 1946 and only slightly worse during 1947, faced greater deterioration during 1948.

Though the cost of living indices of all the centres continued to rise in 1949 also, the extent of the rise was not significant. As in previous years, the Kanpur wage-earners were still the worst sufferers and the Bombay wage-earners suffered the least. The position of wage-earners of Madras and Calcutta was midway between these two. Thus the four groups stood in the same relation to each other during 1949 as in 1948. However, the chief difference to be noted was that during 1949 the relative position of Madras wage-earners had deteriorated compared to that of others.

During 1950, the rise in the cost of living was not only slowed down, there was a decline of 44 points in the Kanpur index as compared with the preceding year. The relative position of the different groups remained almost unchanged, the only change being in the position of Kanpur wage-earners which improved a little relatively to other groups, though they continued to be the worst sufferers.

Decline in Living Standards

On the whole over the period 1946-50, the rise in the cost of living of different classes led to a decline in their living standards. The least affected were the wage-earners of Bombay followed by those of Madras, while the worst affected were the wage-earners of Kanpur followed by those of Calcutta.

Forces of Adjustment

However, the above conclusions would hold only in so far as other factors, for example, earnings, employment etc. remained constant. These other factors may be examined. First let us take earnings.

A study of the movement of wages in relation to the rising cost of living is essential for understanding the economic position of wage earners. Table II which sets out indices of average annual earnings of factory workers of perennial industries in the four regions, shows that during 1946 the index of earnings (base 1939 = 100) was 215.4 as against 207.2 in 1945. We notice a decrease in earnings in Bombay by 9.6% and increases of the order of 18.7% in Madras, 7.6% in U.P. and 6.6% in Bengal.

During 1947 everage annual earnings rose by 19.2% as compared to 1946. The higheest percentage increase was recorded in Madras, being 32.7%, followed by Bombay where the corresponding rise was 20.4%. West Bengal and U.P. registerd increases of 14% and 13% respectively.

The increase in average earnings in 1948 as compared to 1947 was 20.7%.U.P. recorded the highest increase, being 31.9%. Bombay wage rate, however, was still the highest (Rs. 1142) and recorded an increase of 16.8%. The increase in the level of earnings in Madras was only 9.2%.

Trend Reversed in 1950

The rising trend in average earinngs which had been evident since 1946 was maintained in 1949. In Madras there was an increase of 18.8% in earnings compared to preceding year while West Bengal, U P and Bombay recorded increases of 15.9%, 11.9% and 6% respectively.

The trend was reversed in 1950 when average annual earnings came down to Rs 966.8 from Rs. 985.8 in 1949. Unlike West Bengal, where a moderate increase of 2.6% was recorded over 1949, Bombay, Madras and U P suffered declines of 5.3%, 22.1% and 5.8% in earnings during 1950. An important reason for the decline appears to be the extension of the coverage of the Factories Act, 1948 to small factories where generally wages were comparatively low.

From the above it appears that generally up to 1947, average earnings were moving with the cost of living. In almost all the provinces, there was a sharp increase in the average earnings during 1947, 1948 and 1949 with the result that the rate of increase in earnings in *this period was fairly steep*, while cost of living followed a flatter course.

Table I

Working Class Cost of Living Index

(To be Continued)

Workers' Participation in Management

WORKERS' participation, through their representatives, in the management of industry is one of those idealistic measures which has made even less headway than profit-sharing. The latter, in select cases, has been found to work but workers' participation in management at higher than workers' council level remains as unattainable as ever. It is one of the declared objectives of the Indian National Trade Union Congress to bring this about and with two of the moving spirits of the INTUC on the Cabinet, it will be surprising if labour participation in industry is not pushed during the life of the second Five-year Plan. And though he has not made any important policy statement since then, it must not be forgotten that Pandit Nehru became an instant convert to the idea during his visit to Yugoslavia.

Though non-political support for such participation comes from the belief that it will ensure better relations between labour and capital and put an end to industrial strife, and it has usually met opposition from employers in the past, opposition from labour to the proposal, it seems, may be even more difficult to overcome. The Labour Panel set up by the Planning Commission to go into this question has not yet completed its task but its proceedings so far have brought this out in an unmistakeable manner. Far from being enthusiastic about it, labour representatives hesitate to join the Board of Directors because they are afraid of losing their class identity and also the loyalty of the workers if they do so. For this may mean losing their position in trade unions and inability to function as labour leaders.

The Conference of Labour and Welfare Officers which met at Nagpur last month did not think that labour participation in management was possible at this stage. The concensus of opinion was that workers' representatives did not have the necessary technical knowledge or the experience to be able to participate in management successfully. This also appears to be the considered view of industry. Tatas have come forward with a proposal for workers' participation, not on the Board of the Tata Industries, but both at the administrative and technical level. The Tata scheme, it is reported, has been favourably received by the Ministries of Planning, Labour, Commerce and Industry. The final aim is progressive participation of workers in the management of industry. This is to be achieved within the next 7 to 10 years. The scheme envisages the setting up of two types of Work Council, one administrative, the other technical. The Work Council on the administrative side would be, to start with, kept fully informed about policy matters, sales, purchases and finance. As for technical matters, the Work Council would be encouraged to suggest modifications, improvements and economic devices as a prelude to more responsible work. If Tatas come forward, others cannot lag far behind, at least not for long.

But while such ambitious proposals are being actively canvassed at the highest level, workers' participation in the humbler spheres through Work Councils does not seem to have made any headway at all. This is one more of the paradoxes of the times in which we live and in which we seem to revel.

(Continued from page 16)

for a long time to come. Due to many reasons, works and production committees have not yet been made a success. As employers, we share a part of the blame, as much as the employees must. But I am confident that given the good-will and co-operation, our works and production committees can be transformed from mere grievance platforms into vital, living institutions which can provide a multipoint contact, at an easily assimilable level, for a large number of the workers. To my mind, this constitutes a more desirable channel, from the point of view of its value as education in management, into which the urge for greater participation in management can at this stage be most usefully directed.

Before I conclude, ladies & gentlemen, I have great pleasure in putting on record my appreciation of the efforts of all my colleagues, big and small, and I convey to them our thanks for the same."

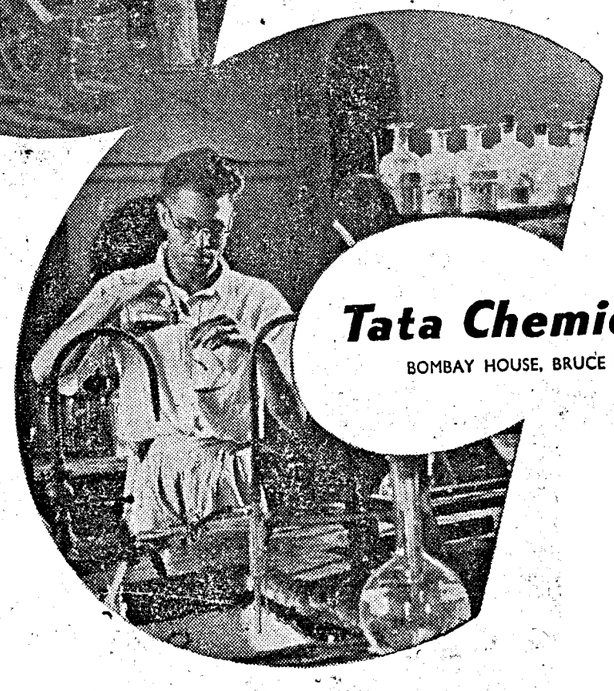
Imagine a world without salt!



Can you imagine how poor the world would be without salt? Your food would lose its savour; there would be no paper to write on; no leather for shoes; no glass to replace the broken window panes; no medicine for the ailing.

In olden days man used common salt as an article of currency and commerce, but the scientists of today have turned it to richer and more varied uses. Out of it they produce such basic heavy chemicals as soda ash, caustic soda, bicarbonate of soda, magnesium chloride and bleaching powder. These chemicals are used in the manufacture of paper, leather, glass, soap, textiles, pharmaceuticals, and other useful commodities.

From the boundless sea as its ore mine, Tata chemicals recover salt and other marine products to convert them into alkalis and heavy chemicals so essential to Indian industry.

External Assistance

THERE *is a polite convention that the Plan Papers—in this particular* case, the Draft Plan—are to be treated as confidential until they are published, and circulated for eliciting public opinion. This will be some time at the *end of February, along with the Budget papers,* or early in March. So, until then, high secrecy must cover all deliberations. But as the National Development Council was set up to enlist the support of the States as also of the people to the Plan, when the Standing Committee of this Council meets, or for the matter that, when the Panel of Economists meets, certain things come out in bits and pieces. The trained seals who frequent the Finance Ministry catch the fish and are allowed to have access to some of the details which they have neither the time nor the appetite to digest. These they pass on to their papers untouched and news editors, always on the look out for scoops, and convinced that anything about the Plan is good copy, pass them on to their readers. The result is good publicity, more confusion and little understanding.

Though much remains to be known about the Plan, however, it is not because of this veil of secrecy. For, the polite convention notwithstanding, the Draft Plan has not remained such a great secret; it cannot when Bombay money bags want to read the writing on the wall and speculators want it for possible tips. There are so few cards to be put on the table. What remains to be known is something that the Planning Commission themselves do not know. The target has been raised. The Planning Commission, with their fingers on the pulse of the country, could not possibly have done otherwise. The target, however, is a reading of the political barometre; resources are quite another matter. Not that there is no scope for wishful thinking in figuring out the latter. After all, these are but estimates and estimates can be optimistic or they may be on the low side. It is all a matter of the psychological approach to the problem. Here the Finance Ministry is not under the usual constraint of past receipts and rates of increase, or whatever the criteria that it uses in forecasting revenue. These estimates are spread over a number of years and in fields that are untrodden. But even with all this, only half the resources are visible; the other half is just not there or no one can see them.

True, the situation might have been no better when the Draft Plan-frame was presented in last April but since then, it is to be presumed, the Planning Commission must have put in a lot of labour and the Finance Ministry had time to probe, scrutinise and investigate. What is the result of these labours and researches? The Finance Minister has agreed to raising the target. The Finance Ministry has persuaded itself that the upper limit of deficit financing suggested some months ago can now be regarded as safe. Allowing for this larger measure of optimism, there still remains a gap. But the gap is now smaller than what it looked in April. Indeed, it is only half of what it was. This is because, after prolonged deliberation, one would presume, it has been found possible to bank on a larger measure of external assistance. The gap, in short, has been reduced by half and external assistance has been doubled.

Not to speak of foreign aid, even foreign exchange earnings may be tricky in the extreme. Of that there was a painful reminder this week. While TTK is busy with export promotion and in ensuring that the quality of cloth exported maintains a proper standard, and a Committee has just been set up to devise ways and means for insuring exporters against some of the risks of export trade, Burma has decided to reserve 60 per cent of import licences for communist countries, which will mean a severe cut on Indian cloth exports to that country.

The required and not the promised external assistance has only to be converted in terms of dollars to explain why even the restoration of the cut in American Aid to India for the current US fiscal year has not aroused any enthusiasm. What is $60 m against $4000 m that is required? This is, however, not a fair comparison. American assistance during the first Plan period would not compare unfavourably to the total foreign assistance that India received, the aid under the T C M for these years being of the order of $250 m. against the total of foreign assistance received of some 200 crores in rupees or $1000 m. If to the TCM aid is added the wheat loan, the total American assistance will come to $450 m, which is about half of all the foreign aid that India received, in the period which slightly exceeds the First Plan period. Of course, the current year's U S aid can suggest nothing, one way or the other, about the probable magnitude of American assistance for the Second Plan.

True, Point Four running in millions is not even a fraction of Marshall Aid for Europe that flowed out in billions. True also, since the Korean war U S non-military aid has sharply come down while foreign military aid has not only been kept up but has been substantially augmented. But India has not fared badly so far, nor can one cavil at the purposes of this aid. Indo-American technical co-operation has ranged over so wide a ground that its focus has never been very sharp at any one point. It began with Community Projects. Though a recent U N publication has given a chit that community projects represent the evolution of Gandhian philosophy, which is a very polite compliment indeed, the Ford Foundation had much more to do with it than Wardha. But though TCM might have been community projects oriented in the beginning, the emphasis soon shifted to agricultural development in general. Later, may other things came in. A break-down of the programme for the U S fiscal years 1952-55 shows that agriculture and natural resources got the first priority with $73 m out of a total of $268 m; industry and mining came a close second, with $69 m; and transport came third with $41. A recent State Department assessment runs as follows:

> "In the first years, emphasis of the Indo-American programme was very largely on agricultural development, since this occupies top priority in the First Five Year Plan. . . . Although much emphasis remains on agriculture, natural resources and health under the 1955 program, increasing importance is attached to industrial projects **in line with the accelerated programme of industrial development** under India's Five Year Plan." (Bold ours)

So if the Second Plan is oriented towards heavy industry, there is no reason to suppose that T C M will fail to keep in step or be deflected by ideological considerations.

But whether Russia smiles and America frowns or America smiles and Russia frowns or both cheerfully agree to foot the bill, it is neither wise nor realistic to count on external assistance of this magnitude. At best, such assistance should only be marginal. For what is planned development, if it is not based securely on self-help? Even if others are willing to help, why embarras them with such importunate demands?

Islamic Pakistan

EIGHT years ago, Congress agreed to the partition of the sub-continent on the basis of regional self-determination. Independent India adopted a written Constitution under which she became a secular, sovereign, democratic Republic. Eight years later, after prolonged political controversies and bickerings, Pakistan has framed a Draft Constitution. Well-wishers of Pakistan will welcome that a Draft Constitution has, at long last, been prepared. But this welcome will be accompanied by a profound disappointment that the Draft has a pronounced theocratic and undemocratic bias. From a perusal of the Draft, the question arises as to the basic purpose of a Constitution. In the main, a Constitution seeks to ensure equality of rights and opportunities to the country's population as well as to safeguard the interests of the people against the arbitrary excesses of the State. Pakistan's Draft Constitution is a negation of these basic principles.

Under the Indian Constitution, India has not been declared a Hindu Republic. Hindus and Muslims have only one, common citizenship. Muslims have equal rights and privileges as Hindus. Under the Draft Constitution, Pakistan will be an Islamic Republic. Only a Muslim shall be the Head of the State. Only a Muslim can be the Vice-President of the Islamic Republic of Pakistan. "No law shall be enacted which is repugnant to the injunctions of Islam, as laid down in the Holy Quran and the Sunnah". There is a provision in the Draft that Islamisation of the law, which will govern the people after the codification has been completed and accepted by the Federal Parliament, will not affect "the personal laws of non-Muslims, the status of non-Muslims as citizens of Pakistan . . ." Fundamental Rights and Directive Principles will be included in the Constitution.

These provisions cannot obscure the Islamic status of Pakistan. That has never been in doubt. But hopes have been entertained that Karachi will have the statesmanship to assure statutory recognition of equal rights and citizenship to Pakistan's non-Muslim minorities. Mr I I Chundrigar, Pakistan Law Minister, is honest in his speech in introducing the Constitution Bill to the Constituent Assembly. There are apologists who cite the safeguarding provisions in the Draft Constitution as evidence that Karachi has no intention to impose an inferior status of citizenship on non-Muslim minorities. Mr Chundrigar is blunt, but not dishonest, in his claim that the Draft Constitution "envisages the establishment of an independent sovereign State consistent with the ideology for which Pakistan was established". Karachi never accepted New Delhi's interpretation of the political basis of partition of the subcontinent. Despite Mr Jinnah's assurance that Pakistani citizenship will have no religious basis or complexion, the Draft Constitution relegates the Hindus of Pakistan to a secondary, inferior status under the Constitution. It is difficult to appreciate how the proposed Fundamental Rights and Directive Principles can ensure equal rights to Hindus when these are explicitly denied to them under the Draft Constitution.

Not only is an inferior status of citizenship made explicit in the Draft Constitution, it is also implicit in the postponement of the basis of elections in Pakistan. Written Constitutions invariably include a provision as to the basis of elections. But the Draft Constitution has left it to Parliament to decide whether elections in National and Provincial Assemblies shall be by joint or separate electorates. It was the Coalition Parliamentary Organisation, representative of the major political parties of both wings, which prepared the Draft Constitution. If it has not been possible for such an Organisation to evolve a scheme of joint electorates, it is idle to pretend that a future Parliament will have the vision to vote for a system of joint electorates. If the Muslim League and the United Front have not succeeded in recommending joint electorates as the basis of elections, it is clear that there are powerful political elements in Pakistan which are determined to perpetuate separate electorates. To stress that the system of separate electorates is a negation of equal rights and citizenship to the minorities is to emphasise the most obvious.

Only on some minor aspects has the Central Parliamentary Organisation succeeded in reconciling the conflict and rivalry between the two wings of Pakistan. Eastern Pakistan will have equal representation with Western Pakistan, after its merger into a single unit, in the unicameral National Assembly. This controversy about the basis of representation was diplomatically by-passed by the integration of the provinces of Western Pakistan into one single unit. Even so, equal representation to Eastern Pakistan does not do full justice to this wing as it is still numerically stronger than the Western wing. It is possible that the United Front has succeeded in granting recognition to Bengali along with Urdu as State [illegible] hence. But those who are familiar with the trend of developments in Eastern Bengal will doubt whether even the statutory recognition of Bengali as one of the State languages will prevent tthe progressive domination of Urdu and Arabic influence in the eastern wing of Pakistan.

Hostile response to the Draft Constitution in Eastern Pakistan deepens these doubts. Under the Draft Constitution, Pakistan will be a federation, with a strong and powerful Centre. Demands for full regional autonomy have, thus, been rejected. Besides the problem of safeguarding the interests of non-Muslim minorities, this is one of the major issues in dispute in Pakis[illegible] on service facil[illegible] to small units powers between the fe[illegible] been urged the federating units a[illegible] Industry the Draft Constitution, [illegible] likely to in the eastern wing of P[illegible]uction of would be idle to pretend th[illegible] second tration of authority at the [illegible]mount Centre stems from considera[illegible]ents territorial integrity. Such a [illegible]rial can only lead to gradual negle[illegible] a not deliberate suppression, of E[illegible] gali tradition and culture in Easte[illegible] Pakistan. It is to be deplored deep[illegible]ly that the Draft Constitution has not only denied equal rights and privileges to Pakistan's minorities, but it has also ignored the urgent aspirations of the people of Eastern Pakistan.

The agreement reached by Tata Iron and Steel Co. with the Tata Workers Union in Jamshedpur, however, did not need the intervention of the Labour Minister. And it is the most comprehensive of the agreements reached in the recent past, or at any time in the history of the labour movement in this country. The price that the Company has to pay is the recognition given to Tata Workers Union as the sole bargaining agents of the employees. In exchange for a 'closed shop', the Company wins willing and active participation by labour for solving all the problems which plague capital-labour relations e.g. in fixing the size of the labour forces, in carrying out improvements in labour productivity, job evaluation, Works Committees, in evolving a procedure for redressing grievances and in selections for promotions. As in the Bombay agreement, adequate contribution by employers to schemes for housing labour is one of the important stipulations.

Indo-Italian Amity

Those who assumed hastily that one of the results of the Russian leaders' visit to this country was a shift in India's foreign policy in favour of the Communist bloc will feel assured at the joint communique issued by the Prime Minister and Italy's Foreign Minister. Italy will now become a memeber of the United Nations. She is a NATO Power. But, as a member-State, Italy agrees to have "close and cordial co-operation" with India to ensure world peace within the framework of the United Nations. Attainment as well as maintenance of world peace is the basic aim of India's foreign policy. In pursuit of this aim, India is always willing to co-operate with Communist Russia as well as with non-Communist Italy. With the possible exception of America, no ther Western Power has mistaken dia's desire to have economic co- ation with Russia as New elhi's alignment with Moscow.

Community—Structured

REAL decentralization means that the country should be covered with a net-work of small-scale industries (not necessarily household and hand) which should be co-operatively owned. Without wider dispersion of ownership, reduction of inequality through progressive direct taxation alone does not go very far. But who will set up and organize the producers? China had the party to do it; our administration would not be equal to the job. Congress does not seem to be interested or capable of delivering the goods. Then, again, there is the question of resources. Electricity has to be taken to the villages, that itself will require an immense volume of equipment, new techniques will have to be developed and perfected; small machines and tools have to be supplied in large numbers. Nothing of the sort can be attempted until we have developed steel production and a widely based machine making industry. So all this can come only in the third or fourth Plan. Meanwhile, as much of the existing idle capacity (not creation of new capacity) should be utilized to supplement production of consumer goods in the organized sector. That is how it looks at the moment.

So all this is yet, to be. It is not here and now. Of course, the ultimate solution of educated unemployed is not to allow such a class to grow at all. Catch them young, and let only the select ones to go to college and higher up. This is what the Member of the Planning Commission for Education, Dr J C Ghosh rightly advises when he suggests that education should be "community-structured". That is to say only the pick of the lot should be sent up for higher education, after a separate and a stiff test. Results at the school final or matriculation examination are not enough and should not entitle the boys to gain admission to colleges. The rest, some 85 per cent or more of the total, should be taught some trade or useful craft at the secondary stage, so that they may be able to make a living either from agriculture or small industry.

Social inequalities enable some, simply because their parents are better off, to go in for college education. Others drift into it because there is nothing else to do. Technical education in the absence of industries expanding fast enough to absorb the technically qualified is no solution. Until the other day, it was by no means unusual to find engineering graduates, or others with similar qualifications, joining Law classes to kill time, or crowd into the general line.

For reorienting the educational system, Dr Ghosh wants to borrow one idea from Gandhiji's basic education—not education through craft, but training in a craft and turning the period of training to some economic advantage. This may be done in two ways. Students may earn something on their own, by practising the craft which they are being taught and the schools may supplement their resources by selling some of the products turned out by the students, so that the cost of education may be lightened both for the school and for the students.

Even this, however, does not go to the heart of the problem which is, can enterprise be taught in schools? For organising small-scale industries, technical training is not enough. Producers who experience difficulties which can be solved, if they get organised in co-operatives, are the right material for starting such co-operatives. How can fresh products of secondary schools be turned into such producers? Not only the economic climate, but a whole set of values will have to be changed before education can be "Community-structured".

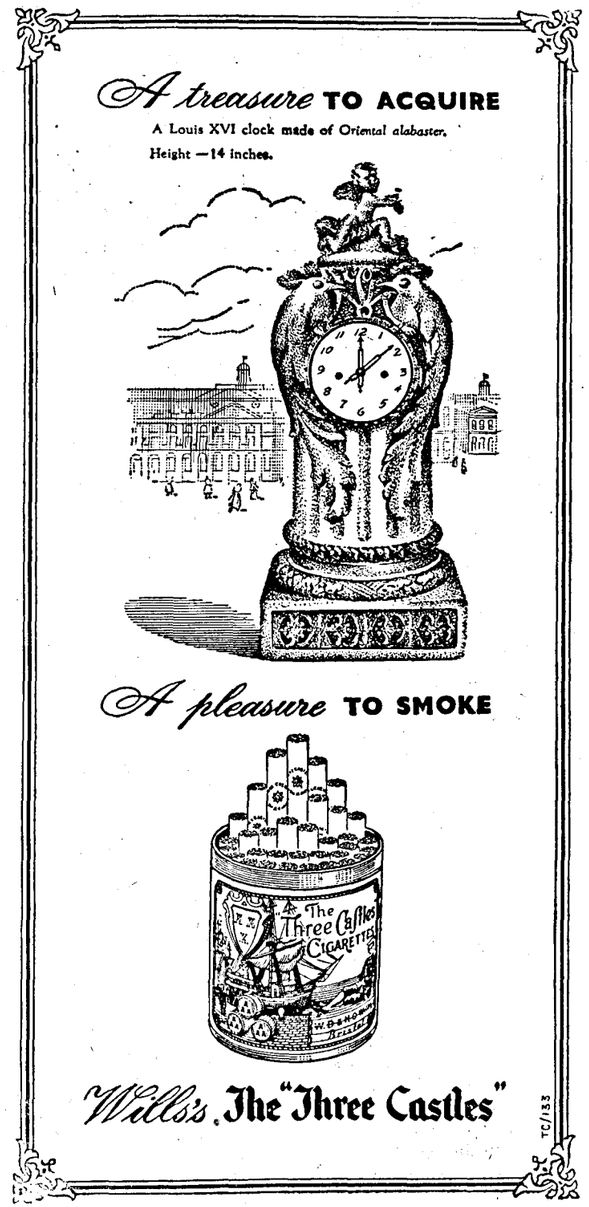
Assistance to Small-scale Industries

THE efforts of the Government of India to develop small-scale industries have run up against the usual snag. In official parlance, they are being impeded by serious administrative bottle-necks. One of the important objects of Shri T T Krishnamachari's last visit to Bombay was to remove some of these. Hence the discussions with the representatives of State Governments of Bombay, Saurashtra, Vindhya Pradesh, Madhya Pradesh and Kutch.

The Government of India have tentatively budgeted a sum of Rs. 55 crores during the period of the Second Five Year Plan for grants and loans to aid development of small-scale industries. Budget allocation under this head has steadily gone up. In 1954-55, it was only Rs 1.04 crores.



The amounts budgeted, however, are not being fully utilised, the reason being cumbersome rules and complicated procedures for sanction of loans under the State Aid to Industries Act. At the meeting held in Bombay last Wednesday, the Commerce and Industry Minister pointed out that the Government of India had recommended to the State Governments that loans up to 75 per cent of the value of the security offered should be advanced. Such security should include equipment, stock-in-trade, and other assets created out of the loan. The rate of interest to be charged to individual small units was 3 per cent and to co-operative societies 2½ per cent. The Central Government would pay the difference between the rate of interest at which loans were sanctioned by the Centre to the State Governments and the reduced rate at which loans were advanced to small units.

For working capital, the meeting of the Small-Scale Industries Board held last month at Rajkot decided that the State Governments be requested to liberalise their rules (i) to allow loans being granted to bonafide small manufacturers up to an amount of Rs. 1,000 on a personal bond, (ii) to allow loans up to Rs. 5,000 to be advanced to small units on the security of one or more personal sureties, and (iii) to allow local industries officers to sanction loans to small units up to an amount of Rs. 2,000 in their own discretion.

The financing of small-scale units by commercial banks, co-operative banks, State Bank of India, State Financial Corporation etc. (with the assistance of the Reserve Bank of India), is also being looked into. The Government of India has appointed Shri S V Ramamurthi, Adviser to the Planning Commission, to make a special investigation on the subject and submit recommendations to Government.

Trading Estates and Machines

A SPEEDY implementation of the scheme for industrial estates where factory space, electric supply, water and common service facilities could be provided to small units on rental basis has also been urged by the Commerce and Industry Minister. A large sum is likely to be set apart for the construction of industrial estates during the second Plan period and the entire amount required by the State Governments for the purpose of starting industrial estates would be sanctioned as a long-term loan for 20 to 30 years at the rate of 4½ per cent.

A scheme for the supply of machinery to small units on hire-purchase supplements the above. Applications had been invited a few months ago by the Regional Small Industries Service Institutes for supply of machinery to small-scale units. It is understood that applications for supply of about Rs. 10 lakhs worth of machinery to small-scale units were recommended by the Small Industries Service Institutes. However, recently, the National Small Industries Corporation, which will actually execute the agreement and supply the machines, decided that the Director of Industries of the State where the small-scale factory is situated should also recommend the application for loan. Small units are to pay outright 20 to 40 per cent of the cost of the machines depending on the nature of the machine, and the balance would be realised in suitable instalments spread over a period of five years or 50 per cent of the estimated life of the machine, whichever is earlier. Interest will be charged at 5 per cent from industrial co-operatives and at 6 per cent from the other small units on the block capital. It may be noted that the rate of interest charged on machinery loans is double that charged on "money" loans.

Jobs for Educated Unemployed

WHILE Shri Krishnamachari was urging expeditious execution of schemes of State Governments for development of Small-scale Industries in Bombay, Shri G L Nanda, the Planning Minister, announced at Delhi that employment opportunities for the educated unemployed would be increased by organising small-scale industries and the co-operative movement. The Development Commissioner for Small-scale Industries had originally put up a scheme for training a lakh unemployed matriculates to set up small-scale industries e.g., hand tools, sports goods, cutlery, agricultural implements, bicycle parts, small machines, machinery parts, automobile parts, repair shops, etc. and later, a study group of the Planning Commission went into the entire question. The report of the study group has not been published yet, but it is significant that Shri Nanda should make it clear that small industries meant 'town industries, and not village industries. The idea appeals, but can the Government's administrative machinery be suitably geared to implement such a training and production scheme?

U S Foreign Aid

THIS is the election year in America. In recent history, election years have invariably seen political stalemate in the States. Today, President Eisenhower is in a dilemma which paralysed Mr Truman at the end of his second term. Both Houses are dominated y Democrats, the political rivals of the Republican Party. In such circumstances, it is natural that President Eisenhower, the Republican President, is hesitant to initiate any new policy. Yet, this was just the time and occasion when President Eisenhower could have enhanced his Party's chances in the coming elections by enunciating a bold and imaginative policy. His State of the Union message shows that he has lost the opportunity.

There is an implied admission in his message that the international situation has changed since the "summit" conference at Geneva among the Heads of State. President Eisenhower is not unaware that Russia has taken the initiative in exploiting the "Geneva spirit" to her advantage. But he interprets the post-Geneva Russian diplomacy to mean "reliance on division, enticement and duplicity". He emphasises that the Russian threat may have become "less obvious", but has not become less dangerous. It has been remarked that the post-Geneva policy of Russia is not yet properly appreciated by the Western Powers. President Eisenhower's State of the Union message confirms such suspicions.

Some of the observations of the Russian leaders during their visit to this country have been criticised on the ground that these statements underline Moscow's determination to perpetuate the "cold war". On second thoughts, such an assessment of Russia's policy since Geneva, is admitted to be hasty. There has been a shift in Russia's foreign policy. It is clear that Russia's current diplomacy assumes that there will be no third world war. On this assumption, Russia started the drive for competitive co-existence. It is evident that the implications of this shift in Russian policy is either not adequately understood or deliberately ignored by Washington. "Our policy", President Eisenhower observes, "must be dynamic and flexible, designed to forward achievement of our own objective rather than to meet each shift and change in the communist front". This explains President Eisenhower's implied assertion that America's policy will continue to be based on negotiation through strength.

Even though President Eisenhower takes elaborate pains to deny that there has been any basic change in Russian foreign policy, one of his major recommendations in his State of the Union message belies such an appraisal of the current phase of Russia's foreign policy. In requesting Congress "to grant limited authority to make longer-term commitments" to non-Communist countries, President Eisenhower confesses, by implication, that Russia's "Point Four" policy needs to be matched by an extended foreign aid programme by America. This is the only positive aspect in President Eisenhower's State of the Union message. His request to Congress is a clear proof that Washington admits that the shift in Russian policy demands a similar change in Washington's foreign economic policy. Underdeveloped countries will welcome the American President's awareness of the implications of competitive co-existence.

REVENUE :

The Indian Tea Industry contributed to the National Exchequer Rs. 19 crores as export duty, and over Rs. 3 crores as central excise duty in 1954-55. Besides, it contributed large sums by way of State income tax, agricultural tax, road tax and certain imposts.

Land—The Biggest Challenge

THE present situation differs in important respects from that prevailing in July 1951. The very success of the first Plan has made it necessary to plan more ambitiously. The political developments of the intervening period also point in the same direction. Discussions so far, however, about financial resources have not gone beyond the present structure of public finances. Tax measures were looked into by an expert Commission; and the results of their findings have been fully availed of. Programmes of borrowing have had the benefit of successful experiments. Even so, the target of investment that is now being considered is far above what, it is now estimated, can possibly be obtained from these two sources. No serious attempt has been made for exploring unorthodox methods of raising resources. Of the latter, the two proposals that have been put forward at one time or another are State trading and nationalisation of insurance. It is not certain yet how far these proposals have any support from Government. Nor has surplus from land figured prominently in the quest for resources. Acquisition of intermediary rights in land has been carried out by different States up to varying points. To the extent that along with it a ceiling is sought to be imposed on rents from land, the surplus arising from land will not be directly available to the State. Acquisition of intermediary rights, however, imposes a social responsibility. Employment and means of livelihood will have to be provided for the people who are dispossessed of their shares in the rent from land. This would be a problem of considerable magnitude if land-owning classes are really displaced. To the extent that the position of tenants is secured not only in law but in fact, landed classes who have enjoyed a status and have exercised authority will not be easily reconciled to a change which deprives them of both. They may be more easily absorbed if, along with real changes in tenancy, opportunities of productive employment are thrown open by decentralisation of the economy in the form of assisted development of small-scale and village industries.

Here it is presumed that there will be room in the co-operative sector for a class whose upbringing and social back-ground qualifies it to discharge the function of management and control. If land is to be given to tillers and intermediaries are to have no place, this class will have no function left. Girasdars masquerading as protected tenants or owner-cultivators are no greater social menace than the more spirited ones among them who take to brigandage.

The argument against re-distribution of land to indigent peasantry on the ground that however desirable it may be as social policy, economically it will be a backward step, as it will lower the efficiency of cultivation, will take a lot of answering. To answer it effectively, it is not enough to say that it is implicit in the re-distribution of land that the State undertakes the responsibility of providing credit and finding the resources necessary for efficient cultivation. Even that is not enough. For the answer, the First Plan depended on co-operative farming. This has made so little progress, however, and experience of these five years has given little hope of its ever being realised. Even the allocation of Rs. 50 lakhs recommended in the First Plan for experiments in co-operative farming has remained unclaimed.

The realists may also claim facts to be on their side in resisting the policy of distribution being carried too far. The progress in agriculture during the last two to three years is undeniable even when a generous allowance is made for favourable monsoons. If inequalities of land holding are a serious impediment to agricultural improvement, how could these remarkable results have been achieved without any substantial progress in the direction of redistribution?

Apart from the economic argument, however, which rests primarily on the powerful incentive which ownership gives to the urge for development, there is a powerful social case for a new deal to the landless. This is based on the study of village society. The village community does not represent a harmony of interests; on the contrary, it is torn by internal dissensions largely arising from the maldistribution of land. It is very often divided into warring camps, on the one side being those who have the land, mostly belonging to the upper castes, and on the other, the landless — mostly the Harijans and the lower castes. So, to talk of building from the bottom, and creating a healthy rural base, are equally unmeaning until this basic disparity is removed.

When land is given away to tillers, economics of cultivation demands that cultivation should be organised on a basis other than that of petty and fragmented holdings. Since we have no means of organising mutual aid under central direction except in so far as community projects may achieve this object, how to reconcile equity with efficiency of cultivation? Those who are impressed most by the urgency of redistribution of land fondly hope that once land is given to him, the peasant will not be found lacking and will have the sense to work out a system of joint cultivation on his own, without waiting for the blessings of the Registrar of Co-operative Societies. However that may be, land is going to present the biggest challenge; an approriate social policy will have to be worked out in respect of land-ownership in the second Plan period.

And not only in regard to land. Indeed, it looks as if questions of social policy will come up uppermost, not at the stage of the formulation of the second Plan perhaps, but in the course of its execution. The emphasis on employment itself is a thin end of the wedge; for gradually employment is coming to be recognized as one of the given premises according to which planning has to be modified, even if in that process, the rate of growth achieved becomes slower than what it could be otherwise.

(*Continued from next page*)

the reduced inequalities needed for promoting consumption and economic growth and the inequality required to channel resources for investments, by keeping down consumption and by increasing the marginal rate of saving, a balance has to be struck. Even if the 'golden mean eludes our grasp, there must be a due sense of responsibility in deciding how the maximum advantage can be derived. This has been grossly lacking and the excuse in putting forward such spectacular proposals of redistribution is that they arise for consideration, if not for acceptance, from the socialistic patteral of the Plan.

Our Delhi Letter

Discussions on the Draft

After the economists, the Standing Committee of the National Development Council has considered the Draft Memorandum of the Second Five Year Plan and a press communique has been issued to summarize the trend of discussions. The anomaly is that the Draft memorandum has not been made public and it is difficult to follow the cryptic statements in the press note. The Standing Committee, we are told, approved the proposals relating to Prohibition set out in the Draft Memorandum. What are these proposals? It appears that second thoughts have brought some understanding on this matter and the Planning Commission has resolved to let the States phase their own programme of total prohibition. If they had been given a deadline, as suggested by the Prohibition Enquiry Committee, the problem of finding resources to make up for the deficit would have passed back to the Centre. The States first submitted to the decision that they should find Rs. 160 crores by way of additional taxation and they are now being called upon to find a further sum of Rs. 65 crores which is difficult enough by all standards. All these were known when the Planning Commission, in a moment of exuberance, set up the Committee and packed it in a way which determined its conclusion in advance. Some tribute is, therefore, due for the courage shown in this retreat towards moderation.

Other concessions to realities of a similar nature are also reported to have been made in the final stages of the Draft. There is the case of coal, for example, on which a very rigid attitude was taken all along about the sharing of the additional production between the public and the private sectors and about guarantees to new investment. It seems the Draft has now omitted any reference to these rigid limits and the Production Minister answered, at a meeting of coal producers a few days ago, that the figure of 8 million tons of coal allotted to the private sector as its share of additional production was not a rigid one. In turn, the coal producers have taken the hint and have wisely refrained from pressing their demands for guarantees. Here again the truth is that an investment of about Rs. 100 crores would have been necessary in the public sector if 15 million tons more of coal had to be raised by 1960, while the private sector needed no more than a fourth of the amount, which it can find from its own resources. There will be greater certainty now of coal becoming available as and when the demand arises. If the responsibility had been left to the public sector, which may take some time to find its mines and start operation, there would be no assurance about supplies. In the Korba fields, for example, it is understood that exploration is slow and the sources of good metallurgical coal have not been located. All these considerations did not weigh strongly with the Production Ministry; but the severe rationing of the resources available for the public sector has led to a wiser decision now.

The third major advance has been made in the attitude to village and small-scale industries, which had provided a lively controversy in the last few months. The issues related mainly to the proposal to check organised industry (by ceiling on spindles, for example) and to the grant of large subsidies for production in this sector. It is now agreed that encouragment to village and small-scale industries should not involve large transfers of funds from one sector to another by way of subsidies. When it is difficult for Government to mobilize resources, it would be folly to part with them for payment of subsidies. Thus, by all these little acts of prudence, the Planning Commission has tried hard to prune some of the loose ends of the Plan. This has not solved the central problem of finding resources of the order of Rs. 4800 crores; but it would certainly help to prevent the position from becoming worse.

Considering that a battle royal was fought over controls at the beginning of the First Five Year Plan and that all the assumptions made then were subsequently thrown over, it is surprising that the question of controls should have been discussed almost on the same lines in the NDC Standing Committee. The Food Minister is reported to have taken a definite stand against a return to physical controls and rationing. Freedom of movement and limited interference with the market, have so far helped to stabilize food prices without hardship to the consumer and it would be unfortunate if controls are to be reimposed on pre-conceived ideas about their necessity. The theory that there will have to be restraints on consumption in order to divert resources to investments may involve fiscal and monetary measures, but physical controls on necessities would be too drastic to contemplate as means to achieve capital formation.

The immediate sources of controversy will be the proposal for reducing disparities in income and wealth which the Standing Committee is reported to have "considered absolutely essential for the success of democracy as a political system". This is a staggering sentence. News agencies have leaked out that the Draft Memorandum has put forward 'modest' proposals for considering a tax on total wealth—which the Taxation Enquiry Commission had dismissed on the ground that the flame was not worth the candle—and ceilings on salaries and incomes of Rs. 20,000 and Rs. 30,000 respectively per annum, after tax. Opinion has naturally been divided even within the Standing Committee and the laconic conclusion, reported above, may mean anything or nothing. It is remarkable that these questions have not been discussed in relation to incentives or savings which are really the governing factors. Would the considerations which apply to the restriction of the rights of absentee landlords apply also to the business and industrial sectors? Are the Planning Commission ready, for example, to offset the decline in employment caused in domestic services or other occupations which cater to the activities connected with "conspicuous consumption", whatever this may mean? Does the virtual liquidation of private savings involved in income ceilings of Rs. 30,000 mean that there will be no need for capital formation in the private sector at all and that the State will take over the entire responsibility? If so, it would mean that the public sector will not be merely "large enough to set the tone for the rest" as British socialists have urged, but an all-pervasive one, which has little use for private savings. Even so, the crux of the problem of attacking disparities in this way, is that of incentives. Between

Official Papers

World Outlook in Fats and Oils

WORLD production of fats, oils and oil-seeds which has been rising at an average rate of 2 per cent per annum since 1950 was about 25 per cent above pre-war level in 1954. As world population has increased only by 20 per cent in these years, output per capita has also risen compared to what it was before the war. Consumption, however, has not been evenly distributed. In 1954, it fell below the pre-war average in the US and Western Europe. In Asia, on the other hand, excluding China, where, according to FAO, production has not yet to come up to the pre-war level, per capita consumption has risen by 30 per cent above pre-war*.

The level of production of fats and oils in 1954, the Study points out, reflected the continuing upward trend of output in these commodities, and world production (excluding USSR) rose to 23.8 million tons—5 per cent above 1953 and 25 per cent higher than the pre-war output. This improvement was mainly accounted for by bumper output of West African and Indian groundnuts, Mediterranean olive oil and US soybeans and cottonseed.

Though consumption per capita has risen, it has not risen in all regions: thus consumption in 1954 was slightly below the 1934-38 average in the US and Western Europe, and was substantially lower in China. But in Asia, excluding China, it was about 30 per cent above pre-war.

World exports also showed a remarkable improvement, but the rise viz. 10 per cent over the pre-war level has not kept pace with the rise in output. The main factors which contributed to the expansion of exports in 1954 were:

(a) An aggressive sales policy pursued by the US and Argentina to dispose of Government stocks of oil and oil-seeds on the world market, at prices which were materially below those in the domestic market;

(b) Strong import demand from Western Europe; and

(c) The entry of East European countries and the USSR into the market for oils and oilseeds as importers.

* Commodity Reports, No. 6, Fats and Oils, FAO. Rome. pp. 67. Price US 25-1|3 cents.

The large supplies of fats, oils and oilseeds in 1954 should normally have led to an appreciable fall in prices. But this did not happen. There was only a moderate drop of 3 per cent in average prices of oils and oilseeds and the price level was relatively stable. In the first place, the improvement in their economic position enabled the countries of Western Europe to make larger purchases of fats, oils and oilseeds in 1954; secondly, there was an appreciable increase in the demand for these commodities from Eastern Europe and the USSR. Both these practically offset the effect of enlarged supplies.

The FAO report did not anticipate any substantial change in the world production of fats, oils and oilseeds in 1955, nor in the world trade in them. This is because although US expects a sizable increase in output in 1955, its effect is likely to be offset by the liquidation of surplus stocks disposed of in 1954.

Edible and Non-edible

The largest increase in production since pre-war has been in liquid edible vegetable oils, especially in soybean and cottonseed oils in the United States. Edible oil production has risen by 35 per cent since pre-war, against a 25 per cent increase in edible and non-edible put together. The production of coconut, palm and palm kernel and whale oils, which are used partly in food, has not only kept pace with the increase in world population, but as a larger percentage of the production is now used for food than before the war, there has been a slight increase in per capita consumption of fats and oils for food.

The production of inedible tallow and greases has also increased sharply since pre-war, and most of the increase has occurred in US. And large exports of tallow and greases from US are being absorbed in soap production in Europe and Japan, thereby freeing a substantial quantity of whale, coconut and palm-oils for food uses. World production of linseed and other "drying oils", however, has not increased significantly, the rate of increase being less than 10 per cent since pre-war. This is mainly due to the development of new chemical products for the manufacture of paints and varnishes, which utilize a substantial quantity of drying oils.

Region-wise, a striking rise in production since pre-war has been in the United States; increases have also, however, occurred in Western Europe and Africa. On the other hand, production has fallen somewhat in China and Argentina.

World Trade

As a result of large-sized oilseeds crops and heavy export sales from the US and Argentina Government stocks, world trade in fats, oils and oilseeds in 1954 at 6.4 million tons was above the pre-war level and 10 per cent higher than in 1953. US has, since late 1953, been disposing of cottonseed and linseed oils at prices which are below domestic prices. This alone greatly increased export sales. The largest single exporter since the War, US sold overseas more than 17 lakh tons in 1954 (11 lakh tons in 1953) and thus accounted for over a quarter of total world exports of fats and oils. Other countries which recorded increase in sales include Argentina 2,57 lakh tons (1.77 lakh tons); British West Africa 7.27 lakh tons (6.24 lakh tons) India and Pakistan 0.85 lakh tons (0.69 lakh tons) and Philippines 5.52 lakh tons (4.4 lakh tons).

The improvement in the economic position of Western European countries enabled them to expand their purchases of "dollar" supplies of fats and oils. Thus, Western European imports (excluding those for re-exports) of fats, oils and oilseeds rose to 38.4 lakh tons from 36.4 lakh tons in 1953. The import demand from the Eastern European countries and USSR also rose from 2.19 lakh tons in 1953 to 3.61 lakh tons in 1954. Among the Asian customers, there was sizable absorption by Japan, India and Pakistan and China.

Commoditywise, international trade in liquid edible oils in 1954 at 15.9 lakh tons was much below the pre-war level of 18 lakh tons, though it was 15 per cent larger than in 1953 (13.9 lakh tons). This was mainly due to the cessation of Argentine exports of edible oil and to the fact that exports from India in 1954—the major pre-war exporter—remained far below pre-war levels: 0.85 lakh tons against 6.76 lakhs in 1938 (undivided India).

World exports of cottonseed and oil in 1954 at 3.43 lakh tons was more than double the pre-war level as well as the level attained in any post-war year. This was largely due to the release on the world market of US Government stocks of cottonseed oil at reduced prices, and the exports went to continental Western Europe, especially to Netherlands. World trade in soybean and soybean oils at 3.2 lakh tons was also 20 per cent higher than 1953, though it was still much below the pre-war figure of 4.02 lakh tons. US and China were the main exporters and Canada, West Germany, East European countries and Japan, the main importers.

Groundnut and Oil

Exports of groundnuts and oils at 6.73 lakh tons established a post-war record in 1954, and registered an increase of 15 per cent over 1953, though the level was substantially below pre-war (9.51 lakh tons in 1938). The improvement in 1954 was due to the bumper 1953 crops in French and British West Africa. The customers for West Africa were the metropolitan countries, while Nigerian exports, considerably expanded by reduction of stocks, went mainly to continental Western Europe.

World trade in palm and whale oil and inedible tallow reached a record figure of 1.6 million tons. Exports of inedible tallow for use in soap manufacture came from the US (5.4 lakh tons), while the main suppliers of palm oil and whale oil respectively were West Africa, Indonesia and the Antarctic. Italy, Japan and West Germany remained the main customers.

Although India is a prominent groundnut grower and her exports of fats and oils amounted to 10 per cent of world exports before the war, she was a net importer both in 1953 and 1954. Following two short groundnut crops and a steep rise in domestic prices, exports from India of groundnut oil was prohibited early in 1953. After the bumper crops of 1953-54, however, domestic prices fell steadily, and larger exports were permitted in late 1954. Actual shipments in 1954 amounted to 0.42 lakh tons but increased to about a lakh tons in the first half of 1955.

Record Linseed Exports

The most striking and largest increase in exports in 1954 was recorded by linseed oil, the world total having reached 6.2 lakh tons—double that in 1953 and substantially higher than in 1938 (5.65 lakh tons). The bulk of the supplies came from US Government stocks of linseed and linseed oil and from Argentine carry-over of linseed oil. US exports in 1954 amounted to 2.87 lakh tons (0.41 lakh tons in 1953) while those of Argentina totalled 2.2 lakh tons, and sales were made at prices below those in the domestic market.

Exports from India, a major supplier in pre-war, was exceptionally low, due to domestic shortage of vegetable oils.

Despite increased production in India and Canada, exports in the first half of 1955 were about 25 per cent lower than in the corresponding period of 1954, owing to strong import demand, especially from Western Europe.

Price Movements

The international market prices of fats, oils and oilseeds in 1954 have not shown any significant changes over the previous year. Although there was heavy import demand, especially from Western Europe and USSR, world supply of these commodities, especially from the US and Argentine Government stocks seems to have more than taken care of the situation. In fact, there was even a moderate decline in the level of prives—the index for fats and oils (1952-54 = 100) having dropped from 102 in 1953 to 99 in 1954. However, all prices have not followed the same course, and there has been considerable diversity around the general trend and the three point fall in the general index is thus an average of various movements—ranging from a decline of 24 points in the index of drying oils (linseed, castor and tung) to the increase of 28 points in that of whale and palm oil and tallow.

There was a decline in the prices of 'soft' oils—soybean and cottonseed—throughout 1954, mainly due to heavy export sales of cottonseed oil from US, and the increased supplies of groundnuts and groundnut oil from Nigeria and India. Another contributory factor was the rise in olive oil output, which led to a reduction in demand for soft oils from Mediterranean countries.

The price of whale and palm oils and inedible tallow was relatively high in 1954, despite large export supplies and the accumulation of stocks in US. But what sustained prices was a strong import demand especially from continental Europe and Japan, for utilisation in the manufacture of soap.

The sharpest price decline occurred in linseed oil, mainly due to heavy export sales from US and Argentia and the lowest level was reached in August 1954. Subsequently, however, with a decline in stocks and increase in demand from Europe, specially the UK and fresh demand from USSR, by July 1955, linseed oil prices recovered to their highest level in two years. Similarly, world price of castor oil fell steeply in 1954 but recovered towards mid-1955.

Outlook for 1955

According to present indications, production of fats and oils is likely to be large in 1955. Though there was some decline in the French West African groundnut crop harvested in late 1954 and the Nigerian crop, West African and Asian groundnut crops are expected to be large, though a smaller groundnut crop for India is predicted. US output of cottonseed and soybean is, however, expected to reach a new record level of 6.2 million tons in oil equivalent. World exports of fats and oils are likely to remain the same as in 1954. Since import demand is also likely to be maintained, international prices of these commodities in 1955 and early 1956 are likely to average roughly the same as in 1954.

From the London End

The State of France

MR. HERBERT LUTHY, in his indispensable guide to French politics under the above title, considers that "for generations France has been searching for a workable system of government without finding it." He, however, believed there exists one stable factor in French Government which alone up to now has permitted survival and status: the civil servants—"a real state behind the facade of the democratic state". Maybe from this point of view, the current stalemate in the party structure is not so serious or so alarming as to make "the sick man of Europe" a more pronounced invalid in the present crucial period for France and all Europe.

The experience of the past five years does, however, suggest that even the highly efficient administrative machine of the Council of State, the Inspectorate of Taxes and the Judicature may not be able to control and master the forces making for change and requiring of France a strong and stable government. These forces are no longer of a purely internal character. The immobilisme of the Laniel regime was possibly the clearest expression of the limits to which the Grand Commis of France's higher Civil Service can hold the reins over the forces fashioning French and indeed European history. The status and survival of France depend to-day not so much on the crankish antics of the Poujadists (though their existence is not without significance) but on Algeria, Morocco, Madagascar, Vietnam and on the growing German counter-weight in Europe.

If the French elections mean anything, it is surely this: the one stable factor which in Western eyes reflects the unreliability of France is that over a quarter of the population, without regard to events, persistently vote for the Communists. For the Americans this persistence in French habit and custom will no doubt call for some heart searching. In spite of the millions of dollars which they "put into France", the Communists go on maintaining a firm hold on French development and on some 25 per cent. of the French people. Some commentators, including M Mendes-France, claim that the continued strength of the Communists is the result of the tactics of M Faure, the outgoing Prime Minister. Such arguments can, however, hold little water when this stable factor in French politics has been in evidence during the whole of the post-war period.

Since over-all stability is not to be had, the nearest alternative, that of feasible party alliances, is now being actively sought. Even here the bitterness with which the elections were conducted leaves little room for manoeuvre. M Faure is possibly the most outstanding parliamentary tactician in France, but even he did not foresee the consequences of his open conflict with the Mendesian Radicals. "Stale-mate" is probably the best description for the results of M. Faure's tactics. The centre parties, that "water-shed" of French politics, appear now to be less likely to produce the next Prime Minister and the next government. Eyes in France are thus being turned to an active "left" alliance to lead France.

It is true that M Faure has canvassed support for a "government of survival" on the negative programme that the Poujadist and Communist successes should be balanced by an alliance of all the parties from the Pinay Conservatives to the Mollet Socialists. Such a government is possibly the best that France would be able to offer in so far as the Americans are concerned.. But nobody in France believes that such an alternative is feasible. The rift between M Faure and M Mendes-France is too wide, too deep. Their differences have their origin not so much in the Mendesian belief that M Faure's dissolution of the National Assembly was inept and opportunist but in issues fundamental to France. It was a rift between a tendency for a decisive solution of problems and the paralysis into which France has been creeping ever since the piastre scandal. That scandal exposed the utter bankruptcy of the French centre groups and their conservative counterparts (including M Bidault's M R P) in finding workable, and above all, moral solutions to France's external and internal problems. The spectacle of the mass murders committed by French troops in Morocco at the behest of that reactionary group **Presence-Francaise** has certainly revolted the mass of the French electorate. And yet French colonial policy remained unchanged. In Algeria the demand for self-government was met by typical wooden-headedness—by despatch of French arms and troops. In France itself, the alcohol interests remained possibly the most influential of all the parliamentary lobby groups. It is these policies which are leading to

the "slow-death" of France and not, as that arch-colonialist M. Sostelle has claimed: "The end of France in North Africa means the end of France."

The fundamental character of the rift has, therefore, brought within the realms of possibility an alliance of the Mendesian Radicals and the Mollet Socialists. Together they are able to muster about 150 votes—somewhat insufficient in the new hostile and bitterly divided Assembly. Their programme of "decisive action"—of electoral reform and solution of the Algerian "problem"—is a relatively moderate one and unlikely to capture popular imagination. Unless M Mendes-France and M Guy Mollet are honest in declaring their differences and hostility to the centre and right-centre parties, such an alliance can only be accomplished with some Communist support. Are they prepared to court such support? This is the question which every commentator asks, but to which none dares an unequivocal answer.

M Mollet's hatred for the Communists is almost pathological. In contrast, M Mendes France has shown a remarkable elasticity—he even shared a platform with M Duclos during the elections. The Communists have in turn mooted the idea of a "popular front" on a programme which is certainly attractive and which can establish a basis for government-making. M. Thorez has declared that a popular front founded on the peaceful solution to the Algerian problem, measures to raise the standards of living of the people, a common front regarding the question of church and schools, and agreement on the need for an international detente, is what all socialists can support. He has pressed M Mollet for an answer —as yet the answer has not been given.

French politics is not a particularly honest expression of the workings of democracy. It is possible that the Thorez offer will be turned into blackmail—the Socialists and the Radicals blackmailing the rightist groups into supporting them, on the threat that Communists would be admitted into government-making. Equally possible is the blackmail on Americans to continue bridging the Permanent budget gaps by dollar aid. These possibilities, however, exist only to the extent that M Mendes-France and M Mollet are prepared to seal the rift between themselves and the centre and right groups, and so put up the sign "no change" in French politics.

Non-economic Aspects of Economic Growth

Balraj Puri

THE socialist movement has a certain tradition in this country. In view of that, it can be assumed (the assumption is, however, on subjective and non-economic grounds) that the socialistic pattern of society refers to a society of economically prosperous, politically free and socially enlightened individuals. It has often been held, even in some responsible quarters, that social, political and economic objectives are mutually exclusive. Relative values of more production, better disribution, more freedom and more cultural development have often been debated. Should food and freedom be valued more than, say, defence equipment and capital base? Which is the end: individual wellbeing or national glory? How far is it politically expedient and ethically desirable to sacrifice the pleasures of a generation or two for the sake of those of the third?

Targets of Distribution

Coming to the first objective of socialism viz. prosperity of the individual, it should be realised that it is not synonymous with increased national income. Unless provision for better disribution of increased production exists, it is quite conceivable that the latter may be accompanied by increasing misery for the people. Some useful analyses have certainly been made regarding the inter-dependence of production and distribution. Let this relationship be made an integral part of planned economic efforts. Just as long range targets for production and national income are fixed by planned societies, distributional targets should also be fixed for that period. Inequality is a statistically measureable concept and the planners of a country should be able to calculate precise figures of coefficient of inequality that they may hope to attain over certain periods.

Though economic development is a necessary requisite for freedom yet in the process of development—in the initial stages—forces likely to regiment the set-up of a society might be generated. While political and constitutional adjustments, changes in the administrative set-up and level of political consciousness of the people might provide some safeguards against regimentation, adjustments might still be called for in the economic system and economic policies. Economists shall have to be continuously in touch with political scientists in working out the implications of economic development and analysing the adequacy or otherwise of political measures as also the need for adjustments in economic policies.

If we approach the problem of development from this angle, it will be noted that it is not the high tempo of development and enlargement of the public sector as such that lead to totalitarianism. It is the way resources are raised for development and its pattern as also the way nationalised industries are managed that cause political repercussions. The weakness of the system, in fact, lies with the administrators, political leaders, consciousness of the electorate etc. and administrative, social and political institutions. The economist can only make allowance for this weakness but cannot provide remedies. If the system is toned up, it should be able to launch and sustain a much higher rate of development without compromising its democratic values.

Decentralisation

A harmony between social and economic aims presupposes a similar harmony within economic policies. Integrated and planned policies should lead to a definite economic system—conceived as an organic part of the desired socio-politico-economic system. But what is an appropriate economic system? This question, again, cannot be answered by economic considerations alone. Let us keep the socialistic objectives in view. If economic and political power remains concentrated in few hands, prosperity and freedom of the individual cannot be ensured. The usual prescription suggested by the the text books of socialism is that the means of production be taken over by the State. But the transfer of concentrated economic power from the hands of a few capitalists to a similar number of bureaucrats and politicians—who would now require and assume more powers of political action—hardly makes much difference for the people. If sufficient safeguards are taken and the people running the political and economic system continue to do it in the interest of the people, democracy will still remain incomplete till the system is not only run for the people but also by them. People can share economic and political power only if the unts of economic and political activities are small or, in popular words, the politico-economic system is decentralised.

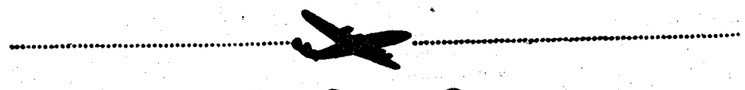
Importance of cottage industries is mainly recognised as a short-term economic expedient due to their employment potential. It is rarely realised that unemployment is not a short-term problem and that there are some other virtues also in organising the industrial system on small units as a permanent feature of national economy. If we accept this objective, let us direct all technological development to encourage industrial units becoming smaller and smaller while retaining their competitive and efficient character. Let us, at least, set a definite trend towards that.

New Technology Needed

All industries cannot be organised on small scale till sufficient technological development takes place. The attempt should be to make units of ownership of such other industries as small as possible. This would require drastic changes in the system of management and assignment of a vital role to the co-operative movement. If we consider a decentralised and co-operative system of economy as the basis of a new society—as an alternative to communism and capitalism—we shall have to revise our present outlook about economic planning and our sense of emphasis and priorities.

A large sector outside the co-operative and small industries where even big capital is unable to play an effective or useful role will remain a legitimate field of State activity. In order to avoid concentration of political and economic powers in the same hands and inefficiency and nepotism in the public sector, it is necessary to depoliticalize a vast field of planning activities and to run the State undertakings through autonomous corporations.

A clear sense of direction and purpose would help in establishing complementarity and co-ordination between present efforts and the ultimtae set-up as also between various economic sectors. The investment on capital goods should, for instance, be made keeping in view the requirements of the future decentralised set-up. Besides setting up a balance be-



tween big and small, private and public enterprises, industry and agriculture should also be conceived as an organic whole. Let a definite relation—statistically measurable—exist between increase in agricultural productivity, marketable surplus and formation of capital for industrialisation.

Co-operation with other Underdeveloped Economies

National economies need also to be linked with the outside world. Economies of the underdeveloped countries are tending to develop on parallel lines so that they are becoming mutually rival and competitive. Under the influence of resurgent nationalist spirit, each country of the South East Asia region, for example, is becoming crazy about indiscriminate industrialisation and full self-sufficiency with little co-ordination with the economy of the neighbouring countries. Even the Colombo Plan has failed to diversify and co-ordinate the economies of the region it covers. Some of the countries are politically so touchy that they are suspicious about any type of external assistance. There is certainly a political aspect of foreign aid and it requires an amount of political maturity to accept it without complexes. There should, however, be less mistrust among the countries of the region and they should be able to seek co-operation and establish complementarity between their economies so that each country specialises in pro-

ducing different things. They can, then, collectively seek adjustment with the economies of other regions. A long term view of the pattern of foreign rade should be closely integrated with the likely requirements of each national economy over a long period viz. of consumption, need for capital goods, industrial potentialities etc.

Margin of Current Saving

The problem of raising resources —the crucial problem of development—should also be tackled with a similar spirit of comprehensiveness. The aim of fiscal measures is not only to collect funds for development but also to promote social justice which is also the ultimate end of development. The way money is raised is thus no less important than the amount of it.

Funds for development have mainly to come from the margin of current production over consumption. There are two courses to raise the margin of savings. Firstly, to lower the level of consumption and secondly to restrict the growth of consumers. Of course both ways can be adopted. But a decision about the extent of each involves a question of values and non-economic considerations. Politically it is the question of making people forgo their consumption. Decision on the political level would depend on the popularity of the ruling party and the extent it is willing to stake it. Ethically, it is a question of the desirability or otherwise of sacrificing the interests of a generation or two for the sake of the third. Administratively, it poses the problem of squeezing and collecting more money from the people. There are social and cultural considerations also. The present generation constitutes the capital base for building a new social order. A new order based on physically starved and mentally undeveloped individuals would have a very weak basis. Psychologically, the sacrifices people are willing to make depend on their emotional response to the economic plans of their country.

Taking an overall view, it would be observed that there is limited scope for curtailing the consumption level in poor and democratic countries. Increasing production, too, would fail to raise the level of savings appreciably as a major portion of it would be consumed in raising living standards to a tolerable level and by increasing population. Fight against increase in population should, therefore, occupy central place in the plans of economic development of the underdeveloped regions—at least a more important place than is being given to it at present.

Wasteful Consumption—Defence

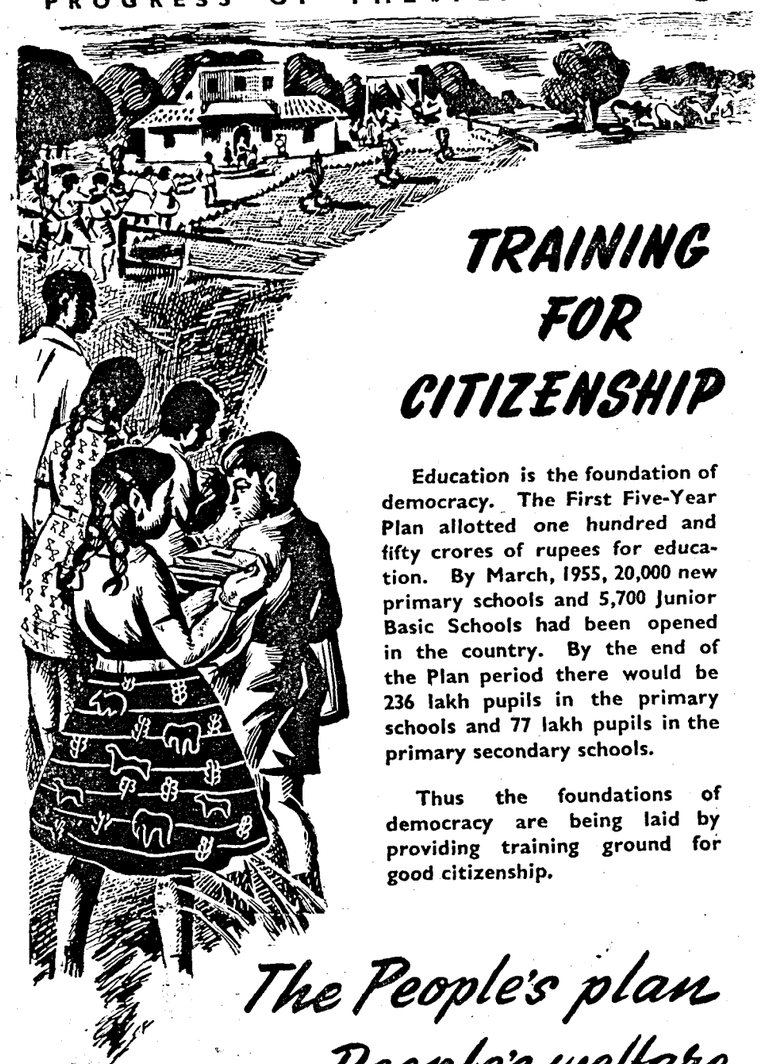
The scope for reduction in defence expenditure — another source of wasteful consumption—could also be considered. Allocations for defence are normally decided by political and emotional considerations. But let us be aware of its economic cost and ask political leaders to seek political remedies of reducing tensions and sparing more funds for development. If India and Pakistan settle their outstanding disputes viz. Kashmir etc., or if South Asian countries are assured against Chinese infiltration or internal sabotage and if they keep out of the conflicts of big powers a large amount of money would be available for speeding up the process of economic development in this area.

The volume of savings must have a link with the pattern of investment and process of development so that a definite proportion of additional income is diverted to capital formation. As there are immense and immediate possibilities of increase in agricultural production, a concerted drive is needed to attain a large marketable surplus. But savings of the people should be collected by putting the least strain on them. As a general rule we should have distinct preference for borrowing—big and small scale—over indirect taxation. For the lending capacity or the people is obviously more than their taxable capacity, while borrowing has distributional virtue also. Present institutional framework and administrative set up in most of the countries are totally inadequate for mopping up the savings of the people—particularly in rural areas. Economists should, instead, of treating them as given, state the changes they require in the existing institutions and press the administrators and politicians for carrying out those changes.

Drawing out Hoarded Gold

Lack of banking habit and suitable facilities for investing savings are mainly responsible for the preference for gold among the people of the under-developed area. Money saved in the form of gold is saving from the individual point of view only. Socially that is a waste. Incalculable amount of gold lies sterilised in the treasures of the princes, underground hoards of landlords and merchants, bodies of brides, domes of temples, safe deposit vaults and at other odd places. Even if a fraction of it were available for economic development, its rate could be multiplied with much less burden on the people. Hardly any attempt has been made in any country to mobilise its hoarded gold by educating the people about the futility of locking up their savings in this unproductive manner.

Besides providing facilities for saving and inculcating the habit of saving among the people, 'gold certificates' can also be issued to collect gold. Just as rupee notes gradually replaced rupee coins and have come to be preferred to them, 'gold certificates' could also be expected to replace the use of gold. A man wishing to give 10 tolas of gold to his daughter in dowry may, for instance, give certificates for that amount just as cheques or notes are now given instead of coins. This would be preferable to keeping gold in deposit vaults inasmuch as the owner can get the function of the gold performed without getting it out of the bank—though it would be available to him on demand any time he likes.



Liability to Posterity

A developing economy is always in need of a large amount of foreign exchange. If sufficient foreign exchange is not available, some of the internal resources may also remain idle. Its contribution to economic development is many times more than its actual amount. Export earnings and foreign aid or loan are the usual source of foreign exchange. While foreign exchange is scarce for most of the under-developed countries, yet due to lack of planning and of integration between foreign trade policy and economic development, some of these countries fail to utilise available foreign exchange. India has not only not pressed for a larger release of sterling balances, but has also not fully availed of released sterling and has often added to her balances with the U. K. She has occasionally earned dollar surplus also. In other words we have on some occasions been lending to Britain and America. It is rather paradoxical that an economy aiming at fast development and short of consumption goods should be lending abroad. A developing economy should rather have a planned trade deficit calculated on the basis of its requirements of capital and consumption goods over a certain period. Fuller utilisation of sterling balances, in-

curring dollar deficit, getting loans from advanced countries as also from IMF, IBRD etc. might make us heavily indebted but it would enable us to earn much larger trade surpluses in later years and speed up the present pace of development. When we are making huge investments for future generations, it is but fair to bequeath some liabilities also to posterity.

This is not meant to be an exhaustive study of how to finance economic development or allocate the resources. What has been attempted here is to present the case for studying economic development from a social perspective. The study of economic growth without a theory of social change has severe limitations. A general theory of changes in society however has hardly been evolved. Besides inadequacies in the tools of economics, other social sciences—so intimately connected with changes in society—are in a far greater state of inadequacy. And difficulty arises from the fact that a proper system of collaboration has still not been evolved between various disciplines. There is no intention to belittle these limitations particularly as they are beyond the role of economists. But economists should be conscious of and make adequate allowance for them and in no case these limitations justify the short cut method of the study of economic growth out of its proper context.

PROGRESS OF THE PLAN No. 3

TRAINING FOR CITIZENSHIP

Education is the foundation of democracy. The First Five-Year Plan allotted one hundred and fifty crores of rupees for education. By March, 1955, 20,000 new primary schools and 5,700 Junior Basic Schools had been opened in the country. By the end of the Plan period there would be 236 lakh pupils in the primary schools and 77 lakh pupils in the primary secondary schools.

Thus the foundations of democracy are being laid by providing training ground for good citizenship.

Wage Earners During The War & Post-war Boom

(Continued from last week)

Ayodhia Singh

WE may now compare the movement of the cost of living with that of money wages in order to see how the real income of the wage earners was affected during 1946-50. An attempt has been made in Table III to determine the magnitude of the wage lag* in different regions.

Table III shows that in Bombay the rate of increase in wages lagged behind that of cost of living in 1946, the wage lag being 15.7 points. However, from 1946 onwards, the pace of wage instead of lagging behind that of cost of living actually exceeded the latter. In other words, unlike the year 1946, during the period 1947-50, an increase, instead of a decline, in real income is noticed. This is indicated by wage advance which was 12.5 points in 1947, 37.8 points in 1948, 56.2 points in 1949 and 32.1 points in 1950. Thus we notice a continuous and progressive increase in real income of the Bombay wage-earners until 1949 and a relative decline in 1950. In Madras also, the highest relative increase in real income was attained in 1949, the wage advance being 130.5 points.

Unlike Madras and Bombay, U P shows a continuous wage lag during the post-war period. The wage lag continued rising until 1947, after which there was a decline.

These figures reveal that due to a failure of proportionate adjustment of wages to rising cost of living, U P wage earners, unlike those of Bombay and Madras, suffered a curtailment in their real income which was most severe during 1946-48 though in 1949-50 it was moderate.

Wage earners of West Bengal like those of U P faced the problem of the wage lag up to 1948, after which they had some relief in the form of relative wage advance in 1949 and 1950. Even during 1946-49, however, the wage lag was not so significant as in U P.

*'Wage lag' measures the extent to which the wage index remains behind the corresponding cost of living index (bases of both being the same). Similarly, 'wage advance' denotes the extent to which wage index exceeds the corresponding cost of living index.

In 1949 and 1950 the magnitude of the wage advance was 11.3 points and 21.6 respectively. These figures show that the relative deterioration in the real income of wage earners in West Bengal continued up to 1947, after which the trend was reversed so sharply that during 1949 and 1950 real income rose both as compared to the preceding years and the pre-war level.

Employment and Cost of Living

Table IV shows that factory employment in 1946 totalled 23,14,587 as against 24,82,663 in 1945 which meant a fall of about 6.8% below the 1945 level. During 1947, however, there was a slight increase of about 1% over 1946.

The increase in employment in Bombay and Madras during 1947 was of the order of 3.2% and 5.4% respectively while U P recorded a significant decline of 6.5%.

Employment in factories recorded an increase of 3.8% in 1948 over 1947, though it remained much below the peak reached in 1945. There was an apparent increase of about 3.1% in employment in 1949 also as compared to 1948, but the wider coverage of employment statistics and the extended scope of the new Factories Act make strict comparison difficult. While Bombay and Madras showed increases in employment in this year, U P and West Bengal showed a decline.

Though the number of factories reporting employment increased by about 4% during 1950 as compared to 1949, the increase in total employment was only of the order of 3%. This was because the newly registered factories were generally small and many of them did not submit their returns. The largest percentage increase was recorded in Madras, U P and West Bengal and Bombay actually registered a fall in employment, in spite of an increase in the number of factories. In Bombay, employment in the cotton textile industry declined by about 27,000; in West Bengal there was a reduction of 15,000 workers in the jute industry, and 3000 in the cotton textile industry; and in U P also, there was a slight drop in employment in the cotton textile industry.

We may now measure the extent of the 'employment offset' as defined in the earlier article (**Economic Weekly**, December 24, 1955). Em-Employment offset, EO= (Ec—Eb)| (Cc—Cb) x100, where Ec and Cc stand for employment and cost of living indices for the current year, and Eb and Cb represent these indices for the base year. The values for EO have been given in Table V.

It will be seen that employment offset substantially declined in 1946. This was due both to increased cost of living and reduced employment in 1946 as compared to 1945. EO remained almost stable during the next two years, and rose moderately in 1949 but declined again in 1950. Thus, throughout the period, how-

TABLE III
Wage Lag During 1946-50
(Base 1939=100)

	1946	1947	1948	1949	1950
Bombay					
Cost of living index	236.5	254.8	276.9	280.7	286.5
Index of earnings	220.8	267.3	314.7	336.9	318.6
Wage lag	+ 15.7	— 12.5	— 37.8	— 56.2	— 32.1
Madras					
Cost of living index	223.3	258.8	294.3	308.4	310.2
Index of earnings	243	337.6	371.8	438.9	341.5
Wage lag	— 19.7	— 79.8	— 77.5	—130.5	— 41.3
Kanpur					
Cost of living index	306.5	353.2	440.2	446.7	405.6
Index of earnings	242.2	284.0	380.9	427.2	401.9
Wage lag	+ 64.3	+ 69.2	+ 59.3	+ 19.5	— 3.7
Calcutta					
Cost of living index	254.6	286.1	313.7	322.2	323.1
Index of earnings	193.6	222.8	282.3	333.5	344.7
Wage lag	+ 61.0	+ 63.3	+ 31.4	— 11.3	= 21.6

Source : **Indian Labour Year Book 1949-52**

ever, EO in Bombay remained substantially below that of 1945.

In Madras, the situation was not so bad. Though EO declined moderately both in 1946 and 1947, in subsequent years, it improved. However, the improvement was not so much due to increase in employment as to a sizable fall in the Madras cost of living index during 1948. In 1949, EO came down but this fall compared to 1948 was more than offset by the subsequent rise in 1950. In UP the situation was rather bad. EO which stood at 38.3 in 1945 continued declining from 1946 onwards and even the slight reversal by 1.2 per cent in 1950 was not due to any increase in employment but rather to a substantial decline in the cost of living. EO was 28.8 in 1946, 14.6 in 1948 and 14.1 in 1950.

In West Bengal, as in UP and Bombay, the economic position of wage-earners deteriorated, as indicated by a continuous decline in EO from 19.1 in 1945 to 16.1 in 1946, 12.1 in 1948 and 10.9 in 1950.

On a comparison of the four regions, it is clear that only the Madras wage-earners could succeed in almost maintaining their standard, while the position of labour deteriorated in Bombay, UP and West Bengal.

Wage Lag and Employment Offset

We may now combine the wage effect and the employment effect and then examine how far the progressive increase in the cost of living during the period was neutralised and what the net position of the wage earners turned out to be.

Madras wage-earners had a wage advance during 1946-50, the largest rise being in 1949 when the wage advance was 130.5 points. In two other years, namely 1947 and 1948 the wage advances were 79.8 points and 77.5 points respectively. They were relatively in the best position from the view point of EO in 1948 (44.7) and 1950 (46.5). The wage lag and the employment offset, taken together, Madras wage-earners definitely enjoyed an improved standard, particularly after 1947 as compared to 1945 or the pre-war period. Compared to the wage-earners of the other states also, Madras labour seems to have fared the best during the post-war period.

TABLE V
Employment Offset 1945-1950
(Base 1939=100)

	1945	1946	1947	1948	1949	1950
Bombay						
Employment	158	146	151	158	169	166
Cost of living	217	242	257	280	284	289
EO	49.6	32.4	32.6	32.2	37.5	34.9
Madras						
Employment	142	133	140	146	164	199
Cost of living	215	226	261	203	311	313
EO	36.5	26.2	24.8	44.7	30.3	46.5
UP						
Employment	174	161	151	151	146	144
Cost of living	293	312	360	449	455	413
EO	38.0	38.6	19.6	14.6	12.9	14.1
W. Bengal						
Employment	131	125	125	126	125	124
Cost of living	263	255	286	314	322	323
EO	19.1	16.1	13.4	12.1	11.3	10.9

The wage-lag in Bombay was rather serious in 1946, but in the succeeding years, there were wage advances. The condition of Bombay wage-earners was best in 1949 when there was a wage advance of 56.2 points. EO, in spite of a moderate decline compared to 1945, maintained a fairly high level during 1946-50. On the whole, Bombay wage-earners enjoyed a slightly better economic position during 1948-50, in comparison with their position at the end of the war.

Unlike Madras and Bombay, labour in UP suffered on both counts, viz., wage lag and employment offset. The wage lag worsened in 1946 and 1947, improving only in 1948-50. Similarly EO also declined to 12.8 in 1949 and 14.1 in 1950. The two effects combined, UP wage-earners found it extremely difficult to maintain during the post-war years even the depressed condition of the war period, on account of falling employment, coupled with almost continuously rising cost of living. From all indications, so far as industrial labour is concerned, UP was conspicuously behind Madras and Bombay on the economic ladder.

West Bengal wage-earners were affected adversely during 1946-48 by the lack of adjustment of wages to increased cost of living, though their sufferings were less than those of UP wage earners. During 1949-50, they made net improvement in their position, as compared to the pre-war level, though this was not so significant as that noticed in the case of Madras and Bombay wage earners.

The conclusions can now be summarised. On the economic ladder, during 1946-50, the wage-earners of UP were at the bottom; those of West Bengal were slightly above them. Wage-earners of Bombay could barely manage to maintain their pre-war standard and Madras labour was on the top and definitely improved its position from the pre-war level.

TABLE IV
Variations in Factory Employment 1945-50

	Employment	Index numbers (Base: 1939=100)					
	in 1939	1945	1946	1947	1948	1949	1950

Around Calcutta Markets

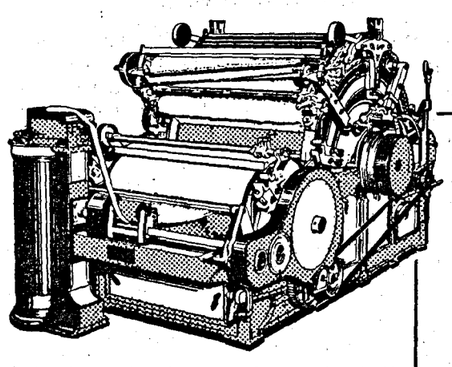
Market Trends

Wednesday, Evening

MANY factors have combined to halt the spurt in equities at the time of this writing. Prolonged disruption of cheque clearing facilities have caused an automatic curtailment of activity in cash scrips. Request to brokers by the stock exchange authorities not to add to their commitments before the resumption of cheque clearings has had its intended effect. Some days ago when the Calcutta police took action against some dealers in jute goods for unlicensed possession and use of telephone equipment and facilities, the volume of business started to shrink. Activity remains subdued.

Disturbed cheque clearings may have caused a reduction in the volume of stock market activity. But "longs" of Indian Iron and of other clearing shares will welcome one of the incidental consequences of the recent bank troubles. There has been a temporary suspension of fortnightly settlement of accounts. It was not without significance that, despite this breathing space to "Bulls", Indian Iron developed an easier trend on Wednesday. It is clear that the technical position in Indian Iron and in some other clearing shares remains vulnerable.

Apart from these technical market factors, some of the recent developments are not discouraging. Revived activity in Coal shares has been a feature of recent stock market activity. In recent months, there have been alternate bouts of optimism and pessimism about Coal shares. Some months ago, Coal shares started moving up as it became known that coal output would be raised substantially during the second Plan period. But the spurt proved short-lived due to certain subsequent developments.



New Delhi's coal policy had a disturbing effect on Coal shares. New Delhi let it be known that its policy was to expand the public sector in the coal industry at the expense of the private sector. This had a chilling effect on Coal shares. Even the assurance that private colliery-owners would be paid full compensation in the event of nationalisation failed to lift Coal shares up. There was renewed depression in Coal shares as TTK informed the Associated Chambers that nationalisation of the coal industry was justified as State-owned railways and the projected steel projects were the main consumers of coal.

As the New Year started, Coal shares were abandoned by investors. Developments in New Delhi in the first week of January caused a sudden revival of activity in Coal shares. As a result of talks between the Government and trade interests, it was decided that the private sector of the coal industry should be allowed more expansion than originally estimated. This was interpreted by the market to mean that private collieries will be encouraged to expand output. In consequence, Coal shares moved up appreciably in the first half of the week.

After the recent spurt, Coal shares are now marking time. This is mainly due to technical market factors. An easier trend in clearing shares, the resultant hesitancy in Miscellaneous and Engineering shares and similar other market factors have had a disturbing effect on Coal shares. In the absence of strength in the other counters, investors are unwilling to add to their commitments in Coal shares at recent higher levels.

Recent market movements have certain redeeming features. It is clear that, in the absence of a fur-

MMC revolving flat cards

are now being extensively used in Textile Mills in India.

Outstanding features

1. Five distinct setting points, used singly or in combination, to control setting to .001 inch.
2. Johnson bronze bearings, for cylinders and doffers. Roller bearings to cylinder; ball bearings to doffer and ball bearing comb box also provided as optional equipment.
3. Ball bearings to licker-in pedestals.
4. Self-lubricating 'Olite' bearings at several locations.
5. William's patent stripping motion for flats.
6. Drop lever with new disengaging handle.
7. Fluted lap roller with positive gear drive from feed roll helps uniform feed of lap at the back with minimum possible stretching.
8. Cards can be geared for any production in a mill organization.

ther sharp set-back in Indian Iron, Miscellaneous and Engineering shares will continue to have a sustaining influence on the market. But fears have been expressed whether these groups alone can help the market as a whole to remain steady. In this context, the steadiness in Paper shares has been widely welcomed. Even so, there have been doubts whether Clive Street can move up with hesitancy in market leaders like Coal and Jute shares.

That was why the revived spurt in Coal shares was doubly welcomed. As Coal shares improved, the market sentiment brightened up on the argument that steadiness in Coal, Paper, Miscellaneous and Engineering shares should help Indian Iron and other speculative counters to steady down at the lower levels.

Jute shares have remained dull for about a year now. But recent events encouraged the hope that shares might begin to move up gradually. IJMA's decision to unseal 2½ per cent of the sealed looms was an event which was not without significance. But it was clear that the investor lacked the industry's faith in the future of the Indian jute industry. Jute shares still remain friendless. But the outlook is not unpromising.

Much has been heard about the growing Pakistani competition. This is a factor which cannot be ignored. But it is equally unwise to ignore the highly satisfactory volume of exports of Indian Jute goods in 1955. Increased, and increasing, consumption of raw jute indicates the gradual improvement in the output of jute goods. Data about exports and despatches continue to be satisfactory. Moderate optimism about Jute shares is, therefore, not unjustified.

French Politics

IN recent history, French elections have always been inconclusive. No single party has yet won such a majority in the elections held under the Fourth Republic as to succeed in forming a Government by itself, although the Communists have always emerged out of the elections as the single largest party. It was to deprive the Communists of their right to try to form a government that coalition governments came into vogue. To-day, after many years of legalised electoral alliances and coalition governments, the Socialists must repent that they initiated a form of parliamentary alliance, with the negative aim of keeping the Communists out of office, which has led to their own political discomfiture.

Much has happened in French politics since the first Socialist move to form a coalition Cabinet, allegedly under the American threat of withdrawal of Marshall Aid, to deny the Communists the right to form a government. Gradually, the coalescing elements elbowed the Socialists out of the coalition Cabinet. Right-Centre coalition Cabinets came to be formed. What happened to the Socialists befell the Right-Centre and Left-Centre parties. Both these latter groups moved further to the Right, away from the Centre. As the Conservative and Catholic elements gained control over the coalition Cabinet, the Radicals, an important element in the various coalition governments, became conscious of their losing hold over French politics.

Some years ago, the Socialists had the wisdom to reorientate their policy and tactics. They decided to keep away from coalition governments. This year, under the dynamic leadership of M Mendes-France, the progressive wing of the Radicals came to a similar decision. M Mendes-France's aim was to restore the status of the Radicals as a Centre-Left party. It soon became evident that M M Faure and Pinay, the Right-wing leaders of the Radicals, opposed this move. To sabotage M Mendes-France and his aims, they manouevred a sudden early election without reforms of the electoral law. They have not achieved their aim. But the elections remain as indecisive as ever.

Despite the inconclusive verdict of the elections, M Mendes-France has achieved his basic objective: Conservatives and Right-Centre parties have lost many seats in the latest elections. Neither the Mendes-France Radicals nor the Socialists can, by themselves, form a government. Whether even the Republican Front, composed of these two groups, can form a coalition Cabinet without participation of some other groups, is not beyond doubt. But it would be a mistake if the Republican Front, on the assumption that it succeeds in forming a coalition Cabinet, decides to function as a normal Cabinet. Wisdom demands that the Front should function as a provisional government to solve the problems of electoral reforms and of Algeria. A proper solution of these problems should enhance the prospects of the Republican Front to win a clear and decisive majority in the next elections.

Around Bombay Markets

All Eyes on Tata New Issue

Thursday, Morning

THERE was not much activity in Dalal Street during the week under review. The market, which had hitherto been divided on the subject, now heavily inclines to the view that the new issue to be floated by Tata Iron and Steel Co. will not be at par; on the contrary, a premium of about Rs 50 per share is now regarded as the more likely possibility. Despite the protest lodged by the Bombay Share-holders' Association against the advisability of such a course, Dalal Street failed to persuade itself that the principle held sacrosanct so far that corporate savings rightly belonged to shareholders will necessarily prevail in the changed climate of opinion. And that in the case of Tata Iron, "the wide disparity between its paid-up capital and the actual block", to which the Association had drawn pointed attention, and which gives a rough measure of such savings, will be necessarily passed on to shareholders through the issue to them of right shares at par. Hence Tata Steel ruled quiet and occasional attempts at whipping up enthusiasm by playing up rumours of new issue at par failed dismally. The sea-saw movements witnessed during the week reflected the doubts and hopes in regard to this particular issue.

In the Textile section, the undertone was better at the beginning of the week and the leading counters remained steady but towards the close, in sympathy with Tata Steel, quotations tended to ease.

In the miscellaneous section, ACC, Premier Construction, Scindia, Bombay Burma and National Rayon moved more or less in sympathy with steels and closed lower.

Cotton

More Confusion

THE resumption of forward trading in cotton was an anti-climax to the preceding excitement. Although trading was formally resumed on Saturday (7th January), the ceiling of Rs 700 proved to be a stumbling block in the way of any activity in the hedge contract. Consequently, transactions were only nominal. There were occasions, however, when the contract was dealt with at a premium of Rs 10 to Rs 15, non-officially of course, which go to show that the stalemate was not really ended by the fixation of an arbitrary ceiling.

Towards the close of the week, the confusion prevailing in the ranks of jobbers and operations became even worse when two leading members of the EICA brought out a notice of motion against the Board of the East India Cotton Association. The purpose was to restrain the Board from enforcing the resolution passed by them on January 6, declaring an emergency and fixing the ceiling at Rs 700. The action by the EICA earlier, it was alleged, was the result of coercion and did not reflect its considered opinion on the state of the market. As a result of this new development, the clearing rate for outstanding contracts, which was scheduled to have been fixed on Monday, had to be postponed by the Board for a week, pending the hearing of the case by the Bombay High Court on the 13th.

Meanwhile, the East India Cotton Association has appointed a sub-committee to examine the possibilities of squaring up transactions both in the February and the May contracts at an agreed level, in order to help an early commencement of the August contract. To avoid the automatic transfer of current contracts to August, the sub-committee will also suggest adjustments in the hedge contract, in view of the changes in the new crop which has suffered both quantitatively and qualitatively.

Unlike in the previous fortnight, the spot market at Sewri was active, if not buoyant, and benefited from sustained enquiries by mills for popular styles like Jarilla, 320 F, 216 F, Vijay, Amravati and Khamgaon.

In the export section shippers were reluctant early in the week to enter into fresh commitments and were awaiting the results of the first sale of American surplus cotton. Later in the week, they gained confidence when it came to be known that the first bids of the US surplus cotton fetched 28.50 cents to 31.50 cents c.i.f. UK and Japan. At these rates, comparable qualities of Indian cotton will continue to be cheaper. Exporters are reassured that America will not, at any rate for the time being, unload her cotton at throw away prices. The care with which the surplus cotton is being released indicates that America is well aware of the threat that this holds for the world markets and that she should proceed cautiously.

Oilseeds

Cold Wind from Cotton

THE oilseeds market which had witnessed some speculative 'rigging up' of prices in the previous week, turned unaccountably easy. It is possible that the Government's strict measures to check speculative rise in prices in commodities market elsewhere, as for instance, in the case of cotton and jute, had a sobering effect on operators in oilseeds, who had neglected this warning so long. For, in view of the paucity of floating stocks and keen overseas enquiries, buyers need not have been reserved. Whatever the reason, throughout the week, there was a steady decline in values all round.

Groundnut, ready quality, which was quoting Rs. 29-8 last week closed at Rs. 28-12 while February-March suffered a loss of 11 as. at Rs. 28-15.

Castor May which had been talked up to Rs. 122-14 last Wednesday, steadily lost ground and closed at Rs. 117-8.

Linseed oil, however, continued to attract overseas enquiries and ruled steady at Rs. 18-2.

* * *

Bullion

Silver Continues Strong

THE continued influx of smuggled gold caused a setback in gold in the beginning of the week. With spot houses selling, and buyers holding back, the market was naturally a little bit shaky.

Silver, however, experienced no such trouble; it never seems to get any smuggled supplies and sustained speculative demand kept prices fairly firm. Cotton market operators are reported to have lent active support in silver which is rather puzzling, considering that stalemate in cotton continues. Perhaps the interest of cotton operators in silver is to be accounted for by the profit made during the period of sensational rise in cotton futures before the Forward Markets Commission stepped in. Anyway, silver closed pretty firm.

Steel Prices Again

IN May last Government announced its decision to allow the steel companies a higher retention price "as would enable both the producers to obtain a portion of their capital requirements of their current and additional expansion programmes from internal resources and to raise the balance from outside". Government had resolved:

1. That the major producers of steel should be paid a uniform retention price;

2. That the uniform retention price to be paid to the Tata Iron & Steel Co. Ltd., and the Indian Iron & Steel Co. Ltd., should be fixed at Rs. 385 per ton, pending an enquiry by the Tariff Commission; and

3. That agreements should be obtained from the two producers that the extra profits made by them as a result of the present increase in the retention price would be earmarked specifically for development and expansion and not for any other purpose, except with the express permission of Government.

We had our doubts then how a uniform price, toned with an element that will pay even partially for development, would work in practice. Cost conditions may, in the absence of retarding factors like natural dis-advantages or existing contracts, become comparable in due course when plant capacity is balanced and production is organised properly. These may remove the special conditions which had made differential prices inevitable at an earlier stage. But when programmes of development are widely dissimilar, a uniform price does not at sight appear to meet the individual requirements of the major producers. Besides, there is the vexed question of averages, when the products of the two producers vary. The question of weights inevitably crops up, when an average price is sought to be fixed instead of prices for individual types of products. The Tariff Commission were expected to throw some light on these questions. But in an otherwise lucid report, the crucial issues have either been avoided or they have been dealt with in a very unsatisfactory manner. The Commission do not even pose the right questions, far from answering them.

That our doubts were not baseless, has been proved by events. Tatas put the problem of averaging clearly enough in their representation to the Commission:

"While the prices for the common categories should be fixed on par with those fixed for the Indian Iron, it would not be correct, in view of the differences in the product-mix of the two companies, to fix the prices for non-common categories so as to equate Tatas' over-all average price to that of Indian Iron".

The contention requires little elaboration. Indian Iron produce only eleven categories of mild steel. Tatas produce all these and besides, they produce sleeper bars, fish plates, wheel tyres and axles for railways, and plates, ordinary and acid. Therefore, when Tatas want a uniform price, what they mean is uniform price for the common categories only.

Officialdom however can think only in terms of the 'over-all picture'. The Tariff Commission may not have succumbed to the charm of this

blessed word 'over-all'. But what can they do? They are bound by the terms of reference; Government views uniform prices as an all inclusive average; so Tatas are virtually asked to subsidize the high cost non-common categories from the extra profits which, impliedly, are allowed to them through the uniform price fixed for the common categories. Tatas naturally failed to see the logic of it; hence their representation. The Commission, however, do not see anything much in their contention and have convinced themselves that the structure of prices they recommend satisfies the requirements of the Government resolution on the subject and is fully in consonance with the Tatas' agreement with the Government on the question of uniform prices.

To be quite frank, the logic by which the Commission have come to this conclusion is quite unintelligible to us. Have the legal advisers of Tatas been taken in by the Tariff Commission? The point that needs clarification is simple. Will the retention pirce be paid at the rate of Rs. 393 per ton, irrespective of the type of product, or is it to be paid at the rates given for individual products in the report? If it is the latter, with changes in the 'product mix', the company's realisation will tend to be either higher or lower than Rs. 393 per ton on an average. In other words, the average price of Rs. 393 per ton assumes that the 'product-mix' will remain the same throughout the period of price fixation. What happens, if the constituents of the 'product-mix' vary over time? Surely the Commission did not have in mind an weighted average which remains constant while the weights vary?

There is another aspect of retention price—the element of cost of development which has to be worked into it. The Government resolution had specifically stated that the price should be such as to enable both the producers "to obtain a portion of their capital requirements . . from internal resources and to raise the balance from outside" (emphasis ours). Will the price recommended by the Commission enable the company to raise the necessary funds from outside, by way of loans or equity capital, or both? It is not clear why the Commission avoided this question. Capital from outside sources could be obtained only under certain conditions. Both the market and the companies concerned have fairly clear ideas about what these conditions are. So when the Directors hesitate to issue new capital because they are not in a position to assure the existing share holders that this will not lead to watering down of capital, which they would be in a position to do only if they can maintain dividends at the same rate on the expanded capital, it does not follow that they are trying to drive a hard bargain or that they are just being difficult. The Tariff Commission, however, have interpreted their terms of reference narrowly, to the point of excluding from their purview the condition that the retention price should be fixed in such a manner as to enable the producers to obtain a portion of their capital requirements for their expansion programmes "from outside". The balance of their requirements only, it is true, are to be thus obtained. But prices have a relation as much to the internal resources of the producers as to the possibility of raising resources from outside. To view prices in isolation is therefore obviously wrong. Why did they do it? Perhaps the Commission had good reason to be cautious; they have had so many rebuffs in the past that they may not have cared to invite more. This is unfortunate for had the Commission laid down clearly the conditions under which outside resources would be forthcoming, the needless controversy over the premium issue, could have been avoided.

The text of the seven-year agreement with the producers has not been published. The Commission, however, have quoted from it whenever it suited their purpose without of course intending to be mischievous. It appears, however, from the Government resolution that the Indian Iron & Steel Co. Ltd., have not yet signed the agreement for further expansion of their production by one lakh tons of steel. Our Calcutta market correspondent has drawn pointed attention to the Chairman's address at the last Annual Meeting of this company, in which there was more than a hint that the Company may not proceed with this expansion, if they find the terms unacceptable. What happens, for example, if Indian Iron finally decide to keep out? In that not entirely unlikely eventuality is the retention price now fixed, which contain professedly an element to pay for this bit of expansion also, going to be revised? Will the wheel turn a half circle and bring back differential prices, a higher price for the Tatas this time? It is not impossible that Indian Iron may contend that by bringing Tata's price on a par with theirs, they have been denied a fair deal. Cost estimates, however, may be upset so easily—Indian Iron had upset them in the past by their performance which far exceeded all expectations—that one cannot be dogmatic. As producers, they may have a case and can the Government force the company to undertake expansion against their wish?

Whatever may be the outward form, there is little of private sector left in steel today. Prices are fixed, production programmes are approved and even resources for development are either provided for or elaborate directions are given for raising resources. If ever there has been trustee-ship in operation, it is in steel. But even after all these years of trustee-ship in operation, it is sad to find that disputes still arise on such fundamental points and that the method of solving the disputes continue to be the old one of Tariff Commission enquiry and 'dharna' at the doors of New Delhi. While price fixation runs its tortuous course, the public is kept guessing whether it is the producers who are at fault and have failed to win the confidence of the Government, or whether it is Government which has failed the producers. It is time that at least in the case of steel, a better working arrangement were evolved. For steel will continue to set the standard, even though the public sector may come to occupy a larger and larger part of the field, if only because it is the industry where collaboration with the Government has been of the longest standing.

There was no issue of the Economic Weekly on February 4. The Annual Number was a combined issue covering numbers 3, 4 and 5 of the current volume. As this change in schedule had to be made at the last moment on account of difficulties in the press which is situated in one of the localities worst affected by the Bombay disturbances, it was not possible to give advance notice.

Business Manager

Uneasy Alliance

SIR ANTHONY EDEN has emerged from the Washington talks with an enhanced reputation for political realism and integrity. Western Powers are agreed to deter aggression. They endorse America's foreign policy of building positions of strength. But it is common knowledge that there is a difference in emphasis between America and her allies. While America relies exclusively on military pacts and alliances to resist aggression or threats of aggression, her allies are willing to experiment with alternative measures to ensure world peace. This has been evident ever since the start of the "cold war". But, while even Sir Anthony's illustrious predecessor has lacked the courage to remind America of this crucial difference in approach to world problems, Sir Anthony deserves praise of all peace-loving countries for making it abundantly evident that Britain does not endorse all the means pursued by America in achieving the common aim.

By far the most significant aspect of the joint communique, issued by the British Prime Minister and the American President at the end of the Washington talks, is the disagreement between the two major Western Powers about the means to reconcile world disputes in order to attain and maintain world peace. "We are agreed that our policies must be directed to achieve these (deterring aggression and maintaining domestic stability and welfare of free nations) ends. After frank discussion, some differences remain in our judgments as to the most effective means to achieve these purposes". This passage in the communique has direct reference to the situation in far east Asia. But it embodies a basic principle which is of wider application. Much has happened since the "summit" talks at Geneva to encourage the British Prime Minister to inform the American President of this different approach to world problems. Considerations of strategy may have prevented Sir Anthony's predecessors to make an issue of this aspect of the relation between America and her NATO partners. Whatever be the reason or ultimate aim, Sir Anthony's open declaration that Britain does not accept all the means of America's foreign policy will be widely welcomed.

To stress this aspect of the communique is not to suggest that Washington talks have brought the end of the global tension or of local disputes nearer sight. Sir Anthony has been wise in informing the world that the means of British foreign policy are not always the same as those of America. But the British Prime Minister has not succeeded in inducing America to change her means to attain world peace. Three broad facts emerge from the joint communique. There is unanimity of views between Britain and America on European issues. Sir Anthony did not go to Washington primarily to discuss European problems. But the most positive outcome of the talks is the joint warning issued against any "attack on Berlin". This warning is sought to be justified by renewal of talks of reimposing the Berlin blockade and the formal integration of the East German Army with the Warsaw treaty. But it reflects basically the Western Powers' determination to solve the German problem only on their terms and conditions.

Sir Anthony went to Washington to discuss two main problems in which Britain and America were, and are, commonly interested. On

west Asia, Britain and America seem to be united in denying Russia any influence, authority or interest. It was the Arab-Israeli dispute which was the main topic of discussion between Sir Anthony and President Eisenhower. But in denying Russia's west Asian status or competence to ensure peace in this region, Britain and America are merely ignoring the realities of the situation. There are implied hints in the communique that Britain and America are contemplating action, along with France, to ensure peace in that region. France is no longer a major west Asian Power. Arab States are angry with the French attitude to North Africa. Realism, therefore, demands that America and Britain seek the co-operation of Russia to maintain peace in west Asia. Anglo-American offer of financial aid for the settlement of Arab refugees will be welcomed. But it is difficult to appreciate how, in the changed circumstances, Britain and America can undertake their obligation to guarantee the frontiers of Israel and Arab States or to maintain peace in the event of aggression.

If the joint communique lacks any constructive proposal to resolve the Arab-Israeli dispute, it discloses wide disagreement between Britain and America on the issues in far east Asia. It is clear that America does not accept Britain's formula of admission of Communist China to the United Nations as a solution to the problems in this region. It is equally evident that Britain does not endorse America's Formosa policy. America's adamant attitude to problems in this area is emphasised by her rejection of the British demand for lifting the trade embargo on China. All the interests involved, including Britain, are in favour of freer trade with Red China. America alone opposes this liberal policy. Restrictions on trade with China are more severe than those in force against other Communist countries. This policy does not seem to have affected Communist China as much as Britain, Malaya and Japan. Economic blockade is a means of warfare. In the interests of peace in this region, there will be hope that America will implement her reluctant concession to Britain that there will be an immediate review of the ban on exports to Communist China.

Washington talks have not removed world stalemate. No exception will be taken to the ten principles enunciated jointly by Britain and America to ensure world peace. But events immediately prior to and following the Washington talks reflect the Western Powers' disinclination to accept any Russian gesture to lessen the international tension. M Bulganin's offer of a treaty of friendship and co-operation between Russia and America has been rejected by President Eisenhower on the ground that such bilateral treaties do not serve the cause of peace. Moscow's latest offer for similar treaties with Britain and France, besides America, has had no response from Washington, London and Paris. Such treaties of friendship between the major world powers can, certainly, help in creating a calmer international atmosphere, even if these alone may not ensure world peace. But the outright rejection of peaceful gestures by Russia deepen the suspicion that the Western Powers are unwilling to reach any understanding with Russia unless she accepts their terms for world peace.

Weekly Notes

Algeria

FRENCH socialists may yet repent that, flushed with the victory at the elections, they decided to dominate the Coalition Cabinet. Both tactics and wider considerations demanded that M Mollet should have stepped down so that M Mendes-France could have been the Premier. M Mollet would seem to have been unduly dominated by MRP in his decision not to assign even the portfolio of Foreign Ministry to M Mendes-France. M Mollet has now become the victim of his party's tactical and political mistakes. Violent disturbances in Algeria are immediate threats to the new coalition Cabinet.

In his election speeches, M Mendes-France had offered a personal undertaking that, if his party were returned to power, he would risk his political reputation in a solution of the Algerian problem in six months. It was unwise of M Mollet and the Socialists not to give M Mendes-France the chance to settle one of the most urgent problems that confront France. M Mollet can still enhance his party's and his country's prestige by doing what M Mendes-France would probably have done had he been chosen Premier. M Mollet must make it clear to the militant colons in Algeria that Paris will refuse to be dictated by the French settlers. Algeria's nine million Muslims want complete independence. One million French settlers claim that Algeria is a part of France where they have the right to perpetuate their political and economic domination. Paris may feel embarrassed by the open rebellion of the colons in Algeria. But there is yet no indication that France accepts the demands of Algerian Muslims. As the situation worsens, doubts deepen whether any compromise solution to these extreme claims is any longer possible.

A Present to Pitambar Pant

THE India Railways are likely to be among the first in the country to make a beginning with the metric system of weights and measures, the introduction of which has in principle been accepted by the Government of India.

The Railways are understood to be planning for a 15-year period of "co-existence" between the present foot-pound system and the new metric system.

A measure of the colossal task which the Railways face in the change-over to the metric system may be had from the fact that for locomotives alone, there are about 12,00,000 drawings in use for various components. Similarly, there is a very large number of drawings for passenger coaches and wagons.

Among the numerous steps which the Railways will have to take will be the substitution of mile pillars along 35,000 miles of railway lines by kilometre poles, change of number-plates on telegraph posts from the mile to the kilometre unit, issue of revised time and fare tables based on the kilometre and the new decimalised currency, preparation of new tariffs for general goods and coaching traffic, printing of tickets according to the new systems of weights, measures, currency etc.

While it is difficult to indicate the total cost of the change-over on the Railways, a rough estimate places this in the neighbourhood of one crore of rupees.

—Central Railway News Letter, January 1956.

First Fruits

NEW DELHI has made its first move to cheapen life insurance with a deceptive promptitude. For, reduction of premium rates by a rupee below the Oriental rates really does not go very far, when a large number of insurance companies had been charging premia which were 2 to 3 per cent below those of the Oriental. Favourable mortality experience and higher yield from investments had initiated rate reduction two years ago. It may go a little farther, but until expenses can be reduced substantially, this nominal reduction of rates can only be a gesture and is to be interpreted at best as an earnest of more to come in the future.

Expenses cannot decline substantially until insurance is rationalised. There is undoubtedly some scope for minimising expenses by revising the salary scales and overall emoluments of top executives. But this will be offset, at least for a time, by the higher costs of field staff, if the latter are to be organised properly and the business of insurance is to be made reasonably remunerative for the mass of insurance workers who have not had a fair deal so far. Reduction in top levels is all the more necessary. In insurance, as in banking, the total emoluments of top executives, it is now conceded, are unduly high. Scaling down is all the more necessary as, in the absence of adequate diversion of employment in rural areas, nationalisation of life insurance may involve retrenchment in the existing agency force. With proper, planned integration between rural post offices and the proposed rural branches of the State Bank, it should not be difficult to maintain employment among the field as well as the office staff at, at least, the present level, although the process may involve individual unemployment and inconvenience.

These organisational details will take time to be worked out. Meanwhile, some of the incidental consequences of nationalisation of life insurance deserve emphasis. One of its effects, intended or not, would be that the Government would acquire interest in some of the organised private industries. This relates to that portion of life funds which are now invested in industrial debentures, preference and equity shares. By nationalising life insurance, the Government has automatically acquired interest and control, through voting rights, in some organised private industries. Here, two questions arise. One relates to bad debts. This raises the problem of malpractices prevalent in life insurance. There is the other problem of the existence of privileged sections in the private sector. To the extent that industrial investments of life insurers reflect the evils of interlocking directorate, the Government proposes to eliminate the harmful consequences through a purposive direction of such investments. In effect, such a policy will mean

that such investments will hereafter be diverted *away from* the privileged section of the private sector, though not necessarily from the private sector. The report from our market correspondent about investments actually made by the newly appointed custodian, if correct, must be intriguing.

Grooming Successors

SHRI KRISHNA MENON has at last got his clearance. His appointment as a Cabinet Minister was overdue. He deserves this recognition. Since Independence, he has been the Prime Minister's principal adviser on foreign affairs. His intimate knowledge of international affairs is beyond dispute. Though no portfolio has yet been assigned to him, and he can be most effective as a Minister without portfolio, he may have to take charge of the Foreign Ministry. In this Ministry, he will be at home. And the Cabinet and the country will gain from his wider familiarity with foreign affairs. He, more than anyone else, is attuned to India's foreign policy which has been shaped and dominated so long by the Prime Minister. His elevation as Foreign Minister will, therefore, assure continuity of policy. There is no question about that, but will he agree to be burdened thus?

For too long, Pandit Nehru has combined functions and responsibilities which are too arduous for any one person to bear. In Shri U N Dhebar, he has now an able and active Congress President. It was characteristic of Pandit Nehru that he admitted recently that Shri Dhebar had qualities which made him a more suitable Congress President than the Prime Minister. Pandit Nehru had to assume additional responsibilities as Congress President under circumstances which were critical for the organisation. That particular emergency may no longer be acute. But Congress and the country now face a graver crisis.

Opinions will differ whether Pandit Nehru is temperamentally suited or capable of resolving the crisis that now plagues both Congress and the people. Neither New Delhi nor Con-Congress has succeeded in solving the problems arising out of the demand for linguistic States. Improvisations inspired by Pandit Nehru have made confusion worse confounded. It is more than time for Pandit Nehru to apply his mind and energy exclusively to this problem and its sinister implications. He will have to accept the realities of the situation. There will be hope that he will have the imagination and the leadership to evolve such a solution of the problem of linguistic States as to avert any future threat of disintegration of the country.

Shri Krishna Menon's inclusion in the Cabinet indicates that Pandit Nehru is not unaware of the grave crisis within the country, and of his responsibilities as Prime Minister to devote his undeflected thought and attention to solving the crisis. He can do so in the sure knowledge that he will have a Foreign Minister in Shri Krishna Menon who will faithfully and efficiently pursue a foreign policy of which the Prime Minister has been the main architect. Though the Prime Minister's decision to appoint Shri Krishna Menon is to be welcome on these grounds, there will be some grievance that the latter, a suave diplomat and an astute mediator, will no longer be so freely available to enhance India's world status as well as the cause of world peace through negotiation. His absence from the United Nations will be a distinct loss to India and to the cause of Asian-African unity. As Foreign Minister, Pandit Nehru can easily find his successor, provided he can find some one to replace Shri Krishna Menon as his personal envoy and emissary at the United Nations and at international conferences on world issues.

Applying the Brakes

THE Reserve Bank has raised the interest rate it charges to scheduled banks on loans to them against bills or promissory notes under the bill market scheme, from 3 per cent to 3¼ per cent. The new rates are to come into force from the first of the next month. Neither will the Reserve Bank any longer share the stamp duty on the usance bills or promissory notes also from that date.

There is no longer any question about the popularity of the bill market scheme. On the contrary, the scheme appears, in the light of the experience of the second half of last year, to have been more popular perhaps than the Reserve Bank wanted it to be. The amounts of borrowing under this scheme in the second half of the year was unusually large—large in any case for the slack season and very large, indeed, for the exchange banks which had come in in a big way only last year. For the whole of 1954, the exchange banks had virtually held aloof. But during the past six months, their borrowing under the scheme has far exceeded that of other scheduled banks, which of course, explains their relative luke-warmness for deposits. Now that this source is proving less attractive, the exchange banks are turning their attention to the call money market, where rates have already gone up by ⅛ per cent to 3⅛ per cent which, with the brokerage, comes to the same rate that is charged by the Reserve Bank viz. 3¼ per cent.

Now it is plausible to argue that concessional rates having served their purpose, the Reserve Bank is merely withdrawing concessions that are no longer necessary. Nor can an exception be taken to the time it has chosen for withdrawing the concessions. It is quite natural that it would not like to be all loaned up right at the beginning of the busy season. But is it not possible that the move may not be as innocuous as it looks and that the Reserve Bank may have been impelled by a desire to put the break on, ever so mildly?

Scramble for deposits is already on; it will gain in intensity as the season progresses. But will the higher rates that the banks have to pay now have an impact on their rates of advance? It will not be surprising if in view of the inability of the scheduled banks to act in concert in the matter of raising rates for advance, those banks who find the higher cost of borrowing a heavy charge on their profits were to revive the move for putting a ceiling on deposit rates with the blessings, if not the active help of the Reserve Bank.

Besides the Reserve Bank's decision to raise its lending rate, there is another important change in its operations which is of little moment at present but which will grow in importance in due course. It is the new entry in the Reserve Bank's returns for February 3, under Liabilities, an entry for Rs. 10 crores—i.e. equal to the total amounts of its paid up capital and reserve fund—under "National Agricultural Credit (Long-term Operations) Fund." The stage is being set for the State Bank to launch on its new venture of institutionalising agricultural credit. Though just a book entry at the moment, it should not be passed unnoticed.

From the London End

Forecasting Private Investment in Britain

THE belated realisation that excessive private investment rather than personal consumption was responsible for the "over-stretched" economy has now made it necessary for the Treasury to call for statistics about "investment intentions" on the part of industry on very much the same lines as in the United States. It is, however, still not certain whether the Treasury would have acted differently, had these statistics been available in February last. But to place the blame on the lack of adequate statistics is the last thing the British authorities should do. The trend of economic activity had long been indicated by the statistics published on "new factory starts" and on machine tool orders. Instead, the Government believed, with a powerful press machine sustaining that belief, that the cause of the over-stretch was personal consumption, and accordingly pursued policies (mainly through the purchase tax and the hire-purchase restrictions) to "restrain" it. The credit squeeze, as it is now so clearly evident, was designed to trim the activities of only the nationalized industries and the housing programmes of the local authorities.

The **Board of Trade Journal** now publishes, for the first time, statistics on industry's investment intentions. These statistics are derived from a sample survey of 600 companies whose issues are quoted on the Stock Exchange. These surveys are to be carried out quarterly. The first enquiry, through the form of a questionnaire, was made by dividing the 600 companies into 25 different industry groups. The choice of companies was based on fixed capital or fixed asset values.

According to the data now published, manufacturing industry in Britain intends to increase its capital expenditure by 17 per cent. in 1956. It has been estimated that investment in 1955 was 18 per cent. above that of the previous year, as compared with an increase of private capital expenditure of about 10 per cent in the five years up to 1954. The form which the heaviest capital expenditure is expected to take in 1956 is once again "new building". Between 1954 and 1955, "new building" investment rose by 34 per cent. Between 1955 and 1956, the increase is expected to be of the order of 27 per cent.

Changes in Private Capital Expenditure
1954 - 1956

Value of Capital Expenditure in 1954 (all manufacturing industry)	£592.4 million
Changes in Expenditure 1954-55	+ 18 per cent.
of which New Building	+ 34 „ „
Plant, Machinery etc.	+ 14 „ „
Changes in Expenditure 1955-56	+ 17 „ „
of which New Building	+ 27 „ „
Plant, Machinery etc.	+ 15 „ „
Expected Value of Capital Expenditure in 1956	£800 million.

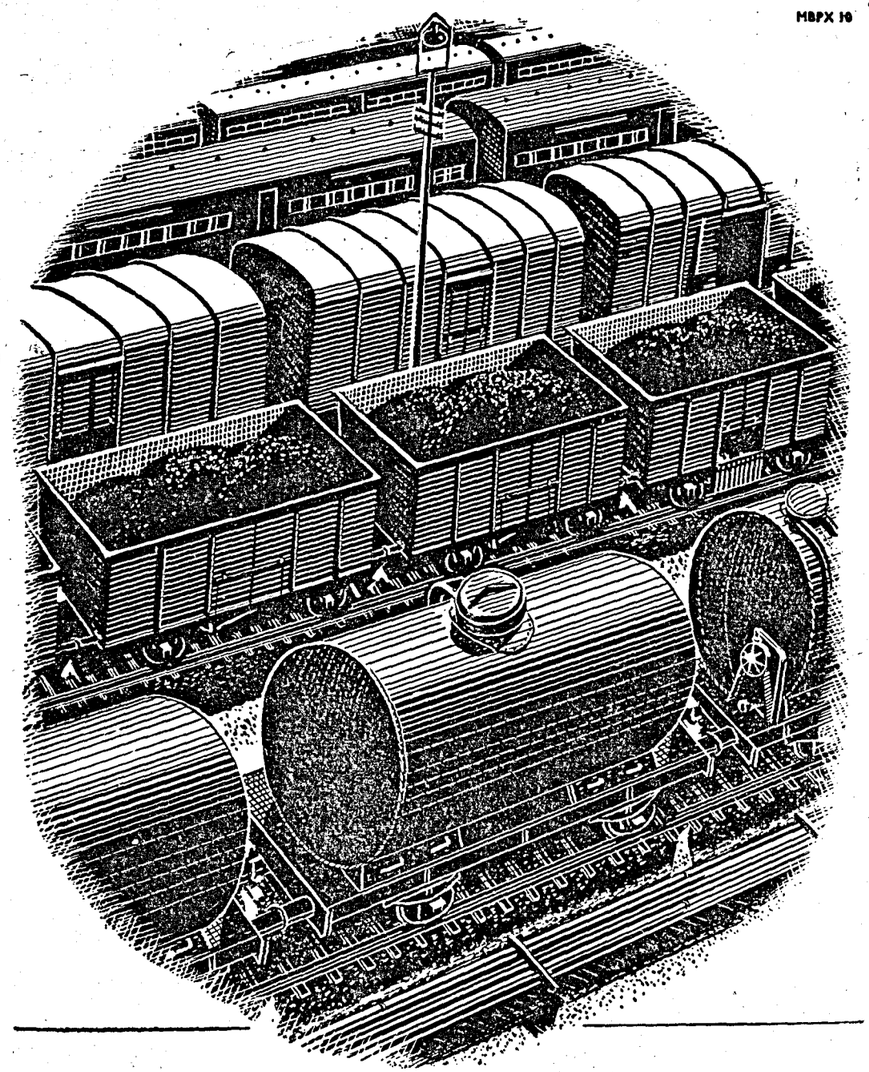
The publication of the above information enables a contrast to be made by various claims on the national product with greater accuracy. More important, it is vital for framing policy. In view of this, the description given in the **Board of Trade Journal** to the compilation of the statistics is of particular interest.

The definitions of expenditure covered by the enquiry are similar to those used for the census of production and the national income estimates. Companies are asked to include all intended expenditure charged to capital account on assets for use or installation in the United Kingdom and for enquiries into past expenditure to show separately expenditure on plant and machinery, vehicles and vessels, and new building work.

For forecasts of future expenditure, a single figure is required for the first two categories. They are asked to exclude expenditure on land and purchase of existing buildings and to make no deduction for receipts from the sale of assets. Most companies make a single return of their expenditure but some of the larger companies are asked, as far as possible, to give particulars for their main industrial divisions.

The changes in capital expenditure have been calculated by grossing up the expenditure of companies to obtain estimates of the expenditure by companies in the population from which the sample was selected and comparing this with a similar estimate of the expenditure of the same companies in a previous period.

The first stage of estimating changes between 1954 and 1955 was to compare estimates made in this way from companies making returns of actual expenditure in 1954 and for forecasts of expenditure during 1955. At the present stage, of course, the inquiry gives very little guidance as to the nature of companies' forecasts of future expenditure and whether they tend to exceed or fall short of actual expenditure. By the end of the year, a considerable number of companies cooperating in the enquiry had made returns of actual expenditure in the first nine months of 1955, and a comparison of this expenditure with previous forecasts (now published for the first time) shows that actual expenditure was in fact only about three-quarters of what was originally intended.



The nature of the statistics now compiled is, in your correspondent's view, worthy of study in view of its applicability to problems of economic planning and more than that, as an indication of cyclical trends where the free price mechanism is given fuller scope. Its compilation in Britain must, therefore, be regarded as a fundamental step in the progress towards provision of comprehensive economic statistics.

The lessons of the statistics now published, it is expected, would have reached the inner portals of the Treasury and the Chancellor's desk. It would also be expected that the April 1956 Budget is being formulated on proposals that record the investment trends in the country. But the statement of Mr. MacMillan to the National Production Advisory Council this week shows how long it takes for such lessons to be grasped or worked on:

> "I can see no sense in disputing about the right place to move and stop a vicious spiral; let us stop it anywhere and everywhere we can ....."

The Times, of course, came to the Chancellor's rescue by stating that his failure to account for the upsurge of industrial investment was due to his taking a "long-term view" of the economy. This appears to be the one occasion, remembering the end-product of inflation in other years and in other countries, when the view that "in the long-term we are all dead" can be particularly valid.

Protecting the Tenant

Agricultural Legislation in India, Vol. VI—Land Reform (Reforms in Tenancy), issued by the Economic and Statistical Adviser, Government of India Press, Delhi, 1955.

Reviewed by W C Neale

THIS volume continues the series of collections of recent agricultural legislation and reproduces the major acts or portions of acts relating to tenancy which were passed over the past two decades, the principle being to give the text of the latest law governing tenancies in each State. The purpose of the series is not really clear to this reviewer, for it is difficult to believe that many people will want the legislation in this form. An administrator or a lawyer working in an area needs a definitive edition of the relevant law, which this is not, and very probably an annotated edition containing or referring to court decisions, which this volume does not do. The scholar's needs are similar, and in addition, the scholar would want to see earlier acts and complete texts; as he becomes involved in land legislation he will have to dig out the original acts in any case. This leaves the 'general reader' or 'layman', and 708 pages of tenancy legislation are more than any general reader can be expected to read, especially at a price of Rs. 15. However, now that the volume exists it is reasonable to expect libraries to carry it for occasional reference by interested but not serious scholars, administrators and lawyers.

The bulk of the volume consists of the texts of the acts governing landlord and tenant relations in all the States, and there is nothing to say but that they are there if you want them. There is, however, an "Introduction" of fifty-six pages providing a potted history of tenancy legislation in India, a comparison of the tenancy legislation in the different States, and a section on "Objectives of Land Reform Policy". The "Introduction" is a good piece of work, and standing alone, worth reading.

The historical section concentrates rather heavily on recent legislation, and covers each act or major provision in a sentence, or three or four, but the highlights are hit and the reviewer found nothing to which he wishes to take exception. There is, as is rather rare in the literatere on land reform, an absence of highly coloured or tendentious phrasing. The same may be said of the second section comparing the legislation in the different States. In a few moments one gets a picture of the various ceilings on rent or the minimum periods of tenancy. The last section, after citing all the reasons why a country might want to reform its tenurial system, provides a good, short summary of the problems of fixing fair rents and the pros and cons of fixing ceilings on the size of holdings. The "Introduction", alone, or perhaps somewhat expanded, would make a fine little book for anyone interested at Re. 1 or Rs. 2.

In going through the introduction, leafing through the acts and remembering other earlier acts, it is striking how often and in how many places similar provisions are made to alleviate the lot and increase the privileges of the tenant, and how unsatisfactory these efforts have proved—at least in comparison with the hopes the legislators had for them. While in some States limitations on rents are very recent—in Bombay and the Punjab for instance—limitations elsewhere have had a long history. Eighty years ago Settlement Officers in U P were fixing the rents of occupancy tenants, and since the nineteen twenties, rents throughout U P have been subject to the judgment of a Rent Officer. Either "because of" or "in spite of" this history, U P has enacted the most far reaching reform legislation of any State (so much so that most of its relevant act appears in Vol IV of this series on the abolition of intermediaries rather than in this volume on tenancy). One has the feeling that States which have tried to limit rents to a third or a quarter of gross produce or to three times the land revenue are going to find that they are not satisfied with the results, perhaps because the provisions of the acts will be evaded, as they have been in the past, but more probably because the legislation does not attack directly the basic difficulties of the rural areas—over-population, under-capitalization and social organisation. Whatever the other merits or demerits of abolishing intermediaries, abolition does eliminate one group from the countryside and ought to make a significant difference in the social institutions within which the cultivator operates.

Legal rights are enforceable under either of two conditions: first, that almost everyone favours the enforcement of the rights so that the few who oppose the rights are quickly brought to book; and second, that there are parties with opposite interests who are able and willing to stand up to each other, so that the full facts are brought out and it is easy to arrive at a just decision. (Roughly speaking, enforcement of criminal law depends on the first condition; enforcement of rights under civil law depends on the second). Land law before Independence provided plenty of rights for the tenants. If these rights were not actually enjoyed, it seems likely that it was not because of anything inherently wrong with the rights, but because the parties to relationships governed by the land law, for whatever reason, found it better to reach an agreement on principles other than those upon which the law was based. The trouble with trying to make a civil offence a criminal one in tenancy cases is that the offender does not arouse the necessary unanimous opposition of the population, for landholders constitute a self-respecting group of appreciable size. It seems unlikely that new laws designed to improve the status of tenants will work better than the old laws, or that old laws newly adopted in other States will work better, unless, of course, there has been a change in the attitudes of the parties to each other. If there has been this change in attitude, then there may not be the same need for strong legislation in the tenants' interest.

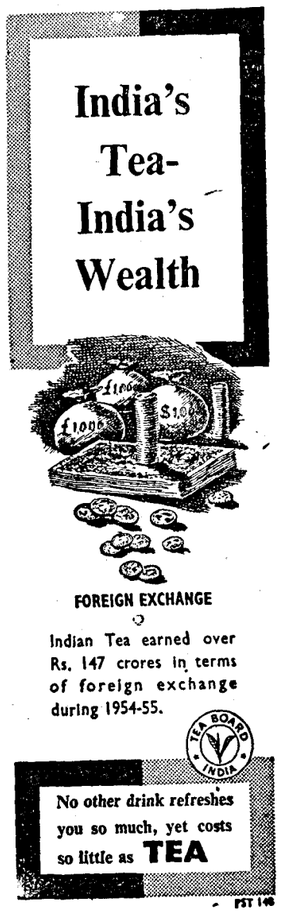
Oversimplification

Economics and Action by Pierre Mendes-France and Gabriel Ardant. Heinemann — Unesco. Pages 222. Price 15 shillings.

THIS is the first publication of the Science and Society series started by *Unesco* with the object of demonstrating the practical results already achieved by *research in social* sciences and the guidance they can afford for rational action. Inspired s the series obviously is by the will o seek progress on rational lines, it s bound to attract a wide circle of eaders all over the world. The first olume deals with the contribution f economics and the aid that can e sought from it. This study will e of especial interest to people in on-Communist countries.

Written by a former Premier of France and a person of distinction both as a politician and an economist, this book combines a historical review of economic analysis with the evolution, as a result, of a technique for economic policy. It traces, to begin with, the evolution of the general theory of employment and its influence on actual policy in the post 1931 era. The problem of full employment which has been in the forefront in recent years as one of the objectives of economic policy, however, has been dealt with almost exclusively from the point of view of industrially advanced countries. Therefore, the analysis cannot afford any direct aid to the solution of the problem in under-developed countries, though certain comments on specific aspects of the problem of full employment are of general interest. For instance, in a valuable chapter on "Scientific Advances and the Fight against Inflation" it is pointed out, rather ominously for India, that "the fight against inflation is one of the conditions of the fight against under-employment". In other words, any schemes for large-scale development of the economy to provide for full or fuller employment must necessarily provide for measures designed to inhibit and restrain the *inflationary pressures*. It follows that it will be disastrous to plan for development through deficit financing on an extensive scale without providing for measures, however unpalatable, to keep the inflationary pressures under control.



M Mendes France obviously does not believe in capital creation through controlled inflation which some economists, e.g., Prof Arthur Lewis, do.

The technique of economic policy, the authors take pains to point out at some *length, must* depend to a large extent on statistical data and its proper co-ordination. In this connection the advantages of an "economic budget" on the lines of the 'Economic Survey' submitted annually by the British Chancellor of Exchequer have been elaborated. One wonders whether any attempt has been made in India on similar lines or can be made, so as to assure that the overall plan for the country's development is well integrated and there is internal consistency between the different objectives, and the methods proposed. One does not know further whether the whole fiscal system has come under review to enable an appraisal of the extent to which the system is in conformity with the technique for economic development. For instance, it will be worthwhile to see whether the system of taxation in the country gives enough incentives and resources to the private sector to achieve the results that are expected of it.

In formulating an enlightened economic policy, the authors emphasize very rightly, what must be pretty obvious viz. an examination will have to be undertaken of the existence of bottlenecks in the economic system, presumably with the help of the technique of economic accountancy associated with the American economist Leontieff. But surely, in-put out-put studies are not merely for spotting such bottlenecks?

The book deals in the second part with the progress of economic analysis in relation to what is termed as "the problem of choice" signifying the optimum use of economic resources. A brief survey is made of the classical theory of "natural mechanism", its limitations due to imperfect competition and the non-neutral fiscal system as well as the inherent shortcomings of the classical analysis. As a conclusion it is stated that there is a case for State intervention particularly in the field of planning for capital investment. This part also indicates the need for further research work on such aspects as the functioning of the public sector in a non-collectivist country and the best conditions for selection of public expenditure. On the subject of public enterprise, the conclusion of the writers is that in order to make the management of State *enterprises more* efficient we have to re-establish an equivalent, a transposition or an imitation of the "natural mechanism". In other words, even where it is considered advisable to interfere with the natural functioning of the economy, the interference should be planned with the help of the concept of optimum choice guided by the "invisible hand" of the classical economist.

On the whole the authors derive inspiration from the conviction that the science of economics can point out the way to achieve full employment as well as a rising standard of living. But "human progress does not depend on rational conceptions alone, it depends also on the enthusiasm evoked by the search for progress".

The Future of Europe's Centre Parties

(From our London Correspondent)

THE outcome of the French general elections highlights what appears to your correspondent to be a particularly critical moment for West Europe's centre political parties. If a parallel is sought for the current dilemmas of the centre groupings in continental European politics, then the happenings of the years 1932-1933 are probably most apt. In the late pre-Nazi era, the centre groups in almost all cases were hemmed in by giant parties at either extreme: the Fascists and the Communists. Today the situation in France, Italy and West Germany—the three crucial centres of political activity in Europe—is not unlike that in 1932-33. This is not to suggest that Europe's historical experience is *going to be repeated. There are possi*bilities, however, of such a repetition and it is in this sense that the centre parties of Europe are facing a crisis today.

Personality Bias

By tradition and even more by temperament, the continental European people prefer a galaxy of political parties. These parties—particularly those between the extremes—are usually divided by issues and interests which the average non-European finds most difficult to understand. Even the best of European political commentators have yet to distinguish between the policies of the French Pinay Independents and Bidault's M R P or between the Italian Liberals and Republicans. This very remarkable situation possibly reflects the high personality bias of the continental electorate.

Government in France, Germany and Italy have up to now taken the classical European form: combination of the centre parties. In France, the Prime Minister has always been sought from the centre parties ranging from the Pinay Conservatives to the Radicals (the Socialists being always regarded as an uncertain element of co-operation). So, too, in West Germany and Italy.

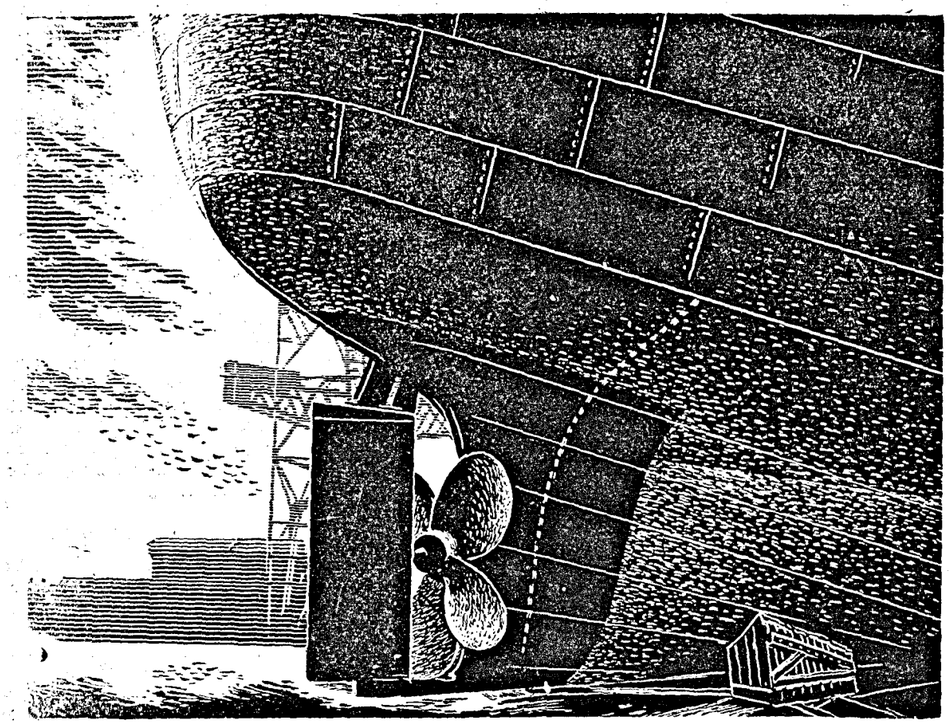
This choice is now no longer open. In West Germany, for example, the force of Dr. Konrad Adenauer's personality—his ability to express the general will of European conservatism of implacable hatred for Communism and yet maintain a respectability that distinguishes him from the Nazi and neo-Nazi groupings—all these qualities make him the inevitable choice to lead the coalition of the Christian Democrats, the Refugee Party, the German Party and the Free Democratic Party. But Dr. Adenauer is now 80—an age when his party should find a successor. No successor has been found and there appears no-one else in West German politics with the capacity of Dr. Adenauer to lead the present centre coalition.

In Italy the crisis was reached when that adroit tactician, Signor de Gasperi, died. Since then the galaxy of parties which compose the Government coalition has been split and divided by the Christian Democratic personalities, Signor Pella and Signor Segni. In the 1953 elections, the Government coalition lost 68 seats in the Chamber of Deputies. It nevertheless maintained a sizable majority to continue. But soon the absence of Signor de Gasperi was felt. The retirement of President Einandi and his replacement presented the first test for the centre parties. They came out of this a very much weaker and a more divided combination. The ultimate choice of Signor Gronchi was made possible only by the support received from Signor Nenni's P. S. I. and the Communists, and the fact that this support was necessary led to recriminations and resignations. The second test—that of ratification of the London and Paris Agreements—resulted in centre party expulsions and in particular the expulsion of influential Signor Meilani from the Christian Democratic Party.

Demand for End of Coalition

These developments were serious but did not shake the essential coalition of the four centre parties. It was the differences over (a) protection of leasehold tenancies of peasants in the south; and (b) confining to the State the exploitation of the country's oil and gas resources, that brought cohesion to an end. Indeed, there developed in the Christian Democratic Party (the largest of the coalition) a powerful faction, the concentrazione, led by right-wing Signor Pella, which demanded that the "quadripartite" coalition should be ended and that a government should be formed by the Christian Democrats alone.

These rifts brought down the Scelba Government and gave birth to the Segni Government composed of members of the same centre parties as before. But it could be kept alive only by the support that was being currently received from the PSI and the Communists. This remarkable position was most clearly demonstrated during the Chambers' debate on the Civil Service Report Bill. The passage of this bill and hence, the continuation of the Government was possible only because of this support.



The position in France is of considerable moment for Europe's political centre. The recognition of this critical phase has forced the M R P and M Faure's expelled Radicals to give unwanted support to M. Mollet and M. Mendes-France. But this recognition and this change of face appear to have had little effect. The election of the Socialist speakers of the Chamber of Deputies was made possible only with the support of the left extreme.

In Other Fields Too

It is not in the political field alone that the crisis of the centre has emerged. In all cultural activities also, Communists and their fellow-travellers have the initiative. So, too, among the youth, the attraction of the left has never been greater since the reaction in the 1930's against fascism. In economic policy, the centre groups have proved their bankruptcy by their dependence on American aid and goodwill.

The well-known West German paper De Welt recently referred to the right-wing conservative criticism against Sir Anthony Eden's leadership of Britain as another expression of the tendencies of our time. If then, there is a crisis in European "centralism", what is the outcome likely to be? The emergence of the Poujadists in France, the defiant attitude of the W. German Nazi and neo-Nazi groups, and the arrogance of the Italian Fascists and Monarchists indicate the dangers in the situation. The lessons of the 1930's should, it is hoped, force upon the European political situation a solution which will avoid a repetition of that era.

The Poona Economic Seminar In Retrospect

Lim Tay Boh

ALTHOUGH the Poona economic seminar was held over six months ago, memories of the experience are still fresh in the minds of those who participated in it, and this together with the fact that a similar seminar will be held this summer at the University of Malaya, Singapore, provides good justification for a review of the purpose and achievement of the Poona experiment.

The Poona seminar was described officially as an Advanced Refresher Course in Economics and was jointly organised by the International Economic Association and the Indian Economic Association. The general aim was to enable the younger teachers of economics in universities of India and other countries of Southeast Asia to keep abreast of current developments in advanced economic theory by bringing them into contact with some of the top-ranking economists of Europe and the United States.

As a first experiment of its kind in Asia, the seminar is significant in that it may mark the beginning of a series of summer residential schools for university teachers of economics in the South and Southeast Asian region. There can be no doubt about the theoretical soundness of the experiment, but if it is to become a permanent feature of the cultural activities of Southeast Asia, the actual achievements of the first experiment need to be assessed in the light of its specific objectives and lessons drawn for future experiments of a similar kind.

These objectives appear to be as follows:

(i) To give university teachers of economics in the countries of Southeast Asia an opportunity of keeping abreast of current developments in the principal branches of economic theory.

(ii) To achieve this objective by using the seminar method; and

(iii) To provide a residential university atmosphere, in which the visiting professors and the scholars attending the seminar would have ample opportunities of social contact and free discussion through living together in the same campus and having their meals together.

These objectives may be conveniently taken in reverse order. First consider the choice of Poona and the Deccan College as the location for the seminar, in the light of the third objective.

As a venue for the seminar, Poona was a suitable choice, as it was easily accessible to the members of the staff of the Bombay School of Economics, who had the difficult task of running both the seminar on behalf of the Indian Economic Association and regular courses of studies in their own School. Moreover, it had the advantage of a salubrious climate at that time of the year when other university centres within easy access of Bombay were affected either by oppressive heat or heavy monsoon rains.

But the choice of Deccan College, where the scholars were accommodated and where the seminar meetings were held, was, however, far from satisfactory, the most serious of its limitations being the absence of an economics library with a suitable reading room, where the scholars could spend their time reading the relevant literature in preparation for the seminar discussions. It is true that some of the books required were either purchased or borrowed for the use of the scholars. This, however, could not replace the facilities provided by a good economics library with a suitable reading room. Without such facilities, no seminar similar to that organised at Poona could yield the maximum benefits.

The second serious disadvantage was the unsuitable accommodation from the point of view of a residential school. Although Deccan College had the advantage of a spacious campus, the hostel accommodation and bathroom facilities were not up to the standards of a modern university hostel. The result was that the visiting professors could not be suitably accommodated in the same campus as the scholars and had to be provided with accommodation in a hotel about four miles from the College. The third objective of free discussion and social contact between the professors and the scholars was, therefore, not fully achieved.

The idea of a residential summer school for the study of advanced economics is an excellent one. The advantages of such a school had never been enjoyed by many of the scholars, who had their education in non-residential universities. For residential universities are something of a luxury in countries of southeast Asia where the pressing need is the extension of higher education to the masses.

There is therefore a strong case for providing short-term residence for small groups of university scholars in summer schools, where active participation in free discussion and exchange of knowledge and experience by scholars from different countries could be encouraged. But a residential summer school can yield the maximum benefits, only if the essential conditions are fulfilled. One essential condition is suitable accommodation for both the visiting professors and the scholars, for it is only by living together in the same campus that professors and scholars can have opportunities of mixing freely and exchanging their experiences.

Fortunately for the success of the Poona experiment, the professorial tutors showed a clear appreciation of the need for personal contact with the scholars and made it a point to stay back at the College and have tea and meals together with the latter. They participated fully in the social activities organised for the members of the seminar. The most successful feature of these activities was undoubtedly the excursions organised during the weekends to places of interest. The first excursion was to Sinhgarh, in which all members of the seminar, whose ages ranged from about twenty-five to over fifty, participated in the exhilarating climb of 2,000 feet to the top of Sinhgarh. This was followed by the instructive tour of the villages south of Poona, where the members of the seminar gained a good insight into the work of the government rural extension services. Finally, there was the inspiring experience of a visit to the wonderful caves of Ellora and Ajanta.

So far as the second objective of using the technique of seminar discussion is concerned, it is necessary to reiterate the importance of good library and reading room facilities to the success of "the method of learning by discussion". Three other observations are perhaps worth recording for the benefit of organisers of future seminars. First, there is the need to co-ordinate lectures and discussions. A useful technique from the point of view of the scholars is the breaking of lectures at convenient stages in the development of the theme to give the scholars an

opportunity of raising points for discussion. Certainly, it is preferable to shorten some of the long lectures in order to allow more time for discussion.

Secondly, there is great advantage in encouraging scholars to prepare short papers for discussion. Many of the scholars were working in special fields and no doubt had interesting problems which they would probably have liked to present to the seminar for discussion. The opportunities of leading a discussion would have been a useful experience for them and would have made the seminar course a much more useful medium of training.

Thirdly, there was a general preference among the scholars for cyclostyled notes giving a synopsis of the lectures delivered at the seminar classes. The advantages of such notes is that they form a record of part of the proceedings of the seminar, but whether it is practical to issue them or not depends on whether the professorial tutors could be persuaded to undertake the preparation of the notes, which requires a more systematic organisation of the seminar lectures and discussions.

Finally, to what extent was the first objective of the seminar achieved? There is no doubt that there was much that was useful and stimulating in the content of the courses from the point of view of the scholars. It was an excellent idea to combine the discussion on theoretical developments by the oversea visiting professors with that on the practical problems of economic development by the local economic experts. It was this study of the theory and practical problems of economic development which gave the courses their basic unity.

It is unnecessary to go into the details of the various subjects covered in the courses. So far as the content of the seminar courses is concerned, the most important lesson of the Poona experiment relates to the need to develop tools of theoretical analysis which are applicable to the special conditions of Asian economics. It is natural that economists and politicians in Asia should be preoccupied with the practical aspects of economic policies rather than with the niceties of theoretical analysis, but it would be unfortunate if the difficulties of applying existing theoretical tools to the practical problems of economic policies cause economists in Asian countries to abandon research in economic theory in favour of descriptive economics. The function of economic theory is to provide the necessary tools for economic analysis, without which it is impossible to determine the proper criteria for economic policy. What is needed is the further development of analytical tools which are suitable for analysing the special conditions of Asian economies, and this requires the continuation of research in the field of economic theory.

How banking serves the SPICES INDUSTRY

There is tremendous demand throughout the world for pepper and cardamoms, and South India produces the bulk of these spices. One-third of the entire world demand for pepper is grown between Karwar and Cape Comorin ; and in 1951-52, India's exports earned more than Rs. 27 crores.

Within the last ten years there has been a remarkable increase in cardamom growing, particularly in the South Indian states of Mysore and Coorg, and the districts of Madura, Tinnevelly, Malabar and Coimbatore.

The Indian spices industry has a happy future, and banking will naturally help to expand and improve it. The facilities and guidance of a good bank, such as the availability of ready funds when needed and the collection of dues from any part of the country, have become part of efficient organisation in every industry.

We at Palai are proud that many spice growers of South India employ the *complete* banking service we offer:

Current Accounts—Demand Drafts—Telegraphic Transfers—Investments—Letters of Credit – Bill Collection—Deposits — Loans & Overdrafts—Confidential Credit Reports, etc.

If you have business interests in the South, it will pay you to open an account with us. Our 25 branches are strategically located, 23 in important South Indian business centres and two in Delhi and New Delhi ; and we have correspondents in all important Indian cities. We offer a fully comprehensive banking service at each office.

Our clients can make deposits at any of our correspondent banks, situated in all important Indian towns and have the amounts credited to their accounts at any of our branches.

PALAI CENTRAL BANK LTD.

Head Office: PALAI — TRAVANCORE

Branches at : Madras, Madurai, Cochin, Quilon, Trivandrum, Mangalore, Bangalore, etc. Also at : Delhi & New Delhi.

A LEADING BANK IN SOUTH INDIA

Measurement of Deficit Finance in India

THE realised deficit or surplus in the balance sheet of the Governmental sector needs to be viewed not from the narrow accounting angle but from the point of view of their effect on the money supply through which budgetary policies influence the national economy. Other things remaining the same, Governmental deficit or surplus should find reflection in a rise or fall in the domestic money supply and through the latter, affect investment and consumption of the community. It would, therefore, appear necessary to exclude from the accounting deficit or surplus of the government the impact of those transactions which do not affect money supply with the public, in order to get a proper economic measure of the extent of real budget surplus or deficit financing.

In the implementation of the First Five Year Plan, it is widely known, recourse has been had to deficit budgeting on an increasing scale; but what is not known is the exact extent of that deficit or the proper method by which the size of the deficit can be measured. While the budget papers spotlight only the net changes in Cash Balances during the financial year, the Reserve Bank takes account (besides the movement in Cash Balances) of the net change in floating debt and net depletion or enlargement of holdings in the Cash Balance Investment Account in its assessment of the budgetary position. The Planning Commission's approach to the problem, as revealed in its estimates of deficit financing in 1954-55 and 1955-56, does not vary from that of the Reserve Bank.

The Reserve Bank's estimates of the quantum of deficit finance in the sense of use of Cash Balances, variation in floating debt and purchase or sale of securities held in Investment Account for 1951-55, are given in the table alongside.

Obviously, in this table the effects of non-money supply affecting transactions have not been segregated, the presumption being that the transactions referred to are necessarily between the State and Central Governments on the one hand and the Reserve Bank on the other. This is certainly not true with regard to items A2, A3 and B2 as also regarding some other transactions, such as foreign receipts and foreign payments, receipt of profits of Reserve Bank earned abroad and net absorption or redemption of Government loans held by the Reserve Bank. These will affect cash balances, though not money supply with the public and we must exclude these transactions for arriving at money supply. Transactions regarding floating debt also transpire between the public and the Government, and to the extent to which the public absorbs treasury bills, the deficit would appear exaggerated. It is thus necessary to exclude public holdings of floating debt as given in the table. It is true that in 1951-52 there was no sale of treasury bills to the public, but since 1952-53, sales to the public have amounted to about Rs. 12 crores each year.

Likewise, the sale of securities held in reserve are made to (a) State Governments, (b) Reserve Bank and (c) the public or vice versa. Of all these transactions, only the one between the Reserve Bank and the Government is meaningful for estimating the deficit. Therefore, the impact of the other two transactions on Cash Balances should be eliminated. It may be pointed out here that the transactions between the Centre and the States may be ignored, as these are taken into account while calculating the deficit or surplus in the balance sheets of the State Governments. Their effect is removed automatically when the surplus or deficit of the Centre is added on to that of the State Governments. Thus, it will be seen that the adjustment will have to be made for only the net sale or purchase of securities by or to the Reserve Bank to get a correct magnitude of the deficit. Detailed Statistics relating to these transactions are not published by the Reserve Bank and, therefore, these adjustments cannot be easily made.

In the same manner, the impact on Cash Balances of external receipts and payments of the Government has to be removed, as these transactions do not affect the domestic money supply. Otherwise, the domestic impact of budgetary policy will appear to be very different from what it is in fact. For instance, the net foreign disbursement on Government account will exaggerate the money supply effect of deficit to the extent to which no allowance is made for the net payments abroad in Cash Balances and vice-vera. Similarly the surplus in the budget will be understated and the corresponding fall in the domestic money supply will appear to be less than what it actually would be. From 1951-52 there had been consistently net foreign outpayments on Government account, and therefore the overall surplus for 1951-52 has to be increased by the amount of over-payment and the overall deficit in the other three years reduced in like manner.

Overall Deficits of Government of India and States during 1951-55

(Crores of Rupees)
(Based on Budget Papers)

Central Government	1951-52	1952-53	1953-54	1954-55	Overall Deficit for 1951-55
A. (1) Additions to or Decline in Cash Balances	+ 0.9	— 63.5	— 61.3	+ 12.2	—111.7
(2) Increase or Decrease in floating debt	— 32.2	— 29.1	+ 19.5	+136.9	+ 95.1
(3) Purchase or Sale of Securities held in Reserve	— 22.2	— 15.6	+ 6.2	— 8.3	— 39.9
(4) Overall Surplus or Deficit (1) — (2) — (3)	+ 55.3	— 18.8	— 87.0	—116.4	—166.9
State Governments					
B. (1) Additions to or Decline in Cash Balances	— 10.5	+ 10.7	— 2.1	— 41.1	— 43.0
(2) Purchase or Sale of Securities held in Reserve	+ 28.6	+ 25.4	— 20.9	— 5.4	+ 27.7
(3) Overall Surplus or Deficit	— 39.1	— 14.7	+ 18.8	— 35.7	— 70.7
Overall Surplus or Deficit on Central and State Governments' Account (A + B)	+ 16.2	— 33.5	— 68.2	—152.1	—237.6

Here a difficulty will be encountered. The precise order of foreign expenditure cannot be obtained from the accounts for the past years, because a large number of items relating to charges made outside the country given in the Demand for Grants has to be added up to get this figure. However, this procedure being too clumsy and to some extent unrealiable, an alternative method may be suggested for arriving at the net foreign position of the Government. We get from the Reserve Bank's published statements the figures regarding net movement in India's Foreign Exchange Reserves which, however, include authorised dealers' credit balances. We also get separately information relating to the net purchase or sale of sterling by the Reserve Bank from and to the public and the authorised dealers. Thus, the difference between the net change in Foreign Exchange Reserves, after adjustment for the variations in authorised dealers' credit balances held abroad, and the net purchase or sale of sterlings from and to the public by the Reserve Bank, should furnish us with the statistics about the net foreign position of the Central as well as State Governments. Statistics about authorised dealers' credit balances held abroad are not published separately; but one may guess that the probable magnitude of the variation in authorised dealers' credit balances is not likely to exceed Rs. 15 crores on either side. It would thus appear that the net foreign payments position of all the Governments in India during 1952 to 1955 would be as follows:—

Period	Foreign position of Central and State Governments—(net outpayment) (In crores of Rs)
1951-52	217 — 247
1952-53	27.2 — 57.2
1953-54	61.4 — 91.4
1954-55	86 — 11.6

For calculating the net domestic deficit, therefore, we have to set the above magnitude against variations in Cash Balances of the Government. It should be noted in this context, however, that from the point of view of the entire economy, exclusion of foreign transactions does not make any significant difference as adjustment is automatically made for the net foreign position of the Government, where the effect of overall balance of payments position both on private and public accounts on money supply is taken into consideration. It is necessary, however, to indicate these transactions for purposes of analysis, particularly for studying the effect of governmental fiscal policy on money supply.

This is not all. There are certain other adjustments to be made. Profits of the Reserve Bank are included in Government receipts on revenue account. This exaggerates the net absorption from the public to the extent to which some of the profits of the Reserve Bank are earned abroad and therefore the impact of the foreign earnings of the R.B.I. that go as receipts to the Government on the cash balances should be segregated. Wherever a surplus in the cash balances is found, it should be reduced by the amount of the R. B. I. foreign profits and the deficit increased similarly.

It seems also necessary that allowances should be made for the proceeds of the debt absorbed by the Reserve Bank or the redemption of the debt held by it as the case may be. The deficit or surplus as currently taken does not take into account the net sale or purchase of the public debt to and from the Reserve Bank. The budget surplus therefore should be inflated by the extent to which there is a net redemption and the deficit accordingly deflated and vice versa.

If all these adjustments are properly made, it will be seen that contrary to the general belief, the budgetary policy was not one of deficit but of surplus except in 1954-55 and in consequence, it tended to contract money supply. Incidentally, this explains, to some extent, why there was a fall in the aggregate money supply during 1954-55 as compared with 1950-51, despite the declared deficit in the budgets of both the Centre and the States. This misunderstanding was largely the result of the general confusion prevailing in the country regarding the accounting deficit of the Governments and the net deficit, limited to the domestic transactions, which affect money supply.

Some Aspects of Indian Minerals

R A Jahagirdar

IN the Process of mineral development, India has just passed from the first stage, when only the rich and surface deposits are exploited, to the second stage of setting up metallurgical, chemical and engineering industries. This was the keynote of Dr M S Krishnan's Presidential address at the last Indian Science Congress.

"We have only a few surpluses and quite considerable deficiencies in the list of useful minerals needed for industry." This was another of his observations. The present position of minerals in the Indian economy may be usefully studied from these two standpoints.

Coal is the key mineral of the second Plan. The much-debated basic strategy of the Plan, which aims at the development of heavy industries, in particular steel industry, hinges on the fulfilment of the target for coal—which is conditioned in turn by the adequacy of transport and implementation of proper policies. The enormous resources of high-grade iron ores in India make the high target for steel highly attractive.

The picture of coal reserves is also not dark. Reserves of coal down to 1000 feet below the surface, in seams not less than four feet in thickness and containing not more than 25 per cent of ash, have been estimated to be about 20,000 million tons. The question however is: Are there adequate quantities of appropriate quality?

The Indian Coalfields Committee of 1946 estimated the reserves of good coking coals at 700-750 million tons which when used for all kinds of purpose would not last long. With the projected expansion of the iron and steel industry, it will be easy to see how necessary it is to conserve coking coal. Shri K D Malaviya's remarks at the Golden Jubilee celebration of the Mining, Geological and Metallurgical Institute at Calcutta deprecating the policy of conservation, are therefore hardly appropriate, at least as far as coal is concerned. His advocacy of "merciless exploitation" of mineral resources is based upon the popular notion of India's "richness" in mineral resources and ignores the distinction between quality and quantity. A policy of conservation does not aim at preservation; it only insists upon each type or grade being put to the use for which it is best fitted by its properties

No Policy for Coal Yet

The present output of coal of 37 million tons is to be increased to 60 million tons in 1960-61 and the increase in output in the public sector is planned from 5 to 20 million tons while the output in the private sector will increase from 32 to 40 million tons. The controversy over the respective roles of the two sectors is now settled with the announcement by the spokesmen of the private sector that they will discharge their duty even in the absence of an assurance regarding nationalisation. The point, however, that still remains to be settled is whether increase in coal output is to be brought about by opening new mines rather than by exploiting existing ones. The latter, it is believed, is likely to be less costly.

The Government of India, however, has not yet finally decided its coal policy. Decisions are occasionally announced regarding a particular matter—for example that mechanisation will be allowed only in the new mines which perhaps will be mostly in the public sector. Nothing will be more appropriate than declaration by the Government of an integrated policy regarding all matters relating to coal such as labour, mining methods, transport, price etc.

An incidental, though interesting, question may be raised. In view of the development of atomic energy, will coal be outmoded? Is the successful development of atomic energy for industrial uses a potential threat to the future of coal industry? Mr J Bronowski, Director of the National Coal Board in Britain, recently answered this question in the negative by pointing out that in course of time coal will be utilised chiefly for the production of chemicals and also

TABLE I

Iron Ore Reserves

State	District	Tonnage (in millions) Estimated	Probable	Iron Content
Bihar	Singhbhum	1,047	8,000	Mostly 60 — 68% Fe

Kashmir	Jammu and Poonch ..	2,000†
	TOTAL	25,766

† Approximate

in the manufacture of steel. He did not however mention the other factors involved viz. the cost and the dwindling deposits of coal. If in the UK, output of coal falls, the marginal cost, which is at present very high, may decline and then coal may be used as a basic source of chemicals. For us in India such a possibility appears fairly remote.

Electricity and Aluminium

We are still in the electrical age. Ambitious programmes of electrification have been taken on hand and the increased requirements of conductors, it has been decided, will be met by aluminium in view of the high price of imported copper and the inadequency of copper deposits in India. Hence the target in the second Plan of increasing aluminium production tenfold—to 40,000 tons in 1960-61.

Table II gives estimates of bauxite reserves in India.

A recent estimate puts the Salem reserves alone at 6 million tons. Thus though we have bauxite reserves enough to yield aluminium for as long as we can forsee, the prohibitive cost of extraction has made aluminium a scarce metal. It needs 25,000 kilowatt-hours of electrical energy to produce a ton of aluminium. The location of alumina reducing plants, therefore, is dictated by the availability of cheap power, which involves hauling of bauxite ores over long distances.

Problem of Location

A similar locational problem is inherent in the cement industry. For a cement factory of an annual capacity of one lakh tons, the daily requirements of water are 3 to 4 lakh gallons and therefore cement factories have to be located near some river. This, of course, necessitates carrying of limestones to the factories over distances which in the case of existing companies vary from half a mile to nearly 170 miles.

The freight that thus enters into the cost of cement must be one of the causes of the difference in the cost of manufacture of different companies. Similarly, gypsum has also to be transported to the factories, over long distances, though in much smaller quantities than limestone (for every ton of cement, 1.5 tons of limestone and 0.04 ton of gypsum are required).

As the present deposits of limestone are depleted, cement factories will either have to use raw materials of inferior quality or get their raw materials from longer distances; they may even have to switch over to other raw materials requiring costly processes for conversion into cement. Over a longer period, therefore, the cost of cement is likely to increase.

There is no such problem of location in the case of two of our important minerals which have however other problems. India possesses rich ores of manganese and for over half a century, she has contributed substantially to the world production of this mineral. The large-scale expansion of the iron and steel industry which we have taken in hand will absorb increasing proportions of domestic production of manganese—it is estimated that for every ton of steel, some 60 lbs of high grade manganese ores are necessary. Besides, there is considerable scope for exports of ferromanganese. But nature has put a handicap in the manufacture of this alloy as our ores and cokes contain too much phosphorous. It is, however, possible to overcome this difficulty by careful selection of ores and cokes and also by using electrical arc furnaces for the manufacture of the alloy.

No such natural difficulty exists in the case of mica which has of late found itself in the doldrums. India has been producing 80 per cent of the world's sheet mica but has been consuming a negligible portion of it. The fortunes of Indian mica have been tied, especially since the last war, to the demand from the US. US has now found an alternative source of supply in Brazil where it has invested heavily both in money and in technical knowledge for the exploitation of this mineral. As a result, India has suffered a slump in mica. Efforts are being made to promote and boost mica exports; there is little effort to expand the utilisation of mica within the country, which is, in fact, a more lasting solution.

An opposite case is that of sulphur which is in great demand but for which we have no domestic source of supply. In the absence of sulphur, the development of an important heavy chemical industry i.e. sulphuric acid, is arrested. Imports of sulphur are costly and irregular, making the cost of sulphuric acid in India high and production fitful. Consequences of an underdeveloped sulphuric acid industry radiate throughout the chemical industry. Superphosphates, for example, are costly in India because sulphuric acid is a raw material in their manufacture, and therefore the consumption of phosphatic fertilisers is hopelessly inadequate as compared to that of nitrogenous fertilisers.

The Planning Commission dwelt at length on this problem and said that "it is essential to reorient the industry for utilising other domestic materials". The waste gases from Ghatsila works of the Indian Copper Corporation were indicated as a source of 6000|7000 tons of sulphur. But the scheme to utilise these gases was given up "owing to difficulties in arranging an outlet for the acid that would be produced." (Third Progress Report p. 194).

Though of late supply of sulphur has become easier, it is not practicable to rely upon it in future. The exploitation of iron pyrites is, from all accounts, the best solution to the problem. With the utilisation of iron pyrites, the production cost of sulphuric acid, it is expected, would not be perceptibly higher than that when elemental sulphur is used. Even gypsum is not likely to be used as its price will substantially push up the cost of production of the acid.

The National Industrial Development Corporation has taken in hand a project for the utilisation of iron pyrites in the manufacture of sulphuric acid.

Then there are, in plenty, deposits of ilmenite which can yield titanium whose compounds are essential in the manufacture of enamels and paints. Lack of adequate demand for the latter robs these deposits of their value, at least at present. The story of the State-sponsored factory at Travancore for the manufacture of titanium dioxide makes sad reading.

The upshot of this short survey of Indian minerals is that though India has rich mineral resources, she does not thereby necessarily have mineral wealth. Resources have to be tapped, exploited and put to economic uses. As we have seen, there are various difficulties in their utilisation; we are also poor in many minerals such as copper and sulphur; further we possess minerals, like mica and titanium, for which we ourselves have not much use.

India, therefore, requires an integrated mineral policy embracing all aspects of mineral exploitation and dovetailing such exploitation with industrial development. Doubtless, we have to make up for our failure in the past to utilise the mineral resources, which however does not warrant "merciless exploitation." What is needed is economic and profitable exploitation.

Perhaps the present estimates of resources are not final. Increased knowledge as a result of new surveys and improved methods of extraction will bring more minerals within our reach; but increased exploitation may deplete them quicker than in the past. The net effect is difficult to calculate. In the meantime we must proceed on the basis of the knowledge we have*.

Around Calcutta Markets

Payments Crisis

Wednesday, Evening

IT started with disrupted clearing facilities. Because of banking troubles, deliveries had to be suspended for a few weeks. So the payments crisis was delayed by a few weeks. As the payments crisis was prolonged, equity prices receded. In the last two or three days, the Calcutta Stock Exchange has somehow started to function. But forward trading has not yet been resumed. And the market stalemate still continues.

In the last month, three developments have occurred, which have aggravated the crisis on the stock market here. Nationalisation of life insurance was the first shock to stock markets. The possible repercussions of nationalisation of life insurance are not yet over. What has uptil now been witnessed is the psychological shock received by the private sector. This psychological factor can have only temporary effects.

Life Funds

The long-term effects of nationalisation have reference to the prevailing malpractices as well as to certain indicated changes in the Government's policy of investment of that portion of life funds which is now invested in organised private industries. This latter aspect can assume significance only if the Government pursues a policy of wholesale diversion of that portion of life funds now invested in the private sector to financing development projects under the Second Plan.

A wholesale canalisation of investment of life funds, however, is unlikely. But it is clear that the prevailing practice, whereby some insurance companies finance their sister concerns, will end. This has a stock market angle, but it is not significant. Only to that extent to which such investments now involve misuse of funds or create privileged sections in the private sector, nationalisation of life insurance will deprive private industry and stock markets of emergency finance.

New Issue Finance

In 1954, Indian Life Insurers' investment in industrial debentures, preference and equity shares amounted to about Rs 40 crores. But, in recent years, the relations between stock markets and insurance companies have been more extensive. A sizable percentage of new issues floated in recent years have been subscribed by insurance companies. After nationalisation, this support to new issue and stock markets may be less active.

Admittedly, the association of life insurance companies with stock markets has involved speculation in equities. But this connection has been of genuine help in some ways. As private institutional investors, insurance companies have occasionally helped the market to find its floor. This has been a legitimate function. Whether the Government's investment policy would be as flexible, remains to be seen. This raises the wider problem of associating investment experts with nationalised financial undertakings.

Speculation

There is another aspect of nationalisation of life insurance, which has reference to activities which are questionable, but which have occasionally caused fluctuations in equities. It is an open secret that, even as some cotton or jute mill owners swap their individual operations with those of the companies concerned in the event of loss, some insurance managers have indulged in gambling with life funds in the comforting knowledge that losses can be shifted to the companies' accounts. This may be misuse of life funds. But the end of such operations through nationalisation is likely to affect stock market activity for sometime to come.

The second major development during the last month has been the Government's decision to permit rights issue by Tata Steel Company only at a premium of Rs 30 per share. It is well known that the Company was in favour of issuing rights shares at par. Spurt in Tata Steel in the last three months was mainly due to the belief that the Company would be issuing new shares at par. Tata Steel have fallen since the announcement of the issue price of bonus shares.

Indian Iron

This has also affected the behaviour of ACC. To anticipate the third development, the possibility of a bonus issue by Indian Iron may be discussed here. Steel retention prices have been announced. That retention prices will be the same for Indian Iron and Tata Steel indicates the growing financial strength and productive efficiency of the former. The difference between the 1954-55 retention prices and the levels now fixed is, however, relatively small for Indian Iron.

This means that the "special element" involved in the fixation of retention prices is negligible for Indian Iron. It is highly favourable for Tata Steel. This Company will acquire resources through the issue of bonus shares at a premium. It will accumulate additional resources of its own out of the substantial difference between the new high retention prices and its own cost of production. These two sources of finance will be of immense help to the Company to implement expansion projects.

Special Element

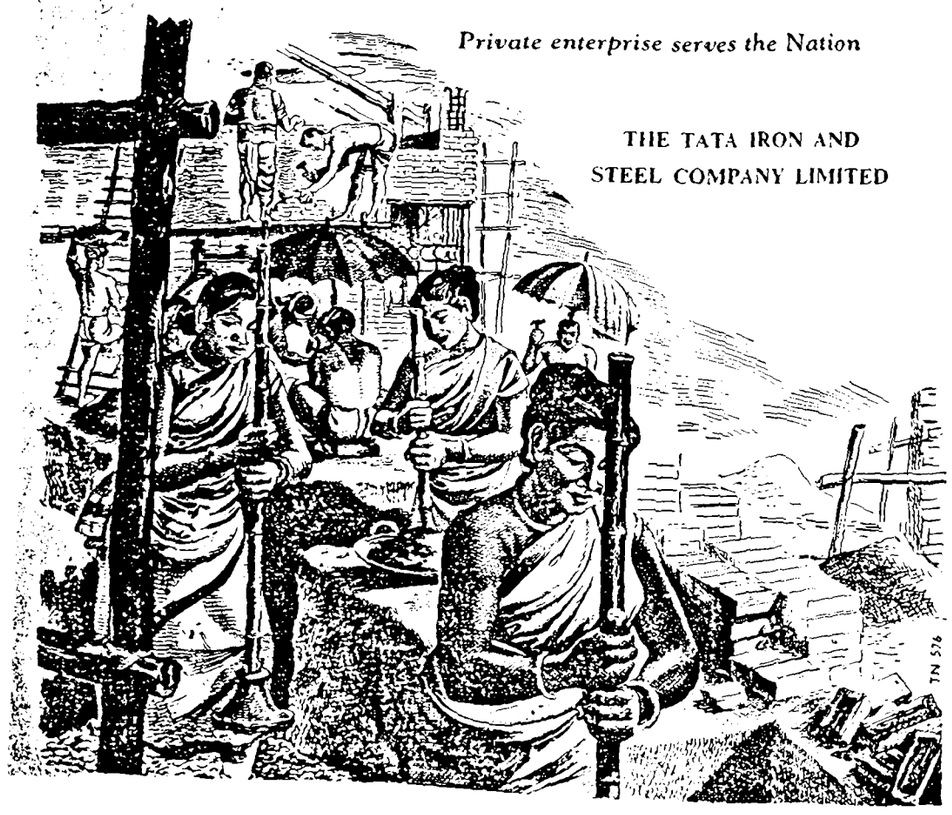
The market feeling is that as the "special element" included in the recently fixed retention prices is less favourable to Indian Iron, this Company will not be able to accumulate enough resources out of its normal operations for executing the second expansion programme. There are passages in the Chairman's speech before the last annual meeting which are liable to the interpretation that the Company may decide not to undertake the second expansion plan, if the "special element" in the steel retention prices fixed by the Government does not warrant such extension of activity.

On the assumption, however, that the second expansion plan will be undertaken, it is clear that Indian Iron and Steel Company will have to issue bonus shares to raise finance. Such expectations should have had a "bullish" effect on their shares. But the Government's decision relating to the Tata Steel issue suggests that Indian Iron also may not be permitted to issue right shares except at a premium. This may have a temporary "bearish" effect on Indian Iron. But investors should be aware that any issue of rights shares at a premium will ease the problem of financing the Company's contemplated expansion projects.

Reasons why higher steel retention prices have not had a "bullish" effect on Steel shares have been discussed above. It was unfortunate that the Government's decision came at a time when the Calcutta Stock Exchange was passing through a payments crisis. But it would seem, in retrospect, that higher steel retention prices have had a sustaining influence on stock markets. In the last few days, both Tata Steel and Indian Iron have been crawling up.

On current indications, stock markets are likely to mark time for some weeks more. For one thing, Clive Street will take time to recover from the consequences of the payments crisis. This crisis has somehow been overcome. But trading remains sub-normal. Revival of confidence will, naturally, take time. At the moment, stock markets are anxiously watching the deliberations at Amritsar. Equities are not likely to take any decisive trend before the presentation of the budget at the end of this month.

How strong must the foundation be for 43 lakh houses?



In the last few years, large segments of our population have moved into the cities. Here they live in unbelievably congested tenement houses, adding to the cities' already acute housing shortage. We need 43 lakh houses to ease the strain on our cities.

In 1947 our cement production was 1.45 million tons. Today, it is 4.34 million tons—almost three times the 1947 figure. 40,000 people are employed in 26 modern, efficiently run factories.

In our developing economy steel is essential. That is why the Tata Iron & Steel Company has launched an expansion programme which will raise its capacity.

Around Bombay Markets

Successive Shocks

Thursday, Morning

THE Stock Exchange had to endure many shocks since the opening of the year. There is little left of the confidence and the bullish fervour which marked the close of the year. In the past few weeks, it had to contend with a number of adverse developments. There was, to begin with, nationalisation of life insurance which, apart from psychological repurcussions, deprived it of an important source of investment support. Then came the settlement crisis in Calcutta. Delhi's refusal to new capital issues at par by established companies, as indicated by its insistence on issue of right shares by Tata Iron and Steel Company only at a premium of Rs 30, instead of at par, as the market had expected, was another blow. Finally, there were the signs in the air of a revision of the Industrial Policy Resolution of 1948 and gathering clouds overshadowing the new financial year, ominous possibilities of new taxes and higher rates for taxes now current. These can no longer be dismissed in view of the general trend of things. The one single factor which helped the market to maintain its morale in an extremely trying situation was the announcement of a uniform retention price for steel at the reasonably high rate of Rs 393 per ton for the five years from 1955-56 to 1959-60.

The recession in share prices was more or less orderly in the beginning; it became a rout, after the settlement crisis in Calcutta. With the crash in Indian Iron at Calcutta, Tata Steel touched a new low of Rs 222 in Bombay. Towards the close of the week, however, share values steadied a little.

The market has drawn some comfort from the report that the second Plan may be extended over a period of six years instead of five. This is interpreted as a reasonable assurance that there will not be the same pressing necessity of raising taxes just yet. Moreover, reports of some sizable investment buying on insurance account by the newly appointed Custodians also helped to restore sentiment.

Both Indian Iron and Tata Steel attracted moderate support and closed firm at Rs 33-13-6 and Rs 228-12 respectively. Textiles and miscellaneous issues also moved up at the close, with the popular scrips registering fair gains. Bombay Dyeing, Kohinoor, Century and Swadeshi closed firm at Rs 515-10, Rs 332, Rs 458-8 and Rs 212 respectively.

Cotton

Blocked Trading

THERE has been hardly any trading in cotton futures since the suspension of forward business on December 23. Though the ban was lifted on January 7, no trading was possible as the ceiling of Rs 700 fixed by the Forward Markets Commission made it impracticable for jobbers and operators to do any business. The unofficial rate has remained throughout much above the official ceiling. Following the High Court case, in which it was contended unsuccessfully that the declaration of emergency was invalid, a compromise had been effected between the two contesting parties and it was thought that futures trading could be resumed not only in theory but also in fact. But this was not to be. For, like a bolt from the blue came a directive from the Forward Markets Commission, on the very day on which the compromise was reached, to the effect that both the February and the May contracts should be deemed to be closed out at their respective closing rates as on 24th January, namely at Rs 700 and Rs 686-8 per candy.

The attention of the trade has, since the Forward Markets Commission's directive, turned to exploring the possibilities of an early commencement of futures trading in the August contract. A sub-committee of the East India Cotton Association, which had been appointed to go into this question, has since recommended that the grade should be lowered from "fine" to "fully good", in view of the deterioration in the quality of the new crop. Among other measures, it has also suggested that the staple length should be maintained unchanged at 13/16" and the system of fixing room rates on the basis of forward rather than spot prices should be re-introduced.

In the absence of trading in futures, it is natural that the spot market should be doubly active. Indeed, there was a time when spot rates threatened to approch their respective ceilings. But the lurking fear that Government might step in in the spot market also, restrained enthusiasm and prices gradually came down. Towards the end of the week, the spot market developed a distinctly bearish tendency and popular styles like Vijay lost heavily in a single day. It is as much a reflection on the Government as on the cotton trade that they should let matters come to such a pass.

Oilseeds

Firm Trend

IN sharp contrast to both the stock exchange and the cotton market, the oilseeds market displayed a firm trend for the greater part of the last fortnight. The main factors which influenced the market were sustained US enquiries for castor oil, and reduced arrivals at the terminal markets. Towards the close, however, on reports that the export policy might be tightened, there was considerable bull liquidation which brought down prices from high levels touched at the outset.

In the groundnut section, prices of ready seed and delivery appreciated at the outset, thanks to tight statistical position. In sympathy, oil, ready and delivery rates also moved up. The February-March delivery was supported up to Rs 31-12 but this upward trend proved short-lived as UK prices for groundnut oil suffered a fall of £4 per ton.

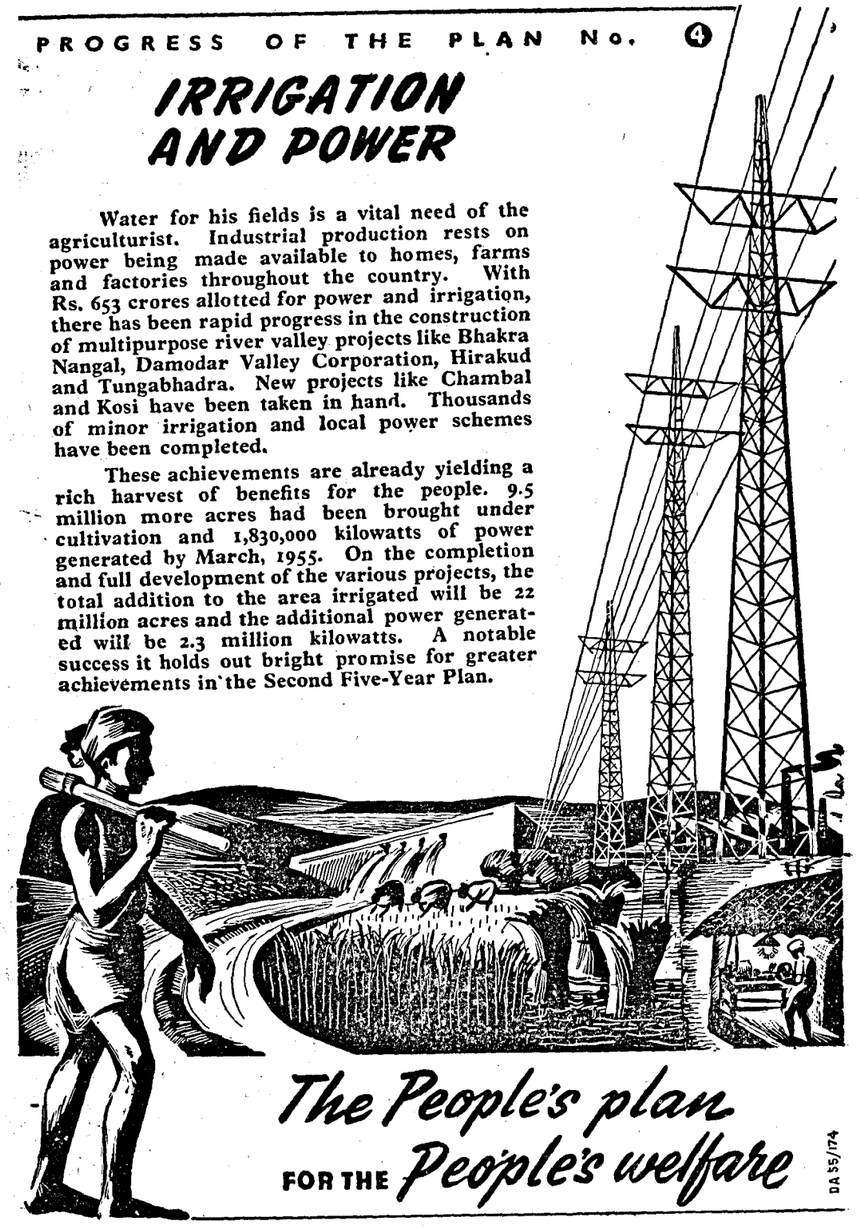
Castor May delivery touched a new high at Rs 125-6 on sustained enquiries for castor oil from America. Shippers were reported to have put through business for about 300 tons of castor oil at £106 per ton c.i.f for the commercial quality. Towards the close of the week, due to fears of an export duty, Castor May lost the earlier gains.

The pattern of trading in linseed and niger and kardiseed was in line with that of castor and groundnut, the early firmness being followed by a decline. At the close all sections were quietly steady, and the firm trend displayed in the beginning of the week was no longer in evidence.

Bullion

Heavy Reduction of Stocks

Erratic fluctuations characterised



trading in bullion throughout the past fortnight. Each bout of selling was followed by marked signs of returning confidence which in turn induced profit-taking by bulls. This would push prices down once again. However, spot demand was maintained and it was on the strength of such demand that the bullion market managed to survive the bearish rumours about sales of confiscated smuggled gold. These rumours were responsible for a drop of three points in gold futures at one time to Rs 96-4. This gave rise to fears of a major decline. But thanks to the brisk demand for spot, there has been such a heavy fall in stocks of gold in Bombay that no decline need be feared for the time being. Stocks came down from 1.25 lakh tolas to about 50,000 tolas, as a result of the daily offtake, during the last ten days, of 10 to 12,000 tolas on an average. The early gains were, however, wiped out towards the close, when a leading bull started booking profits. The undertone nevertheless remained steady, with gold forward closing at Rs 95-11 and Silver forward at Rs 174-14.

PROGRESS OF THE PLAN No. 4

IRRIGATION AND POWER

Water for his fields is a vital need of the agriculturist. Industrial production rests on power being made available to homes, farms and factories throughout the country. With Rs. 653 crores allotted for power and irrigation, there has been rapid progress in the construction of multipurpose river valley projects like Bhakra Nangal, Damodar Valley Corporation, Hirakud and Tungabhadra. New projects like Chambal and Kosi have been taken in hand. Thousands of minor irrigation and local power schemes have been completed.

These achievements are already yielding a rich harvest of benefits for the people. 9.5 million more acres had been brought under cultivation and 1,830,000 kilowatts of power generated by March, 1955. On the completion and full development of the various projects, the total addition to the area irrigated will be 22 million acres and the additional power generated will be 2.3 million kilowatts. A notable success it holds out bright promise for greater achievements in the Second Five-Year Plan.

The People's plan FOR THE People's welfare

DA 55/174

The Tin Pots that Initiate Change

IT is difficult to think of an Indian village without tin canisters which came in as containers for kerosene and stayed on. The number of uses to which the kerosene tin is put is amazing. Before it starts springing leaks and getting rusted, the canister is used for storing liquids of all sorts, water, oil, gur, hooka tobacco in fermentation and so on—two canisters balanced at the ends of a piece of polished, well oiled and split bamboo constitute the commonest equipment used by carriers of all sorts for carrying water, oil, sweets and what not. By the time their shine begins to wear off and holes appear, the kerosene tins are converted into improvised miniature silos for storing grain and all dry goods in general. But in the villages it is rare to see a tin canister used as a pot for growing plants. That is, however, a familiar sight in Bombay chawls and in working class localities in other industrial towns where the hunger for green and growing things finds its outlet in the humblest of working class homes through these improvised flower pots.

While approaching a Bengal village, however, or villages elsewhere, wherever rainfall is high, one sees the canister tins, long before one gets a peep into the huts or grocers' shops. Beaten into sheets and painted with tar, they replace thatch on the roofs of the poorer huts, thatching material being so difficult to get these days. They have to do for corrugated zinc sheets which are beyond the means of the poorer villagers.

From beaten tin sheets nailed together and painted with tar to collapsible tubes, offset printing and enamelled perfection, is a far cry. But modern technology makes its way slowly but steadily even into the most unsuspected places. The Bengal village scene, with its ubiquitous canisters, has been changing too, however imperceptibly and tin cans which are smaller but brighter have been slowly making their way on to the bamboo racks inside the huts and replacing steadily the canister of the old days. The process of penetration, however, is less perceptible, because cigarette tins, containers of tinned foods or even the larger Dalda tins cannot be beaten into sheets and nailed together so conveniently for outer covering for village huts either on the walls or the roofs. Along with this penetration of tin cans goes a process of change and transition.

Metal Box are the instrument and the agency for this change and transition and have been doing the job almost single handed, the change from twigs to toothpaste, from fresh fish and fruits to canned foods, and from earthen pots and plates, hand painted or plain, to the finest products of modern technology, all carried out on a thin plate of tin or rather some metal composition, with a plating of tin. They run their major factories in Calcutta, Bombay, Madras, Delhi and Bangalore, but a factory exclusively for printing plates in the latest design is exclusive to Calcutta only, for the present. Here printing is done by the photo offset process with pinpoint accuracy for advertising show cards, instrument dials, and tins for foodstuffs, pharmaceuticals, baby foods, paints and toilet goods. The final products are frequently fine examples of commercial art and manufacturing technique that will stand exposure and storage under the most difficult conditions.

They hardly sell anything however directly to the final consumer except perhaps tin trays and a few odds and ends. Their clientele are other industries, chemical, pharmaceutical and food processing industries. Between manufacturing and selling, between the producer and the final consumer, comes the packager and Metal Box come in everywhere, with their specialised tin printing, plain and lithographed general line tins; composites; collapsible and rigid tubes from lead, tin and aluminium polyethylene bags; advertising showcards and novelties; insecticide sprayers; toys and other hardware; crown corks; screw caps, pilferproof and other closures and industrial components. They supply the leading manufacturers and as such, the company's activities embrace only the urbanities directly, but through the latter, if in the humble form of discarded tins, they embrace the villagers too.

Metal Box celebrated the opening of their new printing factory at Calcutta the other day with a pleasant social function. The guests were shown round the ultra modern factory which occupies 10 acres on Hyde Road extension. Designed with an eye to giving unusually fine working conditions, the building itself had much to interest the visitors and engage their attention. But the hosts were not content with that. They had arranged a course to initiate the guests, by easy stages, into the technique of sheet metal printing by offset lithography. The first lesson the visitors had to learn was that water and grease do not mix. That is what makes lithography possible. The course ended up with actual printing. Automatic feeding leads on to it and the printing is followed by stoving, taking off the oven itself being a delicate process but it is only a preparation for putting on the next colour or varnishing; the latter gives the final finishing, after which the sheets go to the stores to be cut into pieces and made into required shapes and forms.

This is being passed on second hand, from one who went through this gentle process of initiation and found it exhilarating.

Year by year MORE motorists buy Standard batteries than ever before

Choose wisely—choose 'Standard' for your car or truck

Made by India's LARGEST national manufacturer of Lead-Acid Batteries

INVITATION

AS one of the leading Exporters and Importers in this country we invite you to make use of all the facilities offered by our Export and Import Departments—with representatives throughout the world

WE IMPORT

★ HEAVY CHEMICALS

★ TEXTILE MACHINERY STORES & SPARE PARTS

★ ARTIFICIAL SILK YARN

★ STAPLE FIBRE

★ ELECTRICAL APPLIANCES

WE EXPORT

★ TEXTILES & YARN

★ OILS & SEEDS

★ JUTE

★ MICA

YOUR ENQUIRIES WILL RECEIVE A PROMPT AND RELIABLE RESPONSE

Lost Opportunity

AMRITSAR was a challenge as well as an opportunity to Congress. It has missed the opportunity but has accepted the challenge. The manner of its acceptance, however, the arrogance with which it has taken up the challenge, will be deplored by all democratic elements within the country. Before independence, Congress equated itself with the country. It was justified in this claim. Congress was the only national organisation which represented the true instincts and aspirations of the people. On all major issues, Congress and the people spoke with one voice. Much has happened since independence. Congress is no longer the only political organisation. There are issues on which Congress and the country no longer think alike. Amritsar is an agonising reminder that Congress is determined to impose its iron will on the people against the wishes of the people. Congress, the party in power, opposes the people's demand for linguistic States. At Amritsar, Congress bluntly told the people that it will not accept the country's demand for linguistic States.

Congress is the only political organisation which rejects the demand for linguistic States. Competent political commentators are agreed that Congress will lose the elections if it decides to seek a mandate on this issue. Congress has no intention to accept this challenge. Pandit Nehru talks about the need for Congress, the major political party, to co-operate with those who hold different views. But Congress shows no desire to hold an all-party conference to discuss the issue which divides it and the country. Instead, it relies on its overwhelming majority in Parliament and in State assemblies to impose its decision on the people. It seeks to justify such a policy on the accepted conventions of Parliamentary democracy.

Here, one of the most revealing aspects of Amritsar deliberations may be emphasised. Congress leaders are familiar with the technique and organisation of political parties. On the issue of linguistic States, there is widespread dissension within Congress. It is common knowledge that, in Parliament as well as in the State assemblies concerned, Congress members will themselves, if allowed free choice, vote against the Congress decision on the SRC recommendations. Developments in Bombay and Orissa and the reaction in Bengal against the proposed merger of Bengal and Bihar are rude reminders to Congress that it is a house divided against itself. But the Congress reaction to developing events is symbolic of the authoritarian element within this organisation. In the name of discipline, it has formulated measures to streamline the organisation which will leave Congress members with no alternative to bowing down to the diktat of the "High Command". Organisational aspects of the Amritsar session emphasise that Congress has, for the first time, admitted, by implication, that it is only one of the many political parties in this country.

Congress does not lack ingenuity to spread confusion of thought and of purpose. Shri U N Dhebar, the Congress President, echoes his master's voice in disparaging popular aspirations for linguistic States as "tribal, feudal and bourgeois values". All thinking persons will feel bewildered at the deliberate distortion by Congress of the demand for

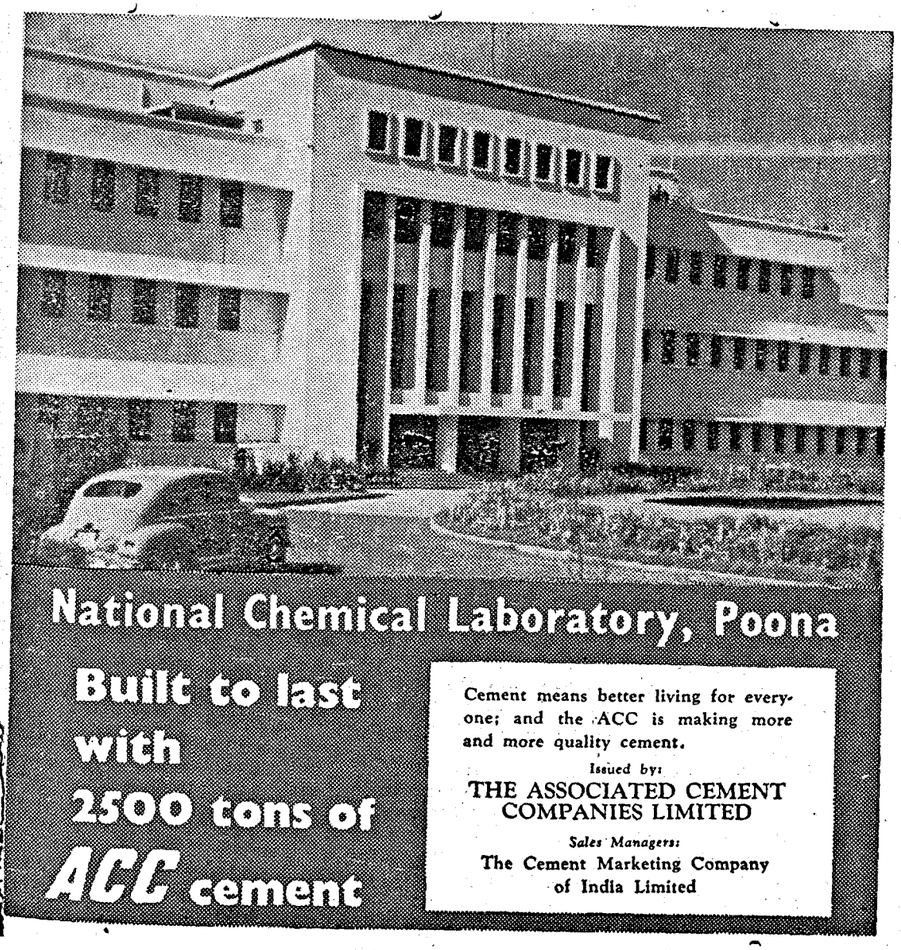
linguistic States as parochialism. It is surprising that Congress should misinterpret or misjudge the people's claim for linguistic States in order to develop their languages, culture and tradition. It is much more surprising that Congress should deliberately tinge it with a political complexion which responsible advocates of linguistic States disown. Congress has, by inventing threats, complicated a problem which is as simple as its solution should be.

To accept linguistic States, is not to condone violence. But even as violence is to be condemned, Congress will be accused not only of provoking passions, but also of political dishonesty in exploiting the violence of its own creation as sinister evidence of irredentism. If the Congress response to the people's demand discloses its lack of contact with the people, the alternative solution formulated by it reveals its political bankruptcy. Congress has accorded "warm welcome" to the proposed merger of Bengal and Bihar. Equally "warm" is the Congress welcome to Pandit Nehru's proposal for four or five regional States. This formula has been rejected by the people on the ground that it ignores the people's claim for linguistic States. There are weightier reasons for rejecting such proposals. Formation of four or five large regional States will not prevent but is more likely to provoke, civil war in the future. Creation of such large regional States has sinister implications. Demand for linguistic States has no, or should not have any, political content. But large regional States have associations which may easily explode into threats to the political stability of the Republic.

Congress is as confused in imagining a threat to territorial integrity from the demand for linguistic States as in hoping that a bold second Plan will satisfy the people's emotional urge for linguistic States. Poverty is an ever-present menace to political stability. Advocates of linguistic States claim, and not without logic, that the fulfilment of the demand will lead not only to social and political stability, but also to a more spontaneous response to the second Plan. Congress is wise in framing a bold second Plan to evoke hope and enthusiasm among the people. In spelling out Avadi, Congress has been successful in discrediting both Communists and Socialists. But it insults the intelligence of the common man in rejecting the demand for linguistic States on the plea that its acceptance will create chaos. Congress has ceased to equate itself with the country. It now claims that it alone can ensure stable and ordered development. It invents threats to coerce people to lend blind support to it so that it can become politically strong to impose its diktat on the people. India must be economically strong to ensure political stability. Congress has the support of the people for implementing the second Plan so that the nation can gain economic strength. But the people resent the undemocratic assertion by Congress that it has any right to force its decision and policies on them.

Away from Planning—To the Forests

THE Draft Outline has now been circulated for eliciting public opinion. This is the time for the Planners to take a holiday from Planning. The same privilege may be claimed for humbler folks also whose business it is to dabble in *Planning*. What a pleasure it is to be able to get away from Delhi, for example, just at this time of the year, after the bustle and noise of the Republic Day celebrations and betake onself to nearby hills, preferably to Almora which, not being a fashionable hill resort, welcomes visitors all round the year. What a magnificient invitation is extended by the mimosas which are now in bloom and by the apricots, which have just begun to put out their buds. This is the time of the year to go to the forests. Those who are denied that pleasure, can have the next best and work off the fatigue of heavy days in office, and crowded programme of celebrations in Delhi, sampling the attractions of the roads that take you into the sorrounding wooded hills. At least in Kumaon, Vasanta Panchami is still observed punctiliously and lemon yellow is the colour on everyone, man, woman and child, be it only in a kerchief dyed in vasanti.



To those who are denied the pleasure of travelling—in a planned economy in the making such pelasure should be strictly verboten, being anti-social—there is the substitute satisfaction of turning over the pages of a railway time-table or studying bus routes and road maps. The Directorate of Economics and Statistics of the Ministry of Food & Agriculture have thoughtfully placed Indian Forest Statistics in our hands just at this time. What could be better for those unfortunate ones who want to take their minds away from Planning for a while and yet cannot betake themselves to the forests than to turn over its pages and wallow in forest statistics? We will not quarrel why the statistics for 1950-51 and 1951-52 issued in one volume in 1955 should reach us in 1956, nor why the subsequent issue Volume I (*Summary* Tables) for 1952-53 should have reached us weeks earlier.

What a wealth of statistics, all classified neatly under so many heads and what a number of tables under each head, numbered serially in decimals in the approved style of scientific publications! The Introductory Note however is laconic, and does no more than set out the headings of the tables and the tot figures against each head. A depar ture from the severely statistical in respect of the new forest polic formulated in May 1952, replacin the old one of 1894 which finds place in the publication though brings the story only up to Marc 31, 1952. Another departure is in r spect of the Rajasthan desert. T otherwise dry Introductory Note relieved by a piece of colourful wri ing on the march of the desert whic we are told, "has spread through th ages and threatens to engulf th fertile alluvium of the Indo-Ganget plain". *This sounds ominous* indee For all one knows, the threat ma be imminent. But there is no inte tion to raise a scare. *The measur* recommended for the immobilizatio of the desert are set out in deta too.

In the tables there are many gap e.g., in those purporting to gi e t estimates of the volume of s ands timber and firewood. Little i tion on the subject is availabl for forests under the Forest ment. *Only* a few of the St ported anything on the subje forests under civil authorities still reported *on forests* und porate bodies. One cannot v

hold the compilers responsible for the remissness of the reporting authorities; one can only admire their courage and boldness in pressing ahead with the totals, undeterred by gaps or thoughts of comparability. But just as there are gaps in some places where information is most to be desired, there is too much information in others where gaps would have been more discreet. The tables of employment are a case in point. The total employment in forests is given as 135 million in 1951-52, of which 44 million are supposed to have been mainly and 91 million partially dependent on Forest and Forest Industries. This is startling indeed, and should give added impetus to Vana Mahotsava. Whoever can say after this that 'tapovanas' have disappeared from the face of India, when 135 million out of her total population of 357 million continue to derive their livelihood, directly or indirectly, from her forests? The Introductory Note solemnly reproduces these figures, disdaining to take any note of a humbler series in another table in which the daily average of persons employed in forest and forest industries is given as 370 thousand, of which 120 thousand are mainly and 251 thousand partially so employed. The Directorate have been so busy centralizing these statistics and taking over from the Forest Department that they probably did not have the time or the energy left to look into such minor details. Or is it that they, too, have become employment-minded and fallen a victim to the Government propoganda? That is not unoften the case. Propoganda recoils on those who propogate; how else could it be effective? One must first convince oneself.

Alas! even the delight of browsing through the forest statistics is not for everybody. It is only for those who are prepared to pay Rs. 20 for 192 pages of tables. If such statistical delights are only for the Government departments, why price the publications at all? The theory of costing that Government publications follow may not be democratic in that it prices out prying eyes, but it is sound accountancy. The method is somewhat like this—First find out the copies needed by the departments for distribution, next decide the total number of copies to be printed and then put the entire cost on the balance of the copies, that is, those not needed for free distribution. It is just as simple as that. What if, as a result, the publication does not sell at all? You cannot blame it on Government accountants. They take no risk with public money and cover the cost in advance and in full, on paper.

Weekly Notes

ECAFE Conference Concludes

A CORRESPONDENT who attended the Bangalore Conference writes :

To a casual observer, the principal feature of the ECAFE meetings was the introduction of the 'luke-warm' as distinguished from the 'cold' war in the discussion of the economic problems of the region. Apart from the normal introduction of the China question, the discussion was enlivened by the USSR's offer of economic aid and technical assistance. This was prefaced with the usual criticism of economic aid previously given on the grounds of political strings, and was buttressed by the statement that Russian aid would be free of such strings. The United States delegation answered this thinly veiled attack and in turn summarized its past and future aid programme. If the countries of the region are in fact able to take advantage of these offers, they should gain by the competition to give them assistance. The Russian criticism and the general reaction to the present aid programme also raised questions with respect to the superiority of a programme of aid or one of loans on a straight business basis in terms of creating less antagonism on the part of the recipient.

One would have wished greater discussion of the economic problems of the region, and of the integration of their respective plans of development. Perhaps, however, this is too much to expect from an organisation which consists of a wide variety of independent countries, each very sensitive of its position and of criticism from other bodies.

The conference concluded with generous appreciation of Dr Lokanathan's work for the Commission on his proposed retirement from ECAFE to head a programme devoted to the study of problems of industrial development in India.

The Future of Indian Tobacco

IS the favour that Indian tobacco enjoyed in West European Markets, particularly in Britain, proving to be temporary? Was it fortuitous and is it now disappearing with the passing away of Europe's dollar shortage? In British markets, of course, India enjoys the benefits of preferential duties and for tobacco, on which import duties are very high in every country, the preference does mean a lot. But it has to be shared with Rhodesia, another Commonwealth producer. Cultivation of tobacco in Rhodesia, however, is an organised affair and on a plantation scale, in which British settlers and British capital have been trying their best to improve quality. That American grown virginia tobacco should still hold the field, despite dollar shortage and high duties, proves how difficult it is to work against consumer preference. Not that consumer preference is everywhere for one standard product—bidi tobacco has its own clientele and so have others. Hence Shri Randhawa's exhortation for "competitive improvement in quality" at the last meeting of the Indian Central Tobacco Committee has to be interpreted accordingly, keeping in view the special markets for various grades.

Such qualifications are particularly called for when the meeting was held in Anand, in the heart of Gujarat the principal grower of bidi tobacco which has its own difficult problems of grading and differential excise duties which baffled the Taxation Commission. On the recommendation of this Commission, the Government has appointed an Expert Committee to review the present complicated structure of tobacco excise duties. The main point for examination is however the procedure to be adopted and the criteria to be applied for various grades according to their useability or intended use for the different purposes for which tobacco is used.

The tobacco trade has been slowly pulling itself up from the severe slump which overtook it in 1953-54. Reduction of duties offered as a special concession for clearing old stocks helped. So did the export drive resulting, among other things, in an off-take of nearly 9 mn lbs by China. What it means for the trade may be judged from the fact that exports to Britain, the largest customer for Indian tobacco, were of the order of 33.5 mn lbs in 1952-53, 30 mn lbs in 1953-54 and 31 mn lbs in 1954-55.

As a result of all these special efforts, the stocks which had accumulated over several years have now been liquidated, according to Shri Randhawa. But this is a statement which Gujarat will find hard to accept.

About the measures proposed for the improvement of the tobacco crop there are some special features. One is the suggestion for co-ordination the work of the various commodity Committees, the idea being that the commodity stations should be multi-purpose instead of devoting themselves to only one crop like sugar, cotton or oil-seeds. Another is the creation of a statutory monopoly for handling all tobacco exports. It would have been helpful had the Chairman given his reasons why he considers tobacco to be specially suited for State Trading. Is it because export drives in the future have to be directed to countries behind the iron curtain for which State trading would be the most suitable method of trading? Or is it also because Indian tobacco will have to look increasingly to South East Asia, for which existing trade agencies are hopelessly inadequate?

"He who is firmly seated in authority soon learns to think security."

Self-Government for Malaya

BY the end of August 1957, Malaya will emerge as an independent country within the Commonwealth. By then, the Government of the Federation of Malaya will assume complete control over external defence and foreign affairs. It will immediately assume responsibilities for finance and internal defence. Tengku Abdul Rahman, Malaya's Chief Minister, is satisfied with the outcome of the London negotiations. But some of Malaya's nationalist elements may have doubts on two major issues. One of the conditions seems to be that Malaya will be granted independence within the Commonwealth. With the exception of Burma, all the former Asian territories of Britain have willingly decided to remain within the Commonwealth. In the absence of details, it is not quite clear whether the Malayan Federation will be denied this free choice.

To stress this aspect of the Malayan-British negotiations would be as unwise as to emphasise the interim arrangement whereby the armed forces fighting the Communists would be under a British commander. A Malayan Minister for Internal Defence will be responsible for the policy relating to the Federation's campaign against the insurrectionists. More debatable is the provision under which the Tengku Government has agreed to the stationing of British and Commonwealth troops in Malaya both before and after independence, though the garrisoning of such troops after independence is to be governed by a treaty. Malaya's strategic position in South-east Asia will not be denied. It will be equally unrealistic to ignore that Malaya is a valuable dollar arsenal. Available details indicate that Malaya will have reasonable economic freedom enjoyed by all sterling area countries. But the continued existence of foreign troops in Malaya even after independence is an issue which the Communists are most likely to exploit. It will be recalled that Chin Peng, the Communist leader, gave an undertaking to lay down arms on the condition that the Federation Government would have full authority over internal security and that foreign troops would be withdrawn from the peninsula.

This is not the only problem that the Tengku Government will face in the process of transfer of power by Britain. There is the problem of association between Malayan mainland and the island of Singapore. Mr Marshall, Singapore's Chief Minister, will pay his second visit to London in April next. He will go to London to continue earlier talks about the grant of full self-government to Singapore. This island's strategic position is more important than that of the mainland. This may be one of the reasons why the Tengku has found it politic not to discuss any joint plan for linking the island with the mainland. But some association between the island and the mainland will have to be established in the ultimate interest of the peninsula as a whole. Developments so far indicate, however, that both Britain and the Tengku Government favour separate political arrangements between Britain and the two parts of the Malayan Peninsula.

Reasons which make Tengku Abdul Rahman unwilling to enter into any close association with Singapore are significant. There is a considerable Chinese element in Singapore's population. That is why the Federation Government is reluctant to establish any close political link between the island and the mainland. This underlines the racial complications in the Malayan Federation. In the mainland, there are, besides the Malays, considerable numbers of Chinese and Indians. Since the war, there have been some attempts at racial fusion and amity in the Federation. By insisting on a declaration of loyalty, the Tengku Government implies that the Chinese Communists have extra-territorial sympathies. Though the Alliance Party's attitude to the Indian population in Malaya has yet to be clarified, this racial aspect of the Malayan problem is of direct concern to New Delhi. Malaya's rapid emergence as a free nation will be welcomed by India. But there will be hope that the emergence of Malaya as a free nation will not repeat problems which now affect the relations between New Delhi and Colombo.

Military Pacts

THERE can be no smoke without fire. Sir Anthony Eden denies that there is any disagreement between Britain and America on the Baghdad Pact, though he confesses that the two countries differ on many aspects of the situation in far east Asia. Circumstances preceding the Baghdad Pact as well as subsequent events lend weight to suspicions about differences between Britain and America on this issue. It was at the initiative of Mr Dulles, the American Secretary of State, that the Baghdad Pact was mooted. America has a team of observers, but she is not a member of the Baghdad Pact. It is this fact which has fostered rumours about disagreement between London and Washington on this issue.

Oil dominates politics in west Asia. There are suspicions that conflicting oil interests of Britain and America have created certain differences in emphasis in these countries' policies to west Asia. There have been insinuations that America is unwilling to become a full member of the Baghdad Pact in order to assuage Saudi Arabia, an oil-rich country which is united with Egypt in resenting the Baghdad Pact. There is an issue in dispute between Britain and Saudi Arabia. It is, therefore, not difficult to appreciate why the British Press is suspicious of America's attitude to the Baghdad Pact.

America pursues an active policy of creating regional military alliances to contain Communism. Therefore, America should have lent energetic support to the Baghdad Pact. Subsequent events have shown the unwisdom of this alliance. It has provided Russia with the opportunity to extend her sphere of influence in west Asia. Anglo-American support to the northern tier has provoked Russian encouragement to the formation of a southern tier. This has complicated the already disturbed situation in west Asia. Increasingly it becomes obvious that the Arab-Israeli dispute is a threatening menace. Through the Czechoslovakian arms deal with Egypt, Russia has gained friends in west Asia. But neither Britain nor America is willing to help Israel with arms, as any such policy will further estrange relations with Arab States.

These diplomatic cross-currents in west Asia justify New Delhi's opposition to regional military alliances. It is undeniable that the Baghdad Pact has not only been exploited by Russia to extend its sphere of influence in west Asia. It has also worsened the situation in the border areas between Israel and Arab States. Similarly, SEATO has complicated the position in Laos, Cambodia and, in particular, in Indo-China. It is not without significance that Sir Anthony has recently taken elaborate pains to explain that the

Baghdad Pact has also the economic aim of aiding the undeveloped countries concerned. SEATO, incidentally, has not even this indirect advantage in its favour. That Congress, at its Amritsar session, will endorse Pandit Nehru's opposition to SEATO and the Baghdad Pact, was a foregone conclusion. But even those who do not accept all the aspects of India's foreign policy will concede New Delhi's stand that such regional military pacts are threats to peace in the areas involved.

Bhakra in News

THOUGH rightly regarded and called a joint project, the power part of the Bhakra project is separate from that of Nangal. The Nangal part of the project, both irrigation and power generation, has had a flying start; it went according to schedule and Nangal power stations have been feeding the Punjab transmission system for some time. In fact, the system won its spurs when the Nangal Ludhiana transmission withstood successfully the ravages of the flood which swept across the Punjab last year. Two power stations of 24,000 KVA each of the Nangal project have been in commission for more than a year; two other generators of the same capacity will go into commission next summer.

Bhakra dam, however, had been for quite some time somewhat under a shadow. Operations were delayed by difficulties which could not have been entirely unexpected but which had not been played up in the publicity literature issued at the time when the Nangal barrage was opened with such fanfare by the Prime Minister himself. There were landslides which held up work—last year's floods must have played their part also and above all, this being a project reserved for departmental execution, the team of foreign experts and State engineers naturally took some time to evolve a system of working together efficiently. Luckily, Bhakra just managed to keep out of the headlines which is saying a lot, considering the problems that were bound to arise in the departmental execution of such a colossal project. The administrative set-up, trained to a different system of working, had to be adjusted and made ship-shape to bear responsibilities which do not come to them as part of the day's work. Working with a large team of foreign experts itself inevitably raised problems of co-ordination and of sharing of responsibility. Knowledgeable persons are sharply divided in their opinion about the feasibility of departmental execution and therefore the reports that came out were highly coloured by the predilections of the individuals who were in the best position to enlighten the public. To cut a long story short, Bhakra did not hit the headlines for the wrong reasons, which is saying a lot.

Now that differences have been smoothed over and the machinery for execution has been set going, Bhakra should soon make headline news by making rapid progress. Until last November, not an ounce of concrete had been poured into the dam site; now activity is going on in full swing. A couple of months after concrete had started pouring into the dam, the Punjab Government has placed an order for 5 water-turbine driven A C generators for the first stage of the Bhakra dam. The generators, which will be supplied by Metropolitan-Vickers Electrical Co. Ltd., England, through its associates, Associated Electrical Industries (India) Ltd., Calcutta, will be of the vertical shaft type with a thrust bearing above the rotor and two guide bearings, one above and one below. Each generator will have an output of 100,000 KVA at 166.7 rpm. the voltage being 11 KV three-phase 50-cycles and the power factor 0.9. They are for driving by Francis type turbines of 125,000 hp each.

This order is one of the largest ever received by a British firm for this type of equipment and is valued at over £1 million. Among the ancillary equipment included in the order are five Metropolitan-Vickers type VYSR automatic voltage regulators, which are of the quick-response magnetic amplifier type. Delivery of the equipment is expected to commence in about two and a half year's time.

Though provision had been made originally for eight 90,000 KW units for the Bhakra part of the project, a technical committee which had gone into the question had recommended that after installing two of these, in addition to the power already available from the Nangal installations, the installed capacity would be adequate for the present and therefore decision regarding further increase in generating capacity should be postponed till the beginning of 1957. It had not been certain, however, whether one or two of these units would be installed in the first stage.

The present order removes this uncertainty. But it fulfils only the first stage of the programme and it does not, by itself, suggest anything about further expansion, which the technical committee had recommended should be considered only later. A point to be noted, however, is that these generators have a capacity viz 100,000 KVA each. This is somewhat greater than had been proposed earlier. What technical or other consideration led to this modification has not, however, been told to the public yet.

This is indeed another feather in the cap of Metropolitan-Vickers and their associates in India, AEI. The question naturally arises how Westing House who bagged the bulk of the orders for Nangal, or for the matter of that, other American manufacturers who have very largely led in this particular field of turbines, failed where AEI succeeded. Part of the explanation could be higher dollar costs of American equipment. American manufacturers score even in cost, where mass production methods can be utilised to the maximum advantage. In equipment like these which are more or less tailored jobs, and have to be specially designed, labour costs come in in a big way. American manufacturers may not therefore enjoy the same superiority and have often to lose to British and Continental manufacturers. This, to repeat, is only part of the explanation, for American manufacturers do not agree that this is the whole story. They contend that American specifications are higher than British or Continental. When British manufacturers compete for American orders, and have to quote for equipment of standard American specifications, in all such cases the price differences have been known to have narrowed down considerably.

LIFE INSURANCE

LIFE BLOOD OF NATIONAL PROGRESS

By the Life Insurance (Emergency Provisions) Ordinance, 1956, promulgated by the President on 19th January 1956, the Management and Control of Life Insurance business in India, including the foreign business of Indian Insurers and the Indian business of Foreign Insurers vest, with immediate effect, in the Central Government.

This is the first step towards complete Nationalisation of Life Insurance business—a step never before attempted anywhere in the world on such a gigantic scale—and opens a new chapter in the history of Indian Insurance.

How does the new set-up affect YOU ?

EXISTING POLICYHOLDERS

If you are insured with any Insurer in India, the terms, conditions, benefits and privileges attaching to your Policies remain exactly as they are and claims will be settled as and when they arise, with absolutely no delay or trouble. What is more, Government Control will ensure prompt and efficient service to which you are entitled as a Policyholder.

Keep your Policies in force. Do not lapse them or make them paid-up. Continue to pay your premiums in the normal manner.

LIFE INSURANCE AGENTS

If you are a Life Insurance Agent your appointment will continue to remain in force.

Armed with the knowledge that the Policies you now sell have the entire backing of Government, go ahead and spread the glorious message of life insurance to as large a section of the public as possible, confident in the belief that thereby you will not only be increasing your income but, at the same time, will also be directly serving the country towards planned economic development.

INSURING PUBLIC

Nationalisation of Life Insurance is primarily aimed at widening and deepening of all possible channels of public savings and is an important step towards mobilising these savings more effectively than heretofore to finance the National Plan.

Every rupee you invest in Life Insurance to-day will not only secure the future financial security of your family but also ensure greater prosperity for more and more people.

The Policies you now effect will have the full backing of the Government and be subject to liberal Policy conditions, uniform throughout India. The rates of premiums will also be uniform as indicated below :

REDUCTION OF PREMIUM

The Premium applicable to Life Insurance contracts completed on and after the 20th January 1956 will be **Re. 1** per Rs. 1,000 Sum Assured per annum less than the rates of premium of the ORIENTAL GOVERNMENT SECURITY LIFE ASSURANCE CO., LTD., for all terms and ages and for all schemes of Insurance, provided that where the annual premium is below Rs. 20 per Rs. 1,000 sum assured the reduction will be 5% of the premium. This reduction is not applicable to Single Premium Policies. Only those Schemes of Insurance which appear in the Tables of Rates of the ORIENTAL in force prior to 20th January 1956 will be offered.

NATIONALISATION

offers to you

ABSOLUTE SECURITY — BETTER POLICY CONDITIONS — CHEAPER RATES — DEPENDABLE SERVICE — ECONOMIC MANAGEMENT — FAVOURABLE RETURNS.

So take out a Policy **NOW** and become eligible to reap the benefits of **Nationalised Insurance.**

From the London End

Economic Aspects of the Malayan Agreement

THE agreement resulting from the Conference in London between the Colonial Office and delegates from Malaya is certainly a document of considerable significance. Apart from its constitutional provisions under which full self-government and independence is to be aimed at by August 1957, the concord on the financial relations between the two Governments and hence between Malaya and the sterling area as a whole suggests the degree of success, though not complete, achieved by the Malayans.

The agreement contains three important provisions relating to economic matters. In the first place, all financial matters of the Malayan Federation will be transferred to a Malayan Minister of Finance. Next, Malaya will remain a member of the sterling area. Finally, both parties to the agreement recognise the "importance" of overseas capital in the "social and economic development of Malaya".

The transfer to a Malayan Minister of Finance of all financial matters is, of course, the most important of the economic provisions. Monetary control is at present in the hands of the Malayan Currency Union (which covers the additional territories of Singapore, Brunei, British North Borneo and Sarawak). The functions of the Currency Union, like those of the West and East African Currency Boards, are strictly defined by the Secretary of State for the Colonies in London, who also appoints its members. The regulations provide that the Union should ensure adequate stocks of local currency but more important, to employ the Union funds in London in sterling investments of the British Government and in other securities approved by the Colonial Office. The Secretary of State for the Colonies does not permit investment of these funds in local Malayan securities.

The manner in which the Currency Union's activities are regulated, it should be observed, has important consequences on the supply in London of short and long-term capital. There is also the question of the sources of the accumulated funds of the Malayan Union which remain invested in London. The sources are principally two: the past surpluses on the balance of trade, and inflows of overseas capital for which a credit balance accrues to the Currency Board in London against the payment locally of Malayan dollars. At the end of 1954, the Malayan Currency Union held £303 million in sterling in London, which were distributed over various sterling securities, and were managed by the Crown Agents for the Colonies.

Against this current practice, the constitutional changes agreed to can imply that the Malayan Currency Union will be converted into a Malayan Central Bank under Malayan direction with power to liquidate some of the sterling balances against the issue of local securities and so employ these resources for internal economic development on some planned basis. It can mean that such a Central Bank will consider the Currency Union practice of a 100 per cent cover (in sterling securities) for its local paper issue as unnecessary and wasteful and so employ this large sterling resource for the import of capital equipment for the development of Malaya.

If these are the possible implications of the change, then the Malayans have certainly secured major concessions from the British. The type of self-government in West Africa is different. In the constitutions of the Gold Coast and Nigeria, finance, like defence, foreign affairs and internal law and order remain prerogatives of the Crown. The West African Currency Board remains intact, unaffected by the constitutional changes.

These possibilities for Malaya are, however, tempered somewhat by the second of the economic questions mentioned in the Agreement. Malaya is to remain in the sterling area and further "so long as a sterling area Balance of Payments Problem remained, the Federation would have to exercise restraint in its dollar expenditure". For 1955 it is estimated that Malaya had a balance of payments surplus of £ 15 million.

This balance was secured almost completely by Malaya's active dollar balance (in spite of interest payments on dollar account of about £17½ million). The clear advantage to Britain and possibly the Commonwealth countries of continued Malayan membership of the sterling area is thus self-evident. How far sterling area membership will really impinge upon Malayan financial independence is not clear. The present restraint over dollar expenditure does not allow Malaya to go to the cheapest and best market for its requirements. On the other hand, it is difficult to see how the small Federation could maintain a completely detached currency in a world of currency blocs.

The recognition of the "importance" of overseas capital (the third economic provision) is surely designed to give safety to existing British investment in the Malayan Federation. It is estimated that British owned investments in the rubber estates and tin mines are in the region of £150 million. The British controlled rubber-producing industries are represented by some 300 companies, 98% of which are registered in London. Britain's income from these investments amount to about £10 million annually. Probably the activities of these companies in the period of Malayan independence will be left uncontrolled and unrestricted and the British concession for this understanding is that the U K Government "will at all times be ready to examine sympathetically the Federation's borrowing needs on the London market in connection with its development plans."

The agreement reached has, by and large, been received with good grace in the British financial and economic Press. There has, however, been some anxiety also. The **Financial Times** devoted a column and a half to the implications of the agreement and tendencies likely to follow: Pressure to Malayanisation of the civil service and of British-controlled companies; Pressure of foreign companies to retain profits locally; Pressure to diminish the repatriation of British overseas earnings and the curb on the growth of the colonial sterling balances. It concludes:

> "The only question is whether British business and British official interests, like the Treasury, adapt themselves to it with good or bad grace".

This, indeed, is the 64-dollar quiz.

Mighty But Tripeish

Kurukshetra A Symposium on Community Development in India 1952-55. Publications Division, Government of India, on behalf of the Community Projects Administration. November 1955. pp. 525 Royal 8vo. Price Rs 7-8, 15sh, $2.50.

Reviewed by **Evelyn Wood**

THE variety of subjects treated in this large book unwarrantably stretches the term "symposium". For that matter, the so-called seminars which are such a useful device in Extension work take many shapes, but none of these so far recorded much resembles the original academic practice of a seminar. One of the strangest omissions in this book is an excellent article on Village Seminars which appeared in "Kurukshetra" for May 1955. This was a simple account of one way in which Extension works practically to change the attitudes of village folk by and towards community action. A much inferior article by the same author is included in the volume under review.

There is too much in the volume anyway. Much of the matter would have been better left out. Some of the pieces, notably those by a pseudonymous author, are so badly written and present such loose, turgid thinking that I suspect they have been included as comic relief. Perhaps the prize goes to this one:

> ". . this cataclysmic movement which will engulf all, levelling down the barriers between man and man, which today cloud the vision and paralyse the muscle."

This is an intriguing assembly of images, which far outdoes the horrors of the Bihar earthquake!

Each contributor must have knowledge—and must be identifiable. It is overstretching a "symposium" to have so many articles without bylines. A printed symposium requires that each author contributing be identified by at least a paragraph of potted biography. Considering the Hellenic original of the Symposium as a conversation tied to one subject as the wine flowed at the intellectual dinner-tables of Athens, this identification of the contributors is a very real need in a symposium. One must be able to see the background of the contributors to a symposium so that one can place values on their judgment in the subject treated.

Perhaps it is thought that the VIPs who supply the bulk of the text in this book are well enough known anyway. Most of the contributions of the really well-known names to this book are completely useless towards defining either Community Development or Extension work. They also fail to indicate any useful practice of rural development through such means.

Unblushing Confessors of Ignorance

It is not flattering that the foreign contributors make such a distinguished showing in this book. This shame could so easily have been avoided by omissions of so many of our superior persons who in fact don't know a thing about rural development, whatever may be their responsibilities. For example the following conflict of facts is allowed to appear, the first extract being from a putative Indian VIP and second from the head of the American TCM.

> (a) "The Community Projects, as they exist today in America . ." (Paragraph 1, page 12)
>
> (b) "America does not have "community projects" as such . . ." (opening of article on page 15).

There is a distressing facility among our VIP's for loosing off about things of which they have no knowledge. Writer after writer, holding a high position in the official world, has repeated the usual error for which the Programme Evaluation Organisation has rightly slated the superior Extension staff in the field. Here is a handful of such errors:

> p. 43 "The economic development of . . the Blocks is necessarily the most immediate and fundamental objective of our efforts . . " (Pandit K Santhanam)
>
> p. 165 "Logically, the prime objective is the revival of the economy . . " (Sri Sushil Dey)
>
> p. 177 ". . The programme . . aims at creating in the people an ambition for higher standards of living" (Sri Govind Sahai)
>
> p. 333 "Community Development is a people's movement by which village people advance their standard of living. The basic objectives are increased production and employment . ." (S C Roy)

The last authority here was the chief of Extension workers' training! His article is therefore the most remarkable of all the contradictions of the actual four objectives which were laid down by the Planning Commission and which have been expressed again and again by the Prime Minister. In this volume, there is plenty of stress on these real objectives. For comparison, they may here be quoted from the Report of the PEO on Second Year's Working of Community Projects, page 1, paragraph 2.

1. . . . a transformation in the outlook of the people, so as to make them desire progress and welcome new knowledge by which to achieve it.
2. . . inculcation of a spirit of self-reliance . . strong enough to face every situation as it arose with confidence and vigour.
3. Habits of co-operation through appropriate popular bodies.
4. Life and living of all . . a new enlightenment, strength and hope.

The distortion of these magnificently high-principled objectives by the unconscious play of dialectical materialism in the minds of many of the authors represented in this volume is quite shocking.

A Poor Show for Indian vs Foreign Authors

What hurts me most, however, is the fact that it is our own people who have wandered away from the real aims of the National Extension Service and its Community Development aspect. Not a single one of the foreigners represented in this volume makes this sort of error. The collection therefore makes it look as if only the lowly or the foreigners can maintain unanimity on the principle of humanities being the primes in rural development? This is certainly the impression which any person reading this volume would receive, if he had just previously studied the four major objectives quoted above.

Neither the Prime Minister nor the veteran Planning Commission chief, Shri V T Krishnamachari, ever slip in this way. But far too many of the other non-professional authors do so.

Plums and Lemons

Now for some good stuff, buried amidst all the verbiage. Shri G Ramachandran of Gandhigram near Madura, on p. 234, states the Gandhian principles of rural work with great clarity and a most refreshing realism. Further, on p. 57, Shri R N Bose most conveniently lists the 18 succinct items of village-work according to Gandhiji. The very next article by the distinguished American Sociologist, Dr Carl Taylor, is as clumsy as Shri Ramachandran's is clear; Dr Taylor says plenty about what Community Development is not, but he is disturbingly vague about what it is. This is disappointing from so eminent a social scientist. The effect is all the odder since the negative approach comes from one who does not belong to the 'Neti, neti' line of philosophy.

When Dr Taylor next appears in the volume, on pp 75 ff in co-authorship with Dr Douglas Ensminger, of the Ford Foundation, their summary of the situation is quite masterly. To be sure, there are far too many baseless statements to make the paper acceptable as a scientific contribution. But these romantic glimpses into India's Golden Past are perhaps something about which foreign friends feel that they have to be unscientifically generous in accepting myth, with open minds.

Shri M S Randhawa's article on Consolidation of (land) Holdings in the Punjab was absolutely first-class material, factual, concise—in fact that rare thing: a scientific paper which is also exciting—when it appeared complete with all its diagrams in "Kurukshetra" of June 1954. The matter loses all its punch when it is printed cold, in this volume, without a single one of its lucid illustrations.

As a completely outside and general view—but of a UP area—the Canadian High Commissioner, Mr Escott Reid, has a very fine article indeed on pp 150 ff. Mr Chester Bowles' "Fundamental Questions" on pp. 205 ff. should be enforced reading (and perhaps memorizing) for all Extension Administrators. Not merely Extension administrators, but all in that thankless profession of the desk should read Mr Ernest Neal (TCM Extension specialist) on pp 221|3. He is short, sweet; and, to my mind, final on the subject of who must do what in rural India.

A profound and well-written contribution is Shri P M Mathew's statement of the problems of Kerala development, pp. 243 ff. As a foreign contrast, it is astonishing how Mr Ramy Alexander, of the Ford Foundation's International Small Industries Team, entirely misses the point, on pp 292 ff. Mr Jack Gray, TCM Extension specialist in Bengal, is beautifully lucid on methods of demonstration pp 315 ff.

The contributions on Health in general and on Women and Children in particular are remarkable for their feebleness and obtuse, urban, apparently westernized superiority. Only Dr Barkat Narain's minor contribution on p 429 ff shows any realism towards this field of rural development; but he says far too little to be constructive. Perhaps he is wise in this reticence.

Dr Ensminger hits several loose nails in the present structure of Extension squarely on their heads, on pp 493 ff. But there are more wobbly nail-heads which he is perhaps too polite to hit—at any rate in public. This is a really fine analysis, especially as Dr Ensminger's smacks are firmly reasonable. Dr Carl Taylor redeems his reputation for precision on pp 479 ff, because he uses here the Socratic approach which always seems to make sociology more usable.

Empty Places in the Assembly

Gaps in the volume are remarkable for their prominence. A very serious one, in view of the high rate of illiteracy in rural India, is the complete absence of any useful reference to audio-visual or other teaching materials. There is not even a word about provisions for Adult Literacy. One article on films for villagers by Khwaja Ahmed Abbas is an exquisite specimen of the cardboard czar school of thought, which is so popular in Russia and Hollywood. Janab Abbas shows an amazingly limited knowledge of films for village proper, considering his actual experience.

There is not a word in the whole volume on the many experiments which were made in Extension by rulers of the Indian States. Mysore, Bikaner and Baroda are examples of the large States which definitely did something to keep village folk in the swim of progress, despite the rural freeze in British India of those days. Above all, the little Deccan State of Aundh was the root and stem of many of the improved practices of today's Extension. Yet no author seems to have heard of these efforts, doubtless because they are politically best forgotten.

Similarly, the thinking which opposes Christian missions must be active among writers on Community Development. Everyone in this book has ignored several of the Extension pioneers who worked under missionary auspices. The Rev. Denys Saunders of Hyderabad is a recent example. Verrier Elwin and Shamrao Hivale in the Maikal Hills are another. India Village Service of Dr. Wiser in Etah District is a very senior omission. The pioneer health work of, for example, the Madanapalle Hospital for women, and the Basel Mission's cultivation of handlooms in Malabar . . .all these might never have been, if this volume were to be taken as a guide to history, which it probably is not.

This book **should** have been a most important addition to the literature of Extension in India—which is a very new professional field, and, to my mind, of global importance to the future of human society. Hence my acute criticism of this really unfortunate publication. To readers abroad, this mighty but tripeish tome can only give the false impression that we are not serious, at any rate at high administrative levels, about rural development through Extension in India.

Production of the Book

The second half of the book, which is printed by a Government press, is very badly done; in sharp contrast with the nice clean job of the commercial printer who did the first half. There is no index, which is an unpardonable omission in a supposed reference book of this bulk. The binding is flimsy, pages are not properly stitched in. The preliminary pages are poorly designed, and the binding case itself is unbelievably shoddy in fact as well as in appearance, especially for a fifteen Shilling book.

Regional Differences in Customs and Village Institutions

M N Srinivas

Enough work has not been done in the field of Indian ethnology—enough, i.e., to enable anthropologists to mark out clearly the various culture-areas of this sub-continent. True, a certain amount of work has been done in this field—the major linguistic divisions have been sorted out, the racial composition of the population has been analysed and the kinship terms used in different parts of the country have been discussed. Even so, we are only at the very beginning of our researches. Prof. Srinivas is, therefore, afraid that the title of this paper assumes a level of advancement in our anthropological studies which simply is not there.

There was another reason for his diffidence in publishing this talk delivered on June 14, 1955 to non-Indian members of the Orientation Course conducted by the Delhi School of Economics. It was prepared in a hurry and without adequate library facilities. The subjest matter of the paper, however is so important and interesting that the author has been prevailed upon to agree to its publication though he would like to make it absolutely clear that it is elementary and does not claim to incorporate any new material whatever.—Ed.

THE first important regional difference deserving of mention is the different types of village settlements obtaining in different parts of the country. In a great part of India villages are nucleated while in a few restricted areas they are dispersed. By a nucleated village I mean the restriction of the inhabited area to a comparatively small space while the fields which the villagers cultivate lie round about. A nucleated village is easy to mark off from other villages, because it has a certain physical distinctness, and is separated from other similar villages. Nucleation usually means a certain amount of separateness of social life—each village is a unit of communal life, the members of the village being bound together by the ties of neighbourhood and by common social experience of misfortune as well as joy over a long period. Each such village constitutes what the Americans call a "face-to-face" community—by this is meant that relations between persons are usually direct, and each man knows a good deal about everybody else. It will probably be not inappropriate to call such a community a "back-to-back" community, because of the great interest which each person shows in other members of the village, which naturally leads to gossip and unpleasantness.

Dispersed Villages

A dispersed village on the other hand has not got such a distinct physical identity. In a dispersed settlement each farmer lives on his own farm, and what is called a village is very often nothing more than a number of such isolated farms brought together for purposes of administration. The administrative village may not have any correspondence in social life. For instance, a barber in an administrative village might be serving two or three adjoining administrative villages while the washerman living next door to him might be serving six or seven villages, and a musician eight or nine villages and so on. In such a case the administrative village is nothing more than the gathering together in one area of a number of people each with his own distinct sphere of activity. Such a situation could be diagramatically represented by a series of intersecting circles.

Dispersed villages obtain on the west coast of India, south of Mangalore, in Coorg, Wynad, and in the north-western parts of Mysore State. Modified dispersion obtains in Ratanmahal and Panchamahal areas of Bombay State. By modified dispersal I mean that the type of dispersal which obtains in Malabar or Coorg—each man ideally living on his own farm—is not there, but instead we have a situation in which the members of a lineage are collected in three or four houses or huts in the midst of their fields, and a village is made up of a series of such small collections. It is not unlikely that dispersed villages also obtain in other areas of India, especially in the mountainous and forested parts. We have not heard of them. (I am not here suggesting that dispersed villages necessarily occur in mountainous areas. It is interesting that while the whole of Coorg is covered with mountains, dispersed villages occur only in the southern and western parts, while in the northern and eastern parts nucleated villages occur.) It is interesting to know that a distinguished economist surveying Indian villages commented that there are no villages in Western India. What he meant was that there were no nucleated villages.

Form of the Local Community

A question which the sociologist cannot help asking is, "What forms does the local community take in dispersed villages?" There are some who maintain that in such areas it is the caste which is the local community and that there is no village unity as we know it to exist in nucleated villages. And another question that we have to ask is, "What other things accompany dispersal?" "Do caste relations become really far more important in a dispersed village than in a nucleated village?" In the case of nucleated villages, the defence of the village community from robbers and wild animals—this was a very important consideration before the establishment of **Pax Britanica**—falls on all the inhabitants living in the settlement. An epidemic or a drought or flood affects practically everyone and, during famine and epidemic it was common for the entire village to be shifted. This assumes that there is a body of elders who can take decisions and who see to it that everybody obeys these decisions. In a dispersed community all the members of the village do not live together, and the problems of defence etc. have to be faced by a small group living in the same house or in adjoining huts. Does this then mean that dispersal gives rise to greater kinship solidarity expressed in the occurrence of large lineages? This is a situation that obtains in Coorg as well as in the Panchamahals and Ratanmahals.

Types of Tenure

Villages differ from each other in the type of tenure under which rights in land are held. Earlier writers on the village community like Maine distinguish between two types of villages in India—the 'joint' and 'severalty'. The 'joint' type prevails in N.W.F P., the Punjab and U. P., while the 'severalty' type prevails in Peninsular and Central India. The 'severalty' type existed in Bengal and Bihar before the introduction of Permanent Settlement in 1793. The 'joint' type may be further sub-divid-

ed into Pattidari and Zamindari sub-types, in both of which the village lords constitute a joint property of an organized proprietary body. But while in the Pattidari system the joint families constituting the proprietary body own separate shares in the cultivable land, and hold the waste and pasture lands in common, in the Zamindari system all land is held and managed in common, and not divided. In the latter (zamindari) sub-type, the tenants, if any, are tenants of the whole body of proprietors, their rents and other receipts are paid into a common fund from which common expenses are met; and the annual profits are divided among the co-sharers according to their respective shares. In a 'joint' village, there are two classes of men, one with proprietary rights, the other without them, power resting exclusively with the farmers.

The 'severalty' village is also called a 'ryotwari' village. The term 'ryot' means peasant. In a 'severalty' village—it must be remembered that this type is prevalent over the greater part of India—the unit of land revenue is not the entire village, but the holding of each individual owner. Each holding is separately assessed, and each owner is individually responsible for the payment of tax. A 'severalty' village has also some waste and pasture land in common, but unlike in a 'joint' village, the waste and pasture may never be—not even during an emergency—utilised for the purpose of cultivation All that the villagers have, are only certain rights in waste and pasture-land—the village cattle may graze on the pastureland, and villagers may collect fuel from the bushes growing on the wasteland. (If, for instance, there are any mango or tamarind or coconut trees growing on the waste land, the Government auctions the fruits to the highest bidder.)

It is necessary to mention here that in Bengal proper the landowners hold generally considerable plots, on a permanent settlement of the amount to be paid to Government, while in the north-western areas of the Indian sub-continent there are often a great many land-owners in a single village, holding land by a common settlement which is periodically renewable. Thus, in the latter areas, if one family decreases in size and another increases in size, the headman, in consultation with the elders, may redistribute existing arable land. (I am told that this type of tenure obtained formerly in the N.W.F.P. and that nowadays it does not exist even there.) This is not possible in the 'severalty' areas where, if a family dies out, land escheats to the State.

Wide Variety, Infinite Complications

I have given a very brief and superficial idea of the different types of tenure obtaining in India and I have derived this from standard writers like Maine and Baden-Powell. I am certain that the situation as it obtains to-day is far more complicated than is indicated in the above account. The only remedy to this deplorable situation is conducting intensive field studies in different parts of the country. The present situation is so bad that there is vagueness even in certain essential terms like zamindar—a zamindar might mean anyone having proprietary rights in land in contrast to the ryot who is only a tenant having only certain occupancy rights. It is the zamindar who pays the tax on land to the Government. In another and more restricted sense, zamindar refers to a person whose ancestor was given a gift of land by the local ruler for services rendered. The terms of the gift differed in each case—sometimes a man was given rent-free land while at other times he was required to pay full or partial rent. The zamindar may cultivate the land personally through servants or may hire it out to tenants. In course of time, numerous intermediaries established themselves between the zamindar and the actually cultivating tenant.

Wills's The "Three Castles"

TC/134

In some parts of the country such as Malabar, Andhra, Bengal and U. P., the land granted to a zamindar often ran to several hundred acres. Another term which is used for zamindar is Inamdar. In Mysore a Jodidar is one who has the rights of collection of tax over a group of villages included in the jodi gift. In Malabar, zamindars are called Jenmis. One of the features of agriculture in Malabar is the number of intermediaries who have interposed themselves between the Jenmi and the cultivator. There are several varieties of tenure in the small area of Malabar. In Coorg, the dominant tenure is Jamma—a Coorg holding land under Jamma tenure pays a trifling amount of cash as tax. Under the Lingayat Rajas of Coorg each able-bodied Coorg had to serve in the Raja's army, and this was a condition of Jamma tenure. There were, in addition to military service, other services and gifts to be paid. There was also another type of tenure in Coorg called Sagu, in which the landholder paid twice the tax which a Jamma-owner paid, but he was free from having to render military services to the State. Sagu tenure did not have the prestige of Jamma.

Origin of Zamindars

One can go on enumerating the various types of tenures existing in different parts of the country. But it is not necessary for our purpose. My only point is that we have been using terms like zamindar and inamdar very loosely. What is needed is a clear recognition of the various senses in which the term is used, and to specify in each case in which particular sense the term is used. We should also try to list the various services which were due from and to the zamindars. I am certain that we will find as a result of our investigations an extremely complicated system of rights and duties, some customary and others personal, binding together a number of individuals and groups. So far land tenure has been studied either by lawyers or economists and not by sociologists, and the result is an over-emphasis on legal rights and their economic consequences and a deplorable neglect of the facts and customs as they really are, and of the total social matrix in which the rights and duties exist and function.

In origin, these gifts of land were made to distinguished citizens such as soldiers, musicians and scholars, or to court favourites and courtesans. What is more important for our purpose, however, is that in each village community there are a few hereditary officials and servants whose services are guaranteed by gift of land. Chief among such officials are the village headman and accountant. Certain village servants such as the **chakra** in Mysore State, and the waterman were also given gifts of land. It is the duty of the **chakra** to help the accountant and headman in the collection of tax, and the **chakra** has also other duties such as running errands for visiting officials and to act as town-crier when necessary. The waterman is an important figure in areas where canal or tank-irrigation obtains—he regulates the supply of water from the water-source to the fields. Frequently he is given in addition to land, a head-load of grain-with-stalk by each cultivator during harvest. The temple-priest enjoys land with which the temple is endowed—either by the state, or privately by pious individuals. There is, in addition, a priest who functions at marriages, funerals and other ritual occasions—such a priest more often has only the right of acting as priest in a defined group of villages. This right is heritable, divisible, and disposable otherwise. The point is that the village community requires certain services, and the rulers of old tried to secure these services by gifts of land to the concerned functionaries. In certain parts these functionaries were given a share in the grain produced in the village, or a share of the money-tax collected, but a gift of land is more valued than other payments because land means not only greater security but also greater prestige.

Types of Cultivation—Tribal

From the point of view of the type of cultivation prevalent, villages may be classified into three types: tribal villages where shifting cultivation obtains, and in those areas where there is cultivation with the plough, land may not be irrigated. Shifting cultivation—the Americans call it slash-and-burn—occurs in the forests of the Central belt where it is common for tribes to set fire to a stretch of forest and sow the seeds broadcast in the ashes. Every few years the tribe moves off to a new stretch of forest. This type of cultivation is called **Bewar**. A similar type of cultivation prevails among some tribes of South Canara (**Kumri**), Travancore-Cochin and in parts of Assam (**Jhum**). Shifting cultivation has not developed in India, the complicated forms which it has developed in the various parts of Negro Africa. Some tribes of south India use a digging stick for cultivation instead of plough. In tribes such as the Baiga of Central India, there is a resistance to plough-cultivation. The Baiga believe that plough-cultivation means tearing the breasts of Mother Earth. It is hardly necessary to comment on the economic significance of shifting cultivation—it requires a large amount of land to support a single family, and in a country where population is increasing, and which is undergoing rapid industrialization, much valuable forest will be destroyed through these primitive methods. Not all primitive tribes practise shifting cultivation, however. Some Naga tribes are skilful cultivators and they terrace the steep hillsides of Assam to grow paddy.

In non-Tribal India

In non-tribal India plough cultivation is the rule, and such land is either irrigated or cultivated with rain-water. The greater part of agricultural land in India is unirrigated. The crops grown are wheat, sorghum, finger millet, pulses, chillies, and commercial crops such as cotton and groundnuts and castor seeds. Rice and sugarcane are the principal crops grown on irrigated land. I am leaving out of consideration commercial crops such as coffee, pepper, tea and rubber which grow only in areas receiving a very heavy fall of rain.

A successful crop is a chancy affair in an unirrigated area. Droughts are frequent, and in pre-British India, famines occurred every few years. It is only in the last hundred years that India has been able to obtain gradual control over recurrent famines. Famines are a potent source of population movement and change of occupation. We do not yet have a systematic study of the sociological significance of Indian famines. Unirrigated villages

are much poorer than irrigated villages, and they are much more backward. A few studies are currently being made of the social consequences and implications of the introduction of irrigation in some parts of Mysore, and the results indicate that irrigation means more or less a social and cultural revolution. The peasants of one village, for instance, altered their dress, to some extent their diet too. Communications improved and there was more money than before. Relationships became more contractual instead of being based on status. This prosperity was followed by a general desire to imitate the way of life of the Brahmins. The villages themselves say that refinement (**najuku**) came to them with irrigation.

I hope I have not given the impression that irrigation came to India with British rule—far from it. The Mysore village which I studied in 1948 was served by two canals, one over 600 years old, and the other, 300 years old. In the north-eastern part of Mysore State, tank irrigation was highly developed, and one district possessed over 4,000 tanks, the waters of which were used not only for drinking and washing, but for irrigating land. Tank-irrigation is not confined to south India, however. Gujarat had it, and in Gujarat are also to be found huge stepwells (vav) which irrigated many acres of land. Considerable engineering skill went into the building of these joint wells which were lined with steps right to the very bottom. Well-irrigation with Persian wheels obtains in parts of the Punjab and UP. In a considerable part of India, bullock power is used to lift water from wells to the fields. In south India, especially Tamilnad, human power is used to lift water from wells. I may repeat here, that in those areas where tank-irrigation prevailed, there was a hereditary village servant whose duty it was to regulate the supply of water from the tank to the fields.

Caste and Food Habits

It is well-known that there is an intimate relation between caste and diet all over India. Generally speaking, the upper castes are vegetarians and abstain from alcoholic liquor, while the lower castes are non-vegetarians and some of them consume alcohol as well. In fact, corresponding to the caste hierarchy there is a dietitic hierarchy. Orthodox Hindus belonging to the topmost caste abstain not only from all non-vegetarian food but also from certain root vegetables like garlic, onion, potato, beetroot, radish, and from tomato, drumstick and mushroom. Among non-vegetarians those who eat fish consider themselves superior to those who eat domesticated pig, and at the bottom rung of the ladder come the beef-eaters. Consumption of toddy and arrack begins at some low point in the hierarchy. There are, however, important regional differences. In parts of Rajasthan and Gujarat, which are dominated by Jain-Vishnava tradition, the bulk of the people are vegetarians.

It is clear that these religious rules and restrictions have an effect on the health and efficiency of the people, and these food-habits may be regarded as a 'hard point' in the culture of the people. It should be folly to expect quick changes of food-habits in the bulk of the people.

Vindhya—the Dividing Line

India is a country of bewildering cultural diversity, but underlying this diversity there runs a unifying principle. This has been observed by every student of Indian culture and thought—and indeed by everyone who has a wide and deep acquaintance with the country. But it is very difficult to handle this idea in a scientific manner. I have tried to handle this problem in my book **Coorg Religion and Society**. I regret it is not possible for me to discuss this here. I will confine myself to describing a few instances of this great diversity.

For my purpose India may be divided into two parts, the line of division being the Vindhya Mountains in the middle. The area north of these mountains is Continental India, and the area to the south, Peninsular India. Peninsular India and Continental India differ from each other in important respects. But in each of these major divisions, there are further sub-divisions: for instance, Bengal and Gujarat differ from each other and from other areas in Continental India. In the latter area a man may not marry a girl from his own village. A man normally has to marry within his caste both in the North and South. But in the North he has to avoid a girl from his own village. In U P, for instance, an exogamous circle with a radius of four miles may be drawn round a man's village, and the average distance of marriage is twelve miles. One investigator working in the Punjab reports that "two-thirds of the marriages have taken place with villages between four and twelve miles from Jhabal, with the greatest number clustering round an eight mile radius". Village exogamy is accompanied by certain attitudes towards girls born within the village. The girl born in the village is called a village daughter, and she is not in **purdah**, whereas girls who have come into the village by marriage have to observe **purdah**. A man is enjoined to treat a village daughter as his sister. In south India, on the other hand, there is no objection to marrying a girl from one's own village. A south Indian prefers to marry certain relatives like his mother's brother's daughter, or father's sister's daughter, or own elder sister's daughter. Where marriage with the maternal uncle's daughter is common, a family or lineage continues to recruit girls from another family or group of families, while where marriage with the father's sister's daughter is common, two families go on exchanging their girls. This also happens where a man marries his elder sister's daughter. One finds that in south India marriages occur in great numbers with particular families or villages. The social space of a villager does not seem to exceed a radius of 10 miles. This was much more so in the past than to-day.

Two Types of Marriage

If we contrast these two types of marriages we find that in north India the principle in choosing a spouse seems to be to extend one's connections, whereas in south India the principle seems to be to repeat and thereby strengthen already-prevalent bonds. In north India a man's social space seems to be greater than that of a man in south India. Again, in south India, the friction between mother-in-law and daughter-in-law was probably lessened by marrying a relative. It probably also delayed the partition of the ancestral estate. It will be interesting to study the social and economic effects of these two types of marriages.

Hypergamy in Bengal

A type of marriage known as hypergamy prevailed in certain parts of India. In Bengal, for instance, is a caste of Brahmins known as Kulins who constitute the highest division in the caste system of that place. A Kulin girl may only marry a Kulin boy, and as there was no restriction on the number of wives, a Kulin was free to marry as many girls as he liked. Marrying a Kulin boy lifted up the status of bride and her group, and therefore Kulin grooms were much sought after, and with the development of the dowry system many a Kulin boy found it convenient to go about the country marrying as many as he could. Marriage meant nothing more than a ritual conferment of status for which the groom had to be paid a certain fee. This led to polygamy among Kulins.

In Malabar

In the south-west corner of India a different type of hypergamy prevailed—it still prevails to some extent. There are two dominating castes in Malabar, the patrilineal Nambuthri Brahmins and the matrilineal Nairs. The Nairs were formerly soldiers and peasants, and huge estates were granted to them in recognition of their military prowess. The Nairs are not a single caste, but a group of nearly 300 sub-castes, constituting a hierarchy within themselves. Hypergamy prevailed both among the various Nair castes, and between Nairs and the Nambuthris. The topmost Nair girls liked to marry Nambuthri Brahmins. In fact, such a marriage was not known as a marriage, but as Sambandam which was a quasi-legal relationship between a man and woman. The Nambuthris are patrilineal and have primogeniture. The eldest son inherits all the property, but he has the duty of looking after his younger brothers and sisters. Among them only the eldest son is entitled to marry a Nambuthri girl. This is an important reason for Nambuthri estates remaining intact even to-day. The younger brothers are not allowed marriage. They have instead Sambandam connections with Nair women.

Among Patidars in Gujarat

A third type of hypergamy, prevailing in Gujarat, is even more interesting. Hypergamy prevails among the Patidars of Charotar, Anavil Brahmins, and a few others. The Patidars are divided into those belonging to Twentyseven Villages, Twelve Villages, and Six Villages. A girl from the Twentyseven Villages may marry a boy within her own group, or a boy from the other two top groups, while a girl from Twelve Villages may marry either one of her own group or a boy from Six Villages. Finally, a girl from the Six Villages may marry only a boy of her own group. In addition, no girl may marry a boy of her own village. There is a great competition for the hand of a Patidar boy. The Patidars are a rich agricultural and commercial community and many of them have made huge fortunes in East Africa. Even emigration to a different continent has not freed them from the bonds of hypergamy. Huge dowries are paid to the groom at the marriage, and as long as marriage lasts, the girl's party is expected to make periodic gifts to the boy's party, and they generally have to behave in a deferential manner towards the groom's party. A Patidar works hard and saves hard in order to meet the huge expenses of marrying his daughters. Formerly, infanticide prevailed among the Patidars. Girls were an expensive burden and parents therefore got rid of them by drowning them in milk.

Inter-Village Relations

In the whole of Continental India, the village which gives a girl in marriage is considered inferior to the village which receives her. Girls always move in one direction—from inferior to superior villages. In South India on the other hand, no such idea prevails, and it is common to find members of the same caste living in neighbouring villages and continually exchanging girls.

This certainly means that inter-village relations are closer in South India than in the North. It looks as though that the idea of village unit is far more developed in the North than in the South—in the North, land is not commonly given for cultivation to those who are out-

in agriculture

side the village while in the South such a thing is quite common.

Evil Economic Effects

Indian economists have long been complaining about the evil economic effects of caste, joint family, and costly weddings and funerals. They have been so busy denouncing the peasant that they have made no attempt to understand him and his social environment. It is only now that a few anthropologists have tried to make studies of the social and economic effects of the periodic social crises like weddings and funerals. The peasant is proud, and failure to spend at wedding and funeral would injure his 'face' before his relatives, neighbours and friends. Any attempt to reform him must show more sympathy and subtlety than has been shown so far by our economists and welfare workers.

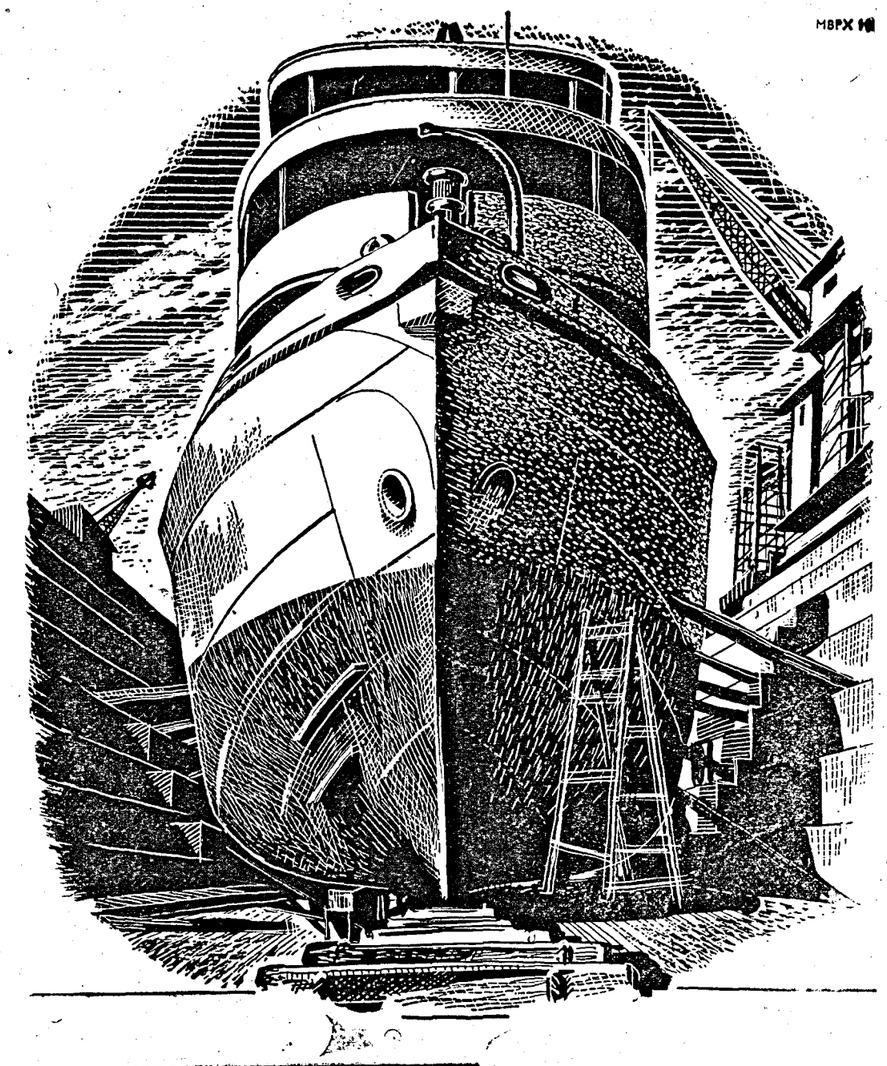
Segregation Between the Sexes

Another matter to which I have to refer, is the difference in the patterns of sexual segregation obtaining in different parts of rural India. Difference of sex is an important basis of social differentiation all over the world, including India, but it takes different forms in different parts of the country. In both continental and peninsular India, men and women keep apart from each other. In the North, women in the villages are required to observe **purdah**, that is they may not show themselves before men, and when they have to, they have to wear a veil or its equivalent. In parts of Western UP, each important farmer has three houses, one where his womenfolk live and cook the food and the other where the men lounge about and the third for cattle. Muslims are much more prone to **Purdah** than Hindus. But even Muslims do not have the **Purdah** in the rural areas of South India. The economic factor is, however, important in this connection—for the women of the poorer and lower caste families are required to work outside their homes to keep their families going. In Peninsular India there is no **purdah** though women between ages of 15 and 40 try to avoid showing themselves before men. The women of all except the richest families work in the fields.

Pollution

Another important fact that must be mentioned is pollution. One may say pollution is at the heart of social relations between individuals and groups in the rural areas, and a failure to understand ideas of pollution and purity will lead to great misunderstanding of Indian culture and society. (I have again to refer to Chapter IV of my Coorg Book where I have considered in detail the pollution concepts of the Coorgs and their relation to their kinship and social system). Pollution is ubiquitous, and women observe it much more than men, and old men much more than young men. The food that one eats comes under pollution ideas in a variety of ways. In south India a man may eat cooked food only from the member of an equally high caste or a member of a higher caste. He may not even accept drinking water and lime-paste for betel leaves from a member of a lower caste. Untouchables may not use the village well. They may not wash in the village tank, or at a higher point in the river than an upper caste man. In north India the rules regarding food are extremely complicated. Cooked food is divided into **Kacha** and **Pakka** — **Kacha** being the food cooked with water and **Pakka** being food cooked with ghee. **Kacha** food is only accepted from an equal or higher caste whereas **Pakka** food may be accepted even from some lower castes. Each man knows what food he may accept from whom.

Extreme Example



Pollution rules govern the relations between different castes. Untouchables have to stay apart from caste Hindus because contact with them defiles the members of the higher castes. Contact is again culturally defined. An extreme example of pollution by contact is obtained from Malabar where a Pulayan may not go nearer than ninetynine feet from a Brahmin, an Izhavan, sixty-six feet, a Nair thirty-three feet, and so on. Each man knows how near he may go to another. There are even unseeable castes.

Unity of the Village

I will now very briefly refer to the idea of the unity of the village which is common to all parts of India. In fact we may say that it is a near-universal. A small body of people who do not enjoy contact with other groups of people living far away, who share the same experiences year in and year out for many years, come to have certain common interests. Sociologists interested in India cannot help asking the question, "In what way does caste effect village unity"? In other words, caste divides people into clear-cut and hierarchial groups. A Brahmin has links with Brahmins in other villages, and similarly an Untouchable. Under these circumstances, what happens to village unity? Again, inter-village brawls are not unknown in rural India, and in a good many cases they mean only that the dominant caste in either village fights. It is unlikely that a Brahmin would be beaten in such a brawl unless he himself took the initiative and beat someone belonging to the other side. (I am assuming that the Brahmin does not belong to the dominant caste). An Untouchable certainly gets involved in a fight, but not however as a member of a village, but only in his capacity as a servant of one of the members of the dominant caste. But several observers have noticed that where a village comes into contact with an external authority like the Government, it usually shows unity. The presence of factions inside the village is usually temporarily ignored. This idea of unity receives a somewhat exaggerated recognition in parts of Saurashtra. The concept of **Gam nu nak** (the nose of the village) is very strong there. It means the nose of the village—if, for instance, the village cattle herd is injured, or if a village girl is insulted, then it is the duty of the whole village to take revenge on the person who inflicts the insult.

Self-Sufficiency

I will mention one last point before concluding this talk. One often hears of the self-sufficiency of villages. This self-sufficiency is a myth. It does not exist and it never did exist. It is true that in pre-British India the lack of communications, and the minimal part which money played in the economy enabled villagers to be largely independent of the outside world. But even then villages had close economic and social relations with neighbouring villages; they made use of nearby weekly markets, and they went on pilgrimages to famous shrines. They sought their brides in neighbouring villages—especially so in the North. It is important to stress this fact because responsible people talk of reviving the self-sufficient village. It is like reviving the double-headed eagle or the dragon.

Reflections on Planning of the Economic Development of India

Paul A Baran

The author who holds a Chair in Economics at the Stanford University, California, is at present in India and is working at the Indian Statistical Institute at Calcutta.

THE objective of planning for the economic development of India should be maximal possible increase of current output, and such allocation of it as will insure the largest attainable rates of growth of output for the period encompassed by the planning horizon: 20-30 years.

In the light of this general goal, the immediate task facing economic policy is as complete as possible utilization of the country's available productive resources.

Although this basic goal is in conflict with a programme of maximization of gainful employment in the short run, this conflict is only partial. For unemployment consists of two segments that must be sharply distinguished. There are on the one hand unemployed who are urban dwellers, and have no jobs while there are available plant and facilities required for their productive employment. There are on the other hand fully or partly unemployed who inhabit the villages and who subsist—if ever so precariously—by drawing on their families.

It is clear that the limitations on the productive employability of the latter group (the "disguised" unemployed) are set by the speed of the accumulation of additional plant and equipment. Those limitations cannot be removed in the short run; they can be overcome only by a major investment effort.

The limitations on the productive employability of the former group of unemployed (the "Keynesian" unemployed) are of an altogether different type: they are the result of insufficient effective demand, and of prevailing monopolistic controls over the existing means of production. They can be removed by appropriate economic policies. The existence of limitations on output and employment stemming from the inadequacy of effective demand and from monopolistic controls is intolerable in advanced countries. It constitutes a veritable disgrace in the case of a poor country.

In an excellent study by Messrs. Lobel and Das (prepared for the Indian Statistical Institute) it is shown that the under-utilization of existing productive capacity in India reaches as much as 40%. The situation is even worse in some individual industries. To be sure, this unutilized capacity is unevenly distributed, and an attempt at its full utilization is bound to run into bottlenecks of various kinds. It is the primary, and indeed the most urgent task of economic planning at the present stage of India's economic development to examine carefully the structure of the available unutilized capacities and to identify the bottlenecks that are likely to obstruct the full utilization of the available excess capacities.

Such bottlenecks may appear in various areas; the measures needed to deal with them have to be selected accordingly. Broadly speaking they will fall into the following groups :—

(a) deficit financing of the planned investment programme creating the effective demand for additional output;

(b) investment in such plant and facilities as may be needed to overcome possible shortage, and to assure the necessary composition (proportionality) of output; the productivity of such (supplementary) investment would be necessarily very high;

(c) where the output that would be produced at full capacity utilization is of such a physical nature as to exceed the (increasing) effective demand, shifts in production may be necessary. Where such shifts are impossible—for technical reasons —government purchases with a view to exporting the resulting surpluses must be organized;

(d) where existing monopolistic controls are such as to prevent expansion of output in response to rising effective demand, nationalization of the relevant plants and facilities is called for;

(e) if balance of payments complications should arise, severest economies of foreign exchange as well as purposeful borrowing abroad must be instituted.

Until the investment programme in new plants and facilities has begun absorbing a growing number of "disguised" unemployed, that is, as long as those unemployed are compelled to remain in their villages, all measures must be taken to improve their lot in the countryside. Such measures include first and foremost an agrarian reform that would provide for a more equitable distribution of **that share of agricultural output that is currently consumed in the villages,** and secondly, the provision of a stable market for both agricultural and handicraft outputs that are marketed by the rural population. A government purchasing agency for the products of cottage industries removing the limitations of effective demand on their output would be urgently required. Such an agency could either market that output at home, if there is sufficient demand for it (at lower prices), or export it —absorbing, if need be, such losses as may occur. This amount of subsidy to the rural population would constitute a social relief payment warranted by the distressed state of the rural population and by the desirability of preserving the skills of rural craftsmen.

II

Of the maximum attainable current output a maximum possible share must be mobilized for productive investment.

Possible foreign assistance apart, the resources required for an investment programme are provided by the **economic surplus** that is currently generated in the economy. The **actual** economic surplus is equal to the actually observed saving (and investment). In poor countries this actual surplus is small, both absolutely and in relation to national income.

The actual economic surplus does not delineate, however, the volume of resources that could be mobilized for investment in productive plant and facilities. It is the **potential economic surplus** hidden in the country's economic structure, that has to be tapped, if a concentrated effort to promote economic development is to be undertaken.

This potential economic surplus appears under a number of headings. In addition to the output that can be secured by full utilization of available productive capacities, the most important categories are the following:—

(a) **The excess consumption on the part of the upper income groups.** It reflects itself in a high standard of living of those groups, in the large number of servants maintained by them, in trips abroad, in the acquisition of jewels, foreign luxuries and the like. It appears in the construction of lavish residences (Bombay), in the acquisition of land and in other forms. The exact magnitude of the amount that could be saved by the suppression of this form of resource utilization is not readily calculated; such tentative estimates as I have been able to make suggest that it might reach as much as Rs 500 crores per year. It would be an urgent task of economic research to secure as precise as possible information on this crucially important portion of the national income. It should be a matter of the utmost importance to those concerned with economic planning to scrutinize closely all possible measures (fiscal as well as administrative) that might enable the government to secure that slice of the national product for the purposes of economic development.

(b) **The unproductive workers** who absorb a considerable share of national income. They are first and foremost absentee-landowners and money-lenders; also super-abundant merchants, traders, agents and commission-men as well as redundant civil servants, lawyers and advertizing agents. Their total revenue might be estimated to be close to Rs 2000 crores per year. It would be imperative to study this problem carefully to estimate the amount of possible savings and to examine the possibility of a planned transfer of the individuals involved to socially useful occupations.

(c) Losses suffered by the economy as a result of **fluctuations of business activity.** To the extent to which such fluctuations are attributable to domestic causes, suitable countercyclical measures have to be considered and adequately prepared. To the extent to which such fluctuations may be caused by changes in world market conditions, the government should stand ready to insulate the economy against sudden declines in the demand for and the prices of Indian exports. Here again, economic planning calls for timely arrangements that would be able to cope with the problem.

(d) The drain on national resources caused by **capital flight** and by **transfer of profits abroad.** Strict controls on capital movements and blocking of the transfers abroad of profits earned in India by foreign companies are indispensable. Profits thus blocked will find their way into investment in India. In view of the smallness and frequently undesirable allocation of foreign private investment in India, the disincentive effect of such measures with regard to further private foreign investment may be safely disregarded.

It is my considered opinion that given a determined effort to eliminate waste in the Indian economy, and to mobilize at least a part of its potential economic surplus, the ratio of investment to national income could be rapidly raised to 15 per cent.

No planning for the economic development of an underdeveloped country can be considered to represent a wholehearted undertaking as long as the prevailing low ratio of investment to national income is accepted as a datum, and until all possibilities for its increase have not been fully explored and realized.

It is of crucial importance, however, to secure the indispensable increase in the investment ratio not by an encroachment upon the desperately low levels of mass consumption but by a systematic mobilization of the potential economic surplus.

Whether from the standpoint of economic rationality—the effect on the health and efficiency of the working population—or whether from the standpoint of elementary canons of social equity—a programme of financing the necessary investment by increased indirect taxes is wholly inadmissible. It would be most undesirable even if the entire potential economic surplus were already mobilized. It is altogether reprehensible as long as **nothing has been undertaken to utilize the potential economic surplus for development purposes.**

III

Little need be said about the **mode of utilization** of the economic surplus. Under the prevailing conditions, a considerable part of investment in the so-called private sector is undertaken in the wrong areas. Therefore, a system of strict investment controls is necessary that should assure the proper allocation of investment funds. Licensing of imports, of new construction etc. represent some of the requisite tools.

The division of the proposed investment between the public and private sectors as envisaged in the Second Five-Year-Plan is subject to doubt. It leaves to the government all the projects that by their very nature are bound to be most difficult, and most seriously hampered by lack of skilled manpower, of industrial tradition etc. It reserves at the same time to private business such enterprises as are more readily established and operated. The result will be a "socialization of losses" accompanied by private appropriation of rising profits. Such a situation will be readily exploited by those who are interested in discrediting the idea of economic planning with a view to force the "re-privatization" of inefficient and unprofitable government enterprises. It is mandatory, therefore, that the public sector should contain not merely the "tough" subjects, but also a sufficient number of ventures that in the present state of the economy will yield satisfactory profits and display the advantages of planned economy.

The division of the entire investment outlay provided for by the Second Five-Year Plan as between producer goods industries and consumer goods industries is inadequate. Given full utilization of the existing capacity of the consumer goods industries, a much larger allocation to producer goods industries is possible. Such a larger allocation combined with a considerable increase of the investment total could yield much more impressive rates of growth and permit a much earlier liquidation of "hidden" unemployment.

IV

The problems refered to above offer a rich field of work for economists and statisticians concerned with actual economic planning.

The development of economic thought and research has been always closely related to the needs of society at various stages of its development. Where this relation has been torn apart, economics was condemned to sterility or played even a negative, reactionary role in the process of social advancement.

What is needed in India to-day is undivided attention to the central issues of the mobilization and correct allocation of investment funds.

Gloom in Markets

Wednesday, Evening

THERE has been a shake-out in equities since the publication of the draft outline of the second Plan. A combination of adverse developments, such as banking disturbances, payments crisis and nationalisation of insurance, may have aggravated the slump in equities. Even so, it is abundantly evident that stock markets are nervous about the implications of the second Plan. This explains why enlarged provisions for deficit financing have not had any tonic effect on equities.

Investors are not worried as to whether the second Plan targets can be reached, or whether it can be financed without inflation. This is the main headache for the economists. But it is not without significance that stock markets do not seem to be enthused about these aspects in which investors may be expected to be interested. They seem to have reached the conclusion that the Plan may or may not raise national income to the estimated level, but it will not cause any boom in stock markets.

Gloom has descended over stock markets since the publication of the draft outline of the second Plan. That Congress was committed to ensuring a socialistic pattern of society, was not unknown to investors. But their alarm is not as much due to the estimated increase in taxation or to talks about fixing a ceiling on individual incomes as to the wider implications of the second Plan. Investors interpret the draft outline to mean that it is New Delhi's intention to impose gradual restrictions on the activities of the private sector.

Even before the publication of the draft outline, the Government's decision to nationalise life insurance had dealt a severe blow to confidence in the private sector. It is this psychological factor which is significant.

There are many provisions in the draft outline which would seem to confirm these apprehensions. It would be unfair for investors to be unduly disturbed over the Government's intention to develop and exploit mineral resources in future within the public sector. Informed investors could not have been unaware of the changing policy of New Delhi. It was known for some time past that the Government was in favour of including mining and mineral resources within the public sector.

Nor was it news that New Delhi was in favour of developing heavy industries hereafter within the public sector. Developments relating to the three steel projects made that evident. But there are indications in the draft outline that heavy machinery and basic capital goods will hereafter be developed only within the public sector. Even these indications are not as damaging as the other implications of the draft outline.

There are indications that the Government now prefers to grant long-term financial aid to industry not in the shape of interest-bearing loans, but through participation in equity capital. This is a possible development which has caused consternation among industrialists. This will mean that organised private industries seeking State aid will have to accept the Government's control and voting rights in return for financial aid. This progressive encroachment on the private sector is the main reason for the current slump in equities.

It will be conceded that there is much in the draft outline of the second Plan which should cause disquiet within the private sector. Increasingly it becomes obvious that the private sector will be allowed to function only within spheres now under its operation. Even subject to this limitation, there are many industries in and around Calcutta which should have scope for expansion. By and large, some consumer goods industries and light engineering concerns should have scope for expansion during the second Plan period.

Tea and jute are two consumer goods industries in which the Calcutta Stock Exchange is vitally interested. There are reasons why the present outlook for the tea industry is gloomy. But there are abundant indications that, despite the implications of the draft outline the jute industry should prosper. In recent months, there has been a welcome increase in the demand for jute goods. This industry is being modernised. In spite of growing Pakistani competition, the immediate future of the Indian jute industry is not as gloomy as to warrant continued neglect of jute shares.

Under the second Plan, light engineering industries will have unrestricted scope for expansion. In this sphere of operation, the Government will not intervene. As heavy industries expand, there will be wider scope for expansion of light engineering industries. This was the argument on which Engineering shares, listed on the Calcutta Stock Exchange, started moving up two years ago. These reasons are equally relevant to-day, and should encourage investors to take interest in these shares as the stock market here regains its poise.

Rohtas Industries Limited

NOTICE is hereby given that the Twentythird Ordinary General Meeting of the Shareholders of the Company will be held at the Registered Office of the Company at Dalmianagar, on Tuesday, the 20th March 1956 at 11-30 A.M. to receive and adopt the Directors' Report and the Audited Accounts for the year ended 31st October, 1955, to declare dividends, to elect Directors in place of the retiring Directors, to appoint auditors for the current year and fix their remuneration and to transact any other business that under the Articles of Association of the Company may be transacted at an Ordinary General Meeting.

Share Transfer Books of the Company will remain closed from 20th February 1956 to 6th March 1956 both days inclusive.

By order of the Board
SAHU JAIN LTD.
Managing Agents.

Calcutta,
8th February 1956.

Dividends when declared will be payable to those shareholders whose names stand on the Register on 6th March, 1956.

Nursing its Old Wound

Thursday, Morning

THE Draft Outline of the second Plan has left the Stock Exchange cold. The reason for it is not easy to find. Now and again, whenever it feels depressed, the Stock Exchange nurses its old wound in public and complains about the stepmotherly treatment meted out to the private sector. There was also some nervousness on account of the reported impending payments crisis in Calcutta.

The reason for the Stock Exchange being off colour may, however, be none of these. The over-sold position in the leading scrips as disclosed by the budla rates for the last settlement might explain the present mood better. For carrying their purchases to the next settlement, bulls had to pay fifteen annas for Tata ordinary and ten annas for ACC. The budla rate for Indian Iron rose to 2½ annas. Tired longs, in the circumstances, may find it onerous to carry their holdings which, judging from these rates, must be pretty high. Against this background, occasional spurts have to be regarded more as temporary effects of covering rather than as an indication of a steadying trend.

The reported support by custodians of insurance companies to the share market appears, in retrospect, to have been nothing more than covering operations. The custodians could not have made any fresh purchases without specific directions from the Government. What they did was to complete the deals that had been entered into before they took over.

Textiles had tended to look up earlier in the week on hopes of higher dividends, inspired by the fine performance of some of the cotton mills e.g. that of the Brady group of mills whose working showed considerable improvement. Directors of New Great have recommended raising of dividends from Rs 7-8 to Rs 10. But the improvement could not be maintained and Bombay Dyeing led the way, declining from Rs 516-14 to 493-12. The selling pressure could only have been induced by speculation regarding a possible increase in excise duties, though reported fall in sales of cloth also contributed. Bombay Dyeing, however, soon improved as it came to be realised that despite a temporary decline in sales, the company must benefit substantially from increased production. In line with Bombay Dyeing, the other leading textile shares also closed better.

In the miscellaneous section, Belapur was knocked down from Rs 218-8 to Rs 214|- on rumours of a fresh agricultural levy but following reports that Walchandnagar was going to raise dividends from Rs 16 to Rs 18, Belapur not only recovered but shot up to Rs 242-8 and closed at Rs 239-6.

Cotton

Who has the Last Word ?

A BATTLE royal has been going on between the EICA who have had the last word on cotton so long, on the one hand, and the Forward Markets Commission which has been set up by the Government of India for regulating forward trading in all commodities all over India on the other. The Forward Markets Commission thinks that it is the Commission which has the last word on cotton as on other commodities. This dispute has to be settled, once for all. The first round went in favour of the Commission, the second round is now being fought out in the Bombay High Court. Considering the nature of the dispute and who the contestants are, it would be surprising if there were to be a third round and a final round. No one need doubt what the final outcome is going to be, though it seems that the dispute will be dragged on for a long time. The case is bound to go to the Supreme Court and until this final authority has delivered its judgment—and if the judgment is unfavourable, until the law is amended suitably—the cotton trader and the mills will have to do without hedge facilities which are so vital to the smooth marketing of a commodity like cotton in its long journey, through various stages, from the grower to the ultimate consumers, the mills.

Meanwhile, the continued absence of hedge facilities has been telling on the spot market also where activity has tended to slacken. There has not been much enquiry of late from overseas and mills are holding aloof, in expectation of a further decline in prices. Vijay has begun to move and its quality is reported to be good, both in staple and grade. But in the absence of any keenness on the part of buyers, prices of Vijay have tended to sag. Bengal, on the other hand, has managed to stay put, due to scarcity of supplies.

The presence of the President and the Secretary of the Karachi Cotton Association in the city has given rise to speculation about the possibility of an Indo-Pakistan deal for the exchange of 15,000 bales of Pakistani cotton for Indian coal. The Pakistan visitors are reported to have held preliminary discussions with representatives of the cotton trade.

Oilseeds

Curb on Exports Feared

ALTHOUGH the oilseeds market opened steady on sustained short-covering and renewed buying, the undertone perceptibly weakened towards the latter part of the week. The main reason for this reversal in trend was uncertainty surrounding New Delhi's future export policy. Following the ban on export of foodgrains, it was felt the Government might restrict exports of groundnut oil, especially when internal prices have been decidedly firm. The downward revision of the crop estimates confirmed these fears.

Groundnut February-March delivery which opened at Rs 30-10 gradually declined to Rs 30 on Tuesday and groundnut oil also came down in sympathy from Rs 15-13 to Rs 15-11. If the decline was no sharper, it was because of the strength in the ready section where groundnut received good support from crushers. There was hardly any export activity in groundnut oil due to paucity of export licences.

Castor May which had closed at Rs 119-12 last week fluctuated between Rs 118 and Rs 120-6 during the week. Ready castor also moved up with futures.

In linseeds, the trend continued to be easy following repeated rumours that the Government might impose an export duty on linseed oil. A bearish trend was noticeable in linseed oil at the beginning of the week. But towards the close, linseed improved fractionally from Rs 17-12 to Rs 18-2.

INVITATION

AS one of the leading Exporters and Importers in this country we invite you to make use of all the facilities offered by our Export and Import Departments—with representatives throughout the world

WE IMPORT

★ HEAVY CHEMICALS
★ TEXTILE MACHINERY STORES & SPARE PARTS
★ ARTIFICIAL SILK YARN
★ STAPLE FIBRE
★ ELECTRICAL APPLIANCES

WE EXPORT

★ TEXTILES & YARN
★ OILS & SEEDS
★ JUTE
★ MICA

YOUR ENQUIRIES WILL RECEIVE A PROMPT AND RELIABLE RESPONSE

Save valuable working hours!

FAST NEW Night Air Service

by Luxurious 4-engined

Skymaster

to BOMBAY-CALCUTTA

DELHI-MADRAS via NAGPUR

SAVE precious time and unnecessary expenditure on the way — *fly overnight* by new, Luxurious Skymaster service, connecting Bombay, Delhi, Calcutta, Nagpur and Madras. The new service cuts out irritating overnight stops, lands you in time for breakfast — and it is carefully scheduled to connect with 34 morning flights from the big airports. So by midday tomorrow, you can reach almost any important town in India! Wherever you want to go, whichever flight you choose — Skymaster service makes sure you get there in time! And you have complimentary meals, free travel to and from airport, everything. No extras to pay.

The Railway Budget

THE Union Minister for Railways, Shri Lal Bahadur Shastri, must have enjoyed presenting his budget for 1956-57. He was, in the first place, able to tell the Lok Sabha that the mammoth undertaking managed by him did better in 1955-56 than he had anticipated this time last year. Gross traffic receipts in the year that is ending are expected at Rs. 314 crores, or nearly Rs. 22 crores more than the amount estimated in the budget last year. Ordinary working expenses have, it is true, also increased; but this increase has been much less than on the receipts side. In consequence, Shri Shastri has not only been able to step up the appropriation to the Depreciation Reserve Fund in 1955-56 by Rs. 10 crores; but he is able to show a larger net surplus as well.

The Minister was, secondly, in the happy position of assuring the House that, with nothing more than a 6¼ per cent surcharge on freight rates, the railways would be able to gather a much larger surplus in 1956-57. The surcharge would add Rs. 11.6 crores to railway receipts and would not be levied on transhipments of grains and pulses, fodder, manure, khadi, newspapers, newsprint and books. Given this additional charge, and assuming a further increase in the volume of traffic, the railways would have a net surplus of nearly Rs. 23 crores, after allocating Rs. 45 crores to the Depreciation Reserve Fund and paying over Rs. 39 crores as Dividend to General Revenues.

It is good to see the railways relatively prosperous once again and think in terms of net surpluses of over Rs. 20 crores. But there is as yet no room for complacence in this regard. The size of railways' surplus and depreciation provision has to be viewed against the capital expenditure of the railways in the coming years. In line with everything else under the Second Plan, the railways have a heavy development programme, involving an outlay of Rs. 1125 crores over the five-year period. And even with the surcharge on freight traffic, the railways will be able to find only Rs. 375 crores, or only a third of the needed resources. In other words, the main burden of railway development will fall on the General Budget rather than on the railway budget.

Shri Shastri therefore benefits at the expense of Shri Deshmukh. It would be short-sighted to forget this and rejoice at the fact that the railway rates have, by and large, been left at the existing levels. It is true that Shri Shastri has in his favour the arguments that he had already raised passenger fares last year, that any large increase in freight rates would inflate costs and that, in any case, the Freight Structure Enquiry Committee has yet to make its recommendations on the tariff schedule. These are not arguments that can be lightly brushed aside. Nonetheless, there is the undeniable fact that if we want more transport facilities, we should all put more into the railways in one way or another. Situated as we are, we cannot have too much development of railway facilities. And the expansion programme for the Second Five Year Plan will hardly suffice to meet the ever-increasing needs of the country. Under these circumstances one naturally asks the question: are the railways doing enough to finance their development programme?

As mentioned earlier, the Union Government will have to find Rs. 750 crores for the railways in the next five years, or an average of Rs. 150 crores per year. Of this, it is expected that Rs. 680 crores will constitute capital investment on the railway undertaking, on which dividend will be payable to general revenues. The remaining Rs. 70 crores will be in the form of withdrawal from railway funds and/or special loans to the Railway Development Fund as recommended by the Railway Convention Committee last year. Either way, the funds have to be found by the Union Government, through taxation, loans or a budget deficit.

When one is thinking of thousands of crores of expenditure, to worry about a paltry Rs. 70 crores might appear incongruous. But the point is that of all the public undertakings in India, the railways are the biggest and the most profitable. If even this undertaking should make inroads into the general fisc, it does seem worth a thought. Apparently, if railways earn a larger surplus in the coming years, it will not ease the strain on the general budget. For, the understanding between the Planning Commission and the railways seems to be that to the extent the latter add to their surpluses, the size of their plan will also increase.

All this is not to say that the railways plan should be cut down drastically. We have, in fact, already observed that the need for development of railway facilities is great and will be greater in the future. There is therefore no question but that resources have in one way or another to be found for this purpose. It is also true that Shri Shastri will not by himself be able to get all the funds needed for the railways. But one might still ask whether he could not have gone a little further than he has done in order to augment the resources for development.

This is a moot point, involving a nice balancing of the advantages and disadvantages of making the community contribute a little more in the form of higher railway rates than in the form of higher taxes. Each of these modes will have far-reaching effects on various sections of the economy; and it may be that taxing the community directly is better than adding to transport costs. But how and why such a decision is taken should be made clear, so that the country at large is convinced that the sacrifice imposed on it is the least possible and the fairest under the circumstances.

With the Second Plan and the total financial implications of it occupying so much of our thoughts, it is natural that this part of the Railway Minister's budget speech should receive primary attention. Shri Shastri has, however, many interesting things to say on other matters. Before the next five years are over, the quality of service provided by the railways will be better and safer. Members of the railway staff will enjoy more power and be, on the whole, better off. All this is very comforting. But when one desires austerity in consumption, even small things like this matter, and it would be unwise to ignore them.

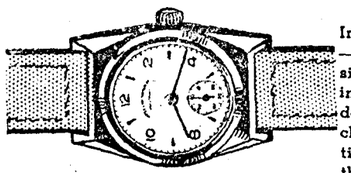
Russia's "New Look"

REJECTION of the "cult" of personality is an incidental outcome of the Communist Party Congress. Far more significant is the decision to disown Stalinism. Not M. Khruschev, but M. Mikoyan seems to have emerged as the theoretician of the Communist Party in Russia. M. Mikoyan and Marshal Zhukov, and not M. Khruschev, have made significant policy statements before the Moscow session of the Congress. Since Stalin's death, the principle of "collective leadership" had gradually replaced the Big Brother concept. But the "father figure" idea has not been abandoned. Even as Mahatmaji is revered in India as the "father of the nation", Lenin has now replaced Stalin as the "father figure" in Russia. This is not as significant as the revival of Leninism. Not only Stalin's one-man dictatorship, but Stalinism, as a principle, is disowned. Lenin is re-discovered as the true interpreter of Marxism.

M. Khruschev is still the dominant leader of the Communist Party in Russia. But his role does not seem to be more than primus inter pares. Policy decisions will not be made by him alone, but by joint consultations between him and his top-ranking associates in the Party Executive. One-man dictatorship of the Party is rejected. But the role of the Communist Party remains the same. It is the "collective leadership" of the Party, and not the Prime Minister, who will control and dominate the State and the country. This aspect of life, society and government in Russia has been a matter for constant criticism in democracies. In Communist Russia, as also in all democracies, it is the Party that dominates the party in power. In a democracy, there is party system of government. So in Communist Russia. But in a democracy, there is more than one party. In Russia, there is only one party. But Communists argue, as M. Bulganin explained at his Press Conference in New Delhi, that in a Communist country, there is no scope or necessity for multiple parties.

Even as the re-introduction of the principle of "collective leadership" reflects the strength and influence of the Communist Party within Russia, some of M. Mikoyan's observations indicate a new relationship between the Party and the people. Even during the Stalin era, differences among the Party heirarchy were not unknown. Since Stalin's death, these differences have been openly discussed and re-discussed. Emphasis on "collective leadership" means that freedom of expression among members of the Party Executive will not only be tolerated, but will be encouraged. It is a logical corollary that the people will be allowed more freedom to discuss the policies formulated by the Party. M. Mikoyan was as critical of the Party's attitude to the people as of the defects of Stalinism. Even as the admission of the need for more freedom of thought and expression to the people is symbolic of the Party's growing strength, this internal political trend will not be unfamiliar to those who are aware of developing political events in Russia.

Peaceful co-existence, on the basis of **Panch Shila**, as the foundation of Russia's foreign policy and greater freedom within the Communist Party and the country are the major decisions of the Communist Party Congress. Before the latter aspect is analysed in detail, it is necessary to appreciate Moscow's foreign policy. In their speeches, all the Russian leaders accept peaceful co-existence as possible and desirable. But it is not without significance that Marshal Zhukov has been at pains to explode the Dulles threat of "massive retaliation" as well as of the theory of Gradual Deterrent through use of tactical atomic weapons. Marshal Zhukov has bluntly informed the Western Powers that Russia would not accept any limitation to an atomic war. He rejected the theory that, in any future war, nuclear weapons could be confined to front-line, tactical uses only. It is as well that Washington now knows that Russia will carry any future atomic war to American territory. This open declaration, like Russia's hydrogen bomb, should not only perpetuate the present "hydrogen stalemate", but may further the cause of peaceful co-existence.



If Marshal Zhukov underlined Moscow's determination to match the Dulles policy of building positions of strength through consolidation of Communist Russia's military might, the speeches of the other leaders indicated a new shift in Russia's economic and foreign policy. It is clear the Russian leaders have come to the conclusion that the present "hydrogen stalemate" will be followed by a prolonged period of peaceful co-existence. This is the main reason behind the shift in Russia's economic and foreign policy. Details of the new policy may be changed as circumstances alter. But the new policy is based on M. Mikoyan's analysis of Capitalism. In 1952, Stalin propounder the theory that capitalist economy will disintegrate as the world market for capitalist countries shrinks. Stalin was not wrong in his premise, but in his conclusion. As Communist Russia's economic strength has developed, as the economies of Russia and her neighbouring Communist countries, including China, have been integrated, there has been a shrinkage in the world market for capitalist countries. But the longed-for crisis of Capitalism has not come about. In rejecting the Stalinist theory of absolute stagnation of Capitalism, M. Mikoyan emphasised the post-war improvement in talist countries. Ultimately, the cause of the world proletariat will triumph. But Russia, the home and leader of world Communism, will fight the battle with changed tactics.

Russian leaders have not abandoned their Marxist faith in the revolution of the world proletariat. M. Mikoyan is emphatic that the Welfare State experiment in capitalist countries cannot prevent the revolution of the world proletariat. He is sarcastic in his comments on evolutionary reformers of Capitalism. But he is an economic realist who is convinced that the cause of the world proletariat cannot be advanced by any blind belief in the inherent contradictions of Capitalism.

Peaceful co-existence will mean competitive co-existence. Encouraged by Russia's impressive economic strength, Russian leaders hope that they can beat capitalist countries at their own game. Russia will now try to emerge as a major world exporter of goods and technicians. Her economic policy will continue to have an accent on heavy industry. But she will soon produce enough consumer goods to enable an improvement in the standard of living of the people. Peaceful co-existence will help Russia to pursue such an economic policy. Labour productivity will be improved through progress of technology and abundant supply of power. There is an implied confidence in M. Mikoyan's address that Communist Russia will soon equal, and then surpass, America's economic strength. To achieve this aim, Russia must be assured of world peace. As peaceful co-existence helps Russia to attain this fundamental objective, the world proletariat will emerge supreme without firing a single shot by Communist Russia. Stripped of the obscure jargon in which Stalinism is rejected, this is the main assumption behind the new Russian policy. Such a shift in policy is a logical sequel to competitive co-existence. Throughout the world, the common man will expectantly await the outcome of the new policy of the new leaders of Russia.

Rolled Gold, 30 Microns	...	Rs. 135

Behind every 'West End' model is our reputation of over 75 years as experts in Quality watches, specially designed for use in India.

In Office, in factory, in mill —in fact throughout professional, commercial and industrial life, time is a dominant factor. Time to clock in, time taken on a job, time for delivery — everything must run smoothly to a plan, and a watch is every man's need, whether he be master or employee. For those who place dependability first, a 'West End' watch is the right choice.

BOMBAY CALCUTTA

Weekly Notes

The Budget Next Week

NOTWITHSTANDING States' Reorganisation and all that, the coming week belongs to Shri Chintaman Deshmukh and his budget box. The budget he will introduce in the Lok Sabha next week ushers in the second Plan, a plan which so many have for so long desired will be bolder and better than the first Plan. It will have to set the pace for the next five years, and therefore invites more than normal interest.

That Shri Deshmukh will budget for a big increase in development outlay should by now be obvious to the meanest intelligence. It is equally obvious that, in the chaotic position in regard to the States, the Union budget will be the main instrument for pushing ahead towards the many objectives indicated in the Draft Plan. There will, therefore, be limited speculation on the expenditure side. By and large, speculation will be confined to the manner in which the Centre will distribute its expanded outlay among the various projects and States.

The bigger question is, however, how Shri Deshmukh will cover this increased expenditure. Looking at the Railway receipts for 1955-56, one might guess that the Union budget will also have benefited to some extent by the increase in the tempo of economic activity this year. Shri Deshmukh will probably draw part of his resources from larger yields from existing taxes. Further, the coming year is, fortunately, one in which there are no large debt maturities to be covered by the Government. But sizable loans are due for repayment in 1957-58, and the Finance Minister may well try to extinguish part of the future liabilities in the budget for 1956-57. Even so, it seems safe to expect that the Capital Account will take credit for sizable net borrowing from the open market. This, with the steady increase in small savings, should give Shri Deshmukh considerable amounts to play with.

And yet, he cannot avoid tapping new sources of taxation and a large budget deficit. If the expenditure targets in the second Plan are to be achieved, he will have to find Rs 250-300 crores more than in 1955-56 for development purposes. This is obvious from the fact that the steel plants are already on hand, and the Railways have gone ahead on the basis of an expected capital investment by Government of the order of Rs 115 crores. And if past trends are any indication, loans to State Governments will need to be larger than ever. Even with higher yields from existing taxes and larger borrowing, Shri Deshmukh will have a big gap in resources, the major part of which will need to be covered through borrowing from the Reserve Bank.

In the matter of deficit, Shri Deshmukh cannot now feel as uninhibited as he was last February. We have today a larger money supply, and no clear case for a reflationary programme. The world outside has, once again, reverted to anti-inflationary measures. And even in India, monetary policy may have to be somewhat more restrictive than in the past. All of which will cause him to be circumspect while stepping up the rate of deficit-financing. Which means in its turn, that the probability of a fair-sized increase in taxation is, as Damon Runyan would say, more than somewhat.

Marathon Session for Lok Sabha

ONE of the longest sessions of the Lok Sabha—planned to last nearly 3½ months—began last week, and is expected to end on May 26. If the amount of legislative work that has to be carried through is any indication, the current session may indeed be extended further, in order to allow for marathon speeches by members, especially on such subjects as States' reorganisation and the second Plan.

The present session, though technically a budget session, will perhaps spend less time on Railway and the General Budgets than on the States' Re-organisation Bill. Apart from being the most controversial item on the agenda, it has necessitated the introduction of two related Bills, proposing amendments to the Constitution in order to facilitate the reorganisation of States. Three categories of amendments to the Constitution have been proposed: first, those relating to ancillary or consequential changes, such as the abolition of the office of Rajpramukhs and the three categories of States, which will be incorporated in the States Bill; secondly, amendments which do not require the sanction of State legislatures e.g. safeguards for linguistic minorities, involving adjustments in article 35(b) of the Constitution; and finally amendments which require the sanction of State Legislatures, viz. changes in article 1(2) and the Fourth Schedule of the Constitution relating to alterations and renaming the units of the Republic and the allocation of Parliamentary seats among States. Both the States Bill and the amending Bills are expected to be referred to a Select Committee and may be taken up for discussion by the end of March.

The second Plan is another important item on the agenda which will engage the Lok Sabha for a good while. However, since the Plan has been under public discussion for quite some time now and has been considered recently by the Amritsar Congress, it is possible that attempts will be made to have the blue-print approved in a hurry. But it is unlikely that the non-Congress members of the Lok Sabha will let this important document, which proposes far-reaching economic and social changes, be passed without saying their pieces on planning at great length. Another important piece of legislation which is likely to occupy a great deal of the time of the House and generate some heat is the Insurance Nationalisation Bill, replacing the recent Presidential Ordinance. A lot will be heard about the autonomous nature of the proposed Life Insurance Corporation and extreme views may be expressed on the question of compensation.

An interesting feature of the present session is the large number of pending Bills before the House—33 official and 77 non-official. In addition, Government have on hand a dozen new Bills, while members have sought leave for moving more than half a dozen. To add to all these are the Representation of the People (Second amendment) Bill, as reported by the Select Committee, the Bar Councils Bill, the University Grants Commission Bill and the Voluntary Surrender of Salaries Bill. With so much important work to be done in so short a time, members of the Lok Sabha might well feel apprehensive. But perhaps our legislators are made of sterner stuff than many outside, and will find both the time and energy to do justice to the rich fare before them.

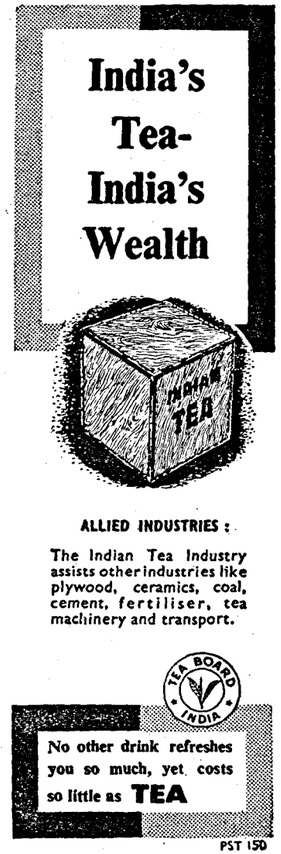
Pressure on the Bank Rate

THE dramatic rise in UK's Bank Rate last week has naturally led to some speculation about the future of the Bank Rate in India. The announcement made by the Reserve Bank regarding the increase in the rate for loan against bills and pro-notes from 3 per cent to 3¼ per cent just before the rise in the UK Bank rate has led some to believe that the Commonwealth Central Banks act as a team, when it is a question of making credit dearer. And, in any case, the feeling is gaining ground that inflation is round the corner.

Some monetary purists have been clamouring loudly against deficit-financing before it has actually got into its stride. Any upward movement in prices is frowned upon by them and an alarm is raised. The rise in the monthly average of wholesale price index in India from 363 in January 1955 to 375 in January 1956, which is no more than 4 per cent, is pointed out as an eloquent testimony to the fact that inflation is already on the way. Hence they say, the Reserve Bank should follow the Bank of England and raise its Bank rate, so as to bring it into line with the effective rates of interest in the economy and prevent an undue increase in liquidity. The banks are, in fact, reported to be contemplating an increase in the advance rates in order to impart a healthy tone to the Indian Money market. Average bank credit has moved from Rs 573 crores in January 1955 to Rs 675 crores in January 1956, and hence the feeling that it requires to be squeezed a bit.

It is, however, noteworthy that though total money supply has increased by Rs 244 crores or about 13 per cent during this period, the wholesale price index has moved up by only 4 per cent. The change in the group indices is even more revealing. There has been no change in the wholesale price index of Manufactured goods, and there is a negligible rise in that of semi-manufactured goods. The price index of industrial raw material has risen by over 5 per cent. But much of this rise is accounted for by the sharp increase in the price of oilseeds, which is due more to increased demand from abroad than to any monetary cause inside the country. In respect of food articles, the price index has gone up by 7 per cent, but in the context of the fall it suffered previously, this rise is more in the nature of a return to proper levels. In other words, in spite of the large increase in money supply, prices have not shot up dangerously as monetary pundits would have us believe.

Call Money



BUT there could still be a case for initiating a credit squeeze in view of the mad race for funds which the banks themselves are running. 'Call money' which used to be, in the past, a minor element in the money market is now a factor to be reckoned with. Many banks are now paying 3¼ per cent for 'call'—the same they offer for 1 to 12 months. Having got into the habit of depending substantially on this means, the banks are now unable to give it up. Unfortunately no statistics are available of the call money the banks are receiving—since current account deposits earning ¼ per cent interest and call money earning 3¼ per cent interest are both lumped together under the heading demand deposits. But it is well known that during the last six months some of the bigger Indian Scheduled Banks have been bidding up the Call money rates. The Exchange Banks have apparently been relying more on the bill market for their requirements so far. Now that the bill market rate has been raised, they might also enter the call money market with increased vigour.

Instead of stopping this scramble for call money, the banks are seeking to raise the advance rates in order to maintain their margin. Should they succeed in doing so, the Reserve Bank will be compelled to bring its Rate into alignment with the market rates at a higher level. Whether or not the Reserve Bank should raise its Rate here and now is a question that needs to be decided in the light of many considerations. But it ought not to allow itself to be stampeded into putting up the Bank Rate merely because UK has done so and the banks here want to safeguard their margins by raising the rates on advances. If the banks cannot agree among themselves to put a ceiling, and quite a low ceiling at that, to the call money rate, the Reserve Bank should step in and do something about it. Though outwardly, the bankers may raise a hue and cry, inwardly they will be glad to be relieved of the Frankenstein they themselves created by sheer cut-throat competiton. The interest structure in India requires adjustment from the bottom and not from the top.

Royal Visitors

INDIA, a secular Republic, wishes well of Iran. It is right and proper that New Delhi has extended a warm welcome to the Shah and the Queen of Iran. As the royal visitors from Iran continue their tour of this country, they can be assured of an enthusiastic welcome from the people. There have been close social and cultural contacts between India and Iran throughout history. There will be hope that the visit of the Shah and the Queen of Iran will lead to an active revival of intimate historical associations between these two countries to their mutual advantage.

Iran is a Muslim State. So are Indonesia, Afghanistan, Saudi Arabia and Egypt. It is symbolic of India's secular status as well as of her foreign policy of good neighbourliness that she has cordial relations with so many, among others, Muslim Asian neighbours. It is equally gracious of the Shah of Iran, as of the King of Saudi Arabia, to remind the Muslims of this country that

their main obligation, as citizens of this country, is to work for the progress and development of India. New Delhi and people of this country will appreciate the Shah's conviction that the Constitution of the Republic of India offers equal privileges and opportunities to all her citizens, including Muslims.

Iran is an oil-rich country. She occupies a crucial strategic position in Asia. She has, therefore, throughout history, been involved in international power politics. It was the present ruler's father who was the architect of modern, independent Iran. The present Shah has rid the country of foreign control and domination of her vast oil resources. By according a welcome to the royal guests from Iran, a member of the Baghdad Pact, India has shown that New Delhi seeks friendship with all nations. Though Iran is a member of the Baghdad Pact, the Shah and the Queen will visit Russia later this year. New Delhi will hope that this proposed visit will lead to amity between Iran and her northern neighbour. And the people of India can hope sincerely that Iran will continue her march to stable progress.

The Life Insurance Corporation Bill

Our Delhi Correspondent writes:

FOR life insurance companies, their employees and the policyholders who have been passing through a period of uncertainty, the prompt introduction of the Life Insurance Corporation Bill has provided some relief, though it will not answer all the questions. The Bill provides for the establishment of a corporation to which the life insurance business in the country will be transferred. But too much cannot be read into this corporation proposal; as the provisions of the Bill stand, the Corporation will be departmental in character, though it is not directly comparable to departments like the Company Law Administration. In common parlance, the word 'autonomous' is always linked with the idea of a corporation and it was the general belief that the Life Insurance Corporation also would have a quasi-independent status. The entire original capital of the Corporation of Rs 5 crores will be provided by the Central Government after Parliament makes special appropriation for the purpose; the members, not exceeding 15 including the Chairman, will be appointed by the Government. In the discharge of its functions under the proposed law, the Corporation is obliged to be guided by the directions on matters of policy by the Government, and the final decision on what constitute such matters also rests with Government.

Thus, though the Corporation will be a body corporate having perpetual succession, a common seal, powers to deal with property and fit to sue and be sued, it will presumably have no life, much less a soul, of its own. It is laid down that the Corporation should act on business principles 'so far as may be' and that its objective should be to develop life insurance business 'to the best advantage' (of whom, it is left unsaid). It is empowered to carry on business even outside India but this is apparently intended to tide over the transitional period since it is provided later on that the Corporation will have power to transfer the whole or any part of the life-insurance business abroad to any other person. The life business of State Governments will also merge with that of the Corporation; but not so the scheme run by the Central Government known as the Post Office Life Insurance Fund.

Among the persons who will be disappointed by the Bill will be the Auditor General who is excluded from the role of audit, to which he had seemed entitled in respect of every nationalised Corporation; auditors qualified to act for companies under the Company Law are considered enough (or are they preferred?) even for this vast new undertaking which will handle nearly Rs 400 crores of life funds. The actuaries will have a busy time, with the proposed valuation every two years; and 'if any surplus emerges'—to use the language of the Bill—not less than 95 per cent of such surplus should be allocated to the policyholder. Those who pay loaded premiums for policies with profits may however still wonder whether this is not a big 'if'. Under Clause 28 of the Bill, the Central Government seeks to guarantee the payments of all the assured sums and bonuses declared before and after nationalisation. This guarantee, therefore, makes it necessary that it should exercise a close watch over the working of the Corporation. The assurance is, however, qualified by the provision that the Corporation can in certain cases modify the contracts of insurance by reducing the amounts assured, if the financial condition of any insurer on the date of taking over is such as to justify that step. The reduction will not be arbitrary but governed by a scheme approved by the Government; even so, it introduces an element of uncertainty.

In Clause 13 of the Bill it has been provided that certain transactions of the insurance companies made in the last two years can be reopened if they disclose 'an unreasonable lack of prudence on the part of the insurer'. Payments made on sale of property without adequate consideration, purchases on excessive terms or other such benami agreements can thus be reviewed before the Tribunal of three members to be appointed to decide compensation and other claims. Whether such retrospective assessment of irregularities is proper may well be argued; there have been many such transactions which justify nationalisation, but should third parties suffer, even though it is provided that the Tribunal should take into consideration the extent of the responsibility of these parties? Why two years? The answer perhaps will be, why not?

The Corporation is empowered to invest its funds in such a manner as it thinks fit subject to rules to be framed by the Government, but whether investment in shares and debentures and loans on property will be available to the private sector as before will depend on the rules and the directions on policy to be issued by the Government. For the insurance employees, there is assurance that they will be taken over by the Corporation on the same terms of service. But there is also a condition that in certain cases, alteration in terms of service and reduction of salaries may be made. It is presumed that this will apply only to the sinecures mentioned by the Finance Minister in his broadcast address but other ranks may also feel uncertain.

Finally, the Bill provides (in Clause 34) for the application of such of the provisions of the Insurance Act of 1938 as Government considers necessary, to the business of the Corporation. Otherwise, the existing law will cease to govern life insurance business, though it has not been formally repealed but only indirectly suspended by this Clause. It is amazing that the memorandum on Delegated Legislation attached to the Bill completely ignores the sweeping character of this power to amend an existing law through notifications issued by Government.

National Institute of Social Sciences

THE proposal to start a National Institute of Social Sciences (first fully discussed in these columns in the issue of October 15, 1955, pp. 1213-4), we learn, is finding increasing support in quarters that matter. It is very necessary, therefore, to reiterate certain fundamentals which, if forgotten, will defeat the very purposes for which the Institute is to be founded. Firstly, the Institute should be devoted to carrying out fundamental research only—this cannot be stressed too much. In this transitional period, when the work of the universities is bedevilled by linguistic confusion, falling standards and increasing numbers, and the desertion of much of the best teaching material to more lucrative posts in Government, foreign firms and international agencies, it is necessary to create a sanctuary, where men with the necessary ability, qualifications and temperament can devote themselves to conducting research at the highest level—and nothing less— in the various branches of the social sciences. Call it even an ivory tower, if you like, but that is what is needed—a full-fledged institute for Advanced Research. There is real danger that without such an institute we will have frittered away the energies of the very few first-rate Indians in the social sciences—the country will have, like many an improvident peasant, eaten up the precious seed-grain with which the next year's crop is to be raised. And the tragedy of it is that there is no awareness at all of this problem in the country, either at the Governmental level or, what is even worse, at the academic level.

The Institute should have a certain number of fellows, selected on a five-yearly basis, and the fellowships should be renewed only if first-rate work has been produced. The fellow's primary aim should be to conduct original research in a field which he considers important and for which he has the necessary training. He might also be asked to guide the research of one or two junior fellows conducting doctoral or post-doctoral research. A few first-rate students, selected on an all-India basis, should be attached to the senior fellows for conducting Ph.D. research—this is being done in certain research institutions like the Indian Institute of Science at Bangalore and the Deccan College at Poona. The National Institute of Social Sciences could also hold occasional seminars on select topics for teachers in the social sciences in the various universities in the country. Both these measures are calculated to ensure that the senior fellows of the institute get the stimulus of contact with young and growing minds. But care should be taken to see that these activities do not encroach on the main business of the institute which should be to further fundamental research at the highest level. Otherwise, a publicity-seeking director may hold too many seminars, or the senior fellows may be spending all their time teaching and guiding research, instead of doing research themselves.

It is quite clear that the Planning Commission and the Community Projects Administration should be kept out of such an institute. Otherwise, the camel of applied research will push the Arab of fundamental research out of the tent. The temptation to be useful must be resisted at all costs. The Institute should develop a healthy convention by which the visits of Ministers and other non-scholarly VIPs are kept to an absolute minimum.

It is obvious that the personality of the Director is crucial in such a set-up. He should be a scholar and an administrator—an administrator who sees that administration is an evil which should be kept to the minimum. The day-to-day administration should be carried on by a Registrar who knows enough of academic life to free the fellows and Director for the important work of research. All policy decisions should be made by a council of senior fellows. The institute should be immediately responsible to a board of visiting scholars.

But it would be seriously doubted whether the country is enlightened enough to start an institute on these lines. What is more likely to happen, however, is that just one more institute will be started in which all the known errors and follies will be repeated—an institute dominated by men whose interests in intellectual problems has given way to a passion for the minutiae of administration, and a body of fellows who will be working on the social science equivalent of the solar cooker, synthetic rice and soya bean curd. The director will be spending all his time addressing press conferences, showing round VIPs, and signing bills in triplicate.

Ours is the age of back-room-boys no less in the field of the social sciences than in the field of nuclear energy. Unless those who are in power realize and create conditions for qualified men to pursue research into fundamental problems in peace, the judgment of history will go against them. But in our ancient and timeless land, who bothers about history?

Off the Record

Wisdom Ex Post

IT is sheer lack of intellectual honesty to make any sweeping statements about the superiority of any one production technique over another on purely economic grounds, without taking into consideration all the relevant factors. And it needs to be remembered that the relevant factors are not all severely economic. Idealism and ethics can and do come into the picture, especially when one is concerned with the preservation and promotion of cottage industries. Importing these considerations into one's assessment of the scope of cottage industries is not tantamount to being romantic. The case for handicrafts can, for instance, be stated clearly and in a manner that leaves little room for any misunderstanding or sentimental nonsense. Broadly, it insists that machines can never kill art; so artistic handicrafts will always have a market and cannot be ousted by mass-produced goods. True, this market is specialised and difficult to exploit fully, without elaborate organisation. True also that art to be saleable should in some measure be wedded to utility, which calls for intelligent adaptation of designs and considerable efficiency in their execution, so that the products may continue to satisfy changing tastes and consumer preferences in the markets concerned. But these considerations are valid in respect of other consumer goods as well.

Since artistic handicrafts are necessarily expensive, however, markets for them have to be sought among the higher income groups, whether in India or abroad. In view of the scarcity value which the handmade products command in markets suffused with mass-produced goods, foreign markets should prove particularly attractive from this point of view. These markets, however, are not only difficult to get at, but also hard to retain, in view of the well-known capriciousness of the rich buyers.

An additional difficulty arises in adapting traditional skill and materials to markets which are highly susceptible to changing fashions—adjustment of supply to changing demand being rendered particularly difficult by the limited supply of skills, lack of adaptability of craftsmen and so on, the very factors which make for the special appeal of artistic handicrafts. Or, in other words, not being amenable to methods of mass production, crafts can rarely be developed in a big way for export markets. Besides these inherent limitations, there is another which may not be obvious at first sight. Art that is divorced from life ceases to thrive. Crafts that are similarly divorced wither and decay. Export orientation, therefore, may snap this vital link and succeed only in producing curios for tourists that will soon lose all cost appeal.

Leaving aside artistic crafts, there is another type of village industry which survives because of the limited local demand, partly because the market is too limited to attract mass-produced goods and partly because costs of transport and distribution offset the comparative advantage of large-scale production in factories. Other factors of advantage to village industries are availability of family labour which involves no cost in the absence of alternative employment opportunities, access to local raw materials etc. But these by themselves are not enough for their survival in the absence of the first two factors noted above.

In the economics of cottage industry, as in other spheres of operation of the economic process, note has also to be taken of inertia or friction. The process of displacement of less efficient by more efficient techniques of production is slowed down by friction of all sorts and by immobility, so that we come across the phenomenon all over India of people still plying some trade in which they are not making an adequate living. In recent times entry into some occupations has been restricted by trade union action. But this by itself does not fully explain the unfavourable ratio of rural to industrial wages in India. Part of it is explained by job cost and part by inertia, apart from hindrance to mobility; but the relative strength of these forces still remains to be studied and clearly ascertained.

Though data on village industries are extremely scattered and no systematic study of these data has yet been undertaken, it can be generally stated without fear of contradiction that in many sectors of the economy, the process of displacement is not entirely a fait accompli. Even today handloom products which are neither artistic nor so specialised as to meet only local demand also sell side by side with mill-made cloth. The village potter still struggles against the steady displacement of earthernware by utensils of enamel, porcelain and aluminium. Lately the process has been accelerated by the entry of plastic goods of all sorts into the range of competitive products. The village cobbler is steadily facing competition from factory-made shoes, especially the cheaper rubber and canvas shoes.

Partly the village craftsman survives because he is in a position, so to speak, to add to his product some 'servicing'; in the case of the cobbler or the blacksmith, it is because of the service he is able to give by repairing the shoes which he makes or the small tools and agricultural implements he turns out from his village smithy. On the other hand, new trades are coming up, such as that of the tailor who is no longer something of a novelty even for backward villages or that of the mechanic in the more advanced villages which happen to be connected by road with neighbouring towns and have, therefore, the indirect benefits of motor transport. A small repair shop catering for the requirements of cyclists or passing motorists has now become a familar sight in many parts of the country.

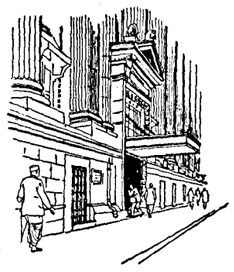
Since classification is the first step of knowledge, it should be made clear here that none of the village or cottage industries considered above are to be confused with small-scale industries which have grown up as an adjunct to large-scale industries. These constitute a separate group by themselves and have to be treated separately.

Leaving aside therefore the non-competing groups, there is still a wide sector, as mentioned above, where the process of displacement has been actively at work. This displacement has been going on, sometimes at a fast rate, sometimes rather slowly over decades and centuries. Even in the late years of

Shahjahan's reign, British yarn had been selling in the markets of Decca, the centre of muslin manufacture. During periods of acute shortage, this process had been temporarily held in abeyance. When world war II ended, import control and continued inflation staved off displacement awhile; but for quite some time now the process has been revived. Economists have at long last understood the character of this process, and what is more, have come to realise clearly, but only very recently, the social aspects of the problem. To be fair, it may be mentioned that the clear-sighted economist had no illusion about it, and when Messrs Bowley and Robertson recommended an economic census for India way back in the late 20s, they suggested that a subsidy for cottage industries, threatened by competition from factory products, would be perfectly justified and rational, as a substitute for social security which India did not have or could not afford.

The subsidy argument has now been revived and has come to win wide acceptance. A variant of this argument in a more sophisticated form is in terms of aggregates for the economy as a whole. Development of factory industries is the result of investment in these industries. If more efficient production displaced labour in less efficient production, it had hitherto been accepted on trust that the answer was not to go slow, but to go fast. It has taken economists many, many years of groping and blundering to see the process in clear and correct perspective. Because we cannot go fast enough with more efficient production, progress being limited by the ability of the country to invest in the more productive industries, we have to go slow until we are able to step up the rate of investment so fast that all the labour that is displaced, as a direct consequence of such investment, can be readily absorbed in employment, the opportunities for which are created by larger investments. The substance of all this had been grasped by men of common sense and leaders of insight long ago. Hence Gandhiji's emphasis on the Charkha, though the symbol of the charkha meant much more. The conclusion is difficult to resist that economists, like philosophers, are wise only after the event. It is in the evening that the owl of Minerva takes wing.

STATE BANK OF INDIA



Successors to the Imperial Bank

The need of the day

Our country's economy is expanding rapidly and with the Second Five Year Plan in sight it will gather further momentum. The need for a strong and efficient banking system has never been greater than today as the nation's savings require to be pooled and managed in a resourceful, confident and prudent manner.

The State Bank fulfils these expectations. It has started upon a programme of opening 400 additional branches throughout the country within the next five years.

The State Bank of India offers to serve you efficiently in many ways. It takes care of your savings and valuables, lends moneys against goods, produce and other approved securities and assists you by accepting appointment as executor and/or trustee of your will or trust. Its wide and varied services are at your disposal. Why not talk things over with your nearest bank agent, or write for information?

The State Bank's local head office at Bombay, one of more than four hundred offices waiting to serve you throughout India

The Macmillan Squeeze

ECONOMIC policy with the mailed fist: the show of drive and determination to squeeze symptoms of inflation out of the economy is what the latest economic measures are designed to portray. After hesitating and dithering for many months with what was and is a critical situation, the Eden Government has now acted in a desperate effort to save its life and what little is left of its prestige. It seeks to give the impression that it is in control of the economic forces at work. In fact, few will be convinced by the exhibition. It is certainly true to say that, with the possible exception of Labour's rule in its last days of 1950, never has a Government of the United Kingdom shown greater lack of touch with the concrete situation than is now shown by Sir Anthony Eden and his colleagues.

The British economy has, since 1945, passed through a number of crises. In only one instance was the policy of capitulation resorted to: the 1949 devaluation of sterling. But never has there been confusion in policy. Today control over the forces fashioning the economy are no longer in the hands of the authorities. This fact became clear as long ago as 1953. The almost revolutionary abandonment of physical controls was replaced by a set of tenuous monetary measures whose subsequent history was to prove their ineffectiveness as a substitute. Even then the use of these measures in the name of 'flexibility' has been bewilderingly varied and out of keeping with the concrete situation. The present variation is, however, the most remarkable of all.

Rise of One Per Cent

The bank rate, which since February 1955 has remained unchanged at 4½ per cent, has now been pushed up to 5½ per cent. Thus in a full year, the rate has been pushed up by one per cent. In that same year the visible trade deficit rose from £599 million to £862 million—a rise of over 30 per cent. In September last, a number of changes in the purchase tax were imposed in a Supplementary Budget bringing within the field of indirect taxation a whole host of consumer and other goods. In spite of this, the volume of imports rose by over 1 per cent between the third and fourth quarters of 1955. At the same time, this tactless measure resulted in trade union submissions, under the threat of strike action, of wage claims amounting to an increase of some £150 million in a year. We may go a bit further: in the six months following the Chancellor of the Exchequer's request for a significant cut in bank lending, total Bank loans have been cut by £309 million. And yet the Board of Trade reports that commercial stocks over the past six months have remained at about a constant level. Maybe the Eden Government has been unlucky—in contrast to its luck in 1952, when recovery was occasioned not so much by the resort to monetary policy, but rather by the maintenance of American import levels and foreign aid—anyway, all that the Eden Government has attempted up to now has come to nought. Inflation persists. It is more likely that the current difficulties have little to do with luck: nothing like the Indian monsoon exists in this part of the world to determine levels of production, employment and the balance of payments. There is, thus, little wonder that the present measures evoke no enthusiasm in the country as a whole. Even the Liberals have censured Government.

Not New Enough

The Macmillan measures are, principally, four in number, and none of them are new enough to call for particular appreciation: (a) the rise in Bank rate to 5½ per cent; (b) restriction on hire purchase transactions by increasing the initial deposit level; (c) withdrawal of a certain amount of subsidies on bread and milk; and (d) pruning of capital expenditure programmes of the public sector (nationalised industries, local authorities and Central Government). It is said that with regard to the first, a Bank rate of 4½ per cent had no longer become penal because of two money market developments —the fall in gilt-edge security values had made their yields move beyond the 4½ per cent level; and secondly, that the discount houses were now so frequently 'in the bank' that a 4½ per cent bank rate was irrevelant to the general pattern of short-term rates.

Maybe these movements justify a rise in the bank rate. But its implication in the wider fields of economic activity are not so clear. Will higher interest rates restrain borrowing in a situation already steaming with inflation and with profit levels generally in the region of 15 to 20 per cent? Your correspondent does not believe that such a restraint will emerge. On the contrary, some of the larger private firms are financing their investments and their stock holdings from huge accumulated liquid resources which they had built up since the war. In this situation the rise in interest rates is more likely to affect prices, encourage wage claims and so make the export trade become increasingly difficult. If, however, a 5½ per cent bank rate is designed to encourage the inflow of private foreign capital to sustain the exchange rate, and so to build the gold reserves, then here again, considerable doubts exist.

Negative Significances

Today, the talk of crisis rather than the bank rate affects the attitude of the international speculator. In this situation, it is difficult to see the bank rate affecting the gold reserves. The other measures, too, are of negative significance to the main questions of the day. The previous hire purchase restrictions had taken off the boil in this field of consumer spending—where it may still have an effect is in regard to control over the purchase of producer goods on the hire purchase system. In so far as this measure will be applied, it will represent the only tangible control over private investment activity.

The withdrawal of bread and milk subsidies—an act of folly at the best and a crime at the worst—will exacerbate the price-wage spiral and will give fresh vent to inflation. As for the controls to be exercised over investment in the public sector, no new development in policy is introduced: the fall of £309 m. in bank advances in the last six months is, in the words of the **Financial Times**, 'reflective of the contraction of lending to the nationalised industries'.

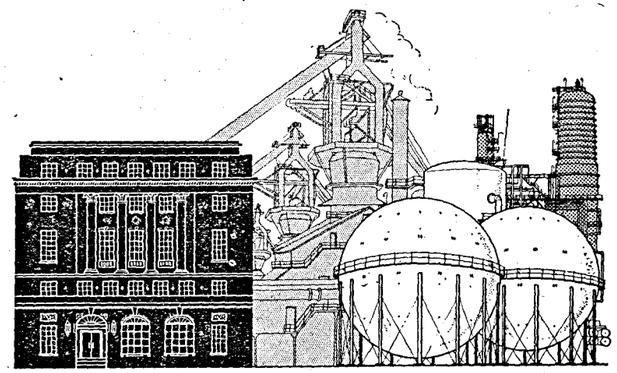
For many months now, the local authorities have not been able to borrow funds from the Central Public Works Loan Board, and the Macmillan measure here is only an indication of the continuance of the existing practice. As for Central Government expenditure, capital and other, the latest estimates coming from each of the Government departments and, in particular, from the Defence Ministry, show that Government spending in the next financial year will be higher than in the last.

Mr Macmillan has informed the House of Commons (against a chorus of 'Resign') that the Capital Issues Committee will henceforth adopt a severer attitude towards all new applications. He did not, however, mention whether the raising of capital of £50,000 or less by any company will come again under the purview of the Capital Issues Committee. There is evidence that a number of companies have been circumventing the regulations by forming subsidiary companies with capital issues of £50,000 and less, and in this way have been free to raise as much money as they want for investment and expansion.

Private Capital

According to an investigation carried out by the Board of Trade, private industry intends to increase its capital expenditure between 1955 and 1956 by as much as 17 per cent, which is equivalent to an increase of about £208 m. Nothing in Government's new measures impinges on this expected level of private capital investment. And it is this field of activity which over the past year, and most surely in the coming, has claimed most of the economic resources of the country.

These claims have, therefore, prejudiced the export trade, called for an increase in imports and has led to the very full employment situation in the country. It would have been expected that even if Government did not wish to impose import controls, it could have, without much difficulty, imposed some control over the building of factories. The impression obtained, however, is that Government is more bent on depressing living standards than interfering with the whims and fancies of private capital, whether or not these whims and fancies lead the country to the brink, if not, to disaster.



Letter to the Editor

EMPLOYMENT FOR WOMEN

I WONDER why in the discussion of cottage industries, the making of papads, pickles, the stitching of dining leaves, and leaf cups, embroidery, knitting and sewing are not mentioned. I do not know how many people are engaged in these activities, nor the amount of money they earn, but I do know that they provide employment for many poor women some of whom are widows. Cannot the benefits of co-operation be extended to them? The significance of such an extension would be out of all proportion to the amount of money earned because every pie earned would go a long way in maintaining many an unfortunate woma and her half-starved children.

Does the Karve Committee Repor mention these activities? If not why not?

Curiou

—by the company we keep

The company we keep is exacting company. In our dealings, whether with banker, steelmaker or industrial chemist, we must continually measure up to uncompromising and searching standards of achievement and stability.

Our concern is with any business with a problem which can be solved by punched card methods — electrical or electronic — a fact which can only be discovered by talking the problem over.

Power for the Countryside

Rural Electrification. Prepared by the Secretariat of the Economic Commission for Asia and the Far East. United Nations, New York. Pages 85, Price 6 shillings.

THE provision of electric power to rural areas has been considered an essential precondition for raising the standards of living of the rural population. While the consumption of electric power in general provides a measure of a country's development, it may be said that the extent of rural electrification provides a measure of the extent to which the rural areas are keeping pace with and contributing to the economic progress of the country. It is, for instance, only through utilisation of power that cottage and small-scale industries in the rural areas can hope to achieve high levels of productivity and efficiency.

The difficulties involved in taking electricity to the rural areas are, however, immense. In fact, except in the most favourable circumstances, they are almost insurmountable by unaided private enterprise. These difficulties arise principally from the low load one can expect in the countryside and its relative dispersal over a wide area. Both these factors tend to raise the cost of production of power above the level that generally obtains in urban areas. The fact that "on the one hand, the cost of energy supply is higher than for urban areas and on the other hand, the value of service to the consumer is lower", also makes it difficult to determine the most suitable tariffs.

The existence of these difficulties provides a challenge to the ingenuity of the electrical engineer. The rapid progress of rural electrification will, undoubtedly, depend upon the extent to which he is able to meet this challenge and devise suitable adjustments by which the cost of electric power will be reduced substantially below presently anticipated levels both by directly reducing the cost of production and by stimulating higher and more evenly distributed consumption of electricity.

The ECAFE report on rural electrification shows that while much can be done in this direction, over-optimistic ideas about rural electrification need to be guarded against. The capital out-put ratios of power projects are admittedly very high. They are likely to be much higher for most rural electrification schemes. While it may be admitted that sectoral capital out-put ratios cannot be the sole determinants of sectoral investments, considerable attention must needs be paid to them when total capital resources are limited. Although, therefore, decentralisation of industry and the mechanisation of rural industries may apppear to be attractive, their scope is dependent on the economic possibilities of provision of power, the capital requirements of which are high and the output low. However desirable rural electrification may be in itself, it will have to proceed slowly until other developments in backward countries have created more favourable conditions.

The report does not examine the question along these lines. It is concerned with the countries of South-east Asia in most of which there has been very little progress in rural electrification with the notable exception of Japan where there has been rapid progress since the nineteen-twenties and 97.5 per cent of all the villages and towns have been electrified. Its installed capacity of 108.0 KW per 1000 of population and 23.6 KW per square kilometre of area compare favourably with the United Kingdom figures of 291 KW and 59.4 KW respectively. For India, the respective figures are as low as 4.5 KW and 4.85 KW.

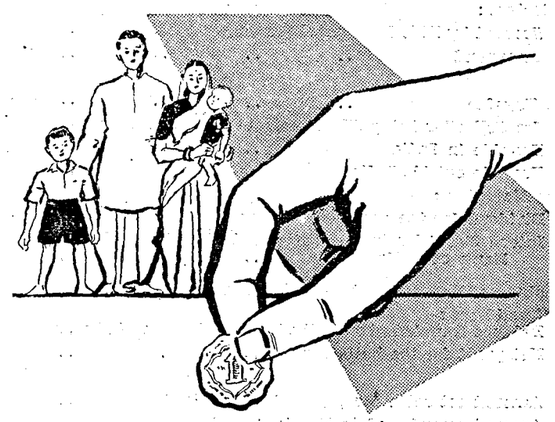
The report examines the difficulties that are likely to arise in bringing power to the rural areas and suggests the directions along which the solution can be found. Power supply to a particular rural area may come from an existing power system or from a local generating station to be specially set up for the purpose. "The supply from a large net-work would provide an area with cheap power," the report points out, "if the distance of the load-centre from the available point of supply on the grid is commensurate with the extent of the load to be catered for." With a large number of hydro-electric power stations in the country, this suggests the possibility of a considerable measure of rural electrification in this way, but the catch is obviously in the phrase "available point of supply". The mere passage of high voltage lines through an area may not necessarily imply the possibility of electrifying it, contrary to what the casual observer is likely to believe.

In cases where supply from a large hydro and thermal grid becomes uneconomical, the report suggests that it may be possible to build small hydro-power stations at dam sites or small drops in irrigation channels or on perennial mountain streams. If thermal power stations of low capacity become necessary (say up to 250 KW), diesel engine generating sets prove generererally more economical. In stream stations, "concerted efforts should be made to utilize the low-grade coals available in large quantities in almost all the countries of the region." As a measure of economy in generation, standardisation of size of generating sets is recommended and certain standard sizes and voltages are suggested.

Since the cost of transmission forms the most significant element in the cost of power, particularly in the rural areas where distances covered are long and power requirements low, the report devotes considerable attention to the question of reducing costs. The following are laid down as the qualifications necessary for an ideal rural line:

1. Adaptability for isolated supply en route
2. Margin for development of load
3. Low initial cost
4. Reasonable reliability of supply and low maintenance and
5. Simplicity of construction with minimum number of parts.

To reconcile these opposing considerations is the task to which the report sets itself. The statement of the principle on which decision must be based is irreproachable. "Sound engineering development", it says, "consists in meeting the immediate and foreseeable needs at the minimum cost consistent with technical suitability and reliability of service; risks have to be balanced, and a satisfactory solution is one which combines immediate suitability with reasonable flexibility to meet increased demands in the future." The difficulty arises in applying this principle correctly as it is stated.



One direction in which the report suggests the reduction of costs is the lowering of certain safety and other standards. "The high factors of safety and large ground-clearances stipulated in the various government enactments and the rules framed thereunder in the past, were mainly intended for use in urban areas and require suitable revision," it says. The use of treated wooden supports, the omission of overhead ground wire, the reduction of ground clearances and the use of substitutes for automatic oil circuit breakers to secure protection against overloads and ground faults are among the measures recommended. A number of other deviations from conventional practices are also recommended for the rural areas. The technical feasibility of these measures is obviously a matter for technical experts who should, however, approach the question free from preconceived notions and with a willingness to reconsider orthodox criteria in the light of needs.

The report also discusses the problems connected with Utilisation, Propaganda and Load Building Methods, Tariff and Finance in separate chapters. For the present, the demand for electricity in the rural areas of the region will be limited to a few purposes: lighting, lifting water for irrigation and operating small machinery for the processing of agricultural products. To increase the utilisation of power, the report lays special stress on establishing a chain of refrigeration plants to preserve food, sea products, vegetables and fruit. The report also points out that though individual farms cannot afford to own large agricultural equipment, electricity will provide the means for the farmer to combine with his neighbour in the collective ownership and economical utilisation of equipment. This might encourage a type of co-operative effort which is highly desirable.

The report is, on the whole, an excellent hand-book on the subject and the recommendations it makes are worthy of careful consideration not only by students of public utility economics, but governments and specialised agencies concerned with adding a little more substance to the living conditions of the rural populace. For us in India, who are thinking of decentralisation in a big way, it offers many suggestions which, with determination and ingenuity, we may be able to put into effective use.

CORRECTION

THE increase in agricultural production expected under the Second Five-year Plan will not be 35 per cent as stated in the Delhi Letter entitled "Phasing the Plan and Industrial Policy" in the Economic Weekly Annual Number, but only about 18 per cent, which gives an annual increase of about 3 per cent at a compounded rate. The error has arisen from the estimate of the increase of the Index of agricultural production to 135 in 1960-61, from its present level of 115, with 1949-50 as the base year (100).

LET EVERY FAMILY SAVE

One anna more

PER DAY . . . . . .

If every Indian family decides to save even so small a sum as one anna more per day it will all add up to Rs. 13.5 crores in Small Savings per month and Rs. 162 crores a year. Small Savings by millions will help finance all our ambitious development programmes. Remember that National Savings Certificates and National Plan Certificates can be purchased for as small a sum as Rs. 5/-.

REPORT OF THE AUDITORS

TO THE PRESIDENT OF INDIA .

We, the undersigned Auditors of the State Bank of India, appointed under Section 41(1) of the State Bank of India Act, 1955, do hereby report to the Central Government upon the Balance Sheet and Accounts of the Bank as at the 31st December, 1955.

We have examined the above Balance Sheet and the Profit and Loss Account and the Accounts relating thereto of the Central Office and the Local Head Offices at Bombay and Calcutta and the Returns submitted and certified by the Secretary and Treasurer of the Local Head Office at Madras and by Branch Agents, which Returns have been incorporated in the above Balance Sheet and Accounts, and report (i) that, in our opinion, the Balance Sheet is a full and fair one, containing all the necessary particulars and properly drawn up so as to exhibit a true and correct view of the affairs of the Bank, according to the best of our information and the explanations given to us and as shown by the Books of the Bank; (ii) that where we have called for any explanation or information such explanation and information have been given to us and have been satisfactory; (iii) that the transactions of the Bank which have come to our notice have been within the powers of the Bank; (iv) that the Returns received from the Local Head Office at Madras and from the Branches of the Bank have been found adequate for the purpose of our audit; (v) that the Profit and Loss Account shows a true balance of profit for the period covered by such account; (vi) that, in our opinion, the Balance Sheet and Profit and Loss Account are drawn up in conformity with the law; and (vii) that, in our opinion, Books of Account have been kept by the Bank as required by law.

The audit of the Books and Accounts of the Central Office has been carried out jointly by Messrs. S. B. Billimoria & Co. and Messrs. Ray and Ray. The audit of the Books and Accounts of the Local Head Offices has been carried out at Bombay by Messrs. S. B. Billimoria & Co. and at Calcutta by Messrs. Ray and Ray.

S. B. BILLIMORIA & CO.
RAY & RAY. } Auditors.

West Bengal's Second Plan

UNDER the second Plan, West Bengal's expenditure is estimated at Rs 153 crores, inclusive of this State's share of expenditure on DVC. In presenting the budget for 1956-57, Dr B C Roy indicated the sources of financing the State's second Plan. As Finance Minister of this State, Dr B C Roy repeats the familiar arguments advanced by Finance Ministers of all States. Under the present system of allocation of resources between the Union and the units, the States have little scope for expanding their tax resources.

West Bengal, partitioned Bengal, has been a deficit State. It has a large current deficit. But Dr B C Roy expects that tax revenue, even at current rates, will gradually increase due to the strengthening of the administration and to the gradual improvement in economic conditions. It is assumed that the total revenue deficit will not exceed Rs 13.4 crores during the second Plan period. Additional taxation is expected to yield Rs 12.1 crores in the next five years. Loans may provide Rs 25 crores. In 1956-57, the State's borrowing programme amounts to Rs 5 crores. This State's share of small savings will come up to Rs 8.8 crores in the next five years. Thus, the State's resources available for the second Plan is estimated at Rs 29.5 crores.

During the second Plan period, additional taxation measures contemplated are "the entry tax on tea, extended coverage of sales tax, irrigation rates, etc. Tax achievements during the first Plan are not impressive. In 1949, the coverage of sales tax was extended. Thereafter, and up to 1954, no new tax was levied nor the rates of existing taxation raised. In October 1954, a tax on aviation spirit was imposed. During September and October 1955, sugar was included within the scope of the sales tax, and the sales tax was extended to cover gold and gold ornaments.

Though additional taxation during the second Plan period is under contemplation, no new taxation is proposed for the first year of the second Plan. In Dr B C Roy's budget speech, the only positive indication is that this State will be borrowing Rs 5 crores in 1956-57. Does the absence of any new taxation by this State for the first year of the second Plan mean that both the Union and the States have endorsed the Union Finance Minister's earlier suggestion that fresh taxation should be postponed for the first one or two years of the second Plan? This is an interpretation of West Bengal's budget which industry hopes is correct. It should not be ignored, however, that the absence of any positive tax proposal in West Bengal's budget may be due to uncertainties about the plan for merger of West Bengal and Bihar.

From the Chair

The Scindia Steam Navigation Company Limited

Speech of the Chairman Shri Dharamsey M Khatau

THE following is the speech delivered by the Chairman, Shri Dharamsey M Khatau, at the 36th Ordinary General Meeting of the Company held on Wednesday, the 22nd February, 1956, at 4 p m at Scindia House, Ballard Estate, Bombay:

Gentlemen,

I assume that, as usual, you will permit me to take as read the Directors' Report and the Audited Accounts for the year ended the 30th June, 1955, which have been in your hands for some time now.

It is regrettable that the results this year have been less satisfactory than in the previous year. There are four main causes for this. The Dockers' strike in the UK and the congestion at UK and Indian ports and the 'Go Slow' of Port and Stevedoring Labour caused a delay of 380 voyage days. The loading of rice at Rangoon was about 400 tons per day as against the anticipated 800 tons per day on which the freight rates were based. This caused considerable loss. The cost of stevedoring has risen to the extent of about 15 per cent over the previous year. The cost of Marine Dues, Claims etc. have also gone up. The cost of coal increased by about As 10 per ton. The necessity of chartering vessels to fulfil commitments for rice liftings from Burma was unprofitable. This would not have been necessary if the construction of ships at the Visakhapatnam Shipyard had proceeded according to programme.

In view of the unsatisfactory results the Managing Agents have agreed to accept Rs 8 lakhs only and waive the balance of Rs 2,26,951 provided that the amount so waived is exempted from Income-tax in their hands. Our thanks are due to the Managing Agents for this gesture.

Our Reserves and Surplus now amount to Rs 6.51 crores against Rs 6.27 crores last year. Our Specific Reserves have increased from 5.29 crores to Rs 5.94 crores at the end of the year.

As we are in need of finance for further modernisation of our tonnage, we have requested the Government to release Rs 2.47 crores invested in the shares of Hindustan Shipyard Ltd. and Eastern Shipping Corporation Ltd.

Coastal Freights

The tonnage plying on the coast today is not sufficient to carry all available cargoes. From 1950 to 1955 Coastal tonnage has increased only from about 200,000 tons gross to 244,000 tons. Due to prevailing unsatisfactory conditions all round about 20 per cent more tonnage is now required to carry the same volume of traffic. To meet the increasing demands and relieve the pressure on Railways more coastal shipping is needed; but the prevailing prices of ships are very high. A standard coastal ship which used to cost about Rs 44 lakhs in 1950 would now cost about Rs 80 lakhs. Unless rates of freight are raised to meet the operating costs, acquisition of fresh tonnage is impossible.

The Coastal Conference therefore decided to increase the freight rates on General Cargo by 10 per cent from 1st June and request Government for same increase in Coal rates from May 1955. Before these increases could be effected, it was suggested by Government that the freight rate structure on the coast should be maintained until the Rail-Sea-Co-ordination Committee reported its findings. On further representation Government have allowed a meagre increase of 5 per cent in the rates on coal and general cargo from 15th October last.

The Coastal Conference believes that the rates of freight should be fixed at a level to meet fully the costs of operation, normal depreciation, reasonable provision for rehabilitation and fair return on capital employed. The present Coastal fleet has many old vessels which will require replacement at no distant date. A provision for rehabilitation of fleet out of earnings is therefore necessary. There is no reason why a return of 10 per cent on Gross Block value should not be granted in the case of shipping, while fixing the rates of freight, as is allowed by the Tariff Commission for other industries. On the above basis, the short-fall of earnings over the operating expenses comes to 28 per cent of the earnings. For a new ship the short-fall comes to over 50 per cent. While I am not suggesting that the rates should be enhanced to this extent, I trust Government will recognise the necessity to provide reasonable incentive to shipping companies for expansion of tonnage.

Pending submission of the Report by the Committee, the Conference has urged that as an interim measure coal and general cargo rates be increased by 15 per cent from 1st March 1956. I hope Government will grant early relief in this conection.

India|UK-Continent Trade

The combined liftings of the two Indian Lines—Messrs India Steamship and ourselves—of the exports from India to the UK and Continental countries amount barely to 15 per cent of total exports to these countries. As soon as the new ships on order are delivered we intend to employ 18 ships in these trades. Even so, in the entire overseas trade of this country, the participation of Indian Lines comes barely to 5 per cent. We have, therefore, still to go a long way towards the target of attaining a 50 per cent share in the carriage of our overseas trade. But we are going to expand and I wish to emphasise that it is the ambition of the Indian Lines to participate equally in the carriage of the foreign trade of this country.

Tonnage Programme

The question of building new ships for the coast is very difficult. I have already informed you about the very unsatisfactory state of affairs on the coast at present. Needless to repeat that no shipowner can think of building new ships for the coast unless the existing conditions show material improvement.

B S N (1953) Ltd.

The operations of this Subsidiary during the year have resulted in a loss of Rs 4.25 lakhs. This is due to heavy cost of repairs and surveys owing to old age of its vessels; these costs for the ensuing year are likely to be still heavier. Another factor responsible for the loss is the complete suspension of the Company's passenger service between

Bombay and Panjim (Goa). It is difficult at the moment to surmise as to when it would be possible to resume this Service.

Four of the six vessels operated by this Company are more than 20 years old and will need to be replaced during the next three to four years. The cost of replacement of four ships is estimated at about Rs 3 crores and, even if orders were placed now, it would take not less than 24 months to obtain deliveries. Before we can decide to make such a heavy commitment we would like to make sure that we would be able to earn an adequate return on capital after meeting costs of operation and providing for at least normal depreciation. This is not possible at the present level of fares. In these circumstances we requested Government as early as last August for an increase of 33-1|3 per cent in the existing passenger fares. Government have now referred our proposals to a Shipping Rates Advisory Board, consisting of Shri N S Lokur, Chairman, Railway Rates Tribunal.

You will agree with me that the Company cannot go on incurring losses year after year and, unless an adequate increase in passenger fares is allowed, we may have to consider seriously the question of closing down these services. I hope and trust that the Authorities will consider this question seriously, keeping in mind the importance of maintaining these services which provide the only convenient link between the Konkan ports and Bombay for 12 lakhs of passengers.

Prospects for the Current Year

I would now like to acquaint you with the prospects for the current year as they appear to me. On the expenditure side, costs of operation under various heads show no signs of decrease. Actually there is bound to be increased expenditure under certain items; for example, we shall have to spend considerably more on ship repairs in view of a larger number of ships having to be put through special surveys during 1955-56. Some of these ships are older and will, therefore, require heavier repairs. Stevedoring costs are already high and will increase further on account of the introduction of the Piece Rate system of payment to labour. As regards fuel-oil, there was an increase of sh. 5|- in the prices with effect from March, 1955, and a further increase of sh. 7|6 d. from 1st January of the current year; from the 15th of the next month the prices will further increase by about sh. 3|-. On the other hand, as I have already stated, two German-built and two Visak-built ships were delivered to us during 1955. Three of them will have been in commission practically for the whole of the current year and one for nearly six months. The increase of 10 per cent in freight rates from February 1955 together with comparatively brisk movement of cargoes from the UK and continental ports to India will show its full effect in the current year. The future increase of 10 per cent in rates which will be effective from next month will be only partly reflected in the current year. A distinct improvement in our freight earnings in India|UK-Continent service may therefore be expected. On the Coast, so far as working coditions at ports are concerned, one may hope that the corner will be turned as a result of the introduction of the Piece Rate system of payment. The rate of freight on salt from Saurashtra to Calcutta has been fixed at Rs 31|4|- per ton for the year 1956, which is Rs. 3|2|- more than the previous rate. The rates on coal and general cargoes were increased by 5 per cent last October. Any further increase that it may be possible to secure in coastal rates will not be fully reflected in the current year. Having regard to the position I have indicated, it appears to me that on the whole the working during the current year should be reasonably satisfactory compared with the year under review.

Price Stabilization in Agriculture

P C Bansil

With the everyday fall in the prices of agricultural commodities, (ignoring for a moment, the recent temporary rise) price stabilization is on the lips of everybody. Floor prices have already been fixed not only for rice and wheat, but also for some of the coarse grains like jowar, bajra and gram. This has necessitated a comprehensive study of the problem.

Meaning

Price stabilization is to be clearly distinguished from various forms of farm relief and legislative measures which are introduced with the idea of raising domestic price levels. A policy of price control like that of the last World War, which aimed at checking the rise of prices to soaring heights is also not to be taken as price stabilization. As pointed out by the Business Men's Commission of 1927 on Agriculture in the U S A, "real price stabilization would affect a mitigation in price fluctuations, but this would involve a scaling down of the heights of prices as well as an elimination of their depths. Though this would not make an incompetent producer rich, it would prevent the ruin of reasonably efficient farmers whose production is really needed and who tend to be replaced by new-comers liable to suffer the same fate." Price stabilization of agriculture would thus enter into the wider field of stabilized incomes and stabilized wages not only of those engaged in the field of agriculture, but also of the mass of non-agricultural workers.

The Need

The natural question that arises is: why should there be need for a policy of price stabilization in agriculture alone? Although the whole of world economy is based on business cycles—and volumes after volumes have been written on how to control them—yet it has been accepted that fluctuations in agricultural prices are so marked that they call for special consideration. According to a Report of the League of Nations on Depressions during the last 20 years, the price of jowar and wheat was halved three times within 12 months, and the price of cotton three times in periods of 18 months. Sir Roger Thomas puts it that next to rain, price changes have been the greatest enemy of the farmer. In a country like India, where agriculture contributes as much as 50 per cent to the national income and where as many as 80 per cent of the population are directly connected with it, such wide fluctuations in the incomes of people are bound to bring ruin to many. It was for this very reason that agricultural countries suffered most during the depression of 1929. It is this importance of agriculture in most of the agrarian economies of the world and the peculiar nature of agriculture that call for a policy of price stabilization.

Again, agriculture being the supplier of raw material to the industrial sector, "the effective guarantee of a minimum price will not only introduce an element of stability in agriculture, but also promote stability in other spheres of economic life" in the words of the Prices Sub-Committee. The Famine Inquiry Commission has opined thus " A fair return to the cultivator is one of the foundations not only of agricultural prosperity, but general prosperity also." Similar were the views of the Bombay Plan which recommended that "large fluctuations in the prices of agricultural commodities have been among the most important factors which have prevented agriculturists from making more sustained efforts to improve the yield of the land. To check these fluctuations in future and to assure to the cultivator a measure of security in respect of the prices of his crop, we suggest that for the principal agricultural crops, the Government should adopt a policy of fixing fair prices."

The matter became so important that the FAO meeting at Copenhagen set up a World Food Board for stabilizing agricultural prices in the international market, so much so that the FAO, in its recent report, attributes the huge increases in world food resources mainly to the widespread adoption of farm price support and other measures to stabilize farmers' incomes giving them confidence to grow more food.

Implementation

Imperative as this policy of active interference by Government in the field of agriculture would appear to to be, it is necessary to find out how far such policies can be implemented. The first problem to be faced is the fixation of appropriate prices. Government is to look after the interests of both producers and consumers. While a producer would like to cover his cost of production with a net balance equivalent to the income obtainable in other comparable occupations, a consumer, and that also in fairness, can only be satisfied by a level which enables him to meet his basic minimum needs at a given level of income. These are obviously conflicting interests, and to reconcile them is not an easy matter. Fortunately for a country like India, where the majority of producers are themselves the consumers, the conflict resolves itself to some extent. But the clash between the rural population, which is predominantly agricultural, and the urban population employed in industry, service and trade still remains. The answer thus lies in the fixation of prices which provide a stable income to agriculturists as well as stable costs of living to urban workers.

The solution normally suggested and even adopted in the USA has been the re-establishment of a parity, so that the goods which the farmer buys should not cost more than the goods which he sells during a normal period taken as the base. This, however, cannot serve as a sufficient test of what 'constitutes a permanently good rural-urban balance', as was pointed out by the Secretary for Agriculture in his Report to the President of the United States of America for the year 1936. F.L. Thomson in his 'Agricultural Prices' went so far as to say that 'parity prices constitute an unscientific, arbitrary, and frequenty misleading objective'.

The Prices Sub-Committee, when presented with this very problem, accepted that the principle adopted while fixing prices should be one of keeping the interests of the agriculturists foremost and that 'if the producer's price so fixed is beyond the means of certain classes of consumers, they should be given adequate relief though consumption subsidies.' Accepting this as an equitable and fair solution of the problem, let us examine how far this is practicable.

In order to watch the interest of

the cultivator alone, while fixing prices, we are required to know the cost of cultivation of the various crops or at least some of the major crops and the rural standard of living indices. Reliable data about both these constants are, however, lacking.

Cost of Cultivation

As for the cost of cultivation, besides comprehensive farm accounting data throughout the country on which very little work has been done so far, the next question is whose cost of cultivation we are to take into consideration. Is it the most efficient, the inefficient, the average or only the marginal cultivator whose cost of cultivation is to be taken as a basis. Each set of cultivator has different costs according to the nature of the land, his environment and his own standard of efficiency in farming. If we fix prices on the basis of marginal or inefficient cultivators, it would mean encouraging inefficiency in farming which is to be deplored at this stage when we are just in the midst of planning. If prices are those of the most efficient ones, that would mean no place in farming for a majority of our subsistence cultivators for whom agriculture has always been a losing concern. This would aggravate the employment situation and defeat the very purpose of planning. The Prices Sub-Committee rejected even the average cost which, according to Krishnaswami, should be an average for all along the line, i.e., the class of land, nature of ryot, methods of cultivation, area of holding, tenure of holding and all such similar factors. He recommended instead 'representative' costs.

Now how are we to decide which is the representative cost? And how can we afford to ignore the various factors referred to by Krishnaswami? Our cultivator is himself illiterate, and apart from some stray enquiries conducted by some University students, there is no other machinery which can help us in the matter. Some cut and dry solution like the one mentioned by Mr. Krishnaswami that in normal times the cost of production is roughly half the price in the case of paddy and one third in the case of millets would obviously seem to be quite invalid when it has been accepted by all and sundry that agriculture in India is a losing proposition.

Standard of Living Indices

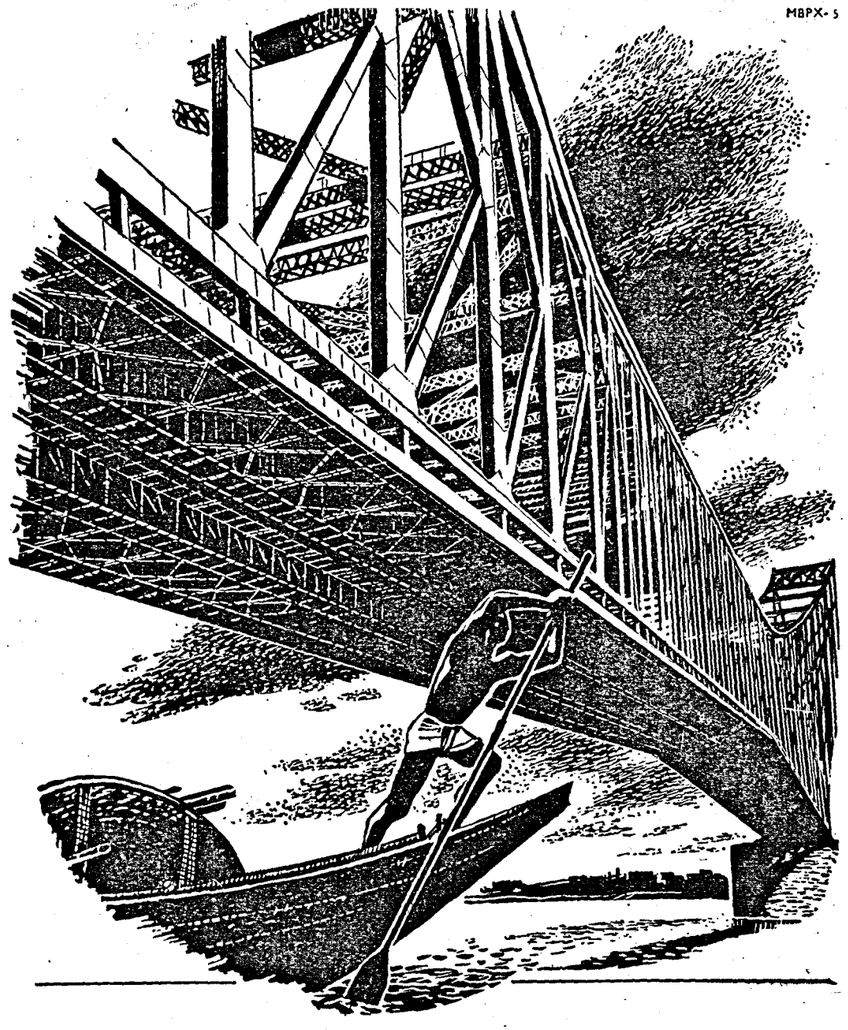
As for this other component, we meet a worse fate here. Firstly, we have the same lack of statistics; and secondly, we do not know as yet what standard of living we are aiming at. There are innumerable items which enter into the peasant's daily consumption pattern. In the absence of proper price indices and a study about the weights to be attached, how can we possibly work out a standard of living indices for the rural masses?

With these limitations about both our constants, one wonders how far we can be successful in our effort to find out the real parity price.

The Cost Factor

Assuming that we reach some sort of rough estimate about the price that is to be fixed for various agricultural commodities, it would be extremely necessary to form an idea of the cost involved in the experiment. Government will have to spend money firstly for the setting up of machinery to purchase foodgrains and then to distribute it to the non-producers at subsidized prices. Our experience of a decade of State trading in food, as pointed out by a recent publication of the Employers' Association, Calcutta, has cost the nation not less than Rs 277 million. Then the subsidy scheme for food, which remained in operation only for 6 years (from 1946-47 to 1951-52), cost another Rs 1551 million. The total on these two counts alone works out at some Rs 287 million per annum. This was when Government handled hardly 6 to 7 million tons or only 12 to 15 per cent of the total of production of foodgrains.

Marketable surplus in the case of wheat and rice alone, as estimated by the respective Marketing Reports, is of the order of 55 and 40 per cent respectively. In a deflationary market and under a price support policy, every farmer will try to sell off the maximum of his grains. It is just possible that the marketable surplus in the case of wheat and rice may even increase in the sense that the producers begin to meet requirements from coarse grains, a major portion of which (75 to 80 per cent) is being consumed at present on the farm. Assuming that no major shift takes place the Government will have to come forward for the purchase of some 30 per cent of the total food production. Taking 60 million tons as the average annual production of cereals (including gram) and Rs 8 per maund as the average price, the total investment would work out at Rs 4480 million for cereals alone. The policy will have to be extended to other crops as well. All this would mean that an appreciable portion of the national income will have to be allocated for the price stabilization policy when every penny is required for the national development of the country.



It may be argued that the amount spent on the purchase of cereals or other agricultural produce will be recovered when they are sold back at the fag end of the year. We do not know what portion of this amount we will be able to recover. Maybe that the price falls down much below the purchase price. In case we are sure that the price will go up, the purpose can be served by a simple method of providing ware-housing facilities where the cultivator can deposit his grain at the harvest time, as already recommended by the Rural Credit Survey. Why then go into the botheration of this complicated machinery at all?

Prices and Production

The other argument adduced in favour of price stabilization which is much advertised during a deflationary period, is the disincentive the farmers are supposed to get in the absence of a price support policy. This in other words means a consideration of the cost of production theory. Seasonal factors remaining the same, Dr Natarajan established a high co-relation between acreage and prices.

This theory is assailed on the ground that firstly, agriculture in India is never a profitable or even a business proposition. It has on the other hand been accepted as a losing concern. Secondly, the cultivator is on the land not by choice, but by force, because he cannot do anything else. Thirdly, the supply of the various factors of production—land, labour and capital—which tend to be more or less inelastic, is not responsive to the changes in the price of agricultural produce. According to George O'Brien capital invested in the land also assumes a fixed form, and the supply of labour becomes all the more inelastic, particularly when the farm is worked by the owner and his family.

The abandonment of a farm in such cases means the abandonment of the home. Even if some little elasticity is assumed in the supply of these factors, the greater time-

Branches at: NEW DELHI BOMBAY KANPUR

lag between the 'input' of these factors and the corresponding output renders the cultivator helpless to adjust production to price changes. Fourthly, agriculture being susceptible to natural hazards most, the cultivator can rarely think of his actual cost of production. According to Wyllie, 75 per cent of crop variations are due to weather conditions.

Lastly, while the costs of production are more or less sticky, prices of agricultural produce are invariably determined mainly by extraneous factors. Costs of production vary from place to place, but agricultural prices tend to be the same over wide areas. There is, for example, a slight difference in the basic price of wheat in the various 'mandies' (markets) of India. No wonder if even world prices exert their influence on the prevailing prices in other countries. Farm prices are at least influenced to an appreciable extent by the general price level. This is supported by E M OJALA who makes a comprehensive study of the farm prices in USA, Sweden and UK.

Changes in prices have been so varied and wide that the question of their having any relation with cost of production would not arise. The prices of agricultural commodities fell by more than 50 per cent during the depression period, while the cost of production fell only by 15 to 20 per cent. The problem can be examined with respect to falling as well as rising prices separately.

Falling Prices

Normally it may be said that when the price of a commodity falls below the cost of production, the supply would stop over a period. The fundamental law seems, however, to be contradicted in the case of agriculture in general and food in particular, where farm consumption itself takes a big slice out of the total production. Again, due to the peculiar nature of agriculture, the farmer cannot introduce changes in his programme at short notice. There are certain paddy lands in South India which are not suitable for any other crop. No shift under such circumstances is possible even over long periods. Where such a shift is possible, the cultivator can at best divert lands from less profitable to better crops. Even this becomes impossible in the case of a general depression.

A glaring proof of the inability of the cultivator to adjust production to the level of the fall in prices is found when we study the position during the 'thirties'. According to the Director General of Commercial Intelligence and Statistics, the value of agricultural crops, taken at an average harvest price, fell from Rs 10,340 million in 1928-29 to only Rs 4,730 million in 1933-34. But there was hardly any decline in the net area sown or the agricultural output.

Odds are that agriculture being more a mode of life than a business proposition in a country like India, the cultivator may be compelled to increase rather than decrease his production under falling prices. The tendency was clearly observed during the depression of 1929-33. This is because he cannot afford any further contraction in his already scanty income. An individual farmer, according to O'Brien, who acting in isolation reduces his production may have to face a double loss arising from a smaller output and a lower price.

It may be argued that the demand for agricultural, particularly, food crops being practically inelastic, the cultivator may charge monopolistic prices. Such possibilities are, however, rare. Firstly, because the number of producers is large and secondly, scattered as these cultivators are over a vast area, there is no machinery or institution under which they can put themselves. Agricultural prices are accordingly rather competitive.

Production may thus have an inverse relation to falling prices, but the question of its having a linear relation would not arise. Supply in agriculture, in other words, remains more or less inelastic during the falling prices. Notwithstanding all this, there are examples in a country like England where between 1873 and 1896, a 50 per cent fall in the price of wheat led to a decrease in the area under wheat from 3.5 million to 1.7 million acres. Again the passing of the Wheat Act in 1932 was followed by an increase in wheat acreage by over 40 per cent in a period of 3 years. Such a price flexibility may be possible where agriculture is run more on business lines and where the country has an industrial rather than an agrarian economy, but not in a country like India.

Rising Prices

The position with regard to rising prices would, however, seem to be a little different. The farmer, under the depressed market condition, while not curtailing his production, is at the same time disinclined to make an addition to the prime costs. The use of fertilizers, for example, was uneconomical in India during the 'thirties', at least for food crops. But the demand for them has tremendously increased during the post-Independence price spurt. High prices also provide sufficient incentive for the cultivator to try improved methods of cultivation and put into practice the result of experiments conducted in the laboratory. It is, however, implied that Government will extend not only full co-operation, but also resort to extensive propaganda in that direction. If normal facilities are not available, even progressive cultivators, who are keen on introducing new improvements, may be helpless to do anything. All these things may have the combined effect of increasing production, but always in response to an effective demand. This is the most important thing. During the initial stages of the Grow More Food Campaign, the cultivator was not prepared to divert cotton lands to food unless Government gave a guarantee to purchase the extra produce at pre-announced prices.

It can be safely concluded from this study that agricultural, specially, food production may never have a sagging tendency either under falling or rising prices. The possibility on the other hand is that in both cases, production may be increased.

Conclusion

In the face of all these difficulties, it would be seen that whatever the attraction of the policy in theory, it is not possible to put it into practice unilaterally. This was the opinion of Messrs Paish and Bauer, expressed by them in their 'Fluctuations in Incomes of Primary Producers', even in the case of America where agriculture hardly contributes 6 per cent to the total national income.

When our ultimate objective is the rehabilitation of agriculture only, this, in the words of the US Secretary for Agriculture, can be well served by giving incentive to production. Agriculture may then ask for an increasing share of an increasing total income. Over-emphasis on prices to the neglect of production leads to scarcity. Larger output at lower unit prices, with industry leading the way, is essential to safe progress towards parity prices and a fair share of the national income for agriculture.

Around Calcutta Markets

Equities Marking Time

Wednesday, Evening

EQUITIES are marking time. Clive Street has somehow tided over its payments crisis. In four of the clearing shares, forward trading has been resumed. In Indian Iron and Burrakar Coal, however, only cash trading is now allowed. But the recent behaviour of the Calcutta Stock Exchange indicates that investors lack confidence. Trading has been extremely thin. Price fluctuations are, therefore, negligible. As neither buyers nor sellers show any eagerness to add to their commitments, equities remain flat.

Till last week, market circles were complaining that activity will not revive unless forward trading was resumed. Since Friday last, forward trading facilities have been re-opened for four clearing shares. But this has not led to any noticeable revival of trading on the Calcutta Stock Exchange. It is evident that the market will take time to recover from the effects of the payments troubles.

Market's Ills

Though Clive Street is suffering from this additional handicap, weakness in stock markets elsewhere indicates that the malady lies deeper. Investors are worried about the implications of the second Plan. Life insurance has been nationalised. Belief is widespread that banks will be nationalised. Industry interprets the second Plan to mean that the Government is determined to restrict the scope of activity of the private sector. This is the main reason for the inactivity in stock markets.

At Amritsar, Congress defined Avadi more clearly. Congress is committed not only to implementing a socialistic pattern of society. But its policy, as Amritsar suggests, is to build a "socialist structure" in this country. It is in this context that nationalisation of life insurance, proposals for fixing a ceiling on individual incomes and the actual enforcement of the new Company Act are having their exaggerated repercussions on stock markets.

Coming Budget

Stock markets are anxiously awaiting the presentation of the Union budget. Details of the second Plan and the Government's plan for organising the nationalised insurance industry are already known. So, the importance of the Union budget relates to possible increase in taxation. Even the Taxation Enquiry Commission recommended an increase in taxation. But the second Plan's estimated increase in taxation exceeds TEC's indications. This will not be denied. But the question is whether direct taxation would be raised further.

Sooner or later, the rate of the estate duty is likely to be raised. There are talks about fixing a ceiling on individual incomes. It will be recalled that TEC is in favour of fixing such a ceiling. But some are inclined to the view that the rate of the estate duty is likely to be raised later rather than sooner. And even Congress admits that the ceiling on individual incomes will be imposed only gradually, and by slow stages.

Indirect Taxes

This indicates that there may be no appreciable increase in direct taxation in the coming Union budget. That West Bengal's budget contains no fresh proposal for taxation, is an indication that the Government may postpone any material increase in taxation for the first one or two years of the second Plan. Two inferences are, therefore, permissible. One is that there may not be any further increase in direct taxation. And the second is that New Delhi and the States have to rely increas-

ingly on indirect taxation to maximise tax revenues.

In normal circumstances, these assumptions should encourage a brighter sentiment in stock markets. But, in the present phase of the economy, any rise in even indirect taxation may affect stock markets. It will be recalled that industry opposed strongly TEC's recommendation that indirect taxation should be increased to check consumption. Last year, the Union budget originally proposed some new indirect taxes. But these proposals were dropped later, on protests that the proposed levies would check consumption.

Money Rates

Apart from these wider considerations, there is the problem of rising industrial costs. With the recent increase, Bank Rate in Britain is fully two per cent above the rates prevailing in many countries of the world. This does not call for a higher Bank Rate in India. In this country, inflationary conditions are not present. Nor is there any serious balance-of-payments trouble. So the reasons wich are supposed to justify the increase in the British Bank Rate are not applicable to this country.

But India is not likely to avoid some of the incidental consequences of a higher Bank Rate in Britain. Already, the Reserve Bank's rate for accommodation under the Bill Market Scheme has been raised. It is only to be expected that exchange banks will increase their borrowings from the Indian money market. This will cause a further hardening tendency in call and short-term money rates. Scheduled banks will, therefore, be forced to raise their lending rates. This, in turn, will inflate industrial borrowing costs.

Tea and Jute

With these wider background factors, the peculiar problems of tea and jute industries may be considered. Recent policy decisions of New Delhi indicate that the Government is not in favour of continuation of the International Tea Agreement. But an enlargement of the export quota is not likely to expand exports when the world demand for tea is falling. There is also the question of restriction of tea output in this country. There are some who wonder whether any such plan can be enforced effectively.

Developments relating to the jute industry are conflicting. Jute output is expanding. Despatches are higher, but are not moving up as much as the increase in output. Increased production has led to a fall in the prices of jute goods, but not in raw jute. Thus, the spinner's margin continues to be unfavourable. Meanwhile, the Government has imposed control over production of jute goods. This does not affect directly the organised sector of the jute industry. But Jute shares remain quiet because of the relative steadiness in raw prices.

Around Bombay Markets

Mixed Trend

Thursday, Morning

ALTHOUGH the stock market opened on a subdued note on Thursday last and succumbed early on Friday to the news of the rise in the British Bank rate, it later emerged with handsome gains all round, thanks to optimistic reports about the settlement of the payments crisis in Calcutta. The rise in the Bank rate from 4½ per cent to 5½ per cent had a mixed reception and while industrials recovered their earlier losses, the gilt-edged tended to rule soft, with the 3 per cent 1986 Government Paper having sellers around Rs 79-12, losing nearly eight annas.

The raising of the British Bank rate naturally created some doubts in the minds of investors as to whether the Reserve Bank would follow suit. Knowledgeable circles, however, felt that there was no likelihood, nor was there any necessity for such a rise. They argued that the Indian economy was on a sound footing and the Reserve Bank open market operations have been conducted in such an efficient manner that Central Government securities were, more or less, stabilised on a 3½ per cent basis for short-dated securities, 3¾ per cent for medium-dated securities and 4 per cent for long-dated ones. Moreover, an increase in the Bank rate would raise the cost of Government borrowing, at a time when the Planners have proposed to raise, for the second Plan, as much as Rs 700 crores by way of loans, and Rs 500 crores through small savings. In view of these, it was felt that an upward revision of the Bank Rate was not desirable. Meanwhile, the Reserve Bank clarified the position in a statement on Wednesday, and as anticipated by the market, there is to be no change in the Bank Rate.

Tata Ordinary opened at Rs 224 and on strong bull support went up to the highest level of Rs 227-8 to close at Rs 225-8. Indian Iron, which were quoted at one time at Rs 31-15-6, fluctuated between Rs 32-5 and Rs 32-10 on Tuesday to close at Rs 32-6-6.

There was a smart recovery in textile scrips thanks mainly to favourable advices from Ahmedabad. Century which opened at Rs 460-8 improved sharply to Rs 484-8, on reports about the encouraging financial results of the mill and the possibility of higher dividends and closed at Rs 481-8. Bombay Dyeing were influenced mainly by reports that the Company might step up dividends; after opening at Rs 518-12 they rallied to as high as Rs 530 to close moderately at Rs 523-2.

In the miscellaneous counter, ACC, Scindia, Bombay Burma, National Rayon and Tata Chemicals were in the limelight. ACC which opened the week at Rs 203-12 declined by a few points to recover once again and improve to Rs 205 before closing at 202-12. Bombay Burma opened at Rs 523-12 and went up to Rs 536-4 before closing at Rs 530, while National Rayon improved by four points to reach the highest for the week at Rs 222-8, and closed at Rs 220-8. Tata Chemicals moved up from 16-7 to 16-11 to close at Rs 16-8.

Cotton

Pakistan Cotton

A NOTABLE development in the cotton market was the announcement in respect of import of Pakistan cotton. While this has been generally welcomed in trade quarters, speculation has been rife as to when Karachi would abolish the export duty of Rs 270 on raw cotton. Traders feel that no good would come out of the announcement regarding

the import of Pakistan cotton unless Pakistan removes the export duty. They point out that inasmuch as comparable varieties of Indian cotton could be had at around the same price as Pakistan cotton, no material business could be expected to result if the Pak duty is not removed. For, the duty will always have the effect of widening the price difference between Pakistan and Indian cotton of the same grade and staple length. Incidentally, this is the first time that the Government of India has allowed imports of 7/8" and above cotton, the normal practice having been to permit imports of 11/16" cotton.

Futures trading in cotton continues to be at a standstill pending the decision on the case now being heard in the Bombay High Court.

Meanwhile, the cotton tangle came up before the Rajya Sabha during the debate on the Cotton Cess Amendment Bill, when the Union Minister for Agricuture, Dr Punjab Rao Deshmukh stated that if it was necessary to act in the manner Government had done (the reference was to the action taken by the Forward Markets Commission) he was certain that "the Commerce and Industry Minister must have strong reasons for it. It is for the House to judge how far his contentions are valid and satisfactory". This would suggest that, on this question, Dr Deshmukh does not see eye to eye with T T Krishnamachari. Defending Government action, Mr Krishnamachari observed that the main reason for interference with the East India Cotton Association was the complete ineptitude of the Association and that many members of the Association themselves were operating on the market. He justified the intervention of the Forward Markets Commision and stated, "when the forward market became a gambling market, I do not know how, because of succeptibilities of a few vested interests, Government could keep quiet."

In the spot market at Sewri brisk activity was witnessed on good mill and export demand. Popular varieties recorded marked appreciation for the greater part of the week.

Oilseeds

Keen Demand for Linseed

IN the oilseeds section, trading in linseed was characterised by near-boom conditions. Prices of linseed and linseed oil reached new peak levels, and the main inspiration for this was provided by a veritable scramble for linseed oil in London. The keenness of the UK demand for linseed oil is evident from the fact that buyers are even pepared to bear the possible burden of an export duty, about which rumours have been current for some time now. London quotations showed a rise of £7 per ton, taking the total advance in price in the past fortnight to nearly £15. Buyers in London have become aggressive in view of the smaller Argentine crop of linseed which resulted in nervous short-covering over a wide front. Indian shippers are anxious to effect shipments before the end of the current season, evidently to avoid the effect of an export duty should it materialise. In the event, spot supplies found ready and active buyers and prices naturally advanced by leaps and bounds. Linseed February-March delivery gained nearly Rs 4 while linseed oil prices improved by Rs 2 per quarter.

Groundnut and castor prices also ruled firm for the greater part of the week. Despite fair arrivals of groundnuts firmness in prices was maintained due to sustained demand. London quotation for groundnut oil was firm at around £125 per ton, but no business of any note could be transacted inasmuch as the bulk of the export quota has already been utilised. Some traders are, however, optimistic that Government might issue fresh export quotas, although Government's reluctance to do so is well known to them.

Thanks to good support at lower levels, castor prices were maintained around high levels. There were also reports that the demand for castor oil from the US would broaden shortly. Meanwhile US quotation for BSS castor oil was around 14 cents per lb and shippers claimed business for a modest quantity.

Compa ny Ntes

Rohtas Industries

THE annual report of Rohtas Industries Ltd. for the year ending October 31, 1955 discloses excellent working results in the wide range of its industrial ventures. The year witnessed a sharp rise in value of sales to Rs. 9.76 crores from Rs. 6.71 crores in 1953-54, and brought in gross profits amounting to Rs. 1.5 crores as against Rs. 1.2 crores in the preceding year. Net profits also show a sizable increase, having risen by over Rs. 17 lakhs to Rs. 83.77 lakhs during the year under review.

Significant progress has been made in the Company's major industrial enterprises; the output of paper has gone up from 16,074 tons in 1953-54 to 20,135 tons in 1954-55; that of asbestos cement from 4,334 tons to 6.156 tons; sugar from 6,718 tons to 9,999 tons; and the output of vanaspati has recorded nearly a ten-fold increase from 688 tons to 6,857 tons. The only industry which has shown a small drop in production—from 3.53 lakh tons to 3.25 lakh tons—is cement; but the directors point out that this has been due to operational difficulties consequent on modernisation of the machinery in the cement factory. However, during the first quarter of the current year, output trends appear to have brightened up.

After adding the balance of profits brought forward from last year, the net disposable profits of the Company for 1954-55, amount to Rs. 88.24 lakhs. Out of this, a sum of Rs. 25.81 lakhs has been set apart for bonus to staff and Rs. 15 lakhs have been transferred to General Reserve, leaving a balance of Rs. 47.43 lakhs. The directors have maintained the dividend on the old ordinary stock of the company at Rs. 1-8-0 per share of Rs. 10 each. After meeting the dividends on preference shares and allocation of Rs. 20 lakhs towards taxation reserve, the balance of Rs. 4.9 lakhs is to be carried forward.

The programme of paper factory modernisation and expansion is proceeding satisfactorily. A new Coating Machine, capable of producing 10,000 tons per year, is expected to go into production by the end of the current year, which will enable the company to meet the entire domestic demand for coated varieties of boards. The vanaspati products of the company are finding improving demand. The management have been successful in arriving at a settlement with their employees valid up to 1957-58 regarding bonus, grades etc. With all these encouraging developments, the prospects of the company in the years ahead should be bright indeed.

Deshmukh and Direct Taxes

SHRI CHINTAMAN Deshmukh's sixth budget has, as usual, been criticised both for what it proposes and for what it does not. It is true that criticism from these two standpoints do not come from the same people; but it often comes from the same class of people. And Shri Deshmukh could well sit back and let these opposite arguments cancel each other out. Not that he will in fact be able to do so; indeed, as last year, he may end up by withdrawing some of his proposals in the course of the debate on the Budget. But in terms of logic, he could hold out that he has done nothing more than translating the objectives of the Second Plan into fiscal measures, necessary or feasible in the first year of that Plan.

The fact is, all of us want certain things without having to risk or sacrifice certain other things. We want, basically, an acceleration of the rate of growth of the economy, but no change in the social and economic institutions to which each of us is in his own way attached. We desire greater social justice, but not through intensive taxation since it results, so the argument goes, in levelling down rather than levelling up. Many such contraries could be listed; but for the time being, we have before us Shri Chintaman's latest proposals and it is about the grouses and grumbles occasioned by them that we are concerned.

Shri Deshmukh has sought to add about Rs. 25 crores by indirect taxation in the form of additional excise duties and about Rs. 8 crores by direct taxation in the form of enhanced corporation and super taxes to the revenues of the Union Government. This he has been obliged to do on account of the increased expenditure on development activities in the budget. He had a problem of covering a revenue deficit of over Rs. 50 crores, ignoring for the moment the large shortfall of resources on the capital side. Part of the revenue deficit, it should be remembered, was occasioned by the unwillingness of the Parliament and the country to accept his budget proposals last year. That apart, the choice before the Finance Minister was to leave this uncovered and raise the budget deficit, or cut down development outlay, or seek to match revenue expenditure as far as possible by revenue receipts. He has chosen, in the main, the last of these and made himself liable to the criticism that he has thereby made it impossible for the private sector to accomplish the task set for it. Had he chosen either of the other two courses, he would have been equally vehemently accused of trying to sabotage the public sector's plan or to imperil the economy by unleashing the forces of inflation. It is surely unfair to ask a Finance Minister to provide more and more funds without giving him the option to impose fresh taxes or to borrow without inhibitions from the Central Bank.

This is perhaps too broad a statement of the situation. The argument is always not that Shri Chintaman should not have resorted to fresh imposts but that he should have arranged them in such a way that particular segments of the economy attracted most of them. Now, the measures that he devises are to be judged from two fundamental angles: firstly, how far do they help in mobilising and channelling investible resources to the sectors where development is most desired; and secondly, how far do they ensure the basic content of a socialistic society, viz. re-

duction of economic inequalities. As observed earlier, he has leaned very heavily on indirect taxation and drawn only mildly on direct taxes. Yet one cannot resist the temptation that it is the latter which has caused most debate. May be this is because such a small proportion of the population pays direct taxes, and this minority is the best organised and the most vocal. May be it is because direct taxes have, or are believed to have, a greater disincentive effect than indirect taxes. Whatever the reason, the point remains that Shri Deshmukh's proposals in regard to corporation and super-taxes have met with vociferous disapproval. In comparison, the outcries against the excise duties have been on a lower key.

What in effect, does Shri Deshmukh propose? Firstly, the super-tax on incomes above Rs. 70,000 is to be slightly raised, so that the tax on incomes above Rs. 1,50,000 will be 91.9 % instead of 88.6% as at present. Secondly, registered (partnership) firms will be subjected to a graduated tax, amounting to a maximum of one anna six pies in the rupee on incomes over Rs. 1,50,000, incomes up to Rs. 40,000 being exempt from the levy. Thirdly, in respect of non-section 23-A companies, the rebate of one anna in income-tax on undistributed profits is withdrawn. Fourthly, a graduated super-tax will be levied on the dividends in excess of 6 per cent of paid-up capital declared by Indian Companies. Fifthly, bonus issues are to be subject to a tax of two annas; and finally, the penal super-tax payable by a Section 23-A company dealing wholly or mainly in investments is raised from four annas in the rupee to eight annas in the rupee on undistributed profits.

These proposals are, so to speak, the principal bones of contention. They are disapproved of because they touch two important sources of funds for the private sector, viz., the savings of persons in the highest income ranges and the retained profits of business enterprises. On the face of it, it is true that these measures seem to be somewhat contrary to the earlier measures for encouraging business enterprises to retain their earnings rather than distribute them. But it is not all one way; the rebate on retained profits is of course withdrawn; but the imposts in respect of distributed dividends is enhanced, so that the margin of encouragement for reinvesting profits is more or less maintained. If in the process a portion is to be transferred to the fisc, it is obviously not such a one as will drastically reduce the funds available to companies, especially when every effort is being made to step up substantially activity in all sectors of the economy. It is doubtless good strategy not to yield anything unless one is forced to; but in the present social climate there are also other things to be considered—as, for instance, a willingness to see the development efforts in the public sector as necessary and complementary to those in the private sector,

The unstated part of the Finance Minister's argument is perhaps this. In the coming year, a great deal will be spent on development by both the public and private sectors. This will, in its turn, augment the demand for a variety of goods, consumer goods as well as capital goods. By and large, the demand for the former will be only partly met by the larger firms, because government policy will be directed to restricting their outputs and providing special encouragement to the smaller units of production. Because of this conjuncture, the larger firms—which would in general be organised as joint stock companies or registered firms—will be in a relatively advantageous position to earn higher profits. Since reinvestment of earnings in factory consumer goods industries is to be regulated, they could well declare larger dividends without harming their asset position. Part of this, it is true, will be taxed; but part will go to augment other incomes from out of which some savings could be expected. These personal savings will be more mobile than the retained profits of consumer goods industries. In other words, the new measures could contribute to a freer movement of investment funds within the private sector. Capital goods industries in the private sector would, in general, be unable to distribute as large dividends as the consumer goods industries and therefore the incidence on them would be comparatively small.

If this is the basis on which Shri Chintaman has proceeded, it is obviously a compromise imposed on him by the plan objectives and the philosophy of a mixed economy. Quite frankly, the way to mop up disproportionately large profits likely to arise in large-scale consumer goods industries and trades is to levy a straight-forward excess profits tax. Instead, he has adopted the graduated super-tax related to distributed dividends. This smacks of an excess profits tax; only it still acts as an encouragement to retain profits in a way that the excess profits tax does not. It does seem, therefore, that much too much heavy weather is being made about the direct taxation proposals—especially when the policy objectives with regard to income distribution are remembered, and when it is realised that a good case for a straight-forward excess profits tax can be made during the next few years.

The indirect taxes in their turn raise the questions whether their incidence is fair and whether in the last analysis, they are not a stimulus to inflation. These questions need to be carefully considered. But considering the limited coverage of direct taxes in this country and the great need for resources for the public sector, the excise duties have to be lumped by the mass of people. Perhaps the mass of people will lump them without crying havoc.

Indictment of Congress

HONESTY may or may not be a political virtue. But integrity is an essential ingredient of statesmanship. Pandit Nehru's views on linguistic States are emphatic and well known. But he has the honesty to admit that many others, including Congress leaders, hold different views. During the ugly disturbances in Bombay and Orissa, as the Congress "High Command" continued its never-ending discussions on the problem of linguistic States without coming to any firm decision, suggestions had been made that Parliament should be recalled. Congress lacked the imagination to provide an early opportunity to the representatives of the people to discuss the issue. It rejected suggestions for an all-party conference. Instead, it held its session at Amritsar to warn the people that it was determined to enforce its own pattern of re-organisation of States. Belatedly, Parliament has now had the opportunity of discussing the issue during its debate on the Address of the President. Pandit Nehru is frank in his confession that the parliamentry debate is "an inquisition and an indictment" of the Government's policy to linguistic States.

True, being only the Minister of Planning, Shri Gulzarilal Nanda does not have to have the sense of proportion or the perspective of the Prime Minister. True also, there is nothing like leather. Even so, one could not help feeling amused at his lament that Parliament was showing a lack of perspective in emphasising the problem of linguistic States to the neglect of economic planning! It is a pity that his devotion to planning makes Shri Nanda forget that he is also a good Congress man or that so long as he is in Parliament, he has to be a good parliamentarian. He cannot be unaware that, at Amritsar, Congress rightly stressed the problem of linguistic States. As a parliamentarian, he should know that a debate on the Address is not the only or necessarily the most proper occasion for discussing the second Plan. Parliament will have an opportunity for debating the Plan when it starts discussions on the budget and again, when the final Plan is presented to it for its approval.

To question Shri Nanda's knowledge about parliamentary procedure or to cavil at his lack of political sense, is not to suspect the people's or their representatives' awareness of the importance of economic planning. Congress can legitimately claim to have made the people Plan-conscious. It can, with equal pride, claim to be a stern critic of its own first Plan. In their report to the Amritsar session, the Congress secretaries take pains to establish that Congress economic experts have succeeded in convincing the Congress Government that growing unemployment is the most urgent economic problem before the country. It would be ungracious not to concede this claim by Congress. But it would be equally foolish to pretend, as the Congress Government, including the Prime Minister, does, that the urge for linguistic States will subside as employment expands. Members of Parliament have indicated that this hope stems from a confusion of thought. All thinking persons will endorse Parliament's verdict.

Two disconcerting facts emerge out of the parliamentary debate on the Address. One is the seeming conviction that the people do not want linguistic States, but that the Opposition is making political capital out of this issue. This is not only an unjust slur on the Opposition, but it is absolutely dishonest of Congress to fabricate such flimsy political arguments in defence of its undefendable stand on linguistic States. Congress will fool no one, least of all its own members, by pretending that the demand for linguistic States has no popular support. It is a tribute to Pandit Nehru's integrity that he does not take cover under any such patently false excuse. He is aware of the people's demand. But he thinks that this demand is not just. As Prime Minister, he regards it his duty to lead the people back to the right path. His right to pursue such a policy will not be denied.

Not only Congress, but even PSP seems to be divided on the issue of linguistic States. Though the national executive of PSP is in favour of linguistic States, Asoka Mehta seems to be concerned with the inherent dangers of such States.

Far more surprising is Acharya Kripalani's suggestion for postponing re-organisation of States so that the problem could be solved later in a calmer atmosphere. Rajaji initiated this suggestion. It has the support of Pandit Nehru. And now, the veteran PSP leader has lent his weight to it. It bodes ill for a country when its undisputed leaders of integrity lack the vision or the courage to solve a crucial problem that confronts it. This is a counsel of despair. It ill becomes the nation's elder statesmen. A problem cannot disappear by postponing its solution. Delay in solving the problem can only aggravate discontent.

More than once, it has been stressed in these columns that Congress or the country's accredited leaders cannot forever advance the 'infant State' argument, that Congress has a responsibility to pursue such a policy as to ensure territorial integrity and harmonious relations between the various units in the future. Even as Congress, the major political party, would be disowning this prime responsibility by delaying the solution of the linguistic problem, it would be undemocratic in imposing its policies against the wishes of the people. Acharya Kripalani is not alone in his criticism against the proposed zonal councils. During the parliamentary debate on the Address, many Congress members have insinuated that Communists supported linguistic States so that they could gain control of some small units, while others supported the formation of linguistic States in order to deprive the Communists of one of their effective political weapons in some of the States concerned. In a federation, the party in power at the centre cannot always hope to be in control of all the units. A time may soon come when some of the States in this country may be administered by a party which is different from that in control of the Union government. Such a state of affairs is not uncommon in the United States of America, but it has never menaced that country's political integrity . It, as well as linguistic States, cannot pose any threat to India's political stability or integrity. These are incidental issues which demand immediate and urgent attenion to the problem of amending the Constitution so as to define firmly the relation beween the units and between the units and the Union. Congress would be well advised to concentrate its energies on these problems instead of imagining threats, where none exists, to national unity.

Weekly Notes

Indonesia

ABROGATION of the union between Indonesia and the Netherlands will not cause any surprise. Djakarta and The Hague signed a protocol in 1954 for the dissolution of the union, but it was not ratified by either. Even the Dutch delegate to the recent series of conferences on the disputes admitted that the union was "an unsuccessful experiment". Djakarta regards abrogation as "cancellation of something that never existed". On both the issues in dispute, both countries are so adamant that there is no scope for compromise.

West Irian, Dutch New Guinea, is one of the main issues in dispute. Djakarta claims West Irian as Indonesian territory. This is denied by the Netherlands. In claiming absolute sovereignty over West Irian, the Dutch argue that this territory is not even a "juridically disputed" issue. Evidently, The Hague implies that West Irian is not an issue in dispute, as the acceptance of any such stand by Indonesia would prejudice the Netherlands' juridical basis of the claim. As Indonesia is equally firm that West Irian is Indonesian territory, it is clear that no compromise solution of this problem is possible. Indonesia's claim to West Irian is widely endorsed.

Under the 1949 agreement, the Dutch investors in Indonesia were allowed certain rights and concessions. This aspect of the relations between The Hague and Djakarta has created subsequent complications. There is considerable Dutch investment in Indonesia. These investments are mainly in sugar, rubber and some other plantations and in oil wells. Djakarta's contention is that it must have power and authority to exploit these resources in the national interest of the country. It is not difficult to appreciate Djakarta's claim that these issues should be subject to national legislation. Though The Hague is reconciled to accept this claim so far as future investments are concerned, it claims that investments covered under the 1949 agreement should not be subject to national legislation in Indonesia. As with West Irian, on this issue also there is deadlock.

Though the breakdown in negotiations was not unexpected, the absence of any agreed settlement had the immediate effect of delaying any solution on the Dutch and Indonesian prisoners held for "infiltrating" into each other's territory. Even without a settlement of the major issues in dispute, the question of exchange of these men should have been solved. That even this issue could not be settled, indicates the sharp conflict that exists between the two countries. It is possible that The Hague is relying on political changes in Indonesia for a favourable consideration of its claims. Admittedly, Dr Harahap's regime is a caretaker government. But, whatever be the ultimate composition of the Indonesian Government, The Hague seems to be optimistic in hoping that Djakarta will ever accept its claims. On the issues in dispute, a coalition government of the Masjumi, the Nationalists and the Nabadatul Ulama is not likely to be less adamant than the caretaker Government of Dr Harahap.

Elections in Greece

IN Greece, personalities rather than policies dominate politics. That is why, the country is frequently without a stable, progressive government. Political instability is aggravated by the unduly complicated system of voting. It may succeed in ensuring representation to all the splinter-groups, but the basis of elections can hardly lead to a stable government. Field Marshal Papago's Greek Rally began to disintegrate soon after the leader's death. But the King's choice of one of his associates as his successor led to a demand by the other political parties for a fresh election.

Though the National Radical Union, the Greek Rally in its modified form, has won the elections, it has emerged out of the polls with a slender majority. Its victory was mainly due to the complicated system of voting and to the lack of unity among its political rivals. It has won the elections, but it will experience difficulties in forming a stable government. In an election fought mainly on issues relating to foreign affairs, the Democratic Union, the Opposition, won more votes than the Radicals. There is a moral in this for Britain. It is clear that the Greeks are in favour of complete Cypriat independence and not merely home rule. Results of the election confirm the Opposition's criticism that the Greek Government's Cyprus policy is moderate. For the defeat in the elections, the Democratic Union can only blame the outmoded basis of elections.

Scholarly Crusader

A SCHOLAR, thinker and humanitarian, the late Acharya Narendra Deva gladly gave to politics what he might have preferred to give to literature and education, were the most pressing needs of this country different. With the struggle for freedom going on, a man of his burning idealism could not possibly look on nor shut himself up in a cloister; and even when independence came, it meant no respite to one who felt so deeply for the poor and the underprivileged. Within the Congress, which he served with great devotion and distinction, there was no position which was not within his reach; but he not only sponsored a socialist group under the auspices of the national organisation, but also helped it break away from the parent body when the political objective of swaraj was achieved. Yet, it is a measure of the man's loftiness of mind and spirit and his catholicity of outlook that the Congress could hardly reconcile itself to the thought that he had left the fold. Indeed, he was one of the few leaders whose appeal was directly to the national mind; and neither ideological differences nor political quarrels could ever affect the quiet influence he wielded in the country.

It is not given to many to find satisfaction in continuing to be in the wilderness when the primary goal has been won and when others scramble for position and power. But the Acharya's single-minded loyalty to the Socialist cause was such that nothing else seemed to matter to him, save perhaps his life-long fondness for scholarship and educational advance. The fact that the party he had nursed was prone to bewilderment and bickering and that it had suffered several setbacks in its difficult career was no damper to his zeal. To the last day of his life, he watched over its progress with fraternal solicitude, and his last thought was, characteristically enough, given to the future of the young party. Such faith cannot but find final vindication, though the odds may seem to be against it just now.

Mobilising Resources

Our Delhi Correspondent writes :

THE Central budget for 1956-57 has to be judged by its effectiveness as an instrument for mobilising resources for the Second Plan and for reducing inequalities in income. And if these twin objectives are to be realised gradually, so as to minimise the overheads of too abrupt a change, the budget has much to commend itself. Once this theory of gradualness is accepted, it would be really difficult to find fault with the budget proposals. All that one may say by way of criticism is that a particular proposal will in fact not conduce to the objectives set or a measure could have been made more effective without discouraging private enterprise.

With Kaldor in Delhi, the first of the recommendations of the National Development Council, which is for a ceiling on income, can only be put through in an attenuated form. The increase of super-tax on incomes above Rs. 1.5 lakhs is as near to 'ceiling on income' as the Finance Minister can get. Of course we would be hearing less and less about it now. Defective as the definition of income for taxation purposes is, attempts at dividend limitation could not have been successful without discouraging the issue of bonus shares. The new tax proposal for bonus shares will also be a damper for the expansion of the existing units made solely with a view to avoiding taxes on income. Thus the new levy will, in a sense, be a substitute for a tax on wealth which is the other recommendation of the National Development Council which has been accepted by the Government.

It is arguable that the substitute is only a pale shadow of the real thing. But, then, an effective tax on wealth would have deranged the stock markets and retarded capital formation in the private sector. Again, a case may be made out against the increase in the super-tax rate in the above Rs. 1.5 lakhs group. It may, instead of fetching a larger revenue, promote tax evasion, both legal and illegal. May be, it is a gesture the Finance Minister had to make. Having relied on indirect taxation for a total of Rs. 25 crores, he could not afford to ignore direct taxes altogether, particularly those on high incomes. A move like this, irrespective of effects on revenue, is likely to prove popular—a thing the Finance Minister may understandably fall for, especially in an election year.

Investors realise that the measures for reducing inequality of incomes could have been much more drastic. That is why the market favourably reacted to the budget proposals in early trading in the post-budget session on Wednesday. Anyway, the recent shake-out had prepared the market for a heavier burden. The uncertain undertone at close is traceable to the proposal for the graduated levy on dividends above 6 per cent. The implications of this proposal which are causing concern among market-men, are likely to have decisive effects on markets.

While direct taxation proposals are enacted to fetch Rs. 10 crores, the additional imposts on the masses are to net Rs. 25 crores. These measures were as much dictated by considerations of balancing the revenue budget as by the necessity of enforcing restraint on consumption. If cloth and road transport are thus made costlier, the burden has to be borne, if not cheerfully, at least philosophically. The Finance Minister may well be right that the average living standard will not be adversely affected by his tax proposals.

Bharata Be-shukriya

(with apologies to the shade of JOHN KEATS & LA BELLE DAME)

O what can ail thee, Taxpayer,
Distraught and palely wondering
What new demands the State will make
On thee, poor thing?

The Budget looms at this year's end
A Kali-Durga terror-form,
And thou shalt make complete returns
Of thy wealth, poor worm.

The public sector much I fear;
It squeezed me in its slow embrace,
And now my bank's small overdraft
I cannot face.

Thy private enterprise must wilt
Since thou art voted socialist.
Thou, in thy lakhs shalt pay and mourn
The welfare thou hast missed.

The Very Rich, thou mayst be sure
Have fixed up properties abroad;
But thou, the simple taxpayer,
Stay, with thy Lord.

Who is thy Lord, O gentle soul?
It must be Labour, field or town.
Take dust from them, and thou shalt live
Their hatred down.

The Second Five Year Planning Chiefs
Have grasped thy goods for deficit.

Sannyas for thee is left, at least.
Go foresting with it!

Thy total wealth, thine income burn
A hole in pockets everywhere
Except thine own. Cast ceilings off!

Come ! Take the air!

Ah no, kind counsellor, I'll stay
Distraught and palely wondering.

Shramdan, sampattidan I'll give,
And Bhoodan sing.

Evelyn Wood

Budget Estimates

An Assessment of Ways and Means

IN recent times, attention is generally concentrated on two aspects of the Union Budget, viz. the taxation measures and the planned budget deficit. This emanates from the fact that everybody expects the Union Government's development outlay to go up from year to year, and everybody knows that the Government's financial resources are not always adequate to meet these demands. The Finance Minister has naturally to devise new measures for enabling the Government to fulfil its portion of the development programme; and unless he taxes or borrows from the people, he has to resort to deficit-financing. The precise point upto which he decides to rely on taxes rather than on budget deficit is a matter of importance —indeed of great importance. The preoccupations of most people with this question is therefore understandable. However, a closer analysis of the mundane figures set out in the budget statements often helps in getting a clearer perspective of what is being attempted and why. We confine ourselves to this type of analysis here.

The principal budget data, relating to both revenue and capital transactions, are set out in the accompanying table*. The Revenue Account of the budget is simple enough, once we keep on the one side the merits and demerits of new tax proposals. It will be observed that the anticipated increase in tax revenue between 1955-56 (revised) and 1956-57 (budget) is in absolute terms less than the additional yield of Rs. 34 crores expected from the new tax proposals. This is traceable to the fact that a number of tax reliefs granted subsequent to the last budget—especially in the field of customs duties—will have a full year's effect on the expected tax yields, compared to the partial effects experienced in 1955-56. Clearly, part of the additional taxation in 1956-57 would amount to no more than compensatory; to that extent, judgments regarding the additional tax burden in 1956-57 will have to be modified.

* For an explanation of the procedure followed in drawing up the Table, see The Economic Weekly for March 5, 1955, p. 326.

As one would expect, the expenditure estimates for 1956-57 show a much larger increase over the revised figures for 1955-56. These revised figures are, it should be noted, smaller than the outlay budgeted for 1955-56 last April, but not much smaller. A great deal of fuss is made about the Finance Minister's propensity to overestimate expenditure and underestimate revenue. But a glance at the figures for 1955-56 indicates that this is in turn due to a propensity to grumble at any and everything After all how big is the discrepancy between the budget and revised estimates for 1955-56? On the revenue side, the expected increase for 1955-56 over the budget estimates is of the order of Rs. 20 crores, or a deviation of about 4 per cent on the plus side. In respect of expenditure, the shortfall compared to the budget estimates is about Rs. 9.5 crores, or a deviation of about 2 per cent on the minus side. Surely these are not errors of estimation that could be classed as "significant". And in any event, it seems unfair to cavil at the Finance Minister for providing a small margin in his estimates for meeting the unforeseen charges that may fall on the fisc in a period of twelve months.

To return from the digression. The anticipated increase in revenue expenditure is due mainly to larger outlays envisaged under the Development Departments, such as education, public health, industries etc. These are inevitable during a period of development; indeed they constitute an indication of further developmental effort. None questions the need for development, nor the need for the Union Government taking an active part in it. One might, if one is not so mightily afraid of taxation, even say that the additional outlay envisaged on these nation-building activities is not enough to ensure the attainment of targets set under the Second Plan. Shri Deshmukh has, if anything, been parsimonious in this respect. And yet people cry extravagance!

Let us continue with the figures. Turning to the Capital Account, which really indicates the quantum of development expenditure to be undertaken in one form or another, it will be observed that the direct outlay on development (item V (i) in the Table) increases by Rs 69.1 crores between 1954-55 (Accounts) and 1955-56 (RE), and by Rs 103.1. crores between 1955-56 (RE) and 1956-57 (BE). This is entirely expected, in view of the rate of expenditure envisaged under the Second Plan. It is to be noticed that under this head the largest increases are in respect of railway capital (Rs. 41 crores) and industrial development (Rs. 64 crores). Needless to point out, this again follows from the Second Plan allocations and priorities. Indeed, the additional outlay on industrial development is somewhat larger, if account is taken of the loans to be advanced to concerns in the public sector, such as Hindustan Steel, Ltd., Rourkela, Sindri Fertilizers, Air-India International etc.

The other big item on the Capital Expenditure side is the lending operations of the Government, mostly to State Governments. This is an item which grows from year to year though apparently the rate of its growth has not been on the increase. Loans to State Governments increased by Rs. 69 crores between 1953-54 and 1954-55, and by Rs. 58 crores between 1954-55 and 1955-56 (RE). The increase next year is to be of the order of only Rs. 24 crores. There are, however, certain things to be remembered in this connection. Loans to States showed a big increase in 1954-55 because in that year State Governments had been asked to keep away from the open market, and a combined loan for both the Centre and the States was floated by the Union Government. The practice was changed in 1955-56 and the States actually resorted to the open market twice in 1955. On the same lines, it is possible that the increase in loans to States has been kept rather low in 1956-57 (BE) on the presumption that State Governments could tap the market to a substantial extent by offering, as they usually do, somewhat better terms than those of India Government loans. Besides, the transfer of funds from the Centre to the States is not confined to the loans alone. Numerous other transfers in both the revenue and capital accounts have to be taken into account before one is able to assess the financial assistance rendered to States to facilitate their development programmes.

Given this situation viz. the necessity of finding funds not only for the Union Ministries but also for the States—the large deficit in the budget is a foregone conclusion. With the economic and psychological obstacles to garnering a large surplus on the revenue account, the Finance Minister has to bank on the Capital Account for the funds needed for capital expenditure of one sort or another. He hopes to borrow in 1956-57 a net amount of Rs. 100 crores internally, and about Rs. 39.5 crores abroad—from USA (Rs. 28 crores), U.S.S.R. (Rs. 10 crores) and the World Bank (Rs. 1.5 crores). It would, perhaps, be possible for Shri Deshmukh to borrow more than Rs. 100 crores internally next year. But, as mentioned earlier, he intends to refrain from doing so in order to let the States float their own loans. Besides the long-term loans, the Capital Account takes credit for Rs. 89 crores in 1956-57 (BE) under small savings and unfunded debt, compared with Rs. 85 crores in 1955-56 (RE). The Finance Minister has, apparently, been somewhat conservative in this regard too, since the actuals have in the past generally been higher than the revised or budget estimates and the small savings campaign is being progressively intensified.

The above two are, in effect, the principal sources of capital receipts. The third major item, other deposits and advances (net) is one about which little prognostication on the basis of past trends is possible. As was pointed out last year, this item is suspect, because a substantial part of the credit under it in both 1955-56 (RE) and 1956-57 (BE) is due to net receipts under 'suspense'. What this means is anybody's guessing but it is certain that this is not to be treated as a genuine source of funds. Further, the larger inflow under this item in 1955-56 (RE) is due partly to net receipts of Rs. 13.7 crores from the Cash Balance Investment Account which is another way of saying that securities held by Government were reduced to that extent. This could, incidentally, be tantamount to deficit financing if the securities are sold to the Reserve Bank.

Unlike in 1954-55, the Capital Account benefited to the tune of Rs. 11 crores in 1955-56 (RE) from State Trading Schemes. This is, in effect, a conversion of the large stocks built up in 1954-55 into cash, and perhaps meant a genuine flow of funds from the private sector to the fisc. For the next year, State Trading Schemes are expected to involve a net investment, so that there is little chance of the funds required for development plans being obtained from that source.

All of which naturally makes it imperative for Shri Deshmukh to go on expanding the Floating Debt. Here, he has been grossly overestimating the possibilities. The budget for 1955-56 envisaged an increase of Rs. 340 crores in Government of India's Floating Debt; the revised estimate for 1955-56 put the probable increase at Rs. 240 crores. Considering that between April 1, 1955 and February 10, 1956 the outstanding of Treasury Bills had increased by only Rs. 31 crores, it seems very unlikely that the actual increase between April 1, 1955 and March 31, 1956 will be as much as Rs. 240 crores. But things may be different next year, in view of the continuous increase in the capacity of the Government to spend, virtually no margin in the cash balances and the increasing demand for money in an expanding economy.

Budget of the Government of India, 1956-57

(in Rs Crores)

		1954-55 (Accounts)	1955-56 (Revised)	1956-57 (Budget)
I	**Revenue Receipts**	**456.1**	**501.7**	**527.7**

new light on your overheads

Actually its good lighting.
Fluorescent lighting—Philips.
Cutting overhead costs, and giving you over 3 times the light on the job.
All workers, office employees and factory labour, who have had experience of this new light correctly handled, will agree that they can work a lot better over a length of time under fluorescent lamps.
Less eye-strain, fewer mistakes, quicker work, and an improved general atmosphere, these are the results of better lighting. And working tests have proved that Philips Fluorescent Lamps, used with quality control gear, have a burning life of 7500 hours, which is just about 4 years. These are a few reasons why Philips Fluorescent Lamps & Fittings are being installed in homes, offices and factories throughout the world.

From the London End

British Military Preparedness

IF any evidence is required to show how far we are from peace or how near to war, then it will be found in the Defence White Paper issued this week. It will also be found in an equal measure in three service estimates now being submitted to Parliament. The White Paper is unequivocal: the forces required to support the present (and new) strategy "must play their part in the cold war" and "must be capable of playing their part effectively in global war should it break out". It goes further: the new strategy (which is examined below) would, according to the White Paper, contribute:

> "to the stability of the free world and the security of overseas territories whose peaceful development may be threatened by subversion whether overtly communist or masquerading as nationalism."

One has come to expect verbiage like this from the Americans; it is a matter of great consequence that Britain's policy-makers should now not only use similar jargon, but also possibly base their policies and assumptions on attitudes for which the U.S. State Department and its Secretary have a reputation.

'New Strategy'

This year's Defence White Paper is significant not only for the possible change in attitude indicated here, but also for the description given to the new strategic factors underlining Britain's military policy and the economic repercussions arising from it. The 'New strategy' is, in fact, not so very new. It has its origins in the 'positions of strength' policy first enunciated by Mr. Dean Acheson, Secretary of State, in the last American Democratic Party Administration. The strategic factors which underline Britain's policy are thus mainly concerned with the ways in which the so-called 'deterrent' — the ultimate weapon — can be strengthened; or, in terms of practical warfare, how a solution to the problem of the 'means of delivery' of the H-Bomb can be achieved.

The White Paper attempts to argue against the well-known view that the policy of 'deterrence' can have little impact when, in fact, the Russians too are in a position of producing thermo-nuclear bombs and of ensuring delivery to destinations as far away as New York. The White Paper states that the objective of the Western Powers is 'defensive'. It claims that Western Powers will never be aggressors; but they must have the power of instant and overwhelming retaliation if attacked. It, therefore, argues that it is this 'retaliatory power which is the vital factor'. The fact that Russians are using a similar argument to maintain their military preparedness and that the similarity of outlook of both the power blocs is necessarily leading to an intensification of the armaments race is, of course, ignored. Those sections of the White Paper which concern themselves with disarmament are as hollow and unreal as the sections defining Britain's new strategic policy are dangerous and tragic.

More Mobile and Flexible

The effect of the so-called new strategy is to make each of the armed forces conform to what is called 'a new concept of flexibility". In the case of the army, there is to be some reduction in manpower between now and 1958. Already the army staff is involved in a considerable measure of reorganisation of design to establish 'the concept of flexibility'. Intensive trials to determine the best organisation 'for a nuclear war' have already been instituted in Germany. The present form of the armoured divisions will be changed so as to make it more mobile and flexible, and, thus, as the White Paper puts it, 'to enable it to exploit rapidly changing conditions'.

Since it has become the policy for nuclear weapons to be used in what is called 'limited wars', the new organisation of the fighting formations will henceforth be adapted to the needs of war theatres other than in Europe. In concert with the new concept of flexibility, the navy is being adapted on the basis of smaller fleets of modern design and propelled in the main by nuclear power. In spite of the fact that the new strategy attempts to re-define the role of the armed services in the age of thermo-nuclear weapons, the navy is still to be assigned a special 'place in the immediate problems of the cold war'. The navy, according to the White Paper, is to play an important part in 'upholding our interests and influence in peace time in the distant parts of the world'.

Since it is the power to deliver the ultimate weapon that constitutes, in the thinking of British military circles, the supreme 'deterrent,' the Royal Air Force comes into its own. The White Paper states unequivocally that the primary task of the air force continues to be the building up of the V-Bomber Force and its associated stock of nuclear weapons.

It is expected that a new bomber —the Vulcan—will join the Valiant in the bomber task force and that the production difficulties experienced last year will have been solved in 1956-1957. The tactical air force is being strengthened largely for the defence of the country, and it appears that some of the expenditure in the air force estimates will cover the increase in fighting power and the lethal capacity of the fighter aircrafts in service or to be put into service. The first generation of guided missiles will also become available from production in the course of 1956-57.

Economic repercussions

The economic repercussions of the new strategy are made particularly important by the economic crisis. The new strategy necessarily involves:

(a) A larger expenditure on the armed services than before,

(b) Greater reliance on the metal and metal-using industries for the provision of weapons required in terms of the new strategy and

(c) The premium placed on skilled personnel in the armed forces.

It is precisely in respect of each of these three problems that Britain's economic crisis is relevant. The higher cost of defence expenditure which, according to the White Paper, will amount in the year 1956-57 to £1,548.7 million will generate incomes which, at least absolutely, will be higher by some £11 million, compared to the year 1955-56. The strain which such an expenditure will impose on the resources of the country is unlikely to be overcome by any sharp increase in taxation or by any other attempt to restrain private consumption and investment. Thus, in spite of the economic situation, expenditure in respect of defence continues to race ahead, and

in spite of the qualms voiced in the White Paper, the prospect is for such a high level of expenditure ultimately to overwhelm the economy irretrievably.

The new strategy calls for weapons which largely emanate from the British metal and metal-using industries—industries which today are possibly the most vital for the maintenance of a high level of exports and thus for equilibrium in the balance of payments. It would, therefore, follow that the military reliance on these industries can, with weighty impact, further imperil the balance of payments.

A Shock

It has only been as a result of the considerable emphasis placed on scientific and technical education in the U.S.S.R that Britain has woken up to the needs of promoting a more science-conscious British labour force. The vacancy columns of the daily newspapers run long with offers of jobs to those with some training in the pure sciences, and it has come as a shock to a largely self-satisfied people that their educational attainments are insufficient for Britain to man its newer industries, and in particular those industries which have good prospects in world trade. In the face of this shock comes the demand for highly skilled and qualified technical personnel for employment in the military establishments of the Government. This demand already impinges upon the supply of labour in the civil sector of the economy.

The White Paper recognises that the economy of the U.K has been overstrained and that there exists 'a pressing need to limit defence expenditure to what is truly essential'. The estimate of £1548.7 million, submitted for the year 1956-57, must, therefore, be construed as being the minimum expenditure required for the pursuit of the new strategy. As stated above, it is slightly larger than the expenditure incurred last year. It is not difficult to imagine increases in this level of expenditure taking place in the coming years, since what is now being planned is to be only the 'absolute minimum'.

Summary of Estimated Expenditure

£ million

	1955-56	1956-57
Admiralty ..	347.0	351.0
War Office ..	484.0	479.0
Air Ministry ..	540.4	517.5
Ministry of Supply	147.5	185.0
Ministry of Defence	18.3	16.2
	1,527.2	1,548.7

Government hopes to obtain some £50 million from the Americans as defence support aid and this expected receipt will reduce the level of defence expenditure to £1,498.7 million which, taking into account the receipts of American aid in the last financial year, would represent an increase of over £4 million.

No Defence?

The attention given to the requirements to strengthen the 'deterrent' would have necessarily called for sufficient measures in respect of direct home defence. The White Paper speaks meaningfully of the nature of nuclear radiation and fall-out and of the vast dangers which these represent. It goes on, however, to attempt to justify inactivity in this field in view of the current economic difficulties. It states rather hypocritically that 'heavy expenditure on purely defensive measures by weakening our economic strength and reducing the sources available for building up the strength of the deterrent might well work against the primary objective of ensuring that global war itself is prevented'. Maybe, this is simply another way of stating that there is no defence against thermo-nuclear warfare.

Bench Mark Survey for New Forest Policy

Indian Forest Statistics 1950-51 & 1951-52. Issued by the Economic and Statistical Adviser, Ministry of Food and Agriculture. Manager of Publications, Delhi, 1955. Pages 192, Price Rs 20.

THE latest issue of the Indian Forest Statistics relates to the year 1950-51 and 1951-52. The information contained in it is, therefore, mainly of historical interest. This particular issue will perhaps be of special interest, as the Government of India revised its Forest Policy in May 1952; and this record of the two preceding years may serve as a bench mark for studying the changes that have resulted from the new Forest Policy.

The main aim of the comprehensive National Forest Policy, which replaces the earlier one dating from 1894, is to check the "indiscriminate extension of agriculture on forest with consequent deprivation of fuel and timber to the local population and stripping the land of its natural defences against dust storms, hot dessicating winds and erosion". A comparison with other countries shows that the proportion of land under forests is relatively low in India, being only 22 per cent of the total land area.

Extension of Forests

The objective of the new policy is, therefore, to have at least one-third of the total land area under forests, to achieve which the extension of regular forests to waste lands is planned. The Planning Commission's recommendations for forest development include the strengthening of the Forest Administration where private forests have been transferred to public ownership; renovation of areas which were over-exploited in war-time; afforestation where large-scale erosion has taken place; development of forest communications; development of village plantations to ease the fuel supply position; and increased utilitsation of non-conventional varieties of timber after proper seasoning and chemical treatment.

Forests are classified according to (i) types—merchantable and unprofitable or inaccessible; (ii) legal status—reserved, protected and unclassified; (iii) composition—mainly coniferous and non-coniferous; and (iv) ownership — State, corporate bodies and individuals. In the interests of national economy and scientific forest management, the trend towards complete State ownership and management is to be welcomed. This trend is evident from the fact that the area under the State increased from 82 per cent of the total forest area in 1950-51 to 91.6 per cent in 1951-52.

Statistical Tables

The statistical tables—of which there is a large number—are classified under the following heads: (i) area of forest (ii) volume of standing timber (iii) out-turn of forest produce (iv) employment of labour (v) revenue and expenditure (vi) foreign trade and (vii) miscellaneous. And the tables are followed by two appendices at the end, including one on Vana Mahotsava. But apart from the bare figures, there is very little by way of explanation from which the lay reader may derive some guidance.

The statistics of employment are an instance in point. Employment of labour in forest and forest industries is presented in a series of tables under four heads, viz., forest management, forest extraction, forest industries and grand total. And under each of these again, information is given for two separate categories, viz., 'A'—those mainly dependent on forestry and forest industries and 'B'—those partially dependent on forestry and allied industries.

Now, of the people employed in forest management, who are mainly dependent and who partially dependent on forests? This is puzzling. Common sense does not help. Nor does the introductory note throw any light. Besides—this is a comparatively minor matter and understandable—there are many gaps in these as in other tables. Many of the States did not report at all. So, it is difficult to compare the totals of employment for the two years, viz., 1950-51 and 1951-52.

Employment Figures

The paragraph on employment, in the introductory note, is perhaps the most breath-taking. An interesting observation is made therein, viz., that forests are an important source of employment; and in 1951-52 about 44 million persons were mainly dependent and 91 million people partially dependent on forestry and forest industries. The total employment would thus come to about 135 million people out of the country's total population of about 360 million. This figure is indeed staggering. For, even agriculture—the primary occupation of the people—does not provide employment to such large numbers. According to the 1951 Census economic tables, the number of those 'employed' in agriculture—including those who are self-supporting and those who are earning dependents and excluding non-earning dependents—totals only about a 100 million.

As regards forestry and the allied industries, it is found that those who derive their means of livelihood from forestry and collection of forest products—i.e. employers, employees and independent workers—number 2.5 lakhs. If we add to this those engaged in the category of occupation described as wood and wood products and in the manufacture of furniture and fixtures and paper and paper boards—which together engage about 11 lakh persons—the total employment would be 1.35 million. How does this figure compare with 135 million given in the forest report? Obviously, either there is an error in compiling the employment figure or there is confusion about what this figure 135 million refers to.

A glance through the statistical tables relating to employment of labour, however, lends weight to a presumption that the figure may refer **not** to **employment** but to total **man-days** worked in forestry and forest industries in 1951-52. Table 4.1 gives the number of persons employed on the first day of each month, beginning from April and ending with March for the years 1950-51 and 1951-52. And on page 139, where the grand total is struck, we find that the average number of persons employed per day for 1951-52 is about 120,000 in respect of those mainly dependent and 251,000 in the case of those partially dependent. If these daily employment figures are converted into man-days for the year 1951-52, we get 43.8 million man-days for the former category and 91.6 million man-days for the latter. These figures, it will be seen, approximate

to those given in the introduction, viz., 44 million and 91 million respectively. This is, of course, only an interpretation.

Major Products

The major products of Indian forests include timber, round wood, pulp wood, fire wood etc., and among the minor products are bamboos and canes, fibres and flosses, drugs, spices, gums and resins, lac etc. The out-turn of major products declined from 558 million cubic feet in 1950-51 to about 517 million cubic feet in 1951-52, but their value went up slightly from Rs 18.94 crores to Rs 19.95 crores in the same period. The value of minor products also increased by about Rs 12 lakhs to Rs 7.04 crores in 1951-52. An interesting point in this regard is that of the total estimated value of Rs 7.04 crores of minor forest products, State-owned forests contributed as much as Rs 6.97 crores.

Despite her vast forest resources, India is still a net importer of wood products. Among the major products, we import more of hard wood than soft wood, such as teak from Burma. Some quantity of hard wood is also imported from US, Canada, Sweden and Thailand. But included among wood products are such derivatives as paper and pulp. This classification is probably in conformity with international usage, but it nevertheless gives a very misleading impression about India's dependence on forest products as it is commonly understood. India also imports minor forest products such as gums, resins and lac, mainly from Singapore, Thailand and UK, and tanstuffs and dyestuffs from Burma, Kenya and Singapore.

Our largest net imports are under the head 'wood products' which were valued at Rs 15.83 crores in 1951-52 as against Rs 10.55 crores in the previous year. We export only hard woods, some derivative products, wild animal products, gums, resins, lac etc. And our net export of minor forest products such as gums and resins, which go mainly to UK, West Germany, Belgium, US and France, were valued at Rs 2.13 crores in 1951-52.

Vana Mahotsava

An assessment of the 'Vana mahotsava" programme is also attempted. We are told that out of the 44 million trees, planted during the first 'Mahotsava' in July 1950, 'more than 38 per cent were reported to have survived'. The second 'Vana mahotsava' (July 1951) has been declared 'more successful' inasmuch as more than 50 per cent of the 35 million trees survived.

Though otherwise dry and severely statistical, the introductory note is relieved by a piece of colourful writing on the march of the Rajasthan desert. The desert, we are told, has spread through the ages and threatens to engulf the fertile alluvium of the Indo-Gangetic plain. But one need not be unduly scared by this threat as measures for the immobilisation of the desert are already in hand. Government appointed an ad hoc committee to advise it on the measures to be taken for the purpose. The recommendations of the committee envisage the setting up a Desert Research Station at Jodhpur to study silviculture of indigenous vegetation, its succession and propagation. The research station is also to undertake extension work consisting of the following:

(a) distribution of seeds and plants,

(b) establishment of cases as nucleus for the spread of vegetation around police posts on the border, railway stations, schools etc.,

(c) establishing shelter belts along selected roads and railway lines, running transversely to the direction of the wind,

(d) improved agricultural practices and animal husbandry, rotational grazing etc., and

(e) establishment of 6 fuel and fodder reserves of not less than a thousand acres each to demonstrate rotational lopping and grazing.

Technological research, relating to forests and their products, is carried on at the Forest Research Institute at Dehra Dun under the control of the Union Government. Forest education is provided in the forest colleges at Dehra Dun and Coimbatore, which are also administered by the Centre. Besides, the Dehra Dun Research Institute holds short-term courses of a specialized nature in the different branches of research conducted at the Institute.

Some Improvement

Since the Directorate of Economics and Statistics took over in 1947 the collection and publication of statistics relating to forest administration in India, some improvements have been effected both in the content and coverage of statistics. Even so, a great deal remains to be done before Indian forest statistics attain the standards of the FAO and some of the foreign countries.

Among the items on which information has to be included are: (i) production of wood classified by important species (ii) wood manufactures (iii) prices of forest produce and manufactures (iv) wages of forest labour and (v) consumption of forest produce. We are told that suitable pro formas for the collection of these data have been designed and sent to forest authorities in the States. One may, therefore, hope that the existing deficiencies in forest statistics will be remedied before long.

India is a Multi-lingual Nation —Not a Multi-national State

G S Bhargava

THE latest political craze in the country is for bi-lingual or multi-lingual States. Indian leaders have changed positions on the subject so often and so drastically that a student of Indian politics is apt to feel like Alice in Wonderland.

Between the formation of the Andhra State and the appointment of the States Reorganisation Commission, the linguistic idea was propagated with varying emphasis. When the S R C, by and large, accepted the principle of language States—Bombay and Punjab were the only exceptions—the leaders of the ruling party and the Government seemed to agree that there was nothing wrong in linguistic re-demarcation of State boundaries.

Then the Prime Minister suddenly put forward a nebulous idea of zonal regrouping of the new States. Even before the Home Minister, Shri G B Pant, had developed the theme and given it flesh and blood, it became the fashion with Congress leaders, Ministers and leader writers in newspapers to acclaim it.

Followed the disturbances in Bombay, Orissa and other places. While a dazed country was recovering from the shock of the unhappy developments, the Chief Ministers of Bihar and West Bengal, who were till then engaged in a bitter feud over a small strip of bi-lingual territory, sprang the biggest surprise of all by proposing the merger of the two States. It has become the fashion since to talk of merger of states. All sorts of combinations have been conceived, among the brainiest being Shri B. Gopala Reddy's idea of the amalgamation of Visal Andhra and Samyukta Maharashtra!

Press correspondents freely suggest that when the bi-lingual idea gathers momentum there will be only five or six large States: the present Bombay State, Vidarbha, Saurashtra, Kutch and Rajasthan forming a Paschim Pradesh, West Bengal, Bihar and Orissa making a Purva Pradesh; the present Madras State joining with Travancore-Cochin and the enlarged Mysore to become a Dakshina Pradesh; U P remaining as it is as Uttar Pradesh; and the present Vindhya Pradesh, Bhopal, Madhya Bharat and the Hindi areas of the present Madhya Pradesh coming together as the new Madhya Pradesh.

It was then hoped that the S R C proposal for a merger of Punjab, PEPSU and Himachal Pradesh would be put through with some safeguards to satisfy the Sikhs. That would have left Visal Andhra in the south, Assam in the east and Jammu and Kashmir in the north as the only 'unattached' States.

Two basic assumptions are at the root of the above way of thinking: first, that the attempt at linguistic reorganisation of States is itself responsible for the recent disorders and internecine strife and secondly that replacing the lid of the Pandora's box, by going in for bi-lingual and multilingual States, will end all troubles. Nobody who is conversant with the origin and growth of the demand for linguistic States will accept either of these assumptions.

Genesis of the Linguistic State Idea

It was in 1905 that the Congress, though indirectly, committed itself to the principle of linguistic States when it lent support to the demand for annulment of the partition of Bengal. Three years later, constitution of a separate Bihar Pradesh Congress—four years in advance of the actual separation of Bihar from Bengal—meant more direct acceptance of the principle that a majority of people speaking one language should be constituted into one State. Formation of two new Congress provincial committees, one for Andhra and another for Sind, in 1917 was the next step.

The Nagpur Congress of 1920 made linguistic redistribution of provinces one of the political objectives of the party. As pointed out by the States Reorganisation Commission, the Report of the Nehru Committee appointed by the All-Parties' Conference in 1928 developed a rationale for linguistic States thus:

"If a province has to educate itself and do its daily work through the medium of its own language, it must necessarily be a linguistic area. If it happens to be a polyglot area, difficulties will continually arise and the media of instruction and work will be two or even more languages. Hence it becomes most desirable for provinces to be regrouped on a linguistic basis. Language as a rule corresponds with a special variety of culture, of traditions and literature. In a linguistic area all these factors will help in the general progress of the province".

Congress Manifesto 1945-46

The Congress manifesto for the 1945-46 elections committed the party to redraw the map of India on a linguistic basis, when returned to power. Even after independence, the Hyderabad Pradesh Congress, notably, pledged itself to the disintegration of the State and the amalgamation of the Telugu, Marathi and Karnatak areas with their respective linguistic regions. In Andhra, the success of the Communists in the 1952 elections was attributed to the demand for a separate Andhra State they had raised. As a counter-blast, in the 1954 re-election, the Congress claimed the constitution of the Andhra State among its achievements. The same year, in Travancore-Cochin, the Congress accepted as a coalition partner, the Travancore Tamil Nad Congress, which had a few months earlier sponsored a violent linguistic agitation. Criminal cases filed against T.T.N.C. leaders were withdrawn by the Congress Government.

In brief, for over 30 years now, Congressmen, individually and on behalf of their party, have been associating themselves with demands and agitations for linguistic States. The Congress leadership and the Government have also realised, as stated by the SRC, that "further deferment of a general reorganisation might lead to more dissatisfaction." Nevertheless, it has been recognised that, besides the linguistic principle, other important factors such as the preservation and strengthening of the unity and security of India and financial, economic and administrative considerations should be taken into account while re-drawing the State boundaries.

Not an End in Itself

In other words, linguistic redistribution of States was not looked upon

as an end in itself but as a means to (1) national unity, (2) economic progress and (3) administrative convenience. To these must be added the vital consideration of achieving a decentralised political set-up, which was one of the points stressed by the Praja-Socialist Party when it pleaded for formation of linguistic States here and now. The SRC also bestowed enough thought and attention upon these ultimate goals and suggested several reforms to be embarked upon simultaneously with State reorganisation. It also made it clear that even after reorganisation, bi-lingual areas would remain, and, therefore, recommended safeguards for linguistic minorities.

For instance, acceptance of Hindi as the **lingua franca** would, as Gandhiji often pointed out, knit the different linguistic States into a united nation. It would militate against linguistic loyalties running riot and leading to separatism. It would, to quote Gandhiji again, make the States "realise their organic relationship with India." Still, Congress leaders who rule out linguistic States on considerations of national unity oppose what they call imposition of Hindi on South India!

That satisfaction of linguistic aspirations will remove the existing antipathy for Hindi in the South goes without saying. Irrational opposition to all things British, including the English language, ended with the transfer of power. Similarly, Andhra, often regarded as a State of linguistic fanatics, is favourably inclined towards Hindi, unlike Tamil Nad!

The SRC recommendations, by and large, accepted the linguistic principle, though while proposing the formation of the new Madhya Pradesh and favouring the retention of unwieldy UP as it is, the Commission has given the go-by to the question of administrative convenience. The economic factor weighed with Shri Fazl Ali when, in a minority report, he recommended continuance of Himachal Pradesh as a separate State. Only in respect of Bombay and Punjab, all the four principles were subordinated to expediency. Without adducing any reason, the demand for a separate Maharashtra State with the city of Bombay as capital was turned down. So too was the idea of a Punjabi State, which was not entertained at all.

Supra-Judicial

Instead of amending the SRC report on these points, the Congress Working Committee, like a supra-judicial body, began tampering with the recommendations with an eye on the next elections. Taking the taluq as unit and on the basis that a majority of people speaking one language should be constituted into one State, it would not be difficult to redraw the State boundaries. Acceptance of a principle for States reorganisation would have taken the wind out of the sails of irrational agitations. People who clamour for acceptance of the principle of linguistic States when it benefits them but fight shy of it when their own State has to cede territory would have then been exposed. Instead of such a principled approach, the Congress High Command made a virtue of being all things to all men, as exemplified by the permutations and combinations tried in the case of Bombay City.

Bilingual Bombay State, bilingual State plus Vidarbha, separate Maharashtra and Gujerat with a City State of Bombay and finally, direct Central administration over Bombay were the alternatives proposed by the Congress leadership. Significantly enough, none of these proposals accepted the linguistic principle. On the other hand, each of them was meant to soften the rejection of that principle. That geographical and economic factors demanded inclusion of Bombay City in Maharashtra did not also appeal to the Congress leadership. They had also overlooked an elementary fact that whosoever controls, economically, the City of Bombay also controls its Maharashtrian hinterland.

Thus, it was the rejection of the linguistic principle, propagated by the Congress for 50 years, which led to the disorders, and not its acceptance. Secondly, the people of Maharashtra, pledged to the idea of linguistic States, were so hurt by the Government's decision that they could not be isolated from the anti-social elements exploiting the situation.

Aloofness of Administration

The democratic rationale behind the demand for linguistic States is, as pointed out by the Praja-Socialist Party's National Executive in a recent resolution on the subject, that such reorganisation of States destroys the barriers between the common man and the administration. Equality of opportunity without which all talk of a "socialist pattern of society" is hypocrisy demands that employment and other opportunities should trickle down to the lower strata of society which will not be possible in a polyglot area.

There is also nothing reprehensible in the movement for linguistic States being an essentially middle class affair. Employment opportunities provide a way out of their present distressed condition for the middle classes and so they naturally plump for smaller and linguistically homogeneous administrative units.

Moreover, multi-lingual States have provided for exploitation of one language group by another. Since there has been no uniform development of the country and since people inhabiting particular areas, like Bengal and Madras, have been, for various reasons, more forward in education and politics, polyglot units have seen their cornering juicy jobs and prize posts. While there should be no premium on reservation of posts on a linguistic basis, it is not also fair that persons speaking a particular language should have a near monopoly of lucrative posts in an area peopled by a different linguistic community. If merit be such an overriding criterion in these matters, there would have been no case for the withdrawal of the British from India.

Therefore, the PSP hit the nail on the head when it declared that the proposals for bi-lingual and multi-lingual States "have not emerged as a result of the wishes of the people but have been brought forward by the leaders of the ruling party to evade the responsibility of solving the conflicting issues of reorganisation of States on the basis of well-defined principles, with due regard for the wishes of the people. The National Executive, therefore, feels convinced that no such move should be entertained before the people concerned have had an opportunity to express their wishes freely on the issue."

To decide the future of bi-lingual areas, the PSP has suggested holding of plebiscite in the areas concerned, a proposal to which the Prime Minister also seems to be agreeable.

Another argument against linguistic reorganisation is that it will militate against economic progress and hamper the smooth execution of development plans. Facts belie this contention. If Andhra is an example, schemes for the exploitation of its rich natural resources which remained in cold storage at the time of the formulation of the

(Continued on page 277)

Israel's Unstable Economy

Hannan Ezekiel

THE two outstanding features of Israel's economy, which I had stressed in my articles in **The Economic Weekly** (December 6 and 20, 1952), were a heavy deficit in the balance of payments and an acute inflationary situation. An examination of economic developments in Israel during subsequent years shows that these two problems continue to plague the economy in spite of the many efforts which have been made to improve the situation.

There has undoubtedly been some improvement in both fields, but they are still far from showing signs of normality, and the stage has been reached when efforts being currently planned to bring about the basic changes in the economy necessary for the long-run solution of these problems are themselves likely to worsen the situation in the immediate future.

Heavy Import Surplus

Israel's foreign trade has been characterised by a heavy import surplus, which over the period, July 1948 to December 1954, amounted to $1,590 million, i.e., 84 per cent of the total imports during the same period. No doubt, the import surplus has tended to decline in recent years; after reaching a peak of $ 333 million (88 per cent of imports) in 1951, it declined to $ 202 million (70 per cent of imports) in 1954. This improvement was brought about by various import cuts, increased exports and a drop in world prices which helped the country in view of the high proportion of imports in its total trade.

The decline in the balance of trade deficit was also brought about partly by an increase in the value of exports, which nearly tripled between 1949 and 1954 reaching $ 88 million in that year. This increase in exports was made possible by greater local production and was stimulated by Governmental deflationary measures, devaluation of the Israeli pound from $ 4.03 in 1949 to $ 0.56 in 1954, conclusion of bilateral trade agreements, opening of new markets and introduction of a system of export financing which provided loans for the export of industrial and agricultural products, as well as foreign currency for the import of raw materials entering into export products. The increasing proportion of industrial products in exports and the diversification of industrial products exported—both these reflect the efforts that are being made to industrialise the country and the special attention that is being paid to the solution of the balance of payments problem.

Unbalanced Character

The financing of the balance of trade deficit indicates the unbalanced character of Israel's economy. The deficit of $1,590 million from July 1948 to December 1954 was covered by contributions of world Jewry, imports of private capital in kind, liquidation of sterling balances and foreign securities, German reparations payments, grants by foreign Governments, United States Export Import Bank loans, independence bond and development bond issues sold mainly in the United States and commercial credits and other net capital inflows.

The German Reparations payments, mentioned above, form part of the total of $ 821 million agreed to be paid over a twelve-year period out of which, however, $ 107 million are to be paid to Jewish organisations outside Israel. By the end of 1954, Israel had received $ 120 millions. This pattern of the financing of the balance of trade deficit indicates that the country still has an artificial economy, whose future cannot be bright unless the factors that lie at the root of this situation are tackled.

The balance of payments problem is intimately linked with the inflationary situation, both reflecting the basic weakness of the economy. By 1954, the wholesale price index had risen to 270 and the cost of living index to 233 (1943 = 100), though the rate of increase had declined considerably in 1953 and 1954, as compared with 1952 when the upward trend came acutely into evidence. The principal factors that contributed to the price rise in 1952 and thereafter were: discontinuation of rationing, lifting of price controls and limiting of subsidies to a few staple commodities only, continuation of investment at a high level, reductions in import surpluses in an attempt to reduce the balance of trade deficits, the linking of wages to the cost of living index and of profits to the value of merchandise rather than to efficiency and productivity, and devaluation of the Israeli pound. The last must be considered an important factor, since, though carried out in stages and though there were multiple exchange rates for some time, the total devaluation must be considered very drastic indeed as it reduced the value of the Israeli pound from $ 4.03 to 0.56. While devaluation was meant to bring Israeli prices into line with world prices so as to reduce imports and expand exports, the inflationary effects it had to that extent reduced its favourable effects on the balance of trade.

Two Main Features

The two main features of the economy with which the major problems discussed above appeared to be linked in 1952 were the high level of immigration into the country and the Arab-Israeli tension. It is now clear that these two factors can still be held responsible for the perpetuation of two problems, the solution of which is essential to the achievement of stability in Israel. The total population of Israel increased from 1,174,000 at the end of 1949 to 1,719,000 at the end of 1954. The Jewish population rose from only 650,000 in May 1948 to 1,526,000 at the end of 1954. Of this rise, about four-fifths was due to immigration and one-fifth to natural increase. There was, no doubt, considerable emigration of the non-Jewish population and also a small volume of Jewish emigration; but it is clear that the problem constituted by immigration in particular and population growth in a newly-founded State in the circumstances of Israel is bound to be highly intractable. The only source of consolation is that the volume of immigration has fallen sharply from 173,900 in 1951 to 17,500 in 1954.

The absorption of immigrants proved to be a major task; it required an estimated investment of about 3000 per immigrant. Many of the earlier immigrants could be settled in abandoned Arab villages, but even in the earlier years, many had to be accommodated in Government-built housing units and in the future the problem will become more difficult from that point of view. The major proportion of the immigrants have been town-dwellers, but to maintain

the balance of the economy, about one-fifth had to be settled in rural areas. Even otherwise a large number of the immigrants were business men or professional people and found it difficult to adjust themselves to conditions prevailing in Israel.

Arab-Israeli tension has prevented the country from reducing its relatively high level of defence expenditure and from concentrating its attention on problems of economic development carried on in co-operation with its neighbours. It has also meant the giving of high priority to projects which otherwise could have been deferred to a later period.

Tackling Basic Weaknesses

In order to tackle the basic weaknesses of the economy, Government has been making every effort to increase production, both agricultural and industrial. This creates new problems in its turn. For, expanding agricultural and industrial output is dependent on a high level of investment in both sectors, which, however, affects adversely both the balance of payments and the inflationary situation.

A development plan, covering a period of seven years from 1954 to 1960, has been prepared. It is a co-ordinated programme for the development of agriculture, irrigation, electricity, quarrying, transport, communications and housing. The schemes have been all selected with an eye to their effcts on the balance of payments. "The plans presented", according to the Ministry of Finance, "will contribute to this purpose directly or indirectly; directly, by earning currency through exports or by saving currency now spent for imports; indirectly, by creating the necessary conditions for the development of the primary productive sectors of the economy".

Only if . . .

This plan will require 765 million in foreign exchange; and over the period, Israel is likely to require 210 million for debt payments and 735 million for the consumption deficit. The Plan presumes 2 million people as the population in 1960. This is the problem which faces Israel now. The impact on the foreign exchange problem and on the price situation of such a programme will be adverse in the immediate future. Yet the programme is absolutely essential if Israel is to achieve stability. Only if foreign assistance in the shape of grants and loans is available in adequate measure will Israel succeed in its attempt.

The State Bank of India

Speech by the Chairman, Dr. John Matthai, at the First Annual General Meeting of the Shareholders held in Bombay on 29th February 1956

THE following is the full text of the Speech of the Chairman, Dr. John Matthai, at the First Annual General Meeting of the Shareholders held in Bombay, on February 29, 1956:

I have much pleasure in welcoming you to the first Annual General Meeting of the Shareholders of the State Bank of India.

2. I would like at the outset to dwell briefly on the genesis of the State Bank and the objects Government had in view in forming it so as to be able to assess the results that have been achieved in the first six months of our working. On the 20th December 1954, the Finance Minister announced in the Lok Sabha the decision of the Government of India to assume effective control over the Imperial Bank of India as a first step towards the setting up of a State Bank of India. This decision was taken by Government on the recommendations of the Committee of Direction of the All-India Rural Credit Survey, which had suggested among other measures, the creation of "one strong integrated State-partnered commercial banking institution with an effective machinery of branches spread over the whole country for stimulating banking development by providing vastly extended remittance facilities for co-operative and other banks and following a policy which would be in effective consonance with national policies adopted by Government without departing from the canons of sound business." Following this announcement, the State Bank of India Act was passed by Parliament in May 1955.

3. On the 1st July 1955 the State Bank of India came into being and the undertaking of the Imperial Bank of India, which was formed in 1921 by the amalgamation of the three Presidency Banks, was transferred to the new institution with the exception of the assets and liabilities of foreign branches to which a reference will be made later in my speech. The process of transfer from the Imperial Bank to its successor Bank was completed smoothly and it is a matter of gratification that the good work put in by all concerned and the satisfactory arrangements made have enabled the change-over to take place without any dislocation or difficulties either within the Bank or in the general economic life of the country. It will be agreed that, with the establishment of the State Bank, a new chapter has commenced in the history of banking in India.

Central and Local Boards

4. The Bank started to function under the direction of a Central Board and three Local Boards at Bombay, Calcutta and Madras, initially appointed by Government, consisting of men of outstanding ability and experience in various fields of economic activity. The Central Board has had a variety of difficult problems to face during the initial period and I would like to take this opportunity of expressing my appreciation of the help and co-operation the Directors have extended to me in handling them.

Foreign Offices and Foreign Exchange

5. In regard to the transfer of the assets and liabilities of the undertaking of the Imperial Bank to the State Bank, as contemplated by the State Bank of India Act, it was felt that, while there would be no difficulty about the transfer in India, it was doubtful whether such "vesting" would be recognised and given effect to in foreign countries. As a precautionary measure, it was therefore decided, on legal advice, to provide for the continued existence of the Imperial Bank as a corporate entity beyond the "appointed day" to enable it to make over its assets and liabilities at its foreign branches to the State Bank. Accordingly, the State Bank of India Act was amended by an Ordinance on the 23rd June 1955 which was later passed into an Act of parliament on the 21st September 1955. The present position is that the Imperial Bank of India is nominally in existence for the purpose of enabling the transfer of assets and liabilities in London, Burma, Ceylon and Pakistan to be effected. While the bulk of these assets and liabilities have already been transferred to the State Bank, there are still a few legal formalities to be completed for effecting the transfer completely and as soon as these are finalised, the Imperial Bank as a corporate entity will cease to exist.

6. While on the subject of our foreign branches, I would mention that these continue to serve a useful and important purpose and we have during the past six months examined the question of opening new branches in foreign countries with the object of fostering Indian trade and expanding our activities, particularly in the field of foreign exchange to which we attach much importance. For diverse reasons, our progress in the matter of further expanding foreign exchange business has been slow, but in view of the great expansion in India's foreign trade, which will result from the Second Five Year Plan, it is our intention to adopt a more vigorous drive towards attracting what we consider to be our legitimate share of this important sphere of banking business.

Branches in Pakistan

7. In so far as our eight branches in Pakistan are concerned, the Pakistan Authorities have informed us that, in accordance with their policy not to allow any foreign bank to open branches in the interior of the country, the State Bank of India will be allowed to operate in port towns only. The position now is that, while our branches at Karachi, Chittagong and Naraingunge may be allowed to continue permanently and those at Lahore and Dacca up to the 30th June 1959, our branches at Hyderabad (Sind), Mirpurkhas and Lyallpur will not be allowed to function beyond the 30th June 1956. Arrangements will therefore be made to close these three branches as required by the Pakistan Authorities. While on the subject of Pakistan Branches, I would like to say that no loss has been suffered by us as a result of the devaluation of the Pakistan rupee which took place in August last.

Branch Expansion and Rural Credit

8. I now pass on to deal with the question of the expansion of banking facilities in rural areas which is one of the main objectives before us towards furthering the banking development of the country. Arising from the recommendations of the

Rural Banking Enquiry Committee, 1950, the Imperial Bank of India had, in consultation with the Reserve Bank of India, agreed to open 114 branches (both new and Treasury Pay Offices to be converted) during the period 1st July 1951 to the 30th June 1956. Up to the 30th June 1955, 63 offices had been opened by the Bank and since that date a further 20 offices have been established, leaving 31 centres where branches are still to be opened. The State Bank has a statutory obligation to open 400 new branches during the first five years of its existence or such extended period as the Central Government may specify in this behalf. The places where such additional branches are to be established have to be determined by the Central Government in consultation with us and the Reserve Bank. As a first step in this process, 100 places have been selected which are confined mostly to district treasury and the relatively more important sub-treasury centres; it is obviously not possible to include every centre which requires banking facilities in the initial list. These 100 centres, together with the 31 centres left over, will be covered in the first programme and thereafter a further list will be drawn up.

9. It must be stated that the Imperial Bank experienced considerable difficulty in securing suitable premises and, in some cases, where accommodation was available in the local treasury buildings, there was inordinate delay in effecting the necessary alterations and additions to make them suitable for the Bank. The Reserve Bank gave the Imperial Bank the requisite assistance in several cases of this nature, but even so the progress was slow for reasons beyond control. In the present phase of the expansion programme and with the assistance of the Reserve Bank, we are intensifying our efforts to open branches as expeditiously as possible. The Reserve Bank of India have been requested to ask the various State Governments to instruct the District Authorities to give all possible asistance to the Bank in securing accommodation for the office and, where necessary, for the members of the staff at the new centres where it is proposed to open branches. I need hardly add that arrangements are being made by us to recruit and train the staff, both supervising and clerical, required for the phased opening of branches.

10. One of the chief reasons which prevented the Imperial Bank from pursuing a more vigorous policy of expansion was that, as a private shareholders' bank, it could not afford the heavy expenditure involved in opening new branches which were likely to prove unremunerative. This position has changed in the new context, as provision has been made in the Act for meeting the losses beyond an agreed figure, on unremunerative branches, from an "Integration and Development Fund" into which are paid the dividends due to the Reserve Bank on its holding of 55% of the total issued capital in the State Bank.

11. An essential part of the development of the rural credit programme is the availability of adequate facilities for storage, warehousing and marketing of agricultural produce, in which the country has been lacking. The Government of India are shortly setting up an All-India Central Warehousing Corporation and State Warehousing Corporations which a view to affording facilities for storage of commodities. An organised system with effective State participation will then come into existence, in which we, along with other interested institutional agencies, will be required to play our legitimate part. I welcome this move in the larger interests of the country and, from our own point of view, I have no doubt that this will increase our ability to make advances against suitable security to the small producer in rural areas.

Remittance Facilities

12. Passing now to the question of providing extended remittance facilities for co-operative and other banks, which was one of the objects Government had in view in setting up the State Bank of India, we have, as agents of the Reserve Bank, agreed to liberalise the existing remittance facilities available to scheduled banks (and State co-operative banks who enjoy similar facilities) by permitting free transfer facilities twice (instead of once) a week, with effect from the 1st November 1955. This matter will be reviewed during the year with the object of considering in what directions remittance and other ancillary facilities to scheduled banks could be further liberalised without imposing any undue burden on our working.

Interest Rates and Collection Charges

13. The State Bank's schedule of charges for the negotiation and collection of bills and interest rates on advances have been fixed in relation to its operating cost and the comparative rates charged by other banks. These rates are necessarily subject to review from time to time in the light of prevailing business and monetary conditions. The transformation of the Bank into a State Bank does not by itself justify relaxing the basis on which the rates are fixed. In any action which the Bank may be called upon to take in the matter, apart from the normal considerations governing the problem, it is necessary to take account also of the obligation placed on it to develop banking in rural areas and the mounting cost of its establishment charges on account of the successive Bank awards.

14. Another matter which affects banks generally and which requires careful consideration is the gradually increasing burden of interest paid for attracting deposits. I understand that an attempt was made in 1954 to reach an agreement amongst banks in the matter of fixing ceilings on deposit rates. Unfortunately, this did not succeed with the result that each bank now pursues its own policy in this highly competitive field. I cannot but view with concern the present trend amongst banks to offer increasingly higher rates of interest for deposits and consider that this is unhealthy competition which should be discouraged. A voluntary agreement among banks appears to be the solution, but if this is not possible because of the diversity in their size and standing, the alternative is for Government to consider suitable action for regulating deposit rates.

Bill Market Scheme

15. At this point, I feel I must make a reference to the helpful role played by the Reserve Bank of India through their bill market scheme inaugurated in 1952, by which cash was provided to banks against commercial bills, in terms of Section 17 (4) (c) of the Reserve Bank of India Act. The scheme has been of considerable assistance to banks including ourselves during the busy season. When the scheme was introduced, the Reserve Bank agreed to charge interest at ½ per cent below the Bank Rate as a concessionary measure to popularise this method of finance and also to bear a part of the cost of the stamp duty incurred by banks in converting demand bills into usance bills. The Reserve Bank recently announced that, as the scheme is now well established and as the resources of banks have now materially changed, advances under the scheme will be made at 3¼ per cent instead of 3 per cent and the concession of bearing a portion of the stamp duty will be withdrawn, with effect from the 1st March 1956. Although this step will result in some increase in the cost of our borrowings under the scheme, I consider that, under existing monetary conditions, it is a move in the right direction.

State-Associated Banks

16. The subject of the amalgamation of State-associated banks with the State Bank of India has been receiving our attention. While the broad outlines of the policy to be followed in this regard must await future developments, we are exploring, in consultation with the Reserve Bank, the feasibility of taking over some of the minor State-associated banks. We have made a beginning in this regard and have set arrangements in train for an investigation of a few selected institutions with a view to making a fair and reasonable appraisement of their position and the problems that will have to be faced before integration takes place.

Small-Scale Industries

17. The Second Five Year Plan accords high priority to the development of village and small-scale industries. Government are providing greater credit facilities to these industries under the State Aid to Industries Acts by liberalising the conditions for distribution of loans. While Government assistance would go some way, the bulk of the credit finance would have to be provided by institutional agencies operating in the field, whose support is likely to prove of more permanent value to the industries concerned. While the State Bank does not differentiate between small-scale and large-scale industries for purposes of providing credit, we feel that more positive efforts should be made to ascertain the credit requirements of small-scale industries and to devise methods by which substantial assistance could be made available to them so as to place them on a firm footing.

18. Small industries run by co-operative societies naturally look to the co-operative credit organisation for assistance. Small industries requiring working capital for short periods and able to provide readily realisable security are normally helped by commercial banks. Those which require long-term capital on fixed security have usually to approach the State Financial Corporations. The credit requirements of small industries cannot however be adequately satisfied unless a scheme is evolved for co-ordinating in an effective manner the activities of the above credit agencies. The initiative for planning such a co-ordinated scheme has been taken up by the State Bank. In this connection, we have had exploratory discussions with the representatives of the Reserve Bank of India and various institutional agencies. A 'pilot' scheme for providing credit to small-scale industries at certain centres in the three Circles of the Bank has recently been drawn up and arrangements are now in progress to work the scheme. In the light of the experience so gained, a general scheme for providing credit in a co-ordinated manner by the State Bank and the institutional agencies concerned will be drawn up and extended to various centres in the country. With a view to facilitating the work of the various institutional agencies, who have no branch organisation, we are arranging for the services of our branch agents to be placed at their disposal in the matter of compiling and furnishing opinions and confidential reports on the worth of prospective borrowers and generally assisting such credit agencies in their operational activities in the centre where they are not represented.

Section 31 (3) of the State Bank of India Act

19. Before passing on to a consideration of the accounts and other matters of interest, I would like to refer briefly to Section 31 (3) of the State Bank of India Act which prohibits Directors of the Bank, even if they are merely ordinary shareholders in companies borrowing from us, from being present at any meeting of the Executive Committee of the Central Board (or the Local Board) when advances for such companies are being considered. This restriction often results in the want of a quorum for the meeting when the majority of the Bank's Directors are "interested" in a particular company (although their interest may be merely that of a shareholder), thus necessitating the postponement of consideration of such proposals. It will be agreed that this is not satisfactory from the point of view of the Bank or its constituents and it is expected that Government will take early steps to remove the present disability which is hampering the expeditious conduct of the Bank's business.

Balance-Sheet and Profit and Loss Account

20. Turning now to the accounts, although the State Bank has been in existence only for the past six months, I propose to compare the figures of our first Balance Sheet as at the 31st December 1955 with the corresponding figures of the Imperial Bank of India as at the 31st December 1954 and similarly the Profit and Loss Account figures for the last half-year with the figures for the corresponding period in the previous year. Thus, it will be seen from our Balance Sheet that our Fixed Deposit, Savings Bank, Current and other Accounts stood at about Rs. 226 crores as compared with Rs. 231 crores at which this item appeared a year previously. Although there is a decrease of Rs. 5 crores over the year, the present position must be considered satisfactory if the downward trend in our deposits which started early in the year soon after the Government's announcement of their decision to assume effective control over the Bank is taken into account. Our deposits in India fell from Rs. 203 crores in January 1955 to Rs. 184 crores in June 1955 and this drop of Rs. 19 crores can only be explained by the initial apprehension in the minds of the public regarding the future policy of the Bank and the continuance of its commercial character in its altered status. I am glad to say, however, that any fears entertained in this regard have proved entirely groundless as is evidenced by the steady increase in our deposits in India during the past six months, which reached the figure of Rs. 202 crores at the end of December 1955, thus almost regaining the level of January 1955.

21. On the other side of the Balance Sheet, our total advances have shown satisfactory improvement and at about Rs. 107 crores are some Rs. 5 crores higher than a year previously. Amongst our assets, investments at Rs. 116 crores were some Rs. 8 crores up on the year. While a substantial portion of our investments portfolio consists of short-dated Government securities and Treasury Bills, we have, consistently with our enlarged responsibilities, participated in and taken up State Financial Corporation Shares and Land Mortgage Bank Debentures in suitable lots. It is needless for me to state that our Investments appear in our Balance Sheet at a figure lower than their market value. Of the remain-

ing assets, cash in hand and with other banks stood at around Rs. 29 crores which represents a little over 13% of our total deposits as compared with the 15% cash ratio which last year's Balance Sheet disclosed.

22. I come now to our trading results from which it will be found that, after allowing for interest paid, our gross profits for the half-year at over Rs. 351 lakhs are approximately Rs. 40 lakhs better than those of the corresponding period last year, as against which our charges are up by a like amount of Rs. 40 lakhs. The principal increase in charges is in respect of Establishment which cost us some Rs. 35 lakhs more than in the corresponding period of 1954. Of this, Rs. 23 lakhs have gone to the clerical, cash department and subordinate staffs and represent for the most part increases in salaries, allowances, etc., arising out of the adjustments made in implementing the Gajendragadkar Award, which was published in August 1955. In the result, our net profit for the last half-year, at approximately Rs. 68 lakhs, is about the same as that for the corresponding period in the previous year.

Dividend

23. The dividend has been declared by the State Bank at the same rate as was done by the Imperial Bank in June 1955 and the previous years, viz., 16% per annum. This on the purchase price represents a net return of about 4.5%. By far the largest part of the sum distributed as dividends is payable to the Reserve Bank. Although, in terms of the notification issued by the Reserve Bank, it was laid down that the new shares of the State Bank would be issued to those shareholders who applied for such shares, in lieu of the compensation payable to them, at a price of Rs. 350/- for each share of Rs. 100/-, only a small proportion of the old shareholders opted for the new shares, with the result that the Reserve Bank of India are at present holding a major portion of the State Bank shares. It follows, therefore, that the private shareholders who benefit from the dividend payable by the State Bank form only a very small minority and the matter consequently is one which affects the investing public to a small extent only.

24. At this stage, it is appropriate to refer to a suggestion which has been made that a note be incorporated on the Bank's share certificate to the effect that the share was issued at the rate of Rs. 350/-. The matter was given full consideration and it was, however, generally felt that, while there was nothing in law to preclude the inclusion of such a note, it was most unusual for a share certificate to mention anything more than the nominal amount of the share. Apart from the fact that this suggestion may not meet with the approval of all the shareholders, there are practical and technical difficulties involved which prevent its wholesale adoption. As the issue price of Rs. 350/- was announced by the Reserve Bank by a special notification, it was considered unnecessary to make a note on the share certificate as suggested. The shareholder's natural desire to see that the price of Rs. 350/- at which the share had been acquired is taken into account in determining the rate of the dividend has already been duly fulfilled by the State Bank declaring its dividend at the rate of Rs. 8 per share for the half-year which is the equivalent of 16% per annum.

Industrial Disputes and Awards

25. As you are aware, the banking industry has been passing through a difficult time during the past 8 years with disputes between banks and their employees dragging on from one Award to another without reaching a final solution. Arising out of the modifications made by Government in the Labour Appellate Tribunal's decision, which was implemented by banks in November 1954, the Bank Award Commission was appointed by Government to conduct a fact-finding enquiry, which submitted its recommendations in July 1955. This Award, known as the Gajendragadkar Award, confirmed the decisions of the Labour Appellate Tribunal, with certain modifications and was accepted in toto by Government. Parliament have also given their approval to the Award by passing the Industrial Disputes (Banking Companies) Decision Act, 1955. The banks have accepted the terms of the Award and have interpreted them in a liberal manner, although their impact on certain institutions was considered to be onerous. The employees have taken objection to certain cuts that have been imposed upon them by the application of the Award and have, without resorting to the constitutional remedies provided in the Act, indulged not only in demonstrations but in various forms of direct action, which disrupted normal banking business in a number of centres, particularly in Calcutta. As a result of the intervention of the Chief Minister of West Bengal, to whose sympathetic and untiring efforts I would like to pay a special tribute, the employees in Calcutta agreed to complete the annual closing of accounts and also work overtime to clear arrears. This has been done and conditions have since returned to normal in the affected centres.

26. In regard to acts of indiscipline committed by employees, the State Bank had to take action, in consultation with other banks, by issuing charge sheets. These, however, have not been proceeded with so far in the hope that better relations will hereafter be established between the banks and their employees. It is necessary for me to utter a warning that no institution, whether public or private, can possibly survive if respect for constituted authority is absent or gross indiscipline prevails. While it is impossible to overlook or condone acts of indiscipline committed by employees in violation of the laws, which is tantamount to flouting Parliament's authority, there can be no objection whatever to employees following approved trade union methods to ventilate their legitimate grievances and safeguard their rights and to work for the amelioration of their conditions of service. In fact, a move in these directions would lead to the creation of an effective machinery for solving labour problems by means of mutual consultations and to the establishment of healthier relations which will be for the benefit of the parties concerned and the country as a whole. Now that the unhappy events of the recent past are over and normal work is proceeding, it is a matter for consideration, if satisfactory conditions for smooth working of banks hereafter can be ensured, whether further avenues should not be explored to remove any undue hardships to the employees.

27. Personally, I have great faith in direct and friendly talks across the table with the leaders of the Staff Unions and in exchanging ideas frankly with them with a view to arriving at an amicable settlement wherever possible. I have already made a beginning in this regard and have met office-bearers of the Unions in Calcutta, Bombay and Madras. The talks I have had have been useful and I am confident that this approach will contribute to a clearer understanding of the problems and a closer appreciation of the realities which have to be faced by both parties. I make an earnest appeal to all concerned to co-operate in finding a satisfactory solution to this problem and, for my own part, I would be prepared to do my best so that the unpleasant chapter of strained relations between banks and their employees is finally closed.

Tribute to the Staff

28. Before I conclude, I must pay a warm tribute to the Supervising Staff of the Bank for their loyal and devoted service during an exceptionally difficult period. Apart from the many transitional problems, which arose from the change-over to the Bank's new status, the difficulties due to disputes with our employees placed upon the Supervising Staff a heavy load of responsibility. I am grateful to them not merely for the work done by them but for the spirit in which they have done it. I would like also, in spite of the unfortunate happenings to which I have referred, to add a word of appreciation regarding the work done by the clerical and other staffs. I know the bulk of them are loyal and normally discharge their duties faithfully and competently, and I shall be failing in my duty if I do not acknowledge the good work they have done during the period under review.

29. My thanks are specially due to the Managing Director, Mr. S. K. Handoo, whose experience and knowledge of banking problems and whose administrative ability have been of the greatest value to us. I wish to place on record my deep appreciation of the energy and zeal with which he has applied himself to the discharge of his responsibilities as the first Managing Director of the State Bank of India.

(Continued from page 270)

first Five-Year Plan because it was then a part of Madras, have since been taken up. Once the linguistic demand is conceded, it heightens national loyalty and breeds a healthy competitive spirit in developmental matters.

Multi-lingual, not multi-national

The contention that linguistic States jeopardise national unity is equally fallacious. Even according to the SRC proposals, the number of States in the Indian Union would have been reduced by eleven from 27 to 16. That would have been a step towards unity, not disunity. Secondly, no lover of India accepts the Communist theory that linguistic communities are "sub-nationalities." In this connection, it is necessary to quote the following from Acharya Narendra Deva's lucid exposition of the problem in his draft Policy Statement of the PSP.: "India is a multilingual nation, misconceived as a multi-national State by Indian Communists. Ethnologically, culturally and historically there are much closer ties between different lingual units in India than those between different lingual groups of Switzerland which is acknowledged as a nation by all competent authorities. There is no comparison between the socio-cultural structures of India and the Soviet Union and, therefore, the analogy of the Soviet Union is not applicable to India. So the problem of cultural autonomy of different linguistic groups of India is not a problem of international character. It is essentially a problem of redistribution of States to ensure equal cultural autonomy to all, commensurate with their stature and requirements of national development."

From the foregoing, it will be evident that the idea of multi-lingual States at this stage is nothing short of escapism. The important fact recognised by the Nehru Committee nearly 30 years ago that in a polyglot area "difficulties will continually arise and the media of instruction and work will be two or even more languages," is now sought to be overlooked.

Ten or twenty years hence, after Hindi really becomes the lingua franca of the country, following introduction of a common Roman script for all the languages, including Hindi, if two or more States are sought to be merged, it would be a step towards unity. Today, it is covering up a volcano to avoid the unseemly sight of molten lava inundating the country. It is escapism par excellence.

Capital: Output Ratios in Indian Industry

George Rosen

The author, who is from the Massachusetts Institute of Technology, is currently examining certain aspects of the development of industries in India.

IN the discussion of both the First and Second Five Year Plans, the capital : output ratio has inevitably been of major interest to economists concerned with the Plans, since the estimate of this ratio is a determinant of the overall investment requirements of the Plans.[1] For the first Five-Year Plan a ratio of about 3.0 was assumed. That is, for an increase in national income of one rupee, an investment of 3 rupees would be required. This ratio was largely and inevitably based on the experience of other countries which had industrialized. In fact the actual ratio during the first Five-Year Plan proved to be much lower—about 2.3. This reflected the great increase in agricultural output during this period, and the relatively low capital : output ratio that existed in agriculture.

This same ratio of 2.3 is assumed to continue during the second Five-Year Plan, although there has been a shift in investment plans and projected output increases from agriculture to manufacturing industry. In both the public and private sectors of factory industry it is planned to invest approximately Rs 1,300 crores to achieve an increase of 540 crores in the income derived from factory establishments—or a ratio of 2.4. There has been a good deal of discussion among economists whether these assumed ratios are too low—that is whether the Plan is too optimistic with respect to its investment programme.

During the past six months I have been studying growth in Indian industry for the specific purposes of computing fixed capital : output ratios for certain industries, and to estimate trends in the use of capital (machinery) and labour in those industries. The three industries studied up to now are the cement, paper and iron and steel industries; and it is planned to make similar studies for the cotton textile, sugar, and engineering industries. The three industries examined up to now are considered to be relatively capital intensive—i.e. to require a large investment to expand output.

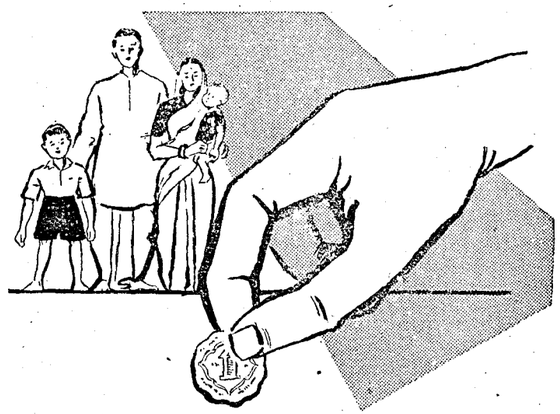
Two methods were used to compute the estimates of the capital: output ratios. The first was to relate changes, over time, in the gross block item on the balance sheets of the companies in the industry, to changes in their output estimated at capacity, after corrections were made for changes in the prices of machinery and output. The second was to use engineering data of actual estimates of the costs of constructing a new plant or expanding an existing one. From these data various ratios were computed. The relevant ratio to use for the Five-Year Plan is the one that relates changes in investment to changes in income derived from the greater output (i.e to net value added). This is called the **marginal** capital : net value added ratio and estimates the additional fixed capital required to increase the income derived from a given industry by one rupee.

It should be stressed that the results are quite tentative at this stage of the research, with the existing data, and with the complicated series of computations and adjustments that are gone through before a ratio is computed. Nevertheless, they are offered since they give what appear to be reasonable orders of magnitude, and because they may be of value in the present period of planning. For the cement industry the **marginal** fixed capital : value added ratio is about 3.0-3.5; for the pulp and paper industry it is about 3.5-4.0; and for the basic iron and steel industry (steel works and rolling mills) it is also about 3.5-4.0. This means that for the cement industry an investment in plant and machinery of about 3.3 rupees is required to increase the net income from greater output by 1 rupee; and in the paper and in iron and steel industries the investment required is about 3.8 rupees to do the same. Working capital requirements for this greater output were not considered. If they were added to the fixed capital the ratios would obviously be larger.

Of the total planned investment of Rs 1,300 crores in factory industry in the second Plan, these three industries will absorb almost 50 per cent (the investment in fixed plant alone in the iron and steel industry will approach 500 crores). With the ratios indicated for these industries, and with the expansion planned for the engineering and chemical industries, which are also supposedly capital intensive, it is unlikely that the ratio for all manufacturing will in fact be as low as the 2.4 ratio that the Plan assumes**.

Various other tentative conclusions with respect to the use of capital and labour in these three industries also emerge from my studies, and these may be of value in the present discussion of the Five-Year Plan.

First, unlike the United States, there is no positive relationship between the size of the average fixed capital: output ratio in those industries and the size of the firm†. In the United States this positive relationship was explained partly by the fact that the larger firms are able to purchase more labour-saving machinery. In fact, in India, if any relationship was found it would support the opposite conclusion—that the larger firms have lower capital: output ratios than the smaller firms. In these three industries the possibilities of variations in the actual product-making machinery are not great. However, in the raw material handling, transporting, loading and unloading, and in packing, it is possible to substitute machinery for labour readily. The lower capital: output ratio for the



*The ratios given in the first two paragraphs have been computed from the Draft Outline of the Second Five Year Plan. Also an unpublished memorandum of W. Malenbaum on the Plan was of value in computing the overall ratios given in these paragraphs.

** This passes no judgment on the overall ratio in the Plan, which may be more correct It is significant that in an as yet unpublished study of capital:output ratios in the USSR during the 1928-37 Plan period both and overall ratio and a ratio for manufacturing within a range of 2.2 to 3.0 were computed. See Eckstein and Gutmann "Capital and Output in the Soviet Union, 1928-37" (mimeographed.)

† Creamer, D—"Capital and Output Trends in Manufacturing Industries, 1880-1948", pp. 62-63. Average Capital:Output Ratio 's the relation between fixed capital and value of output at any time.

larger firms support the notion that both the large and small firms in India use similar plant and equipment. The larger one has certain advantages of size which permit it to achieve greater output with a smaller investment (for example a larger machine may cost less per unit of output than a small one). However, the subsidiary operations mentioned have been done in a similar manner—primarily by using labour—by both large and small firms. The larger firm had not in the past invested more money for the mechanization of those operations. This reflected the past cheapness of labour and dearness of capital in India to both large and small firms. Therefore it had not paid to substitute machinery for labour where it had been possible to use labour.

My studies however indicate a current trend to the greater mechanization of operations in India. While this is of lesser importance in older plants, the plants that are being expanded and the new plants being constructed are increasingly mechanizing those operations—raw material handling, moving, loading and unloading, and packing materials—in which machinery can be substituted for labour. This trend, and it is only a trend, reflects in part the overemployment of labour that occurred during the war. While this was of minor importance when wages were very low and workers could be easily dismissed, the rise in money wages since the war and the increasing difficulty of reducing the labour force have made for greater mechanization with expanded output. Furthermore the necessity for provision of housing, etc., and the increasing legal and union rigidities in the conditions of employment, make for greater mechanization both to reduce costs and to reduce potential future difficulties. Meanwhile the cost of capital in the form of interest rates has remained low in India for large, well established firms and it is possible, with the government's accelerated depreciation policy, to write-off the value of additional plant and equipment within a relatively short period of time. At the same time, where the Government is constructing plants, it is building the most modern, capital-intensive plants. It has invested as much as it believes desirable in those plants without limiting itself with respect to capital supplied for that purpose. The result is that private firms, to compete, are forced to machanize their operations. The combined effect of these tendencies is to raise the capital:output ratio and the capital requirements in manufacturing. With the overall shortage of capital resources indicated in the Draft Outline of the Second Plan, together with the major problem of unemployment of labour, it may be that government policy has gone too far in raising the cost of labour, and in keeping the cost of capital low both to the large private plant owner and for its own plants. Some change of this policy might lead to greater employment of labour in factory industry (especially in the peripheral operations) and to greater conservation of the apparently limited capital resources, during the next Plan period. As the rate of capital accumulation grows and unemployment is decreased it may prove increasingly economical to adopt policies resulting in a greater use of more capital intensive techniques.

LET EVERY FAMILY SAVE

One anna more

PER DAY . . . . .

If every Indian family decides to save even so small a sum as one anna more per day it will all add up to Rs. 13.5 crores in Small Savings per month and Rs. 162 crores a year. Small Savings by millions will help finance all our ambitious development programmes. Remember that National Savings Certificates and National Plan Certificates can be purchased for as small a sum as Rs. 5/-.

A Century of Indian Patents

INVENTORS, with the exception of manufacturers of patent medicines, have not been known to be money makers in this country. The general economic climate of the country has not favoured inventions, particularly of the type which helps industrial technique and the application of which in industry can bring such money returns as to warrant its protection by a patent. It will, therefore, come as a surprise to many that a Patents Act has been on the Indian Statute Book ever since 1856, though naturally it has undergone many modifications and a Bill to amend and consolidate the law relating to patent is now pending before Parliament. The centenary of the first Indian Patents Act is being celebrated in Calcutta in a big way with an exhibition of patented articles, registered designs and other products of Indian manufacture in order to stimulate public interest in inventions and to indicate the development and improvements in particular industries during the past 100 years.

What patents could do and have done are illustrated by another centenary which is being celebrated in Britain this year, viz. that of Sir Henry Bessemer's invention of a process for converting pig iron into steel. The Bessemer process revolutionised the manufacture of steel and greatly influenced the development of structural and other forms of engineering. That the invention brought Bessemer more than a million pounds in royalties in his life time is the least part of it. But it is significant in the present context for when young Bessemer took up the study of steel, he did so without the benefit of national laboratories, and it so happened, without the sponsorship of any giant corporation. The study led him into a protracted experiments that cost a great deal but finally to a success that justified the labour and the expense.

That is how patents came in. By providing monetary inducement in the shape of assuring the fruit that invention might yield in manufacturing industry, it enabled inventors to become money makers in their own rights.

Industrial revolution was heralded in the sphere of industry by a spate of inventions. But barring fundamental discoveries like that of steam engines or electricity, it was all a matter of applying established scientific principles in the field of industry. Often one invention puts such a premium on another that results of scientific research today have ceased to be erratic; they are no longer happy accidents or unpredictable. Industrial research has become an organised affair; it is big business in which returns have become determinate by and large and have come to bear a proportion to the cost or investment involved that is on a par with returns obtainable in other fields of investments. In this progress of technology from a point where inventions were largely a matter of chance and individual effort to organised industrial research, the possibility of making profits from inventions by making the latter a proprietary right, if though for a limited period, has played an important part. When the commercial possibility of exploitation of inventions, which led to and followed the industrial revolution, came to be established, it became evident that legal protection to the inventor could be an effective method of stimulating inventions. Hence the early recognition of patent rights and the commercial exploitation of inventions through the system of patents recognised and protected by law.

The system of patents, however, helped invention in another way. It was not enough that the inventor should be assured of the financial returns obtained from the commercial use of his invention and that no one should be allowed to deprive him of such returns. In order to avoid duplication of effort and guide enquiry into fields other than those that had already been explored, the legal institution of patents became a fruitful means of propagating knowledge about technology and for giving a purposive direction to inventive efforts. So patents not only safeguard the interest of the inventor; they tell the inventor what has already been done so that he may turn his attention from the known to the unknown. The second part of the services of patent will continue even when a changing economic set up eliminates the right of commercial exploitation as a factor of overwhelming importance in stimulating inventions.

In this respect, however, we have come nearly to a parting of ways. The legal protection of patents has become such a complex and cumbrous affair that specifications, rules and regulations framed for the purpose are increasingly becoming obstacles instead of being a help to the dissemination of knowledge to prospective inventors. The latter have increasingly to turn from Patents office records to scienfic journals and specialised publications!

Over the century, the Indian Patents system has undergone many modifications. In fact, the first Indian Patents Act passed in 1856 was repealed in the very next year at the instance of the Directors of the East India Company. The principal aim of the Act was to grant certain exclusive privileges to inventors as a measure of encouragement to new ideas. The law provided that a letter patent would be granted to any person who filed a specification of his invention in writing, describing the nature of the invention and in what manner it was to be put to use. Thereupon, Government would grant the sole and exclusive privilege of making, selling and using the invention in India and of authorising others to do so for a term of 14 years. In the case of an importer, the privilege ceased unless the invention was used within two years from the date of application.

Though the 1856 Act was repealed in 1857, subsequently an Act of 1859 re-enacted its provisions with some modifications. The addition made was that the inventor was to be permitted to file a memorandum, pointing out any error, defect or insufficiency in the specification and disclaiming any part of the invention, or file an amended specification. An important modification was that nonutility of an invention was made a bar against the grant of a patent. Later, this Act was amended by the Patterns and Designs Protection Act, 1872, extending the benefits of legal protection to the inventor of new patterns and designs, and the duration of the privilege was three years. There was another amendment in 1883, which introduced a provision for the protection of inventions shown in exhibitions in India.

In 1888, all previous Acts were repealed by the adoption of the Inventions and Designs Act—divided into two parts, one for inventions and the other for designs. The Act provided the structure on which the present law is based. The next revision of the patents law came in 1911, when many important changes were introduced. Although the 1911 Act has

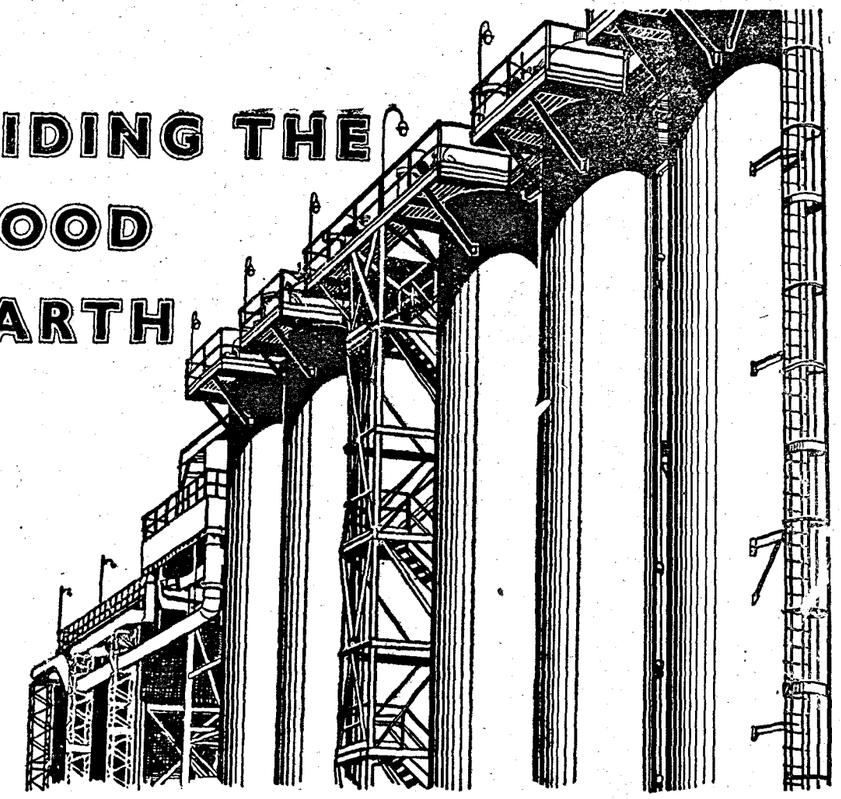
since been amended several times, it continues to be the law governing the protection of inventions in India. For the first time, the Act provided for the creation of a Patent Office under the charge of a Controller of Patents and Designs. An important feature was that it provided for the scrutiny of the specification of an invention by an examiner of patents before the grant of a patent.

By an amendment in 1930, the term of a patent was extended from 14 to 16 years. It was also provided that a secret patent may be granted to an inventor of any improvement in instruments or munitions of war, provided he assigned to the Central Government all the benefit of the invention and of the patent. An important amendment of the 1911 Act, made in 1950, on the recommendation of the Patents Enquiry Committee (1948), was the one relating to the grant of licence to those wishing to undertake the commercial exploitation of a particular patent.

It was provided that if after 3 years of granting the patent, any person interested were to apply for the grant of a licence on grounds such as that the patented invention had not been commercially worked even though it was possible to do so or that such commercial working was prevented or hindered by the import of the patented article or that the demand for the patented article was not adequately met in India, the Controller of Designs might grant a licence to such person and might also direct that the existing licences should be revoked and that the patentee should forfeit any right he might have had. By the emending Acts of 1952 and 1953, it was further laid down that while granting licences in respect of a substance capable of being used as food, medicine, insecticide etc., the Controller of Patents should see that the food, medicine etc. were available to the public at the lowest possible prices, consistently with the patentee deriving a reasonable benefit. (How the poor Controller of Patents was to enforce price control also need not be asked.)

The Indian Patents Act grants four kinds of patents. First there is the ordinary patent. This is free from any special condition or privilege attached to it and has the date of filing as the date of the patent. Next is the patent of addition. This is granted to the proprietor of a substantive patent for any improvement in or modification of the invention which forms the subject matter of the previous grant. Third is the patent claiming 'priority'. Such a patent can be obtained by virtue of a reciprocal arrangement between India on one side and certain countries like Australia, Canada, Ceylon, New Zealand, Pakistan, the States of Eire, the United Kingdom and the Union of South Africa on the other. Under this arrangement any person who files an application for a patent in any of these countries can claim that the patent that may be granted to him in India should bear the date of his foreign application. The application filed under this arrangement is thus given a 'priority' over others. The same holds true for Indian applicants when they file in any of these foreign countries.

Lastly, there is the secret patent. This may be obtained for any invention relating to instruments or munitions of war, if the Central Government considers that it is advisable to keep the invention secret. Inventions in respect of secret patents are assigned to the Central Government.



What led the then Government of India to have a patent Act as early as 1856 was not a sudden flowing of inventive skill in the country on the eve of the mutiny and the clamour on the part of the inventors to have their inventions 'protected' but the in-flow of patented goods and manufactures in the shape of imports and the need felt by the exporters abroad to have their wares protected against imitation or copying. Even in the latest Annual Report of the Patent Office which is for the year 1954, of the total applications for patents numbering 2,497, only 403 are from Indians; the rest are foreign or from "other residents in India". The number of applications have more than doubled compared to what it was before the war. But the percentage of Indian applicants does not seem to have changed at all. It is a sad commentary in our Patents Acts that the protection they offer to foreign patentees is so elaborate and so well guarded that developments in many fields, e.g., chemical industries, have been seriously inhibited in consequence.

The largest number of applications is from UK, which has reciprocal arrangements with India, the next being USA. The breakdown for the year 1954 is given in the table alongside.

What sorts of patents do Indians take up? Well, there is a tide in the applications for patents as in other things. In each of the last three years, problems relating to the sugar industry such as purification of sugar-cane juices, preparation of fructose and of sulphur from sulphates accounted for a large number of applications. Chemical industries have lately come to the forefront; 37 per cent of the total applications during 1954 related to this field. Metallurgy is largely neglected; so is electrical engineering. But along with the chemicals, Indian inventors are showing some interest in pharmaceutical products also. The reports of the Patent Office are usually monotonous and curiously enough there are not many patents taken up by Indians in the textile industries, unlike in sugar. But in some years, there is a refreshing change as in the report for 1952 which says "There was an appreciable number of Indian inventions concerned with such very widely different things as Hindi and Telugu typewriters, boats, insecticide sprayers, motor car steering, animal driven mechanisms, cycle rickshaws, petrol engines driven on kerosene oil and bank cheque protectors."

Among the souvenirs of the centenary celebration, we have been promised a symposium which, we hope, will bring out the role that patents have played in the field of inventions. In a country where application of science in industry still remains to be organised and circumstances as well as choice have left it to the public sector, the incentive to invention has necessarily to take a form different from what the Patents office can give. Even so, the recognition given in the form of registration of patents is not to be lightly thrown aside. Its effectiveness, however, can be greatly increased by awards in lieu of commercial benefits from the exploitation of inventions the prospects for which have never been very bright in the past and must be pretty dim in the future.

The Sindri Fertilizer Factory is the largest and most modern of its kind in Asia. Built at a cost of Rs. 23 crores this giant scheme includes gas ammonia and sulphate plants, a 90,000 storage silo, a power house and 12 miles of railway track. Apart from large quantities of other materials, no less than 12,000 tons of STEEL went towards the construction of this project which is designed to produce 350,000 tons of ammonium sulphate annually for India's agriculture. The enriched soil will yield 875,000 tons of extra food for the country each year—a valuable contribution from a new enterprise.

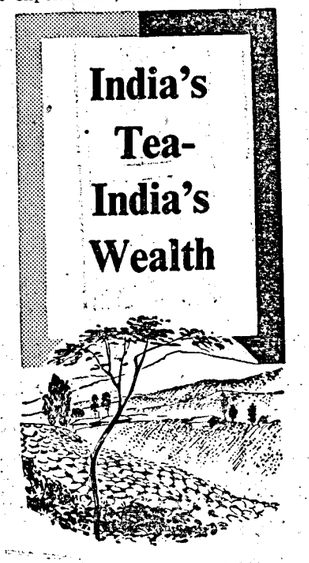
Kaldor: The Expenditure Tax

MR KALDOR is an economist; he believes in incentive and saving and risk bearing. He is also a Socialist; he believes in equality. His present book* is an attempt to reconcile the two, to provide a direct tax which will make the rich less better-off without preventing them performing their economic functions of saving, investing and risk-taking.

Mr. Kaldor is at his best in his criticism of the present system of income-taxation. It is true that 'income' as it is defined for income-tax is a quite inadequate philosophic concept. Indeed, it is really not a concept at all, only a congeries of items which have been held at one time or another to constitute income. The saving in expenditure one makes by owning a house is treated differently from the income one has to lay out to rent a house. The man who is skilled at bridge-building pays tax on his earnings; the man who is merely good at bridge does not. If one works for what one gets paid by somebody else, one pays tax; if one is merely given the money, one does not. Above all, capital gains are not income, although in an expanding economy, in the long run and on the whole, every reasonably prudent property owner will make capital gains. For each of these anomalies, as Mr. Kaldor admits, there are quite good reasons. But their total effect is that the money a man has to live on, and the money on which he is taxed, are two quite different quantities; and that this difference discriminates particularly sharply against some of society's most valuable people, the abler members of the managerial and professional classes, who in effect, and over a life time, pay a considerably higher rate of tax than the property-holding, and particularly the business classes.

The inadequate—perhaps inevitably inadequate—definition of income combines with very high marginal rates of tax to produce a whole series of socially undesirable consequences. Far too much of the community's best talent is devoted to tax avoidance. Every incentive is given to property-holders to live on capital. Particularly, they get their capital gains free of tax, yet they will pay a very high tax at death; obviously the temptation is to spend them as they come in. Finally, high marginal rates are a severe discouragement to risk-bearing. If there is a loss, the individual loses, but if there is a profit, the State takes most of it away; and most people are always more afraid of loss than eager for gain.



Mr. Kaldor's answer is a tax on expenditure. He claims no originality in principle for his proposal. On the contrary he shows that it has the most distinguished of ancestry. And it certainly meets most of the difficulties he has put forward. Saving would be exempt, therefore saving would be encouraged, which is precisely the end every country in the world is today trying to achieve. The inequity which is the result of certain sorts of money which can be used for spending being taxed while other sorts are not is overcome; a man would be taxed on all his expenditure, whatever its source. Moreover, he would be able to make his decisions on what risks he would take unaffected by any consideration of tax, since he would pay no tax until he came to spend his gains.

The technical difficulties of the tax can, as Mr. Kaldor contends, be very easily exaggerated. It is not suited for the population as a whole, only for the better-off; it is a substitute for super-tax rather than income-tax. But once that is accepted, so that the number of assessments to be investigated is limited, it is not impossible to discover what expenditure has been, if it is taken not as an addition of the various amounts spent, but as the difference between assets at the beginning of the year plus receipts and assets at the end of the year.

One may accept all that. One may positively welcome Mr. Kaldor's plea for moderation in the progression of the tax. One may yet have some doubts whether the tax is suitable for India, where the income tax department has much plain evasion of tax to catch before it can take on any further administrative burdens (though Mr. Kaldor might legitimately argue that his tax would make evasion easier to catch) and where living on capital is not yet the major social phenomenon as it is in England.

Vote Against SRC

Increasingly it becomes obvious that, in opposing the formation of linguistic States, Congress reveals deplorable lack of contact with the people. It was argued in these columns that Congress should seek a fresh mandate from the people before creating bilingual or regional group States and it was also emphasised that Congress would lose if it fought the election on the issue of linguistic States.

Within this month, municipal elections have been held in the Bally, Kanchrapara, Gobardanga, Kamarhatty and Dum Dum suburbs of Calcutta. Excepting Gobardanga, all these are industrial suburbs. In all these municipal elections, Congress has lost seats to Communists, but mainly to Independent candidates who had the support of all non-Communist leftist parties. Merger or union of West Bengal and Bihar was the main issue on which these municipal elections were fought. In all these elections, the vote was overwhelmingly against the Congress policy on linguistic States.

Around Bombay Markets

The Budget was No Secret

Thursday, Afternoon

THOUGH the Finance Minister presented his budget proposals late on Wednesday evening, the market knew fully since Monday all the important proposals which had a bearing on the stock market. A leakage of budget of this magnitude is most disturbing and perhaps capable of unseating a Government in another country.

Marketwise the advance information resulted in minimising fluctuations in the post-budget session. Leading speculators who had made heavy short sales halted further decline and technically the market has found itself in an oversold position.

How fully the market was prepared for the budget would be evident to anyone who cared to compare the pre-budget session closing rates with the rates at the end of the budget session. Movements had been erratic as usual when the budget proposals were a matter of speculation but in the last two days before the budget, the rates got so finely adjusted that when the budget proposals were finally out, there was little change. The only exception was in the case of tea, relief in export duty on which had not leaked out.

The Finance Minister, in his first budget of the second Plan, has chosen to hit hard the joint-stock companies. The cumulative effect of all his proposals would be to hold back development of industries through joint stock enterprise. As if income tax and corporation tax are not enough, now we will have an extra super tax on percentage of dividend distribution over 6 per cent of paid up capital. When companies declare a high rate of dividend, it is generally an index of high efficiency. The high rate of dividend can also be misleading because the total capital invested in the enterprise is often much more than paid up capital as it includes reserves and loans. But the budget proposal only recognises paid up capital for this purpose which is wrong. The burden of dividend tax, therefore, is that it is a penalty for the more efficient and soundly managed concerns.

Secondly, hitherto ploughing back of profits was encouraged through a rebate of one anna on undistributed profits. Henceforth there will be no rebate and, as shown above, dividends will now be taxed. This means in effect a sharp increase in corporation tax.

The dividend tax is also unfair because lately Government is insisting on new equity capital being issued at a premium and such premium is not now taken into consideration because only paid up capital is taken into account. The exemption means 4½ per cent when the premium on new equity capital is taken into account.

The proposal to tax bonus share issue at the rate of two annas in a rupee is made against the considered views of the Taxation Enquiry Commission. How can the Finance Minister declare that the Commission's report is his guide and yet go contrary to it? This tax obviously means double taxation for the capitalised reserves were already taxed.

By a new provision, all undistributed profits on liquidation of companies are also to be taxed.

Would this indicate that in the establishment of the socialistic pattern, the Government view the joint stock form of enterprise both undesirable and unnecessary and that the latter could perhaps be gradually taxed out of existence? It would be for the Government to set such doubts at rest.

New corporate taxes are likely to affect adversely the psychology of the investing public in view of the fact that incentives for risk capital are being withdrawn. This new taxation is expected to bring in a return of about Rs 9 crores but it is generally believed that the Finance Minister has under-estimated the yield.

As a result of the taxation on dividends, there will be a tendency on the part of the investing public as well as professional operators to look at the incidence of this taxation for each company, in the light of their prevailing dividends. The Tata Iron and Steel Company will have to pay about Rs 13 lakhs on this count, Indian Iron about Rs. 2.75 lakhs, Bombay Dyeing about Rs. 65,000, Century about Rs 3 lakhs, Kohinoor Mills Rs 2 lakhs, Svadeshi Mills Rs 25,000, ACC about Rs 6 lakhs, Bombay Burma Rs 6 lakhs, National Rayon Rs 83,000 and Premier Construction about Rs 1 lakh. There will be no liability in the case of Scindia Co as the maximum dividend which can be disbursed by the company without attracting this new tax comes to Rs 1.3 while the dividend which is being paid amounts to only 8 annas.

The question now is whether the current level of prices discounts all the bearish factors for the time being. Judged by the behaviour of the market, it appears the bearish factors have been adequately discounted, the technical position of the market is healthier than it has been in the last few months; thus the scope for any further material fall looks remote. It is possible that steels will, in view of the withdrawal of the one anna rebate for undistributed profits, suffer more than other industrials. As bulls have suffered heavy reverses during the past few weeks, the market may also take time to stabilise. It is not unlikely however that nervousness may subside and steady conditions might return in course of time. Investors should now use discrimination and pick out the shares of those companies which will have a relatively small taxation liability. The effects of deficit financing should also be discernible pretty soon and this will have a steadying effect.

Textiles are likely to keep steadier in view of better results for the past year. Steels are somewhat subdued. The miscellaneous section has steadied at lower levels. Banks, Insurance and Electric are mostly neglected. In the gilt-edged section, the 3 per cent conversion Loan has been allowed to drift lower to Rs 77-8 while other dated loans have ruled steady.

The bullion market had ruled firm during the initial stages on apprehensions of steep increase in taxation but later on, prices retreated sharply on active unloading as these fears did not materialise. Moreover, reports of arrivals of silver from Kalimpong also induced weakness with the result that silver lost ground by Rs 3 to Rs 173-12 from the highest level. Gold also met long liquidation and rates eased off by more than Rs 2 to Rs 99-2.

Budget Reactions

Thursday Evening

AFTER the thunderings of Amritsar, the central budget was a tame affair. Fresh taxation proposals are quite heavy. But fluctuations in equities since the presentation of the budget would seem to indicate that investors were prepared for more onerous burdens. This explains why equities have not declined since the presentation of the budget. Technical reasons explain why equities are not responding favourably to the budget proposals.

On the budget day, the stock exchange committee lifted all restrictions on forward trading. From Thursday, Clive Street again started functioning two hours daily. But neither during the budget session nor to-day was the volume of business large. Indeed, trading during the budget session was the most inactive in recent years. There are two reasons which explain this comparative inactivity.

Margin Trading

Though forward trading facilities have been restored fully, the stock exchange authorities here have introduced certain precautionary measures to prevent a recurrence of a payments crisis. Brokers are now required to deposit margins on business exceeding Rs 5 lakhs. This is a device to check speculative activity, and should be welcomed. But it will be appreciated that a margin system of trading will inevitably restrict the stock market turnover.

Even without this technical factor, it is doubtful whether Clive Street would have responded to even a more liberal budget. It is true that the payments crisis has somehow been overcome. But the wound has not yet healed. Many brokers have not received their dues from their clients. So the members are reluctant to entertain business on behalf of their clients. Those clients who have suffered losses are naturally unwilling as well as unable to do fresh business. So the volume of business remains poor.

Tax Proposals

This is the technical background against which the budget proposals should be reviewed. Though New Delhi has not yet imposed a ceiling on individual incomes, the proposed upward readjustment on super-tax over Rs 70,000 is liable to the interpretation that the Government is gradually implementing such a policy. This budget proposal, by itself, is not likely to have any appreciable adverse effect on equities. But it is arguable that it is another discouragement to initiative.

So far as equities are concerned, the proposal under which companies distributing dividend in excess of six per cent will have to pay graduated super-tax will have an adverse effect. This cannot be denied. But the harmful effects of this proposal can be over-emphasised. Most of the companies, it is true, pay more than six per cent, as dividend. But this is not likely to affect dividend payments to any considerable extent.

Bonus Shares

By and large, this is the main budget proposal which is halting the upward trend in equities. It is clear that companies will have to bear additional tax liabilities if they choose to pay more than six per cent as dividend. This may encourage increased ploughing back of profits which is the main intention of this proposal. If it does, it should strengthen the financial position of companies, and ultimately benefit shareholders. But this is too academic an issue to enthuse speculators.

Ploughing back of profits is good for the companies and shareholders concerned. But profits are ploughed back only to be used later. Ploughed-back profits can be used only by capitalising reserves. This is where the tax on bonus shares enters the picture. This proposal should be considered in connection with the withdrawal of the existing rebate of one anna on undistributed profits. One of the budget proposals will mean some form of indirect limitation on dividend payments. By another proposal, ploughed-back profits will get no rebate. By yet another proposal, bonus shares will be taxed.

Hesitant Trend

These implications of the budget proposals are reflected in the indecisive trend in equities. Though the indirect limitation on dividend should encourage bonus issues, it is not without significance that the shares of those companies which are expected to issue bonus shares have been adversely affected by the budget. This is understandable because of the proposal to tax bonus issues. Even so, it is more than likely that the shares of those companies which are contemplating issue of bonus shares will gradually move up.

There are two reasons why Tea shares have not moved up since the budget. One is that Clive Street expected more relief for the harassed industry. There is not much in this argument as the export duty is now adjusted to tea auction prices. But the main reason why Tea shares are not moving up is that tea companies, which pay fat dividends, will be affected most by the indirect limitation on dividend. There are not many tea companies which are contemplating issues of bonus shares. So, even this inducement, despite the proposed tax on bonus issues, will not be in operation in relation to Tea shares.

Outlook

Miscellaneous and Engineering shares remain relatively steady. These groups are as much affected by budget proposals as any other groups of shares. But there are not many companies in these groups which contemplate issuing bonus shares. These groups are steady mainly because of the growing belief that, as heavy industries develop, secondary engineering industries should have more scope for expansion. Incidentally, the rolling stock programme of the Railway budget is a "bullish" factor for these industries.

Tax proposals have had their immediate impact on stock markets. Consequences of the recent payments crisis may prolong hesitancy in equities. But, sooner rather than later, the budget provisions for deficit financing will have a salutary effect on stock markets. There is not likely to be any immediate boom in equities. But the tax proposals, included in the budget, do not warrant any undue pessimism. Moderate optimism is, on the contrary, not unjustified because of the incidental consequences of higher deficit financing.

Military Pacts in Asia

NEW DELHI's foreign policy has the support of the people. Though the Communists remain opposed to India's link with the Commonwealth, they are now less critical of Pandit Nehru's foreign policy. Moscow's overtures to New Delhi have created an embarassing situation for CPI. PSP accepts **Panch Shila.** It endorses Bandung. It has also become less critical of New Delhi's foreign policy. But Mr Selwyn Lloyd's visit to India and the meeting of SEADO Council at Karachi are likely to remind both PSP and the Communists that there are some aspects of India's foreign policy which they disapprove. It would be surprising if the Karachi meeting, Mr Lloyd's emphatic defence of Britain's attitude to regional military pacts and the behaviour of the delegates of Australia and New Zealand to the Karachi Conference do not inspire PSP and the Communists to revive their hostility to India's acceptance of Commonwealth membership.

India is opposed to military pacts. She is more opposed to SEADO and the Baghdad Pact. Her stronger opposition to the latter regional military alliances is based on two reasons. One is that these two pacts bring, through Pakistan's membership in these alliances, the "cold war" to her doorstep. Her second objection is that both these regional military pacts include countries which do not belong to these regions. Within the country, the Karachi session of the SEADO Council has had two major reactions. India, a member of the Commonwealth, disapproves SEADO and the Baghdad Pact. But Commonwealth countries, such as Britain, Australia, New Zealand and Pakistan, are active SEADO members. Britain and Pakistan are also members of the Baghdad Pact. What is the use or justification, it is arguable, of maintaining the Commonwealth link if the major Commonwealth countries pursue policies which are considered by New Delhi to be prejudicial to India's interests? There is something in this argument. But it cannot be stretched too far. Certain common bonds unite the countries of the Commonwealth. But the Commonwealth does not force its decisions on its members. Britain has as much right to differ from some aspects of India's foreign policy as India is free to disagree with some features of Britain's foreign policy.

Certain intriguing problems are posed by the Karachi Conference. SEADO and Baghdad Pact are emphatic reminders of some of the failures of India's foreign policy. India's opposition, it is argued, has not prevented the creation or gradual fortification of SEADO and the Baghdad Pact. It is not openly suggested that SEADO and the Baghdad Pact involve military and economic encirclement of India. But Pakistan's membership of both these alliances have certain military implications which cannot be ignored. Alarmists will not miss the implications of Pakistan's insistence on the creation of a permanent SEADO command on the lines of NATO. Nor will they ignore the reported support of Thailand and Australia to such demands by Pakistan. Admittedly, Pakistan's membership of SEADO and the Baghdad Pact has certain political and military consequences which should not be minimised. But political realists will note Mr Selwyn Lloyd's guarded comment that

military aid to Pakistan has been provided mainly through her bilateral arrangement with America, and not through SEADO and the Baghdad Pact.

Political realists have joined amateur diplomats in demanding a different approach by New Delhi to problems created by SEADO and the Baghdad Pact. It is argued that India will have to be diplomatic in a world where power diplomacy prevails. There are ways, it is suggested, in which India can retrieve her position instead of continuing her futile opposition to regional pacts in Asia. She can emulate Russia in offering her participation in SEADO and the Baghdad Pact. When Russia found that she could not prevent the creation of NATO, she offered her participation in that organisation. This offer was rejected by the Western Powers. Russia has since made propaganda capital out of this event. She has argued, and not without some show of logic, that the rejection of Russia's offer indicates the aggressive nature and purpose of NATO. If it is New Delhi's intention to imitate some of Moscow's diplomatic devices, India could even propose a formula for Asia which Russia subsequently advanced in relation to Europe. India could suggest that her participation in SEADO and the Baghdad Pact should be accompanied by the formation of an all-Asian security system, similar to Russia's proposal for a European security pact, in which certain non-Asian countries, like Britain and New Zealand, who have interests in this region could become members.

These are intriguing suggestions. But these proposals ignore two basic facts. One is that India's foreign policy is based on **Panch Shila**, and not on containing Communism through regional military alliances. In Bandung, India has an arrangement through which she can further the cause of peace and amity among Asian and African nations on the basis of **Panch Shila**. She has no aggressive designs, nor does she fear any aggression. Participation in SEADO and the Baghdad Pact would be a violation of one of her basic assumptions of foreign policy that regional military alliances tend to perpetuate tension, if not to provoke aggression.

India's opposition to regional military alliances in Asia may not have prevented the establishment of SEADO and the Baghdad Pact. New Delhi's denouncement of a foreign policy based exclusively on security may not have had any impression on Washington. But recent developments should be welcomed in New Delhi. It was not without significance that Sir Anthony Eden thought it necessary to emphasise before the Canadian Parliament and the British House of Commons, in defence of the joint communique signed by him and the American President, that the Baghdad Pact was as much concerned with economic improvement as with the defence of the countries concerned. To placate Pakistan, SEADO countries may agree to hold joint military manoeuvres in that part of the Arabian Sea which lies between the Delta of the Indus and the Gulf of Oman. But New Delhi will note with satisfaction M Pineau's forthright comment that manoeuvres in the Gulf of Oman are poor alternatives to Moscow's gestures of economic co-operation to Asia. From the speeches delivered during the first open session of the SEADO Council, it is evident that, apart from America and Australia, other SEADO countries are aware of this elementary fact.

Poverty is the main problem of Asia. Elimination of poverty is an essential condition of peace and stability in this region. Countries in this region will welcome economic aid and co-operation from the Western Powers. No regional military alliances are needed to ensure such economic help. Developments in west Asia emphasise that region's hostility to the Baghdad Pact. Apart from Thailand and Pakistan, no other South-east Asian country is a member of SEADO. In one of his speeches in New Delhi, Mr Selwyn Lloyd admitted that the time had come when the Western Powers should place less emphasis on security. M Pineau, France's Socialist Foreign Minister, is convinced that world peace can best be secured through economic help and co-operation. India can flatter herself that she is making new converts to her foreign policy of peace through plenty.

The Role of State Bank

WE all knew that the State Bank was going to be a potent instrument in the hands of the Government for bringing about some of the changes vaguely described as inspired by the Avadi spirit. But since the transformation of the Bank was carried out at the instance of the Committee of Direction of the All India Rural Credit Survey—at least this was the immediate occasion for it, though nationalisation of the Imperial Bank had been in the air for years—lazy minds had the excuse of associating this change primarily with the task of what may be conveniently called "institutionalising rural credit". They had also their doubts, naturally. How could a bank which was the largest institution financing commercial credit in the country, with added responsibilities imposed on it of continuing to act as a bankers' bank to a certain extent even after a couple of decades of central banking, be transformed overnight into the principal agency for supplying the bulk of agricultural credit in the country? Now the State Bank cannot do that; even a cursory glance at the State Bank Act will give the answer why. It has to pursue the canons of sound business and of commercial banking. What it can do is to open a number of branches and extend banking facilities where none exist today Its progress in that direction will be watched with interest, and reviewed in a subsequent paragraph.

The State Bank actually has to do a lot more than look after agricultural credit. It is good that while speaking at the first Annual Meeting of the Bank, the Chairman, Dr John Matthai, allowed himself the freedom of surveying the entire field of its present and future operations. Not only did he present a comprehensive survey of the existing field, but he also looked into the future. Many things are brought out in the course of this survey which had probably never appeared in quite the same light before and had not been grasped adequately even by those who are knowledgeable in banking and related matters. To begin with there remains a yawning gap in the structure of rural credit which is still to be filled by the Reserve Bank; that progress in filling this gap has been slow, is much to be regretted. The State Governments seem to have assumed that a ready-made organisation for providing rural credit should soon be in operation for they have drastically curtailed their Tacavi loans this year. Leaving aside rural credit for which the initiative does not seem to rest with the State Bank, developments in various other directions are suggested by Dr Matthai which merit careful consideration. The State Bank, for instance, has already taken the initiative in co-ordinating the supply of credit for small-scale industries. This should prove immensely fruitful. Several agencies extend credit to small industries — commercial banks supply working capital to such of them as are able to furnish acceptable security. State Finance Corporations are there to supply long-term capital on fixed securities. But since industries require both long-term and working capital and as the essential first step for financing is proper assessment of their creditworthiness, the task that the State Bank has taken upon itself is of the highest importance.

Then there is the foreign exchange business. The Imperial Bank had a department of foreign exchange, and through unexpected circumstances, the State Bank has to undertake foreign exchange business of considerable magnitude as a result of its Pakistan branches coming under foreign territory. Its progress in the matter of further expanding foreign exchange business has been slow, but there is more than a hint that it need not be slow indefinitely. When Dr Matthai said that "It is our intention to adopt a more vigorous drive towards attracting what we consider to be our legitimate share of this important sphere of banking business", does he have in mind the possibility that the State Bank will some day fulfil the functions of an Indian Exchange Bank, the establishment of which, with the blessings, if not the sponsorship of the Reserve Bank, had been proposed in the past and which proposal is believed to have been accepted and has only been awaiting implementation?

Different people will react to different points in Dr Matthai's speech, each according to his own immediate interest and inclination. But since immediate problems come up uppermost, perhaps the part of his speech that will command most attention at the moment is the one relating to his plea for restraining deposit rates.

Dr Matthai has lent his weight to the suggestion for a ceiling on deposit rates which was discussed in these columns a fortnight ago. A voluntary agrement among banks appears to be the solution, he said, "but if this is not possible because of the diversity in their size and standing, the alternative is for Government to consider suitable action for regulating deposit rates". Naturally, therefore, Dr Matthai is against a general upward revision of rates for advances which some of the banks are contemplating. He makes a reservation in the case of his own Bank, however, "because of the obligation placed on it to develop banking in rural areas and the mounting cost of its establishment charges on account of the successive Bank Awards". The special fund that has been created under the Act to meet the deficits of such uneconomic branches can compensate the State Bank for losses only "beyond an agreed figure".

This particular question apart, the weight of his opinion in favour of a downward rather than an upward adjustment of the money rates deserves careful attention from the Reserve Bank, which has so long been watching the scramble for funds among the banks as a mere spectator. That the same rate of 3¼ per cent (now 3½) is being offered both for deposits on call and for term deposits for 1 to 12 months has led to an extremely anamolous position—not only is money being drawn from current account into call loans, but time deposits on maturity are also being diverted in the same direction. If a survey of call money were carried out, it would not be surprising if the supply of call money were found to have increased more than that of demand and time deposits. This has naturally made the position of the banks extremely vulnerable. It has not proved possible so far for the banks to agree to put a ceiling on deposit rates. Dr Matthai recognises this. Hence the case he makes out for intervention is unanswerable.

Another thing that will attract most attention in Dr Matthai's speech is his reference to the subject of amalgamation of the State-associated banks with the State Bank. The Committee of Direction of the All-India Rural Credit Survey, on whose recommendation the State Bank was formed, had recommended that the Imperial Bank of India should be amalgamated with ten major State-associatted and a number of minor banks for this purpose. The State Bank was formed, however, only by taking over the Imperial Bank. It appears that the object of doing so was to avoid the delay that would result if amalgamation did to precede the formation of the State Bank, and the possibility of disorganisation if this was carried out in a hurry. With the establishment of the State Bank in its present form, the question of amalgamating other banks can be settled in consultation with it.

The feasibility of taking over some of the minor State banks, we are told, is now being explored. "The State Bank," Dr Matthai said, "have set arrangements in train for an investigation of a few selected institutions with a view to making a fair and reasonable appraisement of their position and the problems that will have to be faced before integration takes place". This sets the pattern that will be followed in connection with the others. Evidently, there will be no scope for accusing the State Bank of lack of caution in this respect. Presumably, also, the taking over of the smaller State-associated banks will give the State Bank the necessary experience for the amalgamation of the larger State-associated banks in due course, with the minimum disorganisation.

One of the principal objects, with which the State Bank was formed, was to expand banking facilities throughout the country as rapidly as possible and, in particular, to convert non-banking treasuries in the districts into banking treasuries. During the first six months of its existence, 20 new branches were set up, leaving 31 centres at which branches are still to be started according to the programme of expansion imposed on the Imperial Bank. The State Bank is itself expected to open 400 new branches during the first five years of its existence, and the pace of activity in this regard will undoubtedly have to be speeded up if the target is to be achieved. Apart from the 31 centres selected earlier, 100 new places have been selected for new branches. These are "confined mostly to district treasury and the more important sub-treasury centres."

Dr. Matthai has not indicated how far this opening of new branches has so far assisted the Bank to provide more agricultural credit. It appears, however, that a substantial move in that direction will have to await the establishment of warehouses for the storage of commodities. The certificates issued by the warehouses would enable the Bank, without undue risk, to advance credit against the security of agricultural produce. But as the Government of India have yet to set up the All-India Warehousing Corporation and State Warehousing Corporations, it will be some time before any results can be expected. Meanwhile, the main contribution of the State Bank will be confined to extension of remittance facilities which, in their turn, will enable the rural credit organisation to widen its activities.

To enable the State Bank to accomplish the wide range of tasks that have been allotted to it, the first thing it had to do was to put its own house in order. The staff had to be reorganised, pay scales revised and employee relations put on a stable footing. This has now been done. The confidence with which Dr Matthai approaches the problem, the reliance he is prepared to put on mutual consultation and the generosity with which he offers to discuss cases of hardship bear ample testimony to all that. The bank can now look forward to accomplishing the tasks set for it with the full support of the Government and the people.

Weekly Notes

What Happened to Cement?

THERE must be something very much wrong with the control and distribution of cement; otherwise, why should the producers have to explain to the public that the invitation of offers for the import of cement from soft currency areas is not a punitive measure to check and bring down the internal prices of cement in this country? That import should be called for is not at all surprising. The demand for cement has greatly increased on account of the large development programmes that the country has taken on hand though both the installed capacity and the production of the cement industry have greatly increased too, ever since the end of the war. There is no question about the tremendous increase of production of cement or of the installed capacity of the industry. According to the Directorate of Industrial Statistics, installed capacity nearly doubled between 1946 and 1951; it went up from a monthly average of 316.3 thousand tons (annual capacity 3.8 million tons) in 1951 to 395.3 thousand tons in September 1955, while production more than doubled between 1946 and 1951, and went up from a monthly average of 266.3 thousand tons in 1951 to 391 thousand in November 1955, the latest month for which official figures are available. But demand has gone up too. There was immediately after the war a heavy backlog of building and repairs to be put through; by all accounts, house building has attracted the largest amount of private investment in recent years, and besides, cement is an essential component of every development project, of which construction accounts for a large percentage of the investment.

The fact of cement shortage is so well-known and it is so wide-spread that it can hardly be denied, though the degree of shortage may vary greatly from State to State and it may be easier to get cement for some purposes than for others. But how far this shortage, at least the acuteness of it, measured by the black market premium, is a result of demand overtaking supply and how far that of faulty distribution and marketing, for which Government is primarily responsible, no one can say for certain. It is high time that an enquiry were instituted into the demand and supply of this all-important building material.

The public are naturally puzzled for what they pay for cement is not the ex-factory price. Transport costs, particularly when transhipment at more than one point and change of gauge is involved, load up the price so much. But nothing can be more fantastic than the suggestion that cement prices in India are higher. The price of cement is controlled on the basis of actual cost and though the new units had to be given a slightly higher price on account of their increased capital cost, when the Tariff Commission last examined the case, it was not their finding that cement prices were high in India. On the contrary, at the time, export demand was so keen, and export prices were so much more attractive, that issue of limited export quotas was suggested for the new units to cover their losses on internal sales. As a matter of fact, India has been exporting some quantity of cement, though small, mostly to Pakistan, Ceylon and Middle-East countries, though in the six months to September 1955, the latest period for which figures are available, such exports seem to have gone down from 42,586 tons in the six months to September 1954 to 25,057 tons.

The Ministry of Commerce and Industry reported for 1954-55 as follows:

"There were practically no imports of cement during the year except for a small quantity from East Pakistan into Assam. The export market is being developed gradually, exports being allowed mainly from the factories in South India and Western India, where the supply position is comparatively easy. The total exports during the year amounted to 75,600 tons (up to the end of September 1954 only) as against 64,600 tons in 1953". The report for 1955-56, not yet received, should be able to say why the Ministry had gradually to reverse this process.

To repeat, shortage is undeniable but how far it is being accentuated by the present system of distribution it is very necessary to enquire, particularly when substantial imports are being planned for. If the imported cement also gets into the same distribution bottleneck, we will not derive the maximum value for our foreign exchange expenditure; nor would we be able to expedite development as well as we could have done, if the distribution of this basic building material were smoother and more efficient.

CORRECTION: In the table 'Budget of the Government of India 1956-57' which appeared on page 263 in the last issue, IV Capital Receipts for 1954-55, was wrongly printed as 175.8. It should read as 215.7.

French Socialists

MANY will echo M Pineau's confession that the Western Powers' foreign policy has been marred by "enormous errors". M Pineau is in "profound disagreement" with a foreign policy that places "too much emphasis on security". This has been the major "error" of the foreign policy of the Western Powers. Both Britain and France, America's NATO partners, have been in disagreement with Washington's policy of containing Communism by building "positions of strength". This has not only prolonged the "cold war", such a policy has meant that the diplomatic initiative has always been with Moscow. While the Western Powers, under America's instigation, have been pre-occupied with ringing the globe with military bases, Russia has consistently been pleading for peace through co-existence. Washington may have resented this propaganda initiative by Moscow, but has done nothing to regain the initiative. M Pineau's denouncement of Western diplomacy will be widely shared.

What is more surprising is that, even after the "summit conference" at Geneva, the Western Powers hav not learnt the lesson. Immediately as it became evident that the Western Powers were eager to reach an understanding with Russia to ban atomic warfare, in their mutual as well as in the world's interests, Moscow re-oriented its foreign policy on the implications of peaceful co-existence. Almost a year has passed. But the Western Powers' foreign policy is still based on pre-Geneva assumptions and circumstances. While Russia talks of peace and of economic problems of Asia, the Western Powers are now assembled in Karachi to attend the SEADO conference. France is a SEADO Power. M Pineau, France's Foreign Minister, will participate in the Karachi talks. One would like to know whether he would have the courage to remind the Karachi conference of the need for "a new approach to co-existence and East-West relations".

Morocco

EVEN as France's decision to recognise the independence of Morocco is to be welcomed, there will be doubts about the future relations between the metropolitan Power and its former colonial possession. Sultan Ben Yousef has got all he wanted. There is agreement about the sovereign legislative power of the Sultan. He will have control over the Army. Administration will be in Moroccan hands. France will hereafter be represented by a High Commissioner. France hopes that this gesture will induce Morocco to accept unity with France through "the permanent bonds of a freely accepted interdependence". France's strategic diplomatic, political, economic and cultural rights and interests are to be assured. French settlers will enjoy a status "proportionate to the important contribution which they have made and will continue to make to Morocco's well-being".

France has not been unwise in restoring Sultan Ben Yousef, as well as in negotiating with the Sultan. On his restoration, the Sultan assured the politically conscious elements in Morocco that he would function as a Constitutional Monarch under a democratic regime. Simultaneously, he assured the French settlers that their rights and interests would be protected. Both Istiqlal and the Democratic Independent Party are in agreement with the Sultan in his policy of rid-

ding Morocco of French domination. But neither Istiqlal nor DIP is likely to accept any reservation on Moroccan independence. By negotiating with the Sultan, France has got terms which she could not obtain from either Istiqlal or DIP.

Two problems remain to be solved. Morocco's nationalist elements will hope that the Sultan will implement his pledge to institute a democratic regime under which he will act as a Constitutional Monarch. This is primarily a challenge to the Sultan's statesmanship. But the Sultan's undertaking to protect the rights and privileges of the French colons may create trouble. Their legitimate rights and interests must be ensured. But if France wants to create a relationship between her and her former dependencies similar to that which prevails between Britain and other Commonwealth countries, France and the French colons must realise that political independence without economic sovereignty is shadow without substance. This poses a challenge to French colons. But the situation in Tunisia and in Algeria deepens suspicions whether they are willing or prepared to convert the challenge into an opportunity.

An Episode in West Asian History

SIR Winston Churchill has made more than one attempt to make history. Many of his later efforts have failed as miserably as his earlier efforts during the first world war. Despite his mistakes, Sir Winston remains a great statesman. T E Lawrence has other claims to history than that of Lawrence of Arabia. Whether General Glubb's reputation as a military commander will survive his dismissal as Glubb Pasha of Jordan is an inconsequential issue arising out of developments in Jordan. It will perhaps depend on the "Glubb girls" and the deportment of the soldiers whom he trained up. What is significant is that King Hussein has ousted Britain from her last stronghold in west Asia.

Establishment of Jordan as a British protectorate has a torturous history. It was a creation of Sir Winston, aided and abetted by Lawrence of Arabia, aimed against Turkey's domination of west Asia. Jordan's role changed with the developing situation in west Asia. Britain helped and financed Jordan to raise the best-equipped Army in west Asia. As relations between Britain and Egypt deteriorated, as Egypt sought to replace Turkey as the leader of the Muslim world, Amman the capital of Jordan, which became independent after the second world war, was fortified by Britain as a challenge to Cairo.

London has now lost the diplomatic battle in west Asia. It would be wrong to assume that the Arab-Israeli dispute has hastened Jordan's diplomatic rebuff to Britain. This dispute is a minor issue in the estranged relations between Britain and Jordan. Differences between London and Amman have arisen because of Britain's changed historical role in west Asia. Since Britain, at the instance of America, agreed to build a northern tier of defence in west Asia under the Baghdad Pact, Egypt has been trying to form a southern tier of friendly countries. Syria and Saudi Arabia had already aligned themselves with Egypt in her opposition to the Baghdad Pact. Recent developments underline Jordan's sympathy with Egypt, Syria and Saudi Arabia in their united opposition to the Baghdad Pact, with its headquarters at Ankara. Events in west Asia will cast a shadow over Karachi, where the SEADO conference is now in session.

Indian Forest Statistics: Corrigenda

REMEMBER the forest statistics, to which attention had been drawn in these columns some weeks ago? The Directorate of Economics and Statistics have issued a correction slip, slashing down the employment figures. The Directorate have now discovered that employment figures are not 'additive'. The correction is a surgical operation. So instead of 44 plus 91 or 135 millions being employed in forestry and forest industries directly and indirectly in 1951-52, the figure for employment for 1951-52 is now revised to 120 plus 250 or 370 thousand. The operation involved is broadly that of dividing the earlier figures by the number of working days in a year.

Actually what had happened was that figures of daily employment had been converted into annual employment in terms of man-days which is the method of reporting employment according to international forestry convention. Employment is recorded in the detailed tables as on the first day of each month. So the conversion backwards of the 'annual' figure of employment is not a straigtforward matter of division by 360 or 300, whatever the number of working days that may be assumed for the purpose.

How do these revised statistics of employment, direct and indirect, in forestry and forest industries compare with those given in the 1951 Census under livelihood categories? No direct comparison is possible, of course, for the Census does not give the statistics of employment as such, but only the numbers of those who are dependent for their livelihood on various occupations. The occupations relating to forestry and forest industries are four-fold:

1 Forestry and collection of products,

2 Wood & wood products other than furniture and fixtures,

3 Furniture and fixtures, and

4 Paper and paper boards.

The total number of people dependent for their livelihood under these four heads is given as 1.36 million. This is smaller than the number who would be dependent on forests for their livelihood according to the forest statistics, but not so much smaller as to make a comparison altogether impossible. Taking the daily average employed directly and indirectly in forestry and forest industries at 370 thousand and taking the average size of their families at 4.9 (which is the average size of the rural families in the 1951 census) the total would come to about 1.8 million as against 1.36 million given in the 1951 census broken down:

(Figures in '000)

	Employers	Employees	Independent Workers	Total
Forestry & collection of products ..	6	89	157	252
Wood & wood products other than furniture & fixtures ..	27	192	822	1041
Furniture & fixtures ..	2	9	23	34
Paper & paper boards ..	1	24	6	31
	36	314	1008	1358

Off the Record

Progress of Pottery as a Handicraft

PRAJAPATI Sahakari Utpadak Mandal (Potters Industrial Co-operative, Kumbharwada, Dharavi, Bombay) have made immense strides since they held their last exhibition of pottery and earthenware at the Convocation Hall in March 1953. Reviewing the earlier exhibition it had been commented in these columns:

"If a handicraft is to be revived or rather, an existing one is to be revitalised and made more remunerative for those who ply it than it is today, the lines followed by the Prajapati Sahakari Utpadak Mandal at Kumbharwada certainly merit careful study. The wide variety of forms that the deft fingers of the potter moulds from clay are only the beginning of an adventure which, if it is to be fruitful and not to lead to a blind alley, must finally result in products which fulfil a real need, preferably a common need, that is existing rather than one which has to be created. In other words, if the handicraft is to survive, quality and saleability at competitive prices, which most pottery do not have today, are to be given prior consideration. Otherwise, potters would be just on the margin of subsistence instead of thriving and making good money." (March 21, 1953, p. 319).

After seeing the exhibition which the potters cooperative held last week at the Victoria Gardens, one may say that not only the lines followed by them merit careful study but that they deserve to be emulated widely by all those who are trying to encourage or organise handicrafts. The potters of Kumbharwada were organised into an industrial cooperative as early as 1949. Shrimati Prabha Shah and her sister, Malati Javeri have worked indefatigably for all these years and under their energetic and wise guidance, this group of potters has come up. In fact, in the last two years they have come up so well, and gained such popularity, that had not Prabha and Malati put their foot down, their patient work for all these years would have gone up in smoke! Their very success had invited disaster from two directions, which had to be resisted. Government publicity was one. People have to be told how good the Five Year Plan is and how much is being done for the small scale and cottage industries and therefore anything, the Sindri Factory, D V C, a well run community project or well conducted potters cooperative, is exposed to the glare of publicity and all that this means. VIPs pour in and the iterinery drawn up by the External Affairs Ministry for all important visitors can never leave them out. To take the visitors around and explain to them what is being done becomes a whole-time job. Who are to do it? The few good workers that are there are all needed to do the work—they cannot be spared for showing round the visitors and blowing their trumpets.

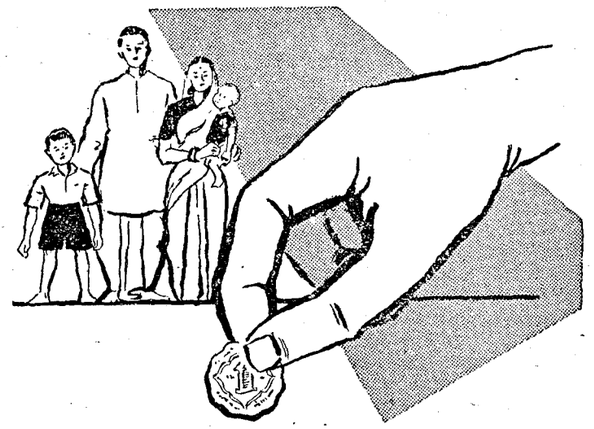
The other danger of the success and publicity is that the products are in such great demand. The Cottage Industries emporia that are being opened up want pottery turned out by the Prajapati Sahakari Mandal to be displayed; discriminating socialites want them to decorate their drawing rooms. The organisers are working patiently to improve the quality of their pottery and turn out new products. They have a lot of problems to grapple with and have still to solve the problem of standardisation and they are just not in a position to meet this demand. They have to work hard to stop this demand being met, for demand has a way of calling forth supply and premature publicity, well earned or not, for particular handicrafts, often brings into existence a class of middlemen who readily come forward to supply the wares. Enterprising handicraftsmen, instead of developing their craft and producing better things, succumb to the temptation of taking orders which they cannot possibly supply themselves and farming out these orders among other craftsmen who may not be so clever or enterprising and living on their commission which, unfortunately, promises a better living in the circumstances than the practice of the craft itself. So, Prajapati Sahakari Mandal have to be firm and have to tell the impatient buyers politely that the society is not yet in a position to supply large orders. At the last exhibition, the organisers had to be quite rude to importunate collectors of fancy wares.

For sales and marketing, the society has now got its own shop in Crawford Market. But you will not find all the products displayed at the exhibition on the racks of this small shop; in fact, a casual visit will disappoint you altogether; the shop has often little to sell. This is partly deliberate for the society does not believe in selling all its wares through its own shop. On the contrary, it wants that if the products prove popular, they should be sold widely through all sorts of shops, cottage industries emporia as well as commercial retail stores.

Against this general setting has to be viewed the progress made which is in two directions—in the direction of improvement of techniques of production and that of the variety and range of products. As regards the first, the most striking achievement is a simple one viz. an improved potters wheel, a number of which were actually being worked at the exhibition site and which naturally collected quite a crowd. This is a simple adoption of the bicycle chain and free wheel. The idea was borrowed from an old master potter of Baroda who had been using the device successfully but considerable improvement was made in Bombay by the addition of ball bearing and the wheel itself is much stronger and better balanced, being cast in cement. The bicycle chain and free wheel device has been successfully adopted in the potters colony at Jhargram in one of the community projects in West Bengal also but there they use the cycle chain as well as the brake. Kumbharwada potters, however, find that the roller bearing gives such a balanced movement of the wheel that the brake is not necessary.

In designing of pottery, the conflict between the functional and the ornamental has yet to be completely resolved . In a way, it is bound to remain like that, for what else is a craft but a continuous quest for combining beauty with utility? A great deal of improvement has been effected however and the emphasis on the functional, in the designing of ash trays, to the deficiency of which pointed attention had been drawn two years ago in these columns, is specially noticeable. In fact, this is noticeable in greater or smaller degree in the entire range of products. An interesting experiment in assimilating decoration to

function is in a special range of products, which are designed in two separate pieces joined together, e.g. surais (water pots) and others where the outer cover is ornamental and yet serves the function of protecting and decorating the container inside. Where enamel colours are used, this is an advantage, because though these colours are water-proof, direct contact with moisture rather dulls the colours and this is avoided by having an outer piece.



An altogether new range of products with immense possibilities has been made possible by the use of metallic ores as colouring material which are put on the clay before it is burnt.

Talking of designs, the exotic was much less conspicuous and hardly ever protruding in the last exhibition, compared to the first, much of it has been so well assimilated, but it is still there. Romanticism cannot do away with the exotic altogether and the revival of an old craft often gains inspiration from the exotic, at least in the earlier stages. Another point to be noticed about the designs is the feeling for the material, which the potters have in plenty, and which enables them to discard shapes and forms which are just not right. Some of the trays, particularly the smaller ones, have a touch of the metallic which the designers, informed as they are by the feeling of the materail which they handle, will soon get rid of.

Of the technical devices which were thought of in the earlier stages, one was the possibility of improving the kilns or of using the simpler type of modern kilns. Experience, however, has not fulfilled these earlier expectations. But with the external economies to which Dharavi has access and which made possible the designing of a potters wheel with ball bearings, who knows, some day, someone will not hit on the right thing?

In the use of different types of raw materials, again the society has made considerable progress. A complete range of white clay pottery bears ample testimony to it. So does the range of red ochre ones. This, however, brings in problems of transport and organisation. Clay has now to be brought from places as far apart as Kutch and Orissa.

Finally, one more word about the functional. The organisers of the exhibition demonstrated how well-made pottery finds a place in modern households. In the model kitchen, these pots and pans naturally find their place. The beauty of it is that they do not look out of place in the sitting room either which was put up in one of the stalls, where most of the decorations consisted of handicarft products, matting for wall, cane and bamboo furniture with liberal use of straw mats and jute tapestries, which served to bring out the soothing effect of the red ochre and the dull white of the clay pieces.

LET EVERY FAMILY SAVE

One anna more

PER DAY . . . . .

If every Indian family decides to save even so small a sum as one anna more per day it will all add up to Rs. 13.5 crores in Small Savings per month and Rs. 162 crores a year. Small Savings by millions will help finance all our ambitious development programmes. Remember that National Savings Certificates and National Plan Certificates can be purchased for as small a sum as Rs. 5/-.

Invest in GOVERNMENT OF INDIA

SMALL SAVINGS SCHEME

12-YEAR NATIONAL SAVINGS CERTIFICATES

10-YEAR TREASURY SAVINGS DEPOSIT CERTIFICATES

10-YEAR NATIONAL PLAN CERTIFICATES

15-YEAR ANNUITY CERTIFICATES

POST OFFICE SAVINGS BANK DEPOSITS

Letters to the Editor

Hypergamy in India

MY essay "Regional Differences in Customs and Village Institutions" (**Economic Weekly**, Feb. 18, 1956, pp. 215 ff.) has resulted in my receiving from a Bengali friend a very interesting letter on Kulin hypergamy. I will quote relevant extracts from the letter: "**Kulins came down by marrying below their status**, and it was a point of honour for my lineage (who formed a separate sect by themselves, Kap, as the founder broke away from his father and even performed the father's **shraddha** while the latter was alive) to secure Kulin bridegrooms for our girls. To this end they made grants of lineage land to the grooms, who, on marriage, left their natal families and joined us as **ghar jamais**—it was **infra dig** for a girl of my lineage to go to her affinal home on marriage.

"A Kulin came down in status by contracting such a marriage. But he did it because he wanted land. In order to save his face, however, things were arranged in such a way that he was 'captured' by the bride's people, and taken away against his will. The groom was whisked away in a fast boat in which there were drummers, priests, and all the other essentials of a marriage. There was also a party of lathials (fighters carrying long bamboo sticks and cane wicker-work shields) in the boat to complete the simulation of capture. The groom's party gave chase in another boat, which also carried several lathials. But it kept a respectable distance from the other boat till the completion of the marriage rites was announced by the blowing of conch-shells.

"This probably led to a preponderance of women over men among Kulins which in turn resulted in polygyny and old maids". (Bold mine).

My correspondent is a non-Kulin Brahmin as may be guessed from his letter, and I am grateful to him for bringing the above facts to my notice. But I wonder whether the situation he has described was widespread—my guess is that it was either the custom of his lineage or was at best confined to a few wealthy lineages in East Bengal. For instance, Risley's description of Kulin hypergamy is quite different. He reports the existence of "several middle-aged Kulins who were known to have had more than a hundred wives each, and to have spent their lives on a round of visits to their mothers-in-law. For each wife they had received a handsome bride-groom-price diminishing in amount with the number of wives they had at the time of the marriage; they made what they could out of each periodical visit and they asked no questions about the children". (See H. H. Risley, **The People of India**, Calcutta, 1915, Second Edition, pp. 166-7.)

It is likely that the type of alliance my friend has described would be monogamous—the groom stayed with his wife's folk and owed his livelihood to them. And the **lathials** were there to see that he didn't try to marry again. In the situation described by Risley on the other hand, the man stayed with his natal kin* and only went for short periods to his numerous affines.

In all cases of hypergamy, the women of the top group have a hard time. They have to choose from a very limited circle of men for whom there is severe competition, and the laws of demand and supply therefore come into operation.

(2) There is a 'blind spot' in the village hypergamy of north India which I may mention here. As I said in my essay, a village always receives girls in marriage from certain other villages which it regards as inferior, and it in turn gives its girls to superior villages. But, very rarely, it happens that a superior recipient village has given a daughter to another village which is regarded as inferior by the first village in the series. To put it in a simpler way: superior village B takes girls from village A and has given a girl in marriage to C from which A has received a bride.

The breaking of the hypergamous chain in this way results in an anamoly. But such instances are extremely rare and they remain unknown because of the great distances involved and the differences in the spread of marriage ties. A few of the villages constantly supplying or taking wives are well-known to all, but there is no formal list in anyone's mind and the list can always be extended. (I owe this information to the kindness of Dr. McKim Marriott).

(3) Regarding Nair hypergamy I would like to add that the majority of marriages are endogamous and only a few are hypergamous.

National Institute

I have read with pleasure and profit your comments in your latest issue on the desirability of starting a National Institute of Social Sciences in India. I looked once more at your issue of October 15, 1955 to fortify my faith in the project. It is an excellent idea indeed, and does one's heart good to know that it "is finding increasing support in quarters that matter". My own impression would, however, tally with what you have printed in bold letters, viz., "And the tragedy of it is that there is no awareness at all of this problem in the country (the frittering away of the energies of the few first-rate social scientists in the country) either at the Governmental level or, what is even worse, at the academic level". Surely, you must be knowing better what these quarters that matter are. If these be the government or foreign foundations then, in my view, it would be better to ring the curtain down on Fundamental Social Research before the actors put on their grease-paint and the pit is filled. By definition, government is instrumentalist; it wants results and quick results. And the foreign foundations, as we know them, cannot but be empiricist. They want to help us in a concrete, visible way and show results to the authorities at home. So the academic bodies remain. They all want research but they are mostly busy in making it impossible. Their best intentions are frustrated by coaxing the powers that be to grant money, and when money is made available, by stupid administrative details. By the time that the project gets going, the original fine frenzy has turned into lassitude. Yet, one senses a general awareness of the need of social research in the air. Only, it is yet too general, too vague, in short, wishy-washy, fuzzy-wuzzy. So which are the quarters that matter?

And then this matter of Funda-

mental Social Research. In the natural sciences, the Fundamental appears to be the mathematical. In Economics, it is also tending to become the same, whatever may be the reasons thereof. But in Jurisprudence, Sociology, Anthropology, Psychology, or for the matter of that, History, what is the Fundamental? Mathematical treatment of the inter-relations? Or merely, the statistical? Or is it the philosophical, in the wider sense? My own feeling is that in those fields with which I have had some acquaintance, Fundamental Research should, at this stage, mean critical thinking, a critique, if you like, of their basic assumptions. These may be tested empirically by research projects. Do you really think that critiques will grow in the set-up of a National Institute? Testing may be done there, but what are we going to test? And who are going to lay down the basic issues? Again, how?

I hope you will not misunderstand me. I am all for a National Institute of Fundamental Social Research. I am only anxious to know how your mind works in the matter of its functioning.

World Trade in the Recent Past

Yearbook of International Trade Statistics, 1954: United Nations, September, 1955 Pp 556 Price $ 5.00 (US)
Available from Oxford Book & Stationery Co., Scindia House, New Delhi.

THIS massive collection of trade statistics is the fifth of the annual publications on the subject by the United Nations. Its primary object is to bring together on as uniform a basis as possible the import-export data for as many countries of the world as possible, with a view to facilitating comparative studies of the structure and trends of foreign trade. Those who have tried to arrange foreign trade statistics on a rational basis for any country or group of countries will appreciate the enormous and careful work that goes into the preparation of such a volume. And considering the fact that the U N Statistical Office has to get the primary data from many countries before processing them, it is indeed an achievement to have brought out the figures for 1954 so soon after that year.

The Yearbook contains detailed trade statistics for 100 countries, which account for about 98 per cent of world trade. As one would expect, "world" in this context means mainly the non-communist world—i.e. excluding Albania, Bulgaria, China (mainland), Czechoslovakia, Eastern Germany, Hungary, North Korea, Poland, Rumania and the U S S R. Presumably, the trade of these countries constitutes but a small proportion of the aggregate. It is however not quite clear whether the Yearbook, when it claims that 98 per cent of world trade in 1954 is covered, implies that the communist countries accounted for no more than 2 per cent of world trade.

Apart from an increase in the number of countries covered, the Yearbook also presents three new tables, the share of world trade by regions and countries (in U S dollars), indices of unit values and quantum of exports. Absolute figures and price/quantum indices are also given for each of the countries separately. But in the country tables, values are expressed in national currencies; and the method chosen for working out the indices varies from country to country. This makes it impossible to compare directly the data in the world tables with those appearing in the schedules for the countries. Nevertheless, those that have the courage, and patience and ability to work it out can do so, since the ratios used for converting national currencies into U S dollars are also given.

The Yearbook is apparently not everbody's meat. One has to have a taste for figures, and an ability to isolate the essentials in order to relish the fare supplied in this volume. For the most part, this Yearbook, like its predecessors, is meant for research workers and economic historians rather than the layman or the economic administrator. Piecing together the several stories that the figures may be made to yield is a job requiring both time and proficiency in arranging and interpreting a large mass of figures. Investment of time and effort on this task would not be entirely fruitless; at the very least, it would lead to formulation of questions in answering which the administrators and policy-makers could well be significantly involved.

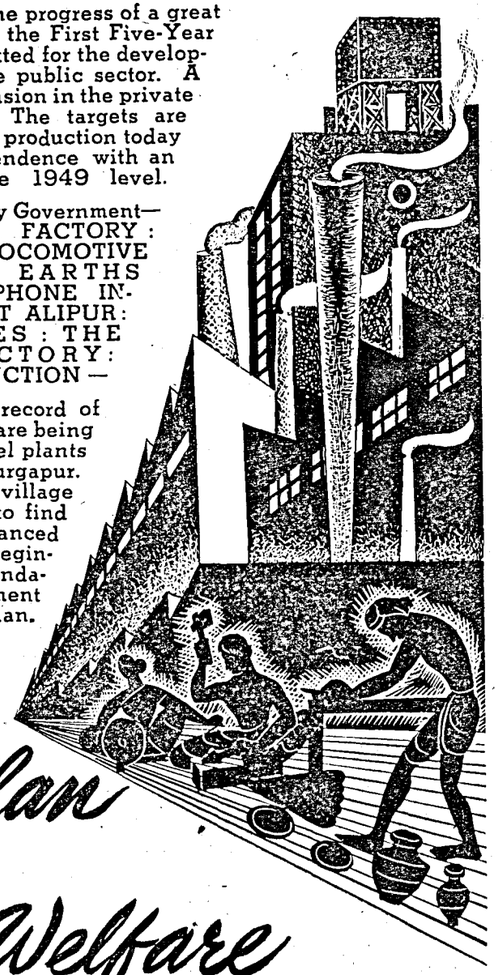
Even from a cursory glance at the tables, certain interesting facts emerge. The value of world exports (f o b) went up from a little over $ 20 billion in 1938 to nearly $ 53 billion in 1948 and over $ 76 billion in 1954. This enormous increase in the value of exports was in part due to an increase in prices; the unit value (price) index of exports (base 1950—100) rose from 47 in 1938 to 115 in 1948, and came down to 111 in 1954 (in terms of dollar prices). Which means, in other words, that much of the increase in export earnings between 1938 and 1948 was a result of increasing prices rather than of an increasing quantity of exports. Since 1948, the increase in quantity has more than offset the decline in international prices. This difference between trends in the war and post-war periods is all to be expected; what is significant is that the price-fall should have been so small and the quantity-increase so large.

This is in respect of the world as a whole. Over the same period, the fortunes of the different regions varied a great deal. For instance, North America (comprising Canada, Newfoundland and U S A) benefited not only from a doubling in the volume of its exports between 1938 and 1948 but also from a more than hundred per cent increase in the unit-value of exports. Continental West Europe, on the other hand, experienced a sharp decline in its exports, so that much of the benefit from the higher unit-price in 1948 was lost. The Sterling Area's export earnings in 1948 were larger than in 1938, due more to the increase in unit-values of exports than to the rise in volume. That these divergent trends should have manifested themselves as the "dollar gap", necessitating major adjustments subsequent to 1948, is obvious.

Comparison of the 1948 indicators with those of 1954 gives some idea of the magnitude of the effort put in by various countries to close the dollar gap. The volume of exports of continental West Europe, for instance, increased by more than 250 per cent, though not all of this is attributable to an increase in direct exports to the North American region. Sterling Area's export trade increased by over a third. Because of the relatively large rise in its exports, continental Europe found its external trade position much more comfortable than did the Sterling Area in 1954, despite the fact that the export price index for the former fell more sharply than for the latter. With the reappearance of inflationary forces in 1955, it is not surprising that the Sterling Area, especially the U K, was faced with a balance of payments crisis.

All of this is by way of illustrating the points that arise from a rough and ready study of the trade statistics contained in the first few tables relating to world aggregates. The position in respect of each country in 1948 and the subsequent changes that have occurred since in respect of foreign trade of each country could be worked out in detail from the country tables, and considerable instruction and amusement may be derived by trying to relate these changes to variations in the domestic and foreign policies of the different countries. It is indeed the scope which the Yearbook offers for such analysis that constitutes its raison d'etre.

One point may be raised in conclusion. The world tables show the aggregate imports (cif) and the aggregate exports (fob) for the years 1937, 1938, 1948, 1950 through 1954. For each of these years, the value of imports is in excess of the value of exports. Considering that exports for the "world", as here defined, is, or should be, the same thing as the imports of the world, this difference can only be due to c i f valuation of imports as against f o b valuation of exports. In other words, the import values include the cost of transporting from one country to another and the cost of insurance of goods in transit. One is not certain if this fully explains the difference between the two aggregates. If it does, the changes from year to year in this margin could well be the subject of further analysis, in terms of changes in freight and insurance rates, types of goods transported, changes in methods and directions of transport etc. It is, of course, irrational to expect the Yearbook to go into these details. But a couple of paragraphs on the factors contributing to this difference would have been of great help. Considering that the tradition of these Yearbooks is to improve continuously both the data and the explanations therein, one might expect that the next volume will have a few words to say on this point.



PROGRESS OF THE PLAN No. 5

INDUSTRIAL EXPANSION

India today is witnessing the progress of a great industrial revolution. Under the First Five-Year Plan Rs. 179 crores were allotted for the development of basic industries in the public sector. A 533 crore programme of expansion in the private sector was also envisaged. The targets are being realised and industrial production today stands highest since Independence with an increase of 63% over the 1949 level.

Key industries sponsored by Government—THE SINDRI FERTILIZER FACTORY: THE CHITTARANJAN LOCOMOTIVE FACTORY: THE RARE EARTHS FACTORY: INDIAN TELEPHONE INDUSTRIES: NEW MINT AT ALIPUR: HINDUSTAN CABLES: THE PERAMBUR COACH FACTORY: MACHINE TOOL PRODUCTION—

already show an impressive record of achievement. Arrangements are being completed for three great steel plants at Rourkela, Bhilai and Durgapur. Small scale cottage and village industries are being assisted to find their due place in a balanced industrial structure. These beginnings would form a strong foundation for Industrial Development under the Second Five-Year Plan.

The People's Plan FOR THE People's Welfare

Small-Scale Industry and Its Place In Economic Development

162482

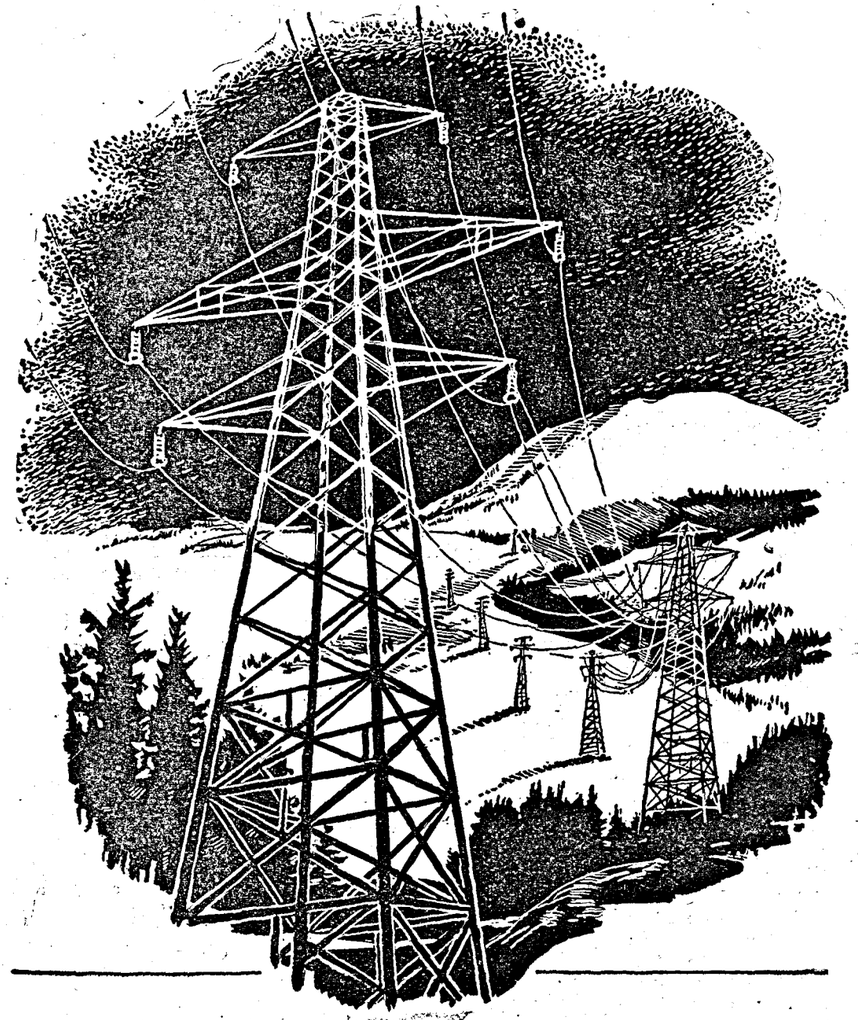
Amlan Datta

FIRST, a word of terminological clarification. The expression "small-scale industry" says nothing about the size of an industry; it refers only to the size of the firms which constitute the industry. An industry may be as large as possible; convention dictates that it would still be called a small-scale industry if it is composed of small firms.

There is a belief that economic development leads inexorably towards larger-scale industry. Actual development does not, however, follow so simple a pattern. It is a fact of experience that after specialisation has made some progress within a particular firm, there is not infrequently a tendency towards some of the specialised processes detaching themselves from the parent firm. In course of time the parent firm comes to be surrounded by a variety of other firms, each concentrating on some by-product or on some particular commodity for which the parent firm has a demand. From economic development one could argue to expansion of market, and from expansion of market to division of labour or increased specialisation: but from increased specialisation one could not argue in any self-evident manner to large-scale industry in the modern sense of that term, for specialisation may be carried within the four walls of a single productive unit or outside it. In certain cases, there are, indeed, special technical factors which make for large units of production and some of these cases are very important. But, by and large, there is no technological inevitability about the growth of large-scale industry.

We should, however, be careful and make certain distinctions. Three such distinctions are specially important.

Non-Technological Factors



First, while small-scale industry may be compatible with technological efficiency, there are factors other than technology which in practice often determine the size of the firm. A clear understanding of the nature of these other factors may help us to create conditions, if we so desire, which will be favourable to the functioning of small-scale industry. A large firm has often certain commercial, as distinct from technological, advantages. It has advantages, for example, in obtaining credit, in buying its raw materials and selling its finished products. A large firm can also make provision for organising research, which a small firm cannot. It follows that small firms are likely to show best results when they are surrounded by supporting institutions, such as cooperatives and other specialised agencies, which provide them with those same facilities of credit, marketing, and research which large firms enjoy by virtue of their size. Alternatively, small firms may live dependently on big firms and financial institutions, which provide them with credit and other facilities.

Japanese Experience

The experience of Japan illustrates these points. What lends distinction to the case of Japan is that what was achieved in that country was not merely a revival of the traditional cottage industry about which so much is heard in some of the poorer countries with an old civilisation, but an adaptation of small-scale industry to the production of those new commodities which an industrial society requires. In 1939, small shops (defined as manufacturing and processing establishments with less than fifty workers) represented more than half of all industrial employment in Japan. As E. P. Reubens points out, "In the technologic operation alone, the Japanese have shown themselves very ingenious at adapting their system of small-scale production to the lines in which they have special advantages.... many a small shop found that the operation of a single-machine-unit could be at least as efficient as the operation of a long line of such units, if there was no concatenation between them." (E. P. Reubens: Small-Scale Industry in Japan. **Quarterly Journal of Economics**, August, 1947) But as the same author is careful to point out, "there is an important distinction to be drawn here between technological efficiency and commercial success". While in such industries as food-processing the small plants often could operate quite independently, in other industries, such as metal-working, the little shops were obviously dependent on the larger establishments for their raw material as well as for a part at least of their equipment, markets and financing. The system that developed in Japan resembled in many respects the 'putting out' system, marked by the dependence of craftsmen on private merchants, which was so common in some of the Western countries before the industrial revolution. In a modern economy, small-scale industry can hardly serve as an element of a democratic society unless, we repeat, it is placed within an adequate framework of cooperative institutions and public agencies, which take charge of its commercial and financial problems and feed it with a continuous flow of necessary knowledge and research.

Large-Scale and Large Industry

We come now to a second distinction. Though the technological advantages of large-scale industry have sometimes been exaggerated, there are certain definite advantages in favour of a large number of firms herding together. The advantages of large-scale industry are not the same as the advantages of large industry: this, indeed, is the reason why we started by drawing a distinction between small-scale industry and small industry. The advantages of a large industry, and particularly, of the herding together of a number of firms, sometimes belonging to different industries in the same locality, are conveniently summed up under the title of "increasing returns", in a slightly unorthodox sense of that term. The law of increasing returns is generally explained by modern economists in terms of the "indivisibility" of factors. With increase in the scale of 'output' of an individual firm, an indivisible factor may come to be more and more fully utilised, and the resulting economies are reflected in "increasing returns". When a scale of output is established which is sufficient for the full utilisation of the indivisible factor in question,

Electricity Supply and Power Station Equipment

A part of the Martin Burn Enterprise to make India industrially self-sufficient

MARTIN BURN LTD 12 MISSION ROW, CALCUTTA 1

Branches at: NEW DELHI BOMBAY KANPUR

further expansion of output will no longer yield "increasing returns", and a phase of "diminishing returns" ensues. Now, just as there is capital investment within a firm, so also there is basic social capital invested within any particular locality, for example, in the form of public utilities, of which the benefits accrue to all the industries within that locality. Up to a certain point, an increase in the number of industries operating within a locality may result in this basic social capital being more and more fully utilised. Instead of thinking of public utilities, we could also think of a local labour market which will be established if there is a sufficiently large number of firms operating within the given locality and of which the advantages will be enjoyed by all these firms collectively, or, again of the services of certain ancillary industries which will be forthcoming if there is a sufficiently large demand for such services. Beyond a certain point, further concentration of industries within any locality will, no doubt, lead to diminishing social returns, but up to a point the advantages may be considerable.

Small-Scale and Dispersion of Industries

This leads up to a third distinction. An argument for small-scale industry is not necessarily an argument for dispersion of industries, though the ideals which incline us towards the one may be similar to those that incline us towards the other. The distinction is of practical importance. Sometimes it is assumed that conditions favourable to small-scale industry are also conditions favourable to dispersion of industry, allowance being, of course, made for the fact that not all small-scale industries are "foot-loose". The relation between the two is, however, rather more complicated. There are indeed certain factors, to which we shall draw attention at a later stage, which encourage the one as well as the other. But it is important to realise that, to a certain extent, the two pull in different directions. When firms herd together there may be a greater possibility of maintaining small production units without diseconomy than when they are widely dispersed. This should be clear from our preceding discussion. The splitting up of productive processes into independent productive units is easier when these units operate in close proximity to each other. In the absence of such proximity, a large firm will find it more profitable to produce certain commodities itself, which otherwise it would have been content to be supplied by an outside firm. As Sargent Florence points out "a localisation of many medium or smaller plants offers similar economies to those found within a single large plant (e.g., juxtaposition between auxiliary services and the main process)". (P. S. Florence: **Investment, Location and Size of Plant.**) To the extent that this is true, a certain degree of crowding of industries encourages the development of small productive units, and dispersion of industries, instead of working in the direction of small-scale industry works in the opposite direction.

However, there are factors which are favourable to dispersion and to small-scale industry alike.

Factors Favouring Dispersion

As Lewis Mumford and others have never tired of pointing out, the "second industrial revolution" based on electricity works in favour of small workshops, and, at the same time, encourages dispersion of centres of production. The arguments in favour of this thesis are so well known that it is hardly necessary to reproduce them at length. "The efficiency of small units worked by electric motors utilising current either from local turbines or from a central power plant has given small-scale industry a new lease of life." (Lewis Mumford: **Technics and Civilisation**). Sources of industrially utilisable electric power are far more widely dispersed than the older source of power connected with coal, and coal is, in any case, incomparably more difficult to transport over long distances than electricity. The "weight-losing" principle which determined the concentration of major industries around the chief coal mines operates today in an entirely different technological environment. The same tendency towards dispersal of centres of industry is strengthened by the complete reorganisation of the system of communication that has been brought about by electricity. The introduction of telephone, for example, makes it possible to combine centralised direction with a far greater dispersion of units of production than would have been possible otherwise. No doubt, the old pattern of industrial concentration cannot be scrapped all on a sudden, so that the past has its pull on the present: but countries which are newly developing today have a comparatively free field to plan in this respect.

Immobility of Labour

A second factor favouring dispersal of industries is the territorial immobility of labour. It has long been known that within a country labour tends to be far less mobile than capital. This is true even of the industrially developed countries like Britain, as Lord Beveridge has clearly pointed out. So long as the transport of heavy raw materials presented the principal difficulty, labour as well as capital had to be moved to the sources of raw material, particularly, of coal and iron. Only those who are unacquainted with economic history minimise the hardship to labour presented by this process. In England, the enclosure movement, and a whole range of inhuman legislation, combined to keep up a sufficient supply of labour at the crucial industrial centres. In the U S S R a whole series of compulsions had to be adopted to the same end, with forced collectivisation providing the background. It is doubtful whether a rapid supply of labour at a few industrial centres can at all be guaranteed today, without reducing the whole trade union movement to a position of subservience to the government and without introducing dictatorial methods extending beyond the industrial sphere. On the other hand, if industries are more widely and judiciously dispersed, if, in other words, industry meets labour at least half way, instead of labour having to meet industry the whole way, large masses of people will be spared untold hardships. This is quite apart from the fact that a policy of dispersal of industry will make possible a more adequate utilisation of the surplus agricultural labour force in the **underdeveloped** countries.

The question of the utilisation of the surplus rural population brings us to our next point. In countries like India, with a long tradition of highly artistic products of cottage industry, there seems to exist a considerable fund of local and traditional skill which, with minor adaptation, can still be utilised under modern conditions. In all such cases, it is a waste of resources to try to fit the artisan to an entirely new environment in which his inherited skill is of no value at all. But if such waste is to be avoided, care has to be taken to allow new forms of industrial

organisation to evolve out of the old, mostly, perhaps, where they had been before.

Dispersion of Industry to Encourage Rural Investment

Finally, spreading industry over the countryside seems to be desirable for encouraging habits of investment in rural areas. This is of particular importance in the underdeveloped countries. In such countries, rapid economic growth is hardly possible, unless, at the same time as measures are adopted for agricultural improvement, methods can be found for mobilising rural savings. This can be done in several ways. In Japan, in the early years of industrialisation, no tax yielded larger revenue to the government than the land tax. In Russia, collective farms are, as Nurkse has pointed out, "collective" in more than one sense. They have served as instruments through which the State has collected compulsory levies from the peasantry. Under such circumstances, the theory that industrialisation takes place on the basis of the exploitation of the villages by the towns gains plausibility. Certainly, the more democratic way will be to spread investment opportunities all over the country in such a manner that reliance on forced mobilisation of rural savings is minimised, and an environment is created in which peasants develop spontaneous habits of thrift and investment. Perhaps there is here something to be learnt from countries like Denmark.

Conclusion: Bunched Dispersal

What is the upshot of the various trends of arguments sketched above? These arguments, taken in their totality, seem to point towards a certain compromise which we venture to present as follows:

(a) There are some industries which can only be large-scale, if serious diseconomy is to be avoided;

(b) But there are other industries which can be organised on a small scale, without serious technological inefficiency;

(c) These industries ought to be dispersed in bunches, as far as possible, every bunch consisting of certain interdependent firms, account being taken also of locally available under-employed labour and skill;

(d) These small-scale industries should themselves be surrounded by cooperatives and public agencies so as to relieve them of their weakness as commercial units, and assist them in research and in other ways.

The picture of bunched dispersal of industries presented above seems to be in accord with the aims of community development projects, with agro-industrial townships lying at the centre of sizable rural areas to which they are organically related.

There is one final observation that one would like to add. Bunched dispersion of enterprise is impossible without bunched dispersion of enterprising people. In all industrial societies, there is a tendency towards the rural area being drained of talents. Talents tend to gravitate towards the cities, partly because the cities offer more spectacular risks and more glittering prizes. There are solid as well as superficial considerations which decide the flow towards city life. And once the flow starts, the very drain of the village has a cumulative effect of dragging down rural standards progressively, until perhaps a reaction arises. The success of an arrangement such as indicated above will depend in no small part on the extent to which small-scale industries can attract enlightened "entrepreneurs", in the Schumpeterian sense of the word. Without the imagination and boldness to experiment and innovate, small-scale industry will languish in a developing economy; and whether such imagination will actually be displayed will depend on the quality of the people who actually interest themselves in such industry.

State Budgets

A STRIKING feature about the State budgets for 1956-57 which have been out in recent weeks—those of West Bengal, Madras, Bombay, Bihar, Uttar Pradesh, Madhya Pradesh, Andhra and Hyderabad—is that though the States concerned emphasise the importance of stepping up resources to meet the increasing demands under the Second Plan, and in most of them expenditure is increasing more rapidly than revenue, only three budgets viz. those of Madras, Andhra and Bihar, propose additional taxation. With the exception of Bombay, which has had the good fortune of realising a small surplus, all the other States have emerged with deficits, though of varying magnitude. Three States, Uttar Pradesh, Madhya Pradesh and West Bengal admit the need for raising tax yields. Thus the West Bengal Finance Minister has stated that in the next five years he intends to raise the tax yield by Rs 12.1 crores through such measures as 'entry' tax on tea, extension of coverage of sales tax etc. His counterpart in Madhya Pradesh has stated that additional taxation is expected to bring in Rs 12 crores in the next five years. In UP, the rates of existing taxes, including sales tax, would be raised; but it is not known how and when. Hyderabad, however, is completely silent on fresh taxation. The States do not appear to be in a hurry to levy fresh imposts with the general elections before them.

Large Deficit for West Bengal

Although there is a large deficit on revenue account, the West Bengal budget contains no fresh taxation proposals. The estimates for 1956-57 disclose an over-all deficit of Rs 16.89 crores, of which deficits on revenue and capital accounts amount to Rs 14.19 crores and Rs 2.70 crores respectively. As against this, the current year ends with a revenue deficit of Rs 15.09 crores and a surplus of Rs 12.45 crores outside the revenue account, resulting in an overall deficit of Rs 2.64 crores.

The capital budget provides for an expenditure of Rs 25.62 crores as against Rs 14.42 crores in 1955-56. (RE). The bulk of the budgeted outlay is on DVC, amounting to Rs 11.67 crores. Capital outlay under the second Plan would be Rs 153 crores, and the budget provision under this head is placed at Rs 35.27 crores.

Surplus for Bombay

Bombay has had a succession of surplus budgets in the last four years, though the surplus is of a small order. Estimates for 1956-57 show a surplus of Rs 23 lakhs—estimated revenue receipts and revenue expenditure amounting, respectively, to Rs 78.10 crores and Rs 77.86 crores. The revised estimates for 1955-56 show a bigger surplus of Rs 83 lakhs, against the anticipated surplus of Rs 22.37 lakhs. This larger surplus is not due to buoyancy of revenue—for there has been a fall in receipts to the extent of Rs 39 lakhs—but to shortfall in expenditure by Rs 99 lakhs. There are no fresh taxation proposals for the budget year.

Madhya Pradesh and UP

Madhya Pradesh has a deficit budget for 1956-57, the third year in succession. There is a revenue deficit of Rs 3.82 crores, the anticipated expenditure for the year at Rs 34.75 crores exceeding revenue receipts of Rs 30.93 crores. The State proposes to meet half of the deficit by additional taxation; however, as mentioned earlier, no tax measures have been announced.

The UP is budgeting for a deficit on revenue account of Rs 9.55 crores, with receipts estimated at Rs 85.35 crores and expenditure at Rs 94.91 crores. The revised estimates for 1955-56, however, show a balance against the anticipated deficit of Rs 5.5 crores.

Capital expenditure in UP during the budget year is placed at Rs 42.98 crores against Rs 29.44 crores in the current year. The overall deficit for the year is expected to be of the order of Rs 1.48 crores.

New Taxes for Bihar

Hyderabad has emerged with a deficit for the fourth year in succession, the revenue deficit having risen by Rs 1.1 crores over that in 1955-56. The estimates for 1956-57 disclose a deficit of Rs 4.3 crores —revenue being placed at Rs 26.04 crores and expenditure at Rs 30.37 crores. The revised estimates for 1955-56 show that both revenue and expenditure have dropped from the original budget estimates—the former from Rs 30.62 crores to Rs 24.75 crores and the latter from Rs 32.83 crores to Rs 27.9 crores. But the deficit has been larger than anticipated viz. 3.21 crores, due to the greater fall in revenue receipts. The Finance Minister has not, however, proposed fresh taxation to cover the deficit.

The Bihar budget for 1956-57 shows a revenue deficit of Rs 29.47 crores, receipts and expenditure being placed at Rs 66.75 crores and Rs 96.23 crores respectively. The Finance Minister has proposed to adopt three fresh taxation measures, viz. levy of a cess of one anna in the rupee on rent, a tax of annas three per gallon of diesel fuel and

levy of a multipoint sales tax at low rates, in place of the present higher single-point tax.

Andhra Tax Proposals

Right since its inception in 1953, Andhra has been faced with deficit budgets, though the size of the deficit showed an appreciable decline from Rs 5.17 crores in 1954-55 to Rs 3.97 crores in 1955-56 (RE). The estimates for 1956-57 bring the deficit further down to Rs 3.24 crores, receipts and revenue expenditure being placed at Rs 23.71 crores and Rs 26.95 crores respectively. The revised estimates for the current year, however, show an increase in the deficit i.e. from Rs 3.66 crores in the budget to Rs 3.98 crores (revised)—revenue and expenditure being placed at Rs 22.39 crores and Rs 26.37 crores respectively.

The Finance Minister has proposed to raise Rs 2.16 crores by new taxation, which includes

(i) levy of full assessment on inam lands (Rs 46 lakhs);

(ii) additional single point tax on mill-made cloth and precious stones (Rs 50 lakhs);

(iii) purchase tax on unmanufactured tobacco and sales tax on cheaper varieties of manufactured tobacco (Rs 60 lakhs);

(iv) surcharge on land revenue on a graded scale (Rs 45 lakhs); and

(v) revision of the rates of court fees and suit valuation fees (Rs 15 lakhs).

Despite the new tax proposals, the year is expected to close with a deficit.

Madras is also faced again with a deficit budget, the estimates for 1956-57 disclosing a deficit of Rs 3.11 crores at the existing level of taxation—with revenue at Rs 59.33 crores and expenditure at Rs 62.44 crores. Rs 1.45 crores proposed to be raised by additional taxation are expected to reduce the gap to Rs 1.66 crores. The new tax measures proposed by the Finance Minister include

(a) enhancement of the tax on diesel oil from 1½ as. to 4 as. a gallon—Rs 30 lakhs;

(b) additional sales tax of one anna in the rupee on sugar at any suitable point—Rs 40 lakhs;

(c) 30 per cent increase in the electricity rates in hydro-electric areas for bulk consumers and licencees—Rs 45 lakhs; and

(d) assessment of inam lands on ryotwari basis in lieu of quit rent—Rs 30 lakhs.

The one tax relief that is proposed in the budget is the exemption of palm gur from sales tax at all points.

We have tried to bring together above the bare figures of revenue and expenditure, together with such tax proposals as have been made by some of the State Governments. Thes figures, however, tell us very little. State Governments all show deficits, but what do these deficits mean? By 1955-56, they had used up all their reserves; so there is very little left in either their cash balances or investment reserves which could be drawn down any further. So these deficits have to be made good, in some way or other, by the Centre. But how far Central assistance in the form of grants and loans (for which data are available from the Central budget) will go to make these deficits cannot be known; so until, Reserve Bank publishes its study of the State budgets in a couple of months, it will not be possible to make out anything really sensible of the State budgets.

This is, by all counts, a very unsatisfactory state of affairs, since no consolidated data of the State finances would be available when the budget of the Government of India is discussed by Parliament. Much hard work has been put in by the Reserve Bank in recent years to reduce these budget statements into an intelligible account. This involves an enormous amount of reclassification but even so, much is left to be desired. For instance, even the Reserve Bank, with its resources, is unable to give a breakdown of the development expenditure in terms of those which are in the Plan and those outside the Plan which the States undertake either because of the pressure of local circumstances or to satisfy their own whims. Since this is a matter of standing dispute between the Centre and the States and comes up every now and again, it is surprising that such gaps should be left in our knowledge of facts. In the past it had been left to the Planning Commision to throw some light on the performance of the States in the matter of development in its Progress Reports, but for reasons which are hard to guess, no such report has come out for a very, very long time. Members of Parliament who are really interested in following financial developments in the country and the progress of the Plan may usefully take up this question and try to put an end to the present unsatisfactory state of affairs.

MARTIN BURN LIMITED

NOTICE

THE Tenth Ordinary General Meeting of the Shareholders of Martin Burn Ltd. will be held on Wednesday, 28th March, 1956 at 12 noon at the Registered Office of the Company, 12, Mission Row, Calcutta, to transact the following business :—

(1) To receive and adopt the Directors' Report and Audited Balance Sheet and Profit and Loss Account for the year ended 30th September, 1955.

(2) To declare a Dividend and Cash Bonus.

(3) To elect Directors.

(4) To appoint Auditors for the current year and to fix their remuneration.

The Ordinary Share Registers of the Company will be closed from 21st to 28th March, 1956, both days inclusive.

By Order of the Board,
A. G. Gidley
Secretary.

CALCUTTA,
5th March, 1956.

NOTE—The Dividend and Cash Bonus, if sanctioned, will be paid on or after 23rd April, 1956 to those Shareholders so entitled whose names appear in the Company's books on the 28th March, 1956 or to their mandatees. No application for dividend warrants will be necessary.

The Tax Proposals

THE budget presented by Shri Chintaman Deshmukh last year had shown clearly the type of the proposals that could be expected in ensuing years. It was apparent that stimulation of private industrial investment through specific tax incentives would be combined with a rising general level of taxation whose object would be to provide the State with the increasing revenues it needed for an expanding public sector, and to reduce existing inequalities of income and wealth still further.

Last year's proposals were determined wholly by the Matthai Commission's proposals. This year, the emphasis has shifted slightly, for two reasons. First, the major recommendations of the Commission had already been implemented last year. Second, the Commission had been thinking in terms of a much smaller Plan for the second five-year period than had ultimately found acceptance. The need for a major tax effort was accepted on all hands.

This year's proposals also provide evidence of the determination of the Finance Minister to close all loopholes in the tax system making for legal evasion and to check illegal evasion as well, by the acquisition of the necessary powers for the purpose.

The aim of raising the revenue resources of Government is made effective through changes in both direct and indirect taxes. "The only changes I propose in personal taxation", says the Finance Minister, "is a slight adjustment upwards of the super-tax payable on incomes above Rs. 70,000. With this adjustment, the rate of tax on the highest slab of income, that is, above Rs. 1,50,000 will be 91.9 per cent against the present figure of 88.6 per cent". What Shri Deshmukh has actually done is to split the two slabs of Rs. 20,000 each above Rs. 60,000 into two equal parts, making the upper slab in each case pay 1|2 anna more than the rate at present applicable to the whole and further to split the slab of 50,000 above a hundred thousand into two, the lower of 20,000 and the upper of 30,000, with the same increase on the latter slab. Since this makes the rate on this slab of 30,000, 9-1|2 annas in the rupee, which is at present the rate on the balance of income above 1,50,000, the rate on the balance is now raised to 10 annas. The effect of these changes are shown in Table I. It should be noted that these changes not only raise the maximum rate of super-tax applicable to the last slab of income, but also raise the rates on alternate slabs from Rs. 70.000 upwards. These rates are, of course, in addition to the income tax and the surcharge of one-twentieth on that and the surcharge of one-twentieth on super-tax which together take the rate applicable on the part of income above Rs. 1,50,000 per annum to the high level of 91.9 per cent. A glance at the table indicates the direction in which future changes are likely. A re-arrangement of slabs and rates are possible between the present third and fourth slab as a rationalisation to smooth the progression at that point!

The most important proposal perhaps is the withdrawal of the rebate of one anna in the rupee on undistributed profits at present granted to companies other than those coming under Section 23-A of the Income Tax Act. This proposal need not be taken to imply that the incentive to keep dividends low and thus expand corporate savings is now removed. That would have been undoubtedly undesirable in the present circumstances. It could be argued that the higher mobility would make them more desirable in the context of limitations on the expansion of the organised consumer goods industries which would be making higher profits and the need for investment in specified industries. But against this, would be the certainty of obtaining the savings at all.

Taken in the context of another proposal made by Shri Deshmukh, however, this discussion becomes academic for the incentive not to distribute profits in the form of high dividends still remains and has, if anything, been enhanced. This other proposal is the one levying a special super-tax on dividends distributed by a company in excess of 6 per cent of the paid-up capital. The rates of this tax are two annas in the rupee on the amount of dividends in excess of 6 per cent but not more than 10 per cent and 3 annas in the rupee on the excess over 10 per cent. For this purpose, the paid-up capital will include bonus capital but exclude preference capital and dividends "on preference shares will not be taken into account for determining the amount of excess dividends to be subjected to this extra super-tax". This last provision seems to be necessary to make the new scheme administratively feasible, but there is a danger in it which the Finance Minister does not seem to have noticed. New Preference shares with higher dividends or participating in additional profits may provide a way of legally evading the new tax.

The rates of special super-tax applicable to the excess paid in dividends above 6 per cent being higher than the original rebate on undistributed profits, the incentive not to distribute profits has, in fact, been increased. An incentive to do something desirable may be given by providing a benefit to those who do it or a penalty to those who do not. It is the latter method which Shri Chintaman has now resorted to. The net effect will be to bring more revenue to the Government while providing the necessary differential in favour of savings and industrial investment. One may also think of it as an indirect "ceiling on dividends" which is less harsh than the direct method and yet yield revenue.

The proposal to levy an extra super-tax at the rate of 2 annas in the rupee on the face value of bonus shares may be considered either as a supplement to the super-tax on excess dividends discussed above or as an independent measure. Considered independently, the tax provides a new source of revenue affecting the class of persons who may be considered to be in a position to pay at that stage. It also implies a tax recouping the Government in part for the benefit which it has hitherto given to the companies in the form of a differential tax in favour of undistributed profits.

The tax is supplementary to the excess dividends super-tax in so far as the permissible dividend is calculated on paid-up capital, inclusive of bonus shares. Those companies that would like to declare high dividends on their present paid-up capital would, therefore, have a stimulus to issue bonus shares so as to reduce the apparent rate of dividend and thus not attract the tax. The tax on bonus shares will detract from the advantages of taking this step to some extent. That is why the Finance Minister said that, "such a tax is an integral part of the scheme". The question is whether it will act as a sufficient deterrent in the face of the immense tax savings

likely every year from the reduction of the apparent dividend rate that would follow the issue of bonus shares. The market angle is not being considered here.

The Finance Minister has also provided a relief which will reduce the deterrent effect of the tax on bonus shares in certain cases. The Finance Ministry's Memorandum explaining the proposal points out that the "extra super-tax on excess dividends and bonus issues taken together will not exceed an amount calculated at 4 annas in the rupee on the total income of a company".

There are other important proposals for direct taxation, but their primary purpose does not appear to be to obtain more revenue as such, though that will no doubt result. These may now be considered. The first is the tax on registered partnership firms. The Finance Minister has now proposed that a small tax should be imposed on registered firms as such at the rate of nine pies per rupee up to Rs. 75,000, one anna up to Rs. 1,50,000 and one anna six pies for incomes above this figure. To understand the significance of this tax it should be noted that the "partners of the firm will get abatement on their proportionate shares of this tax for the purpose of income tax, but not for super-tax". Small partnerships with incomes below Rs. 40,000 are exempt from this tax. This proposal has the object of reducing the advantage which registered partnership firms enjoy over unregistered partnerships on the one hand and over companies on the other. It will no doubt provide additional revenue—estimated at one crore of rupees in 1956-57.

The proposal to increase the penal super-tax payable by a Section 23-A company dealing wholly or mainly in investments from four annas to eight annas in the rupee is somewhat confusing. It will no doubt tend to increase the distribution of dividends by such companies in spite of the special super-tax on excess dividends, but this is in fact what is intended up to a point. "The flat rate of four annas is low", it is explained, "for purely investment companies which do not need to have any large reserves and the shareholders may prefer the company to pay this super-tax at a comparatively low rate rather than themselves pay super-tax at higher rates which they will have to if the profits are distributed to them as dividends." It is clear from this that the intention is to eliminate one source of legal evasion.

With regard to foreign companies, the tax payable by a foreign firm operating through a branch has been raised from 53 per cent to 62 per cent, which is the same as that paid by a subsidiary Indian company which remits the whole of its profits as dividends to its foreign parent company. The form through which a foreign company operates in India will, therefore, no longer make any difference to its tax liability.

Another proposal affecting non-residents is to restore the flat rate of super-tax payable by them as an option to the rate appropriate to their world income to 3 annas. With the insertion of the new lower slab of super-tax in 1955 attracting a rate of one anna, the flat rate had also automatically fallen to one anna. The previous rate has now been restored. The Taxation Enquiry Commission had recommended a flat rate of 2 annas for this purpose.

With the introduction of the development rebate last year, the initial depreciation allowance in existence since 1946 had become allowable only for items such as buildings, motor cars, equipment, etc and for assets held by persons in the professions. This allowance has now been discontinued, though the development rebate will of course be granted on all items to which it is applicable.

To close an important loophole in the existing law, it is now proposed to disallow in the assessment of a company, any expenses for providing remuneration or amenities or benefits to directors or shareholders which are excessive or unreasonable considering the legitimate business needs of the Company. This will be without prejudice to the assessment of the full remuneration or benefits in the hands of the recipients under the law as it stands.

Other minor provisions increasing tax liability subject to tax the distribution out of profits, whether capitalised or not, on the liquidation of a Company and provide for readjustments of the tax relief given to shareholders on dividends received by them where the Company concerned defaults in the payment of the tax due.

While the proposals discussed above all increase the tax liability in one form or another, whether deliberately to increase revenue, or to close loopholes and eliminate anomalies, there are three proposals which will reduce tax liability. Though undoubtedly of a minor character, they ought to have been noticed to obtain a balanced picture of the current budget proposals.

The first proposal recognises that salaried employees do use conveyances of their own, partly, if not wholly, for the purpose of their employment as it facilitates the performance of their duties and otherwise contributes to their efficiency. It is, therefore, proposed to permit in their assessments the deduction of a reasonable portion of the expense and wear and tear which can be attributed to the use of conveyance on employment purposes as distinct from purely private purposes. Here is a concession which may stimulate the demand in India for cars, motor-cycles and scooters.

By another proposal, it is intended to grant unilateral relief in India for income charged to agricultural income tax in Pakistan which was hitherto taxed as non-agricultural income in India. It is proposed to make this concession effective retrospectively from 1948-49.

By the third proposal, a technical difficulty with regard to the exemption of salaries of certain foreign technicians employed in Government undertakings has been removed.

By the fourth proposal the exemption from tax granted to certain industrial undertakings for the first five years of their existence if established before March 31, 1956 has been extended to cover those established during the next five years also. The limit of the exemption to profits not exceeding six per cent of the paid-up capital continues.

It is clear from the various tax proposals made that apart from a tendency towards a general rise in the level of taxation and the continuance of specific incentives, the intention of the Finance Minister is to close as many loopholes as possible and eliminate inequalities as between different classes of tax payers in similar circumstances. That such rationalisation is in most cases achieved by steps which increase rather than decrease tax liability is what one should expect in the context of the requirements of the second Plan.

TABLE I

PROPOSED CHANGES IN SUPER-TAX

Existing			Proposed		
First	Rs. 20,000	Nil	First	Rs. 20,000	Nil

Around Bombay Markets

Post-Budget Rally

Thursday, Morning

THE performance of the Stock Exchange last week, during which the market had time to digest the budget proposals, is significant in that it reflects the final verdict on the budget which is that it is not in fact so bad. This is broadly borne out by the rally which the market witnessed, though technical factors also helped in that the oversold position led to some bear covering which also accounted for the firmness of rates.

Knowledgeable quarters now feel that the companies that would be hardest hit by the tax on dividend are plantation and mining which were paying dividends of over 30 per cent. Thus, such companies like Shivrajpur, Belapur, Bombay Burma in Bombay, and Bengal Coal and Indian Coppers in Calcutta and United Nilgiris, Mettur Industries, Periakaramalai teas in Madras may have to reduce their dividends to pay for the heavy dividend tax. It is also considered likely that those companies which have a strong reserve position will apply for permission to issue bonus shares, despite the tax on bonus shares. It is needless to mention here that permission will be given to capitalise reserves and issue bonus shares only to such companies as have sufficient reserves accumulated from earned profits. In general, however, companies will try to maintain or pay slightly higher dividends and pay dividend tax to Government by reducing the allocation to reserves. When this aspect of the dividend distribution was brought home to market operators, they took courage and gave sustained buying support.

Immediately after the release of the Budget proposals there was of course a pronounced weakness. This was soon followed by a smart recovery on Thursday evening. Since then there has been continued bear covering which enabled the prices to move up by stages. Other incidental factors which also influenced market sentiment were the declaration of a higher dividend of Rs 25 per share (Rs 12-8 final plus Rs 5 bonus including Rs 7-8 interim) by Bombay Dyeing as against Rs 20 per share last year, the raising of the dividend from Rs 13 to Rs 15 per share by Gokak and the expectation of a higher dividend at around Rs 4 per share by Tata Mills and Rs 12 by Swadeshi Mills.

Although the worst to suffer from the new taxes are the cotton mills which have to bear an additional burden on Rs. 14.5 crores by way of excise duty, mill shares in general have recovered from their early setback and are now ruling distinctly firm, supported by the excellent working results of many of the textile mills. New Great mills registered a sharp jump of more than Rs 35 while Century, Bombay Dyeing, Gokak, Kohinoor, Tata Mills and others ruled firm.

In the miscellaneous section, Bombay Burma attracted sustained investment buying on the strength of their good reserves and expectation of bonus. This company has the further advantage of tax relief on tea. Investment support was also noticed in Digvijay Cement and ACC while expectation of a maiden dividend helped Tata Chemical.

Cotton

Resumption of Forward Trading

WITH the end of the deadlock in cotton in sight, the chances of an early resumption of trading in the August contract have brightened. The Bombay High Court has upheld for the second time the validity of the Forward Markets Commission's action in fixing the clearings in February and May contracts at Rs 700 and Rs 688 per candy respectively. Following the High Court's judgment, the East India Cotton Association effected outward payments in the settlement of the two disputed contracts. The Forward Markets Commission has under consideration certain proposals to amend the by-laws of the Indian Cotton Contract and when these amendments are finalised, permission is expected to be given for the resumption of futures trading in cotton for the August contract.

The spot market at Sewri was moderately active during the week and a large volume of business was done mainly in Vijay cotton. While earlier in the week there was a distinctly rising trend in spot values, the process was reversed towards the close of the week when operators became apprehensive that the authorities might intervene to reguate spot delivery contracts. In the event, they became chary of enlarging their commitments with the consequence that prices of basic styles declined considerably.

In the export section, the latest announcement that the US would start selling its surplus cotton at world parity prices acted as a damper. It was feared that despite the assurance that US would sell its cotton at competitive prices, it would ultimately result in a virtual dumping of U.S. cotton on world cotton markets. It was announced by the U.S. Secretary of Agriculture that the new sales of surplus cotton would start only from August 1, 1956 and this sales programme would be a regular annual feature and might be stepped up gradually to attain a target of 5 million bales of surplus cotton exports in a year.

Self-Sufficiency
in
TUBES

On March 7, 1956, the works of the Indian Tube Company were formally opened in Jamshedpur by the Hon'ble Dr. Sri Krishna Sinha, Chief Minister, Bihar

The Tata Iron & Steel Co. Ltd. and Stewarts & Lloyds Limited, the largest producer of steel tubes in Europe, have jointly sponsored this project. A Fretz-Moon Mill with an annual capacity of 12,000 miles of tubes (90,000 tons by weight) at a cost of Rs. 3 crores has been installed. A separate Electric Resistance Weld Mill for the manufacture of some 13,000 tons of high quality precision tubes will be in operation by 1957, and Government's permission is awaited to instal a third mill to make seamless tubes.

When all the three mills are commissioned the country's requirements of practically all varieties of steel tubes should have been met.

The Problem State

IN Travancore-Cochin, the Congress Ministry, after a year of power, has been forced to submit its resignation owing to difficulties within the party. This is the sixth ministry that has fallen since 1954. Earlier, after the general elections in 1952-53, the Assembly was dissolved and fresh elections were held. Whatever the merits of the dissidents' case may be in this particular instance, the frequency with which the ministries change in Travancore-Cochin is a sad reflection on political affairs in the State. The time has come for a dispassionate examination of the forces that cause the downfall of ministries in such quick succession.

For an agricultural tract, Travancore-Cochin is dangerously over-populated. No political party has tried to face this problem squarely. Even family planning, whose effect can be seen in the very long run, has not made any headway in the State. No political party will actively support it for fear of alienating the powerful Christian community, which constitutes more than 30 per cent of the population. Large-scale emigration is impracticable. The other alternative is industrialisation. Here again, the problem is difficult. From the resources point of view, there are many limiting factors for large-scale industrialisation. There is no detailed survey of resources. Further, better and newer uses will have to be found for the commercial exploitation of the natural resources of the State. Here is an instance of population outstripping resources. Can science come to the rescue? Are there people in the State who can take up this challenge to science?

In education, this State is ahead of others, but the system of education is limited in its scope. It prepares young men for white-collared jobs but does not develop their talents in other and more fruitful directions. The result is frustration, as there is acute and unfair competition for white-collared jobs. No wonder, young men turn cynical and anti-Congress.

This is the atmosphere in the State. No political party has a plan to meet the ever-growing threat of over-population. Nor has any party a programme for the re-organisation of education, so as to develop the varied talents of the people, to meet the threat of over-population. What the State requires is men of science who can find better and new uses for resources in the area for the benefit of the people.

Unfortunately, political life in the State has become purposeless. People are too critical to allow any single party to get a working majority in the Assembly. The only party which has shown some sense of discipline is the Communist party. But how members of this party will behave, when put in power, is to be seen. Perhaps, the Communist party may be gaining ground, as the other parties are discrediting themselves.

Coming to the present crisis, the dissidents' case is the weakest imaginable. No ministry can function for long, if Ministers have to justify to individual members of the party, appointments, promotions and transfers of officers. Most of the charges relate to such things. The only question of policy involved in the dissension is about the behaviour

of the Chief Minister in regard to States reorganisation. Though the Chief Minister has very little to do with the loss of the four talukas in the southernmost part of the State to Madras, the fact that he toyed with the idea of a Dakshina Pradesh State has created uncertainty in the minds of the people as to where exactly he will lead the State. The prestige of the Congress will slump in the event of a merger of the State with Madras or Karnataka. Politically, it was therefore an unwise move on the part of the Chief Minister. But the *right thing* for the party to do in the situation was to give a clear mandate to the Chief Minister.

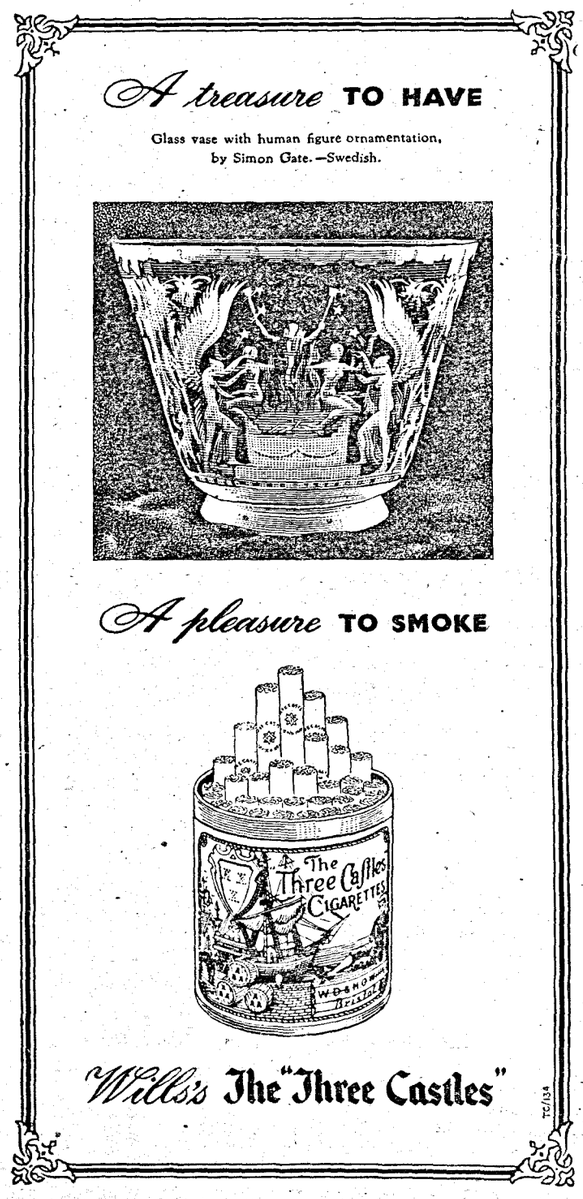
Experience in Travancore-Cochin suggests that it is not in the interest of parliamentary government that a few should be allowed to negative the wishes of the overwhelming majority in a legislative party. One way of preventing a handful of dissenters within a party from precipitating a ministrial crisis could be to establish a convention that such dessidents would not be admitted to other parties. In this respect, Congress and PSP have been the worst offenders. But in a small State like Travancore-Cochin, with party groupings as they are, the other question is even more important. If stable government by a party with a substantial majority is not possible, does it follow that the State is to be deprived of parliamentary government altogether? Whatever the difficulties, there is no situation which is so desperate that it is beyond the resource of political parties in the legislature to cope with it. To assume an alternative to it, is to retard the growth of parliamentary government.

Whatever the provocation, therefore, it is fatal to assume that President's rule is inevitable in Travancore-Cochin or that it is the only possible solution. One of the factors which has swayed party loyalties in Travancore-Cochin in the past and prevented the parties from assuming full responsibility for the situation is the opportunity which the possibility of President's rule has given to parties to play off one against the other. In the past, on more than one occasion, parties have tried to play for safety and manoeuvred to pass on the responsibility for bringing on President's rule. So today if Travancore-Cochin does have President's rule, the question will be, for how long and how will it affect the fortunes of the different parties in the next election, and which party will come out of it unscathed. The answer to it is not to have President's rule under any circumstances and allow the party leaders to go through all the manoeuvres they are capable of to produce the best possible combination they can. People get the Government which they deserve. Why should Delhi have to come to the rescue? After all, it is the responsibility of the people of Travancore-Cochin to run their own Government. The decision of the Praja Socialists, or of what remains of the party, to take the Lohia line without Lohia, and to abstain rigorously from any electoral or ministerial alliance with any party under any circumstance, does not, by itself, rule out the possibility of a coalition between the other parties.

Constitutional proprieties, it may be suspected, are being interpreted too narrowly in quarters which should know better. There is an important responsibility before the next Government, whoever forms it. For reorganisation of States requires, according to the Constitution, that the wishes of the people involved should be ascertained in advance. Without stretching words beyond the verge of decency, the only way the wishes of the people can be ascertained is through their elected representatives. Taking their stand on the letter of the law, Constitutional Pundits have given their decision that if the President is allowed under the Constitution, to run the Government of the State, he can just as well indicate or ascertain the wishes of the people concerned. This is a dangerous doctrine which even the unstable politics of Travancore cannot render acceptable.

Western Powers' Dilemma

NOT even a year has passed since the "summit Conference" at Geneva among the four Heads of State. But sufficient time has elapsed to emphasise the impact of the "hydrogen stalemate" on the world situation, as well as on the relations between the major NATO partners. Subsequent developments have underlined Moscow's awareness of some of the implications of the decisions reached at the "summit Conference". Moscow's diplomatic initiative, since the Geneva Conference among Heads of State has, belatedly, been acknowledged by the Western Powers. They have shown concern over Russia's gestures to eastern European countries. They have expressed alarm over Moscow's economic overtures to Asia. They are perturbed over the spreading Russian influence in West Asia.



But recent discussions at New Delhi between Pandit Nehru and the Foreign Ministers of the three Western Powers have disclosed certain other equally significant consequences of the "Geneva spirit", which neither Russia nor any of the Western Powers seems to have anticipated. As the "cold war" has become less tense, as the realisation has grown that there is no sane alternative to peaceful co-existence, the conflicting interests among the major NATO allies have come out into the open. These inherent conflicts became evident from the communique issued jointly by the President of the United States of America and the Prime Minister of Britain. These differences could no longer be ignored or obscured after the French Foreign Minister's indictment of the Western Powers' foreign policy. Sir Anthony Eden has explained the differences between Britain and America as a natural aspect of relations between democracies. America's Secretary of State has sought to minimise the significance of M Pineau's recent disparaging comments on the Western Powers' undue reliance on security on the ground that France remains a NATO Power. Mr Dulles has not denied the differences between the foreign policies of India and America. But he has repeated Sir Anthony's argument that such differences are only to be expected among 'free" countries.

Despite these sophisticated explanations, it becomes increasingly obvious that the Western Powers are divided on many of the world issues. These differences are of two kinds, though all the disagreements arise out of the Western Powers' attitude to Russia. It is clear that America is not in agreement with all the aspects of Britain's policy to west Asia. No less evident is Britain's resentment over the American policy to far-east Asia. France has a grievance that Britain and America do not consult her in formulating their policies to west Asia and far east Asia. She complains that her

NATO allies, Britain and America, do not appreciate her position or the situation in north-west Africa. Her Socialist Foreign Minister has expressed disagreement with the Anglo-American solution to the Arab-Israeli dispute, which excludes co-operation and consultation with Russia. Both Britain and France resent, implicitly if not explicitly, some of the pressures which America has exerted since the last world war. These are the inherent conflicts among the Western Powers in their constant search for spheres of influence, which have, perhaps, not been appreciated by Russia earlier. Now, after these differences have come out into the open, Moscow is not unprepared to exploit the situation.

In west Asia, the Baghdad Pact has complicated the Arab-Israeli dispute. This regional military alliance offered the opportunity to Russia to create her sphere of influence in West Asia. This military pact has, similarly, helped Egypt to win her Arab neighbour away from Britain. As the Baghdad Pact was inspired by America, she cannot disown responsibility for Britain's discomfiture in west Asia, or for Britain's tense relations with Greece as a sequel to the developments in Cyprus. Arab States are opposed to the Baghdad Pact. They resent the Western Powers' attitude to the Arab-Israeli dispute. They have every reason to welcome Russian co-operation to solve their dispute with Israel. What the Baghdad Pact has achieved in fortifying the northern tier in the region concerned against Russia is not generally known. But it is undeniable that it has prejudiced Britain's position in West Asia, complicated the Arab-Israeli dispute and provided Russia the opportunity to enter the west Asian scene.

SEADO has had equally disastrous consequences. Russia has been emphatic in her hostility to SEADO and Baghdad Pact countries. Even as she has gained friends in west Asia by offering military and economic aid, she has tried to fortify Afghanistan to offset the Western Powers' military aid to Pakistan. She has offered economic co-operation to India and Burma to match America's plans for economic aid to undeveloped countries. Apart from Thailand, Pakistan, Iran and Iraq, all Asian countries are opposed to SEADO and the Baghdad Pact. India remains unimpressed by the arguments of the British and American Foreign Ministers that these regional military alliances are necessary to maintain peace in these regions. She is more in sympathy with M Pineau's appraisal of the changed world situation. Not military pacts, but economic help is the road to peace and goodwill in these regions, as well as in the world as a whole. It would be foolish to pretend that M Pineau's recent outburst against the Western Powers' foreign policy or Mr. Dulles's talks with Pandit Nehru will lead to any change in America's foreign policy. It is doubtful whether Sir Anthony will have the courage or the statesmanship to pursue a foreign policy independently of America. But India can continue her foreign policy of good neighbourliness in the secure knowledge that, as more and more countries realise the futility of a foreign policy based exclusively on security, there will be an agonising re-appraisal in America of the changed and changing world situation.

Weekly Notes

No Case for Higher Bank Rate

WHILE Sir Cowasjee Jehangir was addressing the shareholders of the Bank of India, and calling upon the Reserve Bank to raise its bank rate in order to enable the banks to charge more on their advances, interest rates on advances were being put up by the banks by a quarter to half per cent. The correct news about advance rates is difficult to get; even when the Reserve Bank Bulletin publishes its survey, one cannot be quite sure of the variations in the rates quoted, for advances for rates vary within a range which is usually fairly wide. But this is the best guess one can get at the moment.

Assuming that money rates have hardened, and banks find the margin between their borrowing and lending rates too narrow, it is still surprising to find that so knowledgeable a person as Sir Cowasjee should advocate raising the bank rate as a remedy. Surely the case for it has to be based on altogether different grounds viz. unwholesome inflationary pressures, excessive speculation in commodities, particularly an alarming increase in holding of stocks etc. Though the volume of bank advances has increased considerably over the past 12 months, a hundred crore increase cannot be regarded as abnormal in the absence of specific evidence to the contrary. Partly the expansion has been called for by the rise of prices that has taken place during the year and partly by the fact that development in the organised sector has been considerable and this is the sector that uses bank credit to the largest extent. The movement of the revised index of industrial production which damps down the increase quite substantially, suggests that this may be so. The Reserve Bank should know; it must be watching the situation carefully enough.

Broadly there appears to be a case for expansion in keeping with the tempo of development. Higher bank rate in England—Bank of India seems to have convinced itself that the Reserve Bank must necessarily follow suit and has raised its fixed deposit rates accordingly—has robbed the money market of what little relief it could get through indirect borrowing from the London money market. Foreign assets have not gone up and therefore the only source of liquidity is the extent of deficit financing, the actual volume of which is anybody's guess but may not far exceed 160 crores, compared to the budgeted deficit of 330 and revised estimates of 240 crores for the financial year closing on March 31. There has been a corresponding increase in money supply, of course, but it is obviously inadequate.

Control Over Expenditure

Our Delhi Correspondent writes:

WITH State responsibility for social and economic activities increasing every day and talk of relaxation of Treasury control in the air, the suggestion for more effective parliamentary control is most opportune. If for ensuring efficiency and speed, Treasury control is to be replaced by budget control, closer parliamentary scrutiny follows as a necessary corollary. Ultimate control in theory rests with Parliament which in any case could not abdicate its power to the Government. On the contrary, the time has come for Parliament to make its authority really effective. To Shri Asoka Mehta goes the credit for highlighting the increasing need for stricter parliamentary control.

He suggested the formation of at least three committees of Parliament—a committee on investment, a committee on contracts and a committee to review the working of the public sector, all based on recent experience in France. Without reports from such committees, any discussion on the budget, he pointed out, would be unreal. He also recommended a special committee of the Lok Sabha—an expenditure committee on the lines of the one set up in the U K between the world wars—to look into the finances of the State. These suggestions had been made earlier by Shri M. N. Kaul, Secretary of the Lok Sabha, at the recent Seminar on Parliamentary Democracy, but had not then received the attention they deserved. Now that Shri Asoka Mehta has taken them up, they may secure better consideration.

That changes in the present system of financial control are under contemplation was indicated by Shri C. D. Deshmukh himself in his reply to the budget debate in the Rajya Sabha. Departmental accounting is necessary not merely for having a record of current progress of the Plan, as he seemed to suggest. The essence of this arrangement is that it ensures that responsibility for policy and for the financial consequences of this policy go hand in hand. Management accounting induces a sense of financial responsibility which the spending Departments tend to lack under the present system of financial control. Today they are apt to look upon finance as something troublesome and inconvenient which needs to be thought about only after policy has been settled.

Gone are the days when economy was considered something to be imposed on other Departments by a Treasury acting as "the single-handed champion of solvency keeping ceaseless vigil on the buccaneering proclivities of Permanent Heads of Departments". With management accounting and the consequent devolution of power, the Finance Ministry will learn to shed its omniscience and the administrative Ministries will be forced to make detailed estimates of their schemes before asking for the concurrence or approval of the Finance Ministry. This will ensure both economy and a closer correspondence between estimates and actuals.

The wide variation between budget figures and actuals has raised also the question of the suitability of the present financial year. Management accounting may promote better understanding between the Finance Ministry and the spending Ministries, but it will not help to forecast the course of actual expenditure on public works, for example, any better. The bulk of such expenditure is incurred in the autumn and winter. Revised budget estimates thus often go wrong by a long chalk. It has, therefore, been suggested that the time of the budget should be shifted to the Diwali. If the budget was presented on October 1, final figures of expenditure would cover the months when the bulk of the expenditure is actually incurred. If the new financial year roughly coincides with the business man's year it will be an additional advantage.

Employment—Revolving and Sediment

THERE is a difference between 'revolving' employment called for by a multipurpose project during the period of its construction and the 'sediment' of permanent employment that is left behind when the project is completed. This the employees of the Damodar Valley Corporation have learned to their cost; in fact, they are feeling it in their bones, having been served with mass notices of termination of jobs. As many as 16 thousand employees of the DVC face unemployment at the moment. In a circular, the DVC stated that employment under the Corporation falls under three categories (1) permanent, (2) those who are employed for a specific assignment and (3) contract labour. Of course the permanent ones will continue but what is the Corporation to do with those who have completed the job for which they were employed or with labour employed on the construction project which has been completed? The assurance given on the floor of the Parliament by the Planning Minister Shri Gulzarilal Nanda that none of the DVC employees would be thrown off his job appears, in the circumstances, to have been premature or unwise.

This matter of revolving and sediment of permanent employment, however, needs to be looked into more closely. The Bokharo Thermal Plant is a model of labour saving perfection. Everything is automatic and a handful of people are enough to run the plant. So are the other installations of the project. Once construction is over, the tide of employment recedes. But surely it is expected to devise successive ways of employment elsewhere, not too far from the valley? The Planning Commission must be having some research programme on hand to study the multiplier effects of investment in multi-purpose projects. The results of such research, whatever they are, should be publicised forthwith, if only to console the 16 thousand who are agitating that Nandaji should keep his word !

Esteemed Speaker

IN the course of her apprenticeship in parliamentary government, India has produced eminent presiding authorities, no matter whether they be called speakers or presidents. The late Shri G.V. Mavalankar was not the first of them, nor, let us hope, the last of the illustrious order. Yet Shri Mavalankar had a distinction all his own. He was not content to be just a competent speaker. He strove to put the very institution of speakership on a sound and abiding basis, set up conventions and precedents which should be useful for a long time to come and what is more, protect and strengthen the delicate plant of parliamentary democracy which we are tending with so little care.

It was a self-chosen mission, which found expression not only in the distinguished role he played as free India's first speaker in the Lok Sabha, but also in the periodical conferences of speakers of state legislatures from all over India which he used to convene and guide and the strict code of public utterance and demeanour that he set for himself. In other words, he enlarged the conception of speakership to include functions which, though by no means obligatory, were nevertheless vital to the growth of parliamentary government in the incipient stage. Thus he was guardian not only of the rights of the House over which he presided, but, in a sense, of other such institutions as well.

Lending a grace and dignity to the high office of speaker, he was at pains to protect it against any danger, whether from within or without. Indeed, he was more concerned about the conduct of the presiding authority himself, be it in any deliberative body anywhere in the country; for he rightly felt that public regard for the office would depend more on the utterances and actions of the occupant

than on any other factor. Temptations have not been few for presiding officers to get involved in controversies in the unsettling changes that have followed freedom; but however strongly Shri Mavalankar might have felt on issues raging in the country from time to time, he would not give the least public indication of it, lest the prestige of his office should suffer. For a man who was closely associated with active politics, this was no small act of self-denial.

Sense in Language

IT was perhaps as much the disarming humility and sweet reasonableness of Shri B. G. Kher as the practical need of a medium for inter-State communication that has made the task of the Official Language Commission, which he heads, easier. Shri Kher said last week that contrary to what might have been expected, the Commission had encountered little opposition so far in the course of its tour in the country; and as if in confirmation of it has come the report that the Madras Government has agreed to the adoption of Hindi as the official language. Madras had, not without justification, been more than a little hesitant in the matter. The preponderance of English in that State and the advantages that it had given the people were not to be lightly overlooked. Moreover, Hindi differs so radically from the regional languages of the South, that hostility to it was natural, which the overzealous protagonists of the national language did nothing to minimise. There was also the very human reluctance to learn a new language with which the South had little in common and the attendant doubt whether Southerners would be able to learn it well enough to face competition with others. These factors combined to lend some force to the anti-Hindi agitation which mere logic could not counter nor appeals to patriotism charm away.

That the agitation is still alive is evident from the accusations of partiality for Hindi that were hurled at Government on the floor of the Madras Assembly last week and the angry outbursts of some members that Hindi was more alien to Tamils than English. Whether opposition to Hindi will flare up again in the wake of the Government announcement on the subject remains to be seen. There are, no doubt, certain reservations accompanying the decision in the shape of suggestions made to the Commission to give due importance to English and adjust the process of change-over to the mood of the South. These suggestions are believed to have been favourably received by the Commission. Whether this is really the case or not can be known only when the final report is out. Meanwhile, the State Government can certainly claim credit for its confident handling of the matter in the face of opposition as also for the decision taken by it not to go back on the constitutional provision in respect of Hindi. The Commission would do well to take this fact into account in making its recommendations, and that not so much as a concession to the South or any other part of the country, but as a positive contribution to the ultimate success of the very mission it is engaged in. In the recent linguistic upheaval, Hindi did not come out as a supreme unifying force; and it has yet to be something more than a convenience. The chances of its playing its destined role ought not, therefore, to be vitiated by excessive zeal, haste or lack of a sense of proportion.

Cyprus

COLONIALISM is not the only issue involved in the ugly situation in Cyprus. Military considerations complicate the problem. One of the major mistakes of the second Attlee government was to prolong the dispute between Britain and Egypt. Insistence on the occupation of the Suez Canal zone was even then a blunder, as Britain had decided long ago to fortify Cyprus as an air base. This was the main reason why the Churchill government thought it prudent to settle the dispute with Egypt by evacuating the Canal Zone. It is the military aspect of the Cyprus problem which explains the present British policy to Cyprus.

Revolt against Sir Anthony Eden is spreading. His party's crusade against him stems mainly from the Eden government's internal economic policy. But the deterioration in Britain's position in west Asia has fanned the flame of the party's revolt against Sir Anthony. His Cyprus policy has the support of the "Suez group" of conservatives. But it has been the main target of criticism of the Opposition. When the trouble started, Britain bluntly denied the right of self-government to Cyprus. This was followed by the abortive London Conference. To hold Cyprus as a military base, a soldier was appointed as Governor. After months of barren negotiation, a constitution was prepared which was rejected by the parties concerned. Deportation of Archbishop Makarios emphasises Britain's determination to pursue a "strong" policy in relation to Cyprus.

Developments in Cyprus and Jordan are rude reminders of the consequences of Britain's new-found friendship with Turkey. Baghdad Pact was the main cause of Britain's disgrace in Jordan. It is the "Suez group" among Conservatives who not only insist on holding on to the military base in Cyprus, but are in favour of a pro-Turkey solution of the Cyprus problem. This has caused serious tension in the relations between Britain and Greece. More relevant is the demand of the Cypriots for self-government. In emphasising the strategic importance of the eastern Mediterranean, Britain ignores not only the changing world situation, but the sympathy of the whole of Asia with the Cypriots.

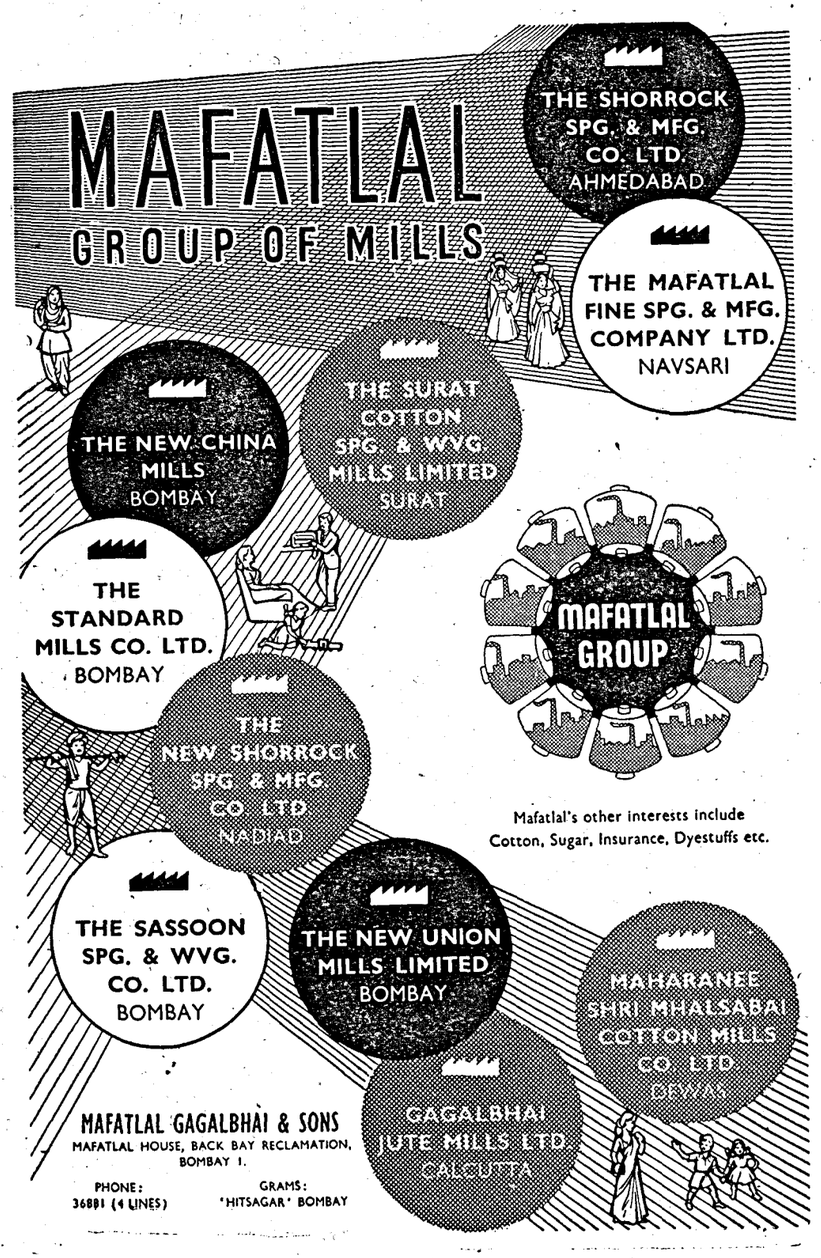
Karachi Conference

IT is clear that, with the exception of France, the members of SEADO are concerned about the effects of the Russian leaders' visit to India, Burma and Afghanistan. Military implications of SEADO are obvious. But these miltary aspects can be over-emphasised. These issues have been duly stressed in the Communique issued after the Karachi Conference. SEADO members are agreed about "the desirability of maintaining certain of their military forces at levels of mobility and combat effectiveness which would be an effective deterrent to aggression". Military experts may interpret this decision as they like. But it is evident that no joint Command, on the lines of NATO, is to be created.

Rusia's offers of economic co-operation to Asian countries have provoked Mr. Dulles, the American Secretary of State, to warn SEADO members of the new dangers of economic subversion. But, despite the Pakistani Prime Minister's appel for increased economic aid, there is little evidence in the Communique to show that America is interested in matching Russian offers with increased American economic aid. Mr Dulles seems content with his complacent conclusion that, in offering economic co-operation, Russia is only imitating America. It is strange that Mr Dulles is either unaware, or finds it diplomatic to ignore, that even Japan seems inclined to the view that the Russian approach to economic problems in Asia is superior to that of America.

Karachi is proud that it has induced SEADO members to accept Pakistan's stand on problems in the north-western areas of the former Indian Sub-continent. On Kashmir, Pakistan has won a pyrrpic victory. SEADO's references to Kashmir are more nebulous than its other decisions. Karachi may well boast that, if the Russian leaders have endorsed India's policy to Kashmir, SEADO members have accepted Pakistan's claims on Kashmir. This is a gross misinterpretation of SEADO's reference to Kashmir. In New Delhi, Mr Dulles has taken pains to assure Pandit Nehru that the Karachi discussions only mean that SEADO members hope that the Kashmir dispute would be settled peacefully either through direct negotiation or under the auspices of the United Nations. Though India denies the right of SEADO to discuss the Kashmir issue, this is a solution of the problem which is not opposed to New Delhi's policy.

Mr Dulles had private discussions with Pandit Nehru. But the American Secretary of State's Press Conference in New Delhi reveals that he is an expert tight-rope dancer. He repeated that there was nothing sinister in his description of Goa as a "province" of Portugal. But it is apparent that he conveniently ignores that, under the Indian Constitution, Kashmir is a "State" of the Republic of India. Pakistani Premier was diplomatic in his references to the right of self-determination of peoples. But, in endorsing Pakistan's soveriegn rights over areas up to the Durand Line, SEADO members, including Pakistan, ignored the demand for Pakhtoonistan. It is amusing to discover that some of the diplomats attending the Karachi Conference are unaware that Afghanistan does not claim Pakhtoonistan to be Afghan territory, but supports the tribes people's right to have a separate, independent country of their own. SEADO Conference in Karachi has ended. Its decisions have not only not brought the solution of Kashmir or of Pakhtoonistan any nearer solution, but have introduced additional complications to these issues.



Alkali and Chemical Corporation

THE annual report and accounts of the Alkali and Chemical Corporation of India for the year ended September 30, 1955, disclose excellent working results. All the units of the company's factory at Rishra, Calcutta, had a satisfactory year and the Chlorine/Caustic Soda Plant ran at almost rated capacity. The company's paints—'Duco' and 'Dulux'—have proved so popular that in order to meet the increasing demand for them the directors are contemplating extension of the paint production plant.

Revenue from sales increased by Rs. 37 lakhs to Rs. 155 lakhs during the year under review. After meeting manufacturing expenses—which rose from Rs. 67.40 lakhs in 1953-54 to Rs. 81.61 lakhs in 1954-55—and other commitments, and providing Rs. 9.48 lakhs towards depreciation (Rs. 8.83 lakhs last year) the net profits for the year amount to Rs. 19.39 lakhs—more than double that realised last year (Rs. 8.37 lakhs). Adding the amount brought forward from last year (Rs. 1.13 lakhs) and the amount at the credit of the Reserve for Exchange Losses (Rs. 2.39 lakhs), total available for distribution during the year amounts to Rs. 22.93 lakhs. Out of this, Rs. 12.5 lakhs have been allocated to Reserve for Deferred Income-tax, Rs. 2.73 lakhs to Dividend Equalisation Reserve and a sum of Rs. 1.55 lakhs is being used for meeting dividend obligations to preference shares.

The directors have recommended higher dividends on ordinary shares at 8 per cent—an increase of 2 per cent over the preceding year—which will absorb Rs. 4.96 lakhs. The balance is to be carried forward.

Off the Record

Question of Caste

THE Rajya Sabha has given its approval to a private member's Bill, already adopted by the Lower House, seeking to do away with the recording of the caste of a person in the registration of documents.

For this purpose, the Bill—which was sponsored in the Lok Sabha by Shri. S. C. Samanta (Congress)—amends the Indian Registration Act, of 1908, under which it is obligatory on the parties to a deed presented for registration to mention their castes.

Shri P. T. Leuva (Cong.—Bombay), who moved the Bill in the Rajya Sabha, said the measure was a small attempt to create a psychological atmosphere in the country, which would help do away with the evils of caste system.

During the two-hour lively debate in which over a dozen members participated, the Bill received overwhelming support. Only a few thought that it might lead to certain complications. Some members suggested that the amendment should be extended to similar enactments.

The Government's support to the measure came from the Minister for Legal Affairs, Shri. H. V. Pataskar. He said though the Bill did not go "the whole length," it removed any hardship a person might experience for not wanting to mention his caste. The extension of the measure to other laws immediately, he thought, would create complications since the Constitution recognised certain backward classes for giving special protection.

Dr. P. V. Kane, the erudite scholar on Dharma Shastras, said that by passing this "hasty" measure, they would be creating complications. He would suggest that refusal to state caste in the documents would not enable the Registrar to refuse registration.

Dr. P. C. Mitra (Congress—Bihar) said the Bill would create difficulties for Adivasis of Chota-Nagpur where there were restrictions on the transfer of property between two sections of Adivasis.

The Minister for Legal Affairs, Shri Pataskar, said the Bill had a limited scope and he failed to understand how it would lead to any complications. He expressed difficulty, however, in taking immediate action for deleting caste in all the Government documents since special protection had to be given to Scheduled Castes and Tribes. He hoped to get guidance from the Law Commission about the laws which needed to be similarly amended.

The above report is from the P.T.I. The debate raises the question: Can caste be abolished simply by refusing to take any cognisance of it? It is easy to take exception to this manner of posing the question by pointing out the obvious omission in it. Caste will not disappear simply by refusal to recognize it; simultaneously other steps have to be taken, such as measures to strengthen social mobility, throwing open all occupations to everyone irrespective of caste, breaking down segregation by a deliberate housing policy and so on. The moment positive measures are thought of, however, the question arises: how are these to be enforced unless those who are discriminated against are labelled as such? If these positive measures for bringing about equality through uplift are to be expanded and intensified, labels cannot be taken off those who are to be uplifted. So though the public spirit of the private member of the Lok Sabha, Shri S C Samanta, who moved the Bill, and the spirited support that Shri P. T. Leuva put up for it in the Rajya Sabha will be widely commended and will receive applause, the Minister for Legal Affairs will also, on second thoughts, deserve some sympathy for not being able to promise total removal of all references to caste from all official records and documents. How could he, when the Administration is committed to special measures for the economic and social betterment of the backward classes? Being the Minister for Legal Affairs, he could not think of anything better than leaving the matter to the Law Commission to decide how best one could get out of this difficulty.

When the late Sardar Vallabhai Patel decided that caste should not be recorded in the 1951 census, the decision was hailed as a bold stroke of imagination on his part. Ever since, we have been going back to the same caste classification but apparantly without the benefit of a systematic and scientific recording.

How could it be different? For the Constitution does not rest content with prohibiting discrimination on the ground of caste; it also provides safeguards, such as reservation of seats in legislature and in the services, for the scheduled castes, backward classes and scheduled tribes, as also for their educational and social uplift. The Directive Principles of State policy in the Constitution provide not only that the State remove the disabilities suffered by the scheduled castes but also take positive steps to promote their welfare. As evidence of what the Government is doing for carrying out this Constitutional Directive year after year, statistics are published of the schools opened for scheduled castes and scheduled tribes, of the scholarships awarded for them and of the money that is spent on educational facilities for the backward classes. Similarly, benefits under Five Year Plan are also tabulated especially going to these classes.

There is, however, a sting in the tale. Though 'backward classes' are mentioned in a number of places in the Constitution, the term has nowhere been defined. So a Commission was appointed under the Chairmanship of Kaka Kalelkar in 1952 to define the term and to determine the tests by which any particular class or group today may be described as backward. Since some are backward compared to others in every caste and sub-caste, this will bring back not only castes but also sub-castes and sub-sub-castes, which Sardar Patel wanted to get rid of. The Commission is to prepare a list of such classes for the whole of India and finally to examine their difficulties and to recommend steps for the removal of these difficulties. When it is published, the report is going to produce a bombshell, the explosion of which may cause even greater havoc than the SRC report.

Now does not this refusal to enter castes on documents of registration go back on all this? One wonders what the specialists have got to say on this very important problem. Some time ago, a Seminar was held

by the Indian Conference of Social Work (ICSW) on casteism and removal of untouchability. Academics have thus formally admitted this ugly word 'casteism' into their vocabulary perhaps to counter another ugly word 'Sanskritisation' which had been admitted earlier. The address delivered by Professor Srinivas, the Director of this Seminar, was published in this paper.* The ICSW has published a report on the Seminar in a handy volume of nearly 300 pages (to be reviewed). About castes, of course, it is one thing to ask whether they should exist and another, whether they are likely to exist. The Director put this fairly enough when he said:

"Agreeing to progressive resolutions satisfies our conscience and assures us of our worldly prospects, while at the same time our sense of facts tells us that nothing serious is going to be done by anyone and that caste will continue to remain what it is. The best of both the worlds are secured by taking such a course."

About the situation that exists today, this is what he says about his own home State: "In the first popular cabinet in Mysore State, headed by Shri K C Reddy, not only were the ministers chosen on a caste basis, but each had a secretary from his own sub-sub-sub-caste. And today, in Mysore State this principle is followed not only in every appointment, but also in the allotment of seats in schools and colleges." When the Backward Classes Commission reports and action is taken on its recommendations, the whole of India will be a replica of what Mysore is today.

The Director naturally suggested that castes being so powerful and pervasive, the first step in the struggle is to have a precise measure of its strength. He had probably in mind something much more subtle than mere strength of numbers, but how can administration do without enumeration? Caste had considerably gained in strength under the British days because the country ceased to be broken up into small fragments. At once horizontal combination became possible, while forces of vertical integration, which make for interdependence, were weakened. Independence has brought fresh strength to it, by making people more conscious of their rights and bringing them the widest opportunities of exercising there rights through the vote. Prof. Srinivas notes with pleasure that as education spread among them, "Harijans are organising themselves to assert the rights which the Constitution gives them". But are they not organising themselves as Harijans—How can that lead to a classless society? Finally, like vaids who advise acute cases to be treated by allopaths first, in order to get some immediate relief, before they take up their patients for long-term treatment, social anthropologists base their hope on economics, on the Five Year Plan and industrialisation, and bank on "greater Sanskritisation of the way of life of the Harijans" to remove the more abnoxious features of the caste system gradually. After all this, one cannot help feeling a little sneaking sympathy for Pandit Gobind Vallabh Pant who, in the concluding address to the Seminar, expressed his wonder if, in the process of the uplift of the Harijans, they were not in fact perpetuating the existence of the Harijans though in his own district, Kumaon hills, an active movement for throwing temples open to untouchables would do a world of good.

About what economic changes can be to class or occupation—caste, however, is a slightly different matter—the current experience of Israel is instructive. Here is a story from Israel which may well be true. A woman who had saved up £. 1000 went to a matrimonial agency. The man in charge offered a grocer; she was not interested. He then suggested a young Doctor who was coming up. She declined. The man lost his temper. "You do not expect a worker for your £. 1000, do you?" That's that.

If the mustard seed with which the ghost of casteism is to be exorcised itself contains the distilled essence of caste, how can it do the trick? Class seems to be able to cut across caste more easily than caste is able to cut across class. So the ideal of a classless society leaves a vaccum in the present which reinforces rather than weakens caste. Neither is social mobility easily promoted by economic development—least of all by the sort of development that is specially intended to help the small man and the rural community. Basic education i.e. education through craft, naturally falls back on hereditary occupations; even the programme of rehabilitation of cottage industry is a programme for helping hereditary crafts. The Birmingham trained tanning expert does not lose his caste by handling leather nor is the Sanitary Engineer in charge of disposal of sewage contaminated by dirt. When members of a backward caste ever gain admittance into such professions, they leave their caste, and enter a higher class; the position of their castemen is not changed thereby. With what shall it be salted, if salt loseth its flavour?

Let the Oxford Brahmins deliberate on caste if they want to, but let them not forget that they can think of a society without class any more than the bigotted Hindu can think of a society without caste. What do social anthropologists know about class-less society? The logical positivist who asked himself why one could not play chess without the queen, could find no answer, called a priest, confessed and died a good Christian, was at least being honest to himself. It is the finding of the social anthropologists themselves that caste is increasingly being used to serve altogether new and modern functions, e.g. that of trade unions. More vigorous growth of trade unionism might render the use of such obsolete means unnecessary. So let them talk of escape from caste into class, but not of a classless society. All the talk of inter-dining and inter-marriage between Congress MLAs and Harijans merely clouds the issue. The social mobility they want is only for producing a social stratification different from that of the existing caste structure.

*"Castes: Can they exist in India of tomorrow?", Economic Weekly, Oct. 15, 1955.

ICI Project for Plastics In India

A project for the large-scale manufacture of plastics in India is to be launched by Imperial Chemical Industries (ICI). The scheme involves a sum of about £2,250,000, and manufacture will be undertaken by the Alkali and Chemical Corporation of India, an ICI associate.

Technical assistance in the design and operation of the plant will be provided under an agreement with ICI, and processing will be similar to that used in the production of 'Alkathene' plastics in Britain.

From the London End

East of Eden

IN a recent despatch, your Correspondent referred to the "lack of touch" of the Eden Government with the economic situation. This lack of touch has now come to embrace almost every field of Government activity. The perceptible slide which began about the middle of last year has now been followed by the arrest and deportation of Archbishop Makarios — an act of supreme lunacy. Actions like this can only be sanctioned by a desperate Prime Minister — a Prime Minister in panic. For those who wished for a more visible proof of the decline of Sir Anthony Eden, the Commons debate on the dismissal of General John Glubb was possibly most timely. As the **Manchester Guardian** remarked about the role of the Prime Minister in this debate "...his lack of composure is no new symptom". The Commons found an overwrought Prime Minister arguing a case made more difficult by its lack of consistency or reason. Being unsure of himself, and thus of his case, he found compensation in vehemence of speech accompanied by gesticulations which are not at all characteristic of him. The gravity of the problems for Britain in the Middle East is such that it is no longer capable of competent handling from so desperate and panic-stricken a man. The earlier right-wing Tory reaction against the Prime Minister has now at least gained a justification which bodes ill for Sir Anthony's continued occupancy of No. 10, Downing Street.

The crisis in the Middle East has been a long-simmering one, but as reasonably thinking people have come to appreciate, it has only been brought to a head by the Baghdad Pact. The two reasons originally advanced for this urchin-alliance were the Soviet flow of arms to Egypt and the need to divert the attention of the Arab nations away from Israel on to the strategy of the Dulles "northern tier" concept. Indeed, neither appeared at the time to hold any degree of urgency, or for that matter, to call for so far-reaching a military arrangement when the failure of the earlier mooted Middle East Defence Organisation was still fresh in mind. There was thus some other reason or reasons for this act of folly as it is now recognized. And your Correspondent believes that Colonel Nasser was the first and the quickest to perceive the more fundamental calculations of the British regime in the Middle East. It was clear to him that the Baghdad Pact was aimed at dislodging Egyptian supremacy and leadership in the Arab world and give Iraq that enviable position. And why? The Asian neutralist trend had already infected Egypt and this infection was rapidly overwhelming a number of Arab states, principally, Syria, Lebanon and Saudi Arabia. Prior to that, sharp conflicts between Britain and Egypt had appeared over the future of Sudan, and many commentators heave accordingly interpreted the Sudanese Independence Act as British **de marche** to forestall the accession of Sudan into another Egyptian province—a fairly unusual and expensive **de marche** on the part of the British.

Behind these conflicting positions, one of the prime reasons for the Baghdad Pact is the end of British dominance over the Suez Canal zone. This fundamental fact has, of course, now led to the path of British folly in Cyprus. No longer was the British posture of military strength possible in Middle East politics when the Suez was lost and the attempt to give Cyprus the Suez character is proving to be as futile as it is dangerous (i.e. the weakening of Anglo-Greek relations and thus of Nato). There remained Glubb's hold over the Arab Legion and this had been some secret consolation to the Foreign Office—now even that is gone. Continued division of the Arab States, transference of Arab leadership to Iraq and the desperate desire to make Cyprus take the military position of Suez—these have been the policies of Britain. That such policies were based on assumptions not only outmoded but in conflict with American intentions is only now being recognized and hence the panic, the decline of Sir Anthony Eden.

The spoke in the wheel of British Policy of fostering disunity in the Arab world has been and remains the existence of Israel. If anything unites the Arabs from Iraq to the little sheikdom in the Persian Gulf, it is the antagonism towards Israel and even when Britain makes such gestures as banning arms shipments to Israel or sharply reprimanding and condemning Israel for the recent Syrian border incident (before the U.N. Truce Commission has fixed the responsibility for it), the Arab nations find little to support Britain's presence in the Middle East. The latest act of British assurance, in spite of being profoundly illogical, has failed to impress the Arabs. In the Commons debate, the Minister of State, Mr. Anthony Nutting, declared against a new treaty guaranteeing Israel's frontiers, for the Tripartite Declaration against "incidents" on Israel's frontiers and finally for the 1948 Anglo-Jordinian Treaty guaranteeing the integrity of Jordan's frontiers with Israel. This fantastic for and against policy cannot but expose the bankruptcy of a panic-stricken Government.

Anglo-American discord is possibly more serious and illuminating. Americans originally sponsored the "northern tier" concept and yet in deference to their oil interests, they have remained outside the Baghdad Pact. This is possibly the clearest indication that the Baghdad Pact has little to do with "containing Communism". Since American oil interests happened to lie on the Saudi-Arabian side of the division line being fostered by Britain, the Americans "have for once kept their noses clean". At the recent Eden-Eisenhower meeting, Britain had once again attempted to obtain direct American acceptance of Iraq's leadership in the Arab world but had failed. Now with the Middle East crisis at its peak, the Eden attempt to obtain American support has met with some very qualified and irritating answers.

There are many problems each of which may spell death to the Eden Government; none however is more dangerous to the life of the present British regime than the Middle East crisis. The powerful right-wing Tory groups have for long been "gunning" at Sir Anthony Eden—the Middle East has been providing ammunition.

Banking Treasuries and Commercial Credit

D L Gupta

THE Imperial Bank of India had been transacting cash work of Government treasuries since its inception, and as such, it became the sole agent of the Reserve Bank of India in Part A & C States. It was also banker and treasurer to some Part B States like Jodhpur and Alwar (Rajasthan) etc. Some of the Part B States, however, have had their own local banks for handling their work. These are now known as "State Associated Banks." In the Indian Union there were 1304 Government treasuries in 1950, out of which 157 were banking and 1147 were departmental treasuries.

After independence, with the implementation of development schemes, financial transactions of the Government have increased enormously which has made it difficult for the departmental treasuries, particularly at Tehsil headquarters, where National Extension Service and Community Projects have been set up, to handle their work efficiently. On the other hand, the services of the banking treasuries have been found by the Government to be comparatively economical, convenient and reliable. This relieves the district authorities of the worries of safe keeping, transfer and disbursement of public revenues. Besides, the use of cheques in payment of Government obligations requires banking arrangement for the Government just as private business concerns have.

The banking treasury system is not only advantageous to the Government but it is also a successful way to maintain stability in the money market. The Financial operations of the Government continue to exercise great influence on the general financial position of the country. At the time of tax payments and issue of new loans, for example, heavy payments are made into Government treasuries which affect the money market. Similar changes—though in the opposite direction—take place at the time of sudden payments of large amounts for redemption of Government loans. All this could be completely avoided by introducing the banking treasury system through the country.

In view of the above advantages and facilities, there was a pressing demand from the administrative authorities and public representatives in Parliament for opening branches of the Imperial Bank of India. In this respect, the Bombay Administrative Enquiry Committee (1948) observed and recommended in their report:

"In the districts where the Imperial Bank of India has a branch treasury transactions are entrusted to it and we have been told that this makes for the general convenience to the public and given confidence to the Collector. We, therefore, recommend that the Imperial Bank should be approached to open branches in those districts where they do not exist at present, and if they are unable to do so Government should recognise approved banks wherever such exist for carrying our cash transactions."

The matter was thereafter referred to the Rural Banking Enquiry Committee in 1949 which also recommended that at 274 places where the turnover on Government account exceed Rs. 64 lakhs per annum, the Imperial Bank should take over the cash work of treasuries. To give encouragement to the bank for opening more branches, the committee further suggested that the commission charges should be increased to a reasonable extent.

Acting on this recommendation, the Reserve Bank of India raised the commission from 1/128% on the last slab to 1/16% on the turnover of the Government transactions to be handled by the new branches of the Imperial Bank. The Imperial Bank agreed to open 114 branches (including 13 treasury pay offices to be turned into branches) within 5 years from July 1951, but up to the end of 1954, it opened only 44 branches and converted 11 pay offices into branches.

In Part B States, which cover more than one fourth the area of the Indian Union, the Reserve Bank was appointed the sole banker by five states—Hyderabad, Mysore, Travancore Cochin, Madhya Bharat and Saurashtra. PEPSU and Rajasthan, however, could not do so, as they had some difficulties. Out of the former five states, only in two States (Hyderabad and Mysore) the Reserve Bank of India appointed its previous banks—the Hyderabad State Bank and the Bank of Mysore respectively — as agents. In other three states it could not do so for some reason or other. So without agency arrangements, the Reserve Bank could not expand Banking treasuries in these states. Consequently the expansion of the banking treasuries and extension of banking facilities particularly in rural areas could not go ahead.

The question again came up before the Estimate Committee on Finance appointed by the Parliament. The Committee, after a careful consideration of the question, recommended in its report of May 21, 1954 that the banking organisation, being more efficient and reliable than the old outmoded system of (department) treasuries, should be made greater use of. It said:

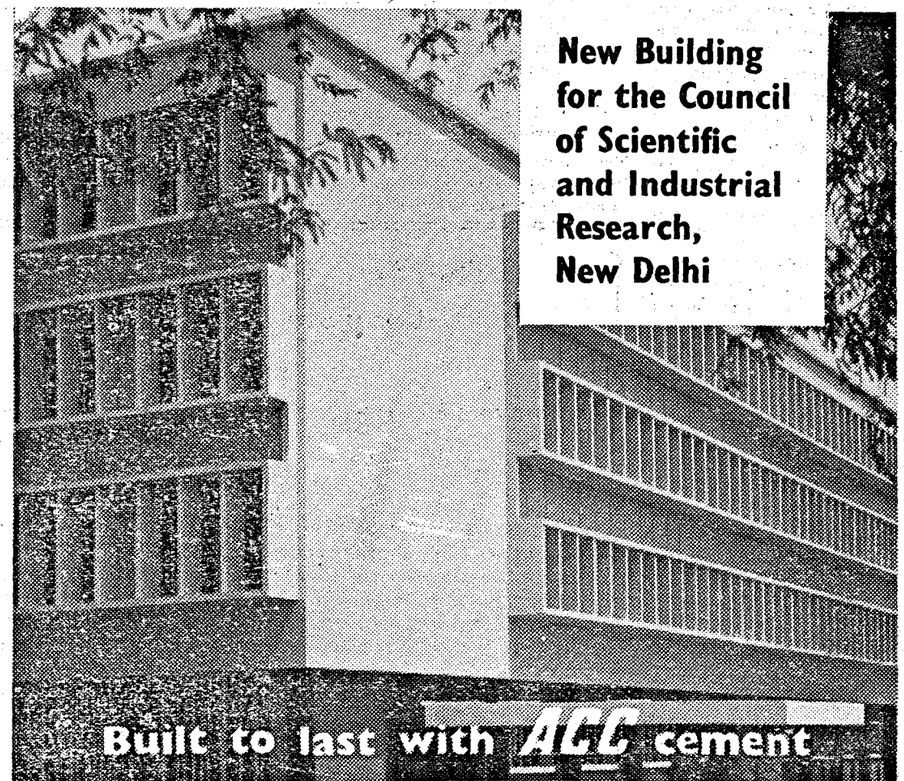
"The present system of treasuries should be abolished. The payment functions should be taken over by the branches of the Imperial Bank of India or, where a branch of the Imperial Bank of India does not function, by a branch of some other Scheduled Bank in consultation with the Reserve Bank. Where there is no branch of the Imperial Bank of India or any Scheduled Bank in existence, the Treasury Office itself should be converted into a pay office of the Imperial Bank of India" (Para 36)

The committee further suggested that:

"the Imperial Bank which is mostly concerned with the payments on behalf of the Central and State Governments should be nationalised at an early date. The demand for the nationalisation of the Imperial Bank has been there for a long time, and assurances have been given from time to time that the matter would be examined with a view to nationalising the bank at an early date. The Committee feel that the time has come when this should not be postponed any longer and in the present context of things, early steps should be taken to nationalise the bank so that the whole organisation of the Government payments is put on a sound and satisfactory footing and utmost promptitude is shown in making Government payments."

While the above recommendations and suggestions were under active consideration, the Government of India received the report from the Direction Committee on Rural Credit Survey which emphatically recommended:

"The State Bank of India should be established by statutory amalgamation of the Imperial Bank of India and the major state associated banks." (Chapter 34 para 2)



Amendment of the law including if necessary amendment of the constitution is recommended so as to make it obligatory on all the State Governments and not merely as, hitherto, the State Governments of Part A & C States to appoint the Reserve Bank of India as their sole bankers. "(Chapter 33 para 6).

"It should also be statutorily provided that it shall not be open to the Reserve Bank of India to appoint any bank other than the State Bank of India as its agent". (Chapter 33 para 11).

The analysis of the circumstances narrated above indicates that if (1) the Imperial Bank had opened at least 274 branches as suggested by Rural Banking Enquiry Committee and (2) PEPSU and Rajasthan Governments had appointed the Reserve Bank as their sole banker which would have been possible, had the state associated banks agreed to adjust themselves to the suggestions of the Reserve Bank, then I believe that the nationalisation of the banks and the establishment of the State Bank could have been, if not abandoned at all, postponed for several years.

There was another complaint against the Imperial Bank viz. that being placed in an advantageous position as being the sole agent of the Reserve Bank of India and the custodian of the currency chest, it extended unfair competition to the other banks. The Rural Banking Enquiry Committee had observed:

"It is wrong in principle and against the long term interests of the country, that Government cash work and currency chests, with all the prestige and other benefits they carry, should be entrusted to a single commercial bank thereby creating a powerful private monopoly, which can disregard the interests of the public, or jeopardizing the working of

Cement means better living for everyone; and the ACC is making more and more quality cement.

Issued by:
THE ASSOCIATED CEMENT COMPANIES LIMITED
Sales Managers:
The Cement Marketing Company of India Limited

other banks"

and had suggested that:

"Either the monopoly should strictly be regulated by the State or the bank should be deprived of the cash work and other special privileges it enjoys at present."

With the nationalisation of the Imperial Bank, the private monopoly has been eliminated but the State Bank of India has become a powerful commercial bank and so the fear of competition remains.

So far as Part B States Banks are concerned, there was no such complaint against them. So they deserve a different treatment at the hands of the Government of India. This point has already been alluded to in my article "State Associated Banks" (Economic Weekly, June 4, 1955.)

The State Bank of India is a national institution and has been established for the service of the country, particularly of small communities, which are at present not receiving banking facilities. This can be done in two ways:

(i) Through the local banks and branches of the regional banks

(ii) through direct dealings with the public.

As regards the first, it should be borne in mind that a single institution, whatever its size, cannot meet the requirements of all the communities of this vast country. They can be met, so far as rural India is concerned, only through the mediation of the other local banks; because the people on account of their close association can easily approach them in a spirit of mutual confidence.

Agricultural credit can be extended only through cooperative banks. But it should not be forgotten that the success of the agricultural credit is mostly dependent on commercial credit as it helps in increasing the purchasing power in the rural market, and also in stablising the prices of agricultural commodities to a considerable extent. Rural commercial credit, for all legitimate purposes and to all the deserving persons, can be extended conveniently and safely through the local banks wherever they exist.

Facilities required for banks.

Again, as the custodian of the Government surplus funds in the currency chests, it is the duty of the State Bank to relieve stringency in the money market; and for this purpose it should extend the following credit facilities to all the good scheduled and non-scheduled banks as their financial conditions permit:

(1) overdraft, instead of loans, against Government securities at at least ½% below bank rate;

(2) purchasing their endorsed demand bills and T.Ts without earmarking the Government securities;

(3) discounting bills (Promissory notes executed by their borrowers against advances secured by pledge of goods) of those banks which do not want or cannot get the facility from the Reserve Bank on account of the rigid formalities or working restrictions etc; and

(2) participating with small banks in their big advances just as the big city banks of U S A help their country correspondent banks.

The above accommodation should be allowed only to extend sound credit to trade, commerce, industry and agriculture and not to encourage speculation.

In addition to the above, the following facilities are also necessary for the banks on very reasonable charges:

(1) collection of their bills;

(2) remitting their funds free of charge without the existing conditions like, twice a week (this was only once a week before) and only to their Head office or Principal account with the Reserve Bank of India; and

(3) drawing limits on the various branches of State Bank against Government securties.

If scheduled banks are accommodated as above, they will realise that the State Bank is a source of help and strength to them and not their competitor. In turn they will extend credit and other banking facilities to their clients. Hence all legitimate demand for credit will be met and there will be no stringency in the money market even at the time of the peak season. In this way the State Bank will be able to achieve the main objective of expansion of banking treasuries in the country.

The Tata Iron and Steel Company Limited

NOTICE

NOTICE is hereby given that the Register of Members and the Transfer Books of the Company will be closed from Thursday, the 12th April 1956 to Thursday, the 26th April 1956, both days inclusive.

Notice is also hereby given that pursuant to the Special Resolutions passed at the Extra-Ordinary General Meeting of the Company held on Monday, the 12th March 1956, the holders of Ordinary shares on the Register of Members of the Company on the 26th April 1956, being the date fixed by the Directors pursuant to the above Resolutions will be entitled to apply for the new Ordinary shares in respect of their holdings of Ordinary shares on such date. Application and Renunciation forms will be posted to the shareholders in due course.

By Order of the Directors
TATA INDUSTRIES LIMITED, MANAGING AGENTS,

J. D. Choksi
DIRECTOR.

Bombay, dated 12th March 1956.

Manufacturers' Associations Speak Out

TO understand how the various industries are shaping and to follow their pattern of development it is no longer enough to go by general reports or the declining figures of imports of manufactures or even by the financial results of the industrial concerns. Alas, the comforting assurance that because imports of such and such a product are going down year by year or that the companies concerned are making handsome profits, the industries are also doing well, is steadily being undermined. Industries may also be 'salted' and their growth arrested while they remain sheltered and continue to make profit! Particular problems of the industries and their changing shape day by day, therefore, need to be followed closely. The operation of various controls, the appearance of Development Councils on the scene and administrative problems that have to be solved by the industries themselves both for conforming to various controls and for complying with excise regulations have led to the emergence of trade and industrial associations. Government professedly welcomes these associations. It is easier for the Government to deal with responsible bodies than with individual producers particularly when they are a heterogenous lot, differing widely in their capital resources, methods of production and trading and if truth must be told, in the degree of their reliability. Industry also wants these associations, badly to put up their case and deal with Delhi, but many of these bodies complain that they are not listened to or consulted. How is that? There are of course always two sides to a question. To be able to sample the problems that arise and the factors that bedevil development over a wide sector of industry, it is useful to study what the spokesmen of these industries have to say. But Chairmen or Presidents of the various industrial, manufacturers' or trade associations do not always get the attention that they deserve because the convention has not yet been established of publishing the full texts of their speeches or addresses as paid advertisements, which is the only way of ensuring the fullest publicity for all. This is much to be regretted, and not only for the loss of prospective revenue it means for the financial papers and other sections of the press, who would not mind having this new source of revenue to replace other sources which are disappearing one by one through the expansion of the public sector. The prospective loss of life insurance advertisements is a case in point that need not be laboured overmuch.

A number of such associations have lately brought their problems before the public. The Chairman of the Paint Federation has recounted the difficulties which paint makers had to face to comply with the regulations enforced by the excise authorities. They are by no means over yet, even after a whole year of discussions at various levels and representations to the highest quarters. He only hopes that "by the next year the situation will have resolved itself into a reasonably smooth working system". Anyway, the case of the paint makers is somewhat especial. Attention was drawn to it in these columns last year when the excise duty was first imposed on paints. The President, however, no longer protests against the excise duty. His association is only trying to come to terms with it, but unlike others, he openly opposes the encouragement to small units (who, by the way, are not admitted to membership of the association) and continues "to deplore the exemption from duty of the smaller manufacturers, which, in practice, places a premium on the quality of the larger manufacturers' products without any compensatory inducement to the small exempted manufacturer to improve his wares."

The Paint Federation Chief is equally opposed to new units being licensed for the production of paint. "It would be quite unjustifiable to license any new units during the Second Plan", he said, "since the burden of excise duty, on top of increasing production costs, was gravely prejudicing the health of the existing units in the industry." But if conditions are really that bad, why should others want to enter this field?

This is sharply in conflict with Shri Mangaldas's Presidential address at the annual session of the Federation in which this acknowledged spokesman of Indian industry declined, with thanks, the monopoly which Government was proposing to confer on the Cotton textile industry, for example, among others, by keeping out new entrants and banning all expansions.

The problems of all these trade bodies have a family likeness. They all complain against 'excessive' imports, for example, though the Paint Federation do not have this particular complaint. They also complain about shortage of raw material and inadequate allocation of controlled or imported materials. They complain against the delay in acceptance of Government tenders, extension of delivery dates and payment of bills.

The President of the Screw Manufacturers' Association is bitter that the Government should have allowed import of wood screws even to the extent of 5 per cent of the past year's imports, after having allowed the G K W to establish a plant for their manufacture. He stoutly denies the existence of any shortage. On the contrary, indigenous manufacturers, he claims, can manufacture all the special varieties of screws the imports of which continue to be freely allowed. That the manufacturers do not manufacture these varieties is only because consumers can get the imported stuff so freely. It is not possible to estimate the exact extent of demand for these special varieties, because the import of these varieties is not separately classified. This is a general complaint—inadequate import classification. "Samples of these varieties manufactured by the member-firms of the Association have already been submitted to the Development Wing and the Association has no doubt that the varieties manufactured by the indigenous industry have been found to be of good quality. When the prospects of marketing them open up, the factories will themselves get the test certificate but as it is, it does not appear to be necessary."

There is another common complaint—estimates of demand and supply are so sharply at variance. Demand, it is complained by the manufacturers' association, is grossly over-estimated. Consumers, on the other hand, make the same charge against estimates of supply and availability, often contending further that the quality of the indigenous product is not up to the standard or that they do not get the special type they require. It is surprising that the area of disagreement and uncertainty is not sought to be narrowed by changes in customs classification which should at least enable a correct estimation of the

actual quantity of imports.

About inadequacy of imports, the Paint Federation has a curious situation to report. Government, it is well known, has decided to protect indigenous titanium dioxide and with that end in view, had restricted the import of lithopone. Nevertheless, Government orders for paints continued to specify the use of lithopone, which the paint manufacturers naturally found difficult to comply with, since the import of the latter was severely restricted. It fell to the lot of the Federation to get the Government to agree to the substitution of titanium dioxide, wherever specifications mention lithopone!

Hurricane lanterns, the manufacturers of which have brought out an excellent directory, are not separately classified in import statistics. They are classed together with "metal lamps and parts." But imports are no longer a matter of active concern to the industry which is generous enough, it is an agreeable surprise to find, to welcome the token imports to the extent of 2 per cent on the face value licence which were allowed last year. The manufacturers concede that they have reached a stage where they are able to compete with foreign lanterns and need no protection. On the contrary, as they are in a position to export and have been exporting on a significant scale, such token imports, they agree, "will act as a check both from the stand point of quality and price."

Now about raw materials. Screw manufacturers get their steel wire and rods from Indian Steel and Wire Products Ltd who are, however, not in a position to meet their demands in full. Naturally, therefore, their own production programme is hampered. The Association has been asked to get the balance of their requirements from imports but here comes the question of import duties. In short, unless the import duty on wire rods and steel wire is removed, the screw industry cannot work to full capacity. Being a protected industry, it is very necessary, in so far as its progress is checked, for it to give a good account of itself, but it cannot, for no fault of its own. Not all manufacturers of wood screws, however, are members of the Association, which creates additional complications in the matter of allocation etc.

As in screws, so in the case of many other light engineering industries, it finally ends up in shortage of steel. The second Plan is being launched against a background of acute shortage of this basic raw material of industry as that of cement, the basic material for construction. Instead of a million tons a year for the next three years, the shortage is now being placed at double that figure. Already considerable quantities of steel are being imported by the private sector at 'free' prices, following the raising of steel prices to Rs 500 per ton, abolition of import duty and removal of price control on non-subsidised steel. As the difference between domestic and free import prics is reduced, the tendency to import on private account will strengthen; at the same time, the logic of circumstances will force controlled prices to be raised, except perhaps for users in high priority categories who are all in the public sector.

A formidable case and a far more complex one is that of electrical manufacturers. Mr Driessen of the Indian Cable Company presented it forcefully at the last meeting of the Indian Electrical Manufacturers' Association. He complained that it was quite impossible to comply with the Government's demands on these industries to increase their production, unless, at the same time, allocation of pig iron and steel to the manufacturers is increased. He suggested on behalf of all indigenous manufacturers that

> "Government plans to import one million tons of steel during the next financial year is not bold enough and that plans should be considered to import steel and pig iron in quantities that will allow India's Industry to expand without the fetters of raw materials shortages until such time as the country's planned steel production is sufficient to fill the needs of the nation."

If in the case of pig iron and steel, the shortage is absolute, in that of raw materials of the electrical manufacturing industries, it is complicated by the import duties on aluminium bars and rods and the stipulation made that aluminium imported under reduced import duties should be used for the manufacture of ACSR alone. The resulting anomalies are unbelievable, but true. Thus all aluminium conductors are allowed to be imported on paying a duty of 5¼ per cent, while domestic manufacturers of overhead conductors have to pay 35 per cent on the metal imported for their manufacture! Again, the import duty on the parts required for the manufacture of motors and transformers ranges from 25 to 30 per cent while the duty on the complete product is much less.

This is not all. The anomalies of import duties may be serious enough but they can be removed. But what about getting the imports? Aluminium, in the form of ingot, bar or rod, is almost unobtainable in foreign markets and the principal suppliers to this country, the Aluminium Union of Canada, are able to allocate to domestic manufacturers only a small and wholly inadequate quota. The sole producer of electrolytic aluminium ingots or bars is the Indian Aluminium Company, which has not yet gone into production. When it does, its total production will be only 18,000 tons of ingot per annum, while the consumption of electrolytic aluminium by manufacturers of electrical conductors alone would exceed 20,000 tons in a couple of years. The gap between consumption and production, on present showing, may well be between 40 and 50 thousand tons by 1960.

The situation is not, therefore, very different from that of steel, the availability of which in foreign markets is far from free or easy. But for aluminium, there is a precedent. Most governments arrange for bulk imports of this metal for distribution to their electrical manufacturers and the other users, viz, utensil and packing industries. The Government of India should follow suit, or alternatively, use the rich bauxite deposits in the country to plan production on a much larger scale than is contemplated in the second Plan.

Electrical manufacturers have also a grouse that their Association is neglected by the Government. It has not been given representation on the Development Council for Heavy Electrical Industries. And like others, the Association is extremely critical of the imports allowed, in its case, of motors from 3 to 10 H P in the first half of this year. The domestic motor industry claims that it is capable of meeting all requirements fully up to 100 H P, and even more up to 500 H P are within its competence. About complaints of shortage, the IEMA Chief has an important suggestion to make: Indentors should plan their motor requirements in advance; if they do, Mr Driessen has no doubt, they will find that domestic producers will be able to give delivery earlier than the dates of actually getting imports. This applies to all engineering products.

Finally, a word about Government purchases, on which most of these producers are so heavily dependent. The Paint Federation Chief had some interesting light to throw on this problem. The Stores Purchase Committee, it will be remembered, made some recommendations for improving the situation, among others that requests for extension of the delivery date should be attended to within 15 days and that payment of final bills should be ensured within 90 days from the despatch of stores. "Although Government has accepted these two recommendations in principle, the Federation has so far been unable to discern the fact of their practical application."

Many of these difficulties arise from lack of liaison between Government and manufacturers. If in the case of paints, the Government Test House methods of inspection seriously impede production and supply, in the case of switch gear it is a great deal worse, because there is no laboratory to carry out tests. The delay experienced in the firm acceptance of tender for electrical goods is no whit less and the arrangement for testing military batteries at Bangalore do not bear writing about. Batteries sent for test are normally not released under 3 to 4 months, though the IEMA Chief makes bold to say "due to modern and efficient form of manufacture employed to-day, not a single case of failure has been known for 10 years". How long would the Directorate General of Supply and Disposals continue to occupy such an unenviable place in the proceedings of all Trade Associations?

Slow Recovery

Wednesday, Evening

EQUITIES have recovered some of the ground lost immediately after the budget. But the recent behaviour of stock markets indicates that some more time must elapse before confidence revives. Speculative scrips remain hesitant. But sound cash scrips are gradually crawling up. Sellers have become scarce. But buyers remain shy. By all current indications, the Calcutta Stock Exchange is likely to remain uncertain for yet awhile.

Tax proposals in the Union budget are not the only factors responsible for the curtailed volume of business. Clive Street is still suffering from the effects of the payments crisis. Brokers have somehow honoured their commitments. But many clients have not paid their brokers in full. Brokers have become more selective in entertaining business from clients. Even professional operators have become less active. Simultaneously, investors remain away from the market.

In recent days, there has been a revival of kerb trading. All the clearing shares are now again being traded on a delivery basis. These are symptoms of revival of activity. But both official and kerb dealings in clearing shares remain small. And the margin basis of trading is, naturally, affecting turnover. No individual broker can now keep an open position in excess of Rs 5 lakhs without providing margin for the excess. This limitation may have had a healthy effect on the market. But the turnover continues to be small.

Though the payments crisis has somehow been solved, "budla" charges in the last settlement indicate that the market is still carrying a weak 'bull interest. Thus, the technical situation remains vulnerable. This is one of the reasons why forward shares remain irregularly lower. And the uncertainly lower trend in speculative counters tends to check the rising tendency in equities in general. These are the market factors which are prolonging the adverse effects of tax proposals.

To stress the technical aspect of the market is not to ignore the unfavourable effects of tax proposals. True, equities are well above the budget "lows", but the lack of confidence reflects the long-run effects of the tax proposals. Industry is not much affected by the Union budget. But it is loaded heavily against the investor. Indirect limitation on dividend payments, withdrawal of the rebate on undistributed profits and the tax on bonus shares explain why investors remain shy.

It is arguable that investors are ignoring the effects of deficit financing on stock markets. This is an argument with which speculators, rather than genuine investors, are more concerned. It would be wrong to assume that investors are disinterested in capital gains. But they are more concerned about the yield on the investment. It will be conceded that budget proposals may affect equity yields. To the extent that the budget may have the effect of minimising capital gains, speculators will lose interest in stock markets. That is why professional activity remains at a low ebb.

Last week's statement by the Finance Minister indicates the pattern of financing the second Plan. There will be stress on deficit financing in the initial years. Taxation will be raised as the Plan progresses. This should have had a moderately "bullish" effect on stock markets. Equities have not moved up appreciably. But the slow recovery in the last few days suggests that neither investors nor speculators are altogether unimpressed by the indicated pattern of financing the Plan.

But it is clear that the annual increase in taxation will be as heavy as in the first year of the second Plan. There may not be enough scope for any further increase in direct taxation. If taxation has to be stepped-up, indirect taxes will have to be extended and the existing levels of indirect taxation will have to be raised. This has been the main trend in taxation since the war. And, even the level of indirect taxation has now reached a level where it impinges on stock markets.

One of the assumptions behind the financing of the Plan is that, as money incomes expand, consumption will not suffer because of the effects of indirect taxes on the prices of consumer goods. But the inflationary consequences of the Plan have other aspects which cannot be ignored. Industry is already losing the advantages incidental to relatively lower prices for foodgrains and industrial raw materials. This cost factor may soon assume significance.

Industrial borrowing costs are also mounting. Money remains plentiful. But money rates have hardened perceptibly since the last increase in the British Bank Rate. Banks are being forced to pay more to secure deposits. In consequence, their lending rates are being raised. One of the bank chairmen has already expressed his opinion that the Indian Bank Rate is out of touch with the market rates of interest. In the event of a further increase in industrial borrowing costs, industrial profits may be affected further.

These are trends which no investor can ignore. Some of these factors explain why Jute shares remain dull. For more than a year, the spinner's margin has remained unfavourable to the industry. There is yet no indication of the extent of the anticipated Russian order. Meanwhile, the industry has been enlarging output by unsealing sealed looms. Modernisation of jute mills is going on at a snail's pace. It is a costly affair. Its benefits will not be apparent until after some years have elapsed.

Though the beginning-of-the-year enthusiasm about Jute shares has subsided, Clive Street now seems to be moderately optimistic about the shares. Tea auction prices have risen in recent weeks. There is growing belief that the worst has already been seen. Though the outlook is still rather obscure, it is possible that the low late-1955 tea prices may not be witnessed again in the near future. In the last few days, shares of the tea companies with gardens, or some interest, in Pakistan have gradually moved up. This reflects the relative tax advantage enjoyed by these tea companies. Slowly, the shares of Indian tea companies are looking up. Investors are no longer under any urge to liquidate. But they yet lack the courage to go in for fresh investment in Tea shares.

Higher Dividends

Thursday, Morning

WHILE speculation is going on as to which companies would capitalise their reserve by issue of bonus shares and which would go in for higher dividends as the lesser of the two evils, there is increasing evidence that even the most conservative of concerns are raising their dividends. A number of such announcements regaled the investors during the week. The new taxation policy is obviously encouarging the cotton mills who have earned substantially higher profits to raise their dividends. Bombay Dyeing raised theirs from Rs. 20 to 25, Gokak with profits higher by Rs. 7 lakhs at Rs. 21.72 lakhs have recommended a dividend of Rs. 15 per share as against Rs 13, while Bangalore Woollen and Cotton and Silk Mills have obtained permission to capitalise Rs 81 lakhs from reserve by issuing two bonus shares for one held.

Phoenix Mills have announced a dividend of Rs 10 as against Rs 8. Dawn Mills profits have risen from Rs 6 lakhs to Rs 14.70 lakhs and the management has recommended two and a half times higher dividend at Rs. 15 per share as against Rs 6. Swan Mills dividend has been stepped up by Rs 5 per share. Gold Mohar Mills raised their dividend from Rs 12-8-0 to Rs 15 per share. Finlay Mills announced a dividend of Rs 20 per share as against Rs 16 paid in the previous year. Several others, like Tata Mills, Swadeshi, Tata Oils, Indore Malwa and India United Mills are expected to have made higher profits and are likely to raise their dividends. Century, Buckingham and Carnatic and Shivrajpur have made bumper profits.

Heavy bear positions had been accumulated as a result of selling presure from prominent operators. The market was in a state of oversold position. This was revealed at the time of budli business during the week. Bears in Shivrajpur were heavily penalised; shorts in other scrips were not in a happy position either as budli judging from the rates in the last settlement.

Despite tight money conditions and the tax proposals, leading industrials are getting consistent bull support and there has been heavy bear covering. Higher deivdends have helped sentiment. The shareholders of the Tata Iron and Steel Co. approved at the extra ordinary general meeting held during the week the scheme to issue new shares at a premium. The Chairman struck a note of optimism during the course of the meeting. This found its due reflection in Tata Steel Ordinaries which shot up by several points from the week's lowest. Indian Iron went up from Rs. 31-11-6 to Rs 33-8.

In the textile section, Bombay dyeing jumped more than thirty points. Century appreciated by twentyfive points. Simplex rose nearly twenty points. Gokak further looked up by more than five points. Swadeshi, Finlay and Swan gained higher levels.

In the miscellaneous section, Associated Cement attracted good investment buying which took the rate to a recent new peak of Rs 214-8. On expectation of bonus, Burma Old rose nearly fifty points to Rs 607-8, and closed around Rs 600. Scindia, Tata Chemical and Premier Construction appreciated considerably.

Cotton

Ceiling for Vijay

COTTON futures trading continued to remain suspended. Meanwhile, demand for quality cotton by spinners in the ready cotton market at Sewri was on the increase. Despite increased excise duty the margin of profit on superfine cloth, is reported to be fairly satisfactory. Following the downward revision of crop estimates, especially of quality styles, influential spinners were in the market for popular quality styles.

Vijay, Navsari and Surati varieties were much sought after at rising prices. The volume of business in these styles has increased considerably, say, from 2000 bales to 8000 bales per day. Broach Vijay, in consequence, hardened by more than twentyfive rupees per candy over the week. Vijay Cotton moveed up from about Rs. 895 to Rs 925. judging from the heavy demand for this type, it seems certain that ceiling price will soon be reached. Vijay ceiling price for 13|16" is fixed at Rs 945.

Vijay Ag. Mark Cotton had buyers at as high as Rs. 945. A foreign firm of cotton dealers was reported to have purchased Vijay certified cotton at Rs. 981 (K.form). Even at higher levels, the demand for this quality persisted.

Following the firmness in Vijay, the rates of delivery contracts of other varieties also recorded improvements. Good business was reported in Jarilla, Batwa, Dabhoi, Jambusar and Telara at higher rates.

In the export section, Wagad continued to attract considerable attention from shippers and was sold at Rs. 705 while Kala had buyers at Rs. 700. Exporters also showed interest in the permissible qualities like Bengals, Comra, Deshi and lower quality Jarilla.

There was some activity in the foreign cotton section also. Business was reported in Busoga at around Rs. 1425, Bukhedi at Rs. 1430 and Jinja at Rs. 1350 per candy.

Oilseeds

Firm Trend

A firm trend persisted in oils and oilseeds throughout the week. In the face of suggestions of a lower crop and steady demand from crushers, the groundnut arrivals both in the terminal markets and locally, are slowly drying up. Besides, enquiries from overseas dealers poured in and rates were taken up to new high levels. It was widely believed that fresh export quotas for groundnut oils will be announced in the near future. Foreign advices were also encouraging.

Following brisk demand in the ready section, castor May futures attracted speculative support throughout the week. Castor ready firmed up to Rs. 25 per cwt. over the week. Firm spot prices and extension of heavy support by bulls led to short covering at advancing rates. The firmness is also attributed to the standing option business. As prices rose and the period for the maturity was nearing, option dealers had to cover their risks. More than 20,000 candies had to be covered, and this contributed to the rise.

don't chase shadows...

An attempt to combine economy with efficiency is often like chasing shadows. Planned Lighting, however, is a sure road to success.
Planned Lighting means greater output, fewer accidents, less absenteeism. It's Fluorescent Lighting—by Philips—which will help you reduce overheads by giving you three times as much light for the same amount of electricity consumed.

PLANNED LIGHTING
BY PHILIPS

Philips are fully prepared to provide you, without any obligation on your part, advice for a planned lighting system. Call them in and discuss it. Philips Electrical Co. (India) Ltd.

PHILIPS

Philips Fluorescent Lighting ensures diffused, glare-free light, without hard shadows.
It is the illumination for ideal working conditions, less fatigue, less eye-strain, hence higher efficiency and increased production.
Why not try it out yourself? Ask Philips Lighting Service Bureau to examine your existing installations and submit recommendations for any improvements required.

make light work for you

What Ails the Indian Banks

THE Indian Banks' Association is now quite an important body among the commercial and financial associations in the country, and the Chairman's speech of such an august body, therefore, demands more than a casual reference. Unfortunately this year's Chairman, Shri C H Bhabha, has not ventured to look in a different and constructive way at the problems faced by the Indian Banks. He has harped on the same old themes like unhealthy competition from the Exchange Banks, inefficiency of the clerical staff and the consequent rise in expense ratio etc. He has, however, tried to put forward certain statistical comparisons to drive his point home in respect of the aforesaid two themes, which deserve careful examination.

The total deposits of the Indian Scheduled Banks increased by Rs 35 crores as against a rise of Rs 45 crores in the Exchange Banks' deposits between the end of 1948 and 1955. This, according to Shri C H Bhabha, is an eloquent testimony to the unhealthy competition waged by the Exchange Banks. It is difficult to imagine the reason for selecting 1948 as the base year for comparison, for it was in this year that the impact of Partition was greatest on the Indian Scheduled Banks. Between the end of 1948 and 1949, Indian Scheduled Banks suffered a decline of Rs 105 crores in their total deposits while those of the Exchange Banks increased slightly by Rs 17 lakhs. Clearly this was not a case of transfer of deposits from the Indian Scheduled Banks to the Exchange Banks. Much of it is explained by transfer of funds from Indian to Pakistan branches.

The decline in Indian Scheduled Bank total deposits was arrested only when the Reserve Bank introduced exchange control on remittance from India to Pakistan after 1949. Therefore, if any long term comparison is to be made, it should more properly be made between the end of 1949 and 1955. During this period, total deposits of Indian Scheduled Banks increased by as much as Rs 135 crores compared to a rise of Rs 44 crores among the Exchange Banks. The choice of 1948 end as the base period for comparison, therefore, vitiates Shri Bhabha's conclusions. A comparison of total deposits between the end of 1949 and 1955 among the Indian Scheduled Banks and Exchange Banks demolishes the basis for Shri Bhabha's inference; but admittedly, it does nothing more. For a proper understanding of the forces affecting the deposits of the two sectors, it is more useful to consider the periods 1949 to 1952 and 1952 to 1955 separately. By the end of 1949 the effect of Partition on their total deposits was more or less complete and the Indian Scheduled Banks were in a position to benefit from the favourable atmosphere created by the Korean boom. Their total deposits increased by Rs. 10 crores between 1949 and 1950. True, the Exchange Banks also benefited from the boom almost to the same extent but this was to be expected as they were more favourably placed in regard to exchange business. The Korean price boom was broken abroad by the middle of 1951, but the full impact of the recession was not felt here until the Bank rate was raised in November 1951. In the course of the next six months, ending in April 1952, however, total deposits of the Scheduled Banks, which had participated in agricultural stock-piling in quite a big way, shrank appreciably.

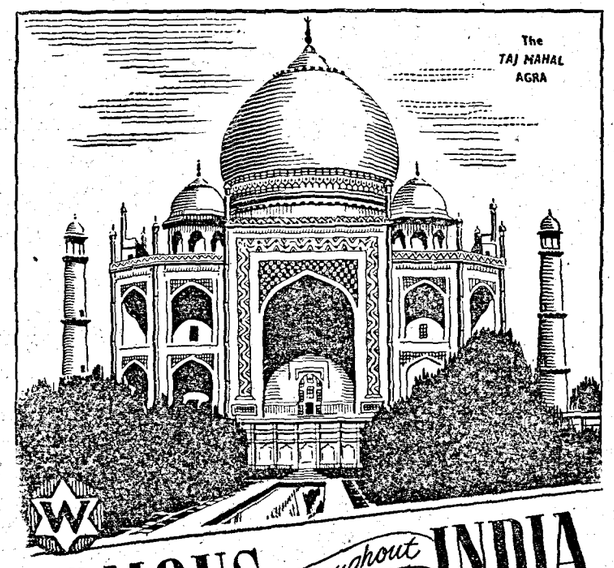
By end of 1952, near normalcy was restored and deposits of the Indian Scheduled Banks began to look up. These banks had been shaken somewhat and it is quite possible that in this period, the Exchange Banks offered stiff competition. Demand deposits of Exchange Banks which had remained constant between the end of 1951 and 1952 recorded a sudden jump of Rs. 15 crores in the first half of 1952. Exchange Banks sought by all manner of means to attract depositors, and Shri Bhabha's strong criticism of the attitude of the Exchange Banks would in a measure be justified, if it were confined to their behaviour during the period 1949 to 1952, especially between the end of 1951 and mid-1952.

Between the end of 1952 and 1955, however, the position became different. During 1953, total deposits of the Indian Scheduled Banks rose by Rs. 20 crores whereas those of Exchange Banks declined by Rs 16 crores. The rise of Bank rate in England affected the business of the Exchange Banks rather directly, and their demand deposits declined by Rs. 14 crores. As against this, there was a fall of only Rs 2 crores in their time deposits which supports the contention that the Exchange Banks continued to strive hard to retain their deposits. But it would be difficult to maintain that this was at the expense of Indian Scheduled Banks, for the time deposits of the Indian Banks had also risen in the meantime by about Rs. 18 crores.

To cut a long story short, between 1952 and 1955, Indian Scheduled Banks' total deposits increased by Rs. 169 crores as against a rise of Rs. 16 crores in the deposits of Exchange Banks. Their time deposits increased by Rs 92 crores during this period against Rs 13 crores among Exchange Banks. Even in terms of percentage, which is after all not a very reliable standard for comparison between two dissimilar figures, Indian Banks increased their time deposits by 37 per cent while Exchange Banks could increase theirs only by 21 per cent. Against this background, it is rather difficult to see the point of the crusade launched by the Chairman of the Indian Banks Association. It would have been more helpful if instead of wasting so much time on questionable comparisons, he had elaborated what should now be done to overcome the present difficulties of Indian Banks. Only a fortnight ago Sir Cowasji Jehangir pleaded that the Reserve Bank should raise its Bank Rate in order to enable the scheduled banks to adjust their rates on advances upwards. Shri Bhabha now attacks the State Bank for not giving the lead in the matter of interest rates on bank advances. Apparently, the leading lights in the Indian banking world are obsessed with the idea that what prevents their earning more is the possibility of the Reserve Bank frowning on a higher charge on bank advances. They forget that banks cannot charge more than what borrowers are willing to pay. What is worse, they pay so little attention to the role that they ought to play in furthering the objectives of the Second Plan, especially as regards private investment. One wishes Shri Bhabha had probed a little the suggestion recently made by Dr John Matthai, that the Indian Banks together with the Reserve Bank of India should find ways and means of checking the rise in the borrowing rates of banks. But, obviously, Indian Banks, like many others, prefer to complain about things and consider it a good day's work done.

In Perspective

SINCE the Geneva "summit Conference", there is stalemate in Europe. But in east Asia, in south-east Asia and in West Asia, the "cold war" has been intensified. Pandit Nehru is aware of this threat to Asia. He is conscious that a continued "cold war" can only "keep up the atmosphere of hatred and fear and the ever-present danger of being converted into nuclear war". New Delhi dislikes military pacts. It is right in its opposition to SEATO and the Baghdad Pact as threats to Asia. India's foreign policy of non-involvement in the "cold war" has the support of the people. They accept Panch Shila as the basis of relations among nations. There will be no quarrel with Pandit Nehru's assessment of the world situation, or with his recipe for world peace.

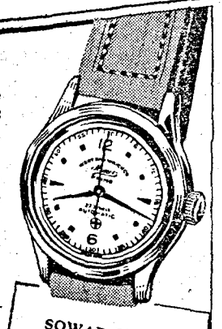


But certain developments in Asia need to be appreciated for a proper reappraisal of India's foreign policy. Events that make such a reappraisal necessary are not unknown to Pandit Nehru. There are hints in his speech in Parliament on foreign affairs, which disclose his awareness of some of the implications of developing events in Asia. India's foreign policy is clear-cut. Her policy of peaceful co-existence is accepted by the rival power blocs. But neither side is willing to accept the full implications of peaceful co-existence. Basically, it is the qualified acceptance of competitive co-existence by the Western Powers that perpetuates the "cold war" atmosphere in all parts of Asia. Both SEATO and the Baghdad Pact were established after the Geneva "summit Conference".

Pandit Nehru is not alone in questioning the wisdom or necessity of these regional military alliances. But he confesses that he has not been able to make converts of the British Foreign Minister or the American Secretary of State. In recent months, he has had talks with his "opposite numbers" from many countries. But these discussions have not been fruitful. India has emphasised her apprehensions about regional military pacts in Asia. Britain and America have informed India that they have no intention of abandoning their policy of negotiating through strength. France's Socialist Foreign Minister has expressed emphatic disapproval of such a foreign policy based exclusively on security. But the Foreign Ministers of Britain and America have politely but firmly informed Pandit Nehru that they have respect for India's foreign policy, but have no intention to abandon their search for security.

Apart from America, the major Western Powers accept India's solution of the critical situation in east Asia. They endorse India's policy that Communist China should be admitted to the United Nations. They will echo Pandit Nehru's suggestion for withdrawal from the coastal islands of Quemoy and Matsu so as to ease the situation in Taiwan. But they, with the possible exception of France, are agreed that SEATO and the Baghdad Pact are necessary for the defence of the regions concerned. One of the essential conditions of peaceful co-existence is an agreement to disagree among the rival power blocs. There can be no peaceful co-existence unless the Western Powers accept Communist States or the latter concede the existence of Capitalist States. To stress this is not to suggest that an agreement to disagree between India, America and Britain can reconcile the situation in west and south-east Asia. Pandit Nehru has informed Parliament that his talks with the British and American Foreign Ministers have had no positive outcome except a tacit agreement to disagree. He has "noted with regret" that these Commonwealth countries "have associated themselves with the offending declaration" made by SEATO Powers on Kashmir.

Because of the changed situation in all parts of Asia, there have been frequent suggestions from some quarters that there is need for a reappraisal of India's foreign policy. There is plausibility in the arguments advanced in these quarters. India is not self-sufficient in the manufacture of arms and ammunition. Her dependence on foreign supplies for defence preparations enhances the threat incidental to Pakistan's membership of SEATO and the Baghdad Pact. In a world dominated by power politics, India's foreign policy, it is argued, should be realistic. Faced with a situation which does not differ in essentials, Egypt has succeeded in averting the threat by accepting supplies of arms from Communist countries. To oblique suggestions that New Delhi should emulate Cairo, Pandit Nehru will probably retort that India is sincere in her policy of non-involvement as well as in her aversion to joining a race for armaments. Those who are conscious of the explosive implications of such a policy argue that realistic diplomacy is not necessarily or exclusively concerned with the military aspects of the situation. There are other ways of combating the threat arising out of Pakistan's membership of SEATO and the Baghdad Pact. Offers of economic co-operation by Russia to India and the hostile reaction in America to such gestures would seem to confirm the assumption that economic issues are no less relevant in power diplomacy.



Even in an era of peaceful co-existence, power diplomacy will prevail. In the circumstances, India can ignore the diplomatic implications of the developing situation in Asia only at her peril. But Pandit Nehru will not be uncharitable in reminding the diplomatic realists that the era of monocled diplomacy is dead. Pakistani Foreign Minister's belated endorsement of the old and oft-repeated Indian proposal for a "no war" agreement between the two countries is, therefore, doubly welcome. Equally welcome is his proposal for a demarcation of the Indo-Pakistani border. Only those who have read more in the recent Karachi discussions among SEATO Powers than they should will feel surprised at the Pakistani Prime Minister's gesture. It would be irrelevant to stress the internal compulsions which have prompted Karachi to accept India's proposal for a "no war" agreement. It would be equally foolish to jump to the conclusion that a "no war" agreement will automatically solve all the issues in dispute between the two countries. But it will be widely conceded that a "no war" agreement will help create a more congenial atmosphere in which disputed issues can be discussed calmly so as to facilitate a negotiated solution of problems which cause discord between India and her neighbour.

FAMOUS throughout INDIA

The qualities of beauty and endurance that distinguish our historic buildings are also found in 'West End' watches, famous in India for over 80 years.

Whether high-or low-priced, these craftsmen-built watches give accurate time-keeping and long-lasting service. Look for the name 'West End Watch Co.' on the dial.

Weekly Notes

Role of Economists

ADMINISTRATORS, Shri D L Mazumdar, I C S, admitted in an Extension lecture delivered at the University of Rajputana, have no difficulty in using the technical knowledge of the natural scientists, but fruitful application of economical knowledge to administrative problems is a different matter altogether. Difficulties arise mainly from:

(a) the different nature and scope of the natural sciences on the one hand and of economics on the other,

(b) the different nature and quality of the data and materials with which economists have to deal,

(c) the somewhat intractable problem of separating 'value judgements' from an objective study and analysis of economic data, and lastly

(d) the relatively unstandardised methods of economic analysis, which make it difficult for administrators, without necessary training in economics, either to assess the merits of such analysis or, as in the case of the natural sciences, to accept the validity of these methods.

Of these, Shri Mazumdar regards the last one as the most difficult of all. In short, economic analysis has not yet secured the same measure of recognition as technical knowledge in other fields. Nevertheless, it is being increasingly recognized that "economic administration, at the higher levels, at any rate, can no longer be entrusted to civil servants who have not received the necessary training or acquired the necessary experience for this specialized field." Moreover, where standardization, because of the inherent nature of the subject, is not possible, only the best is good enough. In this, of course, he has Prof. Robbins on his side whom he quotes with approval. Until economics wins its spurs and is standardised, unlike other sciences, "economics as a technical qualification is not much use unless at a high level of competence". But is competence enough? There is also the question of ends and means and these cannot be separated sufficiently to enable the practising economists to specialise as technicians, who can suggest the best means for achieving given ends. Here the administrators have the advantage of being closer to their "political masters", and "it is their duty to obtain from their political chiefs an affirmation of their faith, on which alone major administrative policy decisions can be based."

In saying this, Shri Mazumdar is not fair to the practitioners of the profession whose job has been likened to that of the family physician. He may not be fair, but if he is probably trying to be realistic—he should know—the analogy that readily suggests itself is that of the poor Hakims who had to examine their female patients from a distance. The patients could neither be seen nor touched. Their pulse had to be felt through a thread tied to their wrist, the other end of which alone the Hakim was permitted to hold. It is, however, a question of fact on which the administrator's testimony should be accepted. Delhi economists, then, are not really as close to the "political masters" as they are sometimes made out to be.

But leaving aside these finer debating points, could not the sterility of economics, to which Shri D L Mazumdar has drawn attention in a very polite manner, be traced to factors other than the difficulties of the subject itself? What Professor Baran said in these columns must at least be historically correct. "The development of economic thought and research has been always closely related to the needs of society at various stages of its development. Where this relation has been torn apart, economics was condemned to sterility or played even a negative, reactionary role in the process of social advancement." It should follow that now that greater attention is being paid to problems of development, economists may be able to play a more fruitful role than they have done in the past.

Expansion Programme for Coal

COAL is another of the issues which the Draft Outline has deliberately kept hanging. The target of 60 million tons, i.e., adding 23 million tons to the present production stands, but its distribution between the public and private sectors has been left somewhat vague. The provision for Government collieries in the next budget, however, throws some light on this question. The State collieries are expected to increase production from 3 million tons as at present to 15 million tons to be distributed as follows:

> 13 million tons by the development of new coalfieds in Korba, Karanpura, Raniganj, Jharia etc; 1.5 million tons by raising the present output of Singareni Coalfields; 0.5 million tons by raising the present output of State Collieries (Bokaro Colliery).

A provision has been made for Rs. 12.54 crores in the budget estimates for 1956-57 which may be compared to the capital at charge of the State collieries as at the end of 1954-55 which was Rs. 6.98 crores.

Though the target of 60 million tons stands, the railways have been told, however, that they would not be expected to carry more than 48 million tons of coal by 1961, which falls short of the target by 7 million tons. No decision has been taken as to who should undertake to produce the balance of the coal required in the second Plan period; it will be decided later, according to the experience gained meanwhile.

Government collieries are reported to have made a profit in 1954-55 —the latest year for which data are available—of Rs. 29.94 lakhs. This is a substantial improvement on the profits of the previous year which amounted to Rs. 1.35 lakhs only. The small profits in 1953-54, it is explained, was due to the writing off the revenue of Rs. 42.15 lakhs on account of the investment made in one of the Government collieries which has since been abandoned, and the adjustment of Rs. 7.24 lakhs in respect of another colliery during the year.

I C I C

MR H T PAREKH, B.Sc. (Econ) (Lon), of the firm of Harkisondass Lukhmidas, Stock Brokers, Bombay, has been appointed Deputy General Manager of the Industrial Credit and Investment Corporation of India Limited and will join the Corporation on 29th March, 1956.

Mill Yarn for Handlooms

THE suspicion of the Khadi group against the organised sector of the cotton textile industry, particularly its open allegation that mills would sabotage the handloom programme by withdrawing yarn from the handlooms must appear somewhat fanciful, in the absence of really convincing proof to the contrary. There may be, and probably there are, serious impediments to the flow of yarn from the mills to the handloom weavers, but it is difficult to imagine that these are all of the mills' own making. The distribution system may be faulty; co-operatives may react even more markedly to changing expectations than capitalist enterprises guided by un-adulterated profit motive; there must also be the common, or garden variety of underhand dealings and it may not be impossible, as has actually happened in the past, that enterprising exporters, tempted by prospects of high profits on exports of yarn, adopt unfair means or bring undue pressure to bear on the Textile Directorate to get yarn, which is earmarked for delivery to handlooms, released for export. But surely, circumstances under which—why yarn alone? —anything may disappear underground, can be met by appropriate action, if the Government is vigilant and undertakes its responsibility seriously of maintaining supplies to the handloom weavers. That no complaints have been heard about shortage of yarn in the last year or two during which handloom production has made considerable headway naturally raises the suspicion that in their genuine concern for handlooms, the Khadi group might be imagining things. The employment potential of charkha of the ordinary or improved variety, however, is a different question altogether. Here we are concerned with the bonafides of the mill industry and its intentions to maintain steady supply of yarn for handlooms.

Mr Sheppard's testimony in his address to the shareholders of the Kohinoor Mills should dispel such suspicion. The Chairman was at some pains to explain to the shareholders why the Kohinoor mills had not shown as much improvement in profits as one would have expected, in view of the brisk offtake and rising prices of cloth. This was because the Kohinoor Mills happened to be composite, but composite in a different sort of way in that half of their spindles are devoted to producing 'free' yarn and sewing threads, for which a special plant has been installed. Now the fact is that though the industry had a reasonably good year, this was largely because of the keen demand for cloth. Yarn, however, did not share this prosperity; prices of yarn remained very low throughout the year, making this part of the Kohinoor Mills business much less remunerative. Surely, relatively low prices of yarn would not indicate shortage of supply for handloom?

No Place for Na-paks !

RECENTLY, much has been heard about the problem of Hindu migrants from East Bengal. There is no dearth of schemes and plans, either of the West Bengal Government or of New Delhi, for rehabilitation of East Bengal Hindus. Calcutta pleads its inability to shoulder the responsibility without aid from New Delhi and other States. Two years ago, New Delhi accepted its responsibility for solving the problem of rehabilitation of refugees from East Bengal. But the problem has assumed alarming proportions in recent months. Recent developments deepen suspicions that, faced with the magnitude of the problem, New Delhi is unwilling to undertake its solemn commitments.

These reflections are prompted by some of the observations made by Shri C C Desai in his Press Conference in Calcutta last week. "India cannot be driven to the position of accepting", India's High Commissioner to Pakistan observed, "any more of refugees than she could successfully rehabilitate". Since the adoption of an Islamic State in Pakistan, the exodus of East Bengal Hindus has been so heavy that New Delhi's main concern now seems to be to devise ways of stopping the exodus. For six years, New Delhi has been hoping against hope that Karachi and Dacca will take steps to end the exodus. To-day, it would not only be idle, but dereliction of duty for New Delhi to pretend that Karachi will implement measures to stop the exodus, or that the Hindu exodus can be stopped or ended.

Shri C C Desai admits that the closing of the border is no practical solution to the problem of continued migration of East Bengal Hindus. New Delhi has, on second thoughts, been wise in not accepting Karachi's implied suggestion that it can stop the exodus by withholding migration certificates. Inflow of refugees in March is proof that even the slowing down of issue of migration certificates is no remedy or solution of the problem. But Shri C C Desai's observations and the repeated policy statements by New Delhi are distressing reminders that New Delhi is still concerned with futile discussions about the causes of the Hindu exodus from East Bengal. It is more than time for New Delhi to formulate a positive policy, instead of wasting time and energy in barren talks with Karachi about the ways of stopping the exodus.

To enable New Delhi to formulate a solution, it is necessary to realise that the problem is no less than that of giving shelter and rehabilitating the entire Hindu population of East Bengal.

This is a responsibility which New Delhi did not undertake, explicitly or implicitly, at the time of partition. It is not a question of mental reservation but of fact that Congress accepted partition but did not accept the two-nation theory. Whatever its other failings might be, even the worst critics of the present Government cannot impugn its record in the matter of building up a genuine secular state. What the implication of a two-nation theory could be, had Congress or the present Government acted up to it, is too horrible even to contemplate. So, it is only fair to concede that New Delhi never bargained for a complete evacuation of the Hindu population of either wing of Pakistan when it agreed to the partition of the country. But that is neither here nor there. As time passes, it becomes increasingly evident that in a theocratic, Islamic State only the Paks can have a place; the rest may at best be tolerated or suffered. But they can have no rightful place in an Islamic State. It is idle, however, to look back and ask, did we bargain for it when we agreed to the establishment of Pakistan as a sovereign State? True, the attributes of sovereignty have undergone a sea change in modern judicial theory but that, again, is an idle thought. Having chosen the humane way and decided to stick to the narrow and straight path of decency and sanctity of human relations, New Delhi has taken upon itself the responsibility of finding a home for the refugees from East Bengal. This responsibility it cannot escape from, however difficult it might be to discharge it. New Delhi must now show realism and willingness to fulfil it.

Propaganda

BASELESS allegations made by both Pakistani Foreign Minister and Prime Minister do not obscure the disillusionment that seems to be spreading in Karachi in quick succession to the temporary jubilation over Pakistan's imagined diplomatic triumph during the SEATO Conference there. Karachi seemed to be satisfied with the military aspects of the SEATO Conference. It made no secret of its diplomatic victory in prodding SEATO Powers to issue a communique which included references to Kashmir and the Durand Line. But the aggressive allegations made by both Pakistan's Prime Minister and his Foreign Minister against India in relation to recent border incidents would seem to indicate that Pakistan has belatedly discovered that her anticipated gains out of SEATO and the Baghdad Pact are illusory.

Evidently, Pakistan's calculations have not materialised. There have been many border disputes since partition. But the timing of some of the recent border incidents lent weight to the suspicion that Pakistan was interested in exploiting these incidents to convince Mr Dulles, during his presence in Karachi to attend the SEATO Conference, of India's alleged aggressive designs. Karachi's subsequent accusations against New Delhi can only mean that Pakistan has not succeeded in her propaganda efforts to impress SEATO Powers of India's alleged aggressive intentions.

Karachi may be ingenious, but is not convincing in her allegations against India. Pakistani Prime Minister has repeated his Foreign Minister's allegation that India is aiding or abetting, if not an aggressor in, the recent border incidents in order to pursuade America not to supply military aid to Pakistan. If India is, as Karachi alleges, an aggressor, Pakistan can be doubly sure of receiving military aid under both SEATO and the Baghdad Pact. That may be the real motive behind Pakistan's allegations against India. If it is so, it is poor propaganda indeed.

Mr Mohammed Ali, Pakistani Prime Minister, has suggested a conference at the ministerial level to discuss the recent border incidents and the establishment of a Boundary Commission. At the initiative of New Delhi, a Joint Standing Committee of the two countries was formed. Mr Hamidul Huq Chowdhury, Pakistani Foreign Minister, admits that this Committee has practically ceased to function. After Nekowal and the recent incident at Chhad Bet, it is doubtful whether any such Committee is of any practical use. India is ever willing to reconcile disputes through negotiation. But New Delhi cannot abandon its duty to resist aggression against Indian territory by force if necessary.

Pakistani Prime Minister now suggests that India and Pakistan should conclude a "no war" agreement to ensure "peace and good relations" between the two countries. Long ago, India's Prime Minister issued an appeal to Pakistan to enter into such a "no war" agreement. This appeal has since been repeated by New Delhi. But Karachi has always been adamant. Pakistan has rejected this proposal on the ground that peace between India and Pakistan cannot be ensured without a solution of the Kashmir problem. Pakistani Prime Minister emphasises, even as he proposes a "no war" agreement, that the Kashmir dispute "prevents" friendly relations between the two countries. New Delhi is anxious to solve not only the Kashmir issue, but all disputes through negotiation. If Pakistan is wiser and soberer by the experience that India is determined to resist aggression against her territory by force if necessary, Mr Mohammed Ali's proposal for a "no war" agreement will be welcomed by New Delhi. It is for Karachi to prove that Pakistan's intentions are sincere.

Off the Record

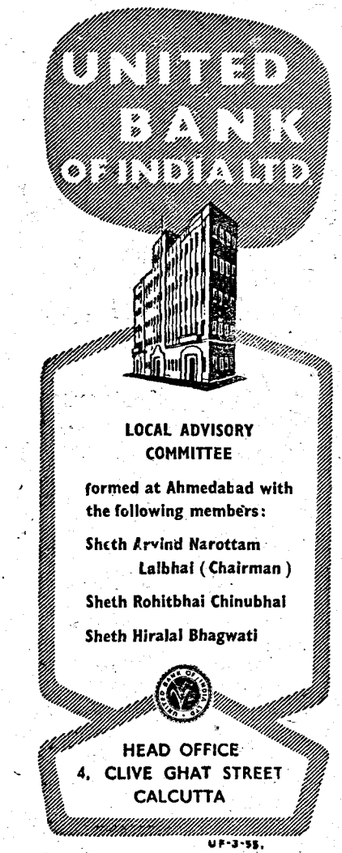
Oil and Assam

ASSAM has been the pioneer in the matter of oil. Leaving aside the Zoroastrians who tapped oil in ancient times and used it for burning lamps in their fire temples located on the mounds, what would correspond roughly to modern oil strikes, the extraction of mineral oils and their use in industry is not even 100 years old. Oil was struck in Assam at Makiem as early as 1867! The first well drilled by the Assam Oil Company in 1899 at Digboi was 662 feet deep. It dried up long ago, but since the first well was drilled, more than 900 wells have been drilled in and around Digboi. The recent strikes, however, are a different matter. They open up possibilities of much more substantial oil production. In a radio talk in December last, Shri K D Malaviya, the Minister for Natural Resources, said "The Assam Oil Company was carrying out intensive surveys both geological and geophysical in the Brahmaputra Valley, following the discovery of Nahorkatiya area two years ago. Out of 10 wells drilled so far, 8 have been successful and out of these two are actually producing around 1,500 barrels of oil per day".

Unlike the earliest well, which was only 662 feet deep, the recent ones are much deeper. Well No. 12 at Naoholia, in the Hirgrijan oil prospecting area of upper Assam, had struck a depth of 11,855 feet (nearly 2¼ miles) in January. As it has not yet been completed, drilling may go still deeper. There are, however, still deeper wells in Sind, Lakhra No. 1 there being 12,666 feet deep.

Now the first step in oil economics is to get the conversion tables correct. How 1500 barrels (or 42 gallons per barrel American and 31½ English) per day work out in terms of tons? Whatever be the equivalent in terms of tons—a million tons a year has been frequently mentioned—production in the Assam fields is expected to reach a figure which will necessitate setting up of a separate refinery. Calcutta has been suggested as the site for this refinery. Digboi will not be able to cope with all the oil that the Assam fields will be producing. Its present capacity is only some 300,000 gallons of crude oil; it cannot be expanded economically to process more than 400,000.

Assam oil has hit the headlines in another way. Attention has been drawn to the high prices charged for oil in Assam some years ago and the matter was to have been taken up by the Cabinet Economic Committee. It may be recalled that the Air Transport Committee had first drawn attention to the matter but at the time it was contested on behalf of the company that prices in Assam were no higher than they should be. They were fixed on the same formula, based on the theoretical cost of transport from the Gulf ports, plus the additional cost of transport from Calcutta to Assam, which was some times high because of the transport difficulties. At the time the late Shri Burgohain, then Deputy Minister for Natural Resources, had no defficulty in pointing out that this would not explain the 300 per cent dividend paid by the Assam Oil Company. Anyway, after the reduction in prices offered by the company, the matter was laid to rest. The company's case, of course, is obvious viz. that as it acts as a subsidiary, separate cost of its operations cannot be fixed, except arbitrarily. The other day, Shri K C Reddi, Minister of Production, implied the same thing when he said in reply to a question in Parliament that separate figures of investment for the Digboi refinery alone in regard to the Assam Oil Company were not available, as the activities of the company extended to several fields, of which the refinery was only a part.



Now the Assam Oil Company holds four separate prospecting licences. The terms of two of these cover 160 square miles in Moran and 280 square miles in Hagrijan. A rupee company is to be formed jointly by the Government and the AOC by March 31 for expanding this area. This company was to have two directors on its board representing the Governments of India and Assam respectively, and it had been reported earlier that Government of India would contribute upto one-third of its share capital. Maulana Abul Kalam Azad, who is the Cabinet Minister in charge of this portfolio, has now staked the claim that in pursuance of the Industrial Policy Statement of 1948, the Government of India will have 51 per cent of the share capital in the rupee company, and not 33-1/3 per cent, as had been reported earlier. The company, he reaffirmed, was to be registered by March 31.

Nobody bothers about oil prices, that is, about the basic price which the oil companies get. For what the motorist pays at the pump is something quite different anyway, and if the companies charge less or get less, the difference will not be passed on to the consumer; it is bound to be taken up in increased taxes. Moreover, facts about oil are hard to come by in any country. In the Government of India, petrol is handled by four different Ministries one way or another. The Ministry of Works, Housing and Supply is in charge of the Petroleum Division which is supposed to be the "coordinating executive authority in India for all users, civil and military, on all policy questions connected with the supplies of petroleum products". Then there is the Production Ministry which is in charge of the refineries. Finally there is the Ministry of Natural Resources which looks after prospecting for oil, a very exciting business these days which is very much in the limelight. There are a lot of Government publications these days and less and less of information. You wade through all the Ministry reports, and you will not be able to find out the basic facts about oil. This year, however, the Ministries have been kind enough to spare busy people the trouble of wading through their reports by issuing them in driblets and only in summary. That a democratic Government should be so negligent about keeping the people informed may be regretted but there is little loss of information as a result. In the year when there was all that agitation about high prices of oil in Assam, the Petroleum Division had only this much to say:

"As a result of discussions, the Assam Oil Company reduced the price of petrol on an ad hoc basis by 4 as. per gallon in Shillong and by 2 As. throughout the other parts of Assam with effect from 1st October, 1953".

It is true that as oil companies are constituted today, it is futile and even unfair to try to compute costs and work out profits. The allegation—that is what it is nowadays, brows are always raised when 300 per cent are mentioned—that Assam Oil Company was charging too much for petrol was really groundless. What can possibly be deduced from it? AOC is wholly owned by Burma Oil Company and the capital of the AOC is nothing but a notional figure. It could have been put down at a rupee; why 300 per cent, then the rate of profits would have worked out much higher. On the other hand, if the capital that is invested by the BOC on behalf of the Assam Oil Company in oil exploitation in Assam were to be taken as the basis for estimating profits, those on the capital actually employed would not probably have exceeded a modest 10 or 11 per cent. AOC was formed as a separate company only as a matter of convenience in the accounting of the operations of the BOC. Go a step further. Burma Shell owns half the share of the BOC. The latter again has vast investments in Anglo Iranian Oil Company and so on.

Consider against this background the proposal of forming a rupee company for exploitation of oil in Assam, as a subsidiary to one or the other of the oil companies. Shri K C Reddi was wise when he declined to state the amount of capital invested in the oil refinery at Digboi. Maulana Azad has been bolder, but one wishes he had been a little more explicit and informative.

Our Delhi Letter

Oil Makes News

OIL is in the news. This time the venue is not the Middle East, Russia or America, but Delhi. Not that oil has been struck in the capital. But the Government of India has defined its policy regarding oil. What forced the issue are the current negotiations with the Assam Oil Company. The purpose of the talks is agreement over the formation of a rupee company to explore, tap, refine and distribute oil that may be available in Assam and the extent of Government participation in the venture. While the Assam Oil Company is reported in favour of restricting the Government share to 33-1|3 per cent, as tentatively agreed upon earlier, the Government is not prepared to have anything less than controlling interests in the proposed company. At a Press conference Maulana Azad stated that the Government must have 51 per cent shares and "not a pie less" in the new company to be formed in collaboration with the Assam Oil Company.

The new-found confidence of the Government of India is the direct result of the economics of co-existence. It does not stand to reason that the Government of India has suddenly realised that oil is a wasting asset or that foreign companies exploiting oil have often worked against national interests. What was preventing the Government taking a firm stand on oil had been a sense of diffidence born of the lack of capital and technical know-how. It is out of this feeling that the Government thought it advisable, a year ago, when the idea of a joint venture for prospecting and exploiting Assam oil was first mooted, to accept a 33-1|3 per cent share.

What changed the situation were the survey report of the Russian experts and willingness of an American company outside the international oil cartel to co-operate with the Government on terms acceptable to it. The Russian experts in their preliminary report indicated that there are large reserves of oil in different parts of the country. This, together with the assurance that Russia would be prepared to provide both equipment and technicians, emboldened the Government to decide to set up a Directorate of Oil and Natural Gas for prospecting and drilling for oil under its direct supervision.

Government's preparedness to start on its own and the recent offer made by the American company in competition with the terms offered by it makes the position of the Assam Oil Company rather uncomfortable. For the breakdown of the negotiations and the failure to form the rupee company will mean that the lease of more than 500 square miles in the Nahorkatiya area granted to A O C for prospecting will revert to the Government.

In the reply to the general debate on the budget the Finance Minister preferred to dwell on the general principles involved rather than on any specific tax proposal. In this choice, he was helped by the absence of any deeply felt grievance. In truth, the budget proposals proved much less rigorous than what had been apprehended. Shri Chintaman Deshmukh seemed to consider just the demand for the prerequisites which enable one to view the budget as an instrument for the execution of the Plan. Under conditions of planned development the quantum of total expenditure and the likely sources to be tapped for the purpose are fixed for a period of five years. In these altered circumstances, the major importance of the budget lies in its relation with what has already been achieved and what still remains to be accomplished. That is why the budget should be preceded by a Progress Report on the Plan. For understanding better the economic trends that exert a strong influence on the Plan, and for judging the suitability of the corrective measures proposed in the budget, estimates of national income and expenditure are also necessary.

Wednesday, Afternoon

Shri Deshmukh has assured Parliament of both. What, however, needs to be emphasised is that to be serviceable they must be ready in time. Once the proper machinery is set up and the necessary experience gained, there is no reason why they cannot be made available before the annual budget is presented.

The Finance Minister, however, would not be hustled into committing himself to any particular course of action, in case inflationary pressures develop. The long and short of it is that he declined to heed the warnings of the pessimists. In a developing economy the correlation between money supply and prices is difficult to predict. Increase in production, extension of the monetised sector and changes in the saving habits of the people, all combine to produce a constantly shifting balance. Thus if the prices of food and cloth can be held in check, a rise in the general price index need not cause serious concern. With a glut in the international food grains market and the USA willing to sell farm surpluses on credit or for national currencies, even large-scale crop failures cannot endanger the stability of the economy. As for cloth, there is unutilised capacity that can be pressed into service at short notice. Thus a breakdown of the production programme for the handlooms and the Ambar Charkha need not cause a cloth famine.

"He who is firmly seated in authority soon learns to think security."

From the Chair

The Kohinoor Mills Company Limited

Speech of the Chairman Mr E D Sheppard

THE following is the full text of the speech delivered by the Chairman Mr E D Sheppard at the 61st Ordinary General Meeting of the Company held in Bombay on Monday the 19th March 1956.

Gentlemen,

I am happy to address you again at the close of another year of your Company's working. The year has been an eventful one and I would like to mention to you some of the more important events.

First of all, it is gratifying that there have been no major flare-ups in international affairs. Peace has been maintained throughout the year with the exception of an occasional foray in China, and periodic skirmishes on the Israel-Arab State borders. As far as the latter is concerned, although the fighting has been confined, the atmosphere in the Middle East has in recent *months become explosive and might*, if it is not brought under control, lead at some future date to a conflagration which might engulf the whole world. The United Nations are sparing no effort to bring about a peaceful solution of the problems that confront the differing parties. India, as usual, is in the forefront.

One feature which is most encouraging is the increasing number of visits that are being paid by the Heads of all countries to others. Here in India, during the course of the year, we had visits from Marshal Tito of Yugoslavia, the Egyptian Prime Minister, the Head of the Peoples Government of China, Marshal Bulganin and Mr Krushchev from Russia, H M King Saud of Saudi Arabia, and since the beginning of the year, Their Majesties the Shah and Queen of Iran. Before long we hope we may have with us the President of the United States. Our Prime Minister has himself paid visits to China, Egypt, Russia, Poland, Great Britain and Yugoslavia, and has been invited to go to the United States as the guest of President Eisenhower. In my opinion there is nothing which can be more conducive to bringing about peace and harmony in the world than such visits of leaders of nations to each other, during which they can see for themselves and understand the problems which confront each one of them and which, to some extent, govern the policy that they follow in international affairs. As in the affairs of individuals so with nations, a sympathetic understanding is an essential for the fulfilment of our aspirations for world peace and the advancement of humanity.

Very serious efforts are also being made by all the major powers to bring about the limitation of armaments and the complete banning of atomic and other weapons which, if ever utilized again, can only mean the complete destruction of man.

It is most unfortunate that it has not yet been possible for us to arrive at an understanding on outstanding differences with our closest neighbour—Pakistan. Let us hope that this will be brought about in the near future.

Power Supply

The power position, so far as we are concerned, continued to be satisfactory during the year. Tatas thermal station should be in operation about the end of this year and then there should be no danger of a further shortage of power at any rate for two or three years, or even for considerably longer if the Koyna dam scheme is completed according to schedule. The Second Five-Year Plan has now been formulated and, although very much larger than the First in its scope, it is to be hoped that it will be as successful as its predecessor. It is unfortunate that the sponsors of the Plan have 'frozen' the mill industry at its present capacity and have decided to rely on the cottage and handloom industries to produce the additional cloth which the country will require. I feel that they could, without in any way prejudicing the position of the latter, have permitted reasonable expansion in your industry to enable it to supply the potential demand for mill-made textiles in India and, at the same time, retain its markets overseas.

Mill Industry

The Mill industry has had a reasonably good year. The demand for cloth has been steady throughout the year. Earlier in the year prices of cloth, though steady, were not quite at the levels they should have reached to permit of a reasonable profit, but as the year progressed they improved somewhat. Yarn prices I am sorry to say remained very low throughout the year making this part of your Mills' business much less remunerative. This is the reason why your Mills have not shown the improvement in the profits one would have expected because of the good offtake and higher prices of cloth. It must be borne in mind always that, although your Mill has 1,20,000 spindles, half this number is working continuously on the making of yarns and sewing threads for which a special plant has been installed. In view of this 'dual personality' of your Mill, there may be times when as compared to balanced spinning and weaving mills *the profits may not seem very large*, but there have been times in the past and they will surely come again in the future when with a rise in the prices of yarn and sewing thread your Mill will be in a position to show better progress than others.

Tax Burden

The Budget proposals as announced on the 29th of last month provide for the enhancement of the Excise Duty by 6 pies per square yard on all categories of cloth. This will mean that your Company will have to pay Rs 9 lakhs more to Government under this head. It remains to be seen how much of this it will be possible to pass on to the consumer. The proposed penal tax on Dividends declared at a rate of more than 6 per cent on the paid-up capital will cost your Company Rs 2 lakhs per annum if it reaches the Statute Book in its present form —asuming that the present rate of Dividend distribution remains unaltered. This proposed tax operates most unfairly against companies such as yours which have prudently accumulated substantial reserves from the taxed profits of past years. Just as disturbing, to my mind, as the actual tax itself is the manifestation of the fact that the "6 per cent mentality" persists in New

Delhi. In conditions as they exist to-day—for example, the Bank Rate in the U K is now 5½ per cent—it does not seem reasonable that Risk Capital should only be allowed a return of 6 per cent without a heavy penal tax, and particularly at a time when it is hoped to attract such capital to enter this country.

As regards the Government's policy on personal taxation, I gave you my views on this last year and also reviewed the matter at some length in my address to the shareholders of your Agency Company. I do not propose to indulge in repetition and would only say that my views are unchanged. There is a saying in England that "all work and no play makes Jack a dull boy". It remains to be seen what effect the Government's present policy of "all work and no pay" will have in this country.

Cotton Trade

Trading in Indian cotton remained free of all restrictions during the whole year as, on account of ample availability, there was no reason for Government to reimpose the quota system. Prices of cotton remained steady throughout the year but weakened with the approach of the new season because of reports that the crop would be 55 lakhs of bales. This position was, however, short-lived as unseasonal rains caused damage to several of the growths and prices started to rise. Towards the close of the year there had been a very large appreciation and the forward market which had been moving around the 600 mark went up to 740. At this point Government decided to step in and take a hand. The contract was frozen at 700 and futures trading came to a stop. However, in the spot market prices continued to rise and some of the growths very nearly reached the ceilings fixed by Government. The position remains the same to the present time and it would seem that because of the statistical position there is little chance of any appreciable recession.

Foreign cotton prices remained reasonably steady for most of the year but during the last quarter there was a definite upward tendency. Alexandria particularly recorded a steep rise. African and American growths remained fairly steady, but because of a recent announcement by America of the impending release of further large quantities of loan cotton at competitive prices, these have tended to weaken.

Accounts

I will now turn to the report and accounts. The amount of Rs 8.50 lakhs provided for taxation is made up of Rs 5.01 lakhs for income-tax, Rs 2.97 lakhs for Corporation tax and Rs 0.52 lakhs extra for contingencies.

To meet the statutory depreciation of Rs 17,62,477 and to set off the initial depreciation of Rs 3,70,175 allowed in previous years, your Directors have set aside a sum of Rs 6.33 lakhs from the profits of the year and have appropriated a sum of Rs 15 lakhs from the Machinery Reserve Account. A sum of Rs 3 lakhs has been appropriated from the profits of the year to the Development Reserve, being the amount of benefit derived from the Development Rebate. A sum of Rs 1.50 lakhs has been put to the Employees' Pension & Gratuity Fund bringing this to Rs 12.50 lakhs which represents a full provision for present liabilities under this head.

In view of the Millowners' Association's Bonus Pact with the Rashtriya Mill Mazdoor Sangh on the lines of the Ahmedabad Millowners' Association's agreement, it is calculated that your Company will be required to pay 3 months basic pay as bonus for all the three years 1953, 1954 and 1955. It became, therefore, necessary to provide in the accounts of the year 1955, Rs 4.43 lakhs in respect of 1954 in addition to Rs 16.57 lakhs for the current year.

The insurance value of your Mills' property and stocks on the basis of their reinstatement value now stands at Rs 10.51 crores which is higher by Rs 36 lacs. This is due to an increase in machinery valuation by about Rs 25 lacs and to higher stocks of cotton.

Strong Position

The Balance Sheet figures show that your Company continues to be in a strong position as the current assets at Rs 2.88 crores exceed the current liabilities and provisions by Rs 1.45 crores. Secured loan of Rs. 38.84 lacs is lower by Rs 2.52 lacs. The liability for expenses is down by Rs. 6.63 lacs as no provision for arrears of D. A. was necessary this year. The liability for Other Finance is up by Rs. 11.27 lacs due to carry-over to the current year of the bonus unpaid for the previous year.

On the assets side of the Balance Sheet the value of stocks of cotton and staple fibre is higher by Rs. 15.66 lacs mainly due to the increase in the stock of cotton. Art silk and other yarns are up by Rs. 2.40 lacs due to increase in the stock of art silk yarn. The stock of cloth, yarn and waste, is lower by Rs. 3.66 lacs due to good deliveries during the concluding period of the year. The stocks of stores, fuel and grain are lower by Rs. 2.36 lacs. Book debts at Rs 3.88 lacs are up by Rs. 2.46 lacs due to bills for cloth, yarn and cotton being outstanding at the close of the year. Advances at Rs. 10.27 lacs are lower by Rs. 10.66 lacs mainly due to cotton advances being down. Taxation under Advances is down by Rs. 1.39 lacs due to adjustments in the advance tax payments.

Profit and Loss

Now I will give you some salient features of the Profit & Loss Account.

Cotton and fibre consumption is down by Rs. 13.37 lacs due to the consumption of a larger proportion of cheaper cotton. Muccadumage is up by Rs. 0.80 lacs due to the increase in the muccadumage rate and also in the quantity of cotton received. Yarn and cloth commissions are slightly down due to the lower yarn and cloth values. The stores consumption, etc. is practically the same. Electric power is higher by Rs. 0.32 lacs due to increased consumption of energy. Salaries and wages are up by Rs. 9.99 lacs due to the adjustment in the quantum of bonus as already explained. Dearness allowance is down by Rs. 11.89 lacs compared to the previous year when Rs. 13.98 lacs including arrears were paid according to a Court Award. Rents and taxes are up by Rs. 0.47 lacs due to the increase in water rate by 2 annas per 1000 gallons. Although stocks were higher, insurance is down on balance by Rs. 1.18 lacs as the Company's contribution to the Employees' State Insurance amounting to Rs. 1.89 lacs has been debited to Salaries and Wages this year as this item has been considered as a part of wages being the compulsory contribution to the Government Fund. Interest is higher by Rs. 0.68 lacs due to

larger purchases of cotton. General charges are up by Rs. 0.58 lacs on account of the Indian Industries Fair, Delhi, where your Company's products were exhibited. Trade subscriptions are down by Rs. 1.98 lacs, as a sum of Rs. 2 lacs was paid as the Company's contribution to the Bombay Textile Research Association Fund in the previous year. Donations are up by Rs. 0.15 lacs due to a contribution to the Prime Minister's Relief Fund for flood-stricken areas in Bihar, Orissa and the Punjab.

On the credit side of the Profit and Loss Account, the sales of cloth, yarn and waste show a decrease of Rs. 9.89 lacs mainly due to the production of a large proportion of the cheaper qualities. Yarn and cloth expenses are lower by Rs. 0.39 lacs in consequence. Miscellaneous receipts are up by Rs. 0.22 lacs due to a refund of excise duty.

Selling Agents

You will have seen from the notice that we have for confirmation by you at this meeting the renewal of the agreements of both our cloth and yarn selling agents. Messrs V S Apte & Son and Messrs Nahalchand Laloochand Ltd., have been your selling agents for 44 and 29 years respectively, and I can say without any hesitation that they have served your Company exceedingly well throughout this period. In keeping with the times they have agreed to reduce their commissions and from the 1st of April they will both be receiving about 25% less than hitherto. Our association with them has always been a very pleasant one, and I am confident that it will continue for many years to come.

The Future

You will expect me to say something about the future. As far as your Company is concerned, it has practically completed a comprehensive programme of expansion and rehabilitation in the last ten years and a pause must now be made to consolidate the position it has attained. The outlook for cloth continues to be good and the yarn market is showing signs of improvement. We are now uptodate with our bonus provision and the current year's accounts will not have to bear any additional burden in this regard as was the case in 1954 and 1955. Further your selling agents have agreed to a substantial reduction in their commissions. Against this, the year has got off to a bad start due to the disturbances in the city in the latter part of January, when several working days were lost and the Bombay Cost of Living Index figure has not come down as much as was hoped. I must leave you to draw your own conclusions.

The Alkali & Chemical Corporation of India Ltd

Speech of the Chairman Mr N. D Harris

PRESIDING at the 19th Ordinary General Meeting of the Members of the Alkali & Chemical Corporation of India Limited held at the registered office of the Company, 34 Chowringhee, Calcutta on Wednesday the 7th March 1956, the Chairman said:

Gentlemen,

The Audited Accounts and Directors' Report for the year ended 30th September, 1955, have been in your hands for some time and with your permission I propose to take them as read.

Your Company has had another successful year in which production and sales of all its products have been considerably greater than in previous years.

Production of Chlorine and Caustic Soda was higher than during the previous year. Caustic Soda sales improved but there was very severe competition in Liquid Chlorine. We were able to sell the entire amount produced but only at a considerably reduced price. An interesting factor and one of deliberate policy has been the growth in the quantity of Chlorine consumed internally for the manufacture of other profitable products. Investigations in this direction continue with vigour.

Gratifying Increase

Sales of Hydrochloric Acid and of Zinc Chloride, the latter a relative newcomer to our range, showed similar gratifying increases. In spite of very great competition from other manufacturers' products the demand for our well known range of "Gammexane" B. H. C. formulations has been difficult to satisfy. To meet this your Company installed greater formulating capacity during the year and sanctioned extensions, now being constructed, to the plant making Benzene Hexachloride (B.H.C.), the basic product.

Our "Dulux" and "Duco" range of paints and allied products continue to be very popular indeed and we have been unable to meet the full demand for them. Your Directors have great confidence that the need for these high quality products will continue to grow as India develops industrially, and because of this they decided last year to double the factory's capacity. These considerable extensions are now well in hand. An important new introduction is the range of metal-pretreatment products which, under the name "A. C. P.", have already proved popular.

I wish to mention here the introduction after the last Budget of an excise duty on Paints. This sudden imposition on a range of manufactures very different from previously excisable products caused great dislocation to ourselves and to all others in the paint trade.

Cordial Relations

Relations between the Company and its employees continued to be most cordial and the Works Committee set up at Rishra five years ago again proved its value by acting as a friendly and effective link between the management and the workers. I wish to express the thanks of the Company to all our staff and workers whose loyalty and hard work helped so much in achieving the year's good results.

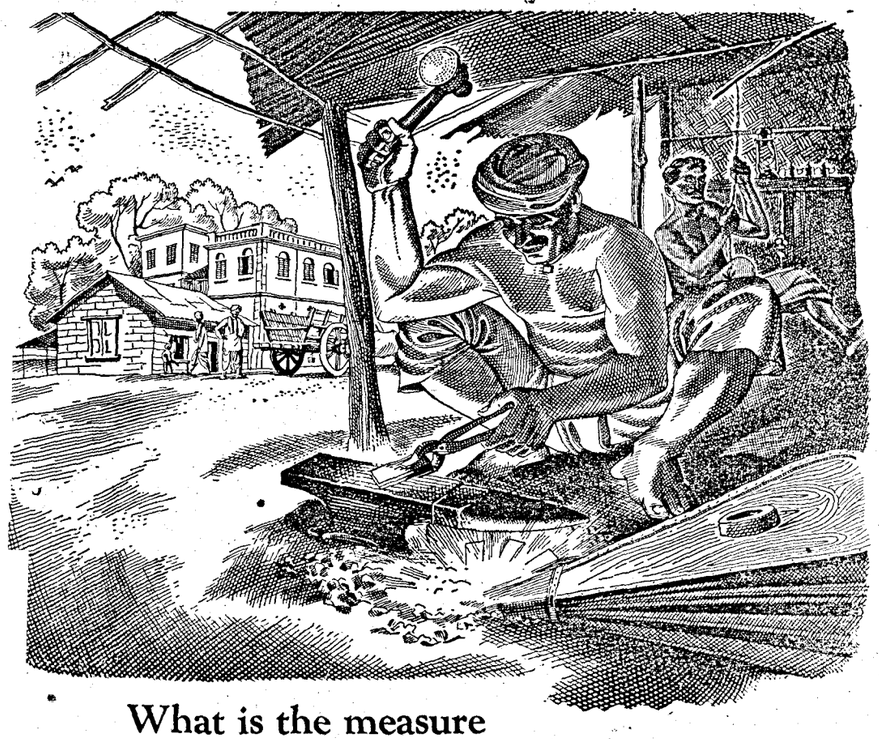
I have talked primarily about what we have produced. Products do not of course sell themselves and I would like to pay a tribute to the Technical and Sales Staff of our Selling Agents, Imperial Chemical Industries (India) Ltd. They have made a remarkably fine effort in finding new markets and uses for our products. This applies in particular to our paints and "Gammexane" products. I ascribe our success in this direction during the last year very largely to their careful planning and hard work.

The nett profit for the year, after providing for depreciation, amounts to Rs. 19,39,845|-. This is more than twice that of the previous year. The sum available for distribution is Rs. 22,93,168|- which includes a balance of Rs. 1,13,627|- brought forward, and a reserve for exchange losses previously held but now no longer required.

Once again there is no liability to taxation for the year due to initial allowances on the new plant installed, but a sum of Rs. 12,50,000|- has been transferred to Reserve for Deferred Income Tax Liabilities. This brings this Reserve to Rs. 23,21,000|- which equals the total tax, payment of which has been deferred by the operation of initial allowances. A sum of Rs. 2,73,000|- has been transferred to Dividend Equalisation Reserve. The dividends on the Preference Shares for the year absorbed Rs. 1,55,000|- and your Directors recommend the payment of a dividend of 8% on the Ordinary Shares, 2% higher than that for last year. If you agree to this, a balance of Rs. 1,19,168|- will be left to carry forward.

You will be pleased to hear that we hope shortly to receive Government's approval to a project to manufacture polythene in India. Imperial Chemical Industries Limited, your technical advisers, have agreed to supply their process and continuing "know-how" on very favourable terms. Polythene was discovered by I. C. I. Ltd., who now manufacture large quantities in the U. K. and have licensed its manufacture in several other countries. The production, actual and projected, and consumption of polythene throughout the world have during recent years increased to a remarkable extent, and give every indication of continuing to do so.

Much in Use



The process will be that used by I. C. I. in the manufacture of the well-known "Alkathene" brand of polythene. The use of "Alkathene" in India has been developed by I. C. I. (India) Ltd. who have operated a plant at Calcutta for the manufacture of film from imported granules since 1953. Polythene is a tough, flexible, thermoplastic material with outstanding electrical insulating properties. Many thousands of tons are used every year throughout the world in the manufacture of packaging film, flexible pipes, submarine telephone cables, radar equipment and moulded domestic articles, to mention only some of the major uses. The largest single use of polythene in India will probably continue to be for packaging purposes, both as film and as coating on paper and jute.

The project will involve a total investment of about Rs. 3 crores for which additional capital will have to be found. Methods of raising this are being studied by your Board at the moment, but I wish to take this

opportunity of telling you that it will take two to three years at least to bring the plant into economic production. Although the project should ultimately prove profitable, capital invested during the construction period will earn no return and it may, therefore, be difficult for your Company to maintain the higher rate of dividend declared on the Ordinary Shares this year.

The Directors retiring by rotation are Mr. B. R. Goodfellow, Mr. K. W. Young and Dr. E. C. Fairhead and my colleagues and I have pleasure in recommending their re-election.

The Auditors, Messrs. Lovelock & Lewes, also retire and you are requested to re-appoint them for the current year. They have however asked for an increased fee of Rs. 7,500|- as against Rs. 6,000|- sanctioned for the previous year. As you are aware the new Companies Act, which will come into force on the 1st April this year, imposes certain additional duties on Auditors for which we must necessarily pay. In my opinion the increased fee is justified and I recommend its acceptance.

What is the measure of an Industry's importance ?

If a bicycle, a sewing machine, or even a hurricane lantern were shown along with a steel ingot to the man-in-the-street, he would not take a second look at the ingot. Yet, in machines, factories and buildings...in the making of the hundred things we use every day...Steel is indispensable.

Started less than fifty years ago, India's Steel Industry is to-day a vital factor in the nation's economy. It produces nearly 1.75 million ingot tons of steel at a cost that no country can equal, of which Tata steel accounts for over one million tons. Tatas plan to produce 2 million ingot tons early in the second Five-Year Plan period.

Private enterprise serves the Nation

Farmers' Union Protest Price Guarantee Inadequate

THIS is the first time that British farmers have not agreed to the annual review of farm prices under which the Government provides subsidies or guarantees to farmers as required under the 1947 Agricultural Act. Farmers have expressed their concern both about the inadequacy of the new guarantees as well as the agricultural commodities to which they apply. Guarantees for the year 1956-57 are now increased by about £25 million.

The subsidisation of British agriculture originated primarily from the problems of the war and early post-war years. During the war the main task of all farmers was to maintain and increase the supply of milk, despite drastic cuts of imports of feeding stuffs and, at the same time, to devote more land to the production of crops for direct human consumption (instead of to permanent pasture), so as to ensure the provision of an adequate diet to the population in the face of diminishing food imports. Both these obligations remained long after 1945. Throughout the post-war years, there was a continual call from the Government for maximum agricultural expansion within, of course, the limits set by the feeding stuffs situation. It was only in 1947 that the nature of this expansion was given serious consideration. It was then believed that the expansion should be consistent with the need to conserve the fertility of the soil and it was, therefore, with this consideration in mind that after some six years of intensive crop farming, expansion was directed towards livestock farming. It became the Government's declared policy to switch from crops for direct human consumption to livestock and fodder crops as soon as possible. This change was urged not only by such factors as the irregular supply of Argentine meat, but more by the revival of European agriculture and the availability, through imports, of a number of food crops for British consumption. In any event the Government then believed that the soil and climate of Britain was for the most part best suited to a mixed system of farming, with grass playing an important part in crop rotation. Simultaneously, the new direction in which expansion was being encouraged implied that there would be a higher standard of self-sufficiency, not only in livestock production, but in the supply of feeding stuffs.

Against this background was passed the Agriculture Act of 1947 which is likely to prove one of the more important landmarks in the history of British agriculture. The Act was in two parts; the first was concerned with guaranteed prices and assured markets and the second with what was termed "good estate management and good husbandry". This presented, what the Government then called, the "twin pillars on which agricultural policy rests". At the same time it was the Government's belief that such a policy would secure "stability and efficiency". Under this Act, the prices system which had taken shape during the war was permanently established. Further, the prescription of standards of good estate management and good husbandry enabled the Government to place under supervision or to direct and further, if necessary, to dispose of the land of such landowners and farmers as had not complied or did not comply with such standards. The price review system which is the particular matter for review here has been used to ensure that given normal weather conditions, the net receipts of farmers in the aggregate will approximate to a figure already determined. At the same time, by means of differential price incentives, the price review system had the purpose of bringing the pattern of agricultural production into conformity with the Government's plan for total food supplies. Provision was also made for special reviews apart from the annual reviews in the event of sudden or substantial rises in the cost of agricultural production. It was not a "cost-plus" system. There was no guarantee against loss on individual farms, even if all the rules of good husbandry had been scrupulously followed.

With the passing of the 1947 Agricultural Act and its pertinent price review provisions, the agreed prices have invariably been more than adequate to cover the working expenses of a reasonably efficient agricultural producer. The Government has always believed, it appears, that for the enforcement of its expansion programme, it would be necessary for farmers to earn enough, not only to cover running expenses, but also to finance new investments on the scale which the programme required. Prices were therefore fixed at levels which were calculated to inject into the industry a sum ranging between £40 million to £60 million a year for this purpose.

This price review system has been attacked vigorously and by various quarters. The **Economist**, for example, has condemned it as "feather bedding". Indeed, a Government Minister resigned in 1950 in view of his opposition to the burden of agricultural subsidies on the Exchequer. In fact, many free traders, particularly in the now more normal conditions of international trade, oppose the subsidisation of an industry which can find little or no justification for its place in the economy. The highly questionable increase in the tariff on Danish imported bacon to protect British pig farmers had recently raised a storm of protest but this protest has largely been a consumer protest—a protest against the consequent rise in the cost of living.

Under the Present Price review, the Minister of Agriculture has outlined the main directions in which the Government would wish to see Production develop. These are: maintenance of a large arable area; increase in the production of beef, mutton and lamb; more of the milk output from home-grown feed; and the reduction of the costs of pig production (why then the new 10 per cent ad valorem tariff?). The new price guarantees are calculated accordingly. There is now a decline in the price guarantees for wheat and rye and an increase in those for barley-oats, potatoes and sugar beet.

Agricultural output is now estimated to have risen from 51 per cent above pre-war last year to 55 per cent above pre-war in 1955-56. The volume of net output is now back to the 1953-54 level which was the highest previously recorded. The increases in output are mainly in respect of record yields for cereal crops and a continued rise in the output of milk and eggs. The net income from agriculture in 1955-56 is forecast at £299.5 millions compared to £285.5 million

in 1954-55.

This apparently prosperous state of British agriculture is now disturbed by the powerful National Farmers' Union which contends that production costs alone have risen by £37 million between 1954-55 and 1955-56 and the increase in price guarantees does not compensate these cost increases. The Union claims that to enable the industry to equip itself for an even greater contribution towards closing the trade gap, the subsidies this year should have been higher in view of the steady decline of income of the past three years.

The Times has described the Government Policy as being in the "right direction". The gradual shift in emphasis away from production of commodities more cheaply available from abroad (cereals and pig-meat) presents the correct step—it attempts a more national and efficient distribution of resources, and here only the British farmers will object. But they are powerful. This first occasion for opposition against the Government's policy is possibly one indication that the honeymoon period of union between the authorities and the farming community is over.

Company Notes

BENGAL PAPER

PAPER shares have been moving up for the past two years. Improvement is due to the growing demand for paper: Investors are agreed that, as population and literacy grow, paper shares should move up. This is the main reason behind the continued spurt in paper shares. But the rise has been helped by other market factors. Some paper-manufacturing companies have expanded output capacity. Some others have been subject to cornering attempts.

For some months now, there has been interested buying of the shares of Bengal Paper for cornering these shares. Balmer Lawrie are the managing agents of Bengal Paper. An extraordinary general meeting of the shareholders will be held on March 29, 1956 to consider the question of renewal of managing agency of Balmer Lawrie for ten years. By January 15, 1957, the present managing agency agreement will expire.

In a circular letter to shareholders, the directors suggest plans to expand the output capacity of Bengal Paper. With the implementation of the proposed expansion plan, it will be possible for the company to earn more profits as well as to face competition more effectively. There is considerable shortage of raw materials for the manufacture of paper. It is disclosed by the directors that they are exploring the possibilities of establishing a bamboo pulp mill in a suitable area. As the cost of this mill will be very high, the company is negotiating with another party to secure the needed finance. But the directors inform the shareholders that renewal of the managing agency is necessary before the negotiations relating to the proposed bamboo pulp plant can proceed smoothly. Shri N G Maniar, who describes himself as Secretary of the Committee of Shareholders of Bengal Paper, has issued a circular opposing the renewal of the managing agency. His complaint about the inefficiency of the managing agents has provoked the latter to issue a circular to shareholders in which his charges are refuted.

BRITISH INDIA CORPORATION

DURING the year to December last, Shri Haridas Mundhra, a Calcutta industrialist, acquired sufficient shares of BIC to control majority votes. In their report, the directors say that he is lending every support to them and management "in their endeavours to ameliorate conditions". In explaining the poor working results, the directors argue that excise duties and the heavy cost of employing or discharging labour have created difficulties. There was a strike in the Kanpur textile mills for three months. Punjab floods dislocated dispatches of products of Egerton Woollen mills. Excise duties acted as "a direct tax on the producer".

Though the dividend has been passed, the directors report that every effort is being made to reduce costs and to expand the earning capacity of the company. Shareholders will welcome the assurance that capital expansion projects are being undertaken according to schedule.

Employment and The Plan

Joan Robinson

OVER the doorway was written: BE BOLD, BE BOLD, BE NOT TOO BOLD. An outside observer cannot but sympathise with the perplexity of the planners who have to decide how bold is bold enough. Mere prudence is no safeguard, for an inadequate amount of development which would allow unemployment and misery to go on increasing with the growth of population holds dangers which, from a long run point of view, are even more menacing than the dangers involved in a breakdown of over-ambitious schemes.

So far as employment is concerned the Draft Outline of the Second Five Year Plan is somewhat pessimistic. It is calculated that it would be necessary to create 15 million new "jobs or job-opportunities" in order to eradicate unemployment during the plan period (Draft Outline, p. 42) while the employment likely to be generated by the plan is estimated as 8 million. The hope of improved productivity in agriculture is left to look after the rest.

End or Means?

The provision of employment is regarded as one of the main objectives of the plan. From one point of view this is obviously correct. But it is a serious error to regard opportunities for employment as a benefit which a humanitarian government offers to its citizens, comparable, say, to old-age pensions. Rather it is idle man-power which offers to the government the opportunity to increase production. The relevant question to ask is not "How much employment can we create?" but "what is preventing us from using all our existing resources?" Setting the question that way round does not make it any easier to answer, but it makes what answers can be found a great deal more cogent, for when we find what the limiting factors are, we can set about planning to widen the limits.

Think of a Number

The basis of the calculation of jobs to be created is left, perhaps deliberately, very vague in the **Draft Outline.** First of all, we are not told to what period the figures apply. Do the figures given (p. 43) refer to the rate at which employment is expected to be running in the fifth year, to an average over the period or to the level of employment continuously maintained over the whole period? The quantitative difference between these interpretations is quite large.

The authors of the outline cannot have overlooked this point, but perhaps they prefer to leave it hazy because at best their estimates must be very sketchy and they wisely refrain from giving them a false appearance of precision.

Furthermore the Outline does not distinguish between what is sometimes called "revolving" employment on schemes of investment and the "sediment" of permanent employment that a completed scheme leaves behind it. The point can be seen very simply in the case of irrigation projects. For, say, two years some lakhs of men are occupied in digging canals. When these canals are dug, the labour force becomes available for some other project, and will relapse into unemployment if no new project has been prepared. But the first two years of work has left a "sediment" of cultivable land which will provide a livelihood for some thousands of families, who can then be subtracted from the reserves of the underemployed. There is a hint in the Outline that the sediment so far achieved is regarded as negligible, for it is argued (p. 44) that the increment of direct employment is not likely to be greater under the second five year plan than under the first, although the expenditure on development is to be twice as great. This means that the whole of the direct employment under the first plan was "revolving" and that merely to maintain it requires an equal expenditure. Is not this too pessimistic? There must surely have been a considerable "sediment" which can be credited to the outlays already made.

The Limiting Factors

However that may be, there is certainly man-power available beyond the amount that it is planned to use. What is the limiting factor? The question is not, why is there unemployment to-day? That question is quickly answered—schemes to employ man power have not yet been conceived, organised and got under way. The question is, what limits the amount of employment that should be planned? How can it be "too bold" to employ all the man power there is?

One answer might be that employment is uneconomic in an absolute sense. Under private enterprise it is uneconomic to employ a man when the surplus of his product over his wages is insufficient to yield a profit on the investment required to employ him. But to say that employment is uneconomic absolutely means much more than this. A man who exists is eating something, but so long as he is idle he eats little, and with any luck he will soon die and cease to be a problem. If he is to work he must eat more and there is nothing he can do which will contribute to production the equivalent of his additional consumption. It is hardly likely that the planners are taking this view.

What then is it that keeps down the level of employment to be aimed at? Obviously there is a strict limit to the amount of employment that can be organised which involves the use of imported machinery, which involves techniques that have not yet been mastered, which involves operating on materials that are not available. Is it the limiting factor that no kinds of activity have been found that do not require such scarce resources? If this is the right answer, the way to look for a remedy is to think of something to do; but it is hard to believe that there is not already an enormous field (irrigation, land reclamation, road making, building with local materials) where almost unassisted man-power can create wealth.

Fear of Inflation

If so, the limiting factor must lie in the supplies required to support labour working on such schemes. It is this limit that seems to govern the thinking of the planners, under the guise of fear of inflation. When armies of workers are being employed to produce wealth that will bear fruit only in the future, they have to be fed meanwhile. They must be paid wages, and their purchasing power competes with that of workers already employed for the stream of goods already being produced. If the flow cannot be augmented correspondingly, prices rise. The workers already employed have a grievance or are actually pushed below the minimum of subsistence, and their wage rates in terms of money have to be raised. So inflation takes hold. At the same time, those who

are benefiting from the higher prices are likely to be consuming more—of their own products in the case of food and of other people's in the case of *manufactures*—so that the very process of trying to provide for the newly employed workers makes it harder to provide for them.

This is the essence of the problem of inflation as a limit to development. The authors of the plan have gone some way to freeing themselves from the usual rigmarole about "deficit finance" but they have not yet gone so far as to set out any kind of estimate of the balance between demand and supply such as would make it possible to judge (or should we say guess?) how much additional manpower could be used without throwing an intolerable burden on those (particularly the urban workers) who are already in work, or what steps would be necessary to restrain consumption (or undesirable types of investment) out of inflationary profits.

Cottage Industry

The other great field for expanding employment is in small-scale industry. Here again the emphasis is wrongly placed if we think of "offering jobs" as the main objective. To favour the cottage industries because they are "labour intensive" comes perilously close to regarding inefficiency as a positive virtue. The point is that they offer scope for making labour productive without impinging upon scarce resources (true, they need organising power and public spirit to help them to get going—but of these there are potential reserves enough if the way could be found to tap them).

Here the problem of inflation does not arise, for the small scale producers cannot consume more than the equivalent of their own sales. In so far as they consume less (for instance, by using part of their proceeds to pay off debt) they are helping to damp inflation by putting more into the stream of consumable goods than they take out of it. But even if they consume the whole, they are at least not reducing any one else's consumption. It would certainly be better if workers could be provided with more capital equipment, made more productive and helped to yield a larger surplus to contribute to investment, but so long as capital is scarce only a very small part of the labour force can be equipped for high productivity, and meanwhile any production is so much to the good.

There is one policy which seems so obviously required, so generally beneficial and so little damaging to any respectable vested interest that a foreign observer can only wonder what hidden snag prevents it from being adopted—that is, stock-piling of food stuffs and locally produced materials. The advantage of having stocks so as to be able to meet a harvest failure without having to use precious foreign exchange is obvious enough. It is hardly less important to be able to take up the excess of good years. Nothing is more demoralising to the effort to increase production than to find supply out-stripping demand, leading to falling prices and repeating the all too familiar tale of the farmer who hanged himself in the expectation of plenty.

Moreover, stocks once built up would provide an invaluable buffer to keep the plan from running into disaster. Over-bold use of manpower would show itself in the first instance not in rising prices but in running down of stocks, and this would provide a breathing space (either to step up production by quick-yielding minor development schemes or, if that is impossible, to slacken demand by reducing employment) before inflation became dangerous. It would have been better if this had been done already. But that applies to everything. What prevents it from being started now?

West Bengal—Bihar Merger

Hallahal follows Amrit!

(Contributed)

APART from yielding an ideological dividend in reversing the trend towards linguistic destruction of the nation, the proposal for the merger of Bengal and Bihar hailed so recently as constituting a new dawn of hope does not seem at first sight to have any particularly attractive features, and has been so assessed by the general public at least in Bengal. The widespread, if partial, acceptance of this idea e.g. by Punjab, Andhra etc. seems however to indicate that the above appraisal is somewhat unfair. The multi-purpose development of any region often requires one to transcend political frontiers, and when the regions are constituted like West Bengal and Bihar this necessity becomes the more compulsive. As the slope of the country is from West to East, the rivers flow in that direction, so that while development projects can be sited only in Bihar much of the benefits e.g. those arising from flood control or irrigation can accrue only to West Bengal; even the demand for electricity at present arises largely in the latter area. Each State if separate can "beggar" its neighbour but only at the cost of beggaring itself. Joint projects, e.g. the D V C, function inefficiently due to the strains and stresses of compromise working, and individual works e.g. The Mayurakshi Project, which depended on the good-will of one party, left the other in the position of a suittor with its attendant bitterness and frustration, while Bihar in this instance felt it was being imposed upon in providing sites for schemes which were not of the slightest interest to her.

In the particular problem of West Bengal-Bihar there are two or three other features which impose union as the only solution. Thus the vast Gondwana mineral tract extends through the hearts of both States, and communications, labour administration, taxation policies, industrial operations, etc. have to be integrated for maximum efficiency. It will be recalled that some time ago there was a proposal for a centrally administered State for this area and the arguments in its favour should not be forgotten. In addition there is the problem of inter-State migration. Apart from those in the predominantly Bengali speaking border areas, there are thousands of Bengalis who have gone to Bihar in professions or services, while there are nearly a million Biharis in West Bengal working in the mills and factories. At present there is admittedly little tendency to discriminate against these migrants in either State, but if bitterness is allowed to grow unchecked till it ends in physical conflict, economic life could be paralysed, and much misery brought to thousands of innocent people. The Border difficulties, with inextricably mixed peoples and enclaves of linguistic groups, also impose union rather than separation.

Political Difficulties

Naturally merger will not be easy. A Purva Pradesh including these States as well as Orissa and Assam if formed might have been more attractive, as no particular group could be predominant, but in its absence, two serious difficulties from the point of view of the Bengalis emerge:

(a) The fear of being swamped by the Hindi speaking majority of Bihar.

(b) The fact that the Revenue per capita in West Bengal is double that of Bihar, so Union presupposes a subvention to the latter.

The average Bihari I think tends to fear that he will be swamped in the services and professions by the more educated Bengali, in spite of Dr Sri Krishna Sinha's assurance that he was prepared to hand over the four crores of Biharis into the great and able hands of Dr B. C. Roy without any safeguard. In addition, the main problem of Bihar being casteism, free influx of Bengalis might merely result in the establishment of yet one more clamouring group accentuating rather than reducing the problem. The apprehension of a subordinate alliance as in the pre-1911 days must have been dispelled by the fact of the Bihari majority.

The above recital shows the inescapability of some sort of safeguards. The mere creation of two Regional Councils of Bengal and Bihar within the Union with their own Budgets and Administrations will be fruitless, as it might merely create two conflicting groups with no union worth the name. It would, in my opinion, be preferable to divide them into 5 or 6 regions, some of which at least would include areas from both States so that facing common and similar local problems a sense of purpose and joint endeavour could arise. Thus the North Bihar and North Bengal areas have very similar terrain and similar difficulties, while even the Maithili dialect of North Bihar is similar to that of Bengali. Union should certainly confer unity on this area. Central Bihar and Jharkhand would have to be separate and individual States. In the same way we could have two Bengali States of say Calcutta and West Bengal, while a sixth comprising the industrial area from Jamshedpur to Durgapur could be a joint Bengali-Bihari one, like the first.

In this way there would be four sub-States which would be purely mono-linguistic and two which would be bilingual. The population of Bihar is certainly of the order of 40 millions and that of Bengal only 26, but as has been shown in a recent pamphlet, with the expected influx of Hindus from East Pakistan, and allowing for the Bengali population now living in Bihar, it is probable that the disparity will be greatly reduced. If these sub-States are so formed as to have approximately equal population (of say 10 to 15 millions) one could have a Union Legislature with equal numbers of representatives from each which it might be hoped would tend to lessen the Bengali-Bihari difficulties. If this is not wholly agreed to, the States should have a Bicameral Legislature, in the Upper House of which at least, the number should be equalized. Any proposals which affect Bengalis or Biharis as a whole should be debated by the Upper House only: a procedure for demarcating such

problems would also have to be agreed upon.

Regarding the financial problem one can imagine that apart from Calcutta City, the revenue arising in the rest of West Bengal must be more or less at the Bihar level. If so one could easily have a financial arrangement by which a subvention from State revenues would be given by Calcutta State to those carved out of the former West Bengal areas only, while Central finances could be similarly distributed on the basis of the actual expenditure in different areas at present. While this will certainly require analysis and study of facts the difficulties are by no means insuperable.

The Bihari's fear of being swamped in the services can be stilled by having a certain quota of local recruitment, and certain local services. As a **quid pro quo** for the immense numbers of wage-earners in West Bengal some concessions might be necessary from Bihar, but with the spread of education there it is doubtful whether their fears really have any justification.

Certain statutory standing bodies, e.g. a Development Corporation for the Union as a whole, will have to be established. Thus it has been said that the allocations for the Second Five-Year Plan, as already made, will stand. This seems short-sighted; not only might the merger impose its own planning, but the third and the fourth Plans are yet unborn and linguistic patriotism must be guarded against even in those stages. If a Committee composed of say one representative of each State is formed, such difficulties will be probably minimized.

A three-tier State with numerous petty administrations might be considered both cumbrous and uneconomic, but actually constitutes the simplest and most practical solution of our difficulties. Thus as the disputed areas will be mainly within the joint sub-States of Mithila or Industralia, a decision on these can be avoided. The financial problem is also solved as indicated earlier. Smaller groups e.g. the Tribes of Jharkhand can get an opportunity of ordering their own lives, while the splitting of Bengal and Bihar will inhibit any over-shadowing cultural conflicts.

The subjects to be assigned, and the revenues to be controlled at each level will require detailed consideration, but clearly items like Local Administration, Health, Education, Police etc. must be with the new sub-States. The Union should be chiefly concerned with development programmes, refugee rehabilitation, communications, etc. and will largely have to depend upon grants from the Centre and subventions from the sub-States, though certain heads of revenue e.g. Land Revenue, Forests, Stamps and Registration etc., in which by themselves the revenues arising in West Bengal and Bihar are approximately equal, might be assigned to it as well.

Economic and Cultural Conditions

It has been urged that with the Bengalis constituting a minority there is a danger of Bengali culture dying out. This merely shows a lack of vitality and self-confidence; Polish literature and culture survived centuries of partition and foreign rule. Moreover safeguards can be provided for this as well. Thus we can attempt to teach both languages in our schools; all children whose mother tongue was Bengali to learn as a second language, either Maithili or Hindi, at their preference, and vice versa, for say at least the first six years in school. Education should be imparted in the language prevalent in the locality though of course denominational schools would be permitted but only under well recognised conditions. Three court languages viz., Hindi, Maithili and Bengali would also have to be recognised, and the local languages permitted in all matters in which regional languages are now used. In competitions for State services a certain minimum quota from each State could also be laid down, though of course a fair proportion should be filled by open competition.

With these safeguards one can well imagine that the Bengali culture will be enriched with the interaction of Hindi far from being impoverished. The latter which has borrowed much of Bengali even in the past should gain immeasurably with its universalisation.

A more important difficulty is the economic one. Agricultural wages are considerably lower in Bihar, Orissa and U. P. than in West Bengal, so the mills and factories of Calcutta are manned from these areas only, and the pressure is sufficient to lower the industrial wage level there. The differential between local agricultural and industrial wage rates is too small to persuade the Bengali agriculturist to leave his fields for the factory, as will be seen from the table below. (Taken from "The Ministry of Labour Agricultural Labour Enquiry Report on Intensive Survey of Agricultural Labour").

The Bengali agriculturist is not really more prosperous; prices are sufficiently high to equalize the level of real incomes, so unless some way of reserving occupations is found, industrialisation will bring no prosperity to West Bengal. As the forman or supervisory class is drawn ultimately from unskilled labour, middle class unemployment also will remain unaffected.

Average Income of Agricultural & Industrial Labour Families with Price Levels

Zones	Average Price of Food grains per seer.	Income of Industrial workers (Monthly)	Income of Agric. workers (Annual)
	As.	Rs.	Rs.
North India—U.P	6.1	83|1|9*	551
East India—Assam	8.2	96/3/8 (Gauhati)	601
Bihar	8.4	92/13/3 (Jamshedpur)	534
Orissa	5.9	59/12/8 (Berhampur)	340
West Bengal	8.2	70/8/4 (Calcutta)	622
All India	—	—	447

*Average monthly wage in U P—Labour Gazette

The possibilities of restrictions on non-Bengali labour must however be discounted. There are none today and any attempt to impose these in future would be retrograde, leading to great dissensions rather than unity. We may at best attempt to reserve a proportion of the supervisory posts in all industries for local inhabitants but this will have to be done cautiously. Obviously then, the merger will not by itself affect unemployment, but with the vast spread of development projects and consequent industrialisation that will become possible, one hopes there will be a gradual amelioration.

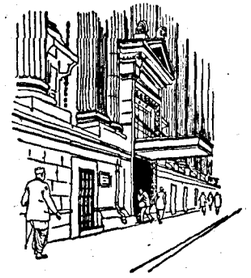
One of the basic conditions for the success of the scheme is the removal of any sense of antagonism among the peoples concerned. Apart from teaching the language of both groups to all, it is necessary to have a unified population as well, to some degree. It is therefore suggested that co-education should be introduced in all the schools as far as practicable and some sort of incentive to inter-marriages between Bengalis and Biharis given. This need not necessarily take the form of cash prizes but encouragement can be given in other ways e.g. by easier entry into Government service for such persons. While details will have to be worked out the principle itself is not a matter of detail.

Above all it must be realised that there is no alternative, the scheme must succeed. Unlike in other nations, with our communal and linguistic and caste separatism, there is no tie of common blood amongst us, the unity imposed by a shared tradition and a common history is wearing thin, and as Bombay has just demonstrated, any moment this India that is Bharat might break up into a thousand fragments. An English poet wrote of the Soviet Union in 1922:

"Of the dark Past
A child is born.
With Joy & Fear
My heart is torn.
Still in his cradle
The Living lies.
May Love and Mercy,
Unclose his eyes!"

Shall we fail for want of a little Idealism?

STATE BANK OF INDIA



Successors to the Imperial Bank

The need of the day

Our country's economy is expanding rapidly and with the Second Five Year Plan in sight it will gather further momentum. The need for a strong and efficient banking system has never been greater than today as the nation's savings require to be pooled and managed in a resourceful, confident and prudent manner.

The State Bank fulfils these expectations. It has started upon a programme of opening 400 additional branches throughout the country within the next five years.

The State Bank of India offers to serve you efficiently in many ways. It takes care of your savings and valuables, lends moneys against goods, produce and other approved securities and assists you by accepting appointment as executor and/or trustee of your will or trust. Its wide and varied services are at your disposal. Why not talk things over with your nearest bank agent, or write for information?

The State Bank's local head office at Bombay, one of more than four hundred offices waiting to serve you throughout India

Where are Farm Prices Leading U S?

G A Rao

THE behaviour of agricultural prices in free markets gives a raw deal to the farmer, who is left to the mercy of vagaries of weather on the one hand and unpredictable changes in demand on the other. In recent times, however, American agricultural prices have attracted the widest attention, not because of their erratic fluctuations, but because of the attempts of the U S Government to stabilize them. Price stabilization has given rise to the problem of surpluses which is plaguing not only the U S Government but also other agricultural countries.

The U S Government aimed at establishing prices for farmers at a level that would give agricultural commodities a purchasing power in terms of articles which farmers bought, equivalent to the purchasing power of agricultural commodities in the base period. The 'parity price' for any agricultural commodity as of any date is determined by multiplying the 'adjusted base price' of the commodity by the parity index of such date. The 'adjusted base price' for a commodity is computed by dividing the average price during the 10 year period immediately preceding the date of a computation by the average of the index of prices received for the same period. A comparison between the prices received by farmers for what they sell with prices paid for what they buy is the 'farm parity ratio'.

U S agricultural price policy is administered by the Commodity Credit Corporation in close co-operation with the Commodity Stabilisation Service and the Government Department of Agriculture. These agencies seek to control supplies of agricultural produce by means of acreage allotment and marketing quotas.

Price Support Programme

Price support is achieved through non-recourse loans, purchases, and agreement to purchase. Loans run for a period of 4 to 14 months and are secured by commodities as collateral under ware-house receipts or chattel mortgages. Purchases are made when other methods of control are not feasible. This is the method of price stabilisation in the case of products like cheese, butter and dairy products. Under a purchase agreement the producer is assured the support price for his commodity at the close of the market in return for a small service charge. The Commodity Credit Corporation agrees to purchase at the loan rate or at the announced price in case there is no loan programme.

Under the price support programme, price minimum or 'floors' of 60 to 90 per cent of the parity price are established for a number of commodities. At present the Secretary of Agriculture is bound by law to support about a dozen 'mandatory' commodities some of which are designated as basic and the others as non-basic. Wheat, rice, cotton, tobacco and peanuts are basic and are supported at 82½ to 90 per cent of parity according to supply conditions, if the farmers do not approve of market quotas. Among the non-basic commodities are included wool, tung nuts, honey, mohair, milk, butter, and fat. These are supported at 60 to 90 per cent of parity. The functions of the Commodity Credit Corporation in the policy of agricultural price control has been described as "a subsidised risk-taking procedure rather than a genuine monopoly technique. The methods used and the policy frame work have been greatly improved over the Farm Board days but the underlying philosophy is the same."

Falling Prices

Since 1952, there has been a marked change in the trend of agricultural prices. As a result of the decline in prices while production was being maintained at peak or near peak levels, stocks have been accumulating at an accelerated rate. Index of prices received by farmers fell from 302 in 1951 to 249 in 1954 while index of prices paid by farmers was 281 in 1954, which means that prices paid by farmers exceeded the prices received by them. The comparison between these two sets of prices is the parity ratio. This ratio reached a maximum of 115 in 1947.

Since then the trend seems to have been reversed. Largely as a result of the Korean War boom, the terms of trade in 1950, 1951 and 1952 were favourable to the farmer; after 1952 the terms of trade have been consistently against the interest of the farmers. It is also particularly to be noted that in the last five decades, in only a few years, viz 1921 and between 1931-34 and 1938-40, the terms of trade were more favourable than those in October 1955. The parity ratio in October 1955 was 82.

Net Farm Income

The position with regard to realised net farm income is also similar to that observed with regard to parity ratios. From a peak of about $17 billions in 1947, the realised net income fell by 30 to 40 per cent to about $10.6 billions in 1955. It may be mentioned in passing that between 1919 and 1930, the realised net farm income fell from 9 billion to 4 billion.

The trend of indebtedness of the farmer is difficult to gauge because the farmer's capital assets increased simultaneously with increase in indebtedness. On July 1, 1955 assets of American farmers were estimated at $163 billion while total farm indebtedness stood at $18 billion. This meant that debt accounted only for

11 per cent of the assets. But when the same figures are viewed in relation to net realised income of farmers, the picture becomes less optimistic. In 1947 indebtedness accounted for about 50 per cent of realised net farm income of the operators, in 1955 the proportion had risen to 17.0 per cent. The main changes in agricultural prices and income are given in Table I.

Rising Agricultural Productivity

It is generally conceded that a storage programme does even out variation in prices in the short-run due to variations in supply of a commodity, assuming that demand remains constant. But in the U S, in spite of so much effort, prices have been falling. One explanation for falling prices would be the rising productivity in agriculture. In industry, prices are left to readjust themselves to changing conditions but in agriculture this process of adjustment has been retarded by policies which protect the efficient and inefficient alike. In the words of Mr Gilbert Bruck in **The Magnificent Decline of U S Farming**,

> "The Government, in other words, subsidised efficiency and then subsidised inefficiency and it is this James-like policy that today is chiefly responsible for what economists describe as an excess of resources in farming".

This rise in productivity has been accompanied by a reduction in agricultural employment. The farm output per man is definitely on the increase, and with increased mechanisation of agricultural production and urbanisation of the U S economy, migration to the city has been a constant factor. The ratio between farm employment and output has, therefore, been markedly ... wise (See Table II).

Falling Farm Incomes

... income of farm people has ... declining. This is because the ... supported are not per farmer, ... per unit produced. But a good ... price policy would aim ... protecting the interests of the ... TABLE II

Farm Employment & Output in U S

Year	Average No. employed on farms (mns)	Farm output per man-hour (1935-39 =100)	Crop land harvested (mn acres)
1920	13.4	81	362
1930	12.5	87	359
1940	11.0	112	321
1950	9.3	164	355
1952	8.7	173*	N.A.

* Preliminary.

Statistics prove that though farmers contribute a good portion to the national produce, the share of the reward they get is not proportionate to their contribution. Compared to 1947-49, the prices they received last year went down by 7 per cent while the prices they paid for supplies, loans and labour went up by 12 per cent. The net income from strictly agricultural activity dropped from $11.7 billion in a year in 1947-49 to $9.9 billion last year. There are also some compensating factors, however, viz, a falling farm population, rise in farmers' income from other sources, variety in American farming which renders the total figure slightly misleading.

Farmer and the Nation

To state that the present fall in prices is due solely to the Government price policy which encouraged over-production, however, is only a half truth. The price policy is generally aimed at securing higher or stable income for the farmer. In spite of all the efforts that are being made, farm income per person is lower than non-farm income. For instance, in 1946 just after the war, net per capita farm income was $756 while non-farm income was $1,283. In 1952 per capita net farm income was $905 and the corresponding non-farm income was $1,842. (See Table III)

The elections in America have given a sharp edge to this problem of agricultural prices, and President Eisenhower has come out with a plan for a policy of agricultural prices. The main recommendation in the plan is to reduce the area cropped or grazed which will divert surplus stocks into trade channels at home and abroad without further addition to stocks. Withdrawal of certain lands from cultivation has been made as a long-term measure. The lands coming under the first part—viz, which aims at reduction of area cultivated to divert stocks—constitute the 'acreage reserve', while lands under the second part which aims at withdrawal of lands from cultivation form the 'Conservative Reserve'. Both long-term and short-term aspects of this plan are to be worked out by the Soil Banks. The participants in this scheme get certificates which can be exchanged for cash at the Commodity Credit Corporation at fixed rates. This scheme is estimated to cost $350 million during 1956, and 25 million acres would be brought against Conservative Reserve. There is yet another proposal to replace surplus programmes with quantity allotments to begin with the crop of 1956. Lower sales prices and an upper limit on price support payments to an individual or a farming unit constitute one of the minor recommendations in President Eisenhower's plan on agricultural prices.

It is difficult to evaluate a policy of agricultural prices which has such enormous proportions. It has to deal with the problem of maintaining the income of millions of farmers against mounting surpluses. The problem of American agricultural prices seems to be essentially one of surpluses. The small American farmers still belong to the most 'disadvantaged' group in the United States. According to the 1950 Census

TABLE III

Farm and Non-Farm Income in U S Dollars

Year	Total Population (in millions)	Farm output (1935-39 = 100)	Per capita net income on farm	Per capita net income not on farm
1910 ..	92	79	—	—
1920 ..	106	92	—	—
1930 ..	122	95	—	—
1935 ..	127	96	236	518
1940 ..	132	110	262	690
1945 ..	140	129	697	1,273
1952 ..	151	144*	905	1,842

* Preliminary.

of Agriculture, about 2.1 million units are large enough to be classified as bonafide commercial farms (grossing $2,500 or more annually); they produce about 88 per cent of the U S marketable farm products. The other 3.2 million farms, over 60 per cent of the total, produce only 12 per cent. Of the non-commercial farms, about half are either part-time, residential or miscellaneous. The other half are mainly subsistence farms grossing in some cases less than $1,000 a year which hardly provide a living to the occupants, regardless of the times. U S agricultural price policy does not to any great extent give particular attention to the problems of numerous small farmers in its schemes.

Capitalistic economy was born and bred in the era of freedom and laissez faire, the essential feature of this system being that price would be the resultant of a series of actions and reactions of the various economic forces at work. It is still doubtful whether in such a system, a policy of controls could be successfully carried out, especially in times of falling prices.

From the above, it is apparent that the farm price situation in USA appears to be confused not only to a lay reader but also to professional economists and policy makers in Government. The situation appears to be more difficult because

(1) While national income continues to increase, farm income is declining.

(2) Production costs are taking increasing share of gross farm income.

(3) The disparity between per capita income in farm and non-farm occupations appears to be widening.

(4) Farmer's share of food dollar continues to decline.

(5) Crop output in 1955, much of which will be marketed in 1956, may almost equal the record of 1948.

(6) Government investments in farm commodities have been mounting.

The farm price situation which the policy makers in U S face, is, to say the least, 'frustrating'.

Around Calcutta Markets

Rising Trend

Wednesday, Evening

TEA shares led the spurt in equities a fortnight ago. In recent days, the improvement in clearing shares has had a sustaining influence on the stock market here. It is evident that this week's spurt in forward shares is mainly due to covering operations for settlement purposes. So far as this aspect of the market is concerned, the support may prove temporary after the end of the settlement. That remains to be seen. Meanwhile, certain market developments may be noted.

Though recent dividend payments by Calcutta companies have been disappointing, increased dividend disbursements by Bombay's cotton textile mills have had a "bullish" effect on the market. Bank dividends are also encouraging. Simultaneously, it is realised that there are peculiar reasons which explain poor dividend payments by Calcutta's jute mills or by companies like BIC.

Good Dividends

Market circles are now arguing that the budget proposal relating to indirect limitation on dividend payments may not in effect curtail dividend disbursements. There is something in the argument that the withdrawal of the rebate on undistributed profits may partially offset the anticipated effects of the proposed indirect limitation on dividend payments. This is not the only reason why equities are gradually moving up.

One of the main reasons for the spurt in equities in the last year was the issues of bonus shares or expectations of such issues by companies. Immediately after the budget, the proposal to impose a tax on bonus shares had an adverse effect on the market. It is now argued that, even as the proposed indirect limitation on dividend payments has not affected dividend disbursements, the proposed tax on bonus issues may not discourage issues of bonus shares.

Bonus Tax

There is a variation of this argument which is more relevant. From the experience of the issue of bonus shares by Tata Steel Company, it is clear that the Government's policy is to control the issue of bonus shares. New Delhi dictated the issue price of the bonus share by Tata Steel. This had an adverse effect on Tata Steel, but Bombay seems to have overcome the difficulty. There is reason behind the argument that the proposed tax on bonus shares will have the indirect effect of fixing the issue price of such shares; that, in the circumstances, the Government will take this factor into consideration in fixing the issue price of bonus shares.

True, companies will not have freedom to issue bonus shares on terms they like. But, with the Government's policy of dictating its terms to companies, the proposed tax on bonus shares will not, it is argued, have any additional adverse effect on the market. This may not be a "bullish" factor. But it is an interpretation of the budget proposal which is not as "bearish" as apprehended earlier.

Inflation

These sophisticated interpretations may have helped the gradual recovery in equities in the last fortnight. But the influence which has initiated and supported the recovery lies deeper. Stock markets are becoming inflation-conscious. Behaviour of prices since the last quarter of last year would seem to confirm this analysis of the economic situation. In retrospect, it would seem that deficit financing in the last three years had the belated effect of raising prices by the third quarter of last year.

This aspect of the economic situation has been stressed in these columns in recent weeks. It has been argued that industry is fast losing the advantage of relatively cheaper prices for foodgrains and for industrial raw materials. This trend will be further aggravated by the massive deficit financing during the first year of the second Plan. Two questions arise. One is the growing cost of production. But the possible adverse effects of this development are being ignored because of the rising trend in prices.

Bank Rate

So far as stock markets are concerned, the inflationary effect of deficit financing has many aspects. One is the customary boom in equities in a period of inflation. This is the underlying reason behind the recent recovery in equities. It is not entirely without basis. But the budget debate in Parliament is a reminder that both the Government and the Opposition are watching the situation so as to avoid run-away inflation.

Though the problem of Bank Rate was not mentioned in the budget debate in Parliament, stock markets have become conscious of the developing situation in the money market. Reserve Bank's weekly returns are anxiously awaited every Wednesday evening. But the recent behaviour of stock markets would seem to indicate that investors are inclined to the view that the time for a higher Bank Rate is not yet. That may be, but speculators will be wise in realising that the time for a closer scrutiny of bank advances has already come.

Tea Shares

Three months ago, Clive Street was moderately optimistic about Coal, Paper and Jute shares. Coal and Paper shares are gradually recovering from the payments crisis and the budget shock. So are Miscellaneous and Engineering shares. But Jute shares remain friendless. Rising stocks of jute goods with the mills in the last two months, disappointing half-yearly reports and the continuing unfavourable spinner's margin explain why Jute shares continue to be neglected.

In the last fortnight, however, Clive Street has rediscovered the prospects for Tea shares. A month ago, auction prices started moving up. To-day, tea auction prices are well above the "lows" touched six months ago. With the gradual increase in tea auction prices, Tea shares are slowly crawling up. There is no aggressive buying. But the selling pressure has subsided. Though the 1954-55 boom is not likely to be repeated, current developments in the tea industry warrant moderate optimis about Tea shares.

Around Bombay Markets

Selective Buying Support

Thursday, Morning

SELECTIVE buying support has been forthcoming on the stock exchange for the third week in succession. This may be interpreted as a sign not only of returning confidence but of confidence that bids fair to be sustained. As time passes, it is being increasingly realized that the strong bullish factor in the market is the size of developmental expenditure. The Reserve Bank has helped the sentiment considerably by acting in a forthright manner at a time when raising of the bank rate was being advocated from banking circles. Far from being bullied into taking action of the wrong sort, it has responded to the situation of hardening money rates in a sensible manner by increasing the note circulation week by week. Currency was expanded by Rs. 25 crores in the last week alone; in the last fortnight, the expansion came up to a sizable figure of Rs. 40 crores. This has encouraged operators, if nothing else, to support first class equities at every dip.

Taking their courage from the general possibilities of development and monetary expansion, investors have at long last had the sense to realize that a tax on dividends is not a ceiling on dividends. This realization, needless to say, has been brought home to them by the series of dividend increases announced in recent weeks. True, the Finance Minister has made no secret of his intentions. This year they may have got off lightly, but that does not mean that in the years to come the tax burden will not be heavy. Apart from the general inclination to discount future burdens and to regard present impositions as being excessively heavy, the investors can also console themselves with the thought that if the present rate of earnings and dividend increases are maintained—they may very well be bettered—future burdens would be much more bearable since they would be put on shoulders which would be, figuratively speaking, much stronger.

Cotton mills were again leading, under the impetus of higher earnings of the mills that published their balance sheets during the week. Svadeshi Mills was one such which nearly doubled its profits from Rs. 8.31 lakhs to Rs. 15.48 lakhs and which has prompted its directors to recommend a raise in dividend by Rs. 4 to Rs. 12. Sales have risen to Rs. 3.63 crores as against Rs. 3.51 crores in the previous year.

Tata Mills have also shown improved working results during 1955. After providing Rs. 20 lakhs for depreciation and Rs. 10 lakhs for bonus the mills made a net profit of Rs. 7.70 lakhs as compared to Rs. 3.40 lakhs in the previous year. Sales of cloth amounted to Rs. 3.08 crores as compared to Rs. 3.26 crores in the previous year. Dividend has been raised to Rs. 4|- per share from Rs. 2-8-0 paid in the previous year.

The Standard Mills have also shown excellent results for 1955. After deducting Managing agents' commission amounting to Rs. 4.58 lakhs and providing Rs. 17.28 lakhs for depreciation, the mills made a profit of Rs. 38.88 lakhs, Rs. 10 lakhs more than in the previous year. Sales amounted to Rs. 5.33 crores recording an increase of nearly Rs. 2 crores over the year. Dividend has been maintained at Rs. 20 per share.

Digvijay Cement has reported a net profit of Rs. 25.56 lakhs for the year to December 1955 as compared to Rs. 23.71 lakhs in the previous year. Sales are said to be Rs. 1.38 crores during the year as against 1.77 crores in the previous year. Dividend has been maintained at Rs. 8-8 per share.

Besides the above encouraging company news, the Chairman of the Kohinoor Mills struck an optimistic note while addressing the company's shareholders during the week. Although the enhanced excise duty would cost the company Rs. 9 lakhs more and penal tax on dividends would operate most unfairly on companies like Kohinoor which had prudently accumulated substantial reserves, the Chairman observed that the company had practically completed a comprehensive programme of expansion and rehabilitation in the last ten years. The Chairman further observed that the company was up to date with bonus provision, and the current (1956) year's accounts would not have to bear any addi-

tional burden in this regard as in 1954 and 1955. He also said that the outlook for cloth continued to be good, with the yarn market showing signs of improvement.

Cloth production during the first two months of the current year has recorded a rise. Production in January amounted to 414 million yards. It rose to 428 million yards in February as against 402 million yards the same month in the previous year. Total production in the first two months was 842 million yards as compared to 839 million yards in the corresponding months of the previous year. The production of yarn also recorded an increase of three million lbs to 263 million lbs. over the two months' production in the previous year.

Along with production, the export of Indian piece goods have also recorded an improvement. Exports in February amounted to 68.67 million yards showing an increase of 17 million yards over those in January.

Bombay Dyeing shot up by Rs. 32-8 during the week to close at the top at Rs. 610. Kohinoor stole the thunder with a smart rise of nearly twenty-five points over the week on good future prospects. From the week's weak level of Rs. 501, Century shot up fifteen points to Rs. 516. Notable improvement was also recorded in Tata Mills, Swadeshi, Standard, Gokak and a few others in this section.

Steel shares also made good headway. On heavy bear covering on Calcutta account, Indian Iron firmed up by one and a half points. Tata Steel closed five points better over the week.

In the miscellaneous section, Associated Cement attracted good investment support. They appreciated by five points. Bombay Burma Old spurted twenty points on heavy bear covering while National Rayon rallied ten points on suggestion of increased dividend. Scindia, Tata Chemical and Premier Construction closed the week with a firm tone.

Cotton

Firm Trend

THE spot cotton market has been ruling firm of late. Demand for quality cotton like Vijay, Surati and Navsari continues unabated. During the week under review Kanpur, Ahmedabad and local spinners bought good many lots of these varieties of cotton at advanced rates. Broach Vijay, March delivery, went up from Rs 920 early in the week to Rs 982 towards the close, for five stations. Vijay, March delivery, any station, was bought at Rs 910. April delivery fetched Rs 900, any station.

Morvi, Manavadar and Jarilla varieties were also favoured by dealers and spinners alike.

In the export section, interest was shown in Moglais, Oomra Deshi, Bengal, C P I and C P II and Zodas. Wagad and Dhollera cotton was also purchased by shippers. According to market men, France showed keen interest in buying Bengals. Japan was in for Saurashtra varieties like Wagad and Mathia.

In the import section, mills evinced interest in African varieties.

Oils and Oilseeds

Boom in Oilseeds

PRICES of oilseeds and oils have been booming. There has been a scramble for castor and groundnut for quite some time. Owing to small floating stocks and the local market prices being lower than in the interior markets, dealers and speculators from Gujerat and Saurashtra were inspired to build heavy long position during the week. Punjab advices were also in favour of bulls. Thus castor and groundnut, ready and delivery, flared up to new high levels.

Groundnut ready were quoted higher initially. Millers and Vanaspati interests bought ready goods to keep their mills running. But, at higher levels, as the profit margin got thinner, the crushers turned to other edible seeds like Kardi. Kardi prices, therefore, moved up substantially. On the other hand, dealers of delivery seeds bought April-May groundnut which resulted in a further firming up of the rates.

Castor ready and futures shot up to dizzy heights. Britain bought about 500 tons of castor oil during last week at around £117 per ton. Business is expected to be done with America in the next few days. New York quoted from 13.80 cents to 14.00 per lb. Local castor stock is estimated to be small.

Castor May futures shot up from Rs 127 per candy on March 14 to as high as Rs 134-8 on March 20. During the last three weeks, it jumped seventeen points. Ready castor advanced from Rs 25 per cwt. to Rs. 26-8. During the last three weeks, it has risen by more than three points per cwt. Oil commercial shot up by one and a half points to Rs 14-6 per quarter during the last three weeks and ten annas over the week.

Groundnut ready advanced two points to Rs 35-4. April-May moved up to Rs 35-12 per cwt. from Rs 33-13 during the previous week. Oil ready jumped by a rupee to 19-2 per quarter over the week. Kardi and Linseed also moved up sharply, the former improving by three rupees to Rs 22-8 per cwt. and the latter by Rs 2-4 to Rs 35-4 per cwt.

Sales Tax Laws Validation

THE Sales Tax Laws Validation Bill, validating the levy and collection, by States, of sales tax on inter-state trade between April 1, 1951 and September 6, 1955, has been passed by both Houses of Parliament and is now awaiting the President's assent. When it becomes an Act, it will replace the Presidential Ordinance issued in January to validate State laws on sales tax on inter-state trade, which had been declared by the Supreme Court as ultra vires of the Constitution in September last. Whatever hardships might have been caused by the Supreme Court judgment will be removed by this Act and the States concerned will be free to retain their tax collections, amounting to about Rs 5 crores.

Controversy about the taxation of inter-state trade or commerce revolves round two conflicting judgments of the Supreme Court, regarding the interpretation of Article 286 of the Constitution which says:

"(1) No law of a State shall impose, or authorise the imposition of, a tax on the sale or purchase of goods where such sale or purchase takes place—

(a) Outside the State; or

(b) In the course of the import of the goods into, or export of the goods out of, the territory of India.

Explanation:—For the purposes of sub-clause (a), a sale or purchase shall be deemed to have taken place in the State in which the goods have actually been delivered as a direct result of such sale or purchase for the purpose of consumption in that State, notwithstanding the fact that under the general law relating to sale of goods the property in the goods has by reason of such sale or purchase passed in another State.

(2) Except in so far as Parliament may by law otherwise provide, no law of a State shall impose, or authorise the imposition of, a tax on the sale or purchase of any goods where such sale or purchase takes place in the course of inter-state trade or commerce."

And the two judgments were in respect of (a) an appeal filed by the Bengal Immunity Company against the judgment of the Bihar High Court given in December 1952, regarding the competence of the Bihar Sales Tax authorities to levy sales tax on its transactions with customers in Bihar State, and (b) an appeal filed by the Bombay Government against the decision of the Bombay High Court in a similar case against the United Motors India Ltd, declaring the Bombay Sales Tax Act 1952, as invalid.

The Bengal Immunity Co. having its registered office, laboratory and factory in West Bengal was called upon in October 1951, under section 33 of the Bihar Sales Tax Act, 1947, to register itself as a dealer as it was selling its products for consumption in Bihar and as such, it was liable to tax. Subsequently, in December 1951, a notice was served on the company to apply for registration and to submit returns showing its turnover from January 26, 1950 to September 30, 1951. As the Company considered its transactions in Bihar as taking place in the course of inter-State trade, the taxation of which is prohibited by Article 286 (2), it did not respond to the notice. Thereafter there was some correspondence between the tax authorities and the company and eventually in May 1952, the company was told that if it did not comply with the authorities' notice, they would proceed to take steps for assessment to the best of their judgment. Against this, the company preferred a petition to the Bihar High Court under Article 226 of the Constitution, for the issue of a writ against the Bihar Sales Tax authorities, claiming that the action of the said authorities was ultra vires of the Constitution. The High Court took the view that the Bihar tax authorities were competent, under the State Sales Tax Act, to investigate the liability of a dealer to tax and that they were well within their jurisdiction in issuing the notice to the appellant company. It, therefore, dismissed the company's petition for a writ under Article 226, but granted a certificate to appeal to the Supreme Court, as the case involved a substantial question of law as to the interpretation of the Constitution.

After this decision of the Bihar High Court, the question came up before the Supreme Court early in 1953, in respect of the other case mentioned above, viz. the State of Bombay vs. United Motors India Ltd. In that case, the majority of the Constitution Bench held that Article 286(1)(a) read with the explanation thereto and construed in the light of Articles 301 and 304 prohibited the taxation of sales or purchase involving inter-state elements by all States except the State in which the goods were actually delivered for consumption. It further held that clause (2) of Article 286 did not affect the power of the State in which delivery of the goods was made to tax the sales or purchases of the kind mentioned in the Explantion, the effect of which was to convert such inter-state transactions into intra-state ones and to take them out of the operation of clause (2) of the Article. In other words, the view taken was that clause (2) of Article 286 prohibiting taxation on inter-state transactions was to be read in the light of the Explanation to clause (1), which stipulates that "a sale or purchase shall be deemed to have taken place in the State in which the goods have actually been delivered for the purpose of consumption in that State". This judgment set the controversy about the construction of Article 286 at rest for the time being, and many States began to levy and collect sales tax on inter-state trade.

The situation was reversed when the Supreme Court took up for consideration the appeal preferred by the Bengal Immunity Co. The court took the view that the earlier interpretation of Article 286 in the appeal of the Bombay State was untenable and therefore thought it necessary to reconsider the whole issue once again. As a fresh re-appraisal was contemplated, it invited other State Governments than Bihar, who were levying sales tax and a few private parties, Tata Iron and Steel Co. among others.

After examining the arguments put forward by the contending parties, the Supreme Court took the view that both clause(1)(a) and the Explanation thereof, of Article 286 was intended to impose restrictions on the taxation of inter-State commerce.

As a result of this judgment, the confusion over the interpretation of Article 286 was finally removed and the prohibition of States tax powers under clause (2) became absolute and as such the State sales tax laws became invalid. It was with a view to meet this difficulty that the Sales tax laws validation Bill has been passed:

Concerning Prices

COMPARED to a year ago, there is now a tendency to view the future economic prospects in the country with a certain degree of cautiousness, if not apprehension. Last April, everything around one was just as it should be on the eve of a 'bolder' plan. Prices were conveniently low, production better than one had hoped for, the relaxation of controls had been smooth and welcome. True, the unemployment position was still bad enough; but it was something which argued for pushing ahead with investment spending. But since then, the situation seems to have changed though not in all respects. We still have the unemployment problem with us, and industrial production is maintaining its upward climb. But prices, particularly agricultural prices, have become wayward. The confidence with which one viewed the prospects of deficit-financing and increased money supply has been a lot shaken, on account of the effect it might have on these prices. Food prices have always had a portentous significance in India. And when, as in recent months, they start moving up, men's thoughts turn to inflation, though they may not talk openly about it.

Part of the difficulty is that it is so difficult to find the one, or even the primary, cause for the upsurge in agricultural prices. One could, of course, lay the blame on the weather to a certain extent. Had we not had unseasonal rains in the last quarter of 1955, raw cotton prices may not have turned out to be as intractable as they are at present. Had the Madras State not been visited by a vicious cyclone, rice prices may not have caused concern. These are not unimportant events, and maybe the realist would consider it intellectual snobbishness to bother about an underlying and pervading cause. But one cannot help bothering about the extreme sensitiveness of agricultural prices in general and seek a diagnosis which can help the evolution of a basically sound economic policy. Ad hoc measures would of course find a place in this policy; but they would not constitute the whole of it.

In a dynamic world, economic policy cannot be based on a set thesis about the characteristics and working of an economy. Even so, certain persistent and pervasive characters must be there, if only because of the continuity of the institutional framework within which the economic forces operate. For us in India, the way the money market has developed so far inevitably influences judgment on matters relating to money supply. Similarly, institutional arrangements regarding agricultural production, marketing and finance circumscribe both the analysis and the prescription in the matter of agricultural prices. Instances can be multiplied, but the point is that, given these facts of history and social arrangements, one has to pay attention to the effects they have on current actions and thinking in a variety of fields.

When one attempts to sort out the forces that have contributed to the present situation, certain elements stand out. We have in April 1956, a much larger money supply, and we can be reasonably certain that over a period, this will grow. This is a trend to which we might get partly reconciled, in view either of a continuous increase in the national product or a widening of the monetised sector or both. But the psychological effects of more money in the system can in the short term be such as to play tricks with the accepted indicators. In the second place, agricultural supplies are not so good as they were twelve months ago, whereas we have

more people and more money to spend now. Thirdly, inflationary pressures have reappeared in several countries of the world and there is no special reason why these should not have any impact on us now. They might, in fact, initiate a scramble for things in anticipation of future shortages and thus hasten the shortages. Against these factors, the old argument that deficit-spending is easily absorbed in the system has lost its edge.

For all one knows, it may be premature to have nightmares about spiralling prices. Agricultural supplies have been short, but not all that short. Nor has it been the case that price-rises have been associated with only those commodities whose output had suffered a setback. The remarkable increase in raw cotton prices is not attributable to total availabilities. Though output in the current season suffered from untimely rains, we started the cotton year with sufficiently large stocks. In market parlance, the statistical position is pretty strong. And yet, prices have gone up so sharply that special measures have had to be taken. Oilseeds prices, which always specialise in shooting up or diving down, have reacted more than proportionately to the reported short crop. Price rises in wheat have already brought forth counter-operations by Government in several States.

If price-rises are not just a reflection of the short-fall in supplies, what else are they due to? Anybody who has heard of the Marshallian scissors will say, increased demand. The only evidence we have for the latter is that there is more money with the public and the prices have gone up. The latter can, of course, be used for a circular argument which is not entirely satisfying. But the former, viz., the increased money supply, becomes valid if we can infer thereby that money incomes have increased, thus raising the demand for all sorts of consumption and investment goods. With all the spending that is going on, some incomes must have gone up. But in what measure these increased incomes contribute to an additional demand for staple agricultural goods nobody can estimate.

There is another line which could be pursued with some profit. Past experience has shown that the relation between spending by the public sector and banking activity is pretty close. Last year was an exceptionally good one for banks and it was also a year of much enlarged deficit in the Central budget. If this close relationship exists, those who rely on banks for their credit needs can hope for continued good times so long as the prospects for large deficit-spending are good. In so far as the agricultural market is concerned, the facility of abundant credit could well stimulate speculative demand. In other words, if the price movement is viewed as reflecting the combined impact of speculative and genuine consumption demand for agricultural goods, increased Government spending for development purposes could well stimulate both of them and thus cause a large enough excess in demand over supply. If this is what is happening, it is only right that the speculative factors should be curbed, and the increase in genuine consumption demand be met by increased production or import or dishoarding of stocks.

If current reports are correct, it would appear that the Reserve Bank has moved in, with a request to commercial banks to disclose their lending against commodities, bullion, shares and debentures. This, together with the Textile Commissioner's check on cotton purchases by mills, and the arrival of kharif crops should mitigate the speculative forces to some extent. But these may have little effect if the past price rises have already stimulated stock-building by primary producers and ultimate consumers. Considering the fact that in the past two weeks, grain prices in upcountry markets have not maintained the rate of increase obtaining earlier, we might be approaching some ease in prices. It may also be that Government policy regarding exports and imports of agricultural goods will be revised somewhat, to strengthen the other factors. Sensitive as they are, agricultural prices should react significantly even to small changes in the total situation. It has been so in the past and there has been no major institutional change in that sector to make it any the less possible now.

Looking back, price movements of a similar sort in the second quarter of 1953 had created apprehensions of a resurgence of inflationary pressures in some quarters; the upward movement received a check around August that year, and that was the beginning of the slide down. Whether the present wavering of grain prices is akin to that, one cannot say. This will be clear only a few weeks from now. Until then, it might be just as well to avoid jitters in anticipation of inflation and all that it implies.

Evil Omens

BETTER late than never. It is as well that New Delhi has, though belatedly, called Karachi's bluff. Pandit Nehru has made more than one major policy statement in the last few days. His statement on Kashmir is not as significant as his other recent observations, though the Prime Minister has done well in putting the Kashmir problem in its proper perspective. Pakistan had committed, as admitted by a U N Commission, acts of international aggression in Kashmir. At the request of the Maharaja of Kashmir, India offered military help to the people to defend the valley. Kashmir's Maharaja signed an Instrument of Accession by which Kashmir became legally acceded to India. Despite this legal aspect of the problem, India had, even before reference of the Kashmir issue to the United Nations, given an undertaking to the people of Jammu and Kashmir that they would have the right and freedom to decide their and their valley's future status. It was in pursuance of this voluntary commitment that India agreed to holding a plebiscite.

But India's agreement was conditional. She demanded that Pakistani forces must be withdrawn from the State before the plebiscite could be held. This condition was accepted by the U N Commission. "When the Commission shall have notified the Government of India that the Pakistani forces are being withdrawn from the State", it is explicitly stated in the August resolution, "the Government of India agree to begin to withdraw the bulk of their forces from the State in stages to be agreed upon with the Commission". It is clear that the August resolution does not envisage simultaneous withdrawal of troops by Pakistan and India. Pakistan is still in unlawful occupation of some parts of the State of Jammu and Kashmir. Pakistani forces have not been withdrawn from the State on the flimsy plea of simultaneity of evacuation by India and Pakistan. Because Pakistani forces have not been withdrawn from the State, India has not withdrawn the bulk of her forces from that State. As the prior condition has not been fulfilled by Pakistan, no plebiscite has been held.

These facts are beyond dispute. India's stand is clear. But it is not yet widely realised that circumstances have so changed that, as the Prime Minister explained, "the whole context of the question" has changed. Though the Prime Minister does not disown India's undertaking to abide by the wishes of the people of Jammu and Kashmir, he is emphatic that the conditions and circumstances have so changed that a plebiscite can no longer be regarded as a legitimate means of determining the wishes of the people. Under the August resolution, India was to withdraw the bulk, but not the whole, of her forces only after complete withdrawal of Pakistani troops. It is, therefore, evident that the UN Commission's plan for demilitarisation is based on the assumption that the relative military strength of India and Pakistan will remain as it was then. Pakistan has since received military aid from America, and through her membership of SEATO and the Baghdad Pact. This changes the circumstances under which the pre-condition to a plebiscite has to be fulfilled by Pakistan. That is why, the Prime Minister explains, "it makes little difference now to what extent Pakistan withdraws (from Kashmir)".

Besides this military factor, there have been other political developments which have made the plebiscite redundant. Soon, the people of Kashmir will adopt a Constitution. This will be followed by a general election. When the election is held the people will have an opportunity to express their wishes. India's undertaking to abide by the wishes of the people of Jammu and Kashmir will, thus, be implemented in a democratic manner. This does not mean that New Delhi is unwilling to discuss the Kashmir problem with Karachi. But the Prim Minister has made it clear that "we (India and Pakistan) have therefore, to discuss it (Kashmir) from another point of view in regard to conditions that have arisen now and try to come to an agreement".

American military aid to Pakistan and the latter's membership of SEATO and the Baghdad Pact not only change the Kashmir problem. These military developments call for a re-examination of India's defence and foreign policies. "With large bases surrounding India and also, as far as my knowledge goes, in the Pakistani-occupied territory of Kashmir, it makes a tremendous difference.... There is a much more military potential sitting there behind it. It makes a large difference". This assessment of the developing military situation in this sub-continent confirms the Prime Minister's earlier apprehension that India is under a threat of military encirclement. It would be rash to cry wolf. There may be no immediate threat of aggression from Pakistan. But, in a world plagued by rivalry between the two power blocs, a situation might develop in which India may experience difficulties in making defence preparations. Many years must elapse before India can become self-sufficient in her defence needs. Meanwhile, she will have to depend on Britain, her traditional source of supply, for arms, ammunition and military equipment.

Because Britain and Pakistan are members of SEATO and the Baghdad Pact while India pursues a policy of non-involvement, the question arises whether a situation may not develop in which India may find to her dismay that she cannot rely on her traditional source of supplies of arms and military equipment. There is urgent need to examine these problems from all the relevant aspects. But those who imply that the developing events call for severance of the Commonwealth link or for approach to the Soviet bloc for supplies of arms and military equipment would seem to ignore the realities of the situation. It would be unwise to quit the Commonwealth. Any such hasty action can only delay and hamper India's defence preparations. As a free, sovereign nation, India has every right to seek co-operation from all and every nation in her efforts to ensure adequate defence. These alternative sources of defence supplies should be explored. But it would be fatal for India to join an arms race, or to jettison her foreign policy of non-involvement. Panch Shila does not prevent India from building adequate military strength for defence purposes. Under the U N charter, India can rely on help from the member States to resist aggression. Military developments in this sub-continent do not justify a change in India's foreign policy, though these events emphasise the need for strengthening friendly relations with neighbouring like-minded nations.

Weekly Notes

The Baby and the Bathwater

WHILE explaining the duties of the Forward Market Commission, Shri W R Natu displayed an ethical bias which is common among our civil servants who are largely drawn from the non-trading classes.

What Shri Natu says about the rationale of forward trading and of the necessity of regulating such trading through the statutory body of which he is the Chairman are unexceptionable. It is only in taking up a very partial attitude towards speculators that he trips. The sole rationale of forward trading is the provision of hedging. This is an important facility for those who have to carry stocks, in so far as it offers an insurance against price fluctuations. By eliminating some of the risks of carrying stocks, forward trading is also believed to help the grower who may not have the means of holding on for a better price. To what extent, in fact, it does so, however, is not so easy to ascertain statistically. But beyond this, it would be difficult to establish any further claim for forward trading such as that it tends to steady prices over time.

Now the role of outside participation in forward markets can be viewed from two stand points, one that of stabilising prices over time and the other of maintaining the liquidity of the market. The speculator unjustly comes in for blame for causing even wider fluctuations in prices than would be the case had he kept out. But except for over-trading, that is for taking risks beyond his capacity, he cannot very well be blamed for coming forward and shouldering the risk of price fluctuation which is the essence of forward trading and which gives it its sole justification. Without such outside participation, the market would be narrower and its liquidity will be greatly impaired. So by putting the blame on the outside operator, is not Shri Natu throwing out the baby with the bathwater? The organised markets are there with their rules and regulations to prevent over-trading and the Forward Markets Commission is there to see that these regulations are properly devised and implemented. Why then pick on the speculator?

To ascribe price disturbances to the outside operator is to subscribe to the fatuous theory that it is the successful speculator alone who plays a constructive role by correctly foreseeing the future movement of prices and making the transition gradual and steady, while the unsuccessful speculator who loses his own money—or rather should, if the markets are properly run—abuses the facilities of forward trading in that he only disturbs rather than smoothens price movements. As a criterion of social behaviour or of conduct in the market, this is not particularly helpful. There is, of course, nothing like leather and no harm in flattering the self-esteem of the professional market operators or in propping up their morale by holding up before them a high conception of their constructive role. But it is hardly necessary for the Chairman of the Forward Markets Commission to believe that this fiction is also a fact. Surely, operators do not participate with the sole object of enabling the farmer to get a better price for his crop. If hedge facilities are abused by persons who have no "direct interest except in making quick money", to quote Shri Natu, what would happen to forward trading if such trading was to be confined exclusively to producers and consumers? A narrower market, less liquidity and no stabler prices! Surely this cannot be Shri Natu's prescription.

Elucidation of a Complex Problem

THE combined effects of the Electricity (Supply) Act and the taxation measures on the electricity undertakings in the country are so complicated that it needs an expert to bring them out clearly. From this point of view, if not from any other, Mr K G Milne's speech at the annual general meeting of the Ahmedabad Electricity Company Limited last week was a major contribution. Analysing the working of that company last year, Mr Milne roamed over the entire question of price and taxation policy in respect of the electricity supply industry. Despite the fact that expansion of this industry is basic to economic development. Government policy continues to be rigid and unimaginative. It is true that supply of power should be as cheap as can be; but intense preoccupation with the price at which electricity should be sold to help the consumers should not blind one to the fact that the supplying firms, as long as they are in the private sector, ought to be remunerated sufficiently to make them willing and able to expand.

It may not be possible for Government to go the whole way with Mr Milne and give the electricity companies complete freedom to adjust their rates. But something should be done—and right speedily too—to remove the anomalies that have persisted so long in the calculation of the Standard Rate of return and the taxation liabilities of electricity supply companies.

Future of Banks Well Assured

IN his speech at the annual General Meeting of the Central Bank of India last week, the Chairman, Sir Homi Mody made, amongst others, two pregnant observations. He viewed increased public expenditure on development as a major contribution to the increase in the demand for bank credit last year, and felt that in the context of the large investment envisaged under the second Plan, the future growth of banking seemed well assured. It is good to see Sir Homi underlining the close connection between the operations of the public sector and the fortunes of banking institutions — though he could not resist the temptation of saying that had Government not chosen to expand their operations in certain spheres, things would have been even better. One might differ from Sir Homi on that; but one must be thankful that he was not, as is generally the fashion, bitter or complaining about it.

The second of his significant observations is in relation to the margins available to banks. He took the position, though not explicitly, that the growing scramble for deposits at steadily rising rates of interest was an unhealthy development. A scramble of this sort could, through an increase in lending rates, discourage borrowers more than it attracted fresh depositors. One wishes Sir Homi Mody had been more forthright on this and deprecated the tendency amongst bankers to consider deposits as highly interest-elastic.

Golden slumbers kiss your eyes,
Tokyo greets you when you rise!

Slumberettes on our Tokyo service! Still more comfort for you—at no extra cost

SLEEP, gentle passenger, as our Constellation wings waft you to Tokyo
— on business or pleasure. You'll enjoy the speedy service,
the courteous attention of our air hostesses. And now, from the 5th of April,
every First-Class Passenger has a Slumberette — at no extra charge!
So fly with us to Tokyo — on a Thursday or a Sunday — and enjoy the dreamy,
comfort-at-the-touch-of-a-button luxury of our *Slumberette* service.

Belated Realism

ON many of the issues on which there are substantial differences between India and Pakistan, New Delhi has adopted an attitude which has lacked consistency or firmness. This is not an argument for pursuing a bellicose attitude to Pakistan. But India has lost initiative on some issues because of her failure to realise that diplomacy is a game which two can play. Karachi has missed no opportunity to remind New Delhi that none of the issues in dispute between India and Pakistan could be solved effectively without a settlement of the Kashmir problem. New Delhi has never been, without an effective counter-argument. It could have retorted that the issues in dispute could not be settled without a solution of the two major problems of evacuee property and of displaced persons.

In his reply to the debate in Lok Sabha on the problem of rehabilitation of refugees, Shri Mehr Chand Khanna, Union Rehabilitation Minister, has sought to emphasise the relation between the problems of evacuee property and of displaced persons. Shri Khanna is a sadder but wiser man after his recent visit to Karachi. Unlike Shri C C Biswas, Minister for Minority Affairs, Shri Khanna has had the sense not to inform Parliament that New Delhi is helpless as the "remedy does not lie in our hands". Only Shri Khanna's Cabinet colleagues will be surprised to know that he does not entertain "high hopes" about the forthcoming talks between him and the Pakistani Foreign Minister on the Hindu exodus from East Bengal. Besides Shri Khanna and his Cabinet colleagues, there were not many others who could not have anticipated his disclosure that, during his recent visit to Karachi, he found the atmosphere "cold and uninviting".

Though the problem of the exodus of East Bengal Hindus has persisted almost since partition, the tragic story is neither unknown nor unfamiliar. New Delhi was prompt in undertaking the responsibility for relief and rehabilitation of refugees from West Pakistan. But, for the first few years, the problem of refugees from East Bengal was regarded as an issue for which the West Bengal Government was held responsible. Three years ago, New Delhi realised the seriousness of the problem. It has since shouldered increasing responsibilities for the relief and rehabilitation of East Bengal refugees. But there is no indication yet that New Delhi is prepared to tackle the problem as a national emergency. There are reasons which explain New Delhi's attitude. But these explanations do not justify New Delhi's inability or unwillingness to evolve a national solution for a problem which has become a national emergency.

These reasons and explanations are as tantalising as the problem is ominous. After his disappointing experience in Karachi, Shri Khanna is wise in not repeating the argument that Hindus are coming out of East Bengal because the Pakistani Government does nothing to stop the exodus. But the Union Rehabilitation Minister still thinks it necessary to emphasise the differences between the problems arising out of the inflow of displaced persons from West Pakistan and that of the exodus of Hindus from East Pakistan. In the west, it was a two-way traffic. So, displaced persons from West Pakistan could be rehabilitated on the lands left by evacuees who had left the country. In the east, it is a one-way traffic. There is not enough land on which East Bengal Hindus can be settled.

What can the Union Rehabilitation Minister mean by repeating this argument? This does not, surely, exonerate New Delhi of its responsibility to rehabilitate East Bengal refugees. Nor can there be any sense in repeating the argument that the East Bengal rehabilitation problem is still fluid. It is fluid in the sense that it is continuing. But, after Shri Khanna's admission of the "cold" attitude of Pakistan, he or New Delhi can no longer hope that the exodus can be ended or stopped. It is no use arguing or implying that India never accepted the two-nation theory. If East Bengal Hindus feel insecure in Islamic Pakistan, New Delhi will have to shoulder the full responsibility of rehabilitating them. East Bengal Hindus know why they are migrating to West Bengal. It is no solace to them to be told that Pakistan is responsible for their migration. They demand New Delhi's help and sympathy to solve the problem of their rehabilitation.

Off the Record

When Delhi Goes Red...

THERE is one day every year when Delhi literally goes red. That is the day of the Holi. To be in Delhi on this day is an experience never to be forgotten. As in other things, you have to be with the right people and in the right place. If you are, and if you allow yourself to be carried away by the spirit of the festivities and let yourself be led wherever the spirit of the festivities in a particular hierarchy of Delhi society happens to lead you, you see things with your own eyes which you had never quite believed to be possible. The round of festivities, of sprinkling colours and of being sprinkled on, includes in turn visits to the Prime Minister's House, the Rashtrapati Bhawán and the humbler, though fairly spacious, residence of the Vice-President. Cabinet Ministers and Ministers without Cabinet rank, not to speak of Members of Parliament and others, are thrown in in good measure into the round and need no separate mention nor do they demand a visit to their respective residences. You run into them as a matter of course in the Prime Minister's House, or rather on the lawn and the wide drive of that house which are crowded with merry-makers, with the Prime Minister parrying the crowd, following a technique not unlike that of the Rugby player who manages to get away with the ball, helped and aided by his expert and experienced aides. The reference earlier to being with the right people and the right crowd, however, needs a qualification. It is an important facility rather than an essential need. For, believe it or not, the Prime Minister is at home to everybody; so is the President, and so are most of the people who count. There may be some minor dignitaries who take shelter under the subterfuge of not being at home but they do not really matter. And so if one can get hold of some sort of transport—it is not easy as taxi-drivers do not ply on this day for fear of damage to their vehicles, a fear which is not fanciful by any-means—or if one is prepared to leg it—in Delhi, distances are long—one can get free access everywhere and participate in the merriment to the point of actually sprinkling colours on the Prime Minister or the President or anybody else and win an embrace from them, though one may not get actually sprinkled in return.

That is too much to expect, especially from the Prime Minister, considering the barrage that the latter has to face.

The gates of the Prime Minister's House are open to all. The police and sentries are there only to regulate the traffic not to stop it. The refugee demonstrators are there too, to plead their case but they observe the propriety of demonstrating in groups of three, so as not to obstruct the traffic or to interfere with the merriment generally.

If Hindu society thought out this deception in order to keep people in their proper places and to prevent the suppressed ones from revolting against their social oppressors, it has done so with devilish perfection. One can witness it on the lawn and the wide drive of the Prime-Minister's House on the day of the Holi. Such an uninhibited mingling of people can be seen in no other country with the possible exception of some Latin American countries on the day of the Fiesta. The common custom of embracing one another, high and low, irrespective of caste or social status on the Vijaya Dashami night is a mere formality by contrast with what transpires on the day of the Holi.

The assorted conglomeration of people in the Prime Minister's House is equally striking. Literally, the highest dignitaries of the land rub shoulders, embrace and wrestle, each trying to outwit the other in this smear campaign, and the sartorial assortment gives insight into our dress habits which is not to be had on any other ceremonial occasion. Practical convenience and drastically cutting down depreciation on clothing appear to be the key note in the choice of garments on this occasion, rather than informality. You wear whatever cast off clothes you can readily lay your hands on. In the process, for a significant proportion of the crowd, striped sleeping pyjamas and half-shirts come out as the second best as the National costume, though kurta and pyjamas lead, but sherwani and churidar disappear completely, particularly sherwanis.

In a continuous snake like movement, the crowd wriggles out from the gate of the Prime Minister's House and disperses in small groups. For though the Rashtrapati Bhavan is equally open to all, few of those who go to sprinkle colours at Pandit Nehru eventually find their way into and enter the more august portals of the Rashtrapati Bhavan. The Rashtrapati himself, affable and courteous, in a long coat and dhoti, stands in isolation at the inner veranda overlooking the lily pond of the Rashtrapati Bhavan. The contrast with the Prime Minister's House is striking. Here also the doors are open but the visitors, few and far between, file in singly or, in twos or threes; there the stream of people is unending and ever widening, completely blocking the entrances to the inner apartments. The Constitutional Head of a Parliamentary democracy, even though elected by the people, is a symbol which we have borrowed but sucked dry of content. One can sympathise with the Maulana Saheb when he says that he has no desire to look after a bigger garden or occupy a bigger house, however much one may regret his lack of discretion in giving public utterance to his feelings.

A word on what actually happens on the day of the Holi in New Delhi and what is reported in the papers about it. News papers have standardized their coverage so well that one misses much of the fun. Many people come and go. Prime Minister receives as many of them as is physically possible with open arms but cameras flash according to a predetermined pattern. Who gives the command? The Home Minister, Pandit Govind Ballabh Pant, put in an appearance with a great deal of physical effort. He was in no fit state to fall into the mood of the occasion but the cameras clicked dutifully and it came out in the papers. When Acharya Kriplani came with what looked like a sombrero but was in reality only a toka (sun hat—Santiniketan style and weave), Pandit Nehru lost no time in removing his headgear and took full advantage of the close crop that Acharya recently had during a course of Malabar massage, to give him a proper daubing. This was by no means the end of the matter, of course, for the crowd fell on the poor Acharya too. But cameras did not click or if they did, the negatives were not used by the news editors. Many other snaps were missing even from the illustrated papers, such as that of the Railway Minister in tight embrace with one of his worst critics, of the lady M Ps with the closest of Eton crops—which by the way, is the new style of hair-do, much favoured by the ladies—in unsophisticated wrangling with commoners with much longer hair and so on.

Out on the streets, the scene changes. What it is like for pedestrians may well be imagined, but even though fairly well protected by the all steel body and triplex glass, the passing motorist is not always quite safe. Crowds collect at street corners—some may let you off with a jet of coloured water from their squirt-gun, but some may be more bellicose, stop the car and force you to get down. The quality of the colours used also changes with the type of crowd and it ends up with coal-tar and mud. Indeed, it is by the coarser counterpart to its delicate, refined and highly stylized ritual that Holi in North India is better known. To some it is a sad reflection that it is only at the lower depths that men can meet without inhibition. They remain constrained and bound by rules at the conscious, responsible levels of behaviour. Some would go further and prefer to call it primal or primordial, rather than primitive—this display of feelings at the lower depth. The association of spring festivities with some form of orgy has been well-known. When the days begin to warm up in the North and fields lie bare waiting for the first shower before sowing can begin and there is little work to do, the rural population feels the disturbance in the air and responds to it without restraint. One aspect of it are the long idle days; the unusually high incidence of crime in U P, for instance, at this time of the year; the slack season of the agriculturist and the problem of finding subsidiary occupation for him. The horror of it is that some day the Bhoodanes or the Bharat Seva Sangh may sieze on the occasion and organize a Shramadan campaign to take advantage of the idle days of spring and that would be the end of Holi.

Industrial Policy and the Public Sector

WITH Indo-Pakistani relations deteriorating in the context of increasing U. S. arms supply to Pakistan, pressure on the balance of payments is likely to develop from both ends. Increased defence requirements may add to the import list while political differences may make the flow of external aid uncertain. The foreign exchange position is thus causing considerable concern to the Government. It is in this context that Mikoyan came with his assurance that Russia would step up her purchases in this country so as to balance by and large her trade with India. Increased Russian purchases may even offset the likely imports of equipment and services for oil and minerals, the development of which is to be reserved for the State under the new industrial policy statement now being processed by the Planning Commission.

The problem that faces the Commission is to recast the industrial policy statement without disrupting continuity. This anxiety for continuity flows from the practical approach the Planning Commission and Government have in relation to economic matters. Contrary to what is often said, the need for restatement has arisen from practical considerations while the original 1948 resolution was a sop to a doctrinaire group inside the Congress. That is why the industrial policy statement could not be honoured in the spirit, and it is doubtful if it was respected in the letter, either.

Inadequate expansion and needs of general development have now persuaded the Government to decide to enter in a big way in a number of industries earlier reserved for the private sector. Minerals (excepting coal) which were left in the private sector are an instance in point. It is now realised that the exploitation of wasting assets by the State is feasible and necessary for a balanced development of the economy.' A draft of the new statement has been prepared by a committee of officials in the light of experience and economic requirements of today and is currently being examined by the Planning Commission. This declaration as finalised by the Union Cabinet will determine the limits within which the Second Plan will operate.

Industries are reported to have been grouped under three heads, depending upon the extent of State participation in them. The first category relates to those which are basic and strategic in character and their development will be the concern of the State only. The second category is of those which come next in importance; the State will take more and more initiative in them, though they will not be closed to private enterprise. The third category covers the rest and their development will be left to the private sector. It is learnt that the new policy statement like its predecessor does not envisage the taking over of existing concerns in the sphere reserved for the State nor even imposing a ban on their expansion.

If along with the decision to expand the public sector rapidly the Planning Commission are also thinking of improving the efficiency of public enterprises, they might think of utilising the services of Professor Galbraith who is now here at the invitation of the Indian Statistical Institute. What is more, the Planning Commission could also, if they wanted to, benefit from Galbraith's expert knowledge of railway economics. Few people here know perhaps that the author of 'American Capitalism', ex-Price Controller in the Roosevelt Administration during the World War II and Professor of Business Administration at Harvard, Galbraith is also a consultant to the Canadian Pacific Railway.

Both on public administration of business enterprises and on the operation of railways, Galbraith has some striking observations to make and eminently sensible measures to suggest which cannot be lightly dismissed as academic and unpractical. What he has to say about public enterprises is not so sensationally new either, though it is sharply at variance with the recommendations of another American expert on administration—Professor Appleby. The solution is to set up public corporations which would be really autonomous, not a separate corporation each time that a fresh undertaking is started in the public sector but one corporation for a whole group of allied undertakings. Departmental working of economic or industrial undertakings, which received the blessings of Appleby, has definitely to go.

Galbraith holds that the secret of efficiency in such matters is not the individual but organisation and though generally he is all for pragmatism in economics, on this question of corporations, he thinks, experience, whether in the capitalist United States or in Communist Russia, leaves no room for choice. The form of organisation has to be public corporation. But there's the rub. Will the Government departments give the public corporations enough freedom in day to day operation? Will the Parliament give them the chance to get on with their job?

Despite all the talk of decentralisation in the air, the tendency is more and more towards centralisation and direct control of the ministries which are responsible to Parliament and have to answer inconvenient questions. This is inevitable. So delegation of authority, which is essential for the working of corporations, meets resistance both from natural desire of Parliament to exercise control and the equally natural reluctance of the Government departments to part with power. A change of attitudes is, therefore, necessary. Popular sanction has to be created for that measure of freedom and non-interference without which corporations become, as they have already become in this country, a pale shadow of their true self.

But it is on the question of operation of railways that Galbraith's ideas and experience have something really new and vital to contribute. It so happens that this paper has been airing somewhat similar views, more from a hunch than from expert knowledge, guided by the experience of the war-time operation of the Assam-Bengal Railway under American management, where the carrying capacity was substantially augmented without any significant increase in investment of capital by changing the system of signalling, among other things. An American railway team is due to arrive here shortly. If only they are asked not to advise how we could get the best of all possible railway systems, but how we could meet the transport requirements of the Second Plan with the minimum of capital investment, probably the country would benefit a lot and so would the Railway Board, if only in the matter of new ideas. Strictly off the record, all the world over railway men love to run trains, but they do not like to think.

From the London End

Anglo-Maltese Integration Proposals

THE British Government have now finally acceded to the Maltese request to proceed with the integration proposals recommended by the round table conference of December last. The movement towards integration is, therefore, going on apace. In the Commons this week the Prime Minister announced Government's decision to introduce a Bill to carry out the December 1955 proposals.

The reasons impelling Britain towards integration are somewhat different from those which have caused the majority of the Maltese to seek such a solution. To the Maltese the need for more direct association with Britain arises out of the realisation that Malta by itself and in its existing status is doomed to carry a progressively impoverished people. Its whole economy has come to rest on the naval repair yards of the British Mediterranean fleet: over one-quarter of the adult working population finds employment in these yards. The rest of the population manages a precarious livelihood and a dismally low one at that, on small-scale farming.

Large-scale Emigration

The islands of Malta and Gozo cover a land area of 122 square miles (about the size of London) and support a population of 316,000. Population increase is high, but it has been offset by emigration. In the eight years from 1945, about 15 per cent of the working population emigrated, leaving the net population increase in these years at no more than one per cent. The Maltese islands are largely rocky; some parts are completely barren. The islands are almost treeless and no minerals or other natural resources have been discovered. Over a third of Malta's national income is derived from UK military expenditure, and some 90 per cent of the islands' imports are financed by these expenditures. These are Malta's compelling reasons for greater association with, and representation in, the House of Commons in London.

On the British side, the considerations appear to be solely strategic. It is difficult to conceive of any other considerations which could have compelled the present line of British policy. Unlike French colonial policy where 'integration' was and is actively pursued, the British solution on matters of colonial representation has always been based on 'constitution' for the colonies themselves. The strategic considerations are now fully visible against the background of British uncertainty and retreat in the Eastern Mediterranean. With the turmoil in Cyprus, the need for a stable naval base in the Mediterranean is satisfied (though not completely) by Malta. Already Malta provides the headquarters of Commander-in-Chief of the British Mediterranean fleet and Nato's Mediterranean Command.

Integral Part

The Maltese Labour Party, whose leader is Mr Dominic Mintoff, went into the February 1955 general election with a manifesto that advocated the 'gradual absorption of Malta into the political, financial and social institutions of the British Isles and a 20-year plan to turn Malta into an integral part of Great Britain with representatives in Westminster and enough safeguards to keep intact the full right and privileges of the Roman Catholic Church'. It also proposed that Malta should retain its own Parliament and promised that, if returned, it would submit its plan for integration to a national referendum. The Nationalist Party, the other of the two largest parties, on the other hand, advocated Dominion Status for Malta inside the Commonwealth. The elections increased the Labour Party representation to 23 as against 19 in the previous Parliament. The Nationalists reduced their representation to 17 (18 previously).

There followed from this Labour victory two crucial Anglo-Maltese conferences. The first was held in London in June last. At that Conference it was decided to convene a round table conference of 17 members from all the British parties to consider constitutional questions arising from proposals for closer association' by Malta and further to consult all the Maltese parties on these questions. At the same time Sir Anthony Eden announced in the Commons his welcome to the 'initiative' taken by the Maltese and his 'sympathetic response to the suggestion that the two peoples draw more closely together.' In December the report of the second (round table) conference was published. With two dissentients, it recommended that Malta should be represented at Westminster by three members of Parliament. It described Malta as 'a tower of strength to British causes' and went on to give some indication of the strategic factors which influenced their views:

> "Recent years have seen the decision to withdraw British forces from the Suez Canal zone; the growth of tension and unrest in the Middle East and North Africa; and the establishment in Malta of the Headquarters of the Nato C-in-C, Mediterranean. All these factors have combined to emphasize the continued importance of Malta as a pivotal point in the Mediterranean."

The local consequences of this position were noted. The Conference was 'impressed by the extent to which defence requirements in Malta .....impinged on the domestic concerns of the Maltese people' and in particular by the exercise of reserve powers by the Governor. Thus:

> "Nearly all the friction has arisen from disputes on the interpretation of the reserved matters.... The ever-widening sphere of defence has involved a practical restriction of Maltese self-government."

Having regard to these considerations, the Conference recommended that three Maltese, elected on the same basis as in the UK, should sit at Westminster and that the British Home Secretary should henceforth be responsible for Maltese affairs. The locally-elected Parliament should continue with clearly defined powers—powers which exclude external affairs, defence and ultimately taxation.

Swift Referendum

This report was the occasion for a quickly-conducted referendum—a referendum which not only was boycotted by the opposition Nationalists and the Roman Catholic Church, but was the subject of an unsuccessful litigation in the Maltese courts. The results of the referendum (held on February 11 and 12) are illuminating:

In favour of integration	67,607
Against integration	20,177
Invalid	2,559
Abstained	62,000

The opposition of the Church to such a quick referendum arose from the alleged absence of adequate safeguards in the integration proposals for the privileges and rights of the Roman Catholic Church. Although the Conference report recommended that matters of education, social welfare and marriage remain within the jurisdiction of the local parliament, the Roman Catholic Archbishop claimed, with full concurrence of the Vatican, that more explicit guarantees were necessary if the Church was to remain silent on the political issues. In a radio broadcast, the Archbishop declared that Mr Mintoff's failure to postpone the referendum constituted a 'declaration of war on the Church' and of 'vulgar insinuations against the Church and the clergy.'

Danger of Conflict

This, thus, represents the background to the British Government's announcement that a Bill accepting the conference proposals will be introduced in the Commons. The danger that may result from conflict with the established Church (as in Cyprus) has, however, forced the Prime Minister to state that British legislation on this matter will be brought into operation only if and when the Maltese people have shown their desire for integration in a general election after dissolution of the Maltese Parliament. In other words, the British Government are granting validity to the view that the results of the last referendum were indecisive — this concession, however, is being made, it is believed, to regain the confidence of the Church. Without the support of the Roman Catholics integration will be ineffective or may lead to what is happening in Cyprus. And with the accepted strategic value of Malta, the British now dare not allow themselves to fall foul of the Roman Catholic Archbishop or his superiors at the Vatican.

Russian Aid Through Trade

(From Our Delhi Correspondent)

IF any proof were needed to show how wrong was Western scepticism about the genuineness of the Soviet offer of trade and technical aid to underdeveloped countries—India in particular — Mr. Mikoyan's discussions with Shri Nehru and some Union Ministers and the negotiations for a shipping service between Russia and this country should suffice. Naturally, the details of the talks are not known. But the subject of the discussions was implementation of the December agreements, the visiting Soviet Vice-Premier stated to the journalists in New Delhi. This may mean that the purpose is to strengthen economic, commercial and technical collaboration. Anyway the selection of the Ministries with the heads of which Mr Mikoyan is conferring confirms such an interpretation. What is, however, still more important is the assurance the Soviet foreign trade expert is reported to have given about the method of paying off the rupee credits being extended to India.

Russia will thus have considerably to increase her purchases in this country if this commitment has to be met. The 1 million tons of steel India is to purchase from Russia during the current and the two following years will cost about Rs 60 to Rs 70 crores. The Bhilai plant will need Rs. 55 crore worth of Russian equipment and technical aid. Besides, India may receive equipment and technical aid for the development of minerals and oil in this country. Of these payments to be made in the rupee currency, only a small proportion is convertible into sterling. Now if India can pay off in goods, she will be able to bridge the gap in the balance of payments and, what is still more important, this expansion in foreign trade will decrease her dependence on the Western markets and the terms of trade will turn in her favour. It is these aspects of far-reaching significance and not the size of the Russian aid programme that are worrying the West.

Compared to what the USA has spent for India this aid may be small. But the difference in the nature of the aid is of great significance. Trade is always more honourable than the dole, even if the latter is of a big size. Even economically trade is very often better than grants, not to speak of loans. The assurance of an expanded market will enable the country to work on its development programme with less fear of supply out-stripping demand. Nothing can be a better incentive for increased production than the absence of a threat of falling prices. Technical advice, facilities for training as also capital goods were all this time a monopoly of the West which was extracting far too exacting a price. Now with Russia as a competitor in the field, the West will have to be reasonable in its dealings with underdeveloped countries.

That the question of expanding the trade between this country and Russia has been taken seriously is confirmed also by the decision to open a shipping service between the two countries. The proposals contemplate the regular operation between Indian ports and the Black Sea ports of Soviet Russia of a fleet of ten or twelve vessels. There is to be parity in tonnage between the two countries.

There is another proposal for the establishment of a shipping service between India and Yugoslavia as also for utilising spare capacity in Yugoslav shipping yards to meet the needs of India for additional shipping during the Second Plan period. Whether it is additional to the Plan target figure or additional to the ships available on the eve of the launching of the Plan—it is not clear. One thing is, however, certain. Delay in the attainment of the target is less likely this time although one cannot be very sure. Negotiations are reported to be making heavy weather. Bureaucratic red-tape and the interest of the shipping companies are slowing down the pace of negotiations. The First Plan target in shipping was not reached in time. The expected tonnage of Indian shipping at the end of March is of the order of 4,80,000 tons. A further 1,20,000 tons to complete the target of 6 lakh tons in the First Plan are now in different stages of construction in various yards, both in India and abroad. Construction is now scheduled to be completed by the middle of 1957. The economics of coexistence will justify itself in shipping if they force the pace of building this second line of defence.

Official Paper's

An Expanding Economy

Economic Report of the President transmitted to the Congress. United States Government Printing Office, Washington. 1956. Pages 248, Price 70 cents.

Reviewed by **T V Jayaraman**

THE American economy has in recent years excelled even its own records of prosperity. The recession that set in with the close of the Korean hostilities in mid-1953 proved to be no more than a mere economic contraction, one of the very briefest and mildest in the entire history of business fluctuations. So if this was an achievement of economic policy, any administration could justly be proud of it.

The President's economic report is in fact a closely detailed analysis of the working of the gigantic American economic machine. It provides an indication of the need for almost technical perfection both in the formulation and the application of methods of economic control. There could be no breakdown if correct policies were correctly applied. It would appear from the report that the market economy has in fact vindicated itself precisely when the socialist method of production is increasingly beginning to be taken as not merely inevitable in the long run, but also more efficient.

Growth with Stability

What the U S Administration is expected to do to keep the economy either from toppling over or grinding to a halt is sought to be brought out fairly convincingly by describing developments in the U S economy over the period of the one-year recession and explaining the measures taken by the Administration from time to time. Currently, prosperity, the prosperity of a record 400-billion dollar economy, is itself a challenge. The problems it poses are great. The Administration has to tend prosperity with as much care as it has to nurse back to vitality a sagging economy. The problem of maintaining prosperity is stated simply enough: The economy of free and competitive enterprise must continue to grow. But this objective is not to be achieved at the price of inflation, which not only creates inequities, but is likely, sooner or later, to be followed by depression. On the other hand great care must be exercised to ensure that a policy of avoiding inflation does not interfere with attaining a satisfactory rate of economic growth.

This is almost a text-book description of the task of a modern government which is charged with the maintenance of stability in a huge and growing economy. Mistakes in policy can be fatal. The contention of the President's report is that the Administration has been very successful while not attempting to maintain the good times by expanding already huge Governmental outlays or by permitting the value of money to depreciate.

The Role of the Consumer

Between the second quarter of 1954 and the final quarter of 1955, the annual rate of Federal spending on goods and services declined by 15 billion dollars, while spending by the rest of the economic community increased by 43 billion. "On an increasing scale, Americans have taken the initiative to make jobs for one another, instead of waiting for the Federal Government to do it for them." It is nowhere overlooked, however, that some people have not enjoyed a full measure of prosperity; and in the President's future programme are prominently included policies designed for their betterment, mainly by helping them to raise their productivity; for the disease here is the same as could be expected in the process of technological revolution, namely, that some have stayed behind and they have to be helped to catch up.

For purposes of control the indicators in the aggregate that need to be watched are chiefly gross national product, employment outside the Armed Forces, and the amount of income disbursed to people by private industry and Government. It was about mid-1954 that the symptoms indicated a resumption of advance. The decline of investments in business inventories stopped in October 1954. The process of rebuilding of stocks gradually got under way thereafter. The output of consumer good industries, which generally increased during 1954, rose more rapidly in the first half of 1955. Outlays on industrial plant, machinery and equipment, which kept on declining until the early months of 1955, joined the expansion in the spring. Total business expenditures on plant and equipment increased sharply after the first quarter of 1955, rising 20 per cent by the end of the year. The major impetus of expansion thus shifted increasingly from the automobile and home-building industries to business construction and the machinery and equipment trades.

Incipient Inflation

The tendency towards incipient inflation began to be seen in mid-1955. By that time many factors served to increase unit labour costs. The average of industrial prices in wholesale markets, which had increased only by about one per cent between August 1953 and June 1955, rose by 3½ per cent in the next six months. Profits continued to rise, but the rise in the aggregate profits tapered off after the first quarter of 1955.

A significant indication here was that while the annual rate of disbursement to individuals from production increased by 6.8 million dollars between the second quarter of 1954 and the first quarter of 1955, the disposable income, that is income after taxes, actually increased a little more. This was because the restraints on the growth of disposable income, which are ordinarily exercised during an economic expansion through a rise in income tax payments and a decline of unemployment compensation, were more than offset by the effects of the tax and social security legislation of 1954. After the first quarter of 1955, the normal fiscal restraints on the growth of disposable income became operative again; but in the meanwhile, personal income from production increased rapidly, and disposable income was able to grow at a much higher rate than before. Consumer spending naturally increased, but as confidence feeds on itself, credit had become a little too plenty, and credit purchases of expensive items, notably of 1955 automobile models, increased with special rapidity.

In a significant assessment of the situation, the report points out that by the late spring of 1955 the expanding demand for the products of industry, swollen by heavy borrowings, was already pressing against the nation's industrial capacity. Shortages of steel, nickel, copper, paperboard, cement, plumbing fixtures, some

types of lumber and other materials developed. Unemployment was low, overtime extensive, and many types of skilled labour scarce. Wages and prices were beginning to stir. Accommodation of the pressing demands of borrowers by any substantial increase in the money supply would, in these circumstances, have served to raise prices rather than increase production.

The Credit Situation

The growing demand for credit began to push up interest rates towards the end of 1954. Until the end of the year, there was little increase in money supply. Conditions in the latter half of 1954 did not call for a policy of restraint, but a mild change in the degree of credit ease, which had prevailed so far seemed desirable in the light of the unfolding economic situation. Accordingly the Federal Reserve System restricted its purchases of Government securities in December 1954. Another action taken by the Administration was to ask Congress to postpone the tax reductions already scheduled to take effect from April 1955. The Congress accepted the recommendation. The move from active ease to moderate restraint in credit policy was executed in several stages. By November the discount rate had been raised to 2½ per cent. Demand for credit remained high. It was only at this time that the commercial banks themselves began to screen their loans more carefully. This appeared to have a salutary effect on the whole credit situation.

Among the credit policies of the Federal Government, the most important relates to the field of consumer credit. A particular difficulty in this connection was that the authority of the Board of Governors of the Federal Reserve System to control consumer credit had ceased in 1953. Restraint could only be applied by persuasion. The need for the Federal Reserve to have powers of control over consumer credit terms is emphasised in the President's report. Another important type of specific credit relates to mortgages, where the authority of the Federal Government is already broad. Some extension of these powers is also recommended.

The weakest part of the report, as could be expected, relates to the action on the farm front. The Federal Government has assumed heavy financial burdens on behalf of agriculture. Yet farm incomes have declined; but it is contended, rightly, that these consequences have flowed from price supports that are out of line with market conditions and from production restraints that do not work well. The recommendations call for a realisation that annual surpluses of important products must be cut at their source, and soil conservation must be extended on land now contributing to such surpluses. The recommendations in this field were contained in a special message on agriculture sent to Congress on January 9 this year, the king-pin of which is the Soil Bank Programme.

The President's report provides also a confirmation of Eisenhower's well-known recipes for expansion of International trade and investment. The report must be considered as one of the most important documents available on the American economy and on the U S Government's policy. The present report contains all the features for which this document has become justly famous.

Deficit Financing in the Second Plan and Prices

S N Sen

THE Draft Second Plan has proposed to raise Rs 1,200 crores through the creation of new money for financing the aggregate investment expenditure. What is going to be the impact of the injection of this amount of new money on prices in the next five years? The relation between money and prices is extremely loose and is one of the most difficult things to predict. So are the relationships between many other variables in the economic system.

But planners have to proceed somehow, and make the best of many such bad situations by taking shelter behind a number of heroic assumptions. One would have to do the same thing if he is to estimate the effects on prices of the additions to the money supply proposed in the second Plan. Two recent estimates—one by Prof Milton Friedman and the other by Dr A K Das Gupta—have revived interest in this matter.

In a privately-circulated paper, Prof Friedman has calculated that since the aggregate output is expected to rise by 5 per cent per year, the money supply, corrected for the decline in the income velocity, should also increase by this ratio. As the income velocity declined in the United States of America by an average of one per cent per year during the period, 1860 to date, when the average annual increase in real income was of the order of 3 to 4 per cent, he has sought to apply this trend to the Indian case. Thus the money supply should increase by 6 per cent per year, and on the basis of an average money supply of Rs 2,000 crores in 1955-56, an increase in the money supply by Rs 120 crores or Rs 600 crores in five years would be needed to keep prices at their present level. This is what he regards as the safe limit of increase in money supply. He then estimates the share of Government-created money in the total money supply to be about 70.5 per cent, and so calculates that the safe amount of new Government-created money in the next five years would be about Rs 475 crores. The rest is excess money, and would drive up prices by about 28 per cent, if deficit-financing (the Indian model) is limited to Rs 1,000 crores as originally proposed, and by about 35 per cent if the limit is raised to Rs 1,200 crores.

Slightly Different Basis

Dr Das Gupta has proceeded on a slightly different basis in his article in the **Economic Weekly** (January 26, 1956). After stating that the proposed using up of the sterling balances would absorb Rs 200 crores, he calculated the net addition to the money supply to be about Rs 1,000 crores. Assuming no change in the income velocity (he actually envisaged the possibility of some rise in income velocity if the attempt to establish a socialist pattern of society caused the share of wages in the national income to go up at the cost of profits), and in the relative proportions of currency and deposit money in the money supply, he made an attempt to estimate the impact of this addition to the money supply on the consumer goods market, where, with a possible 5 per cent infiltration of money economy into the non-monetary sector, the output is expected to rise by 25 per cent. The result would be an increase in prices of the order of 35 to 45 per cent in the next five years.

The coincidence of these two estimates is certainly remarkable, especially when one remembers the differences in their assumptions. In the Friedman model the increase in the money supply is set against the increase in the aggregate output, whereas in the Das Gupta model, it is assumed to impinge only on the consumer goods market. The former assumes a steady rate of decline in the income velocity, whereas the second estimate takes the latter as constant. The increase in the monetary sector at the cost of the non-monetary one, which has been an important factor in causing a decline in income velocity, is however, taken account of by Dr Das Gupta through his assumption that this would lead to an increase in the output of consumers' goods by about 5 per cent. But the decline in income velocity with rising national incomes on account of the increased desire of the people to indulge in the luxury or larger cash balances has been one of the most well-known facts acknowledged by monetary theorists.

All Factors Not Considered

Both these estimates are no doubt highly useful. But they have not taken note of all the factors at work in the money-prices nexus. My own estimate, published in a previous paper was to the effect that the rise in prices would be of a smaller order than these calculations warrant. In the first place, when Government spends Rs 1,200 crores by borrowing this amount from the Reserve Bank, the money supply will not necessarily rise by this amount Experience tells us that the net addition to the money supply may be quite different from the original amount borrowed from the Reserve Bank after we take account of all the factors bearing on the aggregate money supply. Secondly, the decline in the income velocity will be of a larger order than is postulated in the Friedman model on account of the operation of a number of factors at work in the very pattern of our economic development, factors which were not operative in the case of the American economy.

The Draft Second Plan has assumed that out of Rs 4,800 crores to be spent in the public sector, it would be necessary to have recourse to deficit-financing to the extent of Rs 1,200 crores If deficit-financing means Government borrowing from the central bank, or the running down of cash balances of Government, this statement may be accepted as valid. But if deficit-financing is understood in the sense of additions to the money supply, it is quite definite that it would not amount to Rs 1,200 crores. The calculations given in the financial budget of the Draft Plan do not take account of the fact that the aggregate investment of Rs 4,800 crores in the public sector has an import content of Rs 1,100 crores, which is expected to be financed mainly through the foreign aid of Rs 800 crores. The additional Rs 300 crores would have to be sought by Government from the Reserve Bank.

Whatever the source from which the Reserve Bank supplies this amount of foreign exchange, the process need not, and would not, involve the creation of new money, though it would imply that government would be borrowing this amount from the Reserve Bank. If the import content of public investment is Rs 1,100 crores, the net domestic expenditure will amount only to Rs

3,700 crores. With additional revenue from taxes and other sources estimated at Rs 1,200 crores, borrowings at Rs 1,200 crores, and a gap left at Rs 400 crores, the actual amount of deficit-financing involving the creation of new money will be Rs 900 crores instead of Rs 1,200 crores. While Government borrowing from the Reserve Bank would no doubt amount to Rs 1,200 crores, money supply would be increased in the first instance by only Rs 900 crores, the additional Rs 300 crores being spent in foreign countries on the purchase of the necessary capital goods. The revised financial budget would be of the type shown in the Table below:

(Rupees crores)	
Investment at home	
1. Revenue from taxes at existing rates	350
2. Additional Taxes	450
3. Railways & Miscellaneous sources	400
4. Loans & Small savings	1,200
Total budgetary resources	2,400
Deficit-financing	900
Balance to be made good from internal or external sources	400
	3,700
Imports	
1. Foreign aid	800
2. Borrowings from the Reserve Bank	300
	1,100
Total Investment	4,800

If, in addition, there is any deficit in the balance of payments, the total money supply will be reduced by the amount of such deficit.

Confusion in Sense

Thus there is confusion between the two senses in which the term deficit-financing has been used in the Plan. Government borrowing from the Reserve Bank and additions to the money supply need not always amount to the same thing. If, to meet import requirements, Government borrowed a particular sum from the market or raised it through taxes, and handed over the proceeds to the Reserve Bank to buy foreign exchange, money supply would have fallen by this amount against the cancellation of an equivalent amount of sterling balances. Government borrowing from the Reserve Bank will not, however, be followed by any such contraction in the money supply. It will leave the aggregate money supply as it was before these operations took place. But there would be no net addition to the existing money supply because of this method of financing imports on Government account. The additions to the existing money supply will thus be limited in the first instance to only Rs 900 crores.

The confusion arose from the idea that all Government borrowing from the central bank involved an increase in the money supply. It does no doubt when properly interpreted. But it does not always involve an addition to the existing money supply. This mistake committed by the Planning Commission has resulted in the propagation of the wrong idea that the Draft Second Plan involved deficit-financing with the creation of new money to the extent of Rs 1,200 crores. The psychological impact on the market, and in the inflation camp would have been more favourable if it was stated that the proposed deficit-financing would involve an addition to the existing money supply to the extent of only Rs 900 crores.

When Government investment expenditure results in an injection of Rs 900 crores of new money into circulation, what will be the likely increase in the net or active money supply? The first step is to estimate the amount of deposit money with the public that may be created on the basis of the proposed increase in currency. To do that we have to estimate the ratio between these two constituents of the money supply likely to prevail in 1960-61.

Deposit Money with the Public and Currency Supply

Average in December	Money supply (1)	Deposit money (2)	(2) as percentage of (1)
	(Rupees Crores)		
1935	285.2	122.04	42.0
1939	383.7	158.5	41.0
1942	913.7	359.9	39.3
1943	1477.4	540.4	37.2
1946	2138.9	804.4	37.6
1948	1976.3	706.1	35.7
1950	1832.7	630.1	34.3
1951	1773.5	603.1	33.9
1952	1682.5	560.5	33.3
1953	1714.9	561.9	32.9
1954	1848.9	624.3	33.7
1955	2058.7	670.9	32.5

As can be seen from the Table, the average ratio of the deposit money to the money supply was 42.3 per cent in the five years 1935-39, 39.9 per cent in 1940-45, 35.9 per cent in 1946-50, and 33.2 per cent in 1951-55. Thus contrary to the general tendency in advanced countries, the trend in this country has been definitely towards a decrease in the share of deposit money in the aggregate money supply. Actually in 1955 the total money supply increased by Rs 209.8 crores, of which the share of currency was Rs 163.2 crores, i.e., 77.7 per cent, the share of deposit money with the public being 22.3 per cent. Thus the ratio has fallen by a little above 10 per cent in the last 20 years, and in the last five years also, the ratio has been falling at the average rate of 0.35 per cent per year. If this trend continues, the ratio of deposit money in the total money supply would be of the order of 30 per cent in 1960-61.* Thus if the volume of currency in 1960-61 increased by Rs 900 crores, i.e., by the total amount of new money, the demand deposits with the public would probably increase by about Rs 390 crores.

Falling Trend

A portion of the gross money supply would be absorbed in the cash reserves of the banking system on account of the rise in the total volume of deposits. A rough estimate of the amount so involved may be made on the basis of the ratio between the demand deposits and total deposits in the last 20 years. During the five pre-war years, 1935-39, demand deposits of the scheduled banks formed about 56 per cent of the total deposits. From 1939 this ratio began to climb up until it reached the maximum at 76.6 in 1943. Since then there has been a slow, falling trend until the ratio stood at 66 in 1950. In the next five years the ratio has continually declined, and in 1955 it formed 59.3 per cent. In the last five years the decline proceeded at the rate of 1.3 per cent on average per year. In the 12 years from 1943 when the ratio reached the maximum, the average rate of decline has been 1.4 per cent per year.

There is no reason why this tendency should not continue in the next five years, provided the rates of interest continue at their present levels (the decline in the ratio took place also during years of cheap money). It is, therefore, quite possible that by the end of 1960-61 the ratio of demand deposits to total deposits would decline to 57-58. An increase in demand deposits by Rs 390 crores would then mean a rise in total deposits by about 670 crores. In the last three years the average ratio betwen the cash reserves and the total liabilities of the banking system lay between 9 to 9.5 per cent. In other words, the cash reserves of the banking system would probably rise by about Rs 60 crores by the end of 1960-61. The net money supply will then rise by about Rs 1,230 crores in 1960-61. If the average money supply in 1955-56 is estimated at Rs 2,000 crores, it will rise to Rs 3,230 crores by the end of the next five years.

With an average money supply of Rs 2,000 crores in 1955-56, the proposed expansion in the national output by 5 per cent per year would need a corresponding increase in the money supply. This means that the money supply should increase by Rs 500 crores during the next five years. Accepting for the present Prof Friedman's estimate of one per cent decline in the income velocity, it would be necessary to add another Rs 100 crores to the money supply to neutralise the effect of this factor on prices. Compounded annually, the aggregate money supply would have to be increased to Rs 2,670 crores to support prices at their 1955-56 level. Other things remaining constant, a rise in the money supply to Rs 3,230 crores would, therefore, raise prices by about 21 per cent in five years. In other words, the general index of wholesale prices would then rise to 444 in 1960-61 from its present level at 368 in December, 1955, an increase of about 15 points per year.

A Distinction

It is necessary at this stage to make a distinction between planned deficit-financing and ex post deficit-financing, the difference depending upon the rates at which planned borrowings from the public differ from the net absorption of securities by the latter. There are also other items in the financial budget which may have some bearing on the volume of net deficit-financing. If, for example, the different Governments fail to raise Rs 450 crores through additional taxation, the rate of deficit-financing may have to be increased. There is also the gap in resources to the extent of Rs 400 crores which may have to be bridged possibly through more deficit-financing. Lastly, there is the ex ante foreign aid of Rs 800 crores, which may not be available to the full, making it necessary either to cut down the aggregate investment figures or to change the pattern of development so as to reduce the need for imports. In what follows it is proposed to compound all these factors in ceteris paribus and examine the impact of the difference between ex ante public borrowing and ex post absorption of securities on the volume of deficit-financing.

That the ex ante public borrowings may differ from the ex post absorption of securities by the public may be illustrated from an analysis of the figures relating to the year 1954-55. The revised estimates for that year have placed the amount of deficit-financing at Rs 222 crores. This has probably been financed partly by drawing down cash balances and partly by the creation of ad hoc Treasury Bills. The deposits and cash balances of the Central Government declined, during this year, by about Rs 7.7 crores, and so the rest (i.e. about Rs 214 crores) were probably financed by the issue of ad hoc Treasury Bills to the Reserve Bank. The gross amount of Treasury Bills sold in favour of the Issue Department of the Reserve Bank increased by about Rs 214 crores above the amount sold in 1953-54. The amount of Treasury Bills outstanding at the end of the year has, however, increased by only Rs 137 crores, out of which ad hoes held by the Reserve Bank of India were Rs 103 crores.

Market Loans

Over the year as a whole, the Reserve Bank's holdings of Government securities rose by only Rs 65.8 crores. Thus the Reserve Bank must have sold Government securities (including Treasury Bills*) worth about Rs 37 crores to the public. If the Reserve Bank succeeds in unloading a part of its security holdings among the public, the money supply in the hands of the public would decline to that extent. The Draft Second Plan has assumed that the proceeds of the market loans during the next five years would amount to Rs 700 crores. It is not clear whether the Commision has referred only to the proceeds of new loans raised from the market, net of any repayment during the period, or whether they have arrived at this figure after estimating the total absorption of securities by the public. If it is the former, the additions to the money supply would be reduced by the amount by which the absorption of securities by the public exceeds the estimates of new loans from the market. But it would be difficult to give any estimate of the amount of new money that may be neutralised through the operation of this factor, unless we know something definite about the exact composition of the estimates for public borrowing.

The analysis has been made on the assumption of a decline in the income velocity by one per cent per year. There are, however, reasons to believe that the actual decline in income velocity may be more than that assumed in the Friedman model. Prof Friedman arrived at the figure of one per cent decline in income velocity on the basis of the American experience from 1860 to date. Even in the USA, the decline has been, according to Prof Warburton, at rates varying between one to one and a half per cent. In India, there are special factors at work which may result in a higher rate of decline in income velocity.

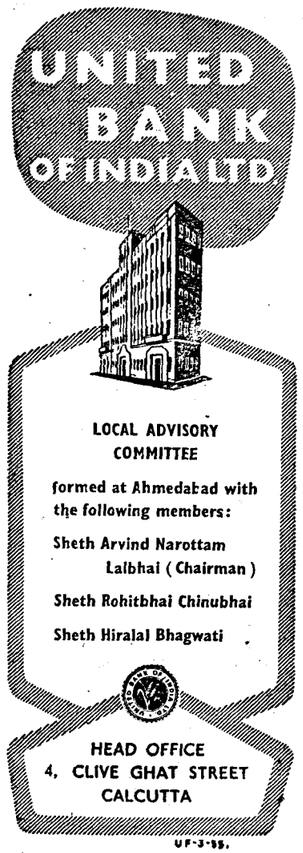
Increase in Liquidity Needs

In the first place, though the percentage of population engaged in agriculture in the USA in 1860 was about the same as that in India to-day, it is extremely doubtful whether the USA possessed a non-monetary sector as large as that in India at the present moment. As the process of economic development leads to the enlargement of the monetary sector, which is likely to be the case in India, the liquidity needs of the people would increase correspondingly. Secondly, the pattern of development proposed in the Draft Second Plan will lead to a widening of the liquidity needs of the economy. The plan has provided for the large-scale expansion of small-scale industries and for securing some amount of decentralisation of industries. About 39 per cent of the additional income to be generated in the next five years would accrue to persons engaged in agriculture and allied pursuits (31 per cent) and in small enterprises (8 per cent). A decentralised industrial structure needs more money

* Between December 1952 (when the money supply touched the bottom in the last five years) and December 1955, money supply rose by Rs 375.8 crores of which the share of deposit money was 29.6 per cent.

* In 1954, the value of Treasury Bills held by the scheduled banks actually declined from Rs 9.58 crores to Rs 6.69 crores.

for the satisfaction of all the three motives for holding cash balances. As the money economy penetrates into the non-monetary sector, as the industrial structure tends to be decentralised into small units, the process of development would call for a large rate of creation of money if prices are not to decline and the income targets laid down in the plan are to be realised in actual practice. The larger proportion of currency in the money supply in recent years may be regarded as providing evidence of the spread of the money economy into the rural areas. The necessity for taking account of this factor has been recognised by Dr Das Gupta who has assumed that the extension of the monetary sector would result in an increase in the volume of consumers' goods to be exchanged against money by one per cent per year.



Special Reasons

But the decline in income velocity may be the result not only of the widening of the liquidity needs of the people, but also because of the deepening factor. As is well known, people have been found to be keeping a larger proportion of their incomes in cash balances as their incomes rise in course of time. Apart from this general tendency, there are special reasons for a comparatively faster rate of growth in cash balances in the case of under-developed and poor countries. When the average income is low, the propensity to save is also extremely low. Cash balances represent saving as well as convenience. Whatever the strength of the motives of convenience and prudence, the amount of cash balances held on average would be comparatively low in the poor countries. As income rises, making it possible on the part of income-earners to hoard (in the Robertsonian sense) a portion, however small, of their incomes, these two motives would join hands to induce the people to build up their cash balances at a comparatively rapid rate. Only after the amount of cash balances rises to a certain minimum level, representing on average a larger proportion of the money incomes, it would become possible for income-earners to think of other available opportunities for the investment of the surplus balance. Even then, in view of the lack of the ready alternative opportunities for safe investment, income-earners may be forced to continue keeping large cash balances. This is specially the case in rural areas where banking institutions have not penetrated, and consequently banking habits are not widespread. Thus the general poverty and the underdeveloped nature of these countries impinge on the liquidity preference of the people in two ways: a rise in incomes enables and induces them to keep larger cash balances, and forces them, because of the absence of adequate opportunities for good investment, to go on retaining such balances. Hence a rise in incomes will be followed by a more than proportionate increase in the holdings of cash balances.

In fact, in the last two years, 1954 and 1955, the total money supply has increased by about 13 per cent, and the general index of prices declined by about 5.4 per cent. If we assume that the national output increased by about 5 to 6 per cent in these years, the income velocity must have declined by more than one per cent per year. Between the five years, December 1950 to December 1955, the total money supply has increased by 12.3 per cent and the general price index has declined by 10.6 per cent. If the national output is assumed to have increased during this period by about 11 per cent, as is the expectation under the First Plan, it is quite clear that the income velocity must have declined by more than one per cent per year. Coming to the organised sector, the average velocity of circulation of bank deposits has declined from an average of 15.6 in the four years before the War to 12.7 in the four-year period, 1951 to 1954.

While a decline in income velocity by more than one per cent per year may thus be envisaged as a probability, it would be necessary for the velocity to fall by about 5 per cent per year if prices are to remain stable with money supply varying between Rs 3,100 to Rs 3,200 crores. A decline of this order may not materialise. What will probably happen, as the result of the combined operation of the last two factors, is that prices will rise by about 14-15 per cent in the next five years, i.e., by about 3 per cent or 11 points per year.

These conclusions, as has been noted at the outset, rest on a number of heroic assumptions. One of the most important is the assumption regarding the comparative elasticity of output, at least up to the level of the various targets. If, for example, agricultural production becomes temporarily inelastic on account of seasonal factors, the prices of agricultural crops may go up, bringing about a temporary rise in the general index of prices, as has been the case in the last 10 months. These cycles of good and bad weather conditions are the inevitable concomitants of our agricultural system; and unless we are exceptionally unlucky, the present bad weather would be followed by at least moderately good conditions within a year or two, when the pressure of another good harvest would bring down agricultural prices. There is as yet no evidence that the supply of the essential agricultural commodities has become so inelastic as to give rise to fears of inflation. On the other hand, the present rise in prices shows a welcome trend in securing a better adjustment between the relative prices of agricultural and manufactured goods.

Reserve Bank of India

APPLICATIONS are invited for the following posts in the various departments of the Reserve Bank of India:

(A) **Posts and Scales of Pay:**

1. Research Officers, Department of Research & Statistics. — Rs 375-55-815 EB 55-925-60-1045.

The appointments to the above posts will be made on a temporary basis in the first instance but are likely to be made permanent.

Note: Candidates possessing exceptionally good qualifications and experience may be given a higher starting salary in the prescribed scale.

2. Probationary Assistants. — Rs 250-25-450 EB 25-650.

Note: Promising Probationary Assistants will be eligible for promotion as officers in the scale of Rs 375-55-815 EB 55-925-60-1045.

(B) **Additions to Pay:**

1. **Local pay:** 10% of pay with a minimum of Rs 10|- per mensem rounded up to next higher complete rupee to the staff working at Bombay, Calcutta, Madras, Delhi, Kanpur and Ahmedabad.
2. **House rent allowance:**
   - Research Officers: 15% of pay with a minimum of Rs 60|- and a maximum of Rs 300|- per mensem
   - Probationary Assistants: 10% of pay with a maximum of Rs 50|- per mensem.
3. **Dearness Allowance:**
   - Research Officers: At prescribed rates. The present rate is 16-2|3% of pay with a maximum of Rs 125|- per mensem.
   - Probationary Assistants: Rs. 65|- per mensem for pay (including local pay) upto Rs 300|- per mensem.

(The rate of Dearness Allowance is subject to revision from time to time).

(C) **Age Limit as on 1st May 1956:**

- Research Officers: Candidates should not ordinarily be over 30 years of age. The age limit may be extended upto 35 years in the case of candidates with exceptional qualifications and/or research experience of value to the Bank.
- Probationary Assistants: Candidates should not ordinarily be over 24 years of age.
  Age limit may be extended but not beyond 30 years in the case of candidates possessing special qualifications and experience of value to the Bank and also in the case of
  (i) candidates with approved war service
  (ii) ex-employees of Banking Institutions whose services have had to be terminated for reasons of economy or as consequence of the closure of unremunerative branches or as a result of the Banks going into liquidation,
  (iii) personnel retrenched from Government offices after at least one year's service, applying through the Employment Exchange, and
  (iv) candidates belonging to the Scheduled Castes or Scheduled Tribes

(D) **Qualifications:**

1. Research Officers, Department of Research & Statistics:

First or high second class Master's degree in Economics, or Commerce or Statistics/Mathematics of an Indian or foreign University or a Doctorate degree in Economics or Statistics of an Indian or foreign University and a period of research work in one or more of the subjects, viz, (a) monetary economics, (b) banking theory and practice, (c) international finance, and (d) sampling theory and econometrics etc; a period of practical banking training will be an additional qualification in respect of applicants with specialisation in (a) and (b).

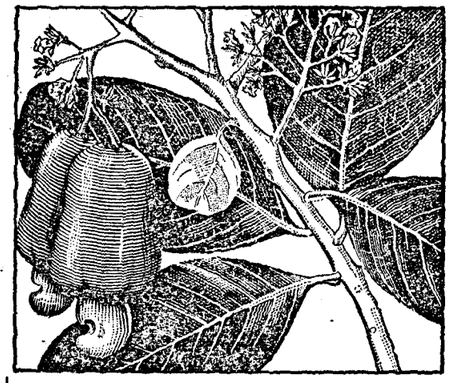
2. Probationary Assistants:

Applicants should have had a brilliant academic record and must possess a first or very high second class Master's degree or a first class Bachelor's degree of a recognised Indian or foreign University in Econo-

mics, Commerce, Banking, Accountancy, or Law as a special subject of study.

The Board will insist on a very high standard of suitability in making selections for the above posts and only candidates who possess good Academic Qualifications and adequate experience of the type specified are advised to apply. Candidates who wish to apply for more than one category of posts must submit separate applications accompanied by separate application fees.

The selected candidates for the posts of Research Officers will ordinarily be on probation for a period of 3 years which may be reduced or extended at the Banks' discretion. Candidates selected for the Probationary Assistants' posts will also be on probation for a period of 3 years during which they will be liable to be discharged at one month's notice or pay in lieu thereof. Candidates selected for the Research Officers' posts will ordinarily be stationed in Bombay but those selected for the Probationary Assistant's' posts must be prepared to serve in any office of the Bank in India.



Applications should be in a special form to be obtained from any office of the Reserve Bank. All the applications should be accompanied by copies of two testimonials (originals should not be sent; the Bank does NOT accept responsibility for returning the originals if sent through oversight) and forwarded to the Secretary, Central Recruitment Board, Reserve Bank of India, Central Office, Post Box No. 406, Bombay No. 1 so as to reach him on or before 1st May 1956. Candidates already in service must submit their applications through their employers. Candidates belonging to Scheduled Castes or Scheduled Tribes should mention this fact prominently on their applications.

Applicants for the above posts must remit application fees of Rs 7-8-0 per application by Postal Order, Chegue or Bank Draft on a **Scheduled Bank payable at Bombay** along with the application. The application fee is in no case refundable. Bonafide refugee candidates who are not in employment applying through any of the Government Employment Exchanges are exempted from payment of application fees while in the case of Scheduled Caste/Scheduled Tribes candidates the fee will be reduced to ¼th.

Appointments will be subject to candidates being found medically fit for service in the Bank. If any candidate desires to have his application acknowledged he should enclose a stamped self-addressed envelope or a post-card. Apart from those who may be specially called, interviews will not be granted to candidates nor will the Bank enter into any correspondence with them.

Canvassing in any form will be regarded a disqualification.

How banking serves the CASHEW-NUT INDUSTRY

Cashew-nuts were first introduced into India four centuries ago, but the organised industry is of recent growth. Already, however, it is second only to jute as a hard currency earner — exports being valued at 25 million dollars a year.

Seventy per cent of the total supply is grown in South Canara, Malabar, Cochin, Travancore and Goa. There is great scope for further expansion of the industry in South India, and banking will continue to play its part in its development. The facilities and guidance of a good bank, such as the availability of ready funds when needed, and the collection of dues in any part of the country, have become part of efficient organisation in every industry.

We at Palai are proud that so many important cashew-nut producers, and indeed leading firms in every field of business in South India, employ the complete banking service we offer:

Current Accounts — Demand Drafts —
Telegraphic Transfers — Investments —
Letters of Credit — Bill Collection —
Deposits — Loans & Overdrafts —
Confidential Credit Reports, etc.

If you have business interests in the South, it will pay you to open an account with us. Our 25 branches are strategically located, 23 in important South Indian business centres and two in Delhi and New Delhi; and we have correspondents in all important Indian cities. We offer a fully comprehensive banking service at each office.

Our clients can make deposits at any of our correspondent banks, and have the amounts credited to their accounts at any of our branches.

PALAI CENTRAL BANK LTD.

Head Office: PALAI — TRAVANCORE

Branches at: Madras, Madurai, Cochin, Quilon, Trivandrum, Mangalore, Bangalore, etc. Also at: Delhi & New Delhi.

A LEADING BANK IN SOUTH INDIA

PC.9865

Book Review

Bombay Middle Class

Report on the Survey into the Economic Conditions of Middle Class Families in Bombay City, published by K C Cheriyan, Joint Secretary, Indian Statistical Institute, Bombay Branch, c/o Reserve Bank of India, Mint Road, Bombay; pages 63 price Re 1.

Reviewed by **K C Chanda**

SOCIO-ECONOMIC surveys, especially those which are meant to study the economic conditions of middle class people of our country, are always welcome. But as the definition of a middle class family is rather difficult and varies frequently from place to place and even from time to time, the planning of such a survey is difficult too. Even if we accept almost all the families for which the chief earning member is a salaried employee as distinct from a wage earner, the question arises as to what should be the maximum income above which a middle class family ceases to be such. The economist can, of course, have his own definition and accordingly modify his population frame, but unless some standard definition is adopted, at least for the same locality or localities with allied economic conditions prevailing, the results of the survey cannot be reduced to a comparable form and hence, to that extent, fail to be of any use whatsoever.

Survey and Results

Again, since the ultimate aim of all Socio-economic surveys is to bring out the underlying continuity and trend of relevant economic activities, in short, to discover and co-ordinate economic laws, it is desirable that the results of the survey be published immediately after the field work and laboratory analyses are over, in order that these may serve as starting points for more improved investigations planned along identical lines. It is, however, an established fact that almost all Indian Surveys suffer from a conspicuous time lag between the completion of the survey and the publication of the final results and if we turn to the present report we find no exception to this rule. As the text of the report indicates, the Survey was conducted over the 12 months commencing in July 1949, the foreword written in 1952 and the general results published only in 1955. There must have been some good reasons for such a long gap in time, as is apparent from the preface itself, but it is to be borne in mind that as there have been large changes since 1949 in the country's economic system, the findings of the report may not now be of so much interest.

Otherwise, however, the report is quite good and we can certainly regard it as having definitely contributed to our general understanding of family conditions of middle class people in Bombay.

It is apparent from the report that the present survey is based on information gathered in the course of a small exploratory survey, conducted in the early post-war years and whose findings were published in 1949. The smaller survey was entitled "Report on the Diet and Health Survey of Middle Class families in Bombay City". Both the Surveys were undertaken by the Bombay Branch of the Indian Statistical Institute. The present survey is larger in its scope and covers 1,024 middle class households distributed over the entire city area of Bombay, a middle class household being defined as one occupying residential tenements having rents between Rs 16 and Rs 75 and for which the chief earning member or the head is a salaried employee.

Design of the Survey

A stratified sampling technique was adopted for the selection of households and although nothing has been mentioned in the text, the selection was presumably without replacement. There were four primary strata and each primary stratum was further subdivided into five sub-strata. The primary strata were formed on the basis of proportion of residential tenements belonging to the lowest rent group viz Rs 16 to Rs 20. The first excluded city wards and sections into which the wards were divided, containing 60 per cent or more tenements belonging to this rent group. The other three were composed of sections containing tenements of which respectively 40 per cent to 60 per cent, 20 per cent to 40 per cent, and 20 per cent and less belong to the lowest rent group. On the other hand those buildings which had the largest number of tenements in the rent groups (1) Rs 16 to Rs 20 (2) Rs 20 to Rs 30, (3) Rs 30 to Rs 50 and (4) Rs 50 to Rs 75 were classified under the sub-strata 1,2,3 and 4, respectively. Those which had fairly uniform distribution of residential tenements over all the rent groups were classified under the fifth sub-stratum. It is claimed that such stratification ensured greater homogeneity of middle class families inside each sub-stratum and at the same time rendered administrative work easier.

The sample of residential tenements to be drawn from each sub stratum was fixed proportional to the total number of residential tenements in the sub-stratum and divided into four sub-samples which were distributed among four, at first, and later among eight investigators engaged for this purpose. Altogether 4,316 tenements were selected for investigation, but partly because the head of the family was not a salaried employee or was a retired person and partly because of non-response, several households had to be rejected and the total number of completed schedules which were finally analysed was 1,024.

The schedule consisted of several main parts and they were (1) general information (2) housing (3) expenditure incurred during the month on different items (4) expenditure incurred during the past 12 months on a few selected items (5) details of income and savings (6) details of liabilities and (7) questions of general interest.

Broad Classifications

For detailed examination of data collected the households sampled were classified

(1) according to per capita expenditure level
(2) according to type of employment of the head of the household, and
(3) according to community.

The six per capita expenditure groups were defined as follows:

(1) Rs. 50 or less
(2) Rs. 50 to Rs. 75
(3) Rs. 75 to Rs. 99

(4) Rs. 100 to Rs. 149
(5) Rs. 150 to Rs. 199
(6) Rs. 200 and above

There were four categories of employments: (i) Government (ii) Railway (iii) Commercial firms and (iv) other institutions.

The five communities were:
(i) Hindus
(ii) Muslims
(iii) Parsi
(iv) Christian, and
(v) others

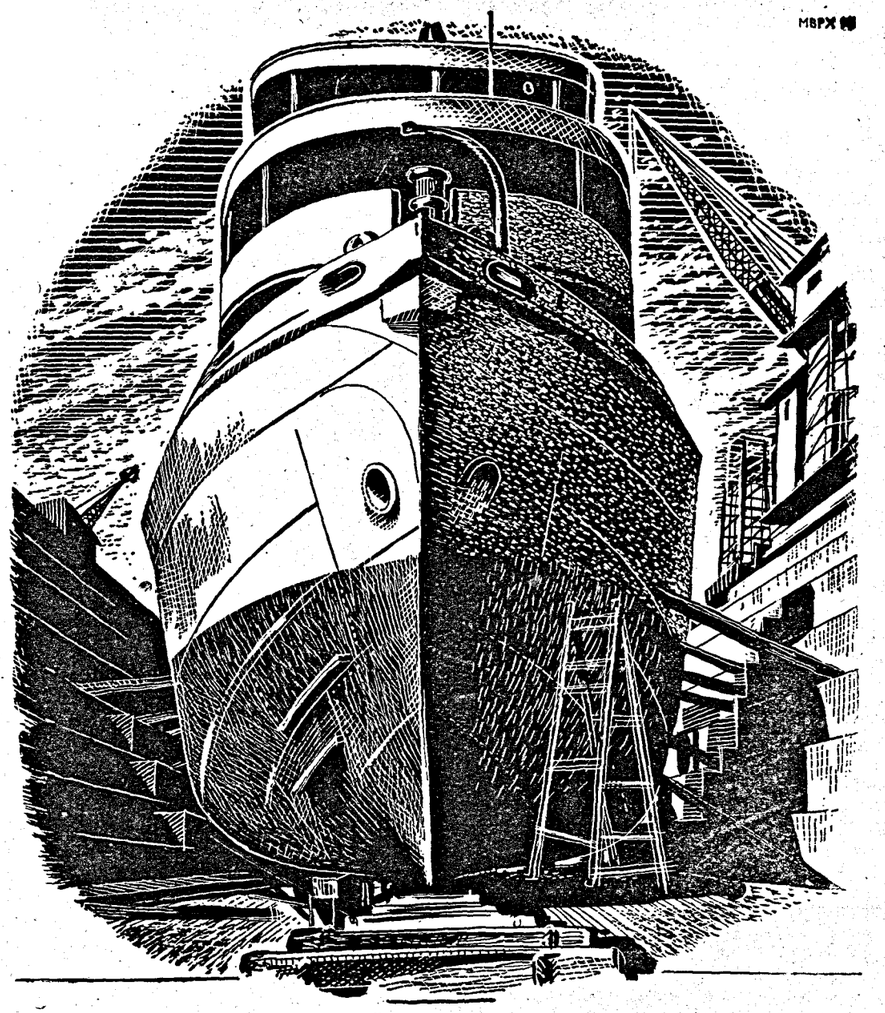
Chapter one of the report describes, in detail, the various aspects of the design and chapter two discusses the economic significance of the three different classifications defined above and contains a brief summary of the information embodied in tables 1.1 to 2.2 in the appendix at the end of the report. The tables contain details about the formation of the primary and substrata in respect of the city wards, sections and the number of buildings and residential tenements, both in the population and in the sample. Tables 2.1 and 2.2 show distribution in sample of residents per tenement classified according to expenditure level and type of employment.

Chapter three contains some observations on the composition of sampled households, and refers to tables 3.1 to 3.6 in the appendix. Details about the average number of adult males, adult females and children per household corresponding to the different expenditure levels and classified according to community and type of employment have been discussed in these tables. Further information such as the marital status of the head of the household, the number of children he has if he is married and the average number of dependents are given in tables 3.4 to 3.6. A separate section in this chapter has been devoted to a discussion of employment incidence, of course in sample, among adult males and adult females of middle class households classified according to community and per capita expenditure level. The results confirm the popular belief that the number of children per household is smallest among the most affluent middle class families and the largest among the poorest section and that the Parsis and Christians have smaller number of children, partly because the percentage of unmarried is larger among them and partly because the percentage of employed for both males and females is higher.

Chapter four discusses the types of residences in which middle class families live. Tables 4.1 to 4.6 in the appendix to which this chapter refers contain information about the type of residential buildings, the average number of living rooms per tenement, average living area per household and per resident, classified employment and expenditure-wise as also the information about kitchens or store-rooms, municipal water supply, arrangements for washing clothes and cleansing utensils, conditions of the floors, walls, ceilings etc and availability of such amenities as open space in the compound, garden, reading room etc. The author of the report concludes that 60 per cent of the middle class families live in chawls sharing common w c and bath rooms and only 28 per cent can afford the luxury of self contained flats. The average living area per person for the richest class, although almost twice as much as that for the poorest, is not quite adequate, which goes to prove the acute shortage of accommodation in the city of Bombay.

Consumption Patterns

Chapters five and six constitute the most important sections of the report. Chapter five summarises the information as given in the tables 5.1 to 5.8 in the appendix. The tables show the monthly expenditure in rupees on different food items of middle class households classified according to community and per capita expenditure level and give figures both for consumption per person and per consumption unit, which has been defined suitably in the introduction of the report. Further information is available in the form of average monthly expenditure per household on all the different items, food and non-food, over which the households distribute their total disbursements. The results indicate that the expenditure on food items increases with increasing expenditure level, but that the proportion of total expenditure on staple items like cereals, sugar and gur is lowest for the richest class, because of substantial transfer of expenditure towards milk and milk products, fruits and foods taken outside. The consumption pattern is almost the same for the different communities except that Christians, Parsis and Muslims take more of meat, fish and eggs, a fact which is well known and that expenditure on items like clothing and footwear, services, rent, amusement, medicines and miscellaneous are slightly higher among Parsis and Christians. Educational expenses are highest among the Hindus and expenses for ceremonials and religious activities are least among the Muslims.



Chapter six is complementary to chapter five and discusses in detail the income and earnings of middle class households. It is found that there is a large concentration (almost 70 per cent) of households in the monthly income group Rs. 100 to Rs. 300, that the main occupation of the head of the household accounts for about 92 per cent of the total income and that the monthly budget of an average middle class household always shows a deficit of about 17 per cent.

Chapter seven contains a summary of the answers to some questions of general interest which form the last page of the schedule and refers to tables 7.1 to 7.9 in the appendix.

Although much care has been taken to prepare the final report, the reviewer is of opinion that there are certain fundamental points which have not been properly attended to.

The greatest drawback of the report is that all the detailed information that is given in the different tables refers invariably to the sample of size 1,024 and no indications have been given as to how the corresponding population figures can be estimated. The estimation problem is no doubt, rather difficult, because the number of middle class households in the different categories are not known and have to be estimated on the basis of the sample drawn. These estimates will then serve as inflating factors for the sample totals or averages for such characteristics as the number of residents per tenement, the living area inside each tenement for a single person, monthly expenditure per household on the different items, food and non-food etc. The problem can be written down mathematically as follows:

Let there be 'k' categories in a given population and let 'Ni' be the total number of units belonging to the 'i'th category. A sample of size 'n' has been selected from the total number $N = \sum_{i=1}^{k} Ni$ of units and the number of units in the sample belonging to the 'i'th category is denoted by ni. Ni's are not known but the total N, is known. The problem is to estimate both Ni and

Ship Building and Engineering

A part of the Martin Burn Enterprise to make India industrially self-sufficient

MARTIN BURN LTD 12 MISSION ROW, CALCUTTA 1

Branches at: NEW DELHI BOMBAY KANPUR

the total $\sum_{j=1}^{Ni}$ Xij where Xij is the observation on the jth individual of the 'i'th category, on the basis of ni and $\sum_{j=1}^{Ni}$ Yij, Yij being observations in the sample and equal to a certain ni-set belonging to the Xij's $(j=1,2,\ldots Ni)$ determined entirely by chance.

The solution is not difficult, although a bit complicated and can be found in any ordinary text book on sample surveys. The standard error of the estimates can also be calculated likewise.

Even if we turn to less fundamental points, we can find several important omissions. For example, the educational level of persons belonging to the different middle class households was not recorded in the schedule although it must be admitted that this is a very significant factor influencing a middle class household.

Non-Response

Another important characteristic of the reports is the absence of charts and graphs. It is known that data represented diagrammatically always help to understand the underlying picture and may substitute for explanations in words and figures, thereby saving both time and space devoted for such explanatory statements.

As in other surveys, the problem of non-response was rather acute in present survey too, although a valid procedure could have been adopted by following up a few of the non-responses whereby estimates for the sub-population of potential non-responses could have been formed. Otherwise, if the non-responses themselves have a random character, in the sense that the total number of responses form a random sub-sample of the bigger sample chosen earlier, the analysis would be the same as if we are working on the sub-sample instead of the sample itself, but then, no such problems disturbed the minds of the statisticians in charge of the survey in as much as they preferred to keep the results as they are without bothering about the population.

Small-Scale Industries

Problem of Technological Change

K N Raj

THE controversy regarding the policy to be adopted towards household and small-scale enterprises in the second Plan has now gone on for over a year. In this controversy, there has been a tendency on the part of economists to take the view that the case for fostering such industries through protection depends primarily on humanitarian and political considerations. They seem to argue that on "strict economic considerations" there is no case for such protection, and that where this policy involves preventing or regulating the introduction of improved technology (as in the standard issue of handlooms versus automatic looms), it is positively injurious to economic progress.

This approach needs to be scrutinised a little more closely, particularly because it is a line which satisfies, almost instinctively, the intellectual and emotional needs of most of those who are called upon to deal with the problem. Economic progress has been historically associated with improved technology, and so it seems logical to them that any policy which retards or slows down the pace of technological change is necessarily detrimental to development. At the same time, it is obvious that the displacement of labour from existing techniques carries with it a certain amount of dislocation and human misery which, in all conscience, cannot be ignored. It does not, therefore, seem to them as inconsistent or opportunist to hunt with the hounds, advocating the need for technological change, and simultaneously run with the hares, openly declaring support for "the man behind the loom". The whole approach leaves so much elbow room and flexibility as to permit one to take positions on a purely *ad hoc* basis, which is its advantage and also its danger.

It is not necessary, in an analysis of this problem, to disavow the importance of humanitarian and political considerations. Indeed, the distinction that is sought to be drawn between them and what are referred to as "strict economic considerations" does not make much sense in terms of pure logic. But it is important to be clear about the assumptions and the criteria that are applied, and perhaps the best way of making them clear would be by defining precisely what one means by "economic" considerations and by being explicit about the assumptions regarding wage levels, minimum subsistence requirements, and the agencies which would maintain those displaced from employment.

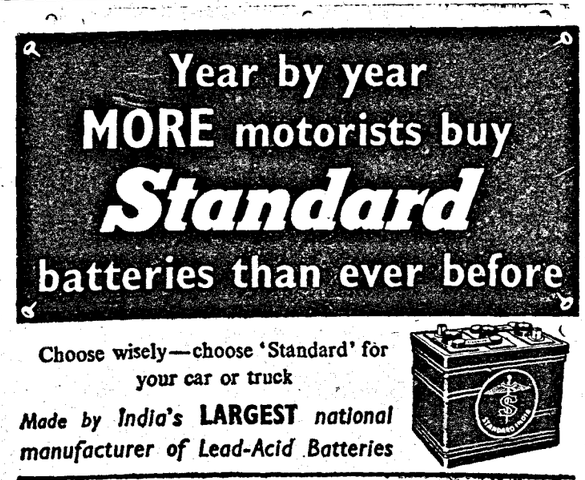
There are two criteria which are often mixed up when people speak of economic considerations. One is the maximisation of output and the other is the maximisation of the rate of growth of output. These have different implications, as we shall presently see.

It is not clear from the 'Draft of the Draft Plan-frame' which of the two criteria was the one in terms of which small-scale enterprises were favoured initially. The first impression one gets from a general reading of this Draft is that maximisation of output was the criterion. For it speaks of the need 'to increase the production of consumer goods as much as possible through the household or hand industries', and explains how this increased supply will meet the additional demand generated by investments in heavy industries and thus prevent undesirable inflationary pressures.

But elsewhere in the same Draft there is evidence of an uneasy recognition that perhaps maximisation of the output of consumer goods will not by itself be sufficient to curb the inflationary pressures generated by increases in investment in the heavy industries. For it goes on to say that 'the greater the marketed surplus of consumer goods in the household or hand industries the greater will be the possibilities of investments in heavy industries without any fear of inflation' (emphasis mine). To what extent such marketed surplus is likely to emerge, and whether it would be adequate for sustaining the rate of investment visualised, are not however pursued any further. Indeed, the whole problem raised here is forgotten in the very next sentence, which claims with satisfaction that 'by expanding the household and hand industries and construction work, the aggregate national consumption would increase continually'.

The lack of clarity in this matter is perhaps explained by an unconscious effort on the part of the framers to be loyal to both Keynesian and Marxist tools of analysis. In terms of the Keynesian system, savings from current income are merely 'leakages', and the problem is primarily to match the increases in demand generated by the initial dose of additional investment with increases in supply. If, therefore, the required elasticity of supply is assured, there is little more to worry about. But in the Marxist model, it is the surplus in one Department (i.e., in consumption goods industries) which maintains consumption in the other (i.e., in producer goods industries); accordingly, the size of the surplus, rather than the volume of the output which yields this surplus, is what matters; and if this surplus is small no increase in the rate of investment activity is possible.

Since the different modes of reasoning represented by these two theoretical systems entered, apparently un-noticed, into the exposition of the logic of the Plan-frame, it is no wonder that a sharp difference of opinion regarding the role of small-scale enterprises has been quick to develop even among those who are otherwise agreed in their support of the Plan-frame. Those with a Keynesian bias have, on the whole, tended to support the emphasis on small-scale enterprises (in company with the Gandhians), partly because of their larger employment potential, but more so on the ground that the low capital-output ratios in these enterprises will help to meet more adequately, with a minimum of investment, the demand generated by investment expenditures. On the other hand, those who have been applying the Marxist model (not all of whom are, by any means, Marxists!) have been, by and large, inclined to deflate the importance of small-scale enterprises and the advantage of low capital-output ratios. They see an inconsistency in the logic of the Draft Plan-frame, and argue that expansion of marketed surpluses implies more and not less capital-using techniques of production, since these surpluses can emerge only through rapid increases in the productivity of labour.



The reasoning on Keynesian lines is all right as far as it goes: if increases in demand generated by additional investment can be matched by increases in supply, the rate of investment and the volume of employment can both be raised without adding to inflationary pressures. In fact, if there are fairly long lags between successive rounds of expenditure and income generation in an economy, the rate of investment and the volume of employment can be raised in this way even when the marginal propensity to save of the income recipients is nil. But there are two points which are often overlooked in using this line of reasoning for supporting the role allotted to small-scale enterprises in the Draft Plan-frame.

The first is that, even if there are time-lags to prevent explosive increases in demand, it will be necessary to have a constantly rising volume of output to sustain the same rate of investment year after year, as long as the marginal propensity to save is itself small. The Plan-frame visualises not merely a rise in the rate of investment but a steadily rising rate of investment, and so one may enquire whether the increases in the output of consumer goods, planned for, would be adequate to meet the cumulative growth of demand. Secondly, even if the increases in output planned for are adequate, it does not follow that the minimum investment with which these increases can be realised is necessarily through relying on small-scale enterprises. For there is no reason to believe that the capital-output ratio is, or should be, always higher for the more advanced techniques involving larger units of equipment and organisation.

It follows from these two considerations that, even though an adequate elasticity of output can, upto a point, be depended on for initiating higher rates of investment, we cannot either ignore the importance of creating surpluses in order to sustain steady increases in the rate of investment or even take for granted that small-scale enterprises have, in all cases, the merit of economy in capital. This much must be conceded to those who argue against relying on small-scale enterprises for promoting a process of growth.

But the line of reasoning developed with reference to the problem of surpluses, and in terms of which unfettered technological change is advocated, needs also to be scrutinised more closely. For it has not been uncommon for those who have put this forward to ignore all the really significant issues involved by making two assumptions: (i) that the income of those engaged in small-scale enterprises is likely to be very small, that this is likely to be spent away entirely in consumption, and that, therefore, these enterprises cannot yield any surpluses at all, and (ii) that, when new techniques yielding larger output per unit of labour employed are introduced, the wage rates in these establishments will not rise, and also that the minimum subsistence requirements of those who are displaced from productive employment will not be a drain on the surplus yielded.

(To be Continued)

Around Calcutta Markets

Continued Recovery

Wednesday, Evening

TOO many holidays have intervened to distort the pattern of price movements on stock markets. During the holidays, equities moved up in kerb dealings. On the settlement day, clearing shares developed an easier trend. In sympathy, equities in general turned hesitant. To-day's price movements were rather surprising. Clearing shares fluctuated erratically, but closed above the day's bottom levels. There were, of course, reasons for this down and-up movement.

Even after the end of the payments crisis, "budla" charges have remained heavy. This does not necessarily mean that the market in, say, Indian Iron is in an overbought position. But it does mean that there are many weak, speculative buyers of Indian Iron. To-day, as also on the previous settlement day, there were erratic fluctuations in all the clearing shares. It is evident that the position in Indian Iron still remains delicate.

Bank Rate

In the last two days, there was another factor which influenced price movements in equities. On Tuesday, the stock market here closed steady. Later, in kerb dealings, Indian Iron slid back on rumours of a rise in Bank Rate. In the last three weeks, such rumours have invariably affected equities on Tuesdays and Wednesdays. To-day, again, Indian Iron firmed up in late kerb dealing as Reserve Bank returns did not disclose a higher Bank Rate.

Bullion prices continue to soar. Commodity prices are rising gently. Recent banking statistics disclose continued heavy borrowings by banks from the Reserve Bank under the Bill Market Scheme. Banks' balances with the Reserve Bank are being consistently depleted. These customary symptoms of inflation have been in evidence for sometime now. This explains periodic market rumours about a higher Bank Rate.

Speculation

Such rumours should have had an adverse effect on equities. Market commentators have been discussing the need to check inflation. But speculators do not seem impressed with their arguments. Nor is there any indication yet that New Delhi is alarmed over recent economic developments. It will be conceded that the time for a higher Bank Rate may not be yet. Yet it is widely believed that the time has already come for the Reserve Bank to introduce qualitative control of bank credits.

In the recent spurt, Dalal Street has moved ahead of Lyons Range. Investors here are, apparently, suspicious of the rapid rise in equities in recent weeks. On the Calcutta Stock Exchange, only the speculative clearing shares are moving up. Cash scrips continue to be relatively stable. It is clear that speculators have not yet succeeded in inducing investors to take interest in the market, though there is evidence that public buying is again on the increase.

Suggestions have been made that the relative buoyancy of Dalal Street is due to investment of nationalised life funds in equities listed there. This report, if true, should cause surprise. Scope of investment is wider in Lyons Range. Calcutta's commercial circles resent the gradual concentration of New Delhi's economic activities in Bombay. It was not without significance that West Bengal's Chief Minister suggested, in one of his recent speeches before a local Chamber of Commerce, that the head office of the Custodian of Life Insurance should be located in Calcutta.

Recent Trends

In the context of these wider issues, the recent behaviour of investment scrips may be analysed. Until a week ago, Tea shares were slowly moving up. Though the spurt in forward shares helped the improvement in Tea shares, the recovery was relatively slow. With the continued increase in auction prices, Tea shares experienced some spurt. But it was not without significance that these shares were marking time in the current week as the weekly auctions indicated an irregularly downward trend in prices.

In Paper and Coal shares, speculative investors have been testing the market for some weeks now. There are enquiries, but neither Paper nor Coal shares are confidently moving up. Investors seem interested in picking up sound shares in these groups, but not at prices dictated by the market. This has been a significant feature of recent price movements on the Calcutta Stock Exchange. No less significant is the behaviour of sound Miscellaneous and Engineering Shares.

These latter groups of shares used to respond quickly to movement in clearing shares. Forward shares have been moving up. Those Paper, Coal and Engineering shares which are included in the forward list are also moving up. But cash scrips in these groups remain relatively stable at lower levels. These are revealing features of the current phase of the Calcutta Stock Exchange. These are features which cannot be ignored by genuine investors.

Company Notes

United Commercial Bank

BECAUSE of the improved working results, United Commercial have raised the dividend from 5 to 5½ per cent free of income-tax, for the year 1955. In the year under review, the bank's deposits increased by Rs 7.27 crores. In terms of percentage, the increase in 1955 was higher than in 1954, and was also higher than the increase in the deposits of scheduled banks as a whole for the last year.

Of the increase in deposits, the bulk was invested in Government and other approved securities, as such investments showed a rise of Rs 5 crores. Including cash resources and unencumbered investments, the bank's liquidity ratio worked out at 50.62 per cent. Citing the increase in the bill business of the bank, Shri G D Birla, the Chairman, stressed that it was the aim of the United Commercial to maintain a high liquidity ratio.

Shri Birla expressed satisfaction at the continued improvement of foreign exchange business of the bank. He referred to the constantly expanding network of foreign correspondents and overseas connections in order always to be ready to handle any business that might be offered to the bank.

Around Bombay Markets

Impressive Performance

Thursday, Morning

DALAL STREET gave an impressive performance once again and is determined not to be outdone by the commodity markets, oilseeds, cotton, bullion and others. It appears to read an inflationary meaning in the trend of commodity prices and is in no mood to stop and ponder that commodities have a busy season as well as a slack season. The strength which was displayed during the brief spell of trading in the previous week asserted itself with renewed vigour.

Apart from general prospects of deficit financing concretized in the steady increase in currency circulation, speculative fervour has been kindled by prospects of higher cloth prices and dizzy profits of cotton mills. While the general temper of the stock market can be gauged from the height to which Tata Ordinary was lifted viz the record level of Rs 253 cum-rights, compared to some Rs 220 before the budget, it is Bombay Dyeing's last year's performance which has been directly feeding speculation at the moment.

Bombay Dyeing shot up by nearly Rs 50 to the record level of Rs 665 before closing at Rs 653-12. The company has made a profit of Rs 25.30 lakhs after providing as much as Rs 29.5 lakhs for taxation and a similar amount for depreciation. A notable feature of the company's report was the disclosure that shipments of automatic looms would commence from the middle of the current year and that deliveries will be completed by the end of 1957. There had been prolonged discussions between the company and the Government over this question, but it is only now that doubts about expansion are finally laid to rest. The company has been granted import licence for the installation of 1206 automatic looms for their Spring Mills. These will be of the latest type and of the highest quality obtainable and will replace 1742 existing obsolete power looms. A second shift, it is reported, will be started immediately the installation is completed and if this is done, production may be easily doubled by the end of 1957.

Led by Bombay Dyeing, other mill shares also forged ahead, the more notable being Century, Kohinoor, Gokak and Finlay. However, towards the end of the week, there was some reaction.

In the miscellaneous group, ACC, which had been rather quiet following the announcement of new issues at Rs. 20 premium, firmed up on investment and speculative support, and fully recovered their losses. Belapur, Bombay Burmah, and Premier Construction also received considerable bull support.

Cotton

Above Price Ceiling

The spot market in Sewri remained somewhat subdued during the week. Nevertheless, prices in most cases, remained well above their official ceilings. Towards the close of the week, however, prices sagged a little, except for Vijay, which continued to get good support.

The resumption of futures trading is still hanging fire. Although this is the longest period for which cotton has been without a futures contract—it is over three months—there is no sign yet of any move forward. This prolonged deadlock is causing considerable concern in trade quarters. Speaking at the annual meeting of the Dawn Mills, Shri Ramanarain Ruia, said "I feel the forward market is not likely to reopen unless the Government revises its policy in consonance with the market trends". Naturally, he found it "difficult to understand the policy behind the Government's action". If all other commodity prices are allowed to rise, he argued, why should Government single out cotton for special treatment? In short, Shri Ruia and the cotton trade generally want the Government to revise its price policy and forget all about maintaining prices at a "reasonable level". More pertinent, however, is his complaint that the cotton trade in general as well as the textile manufacturers are suffering in the absence of hedge facilities, and that some thing should be done to help them with a forward contract.

The pattern of trading in the spot market in the past two to three weeks has been such as to make the Government sit up and take notice. Prices of all popular varieties have pierced the official ceilings. Had the futures market been functioning, the trend of cotton prices would have been even higher if the general belief is accepted that the forward contract acts as a price support. Judged from this angle, Government is not likely to take any steps to effect resumption of forward trading in cotton.

What about prospects of a decline in prices in the spot market in the near future? As spot prices were not affected even by the refusal of the Government to extend a period of grace to shippers in respect of their export licences which expired on March 31, it is unlikely that they will now come down much below the ceilings. One may therefore safely predict a continuation of the stalemate in cotton, but nothing more positive than that.

Oilseeds

Export Policy Uncertainty

In contrast to the stock exchange and the cotton market, oilseeds had rather a dull week and the undertone was quiet. The statistical position in respect of almost all seeds is tight; this is no doubt a factor of considerable bullish significance. Nevertheless, the market is hesitant and apprehensive. There are reports that Government may shortly change its export policy and traders fear that these changes would adversely affect their interests. In the event, there was nervous trading, particularly towards the close of the week which brought about a sharp decline in rates for castor, groundnut and linseeds. That interest rates charged by banks may be raised further was another factor which made buyers hesitate to enter into fresh commitments, while operators were eager to dispose of their contracts.

Castor May opened very firm at Rs. 138-8 and went as high as Rs. 139-4 but lost nearly Rs. 4 to Rs. 134-10 and closed on a subdued note at Rs. 136-4. Meanwhile the Ministry of Food and Agriculture has reported an increase both in area and production of castor seed during the current year, the final estimate being 4.9 per cent higher in acreage and 2000 tons or 1.6 per cent. in production.

Ceylon Goes Socialist

FOREIGN correspondents, though not the world's chancelleries, may interpret Ceylon's election verdict as a Buddhist revolt against that country's Christian politicians. Superficial commentators may explain the ignominious defeat of the ruling United Nationalist Party by emphasising the language problem. They may stress the obvious fact that Sir John Kotelawala and his UNP have lost touch with the people. Apologists have remarked that the defeat of the ruling party after a long spell in office is neither surprising nor unexpected. But those who are aware of social, political and economic trends in post-war Asia will not miss the significance of Ceylon's election verdict, even as they will not be surprised by the sweeping victory of Mr S W R D Bandarnaike and his Mahajana Eksath Peramuna. Social, political and economic compulsions explain why Asia leans towards Socialism. Ceylon is no exception.

All newly-independent Asian countries have a bias to the Left in politics. In all Asian countries, there is an urge to eliminate poverty, resentment against vested interests, foreign and national, and a determined desire among the people to vote that party or coalition to power which promises to fulfil these wishes of the people. It is so in Burma, India and Indonesia. Ceylon's elections conform to this pattern of development. This socio-political trend is spreading in west Asia. Pakistan, though not necessarily eastern Pakistan, Thailand, South Vietnam and the Phillippines are exceptions. It is not without significance that these latter countries are either members of regional military pacts or have bilateral military aid arrangements with America, and that these countries alone in Asia pursue a policy of alignment with either of the rival power blocs.

Sir John and his United Nationalist Party have lost the elections in Ceylon because they have not learnt the lessons of post-war history in Asia. Ceylon's UNP has some similarity with the ruling parties in India, Burma and Indonesia. It fought for independence. It became the party in power after independence. But, unlike Congress in India or U Nu and his party in Burma, UNP has not adjusted its policies to changing conditions and circumstances. Congress won the first general elections in India by formulating the first Five-Year Plan. If Congress wins the second elections, it will be because of Avadi. U Nu has remained in power because of his bias to Socialism. Indonesia tells the same political tale. Only the Muslim League in Pakistan is an exception to this political trend, though the rout of the Muslim League in the elections in eastern Pakistan, explains the defeat of UNP in the Ceylonese elections.

Issues on which Mr Bandarnaike and his United Front have fought and won the elections are symbolic of the political cross-currents in south-east Asia. It was inevitable that in Ceylon, a former crown colony, the precise relationship with Britain was a minor issue in the elections. There were immediate circumstances associated with the transfer of power in Burma which influenced her decision to opt out of the Commonwealth. Ceylon's Communists and Trotskyists are in favour of severing the Commonwealth link. But, along with Congress, Mr Bandarnaike's United Front is not opposed to the Commonwealth concept, though the Front is committed to declaring Ceylon a Republic. On this

issue, Ceylon's United Front is in agreement with Congress in India. Even Pakistan has emerged as a Republic. In India, Burma and Ceylon, the Republic is popular as a political concept, and for similar reasons.

Though Asia leans to the Left in politics, it is not Communist. In Burma, the armed Communist revolt has lost much of its force. The Communist Party has lost its hold in India. Ceylon's Communists and Trotskyists have not gained ground in the elections. U Nu overcame the Communist opposition by turning to Socialism. CPI's discomfiture stems from the Congress policy of ensuring a socialistic pattern of society. This same political trend explains Mr. Bandarnaike's election success. He is not a Communist. But he and his United Front have a bias to Socialism. It is, therefore, natural that he will have a bias against vested interests. But Ceylon's tea and rubber planters have the assurance that the United Front will pay legitimate compensation in cases of nationalisation. Ceylon's election verdict confirms the major political trends in Asia. Her people have an affinity to Socialism. They and their Government believe in peaceful co-existence. It, therefore, follows that they are in favour of closer relations with both Communist States and Western Powers, and that they are opposed to regional military pacts. Because these are the election programmes of the United Front, Mr Bandarnaike and his party have been voted to power.

New Delhi will welcome Mr Bandarnaike's election success. In his election speeches, he has emphasised his endorsement of New Delhi's foreign policy. Mr Dulles may feel angry that the defeat of Sir John means that Ceylon will not join SEATO. But Ceylon's neighbours will welcome Mr Bandarnaike's foreign policy of non-involvement. Her people will hope that trade will follow the United Front's election pledge to have closer relations with Peking and Moscow. Equally welcome to New Delhi is Mr Bandarnaike's liberal attitude to the problem of Indians in Ceylon. He is committed to a policy of absorbing the maximum number of Indians on socio-economic grounds and to make arrangements for repatriation of the rest under an agreed basis of compensation. He has expressed the hope that his endorsement of Pandit Nehru's political and foreign policies will facilitate an agreement between the two countries on the problem of Indians in Ceylon. New Delhi will welcome the United Front's victory in the hope that it will strengthen the forces of peace in south-east Asia, besides leading to a solution of the issue in dispute between India and Ceylon. And the people of India will hope that Mr Bandarnaike will fulfill his election pledges so that Ceylon and her people can enjoy peace through prosperity.

Unutilised Capacity

HOW well are our industries working? To what extent is the production capacity in the country being actually utilized? For an answer to some of these questions, one has to wait for the administrative report of the Ministry of Commerce and Industry which gives in a convenient form information on some of these points. The story has been for the last couple of years of increasing utilisation of capacity in engineering, chemical and other industries. In this respect, there is no change to report; the same trend has been maintained. In order to get an idea of the progress during the first Plan period, the installed capacity of these industries and the actual production year by year has been brought together elsewhere in this issue (see pp. 451-53). These figures of production generally indicate increases in output without any increases in capacity in most cases. The extent of idle capacity in the industrial sector is a very important indicator, particularly when a large measure of deficit financing is being planned. The rationale of deficit financing would be seriously called into question, unless there was substantial idle capacity in the economy to draw upon, and of the latter, naturally, the idle capacity in industry is easier to determine as also to utilise, than capacity of other kinds.

To repeat, the data released by the Ministry of Commerce and Industry suggests a welcome improvement in the utilisation of capacity. To these, two qualifications are necessary. First the data presented here cover only a part of the industrial sector; major industries like cotton textiles, jute, and iron and steel are left out from them. Secondly, the determination of capacity leaves much to be desired. The point has been raised many times in these columns. How unhelpful the official rating of capacity could be was brought out sharply in the controversy over the future of the cotton textile industry when the Ministers of Commerce and Industry and of Planning came out with widely varying estimates. It is not necessary to labour the point further since the Ministry itself has accepted the necessity of a proper re-assessment of capacity. A re-assessment, we are told, is actually under way in a number of industries. But it will serve little purpose unless the basis on which it is being carried out is made public so that finally not only a technical but also an economic assessment of the problem is made possible.

Here we have a flattering record of steadily increasing utilization of capacity while only the other day Prof Paul Baran from Stanford referred approvingly in these columns to a statistical study by the ISI which had shown that "the under-utilization of existing productive capacity in India reaches as much as 40 per cent. The situation is even worse in some individual industries". Despite the accent on increasing utilization of capacity, if the data in the Ministry report is taken as a whole, the estimate would not differ from the above very substantially.

How useless a merely numerical assessment can be would be apparent when it is reported for instance that 30 of the cotton mills are too uneconomic to continue in production, that nearly a third of them has been condemned as hopeless, while about an equal number have been given assistance to enable them to resume production, and the fate of the balance still remains to be decided. Estimates of capacity, therefore, would not be meaningful without some idea of the magnitude of effort that would be necessary for the full exploitation of this capacity. There is another sort of problem in industry which, of course, is not brought out by figures of actual production or of the statistical measurement of capacity, viz., the degree of interdependence, extent of decentralization of production and a full knowledge of the many gaps that have to be filled before capacity can be utilized to the maximum advantage. The Ministry report is least helpful in throwing any light on this group of problems.

To turn to the data presented in the report:

In the enginering group, increases ranging from 50 per cent to 100 per cent of the 1954 output are reported in the production of ring spinning frames, electric winding wire, machine screws, duplicators, automobiles, sparking plugs, fuel injection equipment, electric house service meters, incandescent lamps carding engines, and small and hand tools. Apart from these, there was a 310 per cent increase in the output of steel structures, a 35 per cent increase in the output of bicycles and a 25 per cent increase in the output of sewing machines. Ball bearings which had shown a substantial increase in output during 1954, showed a further 11 per cent increase during 1955.

As increase in production has been achieved during these years without any increases in capacity in most cases, a natural consequence of this tendency has been the formulation of plans for expanding the capacity of those industries which have reached near their limits of capacity. Some of these plans have already fructified during the year, notably in the ball bearings industry, and the consequent fall in the ratio of output to capacity, in spite of further increase in production during 1955, indicates a reversal in the trend towards an increasing utilisation of capacity in all such industries which have programmes of expansion. In the ball bearings industry, for example, the single unit which had a capacity of 600,000 in 1954, actually produced 702,309 during that year. While production increased by a further 11 per cent in 1955 to 806,232, the fact that capacity was raised in the meantime by 50 per cent to 900,000 has meant a fall in the ratio of utilisation of capacity.

In the meantime, capacity did not prove to be any hindrance to expansion of output. The output of woodscrews which was already higher than capacity during 1954, showed a further increase from 5,196.7 thousand gross to 5,743.9 thousand gross during the year. This was possible because of the working of two or even three shifts by many industries. Last year, the Ministry report had referred to several industries in the Engineering groups that had worked extra shifts. This year's report does not mention the subject at all. It would certainly be worthwhile for the Ministry to carry out a study of shift working in different industries today and examine the possibilities of its extension to others. More light on this subject would be welcome. After all, increasing capacity may not always be necessary or desirable merely because production was reaching capacity, if the possibilities of shift working had not been explored. In the light of the capital shortage in the country, there is much to be said for approaching the problems of industry from this direction also, along with that of decentralisation on the one hand and closer integration on the other.

The standard of good time-keeping set by West End Watches has been maintained for well over half a century and is as zealously guarded to-day as ever. It is proof of the high craftsmanship and the excellence of the materials which combine in making West End Watches the best that money can buy. They are in fact made specially for wear in India and our long experience ensures that movements and cases alike satisfy local requirements.

BOMBAY CALCUTTA

Weekly Notes

Mahindra Scholarships

AT an informal function at the Taj, Shri K C Mahindra, of Mahindra & Mahindra Ltd, explained the objects of the Trust which he has endowed for promoting engineering education in this country. The Trust was actually established a couple of years ago, but the Trustees preferred to accumulate the incomes of the Trust to a substantial sum before setting about implementing the objects. Among the objects of the Trust are to create a Chair or Professorship for some specialised branch of engineering technology, to award scholarships to suitable Indian candidates for the study of engineering in India or abroad and thirdly, to bring out publications for the advancement of engineering technology.

The Trustees have been given a great deal of discretion and they have decided to make a beginning by awarding for advanced education in engineering:

(a) Two Senior Scholarships for Oversea study or training valued at £450/500 per annum for three years, and

(b) Three Junior Scholarships for training within India valued at Rs 250 per month for two years

Applications for these scholarships will be invited shortly.

The growth of corporate finance and the position that big corporations have come to occupy in the life of modern communities have made them take up more and more the patronage of art and science which had formerly been the privilege as well as the obligation of princes and wealthy men to discharge. So there is nothing surprising that Mahindra and Mahindra should enter the field, following the footsteps of the Tatas and a few others, unfortunately too few. The point should be noted, however, that the Trust is a creation of Shri K C Mahindra himself; it has nothing to do with the firm bearing the same name. There is nothing especial either in the award of scholarships for study overseas. These are intended for those who have already acquired high qualifications, a first class honours degree in engineering or science, or an equivalent attainment is expected of the candidates. There is something very especial, however, in the junior scholarships which are to be awarded for training in India. The amount of the scholarship has been fixed at a sum which will relieve the student or trainee of all financial worries during the period of its tenure so that he may concentrate fully on his work and give a good account of himself. And Shri Mahindra entertains the hope that it may be possible to pick out for this purpose promising young men and help them to acquire the training which will enable them to meet a crippling shortage in the present organisation of industry, viz, that of supervisory staff of the foreman class. It is to be devoutly wished that the experiment succeeds. If it does, it will remove a very serious lacuna.

As industrialists know it to their cost what even the casual observer does not fail to notice, though we are short of properly trained men in almost every sphere, the worst shortage is not in the ranks of the MIT trained boys or engineering graduates. The rank and file of workers are not throwing up the right type of supervisors because factory hands do not have the requisite education to start with, and workers' education through evening classes and other means has not yet been organised efficiently enough to be able to remove this lacuna. This is to put it rather mildly; hardly a beginning has been made yet in this direction. But true to the kindred point of heaven and home, however keenly Shri Mahindra may feel the lack of suitable supervisory staff, he does not think that we can afford to slacken in the search for the highest technique, if standards are to be raised; and they have to be raised if we are to get somewhere. Hence the necessity of keeping the doors open for oversea studies and providing facilities for acquiring the highest qualifications in technical education.

ICIC and Ministry of Finance

THOUGH it handles a lot of public funds—what else are the World Bank loans to it and the counterpart funds from the sale of U S steel?—the Industrial Credit and Investment Corporation, Sir Ramaswamy Mudaliar was at some pains to explain at its first annual general meeting, was very much in the private sector and should remain so, if it was to serve the purpose for which it had been set up. There was real danger of its losing its private character since now, after the nationalisation of insurance, Government has come to own 18 per cent of its share capital. But Sir Ramaswamy has had an assurance from the Finance Minister that as a major shareholder, Government has no intention of influencing the day to day working of the Corporation. Granted its private character, it does not follow, however, that the decision of its Board of Directors to withhold from the public the names of companies with whom they do business is wise or that it will be possible to maintain this secrecy in the future. Taking the industrial scene as it is today, it is unlikely in the extreme that the Corporation will be able to maintain it for long.

In another way, nationalisation of insurance has affected the Corporation. It has, at least for the time being at any rate, put an end to a very interesting and promising experiment in underwriting and floatation of new issues in which the Corporation, reading between the lines, appears to have worked out a successful technique largely with the co-operation of a select group of insurance companies. Evidence accumulates, and Sir Ramaswamy lends his powerful weight to the contention that it is high time for the Finance Ministry to straighten out the investment policy of the insurance companies which it has taken over. To the general complaint of the loss of influential support to the Stock Exchange, Sir Ramaswamy adds a more specific one. If a healthy investment market is to be maintained and new issues are not to be written off as a source for mobilising savings, it should be looked into without further delay. But against unsolicited advice from busybodies on how the private sector should be run, however, even Sir Ramaswamy's powerful voice will not be a deterrent. That delicate plant, the investment market, one should have thought, must have acquired some measure of immunity from such things by now.

Independent Morocco

GIDI MOHAMMED BEN YOUSSEF, Morocco's popular Sultan, is an able negotiator. Both Paris and Madrid have yielded to his demands. Both France and Spain will quit Morocco. As soon as France decided to transfer power to the Sultan, it became evident that Spain will have to withdraw from Spanish Morocco. General Franco has, in recent years, been a champion of Arab rights. There have been conflicts between Paris and Madrid because of the Caudillo's pro-Arab policy. It was not without significance that, in transferring power to the Sultan, France promised to secure recognition of the integrity of the Moroccan territory by others. Franco might have disliked this oblique hint by Paris, but he could not refuse recognition of Spanish Morocco's independent status after the French decision to withdraw from French Morocco. His gesture will be widely welcomed. There will be hope in New Delhi that the Portuguese dictator will have the wisdom to profit by the Caudillo's tactful diplomacy.

In pursuance of Franco's pro-Arab policy, Spain has given an undertaking to make "Moroccan independence effective" Paris had agreed earlier that the future relationship between France and French Morocco would be based on an equal and sovereign status. France will no longer have the right of veto over legislation. Morocco will have control over its foreign affairs, and will be allowed to build its own Army. But, as in Tunisia, the Sultan of Morocco has agreed to ensure the "inter-dependence" between France and Morocco. In Tunisia as well as in Morocco, the future depends on three factors. Recent demonstrations in Tunis are reminders to both France and Spain that there are influential political elements in both Tunisia and Morocco who are suspicious of the treaty provisions relating to continued 'inter-dependence' between France and these two countries. Paris and Madrid can help assure smooth relations between the metropolitan powers and their former colonies in North Africa by transfer of power without any political or economic reservations. In both Morocco and Tunisia, the colonists will have to adopt a conciliatory attitude to avert future racial or political conflicts. No less significant are the policies pursued by those who have now gained power in Tunisia and Morocco. Both M Habib Bourguib and Sultan Ben Youssef are popular. Both, and particularly the Sultan of Morocco, will need statesmanship to establish governments which are democratic, and are representative of the people.

Cambodia in Trouble

TROUBLE has been brewing in Cambodia for some time. Cambodia is the only State in Indo-China which has held free elections as envisaged in the Geneva Agreement. Cambodia and Laos are not members of SEATO, but these two States are within the orbit of SEATO. This focuses attention on an intriguing aspect of America's pressure tactics. Prince Norodom Sihanouk has had occasion to complain that though Cambodia is not a member of SEATO, the Western Powers "want that I should not declare that I am outside SEATO". Prince Norodom and his party won a decisive victory in the elections held last September. He is opposed to alignment with either of the power blocs During his recent visit to Peking, he signed a joint declaration accepting **Panch Shila** as the basis of relations between nations. Prince Norodom's visit to Peking caused irritation in Washington America has threatened to withdraw military and economic aid from Cambodia.

Thailand is a member of SEATO. In South Vietnam, Mr Diem has established a regime which has the active support of America. Threatened by military encirclement and economic blocade by Cambodia's neighbours, Thailand and south Vietnam, Prince Norodom has resigned. Soon, the Cambodian Popular Congress will meet. Prince Norodom seems confident that his foreign policy will be endorsed by the Popular Congress. At the time of his resignation, Prince Norodom issued a warning to the Western Powers and their SEATO allies that, in the event of continued military and economic blocade by her neighbours, Cambodia will be forced to change her foreign and economic policies. Mr Diem is evidently angry that Prince Norodom is unwilling to recognise his regime in south Vietnam. What provoked Thailand to close its borders with Cambodia is not known. But the tension in Cambodia raises the question about America's responsibility to ensure that countries receiving military aid from her do not abuse such help in pursuing an aggressive policy to their neighbours. Prince Norodom is not a Communist. Cambodia's neutrality has the support of New Delhi and Bandung countries. Cambodia is not under any threat of aggression from Communist China. Prince Norodom has the diplomacy to be aware that, threatened with Communist aggression, Cambodia can defend herself by joining SEATO. Mr Dulles misses no opportunity in emphasising the dangers of Communist infiltration tactics. Developments in Cambodia raise the question of military, political and economic pressures by some countries in Asia which are members of military alliances in this region, or which receive military and economic help from America under bilateral arrangements.

Indian Aluminium

WORKING results of the Indian Aluminium Company Ltd., for the year to December last were encouraging. Sales of the Company's products improved. Efforts towards new uses of aluminium in railway coaches and wagons, bus bodies and various kinds of buildings and structures met with considerable success. Higher sales were possible because of improved production.

In 1954, the expansion of the Alupuram plant was completed. But only in March, 1955, was sufficient power available to raise the output of aluminium ingots to 5,000 tons per annum. At the Belur fabricating plant, additional machinery was installed to increase the range of aluminium alloy products. With the help of technical experts, the Company continued to make progress with the production of medium-and high-strength alloy materials for use by transportation industries. At the Kalwar works, the production of aluminium paste reached installed capacity. To cope with the increased demand for aluminium paste, measures were taken to improve output capacity. These arrangements to raise output of aluminium paste will begin to take effect from the current year.

Encouraged by the growing demand for aluminium, the directors have been considering the erection of another smelter besides the Alupuram plant. They have decided to erect a plant at Hirakud with an initial annual capacity of 10,000 tons. A plan for raising the annual capacity to 20,000 tons is under examination. This factory is expected to start operation by the end of 1953.

After the Hirakud smelter starts functioning, the major bauxite—aluminium expansion programme will begin. These expansion plans are likely to be completed by the end of 1961.

Indian Aluminium's share capital has been increased by Rs 4 crores to Rs 6 crores. Ordinary shares of Rs 100 each have been split into ten shares of Rs 10 each. During the year under review, the Company distributed a dividend of nine per cent. In the previous year, no dividend was declared.

Indian Oil Tankers

THERE has been quite a stir in the otherwise placid waters of Indian shipping. It was announced in a Press Conference last week that Great Eastern had acquired an oil tanker and chartered it to Standard Vacuum for carrying gasolene, kerosene and diesel oil from the Stanvac refinery in Bombay to all the coastal ports. The tanker, christened 'Jagjyoti', has a deadweight tonnage of 13,125 and a draught of 27' 9½". Great Eastern have chartered ships themselves very successfully and have even succeeded in selling the idea to the other members of the Coastal Shipping Association who had at first not only resisted but had actually put their foot down against it. They have been the first not only to own an oil tanker in this country but also the first to charter out their vessel successfully, presumably on a long term contract. Eastern Shipping Corporation, it is understood, will soon follow suit and acquire an oil tanker and charter it out to Burmah-Shell.

Thus has been solved, to the complete satisfaction of all the parties concerned, it seems, the dispute raised by the shipping companies when refineries first came to be established in India. Their contention was that much oil and oil products from the refineries would have to be transported from Bombay to the coastal ports. And for it, coastal tankers were the obvious answer. Why should they not get a cut on it by having tankers of their own? Failing that, they were even prepared to let the Government handle the transport of oil, so long it was carried in Indian bottoms. It has actually worked out fifty-fifty for Great Eastern is very much private enterprise and Eastern Shipping Corporation is now almost wholly public owned, or is soon going to be.

This is not the first time, however, that Indian shipping would be carrying oil. The credit for pioneering in this field and diverting from dry-cargo tonnage also goes to Great Eastern who first started carrying edible oils in bulk on the Indian coast some five years ago.

Why not for Foreign Trade?

THIS much about the tankers for coastal shipping. What about tankers under Indian Flag for the transport of oil overseas? With two of the refineries in operation, we have already developed a considerable export trade in petroleum products. This must have come as a surprise to many. Partly, the exports are fortuitous and may be only temporary, so long as Caltex refinery does not go into operation. For the present, production is somewhat unbalanced. We have an excess of petrol and a very great shortage of kerosene, the bulk of which has now to be imported. There being no refinery east of Abadan until one comes to Japan, we are exporting petrol, diesel and industrial fuel oils to Pakistan, Ceylon, Burma—in fact, as far as Indonesia and Phillipines. On the contrary, except 5 to 7 per cent of our requirements which is met from the Digboy Oil field, the whole of our requirements of crude has to be imported, as well as the bulk of our kerosene requirements. According to the latest report of the Ministry of Production:

"The production of the existing refineries has made the country surplus in motor spirit and furnace oil. This surplus is being exported to other countries. There is, however, still deficiency of kerosene, diesel oils and bitumen.

"Aviation spirit also continues to be imported to the extent of our requirements. Lubricating oils, too, are imported, except for the small production available from the Digboi refinery."

It seems, however, since we are already surplus in motor spirit, when Caltex refinery goes into operation—its erection is scheduled to be completed by the new year—we shall continue to maintain considerable exports. It is time, therefore, for Indian shipping to try to have a cut on the transport of oil products to and from India also.

Indo-Soviet Shipping Services

AS trade followed the flag and the flag followed shipping, one of the legacies we have inherited from the past is the present alignment of shipping routes, which radiate from British and West European ports and girdle the globe. The lack of regular shipping services between India and her neighbouring countries with which she wants to cultivate closer economic and commercial relations is to-day a serious impediment. Except for Ceylon and Burma which come within the orbit of our coastal shipping, we have no regular sailings with the Middle East or South East Asia. Partly the reason is that there is no adequate trade to support regular sailings. But partly also there is little or no trade, because there are no regular shipping services. As the pattern of trade changes, shipping must follow suit. In fact, it has often to initiate the change. This is going to happen in a spectacular manner in India's trade with the Soviet block in Europe. This was heralded by the agreement which was signed this week between the Governments of India and U S S R, establishing a regular shipping service between India and Soviet ports, with the object of expansion of trade between the two countries. In fact, the services are called for for the implementation of our existing trade agreements.

India and U S S R are to provide six ships each of a total tonnage of about 55,000 DWT and the volume of transport that is currently envisaged, it is expected, will keep all the 12 ships fully busy. More ships may be assigned to the service by mutual agreement, if the volume of cargo makes it necessary to do so. The Indian ships which are to serve on this route have been drawn from different Indian shipping companies, the vessels listed being Jalamohan, Jalajyoti, Indian Importer, Indian Endeavour, Bharat Bhushan and Bharat Veer. The schedule of sailings will be jointly drawn up by the representatives of the two Governments who will also distribute the cargo between the vessels of the two countries on a parity basis, revise freight rates and solve other questions connected with the operation of the service. Indian vessels in Soviet ports, and Soviet vessels in Indian ports shall enjoy the most favourable conditions allowed by the laws, rules and regulations applicable to those ports and will be provided with full service and receive all the provisions necessary for normal sailing.

There is one snag, however. While Indian ships at Soviet ports will be handled by the Soviet agency "Infloat', Soviet vessels in Indian ports will be handled by Indian firms to be appointed by the Soviet agency. It is a normal practice, of course, for foreign shipping companies to select their own shipping agents in India but since India has no choice in this matter for her own ships in Soviet ports and has necessarily to entrust them to the Soviet agency, why should the relationship not be reciprocal and India appoint the agent for handling Soviet ships? This is not an unimportant matter for the progress of Indian shipping can be greatly expedited if Government were to make it obligatory on foreign shipping services to employ Indian agents only.

The agreement comes into force with immediate effect and will be terminable by either party on three months' notice.

Our Delhi Letter

The New Industrial Policy

Wednesday, Afternoon.

THE Lok Sabha debate on the demands for grants for the Food and Agriculture Ministry pin-pointed the recent rise in food prices. This was but natural. With food prices moving up during the last few months hand in hand with a comparatively big rise in currency circulation, fears of inflation have seized many minds. Once bitten, twice shy. The memories of wartime inflation are still too fresh in the minds of members of Parliament to enable them to view the recent rise in prices without concern. The Food and Agriculture Minister, however, was categorical in his reply that there was no apprehension of prices going up too high, though he hastened to add that the Government was carefully watching the situation and corrective action would be taken when it became necessary. The answer which Sri Baliram Bhagat, the new Deputy Minister in the Finance Ministry gave was, however, less assuring. If one took a long-term view, he said, there was practically no inflation yet in this country. That there was an undertone of anxiety even in Sri Jain's reply cannot be denied. The fact of the matter is that nobody knows for certain what is the safe limit of deficit financing. In the circumstances, financial pundits, if they choose to take it upon themselves, can easily raise a scare by crying inflation every now and then. This cry may not be just cussedness as in the Aesop's Fable; it may well be a covert attack on the contemplated rapid expansion of the public sector.

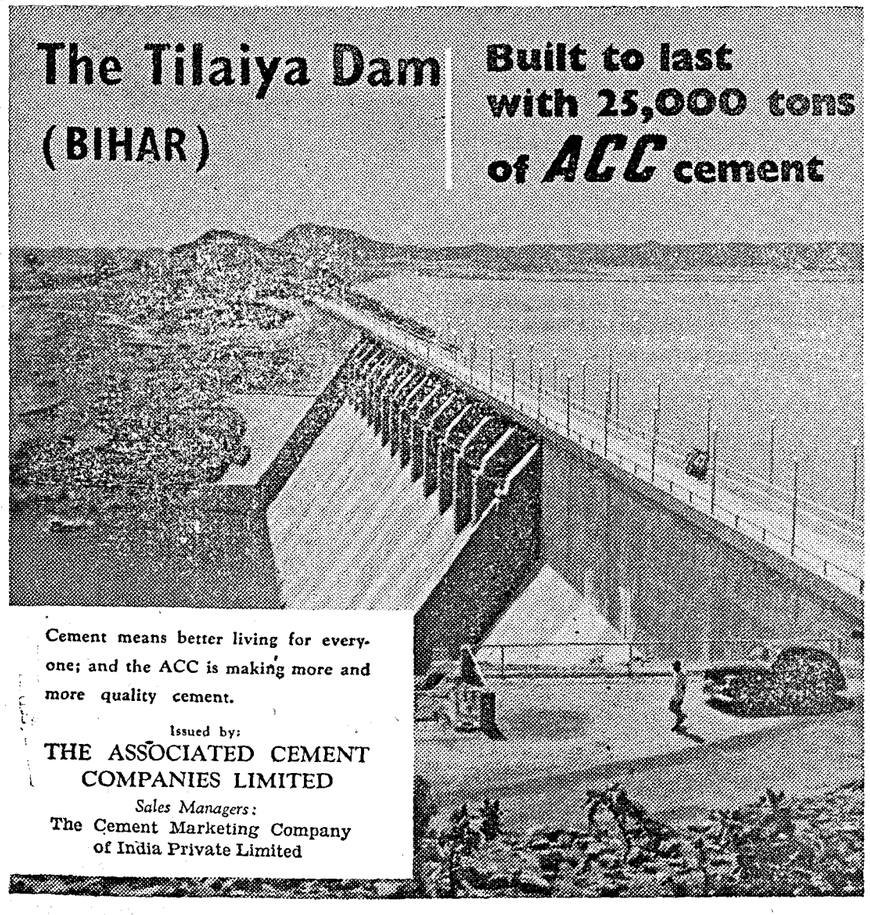
Buffer Stocks of Foodgrains

Whatever may be the motive behind raising this scare, a closer look at the situation is warranted. Food prices, to be sure, have been rising since the middle of last year. Yet they are much lower than in 1953. And nobody has claimed that the 1953 food prices were out of parity. Furthermore, the rise in prices in the Hapur market seems to have been halted; to this the release of stocks by the Government must have contributed. Supply of food today, however, is not as ample as it was early last year. North Indian floods and South Indian cyclones have probably restored the balance between supply and demand which was lacking last year. This explanation fits in with the situation in the cloth market also. True, last year's cloth exports were slightly lower. But what is often lost sight of is that cloth exports of all the major exporting countries suffered in 1955; while the relative position of these countries as exporters of cloth remained unchanged. It is, however, probable that speculative interests have to an extent been influencing cloth prices. They have certainly been influencing food prices. The answer to that is the release of stocks and credit control. Sri Jain in his reply referred to the Reserve Bank watch on bank advances to traders and the proposal for the building of buffer stocks of one million tons of wheat and one million tons of rice, not out of home production but through purchases abroad. Already negotiations are afoot for the purchase of U. S. wheat. There are reports that plans are about completed in Washington for a large transfer of surplus food to India. The Government proposes to have an assured supply for a number of years and to make purchases at a price comparable to the internal price of wheat. Similar negotiations are being carried on with Burma for a long-term agreement for rice imports.

The Plan in Parliament

The Draft Plan is proposed to be presented to Parliament on May 7 after being processed by the National Development Council on May 2 and 3. The outlays under other heads are not likely to change but it is a certainty now that defence expenditure will go up. This will reduce the expected revenue surplus and widen the gap between the estimated resources and expenditure. Attention naturally has been paid to tax sources. The measures recommended by Kaldor could have considerably increased tax receipts. But the administration thinks there are practical difficulties in implementing the recommendations. New tax measures are, therefore, under contemplation and fresh tax proposals may come to Parliament by the middle of the current year.

A chapter on State Trading has been added to the Draft Plan. The task of the proposed State Trading Corporation will be to handle trade with Communist countries, to import commodities under the T.C.A. programme and do business in a number of commodities with non-Communist countries as well. The immediate task of the Corporation will, however, be a modest one. Existing trade channels are not to be disturbed and are to be used, wherever possible. If trade enquiries from Communist countries can be suitably directed to established traders, the Corporation itself will not undertake any commercial transaction.



New Industrial Policy

The new industrial policy statement is awaiting Pandit Nehru's

approval. It may be released before these lines get into print. The main purpose of restatement is supposed to be the removal of all ambiguity and to bring the policy in line with the objective of a socialist society. The new statement is also understood to have enunciated the Government's concept of mixed economy. As before, industries will be divided into three groups, though the number of items in the three groups has been changed. List one, containing those industries whose development is exclusively reserved for the State is understood to have been enlarged. List two, which may be called the concurrent list, is also said to have undergone expansion. List three, i.e. of industries reserved for the private sector, has consequently shrunk. An important change is the emphasis on co-operatives in this category of industries e.g. cotton textile and sugar. If the plans materialise, co-operatives will develop very considerably. Fears of competition with the existing units are discounted. Increased incomes in an expanding economy will not find it difficult to absorb the additional output. In developing small industries, the emphasis will be both on improved techniques and decentralisation. Consistent with decentralisation, the latest techniques will be adopted and here also co-operatives are expected to play an increasingly important part.

Disparity Between States

The revised industrial policy statement recognises the need for the removal of unevenness of development. It draws attention to the glaring disparities in the development of the various States, showing how the presence of accelerating factors like capital, enterprise, transport and power have resulted in the concentration of industries in a few areas. "In the location of new enterprises, whether public or private, special consideration will be given to those areas which are less developed industrially, or where there is a greater need for providing opportunities for employment. Only by securing a balanced and co-ordinated development of the industrial and agricultural economy in each region can the whole country attain a higher standard of living." By recognizing the necessity for regional development implicit in which are the terms of trade as between regions and comparative costs as applied to the various parts of the same country, the policy statement breaks new ground.

Small-Scale Industries

Problem of Technological Change

K N Raj

(*Continued from last issue*)

Given these two assumptions, the case for unfettered technological change is of course unchallengeable, because not only will those displaced by the change be inevitably re-absorbed but their re-absorption will go alongside the higher rates of investment sustained by the larger surpluses. It is then only if the capital-output ratio is higher in the more advanced techniques that one need even make a choice between maximisation of output and maximisation of the rate of growth of output, and since differences in capital-output ratios are not usually brought into the model, the 'economic' considerations are in perfect harmony with the 'humanitarian' and 'political' considerations.

But when we are concerned with applying a theoretical model to a specific situation—particularly in the context of a Plan—we need to be more careful about our assumptions.

In the first place, there is very little basis for the assumption that the incomes of those engaged in small-scale enterprises will necessarily leave no margin for saving. Indeed, as a matter of historical experience, the instinct for accumulation has been found to be as strong among small craftsmen and traders as among the larger capitalists. It is the institutional setting, and the incentives which it provides, that is of importance from this point of view rather than the size of the productive units or even the levels of income of those engaged in them.

Secondly, it is a fact which cannot be ignored that there are considerable differences in wage rates as between different types of organisation. Wage rates in factory enterprises are invariably higher than wage rates in small workshops, and wage rates in small workshops are higher than can be imputed to family labour in productive households. A change-over in techniques and in the type of organisation cannot, therefore, be assumed to leave wage rates constant.

It is also a fact that there is no clear tendency on the part of capital to move towards areas and types of organisation in which wage rates are low. This may have something to do with railways and other 'overhead' facilities being available only in certain concentrated urban areas, but obviously there are also various kinds of imperfections in the capital markets, attributable to a variety of social phenomena and motivations, which work in the same direction.

It is clear from these two considerations that the consequences of immobility of labour and capital cannot be ignored, particularly in under-developed economies, in any analysis of the means for maximising rates of growth. Technological progress in limited sectors, we must remember, means also usually higher wage rates in these sectors, and this reduces the surplus available for investment. The fact that, despite this, the capitalists want to introduce new techniques does not, by any means, prove that the surplus yielded by investment in these techniques is larger than could have been tapped with less advanced techniques in the low-wage types of organisation. It is a tenable thesis that, in pressing forward with technological change, the capitalists are more concerned with reducing the labour force in their establishments (for fear of possible conflicts with labour in the future) and ensuring for themselves a reasonable rate of profit than with maximisation of profits as is often taken for granted.

We must also take into account the likely leakages from the surpluses for maintaining, at the minimum subsistence standards, those displaced from employment through introduction of new techniques. When the problem is looked at from the point of view of only one industry or firm, it may be legitimate to assume that the surplus will not be affected as a result of the change in techniques. But if the labour displaced by technological change in one industry has to be maintained in one way or another by those engaged in another, the consequent reduction in the surplus of the latter will at least off-set to some extent the increase in the surplus of the former.

It is very often implicitly assumed in this context that, when technological change displaces labour in under-developed economies, the amounts available for consumption in the productive households will somehow be re-distributed among a larger number, and that the surpluses created will not therefore be drawn upon to any significant extent. This implies two things:

(i) that the productive households which are compelled to carry a larger number of dependants do not have, and are not expected to have, any surplus which they might be otherwise inclined to draw upon; and

(ii) The minimum subsistence requirements of all those involved are lower than the standards they enjoyed prior to the displacement of labour from productive employment. Taking the two together, it will be clear that what is really assumed is that there is a surplus available for being extracted from existing levels of output, but that the only practical way of getting at this surplus is by pushing out some of those at near-subsistence levels to be maintained for a time by others who are also at near-subsistence levels. This is, by no means, an 'economic' consideration; it is essentially a political and administrative judgment.

It will be, on the whole, more realistic and appropriate to allow for some leakage on this account. For if labour is displaced on any significant scale through technological change, it will either become necessary for the State to provide relief of some kind for the unemployed or the households still in productive activity, which could otherwise have some surplus (i.e., in agriculture), will be compelled to divert part of it for maintaining the additional dependants.

When considering the case for technological change from the point of view of maximising the rate of growth of output, we must, therefore, take into account all these factors, because they are relevant to the size of the surplus that will be available for investment under alternative techniques. To begin with, we must remember that we are concerned with improvements in technology which, even if they do not involve more capital per unit of output, imply certainly more capital per unit of labour employed (for, otherwise, the problem of technological unemployment does not

arise). This means that though a larger surplus may be generated per unit of labour employed through improved technology, the number that can be provided employment with a given initial investment ceiling will be smaller. The aggregate surplus thus thrown up will also be smaller the larger the leakage we have considered, namely those on account of (a) higher wage rates under the improved techniques, and (b) diversion of resources, directly or indirectly, made necessary for the maintenance of those displaced from employment. If, in addition, the capital-output ratio is also higher in the more advanced techniques (as may well be the case, though not necessarily), the aggregate surplus will be reduced still further. It follows that, even if the surplus per unit of labour employed in the less efficient variants is only a fraction of that possible on the basis of the more efficient ones, the total surplus available for capital accumulation in the former case could still be larger.

The simplest way of bringing all these considerations together, and of stating the conditions in which introduction of improved technology can be justified on grounds of maximising the rate of growth of the economy, might be as follows: Given two alternative technical variants, A and B, the former involving higher capital cost per unit of labour and also a somewhat higher wage rate for the labour employed than the latter, Variant A would be preferable to Variant B only if the proportion of the surplus per worker in the former (after making an allowance for the leakage for maintaining the labour displaced by its introduction)* to the surplus per worker in the latter is larger than the proportion of the capital cost for employing a worker in Variant A to the capital cost for employing a worker in Variant B.

If this formula is applied to the possible variants in each industry, and it is observed that there are tendencies towards introduction of techniques which do not satisfy the condition laid down, there is indisputably a case for arresting such tendencies through State intervention, even on the 'economic' criterion of maximisation of the rate of growth of the economy.

Thus, to give an illustrative example, let us take three alternative techniques in weaving in the textile industry, and see how it would work out on the basis of certain assumed values for the relevant variables in each case (see table below).

This is probably not an altogether unrealistic representation of the relative magnitudes involved today in the choice between different types of technology in the textile industry (though no specific claim of that kind is implied here). For, Technique I conforms broadly to the more primitive type of fly-shuttle handloom which is now surviving on a very precarious and unsatisfactory basis; Technique II to the improved 'Banaras' semi-automatic loom referred to in the Report of the Textile Enquiry Committee (1954); and Technique III to the advanced automatic loom, several of which can be operated simultaneously by one worker (assumed here to be 16 per worker).

It will be seen that it is advantageous to move from Technique I to Technique II, because there is no surplus whatever in the former, while a relatively small investment per worker yields a substantial surplus in the latter. But it is not worthwhile to shift from Technique II to Technique III (except to the extent necessary for earning foreign exchange)**. For, though the surplus per worker in Technique III is considerably larger, the increase in the capital cost per worker, involved in the shift, is even larger. Or, to put it in another way, if the amount available initially for investment is Rs 160,000, not only is the employment provided by Technique III limited to one worker but the surplus thrown up with this investment will be only Rs 94,500, while, if Technique II is adopted, employment will

* This deduction from the surplus per worker will be greater the larger the number displaced by the introduction of the technique, but it will also depend on the institutional set-up.

**The concession to be made in regard to production for foreign markets depends on the premium which it is necessary to place on foreign exchange in the context of the investment programme. The greater this premium, the greater is, in effect, the imputed value of the products earmarked for exports.

	Technique I	Technique II	Technique III
Capital cost per loom	Rs 50	Rs 200	Rs 10,000
Capital cost per worker	Rs 50	Rs 200	Rs 160,000
Output per loom per day	4 yds	20 yds	80 yds
Net value added per loom per year (on the assumption of four annas per yard and 300 working days per year)	Rs 300	Rs 1,500	Rs 6,000
Net value added per worker per year	Rs 300	Rs 1,500	Rs 96,000
Wage per worker per year	Rs 300	Rs 900	Rs 1,500
Surplus per worker per year	Nil	Rs *600	Rs *94,500

(*No allowance is made here for 'leakages' on account of the need to maintain the labour displaced from employment)

"He who is firmly seated in authority soon learns to think security."

be available for 800 workers and, at the same time, the surplus will add up to Rs 480,000. If, nevertheless, there is not evident a strong tendency to move into Technique II, it can be only because of imperfectness of competition and insufficient private enterprise, which it is the business of a Plan to remedy.

On this line of reasoning, there is of course no case for "freezing" technological change, but regulation of such change, and active measures to prevent the introduction of certain types of advanced techniques, appear entirely justified. For it shows that there is such a thing as an optimum technique from the larger social point of view in any given set of conditions, and the techniques actually adopted by private entrepreneurs may not conform to it. It is, therefore, the function of the planning authority to take such positive and negative measures as may be necessary to bring about movement towards the optimum.

That it is not their inherent technical inferiority so much as organisational deficiencies which stand in the way of certain techniques, close to the optimum, appearing to be "inefficient" is again illustrated by the references in the Report of the Textile Enquiry Committee to certain experiments with improved handlooms organised on the basis of co-operative societies. For instance, Annexure E to the Report gives the history and the details of the working of the Yemmiganur Weavers' Co-operative Society. This Society was started in 1938, with a paid-up capital of Rs 170, when most of the looms in the area were throw-shuttle looms. In the course of the last two decades, the only important technical change introduced has been their replacement with fly-shuttle looms. But the Society has, in the process, accumulated a paid-up capital of over Rs 1 lakh (almost wholly out of a Thrift Fund into which one anna in every rupee of the wage earned by members is paid), developed another Common Good Fund which meets the expenses of a comprehensive system of health insurance among the members, established its own dye factory, printing section, and a factory for the manufacture of furnishing fabrics, and also initiated a scheme by which houses are built by the Society and the members purchase them over a period on an instalment basis—all of which, obviously, is attributable to the surpluses created by its 1800 members.

On the line of reasoning advanced here, it will be also obvious that, while positive steps are being taken for a planned transition from one technique to another, it is not inconsistent with the objectives implicit in such a policy to give a measure of protection to those who are to be assisted to move into the better techniques but who may, in the absence of protection, be displaced in the meanwhile. The case for such protection, whether it involves direct subsidisation or not, is no less strong than the infant-industries argument which has been accepted for some time as respective economics.

Prelude to the Budget

THE economic events of the last three months are likely to be more decisive in determining the Budget proposals (to be made on April 17) than what had happened in 1955 as a whole. After all, the year 1955 saw two budgets and a series of quick changes in monetary policy and this most disagreeable experience is something that the Eden Government would wish to forget. The **Economic Survey** published last week is, therefore, a quick survey with no prescriptions and little indication of how the Treasury officials are thinking.

The pertinent facts of the economic situation over the past two months reflect the typical cyclical behaviour of the British economy which we are all accustomed to in the post-war years. For 1955 as a whole the gold and dollar reserves fell at a monthly rate of £19 million. In the first three months of 1956, the reserves increased at an average monthly rate of £20 million. Correspondingly, the trade gap in 1955 ran at a monthly rate of £72 million (£50 million in 1954) while in the first quarter of 1956, the corresponding gap fell to £60 million. This improvement was occasioned both by a fall in imports and a rise in exports.

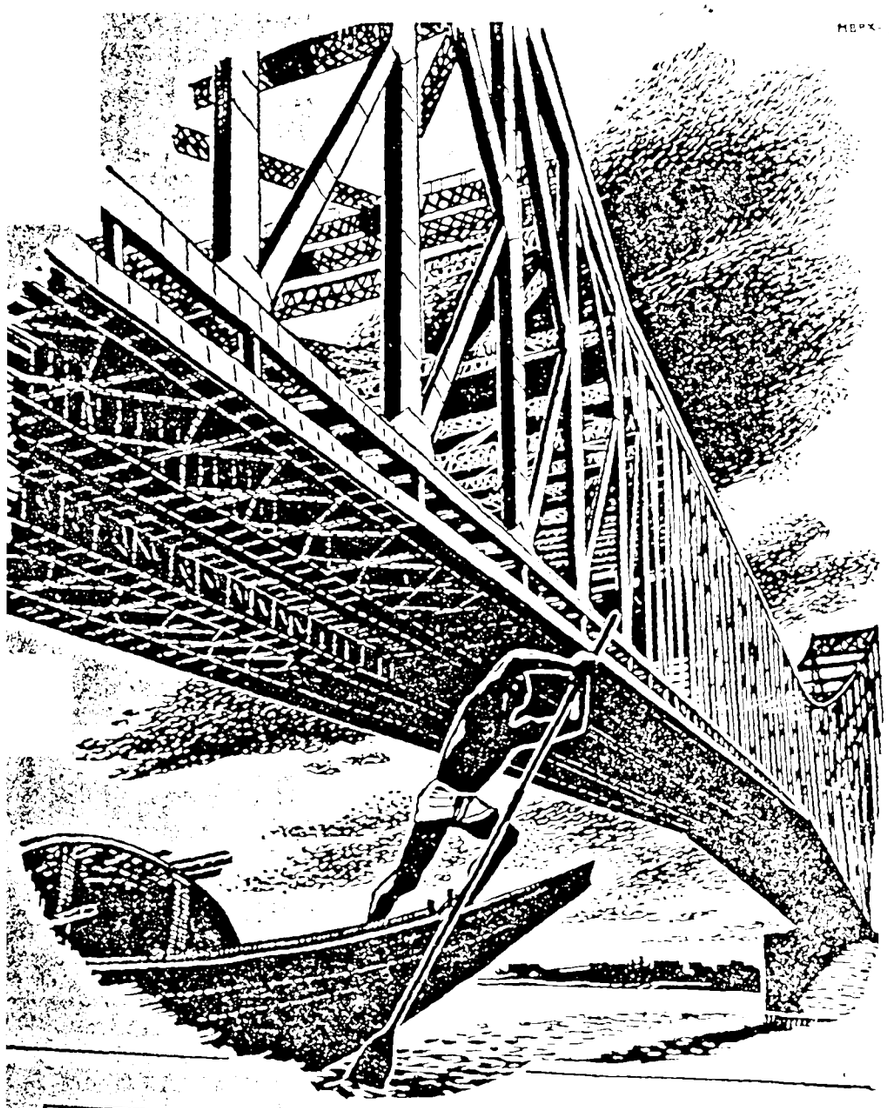
Such improvements as that experienced in the past quarter have in the past always been associated with some decline in industrial activity and in sales turnover. This correlation was again repeated on this occasion. Industrial production in the first quarter of 1956 showed no change compared to the previous quarter and the pressure on labour has been markedly reduced. The home market, particularly for semi-durable goods and textiles has fallen with radios and television recording a decline of as much as 30 per cent. All these factors indicate the abatement of the inflationary pressures of 1955 leading to coresponding improvements in the external payments situation.

The abatement of the inflationary pressures has been particularly marked in the vehicle industry. The industry is a somewhat sensitive one and as in the United States, the level of its activity is one of the crucial guides of how the entire economy is faring. In the first quarter of 1956 vehicle production fell by some 2,00,000 per week compared with the last quarter of 1955. This drastic fall has been accompanied by the abandonment of overtime and the introduction of short-time and some fall in absolute employment not only in the vehicle producing industry but in a whole series of allied industries. Some 20,000 workers are involved in this downward slide of vehicle production.

While little concrete information is available on private industry's investment intentions, there is a marked absence of confidence that the 1955 rise of 18 per cent in such investment expenditure will be maintained in 1956. Allied to this is the sharp fall in bank advances. During December last, Bank advances fell by £63 million to £1851 million. They were then £335 million below their June peak and £46 million below a year earlier. In January, they fell a further £25 million and rose in February by £39 million, compared with a rise of £108 million a year earlier. Between February 1955 and February 1956, bank advances fell by 135 per cent.

All these factors would allow one to believe that the April 1956 Budget should be a "no-change Budget" —a budget of consolidation rather than one of exacerbating the decline in economic activity. In fact, however, this is not expected to take place unless, of course, the authorities are satisfied with the international economic situation, and in particular the trend in the major export markets.

Decline in Exports



An examination of the export data of the main trading nations of the world shows that while world trade in exports rose by about 12 per cent in 1955, Britain's share in this increase was no more than 5 per cent compared to 17 per cent, 24 per cent and 12 per cent for West Germany, Japan and the U. S. A. respectively. This problem for Britain was particularly acute in the sheltered Sterling Area markets. To such markets increase in the U.K.'s exports was less than 4 per cent compared with an increase to all other countries of 11 per cent. Britain's reduced share in the world market related to almost all commodities; for textiles, Britain's international supply fell by 6 per cent compared with a West German and Japanese rise of 12 per cent and 4 per cent respectively. These adverse trends in Britain's international economic situation probably arose out of the fact that the home market took up too much of the national output. If this is true, then the drive to reduce the aggregate home demand should be justifiably speeded by harsher Budgetary Proposals.

Another possible cause for an active Budgetary policy may be occasioned by the international investment requirements of the U. K. The **Balance of Payments White Paper (Cmd 973)** gives for the first time the total U. K. annual net long-term overseas investment since 1952:

1955	£125 million
1954	200 million
1953	175 million
1952	150 million

These totals exclude government-to-government lending. The sharp decline between 1954 and 1955 may have reflected the diversion of resources towards internal consumption when the need for sustained overseas investment became recognized as a basic determinant of the international status of the United Kingdom. Thus, the revival of a high level of overseas investment may be regarded as a State obligation falling within the purview of the Budget.

Within the country there continues to exist a particularly large body of informed opinion holding the view that taxation in the U. K. serves as a disincentive, leading to inefficiency and making for price-increases. This view was recently bolstered by the report of the Royal Commission on taxation. Many now await a concrete change in the tax-structure of the U. K. It is, however, difficult to imagine the authorities embarking on so major a change when the economy is in mid-stream. That some small change towards an incentive-creating public finance system may be introduced is, however, not outside the realms of reality in the coming Budget.

Gandhiji— A Personal Approach

Reviewed by **Nirmal Kumar Bose**

Mahatma Gandhi: The Last Phase Vol I By Pyarelal. Navajivan Publishing House, Ahmedabad. 1956. 16 pages of illustration, pp. XXIX plus 750. Rupees 20.

IN writing the present account of the last years of Gandhiji's life, the author has had two special advantages, namely, his intense personal devotion to Gandhiji, and his intimate knowledge of men and of events in which he himself did not play an inconsiderable part. In presenting the story, he has again kept before himself two, more or less, distinct aims. One was to present a factual account of the political happenings in India between late 1944 and middle 1947 in which Gandhiji was personally involved, and the other was to discuss the theoretical aspects of the technique of satyagraha, as Gandhiji gradually developed it under the circumstances prevailing in India.

Such aims are praiseworthy, and the Navajivan Publishing House entrusted the job to able hands. But the over-all feeling of the reviewer has been that the narrative portion of the book has been overburdened by the author's desire to show how, throughout his many-sided political and social activities, Gandhiji consistently tried to attain his ideal of the sthitaprajna, or the man of unruffled intellect. There has been a greater concern to demonstrate how satyagraha rests upon an abiding faith in God, and how prayer or fasting is integrally related to it, than a desire to examine and assess it as a means of social action. This cannot, of course, be a matter of complaint; but the unfortunate part of it is that the author has frequently permitted himself to stray off tangentially into an attitude of moralising at the expense of the weaknesses of individuals or of groups whenever an opportunity has presented itself. A particularly unfortunate example may be cited from page 323, where in connection with the 'defect of will-to-resist' among the female victims of the communal riot in Noakhali, he wanders and goes on to quote what Gandhiji said in a completely different context how 'the modern girl loves to be Juliet to half a dozen Romeos'.

This temptation to moralize, or even to enjoy the weaknesses of others, would be merely innocent, had it not been responsible for much unconscious distortion of facts. Thus on pages 612-13, the author has drawn a picture of an interview of Maulvi Fazlul Huq with Mahatma Gandhi in which the former has been presented as nothing more than a comical figure. This is completely at variance with another account of the same interview published by someone belonging to Gandhiji's company, and who was present at the time, in which significant events of great political import alone were brought out. A subjective concern has thus materially affected the objective quality of the book in so far as history is concerned.

While on this topic, we may as well draw attention to another serious matter. In terms of the author's presentation of the theory and practice of satyagraha, one is led to believe that in the years covered by the book, Gandhiji principally tried to bring down complicated social and political questions to the personal level for purposes of solution. As Pyarelal presents it, the implication is that if relations can be set right on the personal level, they can also be set right on the organizational level. Perhaps this is the reason why he has taken so much pains in describing in detail how Gandhiji dealt with those who differed from him, how he tried to make them 'prisoners of (his) love' (p. 335) by showing them extra-courtesy and giving them extra-consideration. It is the reviewer's feeling that in describing this part of the Gandhian technique, one can err on the side of exaggeration. In one or two places, this implied subordination of the 'public' to the 'private' has led the author into statements which leave the reader mystified by their excessive demands upon logic. Thus, with regard to the practice of Brahmacharya or continence, the author says with reference to Gandhiji's lessons in this respect to one of his grand-daughters in Noakhali:

> The step which he (Gandhiji) had taken was not taken to prove what he could do, but rather a necessary stage in his grand-daughter's discipline. It was intended to test the full sincerity of her assurance to him. Incidentally, it would provide a test of his own. If his sincerity could impress itself upon her and evoke in her all the excellences that he aimed at, it would show that his quest of truth had been successful. **His sincerity should then impress itself upon the Muslims, his opponents in the Muslim League, and even Jinnah,** who doubted his sincerity to their own and India's harm (p. 580, bold as in the original).

The endeavour to reduce public questions to the level of relation between personalities, has been carried further by the author in respect of graver questions than that referred to above. In the detailed description of negotiations between the Congress and the Muslim League, the impression is conveyed that political problems could not be solved because they foundered on the rock of personal relations. This unfinished story of events which led to the partition of India henceforth begins to take on a portentious or rather ominous significance.

There are indications in the present volume to show that, in the opinion of the author, partition was becoming historically inevitable long before it had become a serious political issue, as about the middle of 1947. Thus we are told that:

> On the day when the Muslim League was admitted into the Interim Government on the Viceroy's initiative and invitation, the battle of undivided India was irretrievably lost (p. 289).

Again:

> The Bihar disturbances of 1946 finally shattered the dream of an undivided India (p. 641).

One may reasonably ask, how and why?

Anyway, in relation to the growing difference in political outlook between the leaders of the Congress and Gandhiji, the author has taken recourse to a curious strategy of explanation. We are told that

> The members of the Working Committee with their purely political approach, felt out of depth in these uncharted waters (of non-violence—N.K.B.) (p. 240).

While

> By unflinching adherence to truth, Gandhiji found a fourth-dimensional way of escape, as it were, out of the impenetrable steel ring that had been thrown round the Congress etc. (p. 483).

When Gandhiji said to the Cabinet Mission that

> If his advice ran counter to that of Pandit Nehru, for instance, they should follow Pandit Nehru's advice rather than his (p. 204),

it is obvious that Gandhiji was, for the time being, withdrawing himself from the trust and responsibility reposed upon him by the entire nation. Instead of dealing with this extremely significant event with scientific objectivity, we are treated with a dose of mystic jargon which can never be a substitute for honest historical explanation.

This desire to escape into mystic words from logic has been carried, we believe, to comical excess in relation to *brahmacharya* or continence. We are told:

> The central meaning and significance of the testimony of Gandhiji's striving for the attainment of Brahmacharya would seem to be this that the practice of Ramanama can serve as a "moderator element" in a nuclear reactor to convert the high explosive potential into an inexhaustible, steady current of controlled energy (p. 604).

Similarly, when describing Gandhiji's influence upon the maddened rioters of Delhi, the author tells us how the last fast was

> the culmination of that power which showed all the characteristics of an atomic chain-reaction (p. 605).

One may reasonably ask, why has the author taken so much pains to show that the growing difference between the Congress leaders and Gandhiji lay in the last analysis in their incapacity to appreciate the mystical religious qualities of non-violence? Was the non-violence presented by Gandhiji to the Congress *so mystical after all*? Could not the growing opposition be referred to the growing divergence between 'national' interests as represented by the Congress and Gandhiji's concern to build up a new India based upon the growing and organized non-violent power of the masses? It appeared to some that, for the time being, at least, Gandhiji permitted himself to go into the wilderness. It was only in the last week of his life that he seems to have decided to assert himself once more. This was evident when he advised that the Congress should be wound up, now that its objective had been attained. But we are anticipating events which would come up in the second volume. In any case, the 'mystic' explanation of divergence seems to us to be *unhistorical*. One can be completely sympathetic towards the Congress leaders even without trying to defend their obvious weaknesses.

Incidentally, we discover in the present book how far astray a man can be led if his purpose is to 'defend' and not to find out the truth and nothing but the truth. We are referring this time to what the author has done not in respect of the political leaders of the land but in connection with Gandhiji himself. There is a curious chapter in the book entitled **Brahmacharya** in which Gandhiji's endeavours to attain the perfect state of continence has been described. We are firmly of opinion that the references to his grand-daughter, as presented in this chapter, are not only uncharitable but also very partially true. It has been made out that the opposition of some of Gandhiji's co-workers to some of the actions of Gandhiji centred on the figure of the grand-daughter in question. But those who have read the **Harijan** of 1935 or 1939, when Pyarelal was intimately associated with that paper, know it well enough that the opposition which raised its head once more in Noakhali was of ancient origin. Moreover, certain things happened in Sevagram which led to the withdrawal from the Ashram of men like Kishorelal Mashruwala, who thenceforward lived outside the precincts of the Ashram. With the author's personal knowledge of these events, we are decidedly of opinion that it has been wrong for him to make of the poor grand-daughter a scapegoat, as has been done in Chapter XXIII of the book under review. This is as unfair to those who cannot now open their lips for one reason or another, as it is unhistorical. If one could not bring to bear upon the question all the facts of the case, then why try to deal with the question at all? A poor defence does not become stronger when fortified by the certificates of people like Badshah Khan or "an English lady", none of whom were in possession of all the facts. Gandhiji needed no laboured defence. The desire to defend him arose in the mind of the author because Gandhiji's practice was beyond the depth of ordinary minds.

In spite of all that has been said above in regard to either fact or theory, Shri Pyarelal has succeeded in giving us much that is valuable and much that is enjoyable. He may have lapsed now and then into unnecessary gossip or irrelevant detail; but barring such occasional blemishes, Gandhiji has been presented to us as a great spiritual personality, and his desperate endeavour to build up a new India from the bottom upwards draws our unstinted admiration. We are indeed thankful to the author for his long-drawn labours; but we must not forget that a good pile of well-burnt bricks does not necessarily make good architecture.

Indian Agricultural Labourer

A Soviet View

G G Kotovskii

The following is a translation from the Introduction to the Russian version of "Agricultural Labourers in Modern India and Pakistan" by Surendra J. Patel.

It is an independent assessment from the Soviet stand-point of the conditions of agricultural labour in India by a distinguished Russian Economist who bases his findings on data from the 1951 census and from the Agricultural Labour Enquiry conducted by the Ministry of Labour.

IN the foreign literature concerning India, this book by the Indian economist, Mr Surendra J. Patel, which is being brought to the attention of the Soviet readers, is the first monographic research on the problem of the formation of the agricultural proletariat in India. Other economists, pursuing this theme have, as is known, based their work on the material relating to various regions or even villages; they have restricted themselves from probing into the historical setting. Compared with these researchers, Patel takes a decisive step forward. His work relates to the whole of India comprising the present area of the Republics of India and Pakistan. The author traces the formation of the class of agricultural labourers over a long historical period—ranging from the sixties of the nineteenth century up to the period after the second world war. Patel has given an extremely interesting account of the disintegration of the Indian agrarian society during the nineteenth century. The historical-economic character of Patel's monograph significantly enhances its perceptive and scientific value.

Many British and Indian bourgeois economists have looked upon the appearance and the growth of the agricultural proletariat in India as some "accidental" and "undesirable" fact. Patel, on the other hand, rightly regards this as the normal result of the whole process of economic growth of the country. This is the chief merit of Patel's work. Patel's book objectively exposes the reactionary role of British imperialists and feudal remnants, who thwarted and deformed the development of capitalism in agriculture in the country, thus directing the process of disintegration of the peasantry into the slow and tortuous path of "non-proletarian impoverishment". In his work, Patel shows the worthlessness, from a scientific point of view, of neo-Malthusian attempts to explain certain characteristics of economic evolution in India and Pakistan by referring to the growth in population.

Careful Study

Patel's monograph is based on a careful study of vast statistical material and economic literature. Attention may be drawn to the fact that the author has made use of some of the works of Karl Marx including his **Capital**. Studying the Russian language, Patel has acquainted himself with the famous work of M. Kovalevsky: ***Obshchinne Zemlyevladyenie: Prichini, Khod i Posledstviya evo Pazlozyeniya.*** (Communal land ownership: The Causes, Course and the Results of its Disintegration). It must be added, however, that the author has, in his study, made use of the best attainments of advanced Indian economic thinking. Undoubtedly, the merit of Patel's study is that the author's propositions and conclusions are supported by abundant factual and statistical material.

Patel, as he himself has stated, has not placed before himself the task of an all-round research on this problem. He touches only in passing the question of conditions of agricultural labourers, the forms of payment for their work, the formation of the market for their labour force. Strictly speaking, the theme of his research work is the formation and the structure of agricultural labourers in India during the historical period mentioned above. The material, brought together in Patel's study, shows objectively that the growth of capitalist relationships is the basic tendency in the evolution of the agrarian economy of India and Pakistan. His work helps to reveal many important features of the process of the disintegration of the peasantry which comprises nearly three-fourths the total population in India and Pakistan.

Analysing the all-India census data, Patel has rightly concluded that the formation of the agricultural proletariat began in the last third of the nineteenth century. This is explained by the fact that in the sixties of the last century India entered the stage of capitalist development. Further growth in the number of the agricultural proletariat and the rise in their proportion to the total agricultural population, particularly during the general crises of capitalism, was associated with the quickening of the disintegration of Indian peasantry. By certain characteristics of this process we may explain the structure of the agricultural proletariat in India and Pakistan.

Transformation

One of these characteristics is that the transformation of the expropriated peasantry (owners and occupancy tenants) into share-croppers without any rights constitutes an intermediate step in the process of their complete destruction and transformation into agricultural labourers. As is known, during the first half of the nineteenth century, the British imperialists confirmed the rights of land-ownership on the feudalized communal top and the communal peasants in the raiyatwari regions (Madras, Bombay and other provinces) and in the Punjab. In these regions, therefore, small peasant proprietorship was generally maintained. During the last third of the nineteenth century, however, as a result of the tendency towards sale of land and the development of capitalism, holdings began to be concentrated in the hands of outside landlords from the circle of traders and moneylenders, as well as in the hands of the upper layers of the peasantry. The process of land concentration gained momentum during the epoch of imperialism, particularly in the period of the general crises of capitalism. The expropriated peasants, however, were not immediately transformed into agricultural labourers. On the contrary, they again took up cultivation, but under worsened conditions as semi-feudal tenants. The growth of landlordship

was accompanied by an expansion in the area cultivated by tenants. In the Tanjore district in the Madras province, for example, most of the land went into the hands of the landlords by the end of twenties of this century; the tenants there cultivated nearly 90 per cent of the land. In the Bombay province, nearly five million acres of land was acquired by moneylenders, traders and such other urban elements between 1917 and 1943. Nearly all this land was leased out to tenants.

In the areas under Zamindari land settlement (Bengal, Bihar, parts of United Provinces, etc.), various feudal groups were given the rights of land owners (Zamindars) towards the end of the eighteenth century.* On the top stratum of the commune, the communal members were conferred full rights by special legislation the rights of protected tenants; i.e. the terms of the lease (amount of the rent and other conditions of lease) were fixed by law. Step by step, a few other tenants also received the rights of protected tenants.

Protected Holdings

The title to the rights of protected holdings as well as to that of receiving a fixed portion of rent became objects of purchase and sale. Tenants, suffering from heavy feudal exploitation, lost their rights of protected holdings to the upper peasantry, moneylenders and traders. In this way, in the Zamindari regions (especially in Bengal) grew up a whole series of intermediary subtenants receiving a fixed portion of feudal rent. Patel rightly observes the known similarity between the expropriation of the rights of the protected tenants in the Zamindari region and the expropriation of peasantry from land in the raiyatwari region and in the Punjab. In both the cases, a major portion of the peasantry is transformed into tenants-at-will, who have no legal protection regarding the terms of lease and against raising of the rent. Most of these tenants pay rent in kind on a share-cropping basis. In the Punjab, for instance, 75 per cent of the tenants were in this category of share-croppers on the eve of the Second World War.

As a result of the increased feudal exploitation of the Indian peasantry during the period of imperialism, the peasants (tenants) became not only impoverished, but also lost the means of production and instruments of work—cattle, implements and agricultural stocks. In other words, some of the conditions for the transformation of tenants into agricultural labourers were created. Such tenants received from the landlords not only land but also some other means of production. The portions of the means of production provided by each side determined, among other things, the ratio between the shares of the landlord and the tenant in the crop.

Share-Cropping

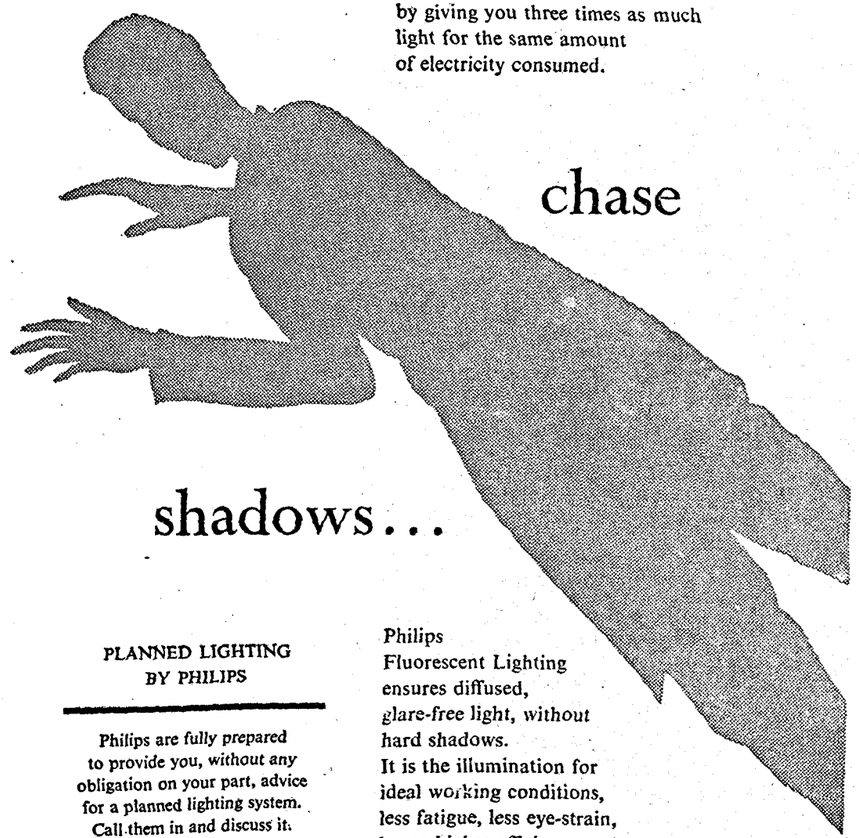
In the Indian conditions under discussion, the form of share-cropping tenancy is in reality almost impossible to define. A "share-cropper", owning some very primitive means of labour, would pay as a tenant or an agricultural labourer, four-fifths of his crop to the landlord. In the face of the relative agricultural overpopulation reflected in the existence of the landless peasantry, there is a keen competition among the tenants for each piece of land that may be available for rent. This creates the possibility for landlords and upper peasantry to raise rents. Thus, the monopoly of the British imperialists and feudal landlords over land as well as the heavy and rising relative over-population are the economic conditions which made it possible and profitable for the Indian landlords to continue exploiting the peasantry by semi-feudal methods—depriving or nearly depriving it of land and other means of production. Share-cropping often conceals such forms of exploitation of direct producers in which they are almost completely deprived of means of production and their position resembles that of agricultural labourers. According to Lenin, such production relationships constitute "direct transition toward capitalism combining with them a series of very subtle transitions." (Collected Works, Russian Edition, III p. 170). V. I. Lenin has pointed out that "there are still many intermediary steps before the complete evolution, before the complete separation of the producer from the means of production." (ibid. I. p. 445). Different aspects of share-cropping tenancy during which a peasant proprietor loses land and other means of production indicate the different steps of exploitation and pauperisation of the tenants; these are the "intermediate steps" on the road to his complete proletarization.

In India as a result of the British imperialist rule which preserved significantly the remnants of feudalism, the process of "de-peasantization" (the separation of the direct producer from the means of production) was held up over a period of time at each of its stages. This was an extremely tortuous process for the peasantry. As a result, the whole countryside of India was filled with mass destitution which affected not less than three fourths of the peasantry. It was because of this that agricultural labourers with holdings, who were exposed to feudal and moneylending exploitation, appear as a special type of agricultural proletariat or semi-proletariat.

Depeasantization

According to the Enquiry conducted by the Ministry of Labour in 1951, 48.6 per cent of the agricultural labourers rented land or owned it. Their average holding was 2.86 acres. Poor peasants, owning or leasing part of their holdings, did not have adequate area of land to provide them with even an extremely low living minimum; they were therefore obliged to seek work as agricultural labourers. As Patel has rightly emphasized, this was the main reason for the increase in the number of the agricultural proletariat.

Another large group of the agricultural labourers was constituted by the enserfed farm labourers, suffering under semi-slave and semi-serf-like exploitation by landlords and the rich peasants. Such a form of exploitation was inherited from the feudal epoch. In the contemporary Indian agrarian society, this exploited group constitutes the lowest social stratum in the caste system. In the eighteenth and the first half of the nineteenth century, the forms of exploitation of these "slaves" in the communes resembled serfdom. With the further development of capitalism, however, they changed step by step into specific forms of hire of agricultural labourers.



Untouchables and Aboriginals

Considering that the category of bonded labourers appeared on the scene after the British conquest, Patel is not altogether precise as to when the "servants" of the communes which had already decayed and who had nowhere to go were obliged to accept debt serfdom. (See Chap. VI section III). In reality, however, debt-serfdom existed as a major form of preserving semi-slave, semi-serf exploitation of the former

* It is true that in the United Provinces major part of the Zamindars were communal peasants.

don't

An attempt to combine economy with efficiency is often like chasing shadows. Planned Lighting, however, is a sure road to success.
Planned Lighting means greater output, fewer accidents, less absenteeism. It's Fluorescent Lighting—by Philips—which will help you reduce overheads by giving you three times as much light for the same amount of electricity consumed.

communal slaves and serfs. This was because of the fact that during the imperialist rule in India, the money-lending capital consolidated various pre-capitalist methods of exploiting peasantry. The major portion of the serf labourers belong to the "untouchable" castes—the very castes to which belonged the communal slaves and serfs in feudal India. The status of the "untouchables" in the feudal epoch resembled complete slavery; in the imperialist period, however, it served the landlords and rich peasants as an additional method to strengthen the exploitation of serf labour. Besides the "untouchables", a significant portion of the serf labourers in various parts of India were from the ranks of the so-called "aboriginals".

"Aboriginals" are the various small tribes and nationalities who live in the hilly jungle districts in central, south and north-western India by following shifting cultivation, hunting, gathering wild products etc. Those who left the tribes turned themselves into serf labourers, or free labourers and casual labourers; they are often counted together with the "untouchables." According to the Indian economist K. G. Sivaswamy, more than half of the 12-million "aboriginals" in India are found to be living under one or another form of serf-like dependence. (K. G. Sivaswamy, Serf Labour among the Aboriginals: Problems of Indian Labour. A Symposium, Delhi; 1951, p. 59).

Debt Serfdom to Free Hire

As a result of the development of capitalism and the class struggles waged by the peasantry, debt-serfdom was step by step supplanted by free hire. The Agrarian Reform Committee of the Indian National Congress, however, disclosed that the system of semi-slave, semi-serf-like exploitation of bonded labourers was yet to a significant extent maintained in Madras, Bombay, Bihar, the United Provinces and other parts of the country. In the report of the Committee, reference has also been made to cases of sale of bonded labourers with (the sale of) the landlord's land or without it, of transferring them by rights of inheritance and of their barter among landlords. According to newspaper reports, it was disclosed in the Indian Parliament at its session of 17 April 1951 that 10 families of farm labourers were sold for Rs. 150 in the district of Darbhanga (Bihar).

The economic basis for the maintenance of these forms of exploitation of agricultural labourers is to be found in the existence of a large body of feudal remnants in Indian villages and of a huge relative overpopulation in agriculture.

According to the Census of 1951, the "untouchables" and the "aboriginals" constituted 39.3 per cent of the agricultural labourers in India. They are thus the second important source to swell the ranks of the agricultural proletariat.

The number of agricultural proletariat also increased after the ruin of the village artisans and the labourers working in cottage industries. Agricultural labourers in India, therefore, consisted of three major groups of the population: the impoverished peasantry, the so-called "untouchables" and "aboriginals" and also the artisans and labourers working in cottage industries.

Sources of Formation

One of the strongest points of Patel's book is the author's research on the sources of the formation of the class of agricultural labourers. While analysing the structure of the agricultural proletariat, the author divides the agricultural labourers not only on the basis of their relationship with land (completely landless labourers and labourers with some holdings) but also on the basis of the forms of their hire, (that is as day-labourers and farm-servants or in his terminology as under-employed labourers and fully-employed labourers.) The author, however, does not emphasise that these two are entirely different methods of classification. He overlooked the fact that the labourers with holdings and casual labourers, for instance, are not necessarily the representatives of different groups of agricultural labourers.

The labourers, with holdings, on the contrary, are, for the most part, day-labourers constituting a sizable portion of this group of agricultural proletariat in India and Pakistan. However, like the tenant or owner cultivators who work as casual labourers, there are also farm labourers (mostly bonded labourers) who have small plots of land. Assigning "plots" of land to the semi-slave or semi-serf labourer, on which he grows vegetables, grain etc. for his personal consumption, and attaches himself in addition to the cultivation of the landlord's lands, creates the conditions for reducing the pay in kind to him.

The day-labourers constitute the major portion of the agricultural proletariat in India. This peculiarity of its structure is associated with the entire process of "non-proletarian impoverishment" of Indian peasantry. The inadequate development of the cultivation of the capitalistic type in the sphere of agricultural production, naturally, presumes the existence of an insignificant stratum of fixed-term farm-labourers.

The author divides fixed-term labourers in two basic groups: farm-labourers with landlord and **kulak** (rich peasant) cultivation and plantation labourers. In our view, it would be more correct to group plantation labourers in a special category, distinct from that of fixed-term labourers, in view of the fact that the form and the condition of the system of exploitation of plantation labourers are significantly different from those of the casual labourers and farm labourers hired by landlords and **kulaks.**

The payment for the work of agricultural labourers in India is being done in kind, in money and in mixed forms with payment in money wages tending to supplant that in kind or in mixed forms.

The Agrarian Committee of the Indian National Congress remarked in its Report that the agricultural labourers live "in perpetual want, almost dying of starvation." (Report, p 127) Under the pressure of the huge relative overpopulation in agriculture, the agricultural labourers are forced to sell their labour-power at prices considerably lower than the cost. This is the direct economic consequence created by the colonial exploitation of India by British imperialists and the survival of feudalism in agrarian relationships.

Census Classification

Not all the agricultural labourers, as Patel has rightly pointed out, figure in the census classification under the three headings 'agricultural labourers' 'plantation labourers' and 'unspecified labourers.' As a result of this, there is really a great difficulty in ascertaining not only the numerical strength of each of the types of agricultural proletariat, but even its total number. Patel has succeeded in overcoming this difficulty. His book, however, was prepared before the publication of the 1951 Census report; it was, therefore necessary for him to use the 1931 census material for determining the size of the agricultural proletariat and its number in various groups. (In the 1941 Census report, data on occupational classification was not published)

The number of occupied agricultural labourers (workers excluding dependants) was 27.8 million in 1921 and 42.2 million in 1931. Their relative proportion in the total agricultural working population rose from 26.2 per cent to 38 per cent during this decade. These numbers and the proportion refer only to those agricultural labourers who are grouped under the above-mentioned three headings of the Census classification. In addition, Patel also includes in their number the peasants, who, as owners or tenants, cultivate less than five acres. On the basis of such 'refinement' of the Census data, the agricultural labourers (with and without land) come to constitute 71.1 per cent of the total agricultural working population (Chap. x, Table 8). This figure may sound extremely exaggerated. However, as the given sources indicate, all the small-holding peasants, during one or another part of the year, are not far from being agricultural labourers.

According to the 1951 Census returns, there were 24.86 million workers in the above mentioned three headings of agricultural labourers. They amounted to 26 per cent of the total agricultural working population. These figures, however, should not be construed as an evidence of the decline in the absolute numbers and the relative proportion of agricultural labourers. The fact is that the Census returns for 1931 and 1951 are simply not comparable. In the first place, the 1931 Census returns related to the whole of India, that is including areas of what is Pakistan at present; 1951 Census data relate only to the present territory of the Republic of India. In the second place, the 1931 Census returns for agricultural labourers included not only all the landless labourers but also some of the agricultural labourers holding small plots of land. In the 1951 Census, the agricultural labourers holding land were grouped in the categories of owner or tenant cultivators.

Comparison with Labour Enquiry

It is therefore more correct to compare the data from 1931 Census returns with the data of the Enquiry conducted by the Ministry of Labour in India during 1951. The Enquiry classifies agricultural labourers with holdings differently from the Census. According to the data of the Enquiry, the total number of agricultural labourers with plots of land was 40 million persons which in fact constitutes the difference between the total number of agricultural labourers according to the Enquiry (83 million persons) and the Census (43 million persons). The total number of agricultural labourers, according to this enquiry, (workers and dependants) was 82.7 million or 35 per cent of the entire agricultural population. This Enquiry, however, did not take into account the number of agricultural labourers living in small towns.

The results of the Enquiry further show that the total number of workers in the families of agricultural labourers (main workers and working dependants) was 47.5 million, or 40 per cent of the agricultural working population (strictly speaking, the working population living in villages).

If to these 47.5 million persons are added 3.73 million unspecified labourers, 0.96 million plantation labourers and 0.8 million workers in families of agricultural labourers living in urban localities, then the total number of workers in the families of agricultural labourers would be at least 51 million, or 41 per cent of rural working population. These figures clearly indicate the undoubted growth in the class of agricultural labourers during the past decade.

Growth of Agricultural Labour

We can certainly remark that in the 60 years from 1861 to 1951, the proportion of agricultural labourers in the total agricultural population rose from 13 per cent to 36 per cent and that their proportion in the total agricultural working population rose from 26.2 per cent in 1921 to 41 per cent in 1951. All these data provide irrefutable evidence on the development of capitalism in the agricultural economy of the country.

Like the growth of agricultural labourers in various parts of the country, its present distribution in various provinces indicates extreme unevenness. This fact has been rightly noted by Patel. On the basis of this unevenness, he demarcates three wide geographic regions—the Southern triangle (Madras, Bombay, the Central Provinces) the Eastern Region (Assam, Bengal, Bihar and Orissa) and the Great North (the United Provinces, the Punjab). According to the calculations of the author, the proportion of agricultural labourers to the agricultural working population in 1931 was over 50 per cent in the Southern Triangle, 20 to 35 per cent in the East and 15 to 20 per cent in the North (see Chap. III).

Labour and Land Ownership

The explanation given by the author for these regional differences is somewhat one-sided. He has shown a striking correlation between the regions, demarcated on the basis of approximately equal proportions of agricultural labourers, and the regions where different forms of organisation of the village communes and of the land settlement systems prevailed. (It may be pointed out in this connection that Patel considers the village communes in northern and southern India as two different types. In our opinion these different forms of organization of communes corresponded in reality only to the different stages of the disintegration of village communes of the middle ages.) Patel links the characteric regional distribution of agricultural proletariat in India exclusively with the differences in the evolution of the form of land ownership in different parts of the country. There is no doubt that the disintegration of the communal ownership of land during the end of the eighteenth and beginning of the nineteeth centuries and the emergence of private proprietorship in land contributed to the satisfication of the peasantry in the village communes on the basis of property holdings, and to the formation in South and East India of sizable groups of landless agricultural population. The preservation of the communal form of land-ownership in northern India, on the contrary, delayed the process in northern India. However, the development of capitalism in agriculture in India and the growth of agricultural proletariat emerging on this basis began only during the second half of the nineteenth century; whereas the village communes in the whole of the country had already disintegrated by the middle of the nineteenth century. It is also undoubtedly a fact that maintaining small peasant proprietorship in the raiyatwari regions contributed toward the disintegration of the peasantry and the growth of the class of agricultural labourers, whereas in the zamindari regions the zamindari ownership of land put a brake on this process. Nonetheless, the regional differences in the proportion of agricultural labourers

would not be adequately explained only by the reasons put forward by Patel.

Regional Differences

The table below would be useful in analysing this question.

As the table shows, the process of the disintegration of the peasantry was accelerated during the period of the general crises of capitalism. Particularly quick tempo in the growth of agricultural labourers was found in Bombay and Bengal—the two regions which are industrially the most advanced in the country. The disintegration of the peasantry also proceeded at a rapid pace in Madras and the United Provinces in which commercial crops such as sugar-cane, tobacco, oil-seeds, etc. began to be produced in large quantities and where new factories and manufacturing enterprises also arose.

Growth of Agricultural Labourers in Various Provinces of India: 1921-31 (in per cents)

	Rise in absolute numbers of agricultural labourers	Rise in the proportion of agricultural labourers to the agricultural working population
South India		
Bombay	200	111
Madras	36	47
Central Provinces	22	19
East India		
Bihar and Orissa	32	35
Bengal	57	87
Assam	17	12
North India		
United Provinces	33	40
Punjab	43	12

Source: Based on Indian Census returns as worked out by Patel in Chapter III.

Comparing the census data for 1901 to 1911, it is seen that the most rapid pace of growth of the class of agricultural labourers took place in Bengal, the Punjab, Bihar and Orissa. This was caused by the fact that the process of turning these regions into producers of marketable crops, such as, jute, rice, cotton, wheat, etc., just begun in the preceding decade, had started to unroll itself during the beginning of the twentieth century. In this way, the growth in the number of agricultural labourers in other regions of India is closely and directly connected with the rise of trade in land and of capitalism in them. This constitutes the major reason for the regional differences, demonstrated by Patel in the number and proportion of agricultural labourers. These differences, established on the basis of the Indian statistical material, cannot be merely explained by the unevenness of the development of capitalism in various parts of India. As for example, the tempo of the disintegration of the peasantry in Punjab between 1900 and 1930 was higher than in Bihar or in the United Provinces in which the proportion of agricultural labourers was significantly greater than in the Punjab.

Development of Capitalism Under-rated

The problem here is that in the Indian statistics, "agricultural labourers" include semi-slaves and semi-serfs, who, as was shown above, are not the products of the disintegration of peasantry: they are, on the contrary, a legacy of the feudal period. As a result, the number of agricultural labourers is large in those provinces where the survivals of slavery and serfdom have been, to a major extent, maintained; this is because of the inclusion of such labourers in the total. Such provinces are the Uttar Pradesh, North Bihar, Orissa, Madras, Travancore-Cochin, Madhya Pradesh and Hyderabad. It is noteworthy that according to the 1951 Census, the "aboriginals" and "untouchables", the groups to which almost all of the bonded labourers belong, constituted 25 to 50 per cent of all the agricultural labourers in these states.

Thus, the unequalness of development in different parts of the country during the pre-imperialist as well as the imperialist epoch is reflected in the distribution of agricultural labourers in various regions.

The development of capitalism in India is somewhat underrated by Patel. Without adequate basis, he considers only that cultivation capitalistic in which the technique and the methods of cultivation have been raised to a higher level of efficiency. It is known, however, that the best guide for judging the development of capitalist relations in agriculture is the hiring of agricultural labourers. The application of hired labour, even on very large capitalist farms, often does not lead to improvements in the technique of production. In 1947, for instance, an enquiry into 401 landlords' farms in the United Provinces disclosed that, although production was carried out in all of these by the exploitation of hired labour, only 40 of them used machines or other mechanical instruments.

Patel, proceeding from this wrong premise under-estimated the extent of the cultivation of a capitalist type in Indian villages. He defines it to be only one per cent of the total. By doing so, he has minimised the significance of the basic process in the Indian rural economy—development of capitalism.

These inadequacies in no way deprive Patel's book of its value. Its translation in the Russian language marks a definite step toward the study of the history and economy of India in our country. The book, full of rich factual and statistical material, and equipped with a scientific approach, will undoubtedly attract the attention of wide circles of the Soviet public which is deeply interested in the life of the Indian people.

Hesitant Trend

Wednesday, Evening

REASONS for the rise and fall in equities in the short term are not always sensible. But instances are not rare when reasons are fabricated or some events are falsely interpreted to engineer fluctuations in equities. Such a development occurred during the first half of this week. Last Monday's fluctuations in equities should not have occurred. But Monday's set-back has brought the stock market to levels which are healthier. There has been a slight recovery since Monday. But the market remains hesitant.

For some weeks, the problem of inflation had been worrying stock markets. Equities may or may not have been moving up because of inflation, though deficit financing has always been a background factor for markets for the last two years. Stock markets were not apprehensive of inflation. But there were fears that the rising trend in equities, bullion and commodities might provoke the monetary authorities to introduce some anti-inflationary measures.

Credit Squeeze

Some weeks ago, banks had raised their lending rates for some lines. Overdraft charges had been raised. But, as it happens in a rising market, these additional borrowing costs had not discouraged speculation. Fears were, however, being expressed that, as industrial borrowing costs rise, stock markets may be affected. These fears failed to check the rising trend, though speculation about a higher Bank Rate continued.

Until last week, however, it seemed that markets had reached the conclusion that the Finance Minister was against any immediate rise in Bank Rate. This view still persists. But towards the end of last week, equities had a temporary set-back on rumours of a credit squeeze. There were reports that banks had been requested by the Reserve Bank to submit details about advances in order to find out the extent of bank advances for speculative purposes. Even those who are opposed to an immediate rise in Bank Rate are in favour of such precautionary measures by the Reserve Bank.

Mining Policies

But the point is that last Monday's fall in equities was not due to the reported steps taken by the Reserve Bank. For the major part of Monday's official session, equities were steady. In the last fifteen minutes, there was a shake-out. Indian copper slumped on initial reports that the Government had decided to nationalise diamond and copper mines. In kerb dealings on Monday, the lost ground was regained as it was later clarified that the Government had no intention to nationalise working copper mines, though a small copper mine in Rajasthan which was not being worked, had been taken over.

As Indian Copper rebounded, other clearing shares moved up. But it was not without significance that next day, Tuesday, Coal shares eased on renewed selling pressure. Evidently, despite the subsequent clarification, some investors are suspicious of the Government's policy to the mining industry. Coal shares have been under the threat of nationalisation for some months. There is another reason for the set-back in Indian Copper. Next week, the judgment is expected to be delivered in the case and counter-case between this Company and the Bihar Government relating to kyanite leases.

Bank Rate has not yet been raised. Equities did not fall because of the reported directive by the Reserve Bank to banks to furnish fortnightly details about advances. But equities dropped on a report that diamond and copper mines would be nationalised. Though the report has been clarified subsequently, equities remain hesitant. There are revived apprehensions about the Government's policy to mining, or rather to exploitation of mineral resources of the country.

"Bulls" of Indian Iron are unlucky that these market events occurred at a time when the Company's output data for the year to March last became available. Output figures are satisfactory. There is no reason why the dividend should not be maintained. But there is another "bull" factor which may be stressed here. Some are inclined to the view that, if the Company decides to implement the second expansion programme, it will have to issue bonus or rights shares. Such a possibility has been apparent since the declaration of retention prices by the Government some time ago.

Tea Shares Easy

Reasons for the hesitant trend in Tea shares lie elsewhere. Until a fortnight ago, tea auction prices were moving up. That was why Tea shares were creeping up. In the last two weeks, auction results have been rather discouraging. So Tea shares have developed an easier trend. Political developments in Ceylon have had a disturbing effect on Tea shares. There are fears that Ceylon's tea and and rubber plantations may be nationalised. This raises the problem of Ceylon's tea export policy. It also revives fears that, with a possible nationalisation of tea estates in Ceylon, the tea plantation industry in India may also be nationalised.

In a week of uncertainties and disturbances, Engineering shares have remained steady. This group has naturally followed fluctuations in clearing shares. Even so, Engineering and Miscellaneous shares have met with support at all setbacks. This week's irregularly lower trend in Tea and Coal shares is a disturbing development for the Calcutta Stock Exchange. Strength in these groups could have had a sustaining effect on Engineering shares even in the event of a set-back in speculative, clearing scrips. Apart from this technical market factor, there is no reason why Engineering shares should not remain steady.

Around Bombay Markets

A Quiet Week

Thursday, Morning

AFTER an impressive performance during the past four or five weeks, the Stock Market turned quiet due to reasons psychological and technical. Psychologically the market was particularly affected by the Reserve Bank's circular to banks, which gave ground for the assumption that some sort of control over advances against commodities like bullion, seeds and cotton was in the offing. Some took the view that it was a preliminary step in the process of an upward revision of the Bank Rate. Whether any of these measures were actually under the contemplation of the Reserve Bank or not, the circular itself, with various conclusions derived from it, had had a sobering effect.

The upward revision of export levies on vegetable oils and the decision to permit imports of cotton 7/8" to 1-1/16", while confirming the trade's view that the uptrend in commodity prices has been due to short supply, has also confirmed the general belief that an upward trend in prices of essential commodities will not be allowed to go unchecked. Then again in the bullion market the continued arrivals of silver coins from Tibet continued to worry the value.

The market, however, was in no mood to take a definitely bearish view and some observers even went to the extent of saying that the setback in prices witnessed during the week was well in line with the process of consolidating the gains recorded since the Budget, before making any further upward move. But the week's trading pattern was dull and was devoid of any spectacular interest as operators were in no mood to extend their commitments in view of the prevailing uncertainties. Tata Steel ordinaries hovered around Rs. 246, while Indian Iron moved around Rs. 34-7. Bombay Dyeings were placed around Rs. 646. The miscellaneous section could not do any thing better.

Calcutta stock interests were reported to have worried over the preferential treatment given to Dalal Street by the Custodians of nationalised life insurance companies. With the new Industrial Policy in the making—the draft of which is expected to be out by next week—these purchases assume considerable significance and the guess has been circulated that when the Life Insurance Corporation comes into being, as successor holder of the shares held by the nationalised life insurance companies, this Government agency would exercise effective control over certain companies, saving the bother of nationalisation.

Cotton

PROSPECTS of resumption of futures trading in cotton in June have been hinted at and this has been welcome news to the trade, who had feared that Government might not favour the resumption of futures trading during the rest of the current cotton season. On the export front, shippers seem to have done a good job and the unutilised export licenses are now placed around 60,000 bales. Even for this an outlet could be found, if the negotiations for a barter deal now going on between private interests in India and Italy materialise and the Government approves of the deal. The negotiations are for the import of Rs. 2 crores worth of rayon yarn from Italy for which the payment would be made in cotton. In the ready market at Sewri, active demand was reported during the week, despite the announcement of larger imports.

The decision to levy an export duty of Rs. 250 per ton on linseed oil and the imposition of an export duty of Rs. 200 per ton on Kardi oil and niger oil led to a decline in the prices of these vegetable oils. The additional export duty on Castor oil though it did affect the market bearishly, did not bring about any sharp fall in prices and immediately after the announcement Castor May was quoted around Rs. 141 as against the previous quotation of Rs. 142. But the revision of duty has confirmed the worst fears of the market and read in the light of proclaimed policy of promotion of exports during the Second-Five-Year Plan period, this action of the Government is considered as of more than ordinary significance.

The reported arrivals of substantial quantities of silver coins from Tibet coupled with prospects of increased arrivals of those coins in the near future owing to possibilities of increased exports of cloth to Tibet had a slightly bearish effect on the bullion market. But reports about good spot offtake in gold and the steadiness in prices of yellow metal brought fresh support to Silver and prices ruled steady during the week. About Rs. 50 lakh worth of silver coins from Tibet is said to have arrived. But more important than this issue, is the question of futures trading in Bullion in the country, an inquiry on which is well under way. The trade will present a very strong case, of course, but the odds are not definitely in favour of them, if not against them. A year ago, the trade publicised the fact that one Cabinet Minister at the Centre was not entirely in favour of futures trading in Bullion. If speculation was right, this charge was placed at the doors of no one else than the Minister for Commerce and Industry. The nature of the inquiry, is also quite different from that of the others conducted by the Forward Markets Commission. Probably for the first time an inquiry is being conducted into the 'utility' or otherwise of a futures market in Bullion. The bullion trade has a more difficult task ahead as compared to their friends in the cotton or oilseeds trade.

† Capacity reassessed.

§ Revised.

‡ Including schemes not materialised.

Regd. No. B.5489

On this occasion we pledge our services to meet the growing transport requirements of our country.

The Railways are now planning to provide such increased transport facilities as are required to keep the flow of raw materials to production centres and manufactured goods to consuming centres. Many new works have been planned for execution and several scheduled for early commencement to meet the country's transport requirements during the course of the Second Plan on which we have just embarked.

The Central and Western Railways will have added some 15% to their passenger carrying capacity and some 40% to their goods carrying capacity by the end of the Second Five Year Plan.

Bigger Jaw but No Teeth

IS it not a wonder that the extensive powers hitherto denied to the Income Tax Department and now proposed to be conferred on it in the Finance Bill this year have not evoked even a murmur of protest from the traditional champions of the tax payer? Is it because the proposals have been set off against the somewhat cheerful background of tax proposals which were lighter than the gloomy forebodings earlier? Or is it because of the prevailing socialistic winds, which have aired the shady nooks and corners of the private sector—for instance the scandals in the insurance business—that no one dares to criticize the growing State authority for fear of being dubbed as a hopeless reactionary? These questions naturally arise in view of the far-reaching and extraordinary proposals which should have normally provoked violent criticism.

It has been proposed that the Income Tax Authorities should have the power to reopen any assessment for and after the assessment year 1940-41 at any time in cases of concealment provided that with regard to cases that are more than 8 years old the suspected concealment should be more than Rs. 1 lakh in the aggregate for the war years. This wide power will be subject to the administrative check of the Central Board of Revenue in the case of assessments more than 8 years old and the Commissioners in other cases, who must satisfy themselves with regard to the necessity of action under the relevant section 34 1(a) of the Income Tax Act. But it is possible to argue that in practice the value of such safeguards is doubtful, as there is no provision for questioning the sufficiency of materials which may satisfy the executive authorities. Even more significant is the proposal in this connection that there should be no limit for the completion of assessment under section 34 1(a). In other words, after reopening an assessment, the Income Tax Authorities can go on making their enquiries for an indefinite period, while the fate of the unfortunate assessee is kept hanging in the air.

It has also been proposed to empower the Income Tax Authorities to invade and search any building or place, seize any relevant documents and also, if they like, to make an inventory of any other articles in the course of their search. This provision will no doubt exercise some check on the proverbial device of the tax dodger who maintains double sets of accounts, one for the Income Tax Department and the other for his normal business. It may also cause some concern to those who accumulate their secret wealth in the form of cash, bullion or jewellery, for their storage dumps may be searched in the course of or in the guise of a search of documents and books of account.

The other amendments to the Income Tax Act proposed in the Finance Bill are of much less significance comparatively. It is a paradox, however, that some of them have received much more attention. For example, the provision to tax registered firms whose effect on the revenue will be comparatively negligible has figured prominently in the budget discussions. A passing mention may be made here also of some other proposals for amendment of the Income Tax Act. The penal supertax on Section 23 A Companies is proposed to be increased to eight annas in the case of investment companies as against four annas for the other

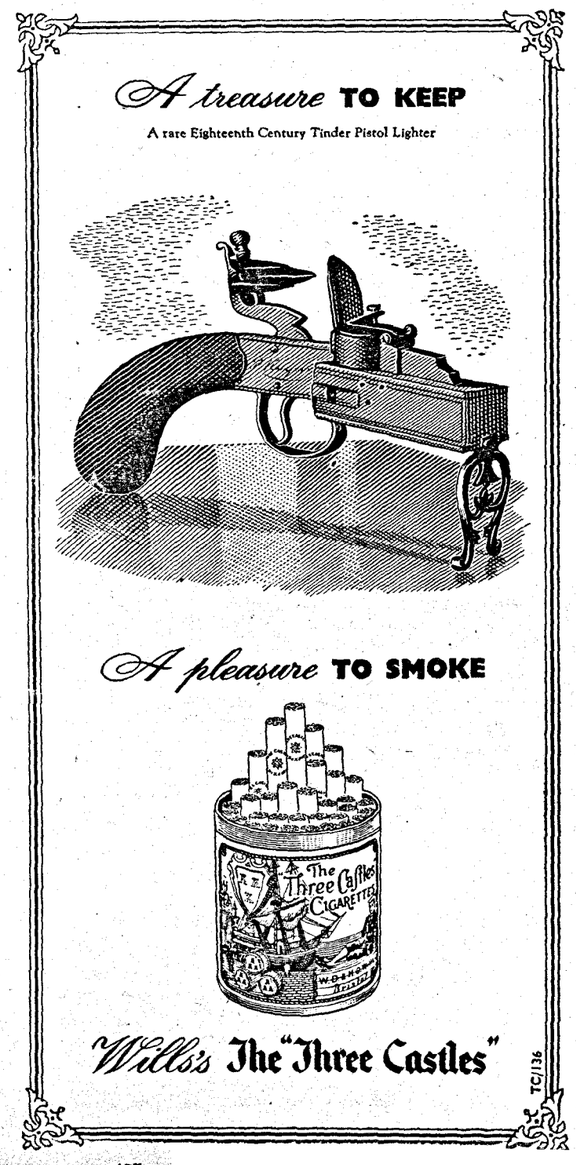
companies. The rationale of this distinction has nowhere been clearly stated. It would appear to rest on the somewhat doubtful theory that if an investment company declares less than the prescribed dividends, it is doing so with an eye to saving super-tax on the incomes of the share-holders to a larger extent than the other companies. An amendment to section 17 has also been proposed which has the effect of withdrawing an unintended benefit which was inadvertently conferred on the non-resident in the matter of super-tax rate applicable to him by last year's Finance Act.

Another proposal is to levy an extra super-tax at the rate of two annas in the rupee on the face value of bonus shares in the case of companies. This proposal has been criticised widely and the Finance Minister himself has had some difficulty in reconciling the imposition of this tax with the clearly opposite views on the subject expressed by the Taxation Enquiry Commission. Possibly there is a stronger case for having an imposition on the lines proposed in the case of private companies where the accumulated reserves can be distributed to the shareholders in the form of bonus shares with greater facility than in the case of public limited companies.

In all such legislation, there is always the possibility of some hardship or harassment being caused to innocent victims, owing to the understandable weaknesses of the administration. The real criticism against these proposals would perhaps be the ineffectual use made by the Income Tax Authorities of the powers already available to them. It has been clear for some years now that the weakest link of the administration of income tax in the country is not so much the inability to detect concealment as the failure to collect taxes found due, as a result of its efforts. Even now the sly tax payer can afford to put on a superior and somewhat cynical smile on the labours of the income tax authorities to bring him to book, for the procedure for recovery of taxes can be very conveniently circumvented by him with the help of legal devices such as the alienation of his assets and properties to persons beyond the reach of the Income Tax Authorities. It will be advisable for the legislature particularly to overhaul the machinery for recovery of taxes so as to give it the effectiveness and punching power which it so badly seems to need. The tax dodgers today can go on adopting dilatory tactics for they know that even if they are ultimately held liable to taxation on concealed incomes, they will have enough time and opportunity to escape without payment of any taxes whatsoever. What the Income Tax Authorities seem to need most at the time is the power to launch deterrent prosecutions in the case of tax evaders combined with the strength to recover effectively and speedily taxes if necessary, from the properties of the tax dodger standing in the name of nominees. While it may be appropriate to vest the Income Tax Authorities with powers to enable them to detect concealment with greater facility, it is more important to provide for deterrent measures to enable them to recover taxes when they have been imposed. If the tax administration of the country needs a bigger jaw, it certainly needs better teeth in it also.

Israel and Arab States

NINE years ago, the issue of Palestine was handed over by Britain to the United Nations. Israel has since emerged as a sovereign State. This is resented by Arab States. There have been frequent Arab-Israeli border clashes since the birth of Israel. Immediately, the problem is to avert a second Palestine war. Dr Dag Hammarskjold, Secretary General of the United Nations, is now on a mission to West Asia to discuss arrangements with the parties concerned to "reduce existing tensions along the armistice demarcation lines". Even as the Security Council was taking steps to ease the Arab-Israeli tension, President Eisenhower informed the world that America will observe her commitments to prevent war in west Asia. President Eisenhower's statement has been interpreted in some quarters to mean an American commitment for armed intervention in west Asia under certain circumstances.



Under the tripartite agreement of 1950, America, Britain and France are commited to ensure peace along the demarcation lines. Under this agreement, each and all of them are committed to armed intervention to deter any aggression. But the timing of President Eisenhower's statement has provoked hostile comment because it coincided with the Secretary General's peace mission under a mandate from the Security Council. President Eisenhower's statement is hedged by the constitutional authority of the American Congress to declare war. But his statement will certainly be interpreted as America's decision, under certain circumstances, to take action "outside the United Nations". Despite the tripartite agreement, the wisdom of any such action is doubtful. It will be opposed by Russia. Arab States will resent it.

Israel may feel satisfied, but President Eisenhower's statement has had a hostile reception among Arab States. They suspect that the conditional American commitment is aimed mainly against them. Later developments indicate that President Eisenhower's statement has more diplomatic than military significance. Washington has been wise in restraining Paris from taking any hasty action. There are reasons why France is more hostile to Arab States who openly support the nationalist movement in French North Africa. This also explains why France has, in recent months, been more active in supplying arms to Israel than Britain or America. Both Britain and France suspect America's diabolic Britain or America. Both Britain and attitude to west Asia. It is clear that Western Powers are perturbed over the spreading Russian influence in west Asia. This provoked Britain to secure a guarantee from America that the latter will come to the aid of Britain and France in maintaining peace on the Arab-Israeli border, and in ensuring the old balance of power in west Asia. America accepts these obligations, but seems reluctant to undertake any action to fulfil these pledges. She is not a member of the Baghdad Pact, though Britain's active participation in this military alliance is the direct cause of her disgrace in west Asia. To assuage Arab States, or rather to dissuade them from active co-operation with Russia, America not only stays out of the Baghdad Pact, but refuses Israeli requests for arms.

These conflicts between America and her allies prevent any effective Western policy to west Asia, while frequent Arab-Israeli border clashes threaten peace in that area. Western Powers endorse Israel's complaint that the arms deal between Egypt and the Communist bloc has caused frequent border disturbances. Before the entry of Russia in West Asia, arms were being supplied by the Western Powers to both Arabs and Jews. Border clashes were then less frequent, the Western Powers argue, because supplies of arms were strictly rationed to suit the legitimate needs of self-defence. Because Egypt was suspicious of the Western Powers' intentions, she entered into an arms deal with the Communist bloc. Russia welcomed this opportunity to extend her sphere of influence in west Asia for two reasons. West Asia is world's oil basin. By winning friends in west Asia, Russia could protect Caucasian Russia against offensive Western bases in neighbouring countries.

Neither the tripartite agreement nor rationing of arms by the Western Powers has prevented occasional border clashes. In the last six months, since the gradual extension of Russian influence in west Asia, the situation has so changed that it is doubtful whether the tripartite agreement is any longer an effective instrument even in maintaining the fragile truce in Palestine. Russia's claims for consultation and co-operation on issues relating to west Asia are now conceded. Moscow has been diplomatic in announcing Russia's willingness to lend support to attempts and measures to achieve peace between Israel and Arab States. This willingness is a guarantee that the rationing of arms to Israel and Arab States can be effectively enforced, with Russian support, under the auspices of the United Nations.

It is clear from the Russian declaration that she is opposed to any attempt to solve west Asian problems by the Western Powers alone, though she is now committed to endorse measures undertaken by the United Nations to maintain peace between Israel and Arab States. This is an approach to the problem of solving the unsettled issues in west Asia which should be welcomed by Israel and Arab States. Both should be interested in preventing intervention by foreign powers. But if foreign intervention becomes inevitable, it is certainly better that such intervention should be by the United Nations instead of by either of the rival power blocs. With Russian support and co-operation, it should be less difficult for the United Nations to maintain peace between Israel and Arab States. There are other and wider problems which need to be solved equally urgently. Arab refugees will have to be settled. West Asia's economic development will have to be hastened through co-operation by all those countries who are in a position to help. Both the immediate and ultimate aims can best be achieved under the auspices of the United Nations. Russia's offer to co-operate with the United Nations in solving west Asia's unsettled problems is a challenge to the Western Powers. In the wider interests of peace, it is to be hoped that they will respond to this Russian challenge.

Weekly Notes

Planning Forums

THERE is no denying that planning has caught on. Perhaps it has attracted more interest outside India than among many sections of the Indian people. This may sound paradoxical but it is nevertheless true. Neither Nehru's foreign policy of non-alignment nor India's achievements in any other field has done as much to win admiration for India among her Asian neighbours as the success of her first Plan and the ambitious targets of her second one. Her community projects have already become an export product. The idea of it may be of American origin the handiwork of the Ford foundation. Even the use of the word 'community' in this special sense is distinctly American. Etawah, as the first field of its application, may not have produced results that will stand scrutiny. It has yet to be established that the Community Projects will pay for themselves and move on their own steam, when Central assistance is withdrawn. But what of that? Indian Community Project experts are much in demand in all the countries of West and South East Asia. And why projects experts alone? It looks as if Planning experts of all sorts will soon become a valuable export product and a foreign exchange earner.

There is still need for selling the Plan to the Indian people. With elections drawing near, fresh spirit has to be infused into publicizing the Plan and now Shri Mishra, Deputy Minister of Planning has taken a hand at it. To catch them young, Shri Mishra has been going round the colleges and universities, trying to induce the students to take up publicity for the Plan by forming planning forums. In New Delhi was held this week the first Conference of Planning Forums which was attended by 130 teachers and students, and was inaugurated by Pandit Nehru. Speaking in Hindi, which the majority of teachers and students attending the Conference did not follow, Nehru started with a cold douche to Shri Mishra who, in his address had welcomed the students as "leaders and workers of tomorrow". Nehru said that he did not regard students as a separate class, either to be flattered or criticised; he was all for improving the intellectual standards but "debating societies have never been known to achieve anything in any country". What else could the Planning Forums be, but debating societies of a sort? In short, students could contribute to the success of the Plan only by training themselves up for specific jobs. This was the age of technicians.

For anyone who did not follow the language to reply to Nehru's Hindi speech would call for presence of mind and tact of a high order. This onerous task fell on the veteran Professor S V Aiyyar of the Annamalai University who had managed to retain his Chair at the Dacca University for seven years after the Partition and he acquitted himself most creditably. The net gain from the Forum was a very honest appraisal of the financial position of the Plan from Shri Chintaman Deshmukh who was unusally frank on this occasion. He did not know where the resources were to be found for it, but he did know that the target of investment was going to be exceeded. Who should then know? Ask me another.

Publicising the State Plans

ON a more pedestrian level, the Plan is being pushed all around. West Bengal is having a Five-Year Plan festival, which is being celebrated in all the district and subdivisional headquarters as well as in some of the villages. The programme usually includes cinema shows, open air theatrical performances and a planning exhibition. Doubtless other States would be holding similar functions and here, in Bombay, the Plan is being publicised in a big way by the Five Year Plan exhibition, which has been drawing crowds during the last fortnight at Cross Maidan. A thoughtful visitor who has apparently been frequenting the exhibition writes:

This is perhaps the first exhibition of its kind in Bombay and it had to wait until the completion of the First Plan period. Curiously enough, the Exhibition is sponsored by a non-Governmental agency, though with the full support of the Government. The All Nations Society of Culture and Art, sponsors of this Exhibition, has certainly shown enterprise, though it is not clear how a Society for the promotion of art and culture took upon itself this particular activity. Does not the Bombay State Government have the resources and the enterprise to organise an exhibition of this kind on its own? Would it involve too great a financial risk? The Bombay Government has many achievements to its credit under the First Five Year Plan. Why is it left to a private agency to tell to the public the story of these achievements?

The exhibits themselves, however, are all prepared by the respective Departments of the State Government. First but not the foremost is the stall of the Directorate of Publicity. The Housing Board, the Electricity Board, State Transport, the Public Works Department, Agriculture and Fisheries Departments, Education and Backward Classes Departments, the Public Health Department and others have each taken one or more Stalls and filled them with a mass of maps, charts, photographs and working models, designed to show their targets and achievements under the Five Year Plan. The Government of India too is represented; indeed, it has the biggest and the best stall in the Exhibition, with some excellent photographs, and other material, depicting the highlights of the Plan.

A visit to the Exhibition would reward anyone who has no access to, (or taste for) current literature on the Plan, with miscellaneous information about what is going on in the State and the country by way of Development Projects. But one does not come away with any sense of the unity of purpose of the whole effort, or any suggestion of the sacrifices that an effort on this scale must entail, or an assurance of the fruits that will be available in return for present sacrifices.

There is need for more of such Exhibitions in towns and cities throughout the State, as is evidenced by the interest which Bombayites, who are generally supposed to be better-informed than people elsewhere are taking in this Exhibition. The State Governments may well invest more in publicising the Plan.

The standard of arrangement and display with the exception of the Government of India's Stall, is not as high as one has a right to expect after the many national and international exhibitions that have been held in Indian Cities in recent years.

Sinhala Nayaka

SHRI Solomon West Ridgeway Dias Bandaranaike, Ceylon's new Prime Minister, has had a past as impressive as his name. Scion of an artistocratic family, closely associated with a succession of Governors in the island, his career ran a course most conducive to his present eminence. A bright student and an eloquent speaker, he distinguished himself at Oxford and won honours which have gone only to a few Asian students. In the contest for the Secretaryship of the Oxford Union, he had the distinction of beating a formidable rival like the son of a former Prime Minister of Britain, namely, Mr Malcolm Macdonald, now U. K. High Commissioner in India. And legend has it that the present Prime Minister, Sir Anthony Eden, while still a student at Oxford in the twenties, was once found pointing to a Ceylonese contemporary and remarking, "There goes the future Prime Minister of Ceylon." And that was Shri Bandarnaike. If one were consciously grooming oneself for a premiership or if Destiny were taking a hand in it, events could hardly have fashioned themselves better than in Shri Bandarnaike's case. Add to it his idealism, the timely appeal of his policy, the blundering of his opponents and the spirit of this era of change in Asia, and the surprise indeed would have been if Shri Bandarnaike had failed to fulfil himself.

Known as 'Sword' in his student days, thanks to his initials 'SWRD', he is once reported to have described himself as the 'Sword of the Nation', and there would still seem to be something of the flash and edge of that weapon about his utterances and gestures, albeit much subdued. Shri Bandarnaike has set for himself big tasks: to declare Ceylon a Republic within the Commonwealth, get rid of foreign bases, follow a policy of dynamic neutrality, and go in for nationalisation. For one who has grown in the midst of wealth and luxury, moved in the aura of the British ruling class and even sat on the lap of Queen Victoria, these are not very nice things to attempt. But it is long since Shri Bandarnaike has wrenched himself from his former moorings, and developed a purposefulness of attitude which scoffs at convention, ceremony, comfort, ease and even innocent relaxation like a visit to a party or a cinema show. It is significant that one of the first things his government did after taking over was to close the bar in Ceylon Parliament. In this, as in the wider sphere of policy and outlook, he is close to India's present leadership, trained in the Gandhian school of stern devotion to duty and earnest pursuit of peace. And he on his part has not stinted words to express his warm regard for our Prime Minister and his policies. While not disregardful of what this affinity of spirit may come to mean for the peace and strength of Asia as a whole, this country may be pardoned if it also looks for a little easing of the problem of Indian settlers in Ceylon. Whatever Shri Bandarnaike has said so far on the subject has not been without promise of helpful initiative. But what is likely to follow is of more importance.

Inter-related Issues

KASHMIR is an issue which should never have been in dispute between India and Pakistan. As the Maharaja of Kashmir signed the Instrument of Accession, Kashmir became part of India. New Delhi sent troops to defend Kashmir against Pakistani aggression. Indian troops could have driven the aggressor out of the Valley. But New Delhi made a mistake in referring the problem to the security Council before completing the military operation. New Delhi made an even more generous gesture of holding a plebiscite. These gestures have not been appreciated by Karachi. Subsequent developments, however, have helped New Delhi to retrieve its position in Kashmir.

In his recent speeches, Pandit Nehru has explained how and why the plebiscite is no longer necessary. Pakistan has not fulfilled the prerequisites to a plebiscite. Some parts of Kashmir are still in unlawful possession of Pakistan. She has since fortified her military strength through supplies of arms and ammunition under SEATO and the Baghdad Pact and through a bilateral arrangement with America. One of the assumptions behind the agreement to withdraw the bulk of Indian forces from the territory is, thus, longer valid. These pre-conditions cannot now be implemented. Therefore, the question of holding a plebiscite no longer arises.

Pakistan's intransigent attitude is evident from the revelation made by Pandit Nehru in one of his speeches in New Delhi some days ago. To ensure amicable relations with Pakistan, India proposed some years ago to reach a settlement of the Kashmir problem through partition on the basis of the present cease-fire line. This proposal evoked no response from Karachi. In his New Delhi speech, Pandit Nehru did not seem to revive this proposal. But his disclosure has been interpreted in Karachi to mean that India is still eager to reach such a solution of the Kashmir problem. Karachi's reaction has been hostile. Both the Prime Minister and the Foreign Minister of Pakistan have summarily rejected any such solution of the Kashmir dispute.

Pandit Nehru's implied suggestion for a compromise solution of the Kashmir problem has been interpreted by Karachi as a sign of weakness on the part of India. Karachi's reaction to Pandit Nehru's conciliatory gesture has a moral for both Washington and New Delhi. America emphasises that she is not supplying military aid to foster aggressive designs among receipients. But the attitude of Thailand and south Vietnam to Cambodia and Pakistan's bellicose attitude to the Kashmir problem are rude reminders to Washington of the consequences of military aid and of regional military alliances.

New Delhi should learn the lesson that a policy of appeasement to the aggressor is bad diplomacy. Cordial relations between India and Pakistan is desirable in the interests of both countries. It will be conceded that a dispute cannot be solved without concessions by both sides. There will not be as much opposition to a compromise solution in Kashmir as to New Delhi's mistaken notion that there can be a solution to the Kashmir problem treated as a separate problem. Kashmir cannot be solved independently of any settlement of the other issues in dispute between India and Pakistan. Continued exodus of Hindus from East Bengal and evacuee property are two such related issues which must be setted along with an agreed solution of the Kashmir problem. Pandit Nehru's recent speech in New Delhi is a welcome indication that he is, though belatedly, realising the inter-relation between the various issues in dispute between India and Pakistan.

Indonesia Takes Bandung Line

INDONESIA'S three-party coalition Government may or may not be Left in politics. But the first elected Government, dominated by the Nationalist Party, is pronouncedly

nationalist in outlook. Dr. Ali Sastroamidjojo, the Premier, has recently enunciated his Government's plans. Abrogation of the Dutch-Indonesian Union is one of the main objectives of the Government. This aim has popular support. Holland is reconciled to the principle of abrogation of the Union. But the problem of West Irian remains a major issue in dispute between the two countries. Indonesia claims sovereignty over West Irian. Holland does not even concede that this is a claim which can be a matter for discussion between the two countries.

Protection to national business and industry against foreign competition is the second major objective of the coalition Government. This is in conformity with the nationalist aspirations in all newly-independent Asian countries. Few will deny that independence without economic sovereignity is shadow without substance. It is right and proper that national industries must be supported and encouraged. Dr. Sastroamidjojo will have popular support to his policy of ridding the country of foreign economic domination. There will be hope that Holland will have the wisdom to co-operate in industrialising Indonesia so as to strengthen future relationship between the two countries.

Indonesia's Asian neighbours will welcome the first elected Government's determination to pursue an independent and active foreign policy. Dr Sastroamidjojo is opposed to alignment with any of the rival power blocs. He will not join regional military alliances, but will pursue a policy of friendliness to all nations. Indonesia was one of the sponsors of the Bandung Conference. Her adherence to Bandung has never been in doubt. In both Indonesia and Ceylon, the general elections have established parties in power who accept the Bandung principle. These are developments which will be welcomed by New Delhi in its search for creating and extending an area of peace.

State Trading and Mining

FROM what T T K said in Parliament about the difficulties of placing tenders for the purchase of equipment for the steel plants and the advantages of a 'package deal', it would not be surprising at all if Bhilai were to go into production earlier than the Rourkela plant, though the latter had a much longer start. If things continue as at present, Durgapur for which also there is no question of calling for tenders —it is a package deal—may come out second, but now that the Ministry of Iron and Steel has decided to give up the tender system, things may move faster.

Another offshoot of the steel plants in the public sector and of the shortage of steel may well be a flying start for the State Trading Corporation which has now been assigned the job of shipping 100,000 tons of iron ore every year for the next three years to Poland under the Indo-Polish Trade agreement signed early this month. The Trading Corporation will also undertake to buy from Poland 100,000 tons of cement. Does it then mean that the distribution of cement imported under the current programme will be handled by the Cement Marketing Board only partially? Light on this point would be particularly welcome, in view of the many questions that have been raised about the operation of this programme.

While the State Trading Corporation will be undertaking the export of iron ore, a State Corporation is being floated as a limited liability company for taking over iron ore mining in Orissa. It is to be hoped, but it cannot be presumed, that duplication will be avoided and that this Corporation will also be able to take up mining of the iron ore that will be necessary for feeding the three steel plants, though naturally separate mines will have to be opened for each, with an eye to convenience of transport. T T K gave some indication of the sources of supply of the principal raw materials for the steel plants namely iron ore, coal, limestone and dolomite.

For the Rourkela plant, iron ore will be obtained from Taldi, 60 miles away. The exact location of the deposit to be worked, however, still remains to be determined, but mining will be undertaken directly by the Government. An American firm of Engineers has been appointed as consultants for this purpose. The Bhilai plant will get its iron ore from Dalli Rajahra. The Russians have already submitted a preliminary project report for the mine which will be designed and worked with the technical assistance of the Government of USSR who will also supply the equipment for it on usual commercial terms.

Present indications are that Durgapur alone may not need a separate mine to be worked by the Government as it can draw its supplies either from the existing mines or from mines in Gua which can be expanded, these being the most accessible deposits.

Now that the three steel plants together will require 5.2 million tons of coking coal per year, conservation of metallurgical coal, it is hoped, will be enforced more effectively than in the past and dependence on such coal reduced by coal washing. The main source of supply of coking coal will be the Government collieries in Kargali-Bokaro, but it will have to be supplemented by coal from Jharia fields. A Government washery is being installed at Kargali but no progress has been made yet in installing one in the Jharia fields. Durgapur will proabaly use Jharia coal which will be washed at the site of the steel works.

Limestone and dolomite for Rourkela and Bhilai will be quarried directly by the Government. Durgapur will be able to obtain supplies from existing sources, at least in the initial stages.

Are all these mining operations under Government auspices going to be handled by the State Corporation or does the Government want to stick to its old formula of a separate 'company' for each separate undertaking, a formula that goes as much against the economics of the corporation as it is offensive to the spirit of joint stock enterprise?

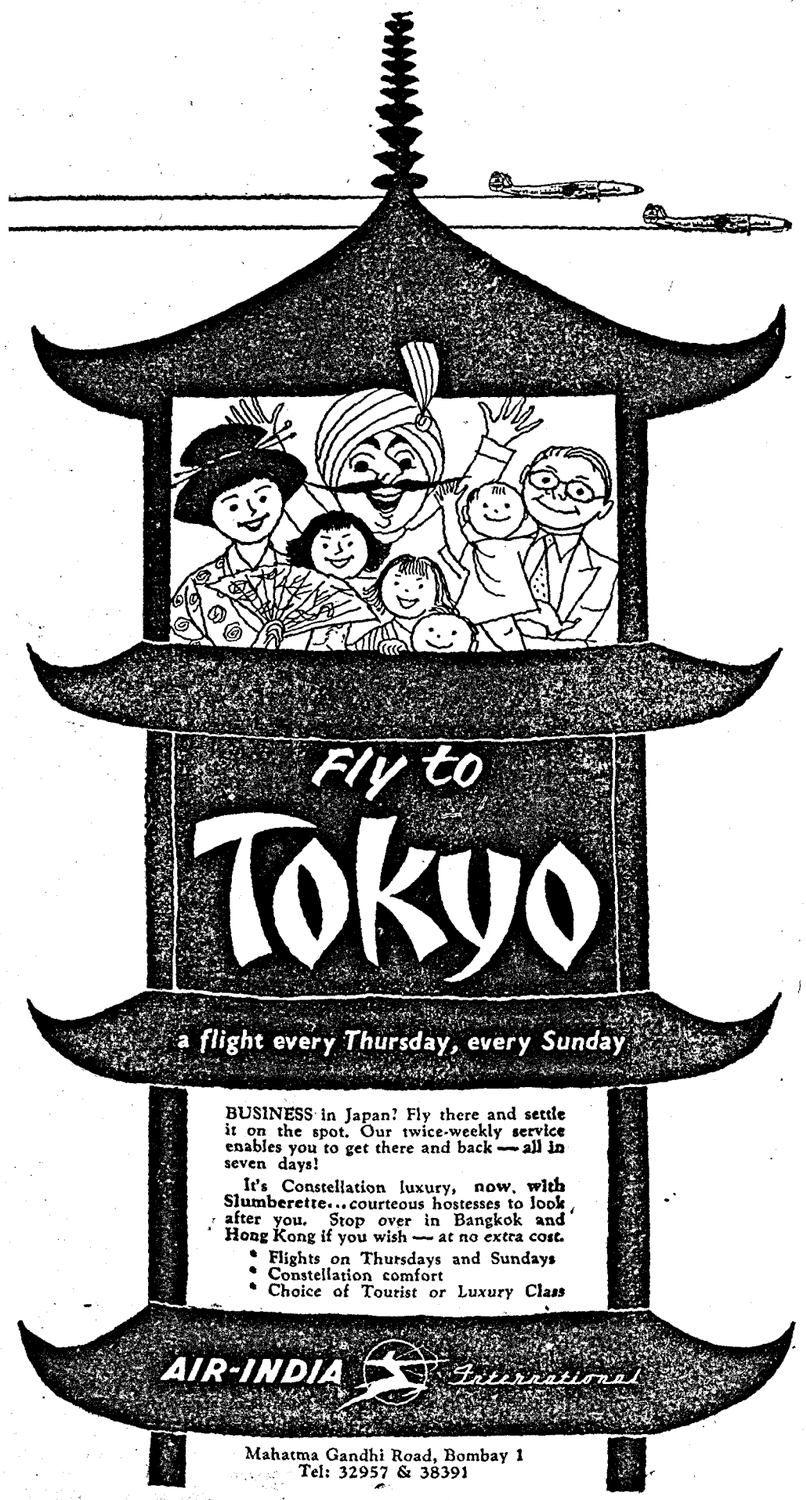
State Trading and Package Deals

E replies to the debates on demands for grants should convince even the worst sceptics that the Government means to stick to the Plan targets. No threat of inflation can persuade the Government to revise the investment targets downward. There are no signs of major differences among the members of the Cabinet on this score. All of them seem equally set on reaching the targets, or rather making the maximum effort towards that end. T T K, considered the blue-eyed boy of the private sector hitherto has gone to the length of maintaining that the targets of industrial production given in the Draft Outline are not to be taken as ceilings. "They are targets," he said, "that have to be achieved any how. It is my own belief that the targets in regard to consumer goods are well below what would be our needs, as the Plan progresses. That is why I emphasised the need for regarding the targets in the Draft Outline of the Second Five-Year Plan of the levels of production to be obtained to be the minimum rather than ceilings".

The necessity for expanding exports follows as a corollary, if the production targets are to be reached. As Shri T T Krishnamachari put it, "We are assuming a gap of a thousand crores in our foreign exchange. It means we are going to import a thousand crores more than what we are going to import normally and we must, to some extent, balance these imports with exports. That is what we are striving to do with these bilateral arrangements".

If we must have a substantial increase in our foreign trade, the uncoordinated efforts of the private sector are not adequate for the purpose. They need to be supplemented and the State Trading Corporation is the instrument chosen for the purpose. The Corporation will handle as large a proportion of the growing volume of trade as possible particularly that of trade with communist countries or in particular items which are regulated on monopolistic lines.



Post-agreement negotiations with Communist countries have revealed certain procedural and other difficulties. State-controlled economies have shown a marked reluctance to make use of the established organisations and procedures for inspection and settlement of disputes. What is more, competition among Indian importers as well as exporters has often resulted in weakening the bargaining strength of Indian traders vis-a-vis foreign monopolistic organisations. By intervening between Indian trading interests and monopolistic trading organisations abroad, the State Trading Corporation is expected to offer a solution to these problems. The Corporation will not only help resolve the procedural difficulties over inspection and settlement of disputes but will assist the two parties in entering into contracts on equal terms. This is what persuaded the Government to decide to set up the Corporation.

Now that it has been decided to set up the State Trading Corporation, the Government feels that it can be used as an instrument for its price policy also and for maintaining a balance between supply and demand. So far it had to depend principally on the Import and Export Control Act and Tariff Act for implementing its policies in the field of foreign trade. For deriving the maximum benefit out of the limited foreign exchange resources available to the country, imports have been controlled. Exports have similarly been regulated with a view to maintaining a stable price and supply situation at home. Again, fiscal measures like import and export duties have been resorted to for protecting the internal price structure from international influences, for mopping up excess profits and for extending protection to indigenous industry.

These measures are proving rather inadequate for a number of essential articles, the demand for which has been outstripping internal production. The State Trading Corporation may be relied upon to take care of such situations and to arrange for imports in time so as to prevent temporary shortages emerging.

Meant to take over certain sectors of the country's foreign trade, the Corporation will have a share capital of Rs. 1 crore, all the shares being held by the President. The corporation is not intended to enter into internal trade or to participate in a large way in distribution. It will function as an autonomous commercial enterprise with freedom to take reasonable risks and wide powers to ensure necessary flexibility of operation. Needless to say, the broad policy governing its operations will be laid down by the Government from time to time, but the Corporation will enjoy considerable latitude in its day to day working. The Corporation cannot be expected to make profits on each individual transaction; surely there will be losses on quite a few, especially in the initial stage, for trading can never be risk-free. Structural and organisational details are still to be decided. The Corporation is likely to have branch offices at the three main ports.

There will always be sticklers for form, just as there will be persons with more knowledge of audit rules than of economics. And they will raise their voices of protest as soon as a rule is violated, be it for saving time and money or for malafide reasons. Sections of the Lok Sabha expressed dissatisfaction at the "package deals" made with the U K and the U S S R for the construction of Durgapur and Bhilai steel works. Tenders were not called for and the parties in these two deals were entrusted with the construction of the steel plants, including civil engineering work. This method of dealing with the problem saved time and involved no extra cost. Despite the comparatively late date at which the British agreement was signed, the Durgapur plant may go into full production at about the same time as, or even earlier than the German plant. With two years start, the first blast furnace at Rourkela is expected to go into production in November, 1958, about seven months before the first blast furnace in the British works. But by June, 1960, all the British works, except for some minor plant, are expected to be in operation. Similarly, the blast furnace in the Bhilai plant will start functioning by 1958, and full production is expected by 1960. The Germans who were the first to arrive on the scene are still engaged in placing orders for plant and equipment with the manufacturers. Delays in placing orders have been caused by the method of inviting world tenders.

From the London End

East-West Trade Impasse

IN an interview to the **Times**, Marshal Bulganin emphasised that "increased trade between the Soviet Union and England would be an important *stimulus* in the development of co-operation in other fields." Whether or not this is something new in Soviet policy, it at least meets the oft-repeated British argument that settlement of one problem at a time is preferable to any attempt at a quick over-all settlement. Yet, the **Times** made the rather disappointing comment that "trade cannot be dismissed in an isolated compartment.. it cannot be divorced from the political background and from the general easing of world tension." At least on questions of trade some common ground could have been expected—particularly so, because of the desperate position in which Britain finds her export trade. That the response has been what it is suggests that what Mr. Mollet had said of the Western attitude to Soviet overtures is of *particular* application to British policy.

The same British attitude was exhibited somewhat sharply at the Economic Commission for Europe Conference on East-West trade. The British representative, Lord Hawke, not only pooh-poohed the idea of an early solution of this problem, but took the unprecedented step of criticising Dr Gunnar Myrdal, the Commission's Secretary, for having concentrated too much of his attention on this question. ".. It is our belief," he asserted, "that the primary function of an inter-governmental organisation such as the E.C.E. is not to attempt to organise trade in any way."

The contradiction in the British attitude is particularly blatant in the case of trade with China. A review of the statements made by members of Government on this question over the past three years is sufficient to show this to be the case.

March 1953. ".. We were obliged to take all possible steps to prevent the export to China of any goods which would be of military or strategic importance to the Chinese forces in Korea".

(Lord Mancroft)

April 1953. ". . . the restriction on strategic goods which was put upon China as long as the warlike activities were pursued in Korea cannot possibly be extended to any general overall peace plan".

(Lord Mancroft)

March 1954 ".. the United Nations resolution of May 1951.. was adopted to meet aggression in Korea and its scope has not been widened .. to hostilities in Indo-China".

(Lord Salisbury)

Dec. 1955 ".. it is necessary to bear in mind that the resolution of the United Nations was not confined to the end of hostilities in Korea".

(Lord Reading)

Feb. 1956 "We are agreed that the test with regard to decontrol is the extent to which it serves the interests of the free world".

(Mr. Selwyn Lloyd)

And so what was orginally a specifically-based embargo has now become a far-reaching political restriction on Anglo-Chinese trade. It must, however, be emphasised that the British stand on Anglo-Chinese trade has always been conditioned by the views of Washington. This conditioning does not however appear to have been so significant on the question of trade with the European Communist States.

Last year saw a 21 per cent increase in trade between Western and Eastern Europe and Dr. Myrdal has indicated that this expansion has continued into 1956. Western imports from the Eastern bloc of countries increased by 31 per cent between 1954 and 1955, and it appears that Britain was an important participant in this trade. These improvements are striking but continue to be dismally small in absolute terms.

The Soviet delegates have submitted a far-reaching programme of economic co-operation to the current session of the ECE. The programme envisages:

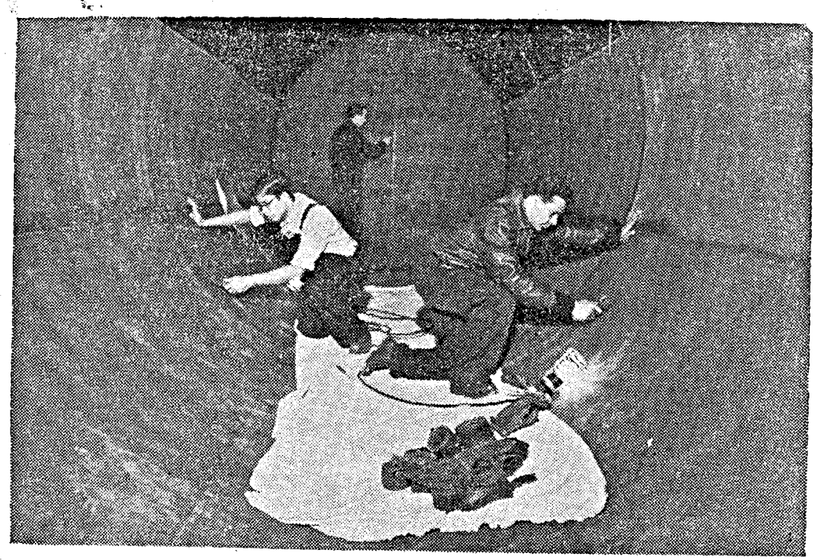
(a) An all-European agreement on economic co-operation;

(b) The elaboration of 'planned' measures for the development of business contacts;

(c) The establishment of an E C E body for the peaceful uses of atomic energy.

These proposals bring together an impressive number of what the French delegate called 'chapter headings'. It provoked some Western response: the Germans wanted to learn what the Russians had in mind and the Swedes called for some study of the proposals. It was the British attitude which indicated that *nothing* far-reaching can come out of such a study.

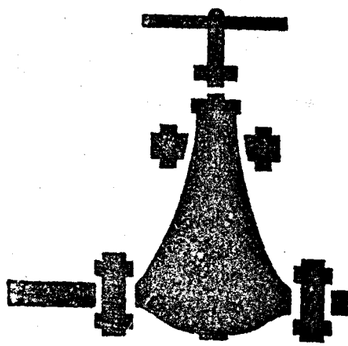
The first Russian proposal was somewhat similar to the scheme put forward by Dr Myrdal. It embodied an all-European agreement on voluntary multilateral compensation which, as Dr. Myrdal stated, would 'unfetter international trade' and make 'a real contribution to general harmonisation of relations in Europe'. The British attitude was, to say the least, unhelpful. Lord Hawke declared that intra-European



West European Trade with the European Communist Bloc

($ Millions)

	First 9 months of Each Year					
	1953		1954		1955	
	Imports	Exports	Imports	Exports	Imports	Exports
United Kingdom	146	29	148	45	198	70
France	29	34	48	51	60	100
Netherlands	34	33	35	58	50	39
Belgium	27	45	36	48	33	46
Italy	33	37	43	41	52	42
W. Germany	43	35	55	54	81	84



payments could be arranged in sterling, and he therefore saw no need for anything new in European financial practice. The British motive in directing European trade through sterling is of course obvious. What is equally obvious is the fact that given the non-convertibility of sterling and other European currencies, the whole pattern of trade between East and West Europe has up to now been confined to strictly bilateral trade agreements. It is towards an ending of this pattern—of introducing multilateralism on the basis of a central compensation machinery—that the new proposals are designed. The other British objection related to the Soviet proposal for a 'planned development of trade contacts'. This, said Lord Hawke, went against the trade practices of British business men, and so his Government was opposed to it.

This then is the impasse in which East-West trade finds itself. It is difficult to imagine how the discussions between the Soviet and British leaders can lead to a purposeful and practical agreement when the trade problem is made to depend on such complex questions as German unification, disarmament and the like.

The Indian Tube Company's works at Jamshedpur bid fair to supply India's growing requirements of steel tubes to the full.

Dunlop anti-corrosion linings have been applied to essential equipment: pipe work lined at Dunlop Sahaganj and Sulphuric acid storage and pickling tanks lined by Dunlop personnel on the site of this modern plant, the largest of its kind in India.

Weakness In Numbers

Indian Livestock Census 1951, Volume I. Issued by the Economic and Statistical Adviser, Ministry of Food and Agriculture. New Delhi. Pages 60. Price Rs. 5 or 8 sh.

THE report of the seventh quinquennial Indian Livestock Census relating to the year 1951, like some of its sister publications, enjoys the distinction of coming out rather late. The census was conducted in May 1951; the report on it was signed by the Economic and Statistical Adviser, Ministry of Food and Agriculture, in July 1953; the Manager of Publications brought it out in September 1955; and now—after the lapse of four years, when it is time for the next census—we have a copy for our education! Its interest, therefore, is purely historical. There are, however, one or two changes—though mainly of form—which invest the report with some amount of newness, and differentiate it from the previous one for 1945. In the first place, formerly known as "Livestock Census in India", it has come to be re-designated as "Indian Livestock Census". Secondly, it now appears in two volumes—the first one gives a brief account of livestock census, livestock conditions etc, and the second contains, districtwise, details about the number of livestock, agricultural machinery and implements etc. Finally, the present report is more comprehensive in coverage inasmuch as the census under reference was held in the post-Independence political set-up and as such, covered practically the entire country except Manipur and Orissa. Comparability of the data for the two census years, viz. 1945 and 1951, is, therefore, limited.

The first livestock census was held in the winter of 1919-20 and thereafter such a census has been held at intervals of five years. The sixth census was carried out in 1945 in British India and some of the Indian States. UP and Bengal, however, held the same in 1944 and 1946 respectively. The seventh all-India census was due in 1950, but was postponed as there was a proposal to combine it with the FAO Census of Agricultural Holdings. However, since the latter was postponed, it was decided to go ahead with the livestock census, which was ultimately held in May 1951. Owing to some administrative and local difficulties, some of the States could not carry out the census according to the stipulated programme. Thus, in Ajmer it was held in June, in West Bengal in September, in Rajasthan in February 1952, and in Travancore-Cochin, in August 1952. But these States were asked to take account of the inter-State movement of cattle since 1951. Though essentially concerned with livestock, the report has also collected information about poultry and agricultural machinery and implements.

Largest Number

India possesses the largest number of livestock in the world—a total of 292 million in 1951 (267 million in 1945)—and unlike in the continent and in the U S where cattle are kept mainly for milk and meat, Indian cattle supply, besides milk, draught power, whose value is estimated at around Rs. 300-500 crores. Indian livestock also supply farm manure and meat; eggs, wool, hides and skins and horns and bones are other useful products. Unfortunately, however, the benefits of the numerical superiority of Indian livestock are largely offset by their poor quality. The yield of milch cows as well as the capacity of working cattle are low when compared with other countries.

Of the country's livestock, cattle constitute the largest number at 155 million. They are followed by goats which number 47.1 million and buffaloes totalling 43.4 million. The number of sheep is 38.8 million, that of horses and ponies 1.5 million, mules 60,000, donkeys over a million and camels less than a million. Of the 155 million cattle, male ones form 39.8 per cent, cows (in milk, dry and working) 31.2 per cent and young stock 28 per cent. The concentration of cattle depends on such factors as topography, climate, agriculture etc.; and it is found that the number of male cattle is highest in U P (23.51 million), followed by Madras (19.41 mn) and Bihar (15.29 mn). Cows in milk predominate again in U P and Madras and in Madhya Pradesh. The number of cattle power per 100 acres of cultivated land is largest in Madras (130.4), followed by West Bengal (88.5) and Bihar (69.1).

An important aspect about Indian cattle is their variety: there are about 25 types of well-defined breed in addition to a large number of nondescript ones. Among the former, some of the well-known names are Sahiwal, Sindhi and Gir among milch breeds and Amritmahal, Hallikar, Kangayam and Kankarej among draught bullocks. Hariana and Tharparkar are the best dual-purpose breeds.

Of the 43.3 million buffaloes, the largest number is in U P (9.25 mn); and Madras (7.86 mn) and Bombay (4.16mn) follow in order. A large number of buffaloes are again of a nondescript type, but the most common breed is Murrah. The heaviest milkers are Jaffarabadi buffaloes, found mostly in Saurashtra.

Sheep and goat rearing constitutes an important occupation both in the northern and southern parts of the country. Wool, mutton and skin are valuable sheep products, while goats yield milk besides meat and skin. Of the 38.8 million sheep, the heaviest concentration is in Madras (15.2 mn), followed by Rajasthan (5.1 mn) and Hyderabad (4.3 mn). The largest number of goats is again in Madras (7.4 mn); and Bihar (5.9 mn) and Rajasthan (5.4 mn) follow in order. Pigs are mostly reared for meat and skin and are found in large numbers in Madras.

Poor Quality

It has been mentioned in an earlier paragraph that the quality of Indian cattle is very poor. The report on the Livestock Census tells us why. It points out that the 'breeding aspect' of animal husbandry has been completely neglected in India, and breeding is done more often than not with the help of stray cattle or the 'Brahmani' bull. In the result, a large proportion of livestock does not belong to any particular breed and is of a nondescript type. We are, however, assured that efforts are being made by Government to improve livestock by scientific selection of breed and mating. Research in different breeds and in cross-breeds is being done; most State Governments have esta-

blished breeding farms; artificial insemination is being successfully carried out; and Community Development Projects and Key Villages also provide facilities for scientific breeding. Vindhya Pradesh, Madras, Bihar and Punjab are probably the most prominent among the States which are making laudable efforts in this matter.

An important factor, which has a close bearing on breeding, is that the inferior males should be segregated. For this purpose, therefore, 'Gosadans', where such inferior male cattle can be kept, are being started at several places.

Any attempt at improvement of quality, says the Livestock Census, can succeed only where the livestock are properly fed. A distressing fact, however, is that the majority of Indian livestock are ill-fed or under-fed. This is, of course, mainly due to the size of the cattle population and to the fact that many of them being poor in quality, it does not pay the owner to feed them properly. Generally, cattle are left to graze on the common land. This serious underfeeding of cattle results in slowing down their rate of growth and in lengthening the dry periods.

This problem, we are told, has attracted the attention of both Central and State Governments; and steps have been taken to improve fodder and grazing conditions. Among the measures taken are liberalisation of rules regarding grazing cattle in State forests, earmarking of common grazing lands, introduction of nutritive varieties of fodder etc.

The housing of livestock in India also leaves much to be desired. Generally, kaccha sheds which are open are used. Only in some parts of the country, are the sheds covered. In the rainy season, the cattle sheds—so-called—get dirty and give rise to disease. Though several municipalities and State Governments have taken measures such as the prescription of standards for sheds, construction of low-priced sheds and supply of building materials at subsidised prices, this is a field in which much leeway has to be made up.

Bad housing is partly responsible for causing infectious diseases which affect the ill-fed, weak Indian cattle. Cattle mortality, due to this, is very heavy, resulting ultimately in an increase of rural indebtedness. Some of the common diseases are Rinderpest, Black Water and Anthrax, Mouth Disease, Liver Fluke, Cholera etc. However, prophylactic measures have been taken in most of the States. Among measures for fighting the diseases are: provision of service through veterinary hospitals, dispensaries and mobile veterinary units, opening quarantine stations on migratory routes, research in cattle diseases and their treatment, free supply of sera and vaccines, training veterinary personnel etc. Vindhya Pradesh, Bihar, Madras, Punjab, Madhya Pradesh, Ajmer and Madhya Bharat are probably the most notable States which have taken up the question of this battle against diseases seriously. Though the present situation about livestock is distressing, the report strikes an optimistic note; it may be hoped that with so many schemes regarding breeding, feeding and control of diseases in operation, the livestock in the country may show a marked improvement both in their yield and expectation of life in the years to come.

The Livestock Census has collected data about poultry also. We are told that except in certain States, where Government has started poultry farms or subsidised private efforts, this enterprise has not assumed the status of an industry. Indian poultry keepers are poor, backward and conservative; and the lack of experience in breeding has resulted in deterioration of the quality of birds. And the birds generally live on what they get in the dirt heaps of lanes and streets. Of late, however, poultry-keeping on proper lines is gaining in importance; and both the Central and State Governments are taking interest in poultry development. Encouragement is given generally through the establishment of poultry farms; and most active among the State Governments are UP, West Bengal, Bihar, Madhya Pradesh, Punjab, Orissa and Mysore.

The information on agricultural machinery and implements throws much light on the extent of modernisation that has been effected. We are told that the Indian farmer still largely uses primitive and simple tools, which are cheap, easy to make and repair and within the capacity of draught animals. However, modern devices such as tractors, bulldozers, harrows, hoes, seed drills etc. are generally coming into vogue, though there is yet a long way to go on the road of mechanisation. There are 8,354 tractors in India—6,857 belonging to private farmers—and the largest number is to be found in UP (2,548). Bombay (1,072) and Punjab (1,064) follow in order. The number of wooden ploughs is 31 million, while that of iron ploughs is only 931,000. Electric pumps and oil engines number 29,834 and 95,140 respectively. Among the States, which have made successful efforts in introducing modern devices, are Madras, UP, Bihar, Assam, Bengal and to some extent Punjab. The progress in Part B States is, however, negligible.

Part 'B' of the report contains tables giving a detailed breakdown of the number of livestock and poultry by variety and State, while Part 'C' towards the end, includes in all five appendices on pro forma for the 1951 livestock cencus, pre-Independence Provinces and States in which the 1945 census was held, authorities concerned with the collection of livestock statistics, breeds of livestock and the number of tractors in India.

Table I—Indian Livestock

('000)

	1951	1945
Cattle	155,099	135,960
Buffaloes	43,351	40,593
Sheep	38,829	37,729
Goats	47,077	46,286
Horses and Ponies	1,514	1,399
Mules	60	45
Donkeys	1,240	1,132
Camels	629	654
Pigs	4,420	3,707
Total	292,218	267,505

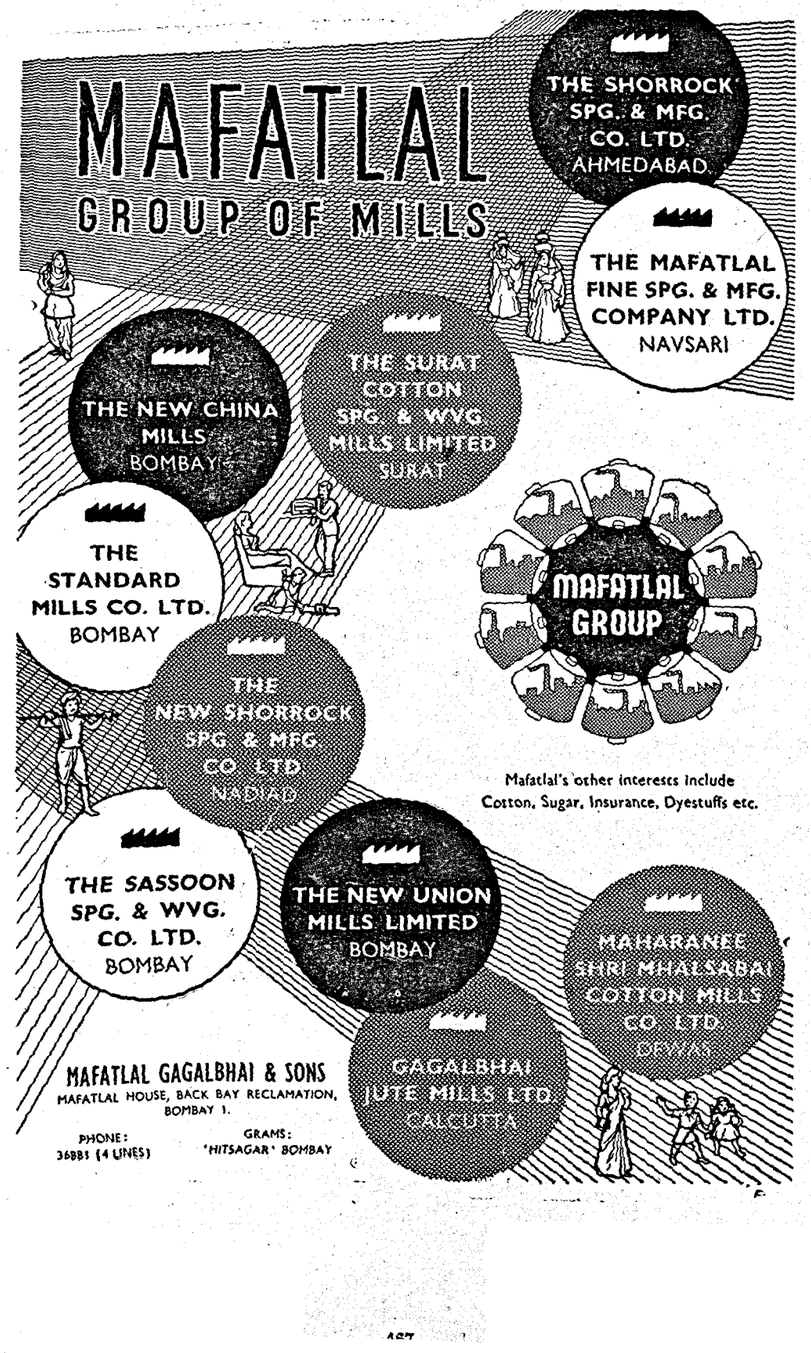

Table II—Poultry in India

('000)

	1951	1945
Fowls	67,135	54,656
Ducks	6,264	3,583
Total	73,421(a)	58,239

(a) Includes 22,000 for which details are not available.

Note: The data for the two years are not strictly comparable due to the change in the reporting areas at the 1951 census.

Budgets in Nepal

Y P Pant

UNTIL recently, the 'hermit kingdom' of Nepal had developed no system of presenting periodic budgets to the public, as there was no separation between the funds of the State and the privy purse of the ruling Prime Minister. It is only since the overthrow of the Rana rule in February 1951 that among the many changes that have taken place, the presentation of an annual budget has found a place. Under the new set-up the country has seen some five budgets. The first was a budget estimate for the Nepali year 2008 which covered the priod from March 1951 to February 1952. Subsequent budgets have been for the Nepali fiscal year, i.e., from July to June.

While presenting the first budget (1951-52) to the country, Nepal's first Finance Minister explained that estimates under many of the heads under revenue or expenditure were far from accurate or exhaustive. This was inevitable in view of the state of affairs that had prevailed till then. The difficulty, in fact, has been that the Government possesses hardly any statistical data and no independent agencies for the survey and collection of facts in a proper way have yet emerged. Reliance has, therefore, had to be placed on such information as was at hand and on estimates made by knowledgeable people. In spite of these difficulties, however, subsequent budgets have become more comprehensive and precise, though they continue to suffer from many defects.

Shape of the Budget

The Nepali budget is similar in pattern to the Indian budget. It is a cash rather than an obligation budget. Revenue and capital are generally separated, and each budget passes through three stages i.e. estimated, revised and actuals. Since the present article seeks to analyse the basic trends of the various budgets presented so far, a brief review of the budgets is necessary. The first budget (1951-52) was presented at the end of the year through Radio Nepal (there being no Legislature), the second (1952-53) was passed in October 1952; the third was never passed by the Assembly; the fourth (1954-55) was considered by the Assembly in December 1954 but was again not passed; and the current budget (1955-56) is said to have been approved by His Majesty the King, but the figures have not been made available to the public. The first two budgets were drawn up in terms of rupees without any distinction between Nepali and Indian currency. Since Nepal has a dual currency system (both the Nepali and Indian rupees being legal tender) it is realistic that the budgets for 1953-54 and for subsequent years are in both currencies.

The Revenue Position

The principal heads of revenue of the last four budgets given in Table I throw light on the existing sources of revenue of the Government.

The principal source of revenue, it will be seen, is land revenue, which provides as much as one-third of the total. Land revenue collections have improved from Rs 94 lakhs in the first budget in 1951-52 to Rs. 131 lakhs in 1953-54. Though this is an inelastic source of revenue, seasonal conditions play a part and so do the extra land taxes imposed at a flat rate. Owing to the insurrection, not much could be collected in the first budget; it is in the subsequent budgets that revenue obtained has been increasing. In the last budget, serious floods in most of the eastern parts of the country caused a decrease of revenue to Rs 125 lakhs.

The Inspector General of Forests in U P, has submitted a report on the Re-organization of Forest Administration in Nepal, in which he makes the point that U P, with half the forest resources of Nepal, realizes ten times as much from forests. The present yield from forests in Nepal is undoubtedly meagre, varying between Rs 29 and Rs 34 lakhs. This meagre yield is due partly to lack of proper knowledge of the existing forest resources and partly to the anachronistic feudal system of land tenure, especially the Birta System (no rent land) in various parts of the country which recognizes the individual ownership of forest resources. This has made possible the reckless exploitation of the forest resources for private profit, to the detriment of State revenue and national welfare. At present, revenue under forests is derived mainly from:

1 the sale of timber and other forest products, and

2 miscellaneous items of fines, refunds and rents of building and so on.

Next to the land revenue come customs duties and their increasing importance is indicated by the increase of yield under this head from Rs 73 lakhs in 1951-52 to Rs 136 lakhs in 1954-55.

It is believed that the substantial upward trend in this revenue, apparently arising principally from the present arrangement with the Government of India, will continue for another year or two. After that, the revenue is expected to level off, unless the volume of imports increases with increased production in the country. Since the bulk of imports at present are necessaries of life, increases in rates of duties would intensify the regressive character of the tax system.

The revenue from excise duties, under which Government contracts are included, has also increased from Rs 9 lakhs in 1951 to Rs 25 lakhs in 1954-55. Yield from miscellaneous sources includes gross income from post and telegraph, railways, ropeways, taxes on vehicles, entertainment taxes, revenue from the administration of justice (presumably court fees) and from commerce and industry, civil works etc. The yield from entertainment taxes may increase considerably in the future. The absence of direct taxes is conspicuous. It can also be noticed that the revenue from land, which is one of the most regressive of taxes, is so far the mainstay of the country's finance.

Table I — Revenue and Receipts

(In lakhs of rupees)

	1951-52 (Estimates)	1952-53 (Estimates)	1953-54 (Revised)	1954-55 (Estimates)
Customs	73	100	102	136
Income Tax	—	—	—	—
Excises (Rakam and Thekka Bandobast)	9	18	22	25
Revenue (Land)	94	123	131	125
Forest	30	32	29	34
Miscellaneous	99	128	93	111
	305	401	377	431

The Pattern of Expenditure

On the expenditure side, the budget data disclose certain specific features (Table II). So far, details of the expenditure on revenue account alone are given. Regarding capital expenditure, only the second and fourth budgets have given accounts of expenditure on aviation, thermal plant, depreciation allowances, pension funds and other deposits and advances. One of the special advantages of Rana Rule was the great economy in administration. As the budgets show, excepting in the third year, administrative expenditure under the new set-up has gone up tremendously. Defence expenditure has been on the increase from the very first year. Knowledgeable quarters estimate that the deficit on revenue account in 1951-52 (the first year of the new set-up) was the result of a 40 per cent increase in the expenditure on general civil administration and a 15 per cent increase in defence expenditure.

The miscellaneous items of expenditure in the budgets for which details are available include costs of collecting taxes, costs of government-owned public utilities (railways, hydro-electric installation), irrigational work, and direct demands on revenue. To-day any budget is necessarily judged by the provision made in it for social services and promotion of nation building activities, but in Nepal adequate attention has not been given to these; expenditure on education accounts for only 4 per cent and that on health forms no more than 3 per cent of the total.

Budgetary Deficits

A regular feature of the budgets is the annual deficit to the tune of more than one crore of rupees. Table III gives the comparative figures of budget deficit during the last four years. These figures indicate that as compared to 1951-52, there has been some improvement, but this has hardly been significant. No doubt, the deficits shown in Table III are subject to substantial inaccuracies for various reasons. Firstly, excepting in the fourth budget, no distinction has been made between Nepali currency and Indian currency. The exchange rate today being about Rs 175 Nepali rupees for every 100 Indian rupees, the deficit tends to be over-estimated as more than half the revenues are in Indian currency. Secondly, experience has shown that actual expenditure tends to fall short of the estimated expenditure. Making allowance for all these, however, substantial deficits have become a permanent feature of the Nepali Budget.

Table II — Expenditure

(In lakhs of rupees)

	1951-52	1952-53	1953-54	1954-55
General Civil Administration	184	224	169	219
Defence	128	127	138	159
Miscellaneous	213	178	161	214
Total	525	529	468	592

Table III — Budgetary Deficits

(In lakhs of rupees)

	1951-52	1952-53	1953-54	1954-55
Revenue	305	401	377	431
Expenditure on Revenue Account	525	529	468	592
Deficit on Revenue Account	220	128	91	165

As deficit budgeting is being increasingly resorted to for financing development in some other backward countries a deficit in the budget itself is not a sufficient criterion for judging the economic position of a country. It is worth asking, however, whether the deficit in Nepal is being incurred for social services and nation building activities or economic development and reconstruction. Had it been incurred to finance essential development projects, the deficit might have been justified in certain circumstances. But in Nepal, as the above study shows, deficits have appeared in spite of general neglect of development works. Such deficits are a great liability to the country and raise serious doubts about its financial position.

Statements of the various funds and cash balances are available only for 1951-52 and 1954-55. A glance at the available figures shows that between 1951-52 and 1954-55 the reduction in reserves was relatively small. Whether the deficits are still considered as obligations against the Development Fund or not, it is not known. Even in the current budget, changes in reserves and balances are not indicated.

However, it is officially reported that some bullion and Rs. 1.95 crores of Indian currency are still untouched, being kept as backing for the Nepali Rupee.

Burma Mines

IN 1955, the revenue of Burma Mines, a company which is an equal partner with the Government of Burma in the Burma Corporation (1951), increased because of the higher dividend received from the operating company. Burma Mines have declared a maiden dividend of 2¼d per share.

Burma Corporation (1951) are doing well. Net profits of this Company for the first six months of the current financial year are almost double that for the corresponding period of the previous year. In the report, the directors of Burma Mines say that the volume of business has expanded with the gradual increase in business activity in Burma. Improvement in quantities for Burma Mines is reported to be due to active American buying on the London Stock Exchange. Some forty per cent of the Company's capital is believed to be owned by American investors.

Trends in Industrial Production

THE rising tempo of industrial activity, which was already apparent in 1954, continued during 1955. The figures of capacity and output published in this journal (for Engineering Industries last week and for Chemical and Other Industries this week) indicate a further movement in the direction of increasing utilisation of capacity. The star performer in showing an increase in output during the year has been the steel structures industry, which recorded a 310 per cent increase in output; but quite a number of engineering industries showed increases of from 50 to 100 per cent. Output of bicycles increased by 35 per cent, while that of sewing machines increased by 25 per cent and of ball bearings by 11 per cent. As was noted last week, programmes for the expansion of output in those industries which neared or exceeded capacity are being formulated and in some cases have already been implemented.

Industrial development in India is also reflected in the increasing range of goods that are being produced within the country for the first time. During 1955, alternators, cycle dynamo sets, complete typewriters, self doffing jute silver spinning frames, tea dryers, clinker coolers and clinker breakers, delivery valves and pump elements for fuel injection equipment, vertical multi-cylinder diesel engines, certain sizes of drilling machine, all geared head bench lathes and hypodermic needles were among the products manufactured in India on a commercial scale for the first time.

New Commodities

Programmes for the manufacture of new commodities, not produced hitherto in the country, were approved for jute mill machinery, capstan and turret lathes, windmills, steam and diesel road rollers, agricultural tractors, and automobile auxiliaries like wheels and rims, clutches and hydraulic brakes. Actual production of these items can, therefore, be expected to be reflected in the figures for 1956 or 1957.

An interesting aspect of industrial development is the increasing emphasis on the manufacture of industrial machinery within the country. Machinery for the cotton textile industry is already being manufactured here. During the year there have been considerable increases in the output of carding engines, looms and ring frames, production having doubled in respect of the last item. The output of looms, which had shown a fall last year 'on account of the present restrictions on the installation of new automatic looms', showed an increase this year. One wonders whether this implies that there has been a change of policy in this respect, or there is some other explanation of either last year's fall in output or this year's rise. This year's output of 2,636 looms is larger than the previous maximum of 2,086, reached in 1953, by 25 per cent; so some explanation ought to be offered.

The 1955-56 Report of the Ministry of Commerce and Industry points out that the "jute textile machinery industry has been more or less established and in a few years' time, it is expected that the jute industry will cease to be dependent on imports in respect of machinery." Steps have also been taken to develop the sugar, cement and printing machinery industry, while manufacture of the complete range of paper mill machinery, earth-moving equipment and water tube boilers "is also receiving the attention of the Ministry".

Automobile Industry

An important industry which showed a big spurt in production has been the automobile industry. The number of automobiles produced increased from 14,462 in 1954 to 23,084 in 1955, while the number of firms decreased from 9 to 8 and capacity from 40,000 to 39,000. While the existing ancillary industries showed substantial increases in output, programmes for new production of some important ancillaries like wheels and rims, clutches and brakes, shock absorbers, oil seals, gaskets and ignition coils were in the process of implementation. Plans are also in preparation for the remaining important ancillaries like carburettors, starter motors and dynamos, steering and dashboard instruments etc. During the current year, one unit each for motor-cycles and scooters went into production with a capacity for 5,000 and 6,000, while actual output was 419 and 536 respectively.

It appears that there is a heavy demand for diesel trucks, and Tata-Mercedez-Benz have been given premission to double their capacity over the next three years. The demand for vehicular diesel engines for conversion of the existing petrol vehicles as well as for original equipment to chassis was also high, and the output of such engines was 3,875 in 1955, against a capacity of 3000. The only unit in the field which came into production in 1955 has thus been able to achieve more than capacity production in the very first year of its existence. Much of this is still assembling, of course; it is expected that in a period of about 18 months, the entire engine less proprietary parts will be manufactured in India. A new unit has also been granted a licence to establish manufacture of another brand of such engines with a programme for complete manufacture in three years.

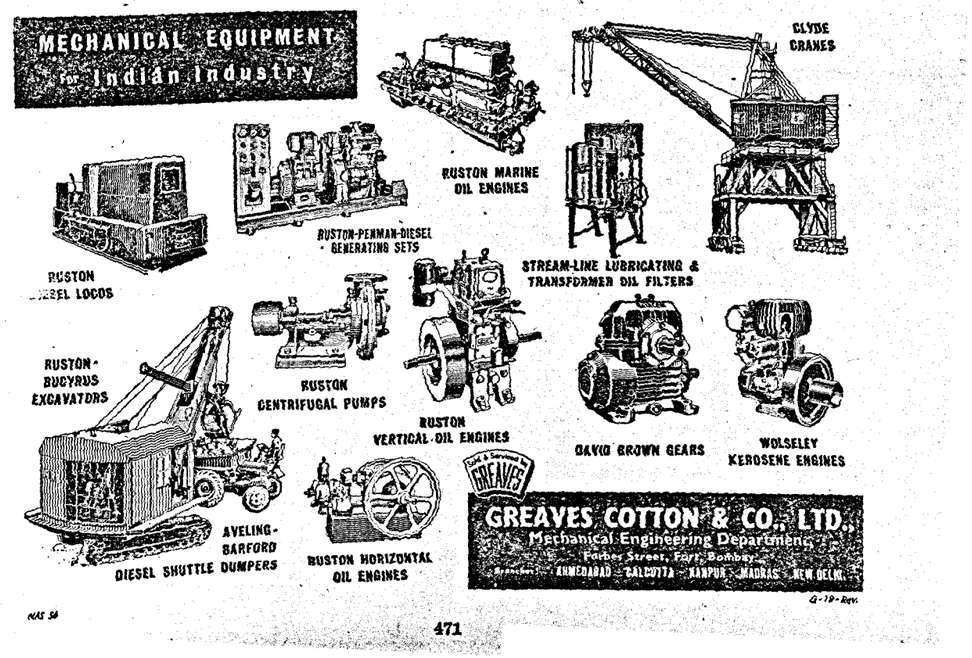
Ordinary diesel engines, which were facing considerable difficulties in 1953, have also increased their output, though production is still far below capacity. The same applies to power-driven pumps. It is anticipated that diesel engines will encounter considerable competition from electric motors in the field of agriculture.

Significant Advance

Electrical Engineering industries reflected the general condition of industries during the year. Among the metallurgical industries, the most significant advance was registered by the aluminium industry, output of ingot metal increasing from 4,900 tons to about 7,000 tons in 1955. The production of sheets, strips, circles and foils also increased from 8,500 tons in 1954 to 11,000 tons in 1955. The existing installed capacity of 7500 tons for ingot metal is completely inadequate relatively to the demand for 20,000 tons at present, which is expected to rise to 30,000 tons in a few years. Plans for additional capacity are, therefore, under preparation. A somewhat similar situation prevails in the small-sized steel castings industry.

There has also been substantial expansion in most of the chemical industries, notably in those producing soda ash, calcium chloride, benzene, sulphur black, phosphoric acid and sulpha drugs. New chemicals manufactured for the first time include Penicillin, ammonium chloride and bismuth salts. Output of sulphuric acid increased by 4 per cent to 156,000 tons, which is still only about 75 per cent of capacity; but additional capacity has been sanctioned in view of the importance of this chemical in the industrialisation of the country. Steps are also being taken to maintain reasonable prices for the products.

Fall in Output



There have thus been substantial increases in the output of most industries and augmentation of capacity during the year for some. In others, plans for expanding capacity are under implementation or consideration, whilst in still others, these are under preparation. In spite of this generally favourable picture of industrial production, output of a few industries has actually fallen. A case in point is the superphosphates industry, whose output fell from 105,056 tons in 1954 to 75,345 tons in 1956. Since this has happened, when the Sindri factory shows full utilisation of capacity for production of nitrogenous fertilisers and imports have become necessary again, some explanation is necessary. The Ministry Report suggests that this fertiliser 'though essential, does not give the same spectacular increases in yield as nitrogenous fertilisers', and the fall in agricultural prices caused a fall in its demand. It also suggests that difficulties of rail transport may have had something to do with it, which hardly seems plausible, however if the nitrogenous fertilisers industry was not affected.

Industries in the engineering group which show a fall in output, though of varying degress, include expanded metal, steel belt lacing, chain link fencing, boilers, hosiery knitting and gramophone needles, reamers and tungsten carbide dies amongst tools, domestic refrigerators, brass and copper sheets, circles, strips etc., and zinc sheet strips etc. Amongst the chemical industries, Aluminium Sulphate, bleaching powder, ferrous sulphate, face powder, glazed tiles, magnesium chloride, white lead, zinc, chloride, crockery, light creasote oil, road tar, azodyes, fast colour salts, solubilised vats, stabilised azoics, aureomycin, P A S and its salts, caffeine, ephedrine, bismuth salts and calcium gluconate showed a fall.

In some of the products mentioned above, the fall is alarmingly sharp. For instance, the output of caffeine fell from over 5,000 lbs to less than 2,000 lbs and of Ephedrine from 732 to only 94. In both cases, present output is only a fraction of capacity. The Ministry Report gives an explanation for the fall in the output of caffeine, but not in the other cases. It is obviously very difficult to pass any judgement without more detailed information which the Ministry presumably has in its possession. It would not be a bad idea if the Ministry issued an annual review of industry in which this kind of analysis of the successes and failures was made in detail, while the Ministry Report itself could be made into a shorter and more businesslike statement of the actual activity of the Ministry during the year. Such a review could then serve as a valuable supplement to the Planning Commission's Progress Reports, provided these have not themselves been dropped altogether.

Reassessment of Capacity

An interesting point which emerges incidentally from the Ministry's Report is that a reassessment of capacity is under way in a number of industries. This is brought out by the publication of the reassessed figures for some of the industries. This journal has commented in the past on the unreliability of capacity figures. It would be desirable for the Ministry to indicate the basis on which it is proceeding in this task of reassessment of capacity, so that the intelligent reader may be in a position to understand its exact implications.

Progress of Indian Railways

THE 103rd anniversary of railways in India, celebrated this week, comes almost immediately after the end of the first Five Year Plan. It provides, therefore, an opportunity to examine the progress made by the railways during this period as also the plans that have been formulated for expansion in the next five-year period.

That the railways had been subjected to considerable strain during the War and the immediate post-War period is very well known. The physical weakening of the system seen in the high ratio of overage stock and of overdue replacement or repair of equipment has still not been completely overcome in spite of the efforts made since 1947 and more particularly in the last five years. Nevertheless, the railways have to perform a huge task in the next five years and the plans of the railways to meet the situation are already well-known. The second Plan presents the Indian Railways at once with a challenge and an opportunity. The Railway Board Chairman's slogan, "We Will Deliver the Nation's Goods," shows that railwaymen in the country are approaching their problems in the right spirit.

During the first Plan, the Indian Railways were concerned primarily with rehabilitation. At the same time, they had to provide for the sharply mounting requirements of current traffic, both freight and passenger. To accomplish this task, the railways were allotted Rs 400 crores under the first Five Year Plan. That actual expenditure was Rs. 432 crores, indicating an overfulfilment of the Plan, is a tribute to the efforts made by the Railways since the general picture in all other sectors of the nation's economy is one of varying degrees of underfulfilment. Particularly gratifying is the new slant in Railway publicity on operational efficiency.

Rapid Progress

Rolling stock alone has accounted for over Rs 240 crores, covering the purchase of 1,589 locomotives, 4,837 coaching vehicles and 61,773 wagons, in all cases both for additions to the stock and replacement of old stock. All the lines dismantled during the War, which the Central Board of Transport had recommended for restoration, have been already reopened to traffic with one exception. Five new lines already in progress at the commencement of the Plan and seven more sanctioned under the Plan have been completed, while many other lines started under the Plan are in progress. The foundation stone of the Ganga Bridge was laid by the President on Republic Day this year, and the provision of additional facilities at Vishakapatnam Port, which is under the control of the Railways, is making good progress.

Internal production of rolling stock has also progressed satisfactorily. The Chittaranjan Locomotive Works produced 337 locomotives during the period of the first Plan against the target of 268. The Integral Coach Factory at Perambur was inaugurated in October 1955. Railway workshops turned out 3,415 passenger coaches, the Hindustan Aircraft Factory 706 coaches and manufacturers in the private sector another 230. In addition, private manufacturers turned out nearly 41,200 goods wagons, annual indigenous capacity having been raised to 15,000 units.

While overage stock—locomotives, wagons and coaches—continue to form a high percentage of the total, the Railways increased the goods traffic carried by them from 96.7 million tons in 1951-52 to 115 million tons in 1955-56.

Second Plan

The Second Plan provides for a much larger allocation for railways than did the first. As reduced under the final draft approved by the Planning Commission, Rs 1,125 crores have been made available for the railways of which they have to find Rs 375 crores from their own resources. The Chairman of the Railway Board has revealed that if the railways are able to find a larger volume of resources internally, they will be permitted to expand their plan accordingly.

Since the final allocation of Rs 1,125 crores is smaller than asked for by the Railway Board, it might be asked what the impact of this is likely to be on the economy during the Second Plan. Shri G Pande Chairman of the Railway Board, has stated that it will be possible to provide for an additional transport capacity of 15 per cent for passenger traffic and for 47 million tons of goods, including about 5 million tons carried over from the first Plan period. "While this increase," he points out, "is expected to meet fully the additional traffic load of 25 million tons on account of coal and other raw materials required for the expanding steel industry and its finished products, and a further 6 million tons of coal and 4 million tons of cement, it will leave a meagre margin for trade in other sections of the national economy".

The inadequate allotment for railways, considering the immense task they are expected to perform, has also meant that the railway plan does not provide for much new rail mileage. "Only about 850 miles of new lines are being planned for the present, and these are mostly required in connection with the steel and coal industry".

The total amount of Rs. 1,125 crores is to be allocated in the following way. The new lines mentioned above will require Rs 66 crores, while renewal and strengthening of track will require Rs 100 crores, and Rs 380 crores will be spent on rolling stock. Works intended to increase line capacity, including doubling, coversion to broad gauge, remodelling of important yards etc, have been allocated Rs 166 crores, while remodelling of workshops and the construction of new ones will cost Rs 65 crores. Electrification of 850 miles at an expenditure of Rs 80 crores is also planned on sections "where steam traction can no longer haul traffic satisfactorily". Housing and other staff welfare measures will cost Rs 50 crores.

Western Railway

The Western Railway, which serves an important industrial region of the country with two major ports, has been allocated Rs 100 crores for its second Five Year Plan. Covering a route mileage of 5,614 miles, the Western Railway includes both broad and meter gauge systems. Like the other railway systems, the Western Railway had to face a considerable backlog of rehabilitation of equipment at the commencement of the Plan. In the task of overcoming this, the Western Railway made spectacular progress. Its task was more complicated than that of most of the other systems because the loss of Karachi as a result of Partition threw an additional burden on it. The decision

. . . say KASHMIR for your holiday!

No matter what sort of holiday you want, Kashmir will be able to provide it! The excitement of mountain climbing... the thrills of hiking along scenic trails . . . angling in the swift, clear streams, and everything that you need to make your holiday most enjoyable is available in Kashmir—the beautiful Kashmir, with more facilities and holiday attractions this year!

Kashmir abounds in holiday pleasures!

Come now . . . or during the season of your favourite sport.

KTG/29

to develop Kandla as an additional major port on the West Coast, while relieving to some extent the burden on the Bombay-Ahmedabad mainline, laid the responsibility for servicing the new port with transport on the Western Railway itself. Besides, this railway was faced with the problem of raising the standards of operation on the meter-gauge section to those prevailing on the broad-gauge lines.

In this situation, without much increase in its holdings of rolling stock and locomotives, the Western Railway carried last year 305 million passengers against 258 million passengers in the first year of its operation. The tonnage of goods carried increased from a little over 13 million tons to well over 16-½ million tons. Over 400 miles of meter gauge line were completely renewed, and nearly 900 miles were partially renewed.

The Western Railway has a large number of bridges. Of these as many as 120 bridges on the 240-mile Bombay-Baroda section alone were strengthened during the first Plan, while a new high-level bridge of 1,500 feet was completed over the Mahi river at Sevalia on the Anand-Godhra section.

To serve the new port of Kandla, the Kandla-Deesa railway line of about 170 miles was completed during the first Plan. An alternative outlet from Kandla is proposed to be provided through the Raniwara-Bhildi line north of Kutch, whose construction has been taken in hand and is expected to be completed within the Second Plan period. Other lines, whose construction has been commenced, are the Indore-Dewas-Ujjain line and the Fatehpur-Shekhawate-Churu line.

Doubling of the line from Ahmedabad to Kalol and conversion of a 30-mile narrow gauge line from Kandla to Bhuj into meter gauge have been completed. Apart from this a number of line capacity works for increasing sectional capacity have also been carried out.

Future Expansion

The Western Railway's Second Plan, cut from Rs 149 crores to Rs 100 crores, proposes to cater for a 15 per cent increase in passenger traffic and a 25 per cent increase in general goods traffic, 'in addition to meeting the additional requirements of industries and agricultural projects for which a definite demand for transport can be anticipated on the basis of information available at present.'

To cater for this traffic, the Ratlam-Godhra-Nagda section and the intermediate section between Baroda and Anand will be doubled, and double-line working will be established from Bombay to Ahmedabad and from Bombay to Nagda. In regard to new construction, the survey for the Loharu-Pilani link, a distance of 13.75 miles, has been completed. The survey of the Kotah-Chitorgarh line (104 miles) is in hand, and it is also proposed to carry out surveys for the following projects: Dungarpur to Ratlam Via Banswara, Bhavnagar to Tarapore, and a broad gauge line into Saurashtra.

Additional line capacity works, bridge rehabilitation, track renewal, workshop expansion, signalling and safety arrangements, are all included in the Second Plan. Additional locomotives, coaches and wagons, costing about 69 crores of rupees, are to be obtained to enable this Railway to cater for the additional traffic. In the second Five Year Plan, an allocation of Rs 230 lakhs has been made for the remodelling of stations to increase their usefulness for goods and passenger traffic.

The three lines between Bandra and Borivli have already been electrified to cope with the additional traffic in the suburban section. It is further proposed to spend Rs. 32 lakhs on the provision of additional facilities and for bringing these three lines into use for suburban traffic also. Additional electrical multiple unit stock has been ordered and is expected to be delivered during 1956-57 and 1957-58.

With the provision of these facilities, it should be possible to run additional trains which can be introduced on receipt of the 25 multiple electrical coaches on order. The new remodelled Churchgate station, which will also provide additional accommodation for the overflow of the Western Railway headquarters office, will be a modern multi-storeyed structure. The suburban traveller, whose number has increased from 145 million to 173 million during the last two or three years may find consolation in the fact that he is not worse off than the "commuter" on the English or American railways.

Central Railway

The first Five-Year Plan commenced with the Central Railway's assets badly in need of rehabilitation. Traffic increased during the War period and has continued to increase thereafter, and this has had to be carried with attentuated and overage assets, by making more intensive use of them. Considerable arrears had to be made up in track renewals, replacement of locomotives and rolling stock and other assets; and this claimed the major portion of the funds available. Although rehabilitation was the keynote, the needs of increasing traffic were not overlooked. During the first three and a half years of the Plan period, additional traffic facilities were provided on a somewhat limited scale to cater for the increasing needs of traffic, then estimated to be of the order of 2 per cent per annum.

It was towards the end of 1955 that the Railway Board directed the individual Railways to prepare themselves to carry 20 per cent more traffic during the busy season of 1955-56. This entailed considerable expansion in the Railway's handling capacity. Additional crossing and block stations had to be provided to increase line capacity. Loop lines had to be lengthened and additional loops provided at a number of stations. It was estimated that on the Central Railway 19 new crossing stations would be required and additional lines would be necessary at 20 other stations. The handling capacity of 16 yards including some major yards, through which the stream of traffic passes, had to be improved. Improvement of terminal facilities in large goods-sheds, facilities for transhipment at break-of-gauge junctions and at repacking points were required to be undertaken. It was also considered necessary that efforts should be made to improve locomotive usage by cutting down drastically all avodiable delays. Detailed plans had to be chalked out to achieve all these objectives.

As a result of these and other steps it is heartening to note that the number of wagons on the Central Railway broad gauge during the six months from September 1955 to February 1956 was ten per cent more than what it was during the corresponding period last year.

The efficiency of operation on the Railway has improved enormously during the last six months. For example, the figure of 'wagon miles per wagon day', which is a measure of the number of miles a

wagon moves in one day on an average (inclusive of delays at terminals, transhipment and other points), improved steadily from 53.5 in February 1955 to 59.6 in February 1956. Likewise, the 'net ton miles per wagon day', which is a measure of the quantum of traffic moved by a wagon each day, improved from 714 in February 1955 to 808 in February 1956.

Additional Carrying Capacity

The Central Railway's second Five-Year Plan covers the generation of additional carrying capacity to reduce overcrowding in passenger carrying trains, and further to meet the tremendous growth of traffic that goes hand in hand with economic development and growth of population. Very great stress has been laid on the broadening of the channels of movement, particularly where they have been restricted, leading to what are commonly called "bottlenecks" in transport. The Central Railway plans to spend a major part of the funds available on works directly contributing to the increase in the carrying capacity and potential of the Railway. These plans it is claimed have been drawn up with a great deal of precision, so as to fit in like a jigsaw puzzle with the other developmental plans in the country.

The railway plan includes the doubling of over 220 miles, the electrification of 190 miles where steam traction has almost reached its peak, the lengthening and addition of loops at over 125 stations, the provision of about a hundred new block stations and the remodelling of 40 major and minor yards. Track renewals and bridge rehabilitation will be on an extensive scale, reducing the number of permanent speed restrictions, which now slow down movement. The 187—mile long Khandwa-Hingoli metre gauge rail line will also be completed during this period thus providing a vital link between the present separate northern and southern metre gauge systems of India. A metre gauge wagon loaded at Tinsukia, the eastern frontier of Assam, will then be able to proceed unimpeded to Trivandrum near Cape Comorin, the southernmost tip of India. The completion of this link will be a great step forward in the transportation system of the country.

Among the major yards planned for remodelling are Bhusawal and Kanti-Murwara, which form the two major sluice valves for the arterial channels on the Central Railway. Bhusawal Yard will be remodelled on modern lines with automatic route-setting equipment and electro-mechanical braking devices, so as to increase its handling capacity almost to double. The inadequate yard at Kanti-Murwara requires considerable expansion and will, therefore, be rebuilt at a new site.

Signalling works designed for greater safety and for augmenting the line capacity will also be on an extensive scale and on modern lines. These include the provision of interlocking, automatic signalling and power signalling. All these works will entail the need for huge quantities of signalling and interlocking equipment for which the capacity in this country is very limited. So the Central Railway has undertaken expansion, on modern lines, of a workshop at Secunderabad, which will be able to make a good proportion of the mechanical equipment required.

The other railways, faced with essentially similar problems, have all progressed rapidly in the achievement of improved working and expansion. The position of the South-Eastern Railway, which serves all the five steel plants exclusively except for the one at Burnpur, served by the Eastern Railway, is of special interest. The fact that adequate arrangements are being made to service the new plants provides the assurance that transport will not prove a handicap at least for this basic commodity so necessary for the country's rapid economic development. On the whole, it is good to find that adequate attention is being paid not only to the expansion of facilities but also to the better utilisation of existing facilities, if necessary, through minor improvements at strategic points.

Life Insurance and Publicity

THE Presidential Ordinance of January 19, 1956, by which Government took over all Life Insurance Companies in India, and appointed Custodians to manage their affairs until such time as a Corporation is set up under an Act of Parliament, opens a new chapter in the history of Life Insurance in India. The merits or demerits of nationalisation, or the rights and wrongs of the manner in which this has been effected are not our concern here. In this article we shall confine ourselves solely to the prospects of Life Insurance Business under Government management and the methods by which business can best be expanded.

What positive and promising measures are open to Government for taking life insurance to every family in the country? There are several organisational improvements that can be made, and according to reports, they are already under the consideration of the Custodians of Controlled (Life) Business and of the Finance Ministry. It is not proposed to deal with them here. Our object is limited, viz., to focus attention on only a part, though an integral part, of the set-up that would be necessary to expand the life insurance business. An increasing and continuous reliance will have to be placed on the weapon of publicity for attaining the desired objective of a rapid expansion of life insurance protection for all classes of our population. In the modern world, publicity is as indispensable as it is effective for putting across to a large and scattered population any sales message—whether the message relates to a commodity of everyday use, or a passing idea, or an article of faith of a more enduring value.

In the past, very few insurance companies in India made any very great use of the weapon of publicity to enlarge their business. That is to say, insurance advertising was largely competitive rather than constructive. The few who did venture into advertising on a national scale, did so rather haltingly and diffidently, and seldom carried out a well-planned campaign. And the emphasis in their advertisements was always on the size, and (by implication) stability, of their own institution, with little or no attempt to bring home to the public at large in a creative way the value of life insurance as such, or a clearer understanding of the working of life insurance and its place in the larger scheme of things. In a way, this was because, with keen competition raging between rival companies for immediate gains, no one—not even the tallest—was prepared to take a long-term view and spend money on such educative publicity, for fear that other companies would reap even partially the benefits thereof without spending for it. This was really a narrow view to take even in the face of competition; but it is unnecessary to argue the point as competition has ceased and given place to a National Corporation as the sole provider of life insurance in our country.

Sustained Campaign

This National Corporation will have before it a wonderful opportunity to do what the individual insurance companies failed to do viz. to embark upon a varied and sustained campaign to tell our people about the miracle that is life insurance, the blessing it can be not only to the family which is unfortunate enough to lose its bread-winner by untimely death, but to all families on account of the regular saving habit it inculcates, the high priority of savings in a Planned Economy, and of the mechanics of the insurance business, of the technicians (the Actuaries) who set up the mechanism and tend it, and finally of the Agents who are the messengers of security for the family and prosperity for the nation. It is a challenging opportunity which, if properly and energetically tackled, can and will help to attain the seemingly impossible targets dreamt of by some visionaries of a bygone age that have now been accepted by the Government of the day.

True enough, a colossal advertisement campaign will not by itself carry us to the desired goal. Many other organizational measures will be equally necessary like proper selection and training of agents, adequate incentive to the field force and an assurance to them of social status and the welding of existing companies' staffs into a well-knit administration for the efficient servicing of policy-holders, to name but a few of them. None of these, however, will be of much avail without a concerted publicity drive, designed to tell the public the throbbing story of life insurance.

This is hardly an easy task. Advertising of an intangible and slightly unfashionable, if not distasteful, product like life insurance presents peculiar difficulties. Few among our leading insurance company managements have given evidence of a true understanding of the principles and potentialities of advertising, and none of the advertising consultants have cared to grasp the details of how life insurance functions. A combination of the positive and creative approach of the advertising man and the solid matter-of-factness of an insurance executive is called for—rather a difficult prescription but not an impossible one.

The impression prevails that insurance companies in the past were quite liberal in the matter of advertising, that they had been spending a not inconsiderable amount under the head of advertisement charges. On a closer study it would perhaps be found that not all the expenditure generally shown under that head was in respect of what may strictly be called publicity, and secondly, insurance being primarily a business of 'connections', companies were often obliged to 'advertise' in programme books and souvenirs and such other publications of which the real advertisement value was negligible or nil. When allowance is made for these, the amount spent on genuine advertising in the powerful vehicles of publicity, viz. the great and growing general press in India, would be found to be not as large as it could well have been. What has been the 'real advertisement' expenditure of all insurance companies put together in recent years? It is hazardous to guess, but not more than about 5 lakhs of rupees annually. For an industry with an aggregate yearly premium income of 50 crores of rupees, and which pays 5 crores of rupees by way of commissions to a hierarchy of agents for procuring this business, 5 lakhs of rupees is not an impressive figure, if the industry in question claims to be progressive and has faith in its own future and in the future of the people it seeks to serve.

What about the quality of insurance publicity? Here again, one cannot help remarking that with but

a few exceptions, insurance advertisements have been neither imaginatively conceived, nor very attractively presented. The general standard of newspaper advertisements in India has improved noticeably in recent years, thanks among others to the enterprise of many Indian Advertising Agencies. There is no reason why insurance advertisements of the future should lag behind either technically or artistically. Indeed, life insurance advertisements of the future will have to be as excellent as those of the costliest luxury goods, because it is with them that life insurance will have to compete in order to secure a high place in the budgets of individual citizens.

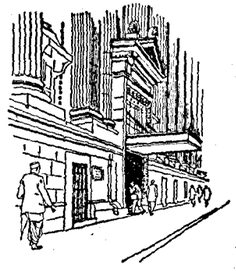
In the economic situation as it is developing in our country to-day, with available resources falling short of planned expenditure, it has become urgent to organise a great Savings Campaign throughout the country. The Small Savings Schemes have in the past done something in this direction; but they have had to rely very largely on voluntary efforts for their advancement because in the nature of things they could not 'spend to earn'. The Indian Life Insurance Corporation, being a business corporation, can take upon itself the responsibility of advancing the whole cause of savings—and not only saving through life insurance—through its programme of publicity. Its advertisements must seek to place before the public a new conception of life—a more austere standard of living which is more in keeping with the economic conditions of to-day and the past traditions of the country.

Dadabhai Naoroji Prize

THE Dadabhai Naoroji Memorial Fellowship of the value of Rs. 3,000 is to be awarded for the year 1956 in the subject of Economics. Nominations are now sought for this award. Persons of Indian nationality who have contributed to the science of economics or done their best to advance the economic interests of the Indian Union during the period of five years ending December 31, 1955 are eligible. The contribution may have been through publication of significant professional literature, participation in professional activities or valuable achievement in any other manner.

The selected Fellow shall have to deliver in Bombay a series of not less than three and not more than five lectures on the subject.

STATE BANK OF INDIA



Successors to the Imperial Bank

The need of the day

Our country's economy is expanding rapidly and with the Second Five Year Plan in sight it will gather further momentum. The need for a strong and efficient banking system has never been greater than today as the nation's savings require to be pooled and managed in a resourceful, confident and prudent manner.

The State Bank fulfils these expectations. It has started upon a programme of opening 400 additional branches throughout the country within the next five years.

The State Bank of India offers to serve you efficiently in many ways. It takes care of your savings and valuables, lends moneys against goods, produce and other approved securities and assists you by accepting appointment as executor and/or trustee of your will or trust. Its wide and varied services are at your disposal. Why not talk things over with your nearest bank agent, or write for information?

The State Bank's local head office at Bombay, one of more than four hundred offices waiting to serve you throughout India

Uncertain Trend

IT is difficult to single out any reason for the hesitant trend in stock markets. But it is evident that even speculators have become cautious. Investors have never been "in" in the last few months. This may seem strange. For, on current indications, stock markets should attract investors throughout the duration of the second Plan. Speculators, on the contrary, should find these years rather boring. By and large, this is not an inaccurate interpretation of the implications of the second Plan for the stock markets.

Price movements in recent weeks would seem to confirm this appraisal of the second Plan. There are many developments which explain the hesitant trend in stock markets. There are New Delhi reports that the new industrial policy will involve nationalisation of many new industries. Stock market circles are not impressed with these reports, though these are partly responsible for the current lack of activity in equities.

Life Funds

Market circles are aware of the relative expansion of the public sector under the second Plan. But neither industrialists nor investors seem worried about the new industrial policy. It is known that the Government is in favour of nationalisation of the country's mining and mineral resources. But that is no new development. Coal shares alone have been affected by these reports.

Something else is worrying stock markets. Incidental consequences of nationalisation of life insurance have been topics for discussion for some weeks. In recent years, life insurers have lent massive support to both new issues and to equities. Market circles hope that the Government should continue the pattern of investment of life funds. Some weeks ago, custodians were reported to be supporting equities on the Bombay Stock Exchange.

State Control

Such investment of life funds is welcomed by market circles. But the consequences of investment of life funds in new issues or in equities are worrying the private sector. Recently, Dr Ramaswami Mudaliar disclosed that life insurers subscribed eighteen per cent of the share capital of ICIC. Through nationalisation of life insurance, the State has automatically acquired control, to the extent of 18 per cent of the share-holding, of the ICIC.

Through nationalisation of life funds, the Government has acquired indirect control over many industries. This is resented by industry, though stock markets hope that such investments will continue so that, to quote Dr Mudaliar, stock markets can continue to perform their important role. Recent activities of custodians in the Bombay stock market have provoked comments whether New Delhi's policy of investment of life funds is such as to acquire control in the major national industries.

Tax Fears

This is not the only development which is worrying stock markets. There are revived fears of increased taxation in the next few years. According to the Finance Minister, there will be need to raise Rs 50 crores annually through fresh taxation. This estimated increase in taxation is not new. But some of the possible sources of taxation which the Finance Minister hopes to tap have had a chilling effect on equities.

Simultaneously, there are growing indications that New Delhi is determined to check inflation. Food imports and food loans from America will be utilised to halt rising trend in food or agricultural prices. This is a policy which should be welcomed by both industry and stock markets. In the recent rise in prices, the relative increase in the prices of food and of industrial raw materials has tended to have an adverse effect on industry.

Deficit Financing

It is the Finance Minister's observations on deficit financing however, that are more intriguing. He admits that deficit financing of the magnitude involved in the 1956-57 budget has obvious inflationary implications. He will watch the effects of such enlarged deficit financing as it is gradually implemented. So will stock markets. And the latter are worried that his latest New Delhi statement implies that deficit financing may be reduced if its inflationary repercussions assume alarming proportions.

Alternatively, the Finance Minister hints, the magnitude of the second Plan may be curtailed, or the Five-Year Plan may be extended to cover six years. These possibilities may be welcomed by the private sector. But any such forced reduction of the Plan, or extension of the Plan period, will disappoint stock market circles. In such events, the inflationary prop behind stock markets will be less dependable.

Tea shares have suffered as equities in general have turned hesitant. In the last few weeks, tea auctions were rather disappointing. But this week's auction results were encouraging. This explains the relative steadiness in Tea shares in the last few days. There is interested buying in sound, dividend-paying Tea shares. Soon, the dividend season will begin. Even speculators are now not interested in selling Tea shares "short". Investors, however, remain cautious. That is why Tea shares are not going up.

Electric Shares

An interesting feature of recent trading on the Calcutta Stock Exchange has been the spurt in Electric shares. There is not much activity in the shares of those companies which supply power. But there is continued activity in the shares of those companies which manufacture electrical equipment. These companies are engineering concerns. What is happening is that the buying movement in the secondary engineering industries is now being concentrated on the shares of those engineering companies which manufacture or deal in electrical goods and equipment.

Price Curb Casts A Shadow

Thursday, Evening

THE signs of recovery which were clearly in evidence in the beginning of the week petered out when it became evident that taxation was going to be sharply increased in the second and third years of the Second Plan. Operators were also becoming increasingly aware of the growing dislike of the Government to the 'bull phase' in commodity markets. The market had opened on a subdued note of optimism leading one to believe that, among other things, the technical position of the market had distinctly improved despite heavy budla rates, following sizeable liquidation in the past two consecutive weeks. This trend, in short, was not kept up.

Closely following the decision to raise the export duty on some vegetable oils and to impose new burdens on some others and to permit liberal imports of raw cotton, a multi-pronged attack on 'excessive speculative' activity in the commodity markets was launched through the Forward Markets Commission. Steeper margins were announced by the Oilseeds Exchange and similar precautionary measures are expected in the cotton market as well. On the top of these came the report that the Government of Bombay had drawn the attention of the Centre to the prevailing high commodity and food grain prices and that it had forwarded certain specific suggestions for curbing prices. What these suggestions were or what line of action the Centre would adopt, it would be idle to speculate. But indications are not wanting that more restrictive measures are under-way.

All these affected Dalal Street bearishly as the week advanced and gains recorded earlier were wiped out by nervous selling. Tata Steel Ordinary which opened around Rs 250 in the beginning of the week eased to Rs 246-4 and Indian Iron receded to Rs 34-14-6 from around Rs 35-8. Bombay Dyeing were brought down to Rs 647 from Rs 653.

Cotton mill shares which were fairly steady for the greater part of the week drew inspiration from the reported change in Government's textile policy. In knowledgeable circles it is no longer believed that the Government would stick to its oft-repeated threat of freezing mill production at 5,000 million yards in order to help handloom production. The Textile Commissioner's notification early in the week that no ceiling has been fixed for import of foreign cotton and that imports of cotton from dollar and non-dollar areas of permissible staple length would be allowed freely helped to improve sentiment. In the event, mill shares displayed a distinctly steady trend.

Prices ruled distinctly steady in the cloth market owing to keen internal demand. But high internal prices and the increasing overseas competition offer no rosy prospect for exports and it now looks certain that our exports of cloth this year will be substantially lower than in 1955. Pakistan is also reported to have sold some grey cloth. But more important is the emergence of China as a major exporter of cotton textiles. This has disturbed the trade, for China had so long been a buyer of cotton textiles and this transformation will impair the export trade of India in the Far Eastern markets. Besides, some of the Communist countries of Eastern Europe have also been offering stiff competition to India in African markets.

In keeping with the general trend, the miscellaneous section also began well, reacted a little in the middle of the week, and improved towards the close..

Cotton

Probe into Delivery Contracts Hits Sewri

THE spot market at Sewri which had maintained its buoyancy unimpaired opened strong on sustained mill buying and all the popular varieties were further pushed up. The continuous rise in prices, however, has been an open invitation for the Government to intervene, and it looks as if this invitation has now been accepted. Government gave out that it was studying the trend of prices in spot cotton and was particularly concerned about the speculation that has crept into trading in delivery contract. The Forward Markets Commission, it was stated, had come across several cases of non-transferable delivery contract being freely transferred. If true, this means that all those who have been carrying on this kind of transactions are guilty of contravening the provisions of the Forward Contracts (Regulations) Act. The Forward Markets Commission has been urging the representative bodies of the cotton trade to look into this question for well over a year now. It has asked the East India Cotton Association to take immediate action to make delivery contracts conform to the Forward Contracts (Regulation) Act. Among the suggestions that it is reported to have made are that, in future, delivery contracts should be in a special form, that there should be a difference between contracts which are transferable and those that are not.

Again, presumably with a view to facilitate an early resumption of futures trading, the Commission is believed to have approached the accredited bodies of the cotton trade to help it to frame proposals for the hedge contract for the next, i.e. 1956-57 cotton season. Since the reference here is only to next season, it follows that hopes of resumption of forward trading during the current season are given up for good. If this is so, all that one can say is that the Commission and the trade should take good care that this fiasco is not repeated in future years. The new hedge contract, whenever it comes, will have to ensure adequate hedging facilities to all varieties of cotton grown in the country and at the same time, the contract should be balanced and not open to squeeze. It should also offer a safe and sure hedge to cotton growers, dealers, exporters and mills alike.

All these, particularly the talk of a probe into delivery contracts slowed down activity in the spot market as the week progressed. Early in the week, on the anticipation that a ceiling might be imposed on the import of cotton, there was quite a scramble for licences. But later, with the clarification by the Textile Commissioner that there was going to be no ceiling, importers visibly cooled off and interest shown by mills also dwindled.

America's Foreign Policy

"WAR in our time", President Eisenhower informed the American Society of Newspaper Editors, "has become an anachronism". This was what the Heads of State realised during the "summit" Conference in Geneva a year ago. Much has happened in the last twelve months. But President Eisenhower now informs the world that recent events do not justify any fundamental change in America's foreign policy. America's allies think otherwise. Britain wants freer trade to ensure world prosperity. She opposes America's insistence on military security as the only way to world peace. But the dissensions within the party in power prevent Britain from pursuing firm and independent foreign policy. France is no less dependent on America than Britain. But her Socialist government has had the courage to disown openly America's foreign policy.

Washington remains adamant. President Eisenhower has doubts whether the recent changes in the Soviet Union have any real significance. He may be right in his suspicion that the one-man rule has been replaced by "collective" dictatorship. His aversion to dictatorship will be shared by all those with democratic leanings. But critics will retort that if America is eager to cultivate friendly relations with Spain or Portugal, she can have no objection to establish amicable relations with the Soviet Union, even if President Eisenhower's assumption that the Russian regime is dictatorial is true. Non-interference in the internal affairs of any country is an essential condition of co-existence. In advocating peaceful co-existence, Russia does not expect the Western Powers to disown capitalism or their form of government. America, therefore, can have no right to expect Russia to jettison Communism or to change the form of government in Russia as a pre-condition to peaceful co-existence. President Eisenhower is, therefore, irrelevant in his reference to the form of government in the Soviet Union in his observations on world problems.

President Eisenhower does not believe that the Soviet Union desires peace. Stalin has been denounced. But "much of Stalin's foreign policy remains unchanged". Continued partition of Germany, continued subjection of the "satellite" nations of Eastern Europe and the continued division of Korea are cited as some of the instances which indicate that Russia does not intend "to provide a real basis for stable and enduring relations". This is poor logic. These are some of the major world issues in dispute. To solve these disputed issues, both sides will have to make concessions. America, President Eisenhower assures the world, is ever ready to explore all avenues to solve these problems.

Moscow has, similarly, informed the world repeatedly that Russia is sincere in her desire for peaceful co-existence. Despite these mutual assurances, world issues in dispute remain unsolved. President Eisenhower's argument is that no agreement with Russia is possible as long as she does not prove her sincerity. To such barren arguments M Mollet, the Socialist Premier of France, will retort that the Western Powers can help Moscow to adopt a constructive policy to world affairs by pursuing a conciliatory attitude to Russia.

Neither France's open disavowal nor Britain's persuasive tactics have succeeded so far in changing America's foreign policy. President Eisenhower offers America's friendship to Russia on certain conditions. He accepts M Mollet's prescription that it is wise for the Western Powers to seek, by every peaceful means, "to induce the Soviet bloc...genuinely to pursue peaceful purposes in its relations with other nations". But the foreign policy outlined by him is tinged with deep doubts about Russia's intentions. Because President Eisenhower has no faith in Russia's peaceful intentions, he emphasises that military security must remain the first and foremost objective of American foreign policy. America must continue to build her military strength and that of her allies so that the Western Powers can "maintain a collective shield against aggression . . ." President Eisenhower hastens to assure the world that America holds her military strength only to guard against aggression. It is not difficult to appreciate why Russia and some of the Asian nations affected by American-sponsored regional military alliances are reluctant to accept these assurances. Admittedly, disarmament is the essential condition of world peace. But recent London deliberations of the UN disarmament sub-committee leave no room for doubt that not Russia, but the Western Powers are reluctant to reach any compromise agreement on disarmament.

No exception will be taken to the President's emphasis on the need for aiding the economic and social progress of the under-developed nations. Nor will there be any quarrel with his appeal to Congress to put America's foreign aid programme on a long-term basis. Economic progress in undeveloped nations will take time. It is, therefore, evident that America and other rich nations will have to formulate a long-term policy for foreign aid. Only under such a long-term plan for economic help can the recipient nations frame their development plans on a long-term basis. Equally welcome is President Eisenhower's awareness of the importance of encouraging the healthy flow of peaceful trade. Not only the Communist bloc, but even Britain resents the "wasteful restraints" on the 'free flow of world trade arising out of the American policy of trade embargo on the Communist countries. Since the Geneva "summit" Conference, it has been apparent that NATO should be replaced by an organisation aimed at furthering trade and economic co-operation between the European countries.

It is inevitable that America will have to shoulder the main burden of ensuring freer trade and world prosperity. But the gradual emergence of Russia as a supplier of economic aid poses a problem which will have to be faced soon. To prevent some of the avoidable waste inherent in competitive co-existence, it is desirable that resources should be pooled so that economic aid to foreign countries can be supplied by the United Nations through the various agencies. M Mollet is in favour of supplying economic aid under the auspices of the United Nations. It is doubtful whether America will support any such extension of the activities of the United Nations. But undeveloped countries would prefer economic help under the aegis of the United Nations to economic aid by individual countries.

Wanted More Technicians

THE importance of an adequate supply of technically trained labour for the rapid expansion of industries visualised under the Second Plan hardly needs to be stressed. Inaugurating the International Technical Education Exhibition in Bombay, Prof. M. S. Thacker, Director of the Council of Scientific and Industries Research, pointed out recently that there is need for a 20 per cent expansion of training facilities in technical and technological institutions if the deficiency in technical personnel is to be met. The problem in particular fields may in fact be much more acute than is indicated by this figure given by Prof Thacker.

Prof. Thacker said that a provision of Rs 50 crores has been made in the Second Plan for the development of technical and technological education. Problems of this kind cannot be solved, however, merely through the allocation of funds. Effective organization is necessary. That is a lesson which the experience of the First Plan as well as of other countries should already have taught to the planners in India. It is not possible to say offhand whether Rs 50 crores is an adequate amount to bring about the required expansion in the usual way. Even if it is, however, it is clear that before the buildings are constructed and furnished and before the technical equipment can be set up, a number of years will pass. After that will come the period of training and it is only after this is over that the country will have an augmented supply of trained technicians. Not that all this will necessarily proceed smoothly. The new institutions will have to be staffed and this will actually make the problem of obtaining trained and experienced technical personnel even more difficult in the immediate future.

If the problem is to be successfully solved, however, with a reduction both in the overall costs of the scheme and in the time interval that must elapse before the increased supply of technicians becomes available, an entirely different approach will have to be made. Pandit Nehru, speaking on the occasion of the opening of the new building for one of the chain of national laboratories, had deprecated the tendency to be satisfied with new buildings as if that was an objective in itself. It was the work done that mattered, he had pointed out, not the building in which it was done. Obviously he could not have meant that the buildings were unnecessary. What he meant was that stress should be laid upon the full utilisation of whatever facilities were already available and to ensure that new facilities set up for any purpose were also fully utilized.

The question to be asked is whether the facilities in the way of technical training institutes that we already have are being fully utilized. It hardly needs a very careful study of these facilities to suggest that they are not. The crucial portion of any technical institution is its laboratory and workshop capacity. Invariably, however, these facilities are used for only a few hours every day. The students of these institutions have to study the theory underlying their particular subjects. Depending upon the course of study, they are frequently also taught subjects of a general educational value. These occupy them for a considerable portion of each working day and the crucial laboratory and workshop facilities remain unutilised during that period.

Even if different classes have their lectures and practicals arranged in such a way that the laboratory and workshop are in use more or less throughout the working day, this is still not enough. For this usually means only that one batch of students of all classes put together uses the equipment. The 'day' over which the equipment is utilised still forms only a fraction of the 24-hour day.

In either of these cases, it should be possible to arrange a more intensive utilisation of laboratory and workshop equipment by the working of shifts of students. Two or even three shifts can be arranged where the equipment is being utilised for a full 'day' already, but where the equipment remains unutilised even during the present working day, because students are otherwise occupied, the number of shifts over which the equipment can be utilised can be even greater. In the former case, it would imply shifts in the teaching of all subjects, thus giving a more intensive utilisation of lecture halls and other facilities also. In the latter case it would mean not only doing this but also extending lecture facilities only or better still, organising an extended use of lecture facilities in other institutions, not necessarily technical institutes at present.

This is about training of new material. What about opportunities of training for those who are already engaged in industry, of the factory hand who has the educational background or the intelligence and ability to use his brains, if an opportunity is given to him to do so? All the while we hear that the most serious gap in our technical personnel is not so much at the top but in the ranks of the supervisory staff. No factories in Bombay, even the best run ones, some of which recruit only matrics or those who have a number of years of regular schooling, have any arrangement worth the name for enabling ambitious and willing workers to get any kind of technical education, which will enable them to use their brains while working with their hands. And that is the best way of acquiring knowledge and making proper use of such knowledge.

Will it not be an unfortunate result of the present arrangement of training when it begins to bear fruit that many who would otherwise have risen from the ranks, would be robbed of their chances of promotion? If this happens, it would not be a welcome change for the large mass of factory hands. It will remove what little incentive there may be for them to do better and to apply their minds to their job. In the formation of the hard core of industrial skill, which is the backbone of industry, as in other things, we are thoughtlessly ignoring the social waste that is involved in displacing what productive capacity already exists by brand new equipment, the full and proper utilisation of which will itself involve time and labour. As in equipment, so with human material, utilisation of existing capacity must have priority.

Weekly Notes

Steel Imports congest Bombay port

THAT steel imports should be responsible for the serious congestion in the Bombay docks last week, though these are still relatively small in quantity—they are expected to reach a level of 2000 tons per day within the next few months—is disconcerting, for the heavy programme of steel imports has been anticipated for some time now. Newspaper reports add that while the Port is itself increasing its capacity to deal with larger steel consignments, these are piling up in the docks because of the inability of the railways to clear them rapidly. A shortage of the special wagons required to transport long steel tubes, it is added, is at fault but even if this is solved, the general inadequacy of carrying capacity will still be there. Doubling of lines on various sectors of the Western Railway and other steps of the kind to increase the carrying capacity of the routes concerned are already included within the Second Plan. It is doubtful, however, whether an approach along these lines will prove adequate to solve the problem.

More careful thought needs to be given to the question of transport from the view point of ensuring the maximum utilisation of all the transport resources of the country. Expansion of capacity of the railway lines leading from Bombay to the consuming centres is the obvious line of thought, but perhaps northern India could be better served by using Kandla port as the centre for receiving imports to a greater extent. Expediting its programme of development might give quicker results under certain circumstances.

Better utilisation of some of the smaller ports is also possible and is likely to help. It was reported recently that port authorities in Saurashtra and the Bhavnagar Chamber of Commerce had launched a campaign for attracting industrialists and businessmen in Gujerat to channel their imports through Bhavnagar. The Ahmedabad textile mills, which import about three lakh bales of foreign cotton through Bombay, were the target of the campaign. Bhavnagar is only 160 miles from Ahmedabad while Bombay is 310 miles and the difference in railway freight alone amounted to Rs. 5-14 per candy. The overall difference worked out to over Rs 9 per candy. While these facts should operate as a powerful argument with the private sector, they highlight the fact that available transport facilities are not being satisfactorily utilised due to an orthodox approach to the problem. The Gujerat Chamber of Commerce had suggested that the Saurashtra ports could easily handle about one million tons per annum and had suggested a broad gauge rail link between Bhavnagar and Tarapur near Ahmedabad to enable fuller utilisation of these ports. Whatever the merits of this scheme, there could be no doubt that a more intensive utilisation of the Saurashtra ports would repay effort, and the same could probably be said of other ports elsewhere.

A more intensive utilisation of road and inland water transport and of sailing vessels as during the war is also feasible and in fact essential. It is clear that a thorough survey of transport facilities in India and their present utilisation and potentialities for the future is called for in the interest of the successful implementation of the Second Plan. An American technical team is touring the country, looking into our railways. A sea-rail transport co-ordination committee has been working fitfully for some time. A survey of the minor ports has already been carried out. To piece together the findings of all these and to knit them together would call for hard, sustained work. Though there are welcome signs of a change in the attitude to transport problems in the direction of better utilisation of capacity, occurrences like the present congestion in the Bombay Port are rude reminders that action resulting from this change is still far away.

Tax Concession on Motor Cars

AMONG the minor changes in income tax effected by the Finance Bill this year, the provision of a car allowance for salaried employees would be of considerable interest to the car-owning middle class families. The provision has been made for an allowance in the case of salaried persons in respect of the maintainence and normal wear and tear of conveyance used for the purpose of their employment. This would confer a much needed relief to the salaried person who in the matter of tax incidence is at a considerable disadvantage as compared to the business man. The proviso to this amendment, however, restricts the benefit only to persons who are not receiving a conveyance allowance. It will perhaps work a hardship in the case of persons who receive a conveyance allowance which is so nominal that they could have possibly been better off had they never received it. Such cases may not be inconsiderable and therefore necessitate a revision of this proviso so as to allow the benefit to a salaried person in respect of expenses on conveyance to the extent to which he may be entitled.

Mention may also be made here of another proposal which will deny henceforth the benefit of initial depreciation on machinery and plant which is not entitled to development rebate introduced by the Finance Act of 1955. It will not be possible for the business man to change cars as frequently as before with an eye on substantial gain from income tax in the bargain.

Meeting Expanding Demand

DUNLOPS have not done so badly, in spite of the cut in tyre prices, effected on the recommendation of the Tariff Commission. True, the working results for the year 1955 reflect only very partially the effect of price reduction. More important perhaps was the rise in the controlled price of crude rubber which was increased from Rs 138 last year, to Rs 150 per 100 lbs. in February, and again to Rs 155-12 in September if only because it affected the results over a much longer period than did the reduction in tyre prices.

The total sales of the company's products were 10 per cent higher in value than in 1954 but the net profit remained more or less unchanged at Rs 97 lakhs, while the ratio of profits, before tax, to turnover declined from 7 per cent to 6.4 per cent. A number of records in the company's history were set up during the year—one was in the consumption of crude rubber which was nearly 10 per cent higher than in 1954, which itself was a record being 18 per cent above 1953. Despite substantial increase in production and sales, the company had difficulty in meeting the demand for its products, which indicates not only a continued expansion of the economy but also the growing importance of rubber tyres and other products in the expanding economy.

Mr Cecil Stack, Chairman of the Dunlop Rubber Company (India) Ltd., was therefore on unassailable ground when he forecasted the necessity of a considerable expansion in output, if the demand for rubber products in the Second Five Year Plan period were to be met adequately. Naturally his company hopes to play its full part in meeting the needs of the expanding economy. In order to enable it to do so, however, the company would need the assistance of the Government in two directions, in the matter of transport and adequate supply of its principal raw material viz. crude rubber. Regarding the first Mr Stack was by no means sanguine. Referring to the unsatisfactory conditions of transport and the shortage of railway wagons, he ventured the opinion which is being increasingly voiced by all the industrialists in the country that "this problem will become more acute in years to come and that it calls for the most serious attention by the Government of India."

As regards crude rubber Mr Cecil Stack sums up the situation as follows: "Against the total consumption of rubber by manufacturers in 1955 of 27,543 tons, India produced only 22,481 tons which means that there was a deficit over 5,000 tons. In such circumstances, larger manufacturers have to import a portion of their requirements, especially when the world market price is higher than the controlled price." Dunlops, in fact, imported 2,368 tons of rubber last year. But if the above figures are correct and the Indian Central Rubber Committee has not challenged these figures, it is difficult to understand why the tyre companies have to experience difficulty in getting import licences from Government. Mr Stack complains of such difficulty and the resulting decline in stocks which at times sank to a dangerously low level.

More significant than all these, however, are Mr Stack's observations about the developing demand for different varieties of rubber products, and of the difficulty which Dunlops experience, and others also, presumably, in coping with this demand. The situation may be gauged from the fact that despite increased production, the company ended the year with lower stocks. This was due partly to brisk sales of some categories of finished goods and partly to the difficulties of importing crude rubber.

Of the different varieties of products, the demand for bicycle tyres increased so enormously that the company was unable to keep its cycle tyre manufacturing capacity abrest of demand, although it hopes to remedy this before long. Shortages continued throughout the year. In fact the situation got so bad that the company itself suggested to the Government that import of cycle tyres should be permitted and the Government acted upon this suggestion.

The company's products other than tyres are proving increasingly popular, indeed so much so that increased manufacturing capacity is now required in a number of lines. One such is Dunlopillo Latex Form Cushioning which has now become a standard equipment for cinemas, hospitals, hotels and transport services and is being increasingly used for domestic purposes and by car manufacturers as well.

Another is rubber ply transmission belting, the sales of which increased by over 60 per cent compared with the previous year.

There was a similar increase in the popularity of such highly specialised products as anti-corrosive and abrasive linings.

The company's progress and the expansion of the company's activities have been made possible, needless to say, by the development work and research of the world wide Dunlop organisation, which is constantly on the look out for improved production methods, equipment and materials and is constantly turning out new products.

Does Advertising Raise Prices ?

DOES advertisement raise the price which consumers have to pay? It is a misconception that it does, said Shri Dharamsey M. Khatau, incoming Chairman of the Indian society of Advertisers, addressing the fourth annual meeting of the Society in Bombay this week. It is a misconception, however, that is still widely prevalent in this country. It arises, he said, from sentimental attachment to rural ways and values, and unfamiliarity with the real character and modus operandi of a modern, industrial economy. If it is admitted that there is economy in large-scale production, then it cannot be disputed that there is economy in advertisement. Efficient and advanced methods of production call for similar methods of marketing; if machinery and power make for cheaper production, advertising makes for cheaper distribution. What is more, by helping to expand markets, advertising brings technological advances within the realm of practical possibility.

Pleading for a wider recognition of the role of advertising in building up a diversified economy in the country, the new President entered a caveat against the reported intention of the Government to bring in some kind of control on the advertisement budgets of industries.

It is not that the Government does not recognise the value of advertising. The sustained campaigns it is conducting for encouraging the use of handloom cloth and other handicraft products show that it does. Shri Khatau pointed out that the Tariff Commission in its report on the bicycle industry felt it necessary to provide for a larger expenditure on advertising on the ground that "advertising on a more intensive scale is necessary to popularise this handy and cheap means of transport." Too often, whenever there is a check on costs, or control on prices, the axe falls heavily on advertising. Shri Khatau, unfortunately, has yet to persuade his fellow industrialists to take advertising more seriously, to apply scientific publicity techniques to their distribution and help the formation of advertising skill of which there is no glut in the country today.

Who Fathers the Plan ?

A SPECIAL correspondent from Delhi writes:—

During the last five years, the Planning Commission has steadily lost authority. Now it is on the brink of losing the Second Five Year Plan. Recent pronouncements of the Ministers of Finance and of Commerce and Industry have reduced the blue-prints to nonsense. This has happened even before the final drafts have seen the light of the day. In a sense, the Second Plan will be stillborn.

Everyone in the Planning Commission knows that the Plan is neither a true estimate of expenditure nor of the time required to raise the resources or to spend them. Shri Chintaman Deshmukh admitted as

much when he said that the outlay contemplated in the public sector of the Plan may have to be increased by about Rs. 300 to Rs. 400 crores. He also conceded that the Plan may require 6 or 7 years to fulfil. The statement publicly cast the long-felt doubt on the basic structure of the Plan but it was far from frank.

The truth is that the country's mounting defence requirements alone may require a capital expenditure of the order of Rs. 300 crores. Rs. 200 crores was the figure contemplated when the Draft Outline was published: it was not included in the estimates of expenditure for reasons which have little to do with security. If annual returns of the amount that we spend on our defence forces and equipment, included in the budget, do not endanger the nation's freedom, surely an overall estimate of our expenditure on defence installations over the next five year period would not have made the country any more vulnerable. Any how, the Planning Commission chose to ignore the financial implications of the defence programme together with that of the programme for the development of atomic energy (Rs 80 crores), raising the salary of primary school teachers (Rs 66 crores), oil exploration (Rs 30 crores) and subsidy to Amber Charkha (Rs 80 crores). It is now understood that another Rs. 15 to Rs 25 crores would be required for building three townships near the new steel plants and the outlay for coal production in the public sector would have to be increased from Rs 40 crores, provided in the Draft Outline, to Rs 60 crores. The Commission may also have to find money for exploitation of oil found at Nahar-katiya, in partnership with the Assam Oil Co., and possibly elsewhere.

Meanwhile the defence requirements seem to have soared in view of the increasing American arms aid to Pakistan and of course the Finance Minister has known it all along. When he spoke of increasing the size of the Rs 4800 crore Plan, he obviously gave figures which were once again under-estimates.

To the above, the correspondent adds this comment.

"Top authorities in the Planning Commission no longer try to gloss over these and the like aberrations. The talk of Plan's flexibility sounds hollow even to their own ears. Few conscientious artists can denounce their own handiwork as dishonest with greater repulsion than some members of the Commission display towards their own brain child."

Unwilling godfathers, or spurious parenthood?

Economi dan Keuangan

THE Foundation, responsible for editing the above English-Dutch bilingual Indonesian monthly received a special permit to open foreign exchange with the Bank Indonesia, Djakarta Kota.

In connection herewith we kindly request our foreign subscribers to pay their subscription fee from now on by sending a cheque, preferably in U.S. $, English £, or Dutch florins, to the Bank Indonesia, Djakarta Kota with sufficient information about the remittance, viz. that their payment is to be credited to the "Jajasan Penerbitan Ekonomi dan Keuangan" Djakarta for subscription fee on E. K. I. volume.

In case payment of the 1956 subscription has not yet been made, we kindly request our subscribers to pay in the above mentioned way, and no longer to the Embassy or Consulate of the Republic Indonesia.

The subscription fee for 1956 in still Rp. 60,—to be converted at the official rate of exchange.

Modification of Tax Proposals

TAX concessions to companies announced last week by Shri Chintaman Deshmukh do not make any substantial change in the original tax proposals. They are aimed rather at meeting the needs of certain special types of cases which would otherwise suffer hardships.

Three concessions are made to corporations:

1 Premia on shares which are in fact receipts of capital from the shareholders themselves will be treated as such by including them in the capital base, with reference to which the dividend is calculated for purposes of the excess dividends tax.

2 Bonus shares issued from share premia will not be taken into consideration for calculating the extra corporation tax on bonus shares.

3 In the case of companies whose profits consist of taxable as well as non-taxable income, the provisions relating to the extra corporation tax will be applied only after taking into consideration such proportions of the dividends, bonus issued and capital employed as the taxable income of the company bears to its total profits.

Of the two concessions made to registered firms, one does, however, involve a modification of the original proposal under which all registered firms, with total incomes of more than Rs. 40,000, were to pay income tax at graduated rates on the whole of their total income. The first slab of Rs. 40,000 out of the total income will now be exempt from the tax. While the Finance Minister has urged that this proposal is meant to give some relief to partners of firms whose share in the income of the firm is small, there is no doubt that a substantial concession has been made which will benefit not only the proposed beneficiaries but also others. The case of those whose share in the income of a registered firm is small could probably have been met equally well by an appropriate adjustment in their personal liability to income-tax or super-tax as under the second concession discussed below.

This second concession is meant to benefit partners of professional firms like those of accountants and lawyers. It is proposed now that in the case of non-business incomes, super-tax shall not be payable by a partner on that amount on which the tax attributable to such income has already been paid by the registered firm.

While replying to criticisms about his proposal for the taxation of bonus shares, the Finance Minister advanced the curious argument that the shareholder "himself does not have to pay an extra tax on account of what he receives in the shape of bonus shares. What is proposed is that the issue of bonus shares should be taken into consideration while calculating the corporation tax payable by a company on its total income. The burden falls on the company and not on the shareholders".

True, it is not proposed to tax the shareholder himself on the value of the bonus shares as if it were a dividend in his hands. But since the bonus shares would be issued obviously from accumulated reserves, the liability to pay the tax apart from its influence on the decision whether to issue the bonus shares at all, would reduce the proportionate value of the shares that could be issued for any given utilisation of reserves. The tax liability would no doubt fall on the current profits but indirectly, by influencing the amount that could be added to reserve during the current year, it would ultimately have this effect. The fact that the tax would be paid by the company would not make any difference to the fact that the incidence would be upon the shareholder in the shape of a reduction in the proportionate value of bonus shares issued.

From Karachi to Teheran

AMERICA dominated the SEATO Council's conference in Karachi. Britain was the major influence behind the Baghdad Pact Council's meeting in Teheran. This is not the only difference between these two conferences. Since the SEATO conference in Karachi, there has been growing opposition among America's allies to her exclusive reliance on military security. In Teheran, there was less emphasis on the military aspects of the Baghdad Pact. Military security was the main pre-occupation of SEATO Powers in Karachi. Wiser by the hostile reaction to Karachi deliberations, Baghdad Pact members had the wisdom to emphasise the economic aspects of regional alliances.

There are other significant aspects of the Teheran Conference. It has been a constant source of irritation to Britain that America has pursued a policy to west Asia which has caused embarassment and loss of political prestige to Britain. At the initiative of America, Britain became an active member of the Baghdad Pact. But America had not closely associated herself with the Baghdad Pact. Both Arabs and Jews are suspicious of Britain because of her active role as a Baghdad Pact member. There has been resentment in Britain that America's policy to west Asia has caused, directly and indirectly, tension between Britain and most of the countries in this region. In Teheran, America indicated her desire to co-operate more actively with the Baghdad Pact members. London will welcome this gesture by Washington.

Britain's attitude to insistent demands by some members of SEATO and the Baghdad Pact for discussions on issues in which some non-member countries are involved may be a concession to New Delhi. But the references to Kashmir in the Karachi meeting and to Kashmir and Palestine in the Teheran conference raise wider issues. Neither India nor Israel is a member of either SEATO or the Baghdad Pact. India is involved in Kashmir. Israel is actively interested in the Palestine issue. Both Kashmir and the Palestine problems are under reference to the United Nations. Only the United Nations have the right and the authority to discuss these issues. References to these issues during the Karachi and Teheran conferences pose a problem for the United Nations. India has lodged protests against discussions of such issues by SEATO and Baghdad Pact members. It is now for the United Nations to issue the requisite directive to regional military alliances to function within their limitations.

Houses For Whom ?

THERE has been no lack of publicity for Government's schemes for housing industrial labour and low-income groups. How these schemes have fared in various States and what benefits they have conferred on the sections sought to be helped, however, are a different story altogether. If Bombay City's experience is any indication, then there is cause for concern. The building programme has no doubt been proceeding quite steadily, although not in proportion to the

needs of this overcrowded city. The question is whether the rents charged, though comparatively low and now deemed uneconomic, have been such as to attract the less well-to-do classes who are most in need of housing and for whom in fact all this construction has been undertaken. If the extent of unauthorised occupation is as large as it is reported to be, then the answer is in the negative. The prevailing practice would seem to be for workers and others entitled to accommodation to take over the rooms and then pass them, on to better off relatives, friends or acquaintances, with or without a premium. The premises are no doubt made good use of; but the primary object of the scheme, which is to provide relief to the poorer classes, is defeated in the process. Apart from that, the drive against unauthorised occupation, which is periodically conducted with all it means in surprise check, searching inquiry and eviction has tended to give the whole housing programme an unsavoury taste.

Things are not likely to be improved if the rents of these buildings are to raised by 40 to 50 per cent. This is what Bombay's Housing Minister indicated in the State Assembly last week. Rents are being raised, it seems, following the findings of the Accountant-General and the Public Estimates Committee that the rents now being charged are uneconomic. Except for the absence of a premium, the step contemplated by Government now would reduce State-built houses more or less to the same level as private ones, with no special advantage left to the worker or the low-income groups. In consequence, even the bona fide occupants of these buildings who are trying to meet somehow the present rents, which are themselves not within the means of most of them, may have to quit, reducing Government's primary object in providing such housing to a mockery. It is not so difficult to put up houses these days, particularly for Government; and there is no great virtue in it. What is important is whether the rents fixed are such that they can be paid without too great a pinch by those for whom these houses are meant; or if the 'economic' rent cannot be reduced, whether Authority can subsidise it to a reasonable extent. Without finding a solution to this question, it would be no more than a gesture on the part of Government to erect houses and allocate them airily to persons who just cannot make use of them, however much they may need them.

Ground for Hope

CEYLON'S Premier, Shri Bandarnaike has given out that he would be having informal discussions with Pandit Nehru on the issue of Indian settlers in Ceylon at the Commonwealth Prime Ministers' Conference in London in coming June. Formal talks are to follow. Shri Bandarnaike has himself been a party in a sense to the last Nehru-Kotelawala agreement which has been bedevilled by hair-splitting essays in interpretation. The three-page agreement might not have led to so much elaboration, if the desire to implement it were sufficiently keen. Nevertheless, as differences have arisen, there are two alternatives open: either to replace it by a new agreement or to refer the differences to the judgment of a third party acceptable to both the sides, as suggested by Pandit Nehru.

Instead of going over the entire ground again, it might advisable to try the second alternative. In any case, if Ceylon is disposed to play fair to such Indians in the island as are entitled to citizenship, there should not be much difficulty either way. Shri Bandarnaike has given ardent expression to his regard for our Prime Minister; and recent developments have shown that there is much in common between them, whether in respect of domestic or foreign policy. The socialist line that Ceylon's new Government is inclined to folow should make it easy for the Premier to give a fair deal to the Indian have-nots in the island, while the policy of friendship with all that is evolving itself in the foreign sphere, with the accent on Asian countries, makes it imperative that there be no continuing cause of misunderstanding between the two next door neighbours. The problem is essentially a human one, and it must be treated as such. With two warmly human personalities like Pandit Nehru and Shri Bandarnaike tackling it now, there is considerable ground for hope that it will at last be solved.

Cominform Dissolved

DISSOLUTION of the Cominform can be interpreted in more than one way. Time and time again, the Western Powers have reminded Moscow that its propaganda and subversive efforts are intensifying the "cold war". Moscow can now claim that the decision to dissolve the Cominform is a gesture which should be reciprocated by the Western Powers. During Pandit Nehru's visit to Russia, the Soviet Union and India issued a joint declaration in which Russia accepted the principle of non-interference in the internal affairs of other nations. Formal dissolution of the Cominform, Moscow can claim, is an emphatic proof that Russia means what she says.

Unlike the Comintern, the Cominform was never rigid. It was created as the war-time alliance between Russia and the Western Powers showed signs of degenerating into the "cold war". To be precise, the Cominform was the Russian answer to the Truman Doctrine. It has played an active role in the establishment of Communist governments in eastern Europe. Cynics will no doubt insinuate that, with the emergence of the Warsaw Pact, the Cominform has become redundant, even as the Truman Doctrine has been embedded in NATO. There will be hope that the demise of the Cominform will be the prelude to the dissolution of NATO and the Warsaw Pact.

That will depend on the end of the "cold war" through an agreement on world disarmament. Meanwhile, the dissolution of the Cominform will be interpreted as another blow to Stalinism. Strict control and supervision of the Communist parties and movements in foreign countries by Moscow was an integral part of Stalinism. By dissolving the Cominform, Stalin's successors imply that such "centralised control" from Moscow is no longer necessary. This does not mean that Moscow has abandoned its faith in World Communism. It implies that Stalin's successors are inclined to the view that the existence of different types of economy in the different countries is no obstacle to the ultimate goal of World Communism.

Small Scale Industries

Problem of Technological Change

I WAS induced to read the two articles published in your weekly by Dr. K. N. Raj because of their interesting title. However, they turned out to be interesting for different reasons. The simple and obvious conclusion emerging after a long winded argument, the search for implicit assumptions in his reasoning and some logical flaws proved of greater interest than the thesis put forward by the author.

Dr. Raj's conclusion, put in simple words, is that that technique should be chosen which maximises surplus and hence profits. His ratio of surplus per worker to capital cost per worker is just a measure of the rate of surplus or profit. Technique II in his example is the most profitable and would be chosen by any firm which wants to maximise its profits. His qualification that the surplus per worker should be calculated after providing for the displaced workers would not much affect the choice regarding techniques, as is evident from a comparison between his Technique I and Technique II. Behind his qualification, however, there is an implicit assumption that either the industry or the State (by taxing the surplus) is responsible for providing for the displaced workers. In our institutional set up, it is doubtful whether this assumption holds good.

Though Dr. Raj has not made it clear, when he talks about surpluses, I think he means surpluses in the consumptions goods sector. He mentions with regard to these aggregate surpluses that they would be lower if the capital output ratios were higher. I fail to understand this. There is a difference between aggregate surpluses and the ratio of these surpluses to capital costs (or rate of surpluses).

Now about his logic. The author delves into the subconscious minds of the Planning Commission and finds that they are confused because they are trying to be 'loyal to both Keynesian and Marxist tools of analysis'. He then goes on to say that there is a difference between a state where supply is adequate to meet the demand for consumption goods (Keynesian case) and a state where the surplus in the consumption goods sector is enough to meet the demand for consumption goods of the non-consumption goods sector (Marxist case). I am unable to make any sense of this distinction. All that I know is that a correct analysis should lead to correct conclusions.

Then follows a sentence which is even more incomprehensible. "In fact, if there are fairly long lags between successive rounds of expenditure and income generation in an economy," Dr. Raj thinks, "the rate of investment and the volume of employment can be raised in this way even when the marginal propensity to save of the income receipients is nil." How can both things be true? If there are lags in expenditure, obviously the marginal propensity to save is not nil.

It appears as if the author wrote these articles to provide exercises to the readers for testing their logical faculty. In that he has succeeded. It does not appear that he had any intention to find out the raison d'etre for the development of cottage and small scale industries.

Bombay, April 25.

Community Projects Uniquely Indian

A NOTE on "Planning Forums" in the Economic Weekly of April 21st appears to state that India's Community Projects are based on an idea imported from America with the help of the Ford Foundation, and that this idea was first applied in India at Etawah, U.P.

The design for an intensive rural development project which eventuated in the Etawah Pilot Project was worked out in India by Mr. Albert Mayer, a private citizen of New York, in collaboration with members and officials of the Union and U.P. Governments during the years 1946-48. The Etawah design imitated no one project that had existed either in India or abroad. It borrowed certain concepts of administrative democracy from the American TVA and from the New Deal generally; it employed some techniques of extension previously used by the US Department of Agriculture; it took ideas from industrial sociology and cultural anthropology, and experience from the operations of UNRRA and other international agencies. It also borrowed many of its elements from existing efforts within India—from Gandhian constructive workers, from certain Christian programmes, and from previous government projects. Building on and beyond these heterogeneous materials, both indigenous and international, the Etawah Pilot Project developed a new and unique organizational framework at district and village levels, as well as a novel programme of "village participation" or social education.

Etawah and the other Pilot Projects in UP have never called themselves "community" projects, although they seem to have inspired much of the Community Project philosophy, later on. The Ford Foundation, following on the heels of the Indo-US Technical Co-operation programme, did not begin to give assistance to Indian Community Development until 1952, four years after work had begun in the fields of Etawah. Etawah and the other Uttar Pradesh Pilot Projects (seven blocks of about one hundred villages each) were from the beginning and are still up to the present day supported solely by UP Government funds.

While Etawah made use of ideas from many parts of the world, there are thus good grounds to support the claim that it and the other UP Pilot Projects, which pioneered the way for the national Community Projects, represent uniquely Indian developments.

Your note further suggests, "Etawah . . . may not have produced results that will stand scrutiny." Such a suggestion implies that credence may still be given to certain exaggerated and uninformed criticisms of the Etawah project, such as those contained in the article by Thakurdas Bang and Suresh Ramabhai which appeared in your journal and elsewhere some time ago. Full study of the record at Etawah to date demonstrates that all eleven points of criticism listed by Bang and Ramabhai, where they are not simple statements of doctrines or misapprehensions, are simple errors of fact.

Our Delhi Letter

Rising Food Grain Prices

Wednesday, afternoon

THE inadequacy and undependability of food statistics have again been causing trouble. No one knows for certain if there is a food shortage and if there is, what is its magnitude. And so long as this is not known, a corrective measure will be in the nature of a shot in the dark. If there is a shortage, priority should go to imports. Not that speculation and hoarding will be allowed a field-day, but imports will have to be rushed. If, instead, there is only a better balance between demand and supply, measures directed against speculation like selective credit control and release of stocks, to tide over the period until the new crops begins to move in, should suffice to meet the rise in food prices. Imports can then be brought in leisurely, after hard bargaining in the international market. Our knowledge of the situation being what it is, we really do not know whether there is time for bargaining. Maybe, the delay caused by the negotiations over price will do us incalculable harm by causing price-upsets. Maybe, the hurry in obtaining imports will weaken our bargaining power.

Whatever may be the actual position, food prices have risen sleeply in all the districts of the Madras State, particularly in the four southern Tamil districts which were hit by last year's cyclone. And prices of rice have shot up at a time when they should have gone down now that the harvesting season is over. To what extent the pressure of Bombay purchases is responsible for this, is anybody's guess. So is the extent of hoarding and speculation The Madras Government, however appears to think that the overall shortage in the country is real and measures against speculation especially those on a State level, cannot do the trick. It thinks that action is called for on an all-India scale. But the question is, is the evidence of shortage conclusive?

North India is experiencing a welcome change in the price situation. With the arrival of the new crop, prices of foodgrains, which were rising since October, have eased during the last three weeks. The grain trade in the north believes prices will move further downward. Rice is, however, an exception. The price of rice has been showing an upward tendency and the general belief is that the rise will continue until the next rice crop comes to the market. On the other hand, the fall in the prices of wheat, grain and barley has been nearly offset by the rise in the prices of pulses and oils.

Grain traders, however, have come to believe that there is an overall food shortage. And this is bound to give rise to hoarding and speculation, which must offset the market supply. Traders are not even prepared to accept that the Food Ministry has a reserve of two lakh tons of wheat. Their estimate of Government stocks is no more than a lakh tons, which are not sufficient to feed Bombay and Calcutta even for two months. And the rice position is considered worse still. The bajra, jowar, pulses and oilseeds position is no better. The trade holds the Government responsible for the present situation. It puts the normal deficiency of wheat at two million tons and thinks that we should have imported this quantity last year. The Government, however, elected to do without imports. The result is, according to this view, this year the deficit in wheat will be of the order of 4 to 5 million tons. What with late rains and rust this year and eating into the reserves of the peasants last year, trade circles fear a serious shortage this year. Whether it is real or not, once trade has got the idea that there is a shortage, food imports have to be arranged double quick. There is little time to lose over price wrangling. If stocks are not released freely and immediately, food prices may go out of control, dragging other prices in their trail. And we may have to pay many times over the loss we may have to suffer in rushing foodgrains deals with other countries now.

Of late, there has been a significant flow of funds from India to the United Kingdom though the rupee being linked with sterling, capital movements of this sort may not have caused a stir in the exchange market, as it has done in Malaya which has been experiencing a considerable outflow of funds. A heavy demand for transfers to the U. K. has made the Malayan banks reduce the sterling value of the Malayan dollar three times during the past month or two. In Malaya, the demand may be related to political factors like impending constitutional changes, though it is likely that fears about the future of rubber constitute a more important reason. But what can be the reason for the outflow of funds from India? The outflow, to be sure, is not small in volume. The balance of payments figures show that the outflow of private capital was of the order of Rs. 14.8 crores last year as against net receipts of Rs. 7.4 crores in 1954, reversing the previous inflow from the U. K. It is not possible to explain it in terms of the payments position. For the country last year had on current account a surplus of Rs. 41.6 crores compared with a deficit of Rs. 4.1 crores in 1954.

This is not a laboured attempt at being clever; this is how "Lombard" poses the question in the The **Financial Times** (April 20). The answer that would occur to the Indian money market correspondant is that funds were moving to or being repatriated to U. K. because of the high Bank rate. "Lombard", however, does not think so. He is convinced that there is repatriation of capital, the explanation for which must be sought in the Government's decision to embark upon a socialisation programme. The fact that he considers fears about the safety of capital invested in this country unwarranted and that he has advised, if only by implication, against such repatriation suggest that there is no attempt at browbeating the Government of India. What, then, is the correct explanation? Would the Government of India or the Reserve Bank throw some light on the question?

Industrial Policy—New Look

(From a Delhi Correspondent - Delayed in Transit)

THE Government of India's new industrial policy is on the anvil. The accent is on the expansion of the Public sector. It will be in keeping with the socialist pattern of society that the Congress Government is pledged to evolve. Pandit Nehru himself has undertaken to inject political content into the statement. Whether he succeeds in that objective, everyone concerned agrees, will be merely a matter of drafting. The danger is that the resolution may emerge more as an elaboration of a political slogan than as the enunciation of a clear policy.

It is known that the Ministry of Commerce and Industry as well as the Planning Commission were opposed to the supersession of 1948 industrial policy statement. All that the Government desired to achieve could be effected within the four corners of that resolution. It was flexible enough. When pressure from the Prime Minister made action inescapable, the Planning Commission put up the widely-publicised draft in consultation with the Ministry of Commerce and Industry. It lists fourteen industries whose future development will be the concern of the State unless the State itself considers it necessary to seek the cooperation of private sector. Another schedule enumerates eleven industries in whose development the State will progressively participate though the private sector will continue to promote them as well.

The industries included in schedule A are:

1. arms and ammunition and allied defence industries;
2. atomic energy;
3. iron and steel;
4. heavy castings, forgings and structurals;
5. heavy plant and machinery required for making machine tools and other basic industries.
6. heavy electric plant including large hydraulic and steam turbines;
7. coal;
8. mineral oils;
9. copper, lead, zinc and molybdenum;
10. aircraft;
11. air transport;
12 railway transport;
13. shipbuilding: and
14. telephone, telegraph, wireless apparatus excluding radio receiving sets.

In schedule B the following industries were listed:

1. iron ore;
2. manganese ore;
3. kyanite, bauxite, chrome ore etc;
4. aluminium, machine tools and ferro-alloys;
5. basic and intermediate products required for chemical industries like the manufacture of drugs and dyestuffs and plastics;
6. carbonisation of coal;
7. fertilisers;
8. synthetic rubber;
9. chemical pulp;
10. generation and distribution of electricity;
11. sea transport.

The rest of the industrial field will be open to the private sector.

It is quite on the cards that Schedule A may be expanded both at the expense of Schedule B and by the addition of new industries like telephone cables or diamond mining. A suggestion that low grade coal should be reserved for Schedule B has been rejected. Fertilisers and drugs, including antibiotics, are sought to be promoted to schedule A though not without controversy. It is proposed that non-ferrous metal industries should be in Schedule A.

While the Prime Minister may drastically recast the basis of classification, certain cardinal principles are likely to remain unaltered.

First, nationalisation would affect only new undertakings.

Second, financial aid of the State for the promotion of new industries would be by way of equity participation rather than extension of loans.

Third, the policy of nationalisation would be hemmed with provisos so that co-operation of the private sector might be obtained wherever necessary. Even equity participation may be modified in the interest of securing a diversity of capital resources for the nascent industry.

In effect, therefore, the new policy statement may just add up to verbal irritation and ideological gas. It may offend the private sector without necessarily enlarging the role of the public sector. In any case, its tenets would be ignored with or without recourse to the provisos. The Mysore Government has already decided to nationalise the Kolar Gold mines and flouted the Planning Commission's considered view that the State's resources should be utilised for the promotion of new industries rather than taking over existing enterprises. The Ministry of Natural Resources and Scientific Research proposes to do the same thing in regard to the Panna diamond mines. Such cases are bound to multiply with the noticeable decline in the prestige and power of the Planning Commission. Already the Government has begun to ignore unpalatable advice from this direction by not seeking it. The ghost of Dr. John Matthai is coming home to roost.

From the London End

Budget

"We asked for a prescription but got instead a betting slip"—Ian Mikardo, M.P.

THE Chancellor of the Exchequer took two hours to make his Budget statement. The presentation however was masterly. By the time he had finished, the Commons and the whole nation was enmeshed in the originality of his suggestion of an issue of "Premium Bonds", a type of state lottery. It took the country a whole day of reflection to realize that the premium bond suggestion (and it was no more than a suggestion) was merely an aside and irrelevant, so far as basic issues were concerned, and that the Budget contained little that was new in economic policy and that it brought no change in the tax-burden now borne by the tax-payers. The **Economist** thought the Budget was a "missed opportunity" and the Stock Exchange went on to add five points to the value of industrial shares. The present Conservative Government has a remarkable ability to devise slogans—slogans which quickly turn out to be dangerous and disastrous. The April 1955 slogan was "Invest in Success". Today, the slogan is: a savings drive. The trends in the motor industry may well show this to be as inappropriate (or disastrous) as was the earlier catch-phrase.

The Budget proposals involve no change in the income tax. What little is given away as concessions is recouped by some small (and nasty) measures. The concessions include, first, a reduction in stamp duty on conveyances of houses, freeing from tax interest receipts up to £15 on savings deposits, and tax-reliefs on pension premiums of self-employed persons. These, in all, will reduce Exchequer receipts by £20 millions this year. The second concession concerns an extension of family allowances involving a loss of £5 million to the Exchequer this year. As against these concessions, the Chancellor recoups £12 million this year by the removal of the remainder of the bread subsidy. Further recoupments are £27 million by an increased tobacco duty and £750,000 from increases of 2½ per cent and ¼ per cent on the distributed and undistributed profits respectively. As a result, the 1955-56 Budget surplus of £397 million is expected to increase to £460 million in 1956-57.

There is one other substantial policy pronouncement in the Budget. The Exchequer has now decided to finance the capital needs of nationalized industries up to £700 million in the next two years. This represents a certain reversal in the previous policy. In the past year nationalized industries, like local authorities, had to find their capital in the money market. The reasons for the change are not particularly clear. When these Public sectors were told to go to the market, it was argued that it would not only be a good thing for them to be subject to the rigours of the market but that it would relieve the monetary authorities of the embarrassment caused by an excess issue of Treasury bills. The Chancellor now says that the Public sectors should be enabled to borrow "autonomously" and that in the past year the Exchequer had to provide assistance to the nationalized industries whenever they had to fund their bank borrowings by market issues of stock.

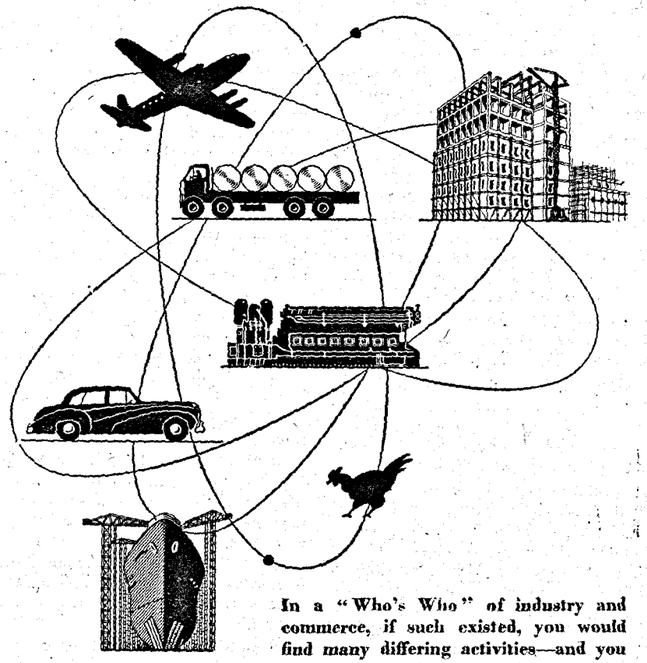
The Budget expresses a hope—a hope which increasingly appears to be beyond realization. The Chancellor claimed that he "hoped" for a reduction of £100 million in Government expenditure. However, in the Commons debate following the Budget statement, a Government spokesman pointed out that such a reduction in expenditure must involve changes in policy. He, however, doubted policy changes on defence or on social welfare taking place. Whence and wherefrom the reduction, then? Since it is a "hope", the question does not call for a reply.

The Budget has been received with little enthusiasm in the country. From the prima donna of British anarchists, Mr Malcolm Muggeridge, to the pro-Macmillan **Economist**, comment has been critical of the fiscal proposals. To Mr Muggeridge, the Budget presumes the continued Great Power status of Britain, thus making it necessary to have such large defence expenditure. This, says Mr Muggeridge, is a disastrous presumption. The **Economist** finds the Budget lacking the "dynamo"—it "will not lose Britain any wickets, but will also not make it any runs".

The April 1955 one was an unabashedly political budget. The present one has the same unmistakable political overtones. The authorities are obviously afraid, as then, to attack the problem of inflation by measures of further restraint on demand. They have chosen to effect a disinflationary policy via the dubious path of exhortation for higher private savings, to be supported by the premium bond bribe. The City of London, the larger industrial interests and the Conservative economists had all hoped that, in the words of the **Economist**, "the object of the Chancellor's new policy is to secure greater stability of prices even at the risk of some sacrifice in terms of production". The hope that the Budget would engender unemployment and thus some price flexibility is now belied. Maybe the fear of trade union retaliation to such a policy made the authorities hold their horses. Government has also refused to meet the demands for implementation of some of the more crucial recommendations of the Royal Commission on Taxation, in particular, a reform of the tax system. The reform favours incentives in industry—in practice this would mean a tax structure that is less progressive. Here, too, the Chancellor's political fears must have dictated his decision to postpone (and maybe relegate into oblivion) all the Royal Commission asked to be effected.

The most active aspects of the Government's attack on inflation is still to be found in the monetary field. It is true that large fiscal surpluses are being persistently reaped and this constitutes the most vital form of the anti-inflationary attack. On the other hand, the active, more public and conscious attack remains the purely monetary measures. But, as the Chancellor admitted, the monetary controls which he and his predecessors have set in motion have taken a long time to work. What he refused to admit, however, is the tremendous cost to the Government of an economic policy largely based on flexible interest rates and credit controls. The interest burden on the national debt has risen by over £100 millions in one year. And having regard to the inequitable nature of the monetary transfer involved in the State payment of interest from tax receipts, the objectives of social policy also appear to be retarded by

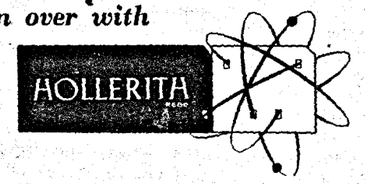
monetary controls. What is remarkable, however, is the contradiction between the pursuit of this monetary policy and the decision of the authorities to finance the capital needs of the nationalized industries. Since the nationalized industries' requirements are to be met by the Exchequer, it will mean two things: an increase in the amount of Treasury bills issued and, secondly, greater liquidity in the capital market (since the demands of the nationalized industries will now not be present). Both these factors can engender a degree of liquidity in the banking system and banks will now be "forced" to extend credit facilities to their clients. The larger volume of Treasury bills will assist the movement towards increased liquidity since these bills constitute the best of short-term paper against which banks can confidently extend the national credit base. And yet the Government continues to persist in its belief that all that it is doing will maintain the credit squeeze.



Mahindra & Mahindra

WORKING results of Mahindra and Mahindra, Ltd. for the first year since its conversion into a public limited company, were satisfactory. For the year to October last, the Company declared a dividend of 10 per cent to ordinary shareholders. As it is a Section 23A Company, an application has been made to the Income Tax Commissioner for relief under subsection (3) of the Income-tax Act.

In the year under reference, the Company's sales reached a record figure. Sales of jeeps, allied vehicles and spares and trailers were about fifty per cent more than those of the previous year. More than thirty-six per cent of steel imported by the Iron and Steel Controller was booked through this Company. In collaboration with David Brown of UK, the Company has plans to manufacture tractors. This plan is under consideration by the Government.



In the report, it is stated that the Company's plans for the manufacture of jeeps started last January. In April, 1955, the automotive plant at Bhandup was acquired. This plant's machinery and equipment were renovated, additional machine tools were purchased and various steps were taken for strengthening its resources to serve as a pilot factory for the manufacture of jeep components and for training of skilled operatives.

It is stated in the report that the steel stockyard in Calcutta has been working satisfactorily. With the transfer of the stockyard to the new area leased from the Port Commissioners, the directors hope that sales will improve further. Active investigations for similar stockyards in Bombay and Madras are being made. Arrangements for the assembly of trailer units in Madras have been completed. "Consideration is being given," it is stated in the report, "to the setting up of an export desk under the aegis of Mahindra Engineering Co. Ltd.—a wholly owned subsidiary of the Company".

In a "Who's Who" of industry and commerce, if such existed, you would find many differing activities—and you would also find on every page the names of users of Hollerith. The reason is clear. Diverse though business is, it is united in its demand for higher and higher standards of efficiency . . . and in Hollerith electronic punched card accounting and the use of Hec Computers, it has a large part of the answer.

Book Review

As an Independent Tool of Analysis

National Income And Social Accounts: An Australian Study by R I Downing. Melbourne University Press, Victoria. Pages 58. Price 6 sh.

Reviewed by **Hannan Ezekiel**

THE controversy over whether economists should have a knowledge of mathematics is no longer a live one. The increasing volume of economic literature with a mathematical approach and the large number of econometric studies indicate how that controversy has been resolved. Now it is suggested that a knowledge of accounting principles is as essential a part of the economists' equipment as is mathematics. The demand for the inclusion of accountancy in the basic courses in economics has come principally from those who have devoted themselves to studies in national income and to the comparatively recent development of an approach to it described by the term 'social accounting'.

The social accounting approach indicates in reality a fundamental change in the character of national income studies. These were formerly concerned chiefly with estimates of national income aggregates and their distribution with a view to providing comparisons over space or time. Keynes' **General Theory** brought about a shift in emphasis to the obtaining of information as a basis of policy, with the object of achieving and maintaining full employment and increasing the wealth of the community.

The dependence of the national income on the level of spending has focussed attention on it's components. The need to break-down the aggregates on which emphasis was laid in the past has ultimately led to the development of the social accounting approach.

Economists who consider the basic principles of accountancy a necessary part of their equipment base their case, however, not only on the need to understand the new approach to national income, since excepting for the expert in national income studies, a study of accounting principles is really not essential for an understanding of the fundamentals of social accounting. They argue that the study of accounting principles will introduce an element of realism into economics. The inclusion of a section on accountancy in a standard text book like Seligmann's **Principles of Economics** indicates the extent to which this view has found support in academic circles already.

The present work does not, however, take that view. It is intended to explain the basis of the social accounting approach and does so without any undue emphasis on an understanding of accounting principles as a necessary pre-condition for the purpose. The book is in fact an elementary introduction to the study of social accounting. Under the new approach to the teaching of economics, students should be introduced to this subject at an early stage. The author points out that this should be done for two reasons. First, the concept of national income is basic to the whole set of problems arising in connection with the study of economic welfare. Secondly, "social accounts are an economic tool which can be understood, although not fully appreciated, without the support of economic analysis used in other fields". Implicit in the first reason—though it needs to be made explicit—is the fact that an understanding of the fundamental principles of the system of social accounts throws light on the general working of the economic system, making the subject both more interesting and more significant to the student who is being initiated into economics for the first time.

The social framework approach to the study of the subject of economics by the student has already found wide acceptance in the West. But the lack of a suitable introduction, which does not complicate the subject too much at this initial stage, has been a grave difficulty in this connection. Prof Downing evidently aims to provide such an introduction and succeeds admirably in this task. His little work is a masterpiece of exposition, simple and clear and yet fairly comprehensive. It is sub-titled "An Australian Study" because the chapter covering the application of the social accounts is based on the latest available Australian figures of national income and its components.

The author begins by describing the income flow, and outlining the various methods of measuring the national income. The problem created by saving and by investment are then discussed. "The Structure of the Social Accounts" is then explained, with particular reference to the treatment of transfer incomes. This latter is a particularly controversial item, and Prof. Downing follows, apparently in accordance with official Australian practice, the principles laid by Earl R Rolph in his article on "The Concept of Transfers in National Estimates" in **The Quarterly Journal of Economics**. After discussing some of the problems involved in determining the scope of national income measurements—rather sketchily—the author goes on to the application of the social accounts in terms of figures of Australian national income for 1952-53.

"One has no protecting power save prudence."

Role of Small Industries

Economic Pundits Confuse

162482

(Contributed)

THE controversy about the place of cottage and small scale industries in the country's economic set-up has been dragging on since Gandhiji published his **Hind Swaraj**, way back in 1908. Gandhiji had argued all through his life, in a lucid, persuasive manner, for the adoption of these industries for curing unemployment. But Gandhiji was no economist and the economists, trained in the belief that economic development means technical progress, had all along rejected Gandhiji's views as out-moded, which if accepted would be like turning the hands of the clock backwards.

Prof. Mahalanobis is no economist. Being primarily a statistician, perhaps, he could accept Gandhiji's remedy in his own way. And the Planning Commission is known to absorb everything like a blotting paper; and it accepted Mahalanobis' thesis, though it is no secret that the economists of the Planning Commission have severe mental reservations on this point. In a fit of absent-mindedness, the Panel of Economists, a solid body of economic pundits, also accepted this line of thought. Now, however, some of these pundits have awakened from their slumber and with a praiseworthy loyalty to their science, have openly repudiated what they had accepted earlier. One admires them for their regard for truth and their courage to own their mistakes and for this virtue, if for nothing else, they deserve to be recognised as being as great as Gandhiji himself.

The economists' case is that they have no objection to these industries, if it is made clear that their development is sought purely on humanitarian grounds. Then, of course, they admit that as economists qua economists, they have nothing to say. But if the development of these industries is to be justified on economic grounds, they, as economic pundits, would not support this move; for they have been taught that economic development is possible only when those industries are developed in which labour productivity is highest. Some economists, however, who seem to have been recently initiated into the Marxian literature, have a different line of criticism. They argue that according to one eminent authority, viz, Keynes, there is probably a justification for these industries; but according to another authority, not merely on employment and output but also on economic development, viz., Marx, there is no justification because, though cottage and small scale industries may maximise output and employment in the short run, they would slow down the rate of growth. As did the Pundits of old, while interpreting their Shastras, these economic pundits draw a subtle distinction between Marx and Keynes. Their argument is that there is a difference between a State, where the supply of consumption goods is adequate to meet the demand, and a State, where the surplus consumption goods in the consumption goods sector is adequate to meet the demands of the non-consumption goods sector. The subtlety of the reasoning behind this highly learned discourse completely beat me. But then I happened to read Mrs. Joan Robinson's article in this weekly. I knew that she was highly respected among the economic pundits here and also knew that she is an eminent authority herself on Marx, Keynes and economic development. She, however, I found to my utter surprise, did not argue with the pundits here; on the contrary she made out a very vigorous case in support of cottage and small scale industries! This threw me into confusion. Could the most erudite of our Shastris be all wrong? I thought that instead of trying to determine the degree of authoritativeness of these eminent masters, if I wanted to find out the truth, I should try to think for myself. And here is how I figure out the problem:

For the sake of simplicity, I divided our economy into two sectors, the sector of the employed and the sector of the unemployed. Now supposing we drew up a plan for the full utilisation of all our scarce resources, this plan would, in the course of its implementation, employ, say, 100 persons out of a total of employable persons of, say, 150. What to do with this 50? They cannot be employed within the framework of the Plan, as it has been so drawn up as to use fully all the scarce resources. Supposing, I thought, these 50 persons started hand-pounding of rice for their own use, or manufacturing gur out of sugarcane which their relatives were just throwing away, or spinning cotton yarn on the idle spinning wheels, or making handlooms and using them for weaving their own cloth. By doing all these, they could increase their own consumption of certain commodities and they would certainly be better off than what they otherwise would be. Should they not do all these, simply because the techniques which they would be using are old, simple and primitive? However much I tried to understand our economic pundits, I could not persuade myself to believe that these crafts and cottage industries do not make the unemployed, and hence the country, richer. On the contrary, I realized that the case I was thinking about was exactly the case presented by Mrs. Joan Robinson. So, then, we will call this case when the unemployed work at simple cottage industries to increase their own consumption as the Robinson case for the justification of cottage industries.

In this case, employment increases from 100 to 150. What happens to income? Supposing the income produced by the 100 employed persons was 100 units. This would certainly increase, when 50 persons work at cottage industries, say, by 15 units. Thus then both employment and income would be greater in the Robinson case than in the case where the unemployed just remained idle.

The Robinson case, it might be argued, is understandable. But what if the unemployed are not prepared to work on the basis of what they might produce themselves? In other words, what if the prospective additional consumption does not provide enough incentive for them to work?

In the Robinson case, the employed worker gets 0.75 units of consumption goods (on the assumption that 90 units out of 100 are consumption goods) while the unemployed gets 0.3 units. On the basis of an increment of 15 units

in consumption goods output on account of the unemployed working at cottage industries, he would get 0.6 units per capita. Now suppose he is willing to work only if he gets 0.62 units per capita. In that case a subsidy of 5 units will have to be provided by the 'employed sector'. This will mean reduction of workers in the investment goods sector by 5 (previously 10 persons were producing 10 units); hence also a reduction in the output of investment goods by 5 units. Five more persons will swell the ranks of the unemployed who will number now 55. Their consumption would be now 15 units which the 50 unemployed were already getting when they were unemployed, plus 15 units, the output of cottage industries (assuming that now 55 persons engaged in the cottage industries produce the same output i.e. 15 units, as would have been produced by 50 persons) plus 5 units of subsidy. This would mean a per capita consumption of 0.62 units in the 'unemployed' sector. Even with this subsidy, the point to be noted is that the output of the economy, when the unemployed are sent to work, is more (110 units) than the output (100 units) produced when they remain idle. However, investment is reduced from 10 per cent of the total output (when the unemployed remained idle) to 4.6 per cent in the case of the subsidy (instead of to 8.7 per cent in the case of no subsidy). Even in the extreme case of such a big subsidy, it appears worthwhile to develop cottage industries with a view to maximising output and employment.

But what about the rate of growth? Some economic pundits have already conceded a la Keynes that cottage industries, if developed, would maximise both output and employment; but they argue that, in that case, the rate of growth would be slowed down. Not being adept at economic terminology, I thought hard as to how this rate of growth is calculated. On investigation I found that it was not as frightening a concept as I had imagined. It is just an arithmetical relationship between investment and productivity of investment. The economic pundits define rate of growth as the proportion of investment to income multiplied by the productivity of investment. If, say, investment as a ratio of income is 10 per cent and the productivity of investment is, say, 20 per cent, the rate of growth in percentage terms would be 2. On this definition, it is easy to see that if 10 is invested when income is 100 and the same amount viz. 10 is invested when income is 115 (in the case where cottage industries employ the unemployed), the ratio of investment to income in percentage terms would be lower at 8.7 per cent than the previous 10 per cent. Productivity of investment remaining the same, viz, 20 per cent, the rate of growth in the Robinson case would be about 1.7 per cent and in the subsidy case a little less than one per cent instead of 2 per cent in the case where the unemployed remained just idle.

So, then, the economic pundits are right. In the Robinson case, the rate of growth is smaller. But what does it prove? It proves nothing. It could not be advanced as an argument against the cottage industries. For in the Robinson case, the country's income is higher (115 instead of 100) and that being so, simple arithmetical exercises are enough to show that when a larger initial income grows at a little slower rate than a smaller initial income, the per capita income in the former case would still be larger in absolute amount for many years (for about 10 years in the subsidy case and for about 50 years in the case of no subsidy) than in the latter case. If we are going to have larger per capita income in absolute amount in the near future by developing cottage industries than by not developing them, there does not seem to be any prima facie case even on economic grounds against their development; one would admit, however, that here is a problem of choice between a larger initial income and a slower rate of growth, and a smaller initial income and a faster rate of growth. If a country chooses either of these, I fail to understand how its choice can be condemned on economic grounds.

Mahalanobis' Case

In the Robinson case, the unemployed were working at cottage industries to increase their own consumption. The factory consumption goods industries employed 90 persons, while the investment goods industries employed 10 persons and the unemployed 50 persons were working at cottage industries. In this case, 90 persons in the consumption goods industries were producing enough to feed 10 persons engaged in the investment goods industries. Now suppose we want to increase employment in the investment goods industries and thus investment also by, say, 5 (as a result of, say, a gift of some scarce materials from other countries). The unemployed then would be 45. Assuming that the consumption of this additionally employed 5 persons would be greater than what it was when they were unemployed, the problem is: How to provide for this additional consumption? Mahalanobis' strategy is to provide for this additional consumption out of the income of the 45 persons who would be working at cottage industries. If these 45 persons are enabled to produce, as a result of some increased facilities given to them, an increased output of consumption goods such that they would not only be able to increase their own consumption but also to provide for the additional consumption of these 5 persons, there would not be any problem. Under these circumstances, the country not only maximises its output and employment, but it is also able to increase its rate of growth as compared to the case where the unemployed just remained idle. Mahalanobis, a non-economist, thus has shown how absurd the arguments of economic pundits are.

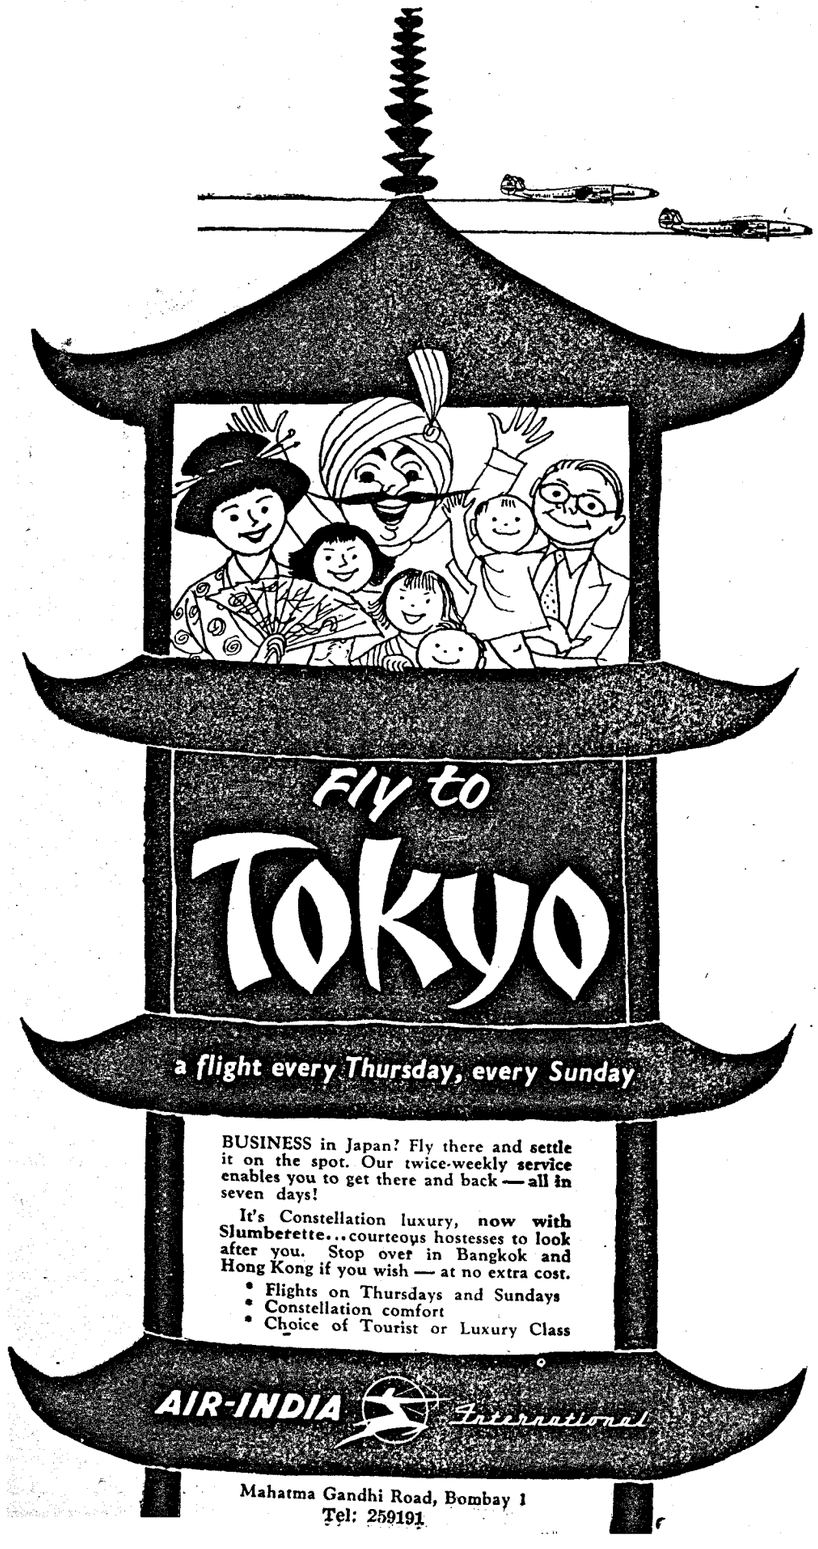
Thus I found that non-economists like Gandhiji and Mahalanobis are better interpreters of the shastras and foreign economists like Mrs. Robinson show greater insight into our problems than our own Shastris. How could that be? Our pundits, in spite of their learning, seem to be confused. But there is that Sanskrit adage: "How can a mirror help a blind person?"

यस्य नास्ति स्वयं प्रज्ञा,
शास्त्रं तस्य करोति किम् ।
लोचनाभ्याम् विहिनस्य,
दर्पणं किं करिष्यति ॥

Those who have a stomach for figures may find the accompanying table useful. Those who haven't, do not have to bother.

Case where 50 persons remained idle

	Units	Per capita Consumption (units)	No. of workers
Consumption goods output	90	—	90
Consumption of 100 employed persons	75	0.75	—
Consumption of 50 unemployed persons	15	0.3	—
Investment goods output	10	—	10
No Subsidy Case			
Consumption goods output through cottage industries	15	—	50
Consumption of the 'unemployed' working at cottage industries	—	0.6	—
Subsidy Case			
Consumption goods output	90	—	90
Investment goods output	5	—	5
Consumption of 95 employed persons	—	0.73	—
Consumption of 55 (unemployed) at work in cottage industries	16.5	0.67	—



Titaghur Paper

SATISFACTORY working results are reported for the Titaghur Paper Mill Company Ltd. for the half-year to September last. Though production during the period under report was slightly less, sales were higher by Rs 52 lakhs. The dividend and the bonus have been maintained at one rupee and four annas, respectively.

Implementation of the Company's renovation plans is according to schedule. During the half-year under review, the Tomlinson soda recovery unit was installed, and the unit started functioning. There has been an improvement in the operation of the plant since. After certain other adjustments have been completed, the operation of the plant is expected to improve still further.

For the Orissa mill project, negotiations are going on with the Orissa Government for the acquisition of the necessary land. Preparations have been made to start work on the mill buildings and railway siding as soon as the negotiations regarding the land have been completed. It is stated in the report under reference that the draft lease for the bamboo areas which will supply the raw material to the new mill is expected to receive the approval of the Orissa Government soon.

FAO on Jute in the Post-War Period

THE partition of the country transferred the main jute growing areas of undivided India to Pakistan, but subsequently the position of India as the major producer of raw jute has been restored. Not so, however, the virtual monopoly of jute enjoyed by India. Many changes have taken place in jute economy, among others, in jute manufacture also. Pakistan has emerged as an important manufacturer, and the rapid modernisation of the jute industries in the countries of Europe has meant a shift in the relative positions of different countries in the field of jute manufacture. The results of a recent FAO survey of raw jute production, consumption of raw jute (providing an index of production of jute goods) and of consumption of jute goods, set out in the three tables below, bring out some of these changes.

The concentration of raw jute in the Ganges and Brahmaputra valleys continues, though the relative share of India and Pakistan has changed, so that India has actually become the world's major producer. India and Pakistan together produce 97 per cent of the world's output of raw jute and allied fibres (principally mesta), roughly in about equal proportions. There has been a sharp change in the proportionate shares of the two countries during the post-partition period, as can be seen from Table I.

The importance of climate and rainfall in raw jute production is well known. But that the supply of labour in growing areas also plays a part is not always realized. In the jute growing areas, the cultivation of jute forms part of a traditional rotation with rice. The FAO found a marked correlation between the ratio of jute to rice prices and the area under jute. Before World War II, nearly two-thirds of the variations in jute acreage in Bengal were attributable to variations in this price ratio. That the consequent variation in the area under jute are wide and are not compensated for by variations in yield is well-known. This results in wide variations in raw jute production from year to year.

The demand for jute depends upon the state of world economic activity as well as the price of jute. Variations in demand were found to coincide with variations in supply in two-thirds of the years, but over the whole period, the variation in demand was not as wide as the variation in supply. It is this relation between demand and supply which has caused the wide fluctuations in the price of jute and jute goods.

In the period after the partition, the fact that area under jute in Pakistan has been subject to licensing has prevented over-expansion. Planting in India has depended to some extent on the price of the marginal imports from Pakistan. The relatively high value of the Pakistani currency between 1949 and 1955 and the limitation of production in that country were, according to the FAO, the reasons for the stimulation of production in India. In the early post-Partition years, short crops and trade and currency difficulties restricted supply and stocks reached low levels, particularly as a result of the Korean boom. Later, however, the raw jute output expanded more rapidly than demand and in 1951-52 and 1952-53, there was little demand and in Pakistan, jute was purchased officially at minimum prices.

In 1955-56, the demand was somewhat better and supply was reasonably adjusted to it. The FAO report suggests that "The recent devaluation of the Pakistani currency could very well have the effect of increasing the incentive to grow jute there; but the effect of increasing Pakistan supply being minimised as far as external prices are concerned, discouragement to jute growing in India may not be very great." The study also points out that Pakistan authorities are giving consideration to limiting the growing of jute to the extent planted this season.

Sixty per cent of the total manufacture of jute is at present concentrated in the main jute growing region. While all the mills were in India at the time of Partition, Pakistan has been attempting to establish a jute industry and her achievements so far can be seen in the table below, 3 per cent of total raw jute consumption for manufacture being in Pakistan in 1954, against 57 per cent in India. The fall in India's share from 65 per cent on the average during 1948-50 to 57 per cent in 1954 is explained, however, by the

increase in the shares of the United Kingdom, West Germany, France, Belgium and Italy, whose combined share increased from 18 per cent on the average of 1948-50 to 24 per cent in 1954. India's present position is to be compared with her 80 per cent share before the war.

As compared with the pre-war period, the study notes, there has been a reduction in installed capacity in British industry and a sealing of a proportion of the looms in Indian industry, but this has been offset by expansion of capacity in other countries. There has also been widespread modernisation in Europe as well as in India.

The entry of Japan into the field of jute manufacture, with a roughly one per cent share in the total consumption of raw jute, is also a notable development. The competitive position of different countries is affected by the availability of cheap and abundant raw material, abundant labour supply, modernisation of machinery and location of markets.

Manufactured jute is principally used as a container and its utilisation for the purpose is geographically widespread. The use of jute has not, however, kept pace with the growth in agricultural output. The study ascribes this to the following three reasons:

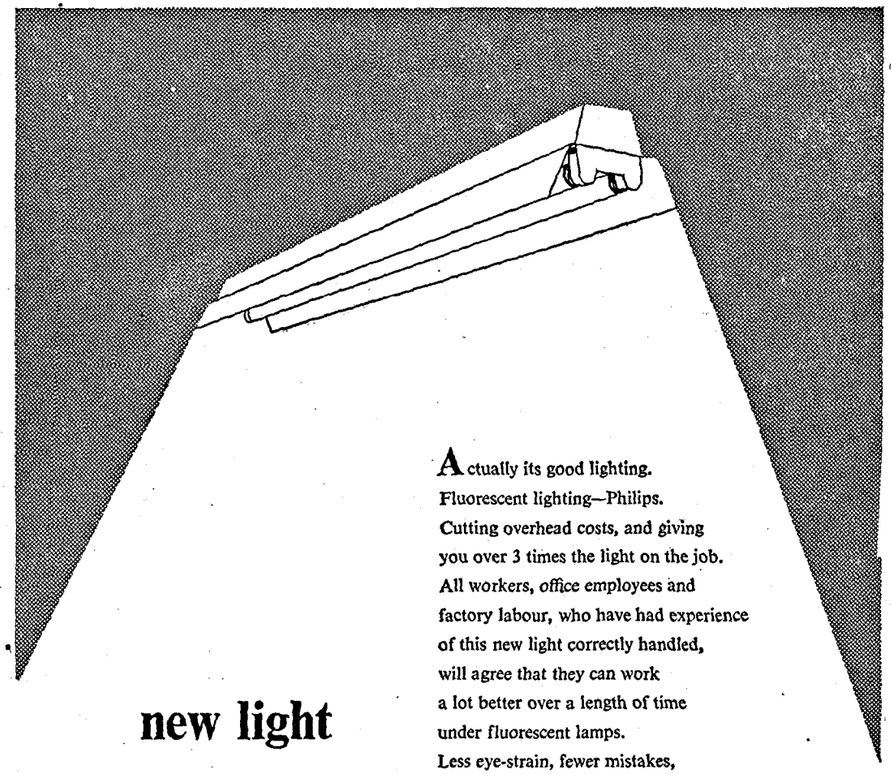
(a) Production or movement into commercial (including export) channels of some agricultural commodities for which jute packaging is particularly suited, has expanded less markedly than that of commodities for which jute packaging is less suited;

(b) Development of bulk handling facilities (inland and at ports) and of pre-packaging for the retail trade, eliminating the traditional type of container; and

(c) displacement of jute containers by those made from other fibres or materials, notably paper.

Evaluating long-term prospects for jute, the FAO study finds that there are conflicting trends. Increasing population and rising standards of living suggest the possibility of increasing demand. The adoption of jute either by itself or in combination with other materials for other uses through research will open up new possibilities.

As agricultural production of such commodities like rice expands in the Far East and there is a freer flow of trade in them, demand for jute bags is likely to rise. Coffee and cocoa are other products whose output is likely to expand as new plantations mature. Even in cotton where, pending surplus disposal, expansion is likely to be arrested, the long-run trend appears to be towards an expansion of output and trade, and hence of the demand for jute.



At the same time, increasing use of bulk handling, which becomes economic as full employment is reached, indicates the possibility of a reduction in demand for jute. The lower levels at which agricultural prices are tending to stabilize will also stimulate research into alternative packaging materials and cotton textile and paper bags may be increasingly utilised. At present, however, paper prices appear to be on the upgrade and the same tendency is likely to prevail in cotton textiles also. The problem is, therefore, ultimately largely one of price.

The FAO's conclusions are interesting. The market for jute depends on two factors. A reasonable degree of price stability will impart confidence to users and slacken the search for alternative containers. Paper prices have such stability while jute prices do not. This conclusion reinforces the argument of the Indian Jute Enquiry Commission that price stability is necessary, if the industry in the country is to develop.

The second conclusion of the study is that as freight rates form an element in the landed cost of jute and jute goods, an upward trend in these rates will be generally adverse to jute prospects, particularly in the more distant markets of the West where substitute materials are locally produced and manufactured.

With all respect to FAO experts, however, the prospects for jute cannot be fully studied in terms of relative prices without some consideration of the technical qualities of jute which makes it the packaging material of world trade. Its resilience, resistance to climatic conditions and other qualities also require a careful assessment without which the competitive position of jute vis-a-vis substitutes cannot be fully understood.

Actually its good lighting.
Fluorescent lighting—Philips.
Cutting overhead costs, and giving you over 3 times the light on the job.
All workers, office employees and factory labour, who have had experience of this new light correctly handled, will agree that they can work a lot better over a length of time under fluorescent lamps.
Less eye-strain, fewer mistakes, quicker work, and an improved general atmosphere, these are the results of better lighting. And working tests have proved that Philips Fluorescent Lamps, used with quality control gear, have a burning life of 7500 hours, which is just about 4 years. These are a few reasons why Philips Fluorescent Lamps & Fittings are being installed in homes, offices and factories throughout the world.

PLANNED LIGHTING BY PHILIPS

Philips are fully prepared to provide you, without any obligation on your part, advice for a planned lighting system. Call them in and discuss it.

The Dunlop Rubber Co. (India) Ltd.

Mr Cecil Stack's Review

THE 30th Annual General Meeting of The Dunlop Rubber Co. (India) Ltd. was held on the 25th April, 1956, in Calcutta. Mr. Cecil Stack, Managing Director, said:

Gentlemen,

The Directors' Report and Accounts for the year 1955 have been in your hands for some time and with your permission I will take them as read.

The Year's Trading

From the point of view of volume of sales the year under review may be considered very satisfactory. Progress was achieved in all products and the factory worked to full capacity throughout the year, thus maintaining the highest possible level of employment. In my speech last year I advised you that our consumption of crude rubber in 1954 was the highest recorded, being 18% above 1953. Another record was created in 1955, rubber usings being nearly 10% higher than in the previous year. Nevertheless we had difficulty in meeting the demand for our products which is indicative of the continued expansion of India's economy and the growing importance of our own particular industry. As I suggested on this occasion last year, the level of output and employment will require to be expanded considerably if the demand for rubber products under India's second Five Year Plan is to be met, and we as a company hope to play our full part.

Distribution of the Company's products was again adversely affected by unsatisfactory transport conditions and shortage of railway wagons. The indications are that this problem will become more acute in years to come and in my opinion it calls for the most serious attention by the Government of India.

Total sales in value were 10% higher than in 1954 but as the result of selling price reductions the net profit at Rs. 96,72,154 was approximately the same as for the previous year and the ratio to turnover declined from 7% to 6.4% before taxation. The price reductions on this occasion arose out of Government's implementation of the Tariff Commission's recommendations regarding tyre prices. I do not propose to comment on the Commission's report other than to say we do not necessarily agree with some of the findings but th's has not in any way affected our relations with the Government which I am pleased to say remain satisfactory.

Products

In the Rubber Industry in recent years the most intensified research has been undertaken in relation to new varieties of raw materials and new methods of manufacture. Development work continues on a vast scale and no manufacturer can afford to stand still. In this respect we are fortunate in having available the benefits of Dunlop research activities not only in Great Britain but in many other countries, notably Canada, United States of America, Germany, France and Malaya. Our technical staff are in constant liaison with the world-wide Dunlop Group research organisation, which ensures that the most modern production methods, equipment and materials are available to us.

The Dunlop Trakmaster Giant tyre, which is specially designed for rough roads and cross country routes, has proved most popular and it is hoped that this year supplies will be sufficient to meet all demands. Another important development has been the introduction this year of the new Dunlop Roadster Giant tyre which I have no doubt will be equally successful. This tyre has been thoroughly tested in many countries of the world on some of their worst roads and results everywhere have been outstanding. The tubeless car tyre which your Company were first to introduce in 1954 has given excellent results and is now being fitted as original equipment by most car manufacturers.

Further progress was made in our sales of tractor, off-the-road and aero tyres and new records were again created in our production and sales of cycle tyres and rims. The use of the bicycle has grown so rapidly that we have not so far been able to keep our cycle tyre capacity abreast of the demand although it is hoped to remedy this before long. Stock shortages unfortunately existed throughout the year and to ease the situation Government have now adopted our suggestion of permitting tyres to be imported.

Substantial increases were also achieved in sales of other products, for which increased manufacturing capacity is also required if the needs of our customers are to be met. Great strides were made in Dunlopillo Latex Foam Cushioning, which is now firmly established as the most economical and hygienic material for cinemas, hospitals, hotels and transport services. It is also being used increasingly for domestic purposes and by car manufacturers.

Our rubber-ply transmission belting sold well throughout the year and we have had difficulty in maintaining dealers' stocks at an adequate level. Many important contracts for Conveyor belts which are supplied only against firm orders have been fulfilled from our Sahaganj factory. It is gratifying to know that our industrial vee belts and fan belts are proving so popular as borne out by an increase in sales of over 60% compared with the previous year. The excellent quality of our braided hoses has justified our decision to increase our range of sizes so that we can meet consumer needs more fully.

During 1955 we further expanded our activities to cover the highly specialised field of anti-corrosive and abrasive linings. This service is available to a wide range of industries and not only do we undertake the application of linings to vessels and pipes at our factory, but at customers' premises as well.

Raw Materials

The raw material supply position was satisfactory throughout the year except in the case of crude rubber. Against the total consumption of rubber by manufacturers in 1955 of 27,543 tons, India produced only 22,481 tons which means that there was a deficit of over 5,000 tons. In such circumstances it is the larger manufacturers who are forced to import a portion of their requirements, especially when the world market price is higher than the controlled Indian price. We in fact imported 2,368 tons of rubber in 1955, but we experienced considerable difficulty in obtaining import licences from Government and our stocks at times fell dangerously low.

The controlled price for local rubber was increased from Rs. 138 to Rs. 150 per 100 lbs. in February 1955 and again to Rs. 155-12 in September. The prices paid by us for imported rubber ranged from Rs. 144 to Rs. 207. There were no significant price changes in other raw materials.

Profit And Loss Account

The net profit for the year was Rs. 96,72,154 and after deducting the provisions for taxation and retirement gratuities the balance of profit available for disposal is Rs. 61,28,686 compared with Rs. 69,45,891 for 1954. The Directors propose the same rate of ordinary dividend as for 1954, that is 15%, which will absorb Rs. 24 lakhs. The Directors also recommend the transfer of Rs 22 lakhs to General Reserve as against Rs. 30 lakhs last year. This will increase General Reserve to Rs. 1 crore 90 lakhs as shown in the Balance Sheet. The total amount transferred to Reserves during the last 11 years was Rs. 2 crores 67¼ lakhs, representing earnings retained and fully employed in the business.

Balance Sheet

The additions to Fixed Assets during the year amounted to Rs. 33,70,000 consisting mostly of plant for expansion and modernisation. The amount of depreciation written off in 1955 was Rs. 27,51,000 as against Rs. 30,20,000 in 1954. Schedule VI of the Indian Companies Act, 1956 lays down that any future amount written off for depreciation in excess of the amount reasonably necessary shall be treated as a reserve and not as a provision. In view of this the Directors have considered it desirable to transfer to Special Depreciation Reserve an amount of Rs 113,86,000 representing depreciation on Buildings and Plant provided in the post-war years at higher than normal rates.

Stock inventories at Rs. 391,63,000 are Rs. 4,18,000 lower than at the close of the previous year in spite of expansion in the volume of production and sales. This was due mainly to abnormally low stocks of raw rubber and some categories of finished goods. Bank and Current Balances are also lower by Rs 6,90,000 but Sundry Debtors are up by Rs. 16,74,000 as a result of the higher sales turnover, giving an increase of Rs. 7,16,000 in total Current Assets. Net Working Capital is, however, approximately Rs. 6 lakhs lower than at the end of 1954 and the closing bank overdraft is reduced by Rs. 17,49,000.

Employee Relations

During the past year no effort has been spared in maintaining our high reputation for working conditions and general labour relations, which, I am happy to say, remain consistently good. Further extensions and improvements have been made to our housing and social amenities for the benefit of our factory staff and operatives. The construction of new quarters for 30 of our Watch and Ward personnel was completed and these are now fully occupied. Work on the additional married operatives' quarters which I mentioned last year was unavoidably delayed but we shall shortly commence the building of 65 further houses. During the year electric lighting was installed in 800 single quarters. The addition of a Tennis and Social Club, consisting of a clubhouse and 3 floodlit tennis courts, has proved extremely popular and successful. A retirement gratuity scheme, which is additional to the provident funds which have been in force for many years, was introduced at the beginning of 1955 and will benefit all long-service staff and operatives.

Once again all our employees, at head office, factory and in the field, have shown initiative and devotion to duty and played their part in the achievement of the year's results. I know you will wish to join with the Directors in sending them a message of thanks and appreciation of their continued efforts.

Tax Policy And Equities

Wednesday, Evening

APPREHENSIONS prevail about the new industrial policy of the Government. But the diminished activity in stock markets is not solely due to such fears. There is not much of selling pressure. But equities have developed a hesitant trend as buyers are reluctant to add to their commitments. Investors remain cautious. Even speculators seem unwilling to extend their operations. In a dull market, equities are, thus, gradually losing ground.

On a closer examination, the present behaviour of stock markets should cause no surprise. Indeed, some are inclined to the view that equities are likely to remain rather stagnant during the duration of the second Plan. There is, of course, always the possibility of an inflationary spurt in equities. That was the main reason for the recent rise in share values. But the spurt has proved temporary, as the belief has grown that the Government is determined to prevent run-away inflation.

Tax Trends

For a proper assessment of the behaviour of stock markets during the duration of the second Plan, it is necessary to appreciate certain developing trends in taxation. It is now common knowledge that the financing of the Plan would involve additional annual Central taxation to the extent of Rs 50 crores. This is not necessarily a "bear" factor for equities. For, even New Delhi concedes that there is not much scope for further direct taxation of incomes. Up to a certain limit, increases in direct taxation are not likely to affect equities adversely.

Not only is the scope of further direct taxation limited. There are possibilities that the direct taxation of incomes may be so adjusted as to increase incentives to greater efforts. Taxation of direct incomes in this country is too high. Current reports emanating from New Delhi indicate that the problem of a scientific re-adjustment of the system of taxation of incomes is under active consideration of the Government. Under certain circumstances, a downward revision of the level of income-tax is not unlikely.

This problem is, in its practical aspects, directly related to the evasion of income-tax. As recently disclosed by the Finance Minister, annual evasion of income-tax amounts to Rs. 30 crores. It is, therefore, arguable that, with improvements in the system of administering the income-tax, there is hardly any case for any increase in taxation as a whole, or in direct taxation, to finance the second Plan. Even if the need for additional taxation is conceded, there is a case for a downward revision of the rate of personal income-tax.

In this context, it is interesting to discuss the trend revealed in the budget proposals for taxation. Tax proposals were significant not for certain upward re-adjustments in super-tax, but for increased taxation of industrial profits in various forms. This basic trend in taxation is likely to become more pronounced. Business undertakings and industrial profits are likely to be taxed more. Taxation of personal incomes may even be lowered.

Effect On Rentier

There is much to be said in favour of such a system of direct taxation. Any such plan would involve, as the Finance Minister recently hinted, more taxation of all forms of surplus incomes. It will mean steeper death duties. Such a plan should include specific provisions for taxation of capital gains. With these forms of direct taxation developed and fully extended, the tax on personal incomes can be lowered in order to offer reasonable incentives to the entrepreneur.

On the assumption that the system of direct taxation will be changed to lower the tax on personal incomes with simulaneous increases in the level of taxation of industrial profits and various forms of windfalls and surpluses, it is interesting to discuss the future behaviour of stock markets. It is clear that, on these assumptions, the next five years should be hard on the coupon-clipper. Here, the problem of the function of the rentier is not under discussion. Nor is that of the changed and changing role of the private investor and the institutional investor, both within and outside the public sector.

Effects On Markets

On the assumption that the stress would be more on taxation of industrial profits as against personal incomes, equities are likely to remain depressed during the duration of the second Plan. This is a possibility, despite the continued growth in money incomes and gradual reductions in the rate of taxation of personal incomes. That is because, under such a system of taxation, equities must yield enough to compensate the higher burdens on the rentier. This is the main reason behind the anticipated decline in equities under the assumed system of taxation.

Assumptions made above indicate a fall in equity values so as to raise yields. But these assumptions, and their market consequences, are not necessarily against the investor. Equity yields in India are relatively low. There is much to be said for higher yields on equities. This has some relation with Bank Rate and interest rates. But the American experience suggests that the relation need not be as close or direct as is generally assumed. Behaviour of equities in the last few weeks would seem to indicate that stock markets are trying to adjust themselves to the hidden implications of the last budget, and subsequent discussions on a proper system of direct taxation for financing the second Plan.

Around Bombay Markets

Undertone Still Subdued

Thursday, Morning

IT is not unusual for the stock market to react faithfully to official statements of policy. This week, the Finance Minister's warning, by implication, that there would be additional taxation in the future put the brake on operations. The warning, however, came in handy for bringing about a technical correction which was long overdue. The volume of liquidation which was more than average would indicate that the market should be on the way to a technically healthier position. Budla rates turned out to be generally moderate, and strengthened these expectations.

For calculating the extra Corporation Tax (dividend tax), it is now provided, the share premium reserve would also be included. This would certainly benefit companies which have a sizeable share premium reserve, e.g. ACC and some plantation companies. The companies which have a share premium reserve can now issue bonus shares by capitalising this reserve. They will not have to pay the tax of 12½ per cent on the issue of these bonus shares. In the case of companies whose profits include both taxable and non-taxable income, the corporation tax will be applied after taking into consideration only such proportion of the dividends, bonus issue and capital employed as the taxable income of the company bears to its total profits, including non-taxable income. Had it not been the end-of-account, and had there not been the simultaneous warning of higher tax impositions in future, these concessions would have been received by the market in quite a different manner.

The circumstances being what they were, the market remained listless throughout the week. Towards the close, a leading firm of industrialists, it was reported, had sold a block of 4000 shares of Tata Ordinary, taking up the total during the week to about 10 to 15,000 shares. Block sales were reported in Centuries also.

In an otherwise declining market, Bombay Burmahs were exceptionally steady, on reports of a prospective reorganisation of the capital structure of the company, which is expected to benefit investors.

Premier Construction and Svadeshis are being quoted ex-dividend since Tuesday. The ex-dividend quotations for both were marked down.

Cotton

Stalemate Extends to Spot Market

THE most significant development in cotton during the week was the resignation of Sir Purshotamdas Thakurdas from the East India Cotton Association, of which he had been the President for the past thirty years. The other was the virtual closure of the spot market also. Following the intervention of the Forward Markets Commission in the affairs of the cotton market, futures trading has now been almost forgotten, there being none for the past four months. It was now the turn of the spot market to be "locked out", though only for a brief while.

P T has been the architect of the EICA. His resignation is a protest against the "regimentation of the cotton trade" by the FMC and the Government which, he thinks, would prove detrimental to the trade. From just being a supervisory body, the F M C has now assumed such control as to virtually displace the Association which had been formed for the purpose of conducting and has been conducting the cotton trade for so many years.

The Forward Market Commission in its fight against speculation has opened a second front. It has launched an attack on speculation in non-transferable specific delivery contracts as well as against dealings in options. These are fields in which the Commission can do much good to the trade, if it succeeds. In fact trade would welcome such action. But because it is invested with powers, trade is far from convinced that the FMC should go beyond supervision, except in the event of an emergency. True, P T is out but this is only the first round. Cotton circles are not disposed to accept that this is the final.

In view of these developments, there was hardly any trading worth the name in the spot market. What shape the EICA would assume after the resignation of P T is now the principal subject of speculation. Pending the re-constitution of the EICA, trading must perforce remain nominal.

Oilseeds

No Relief

THE delegation of oilseeds representatives which went to New Delhi to put its case before the Government and lodge a protest against the recent increases or fresh impositions of export duties has come back disappointed. It was firmly told that if heavy export duties make oil exports impossible, it would be so much the better for the country, for it would ease the domestic supply position. If exports could still be effected, the Government would not mind. But overseas demand at relatively higher rates must not be allowed to raise domestic prices too high.

The trade has also been pleading for the exemption of outstanding foreign commitments from the consequences of the recent revision of duty. But the authorities are not to be moved on this score either. They point out that the trade has itself to thank for such a situation as it should not have made large commitments without adequate covering.

If the trend in linseed oil was still firm, despite all these, it was due to persistent buying by an export house in order to fulfil outstanding contracts.

Groundnut was supported to some extent and fairly keen interest was shown by Vanaspati interests.

Castor futures, however, developed a distinctly easy tone on long liquidation and fresh sales, though on a small scale.

Reaffirmation of Welfare State

THE Prime Minister has a reputation of being a master draughtsman. During his long years in the Congress, whenever a tricky situation arose in the past or a crisis had to be faced, his services have invariably been requisitioned, and invariably the crisis was tided over, aided by his superb draughtsmanship and the leadership that the Congress could command in those days with Gandhiji at the helm.

Dissatisfied with the draft that the Cabinet had drawn up, when Pandit Nehru undertook to draft the resolution himself, an irreverent Delhi correspondent had remarked that his drafting might add to verbal irritation and ideological gas, but he was sure to offend the private sector, without necessarily enlarging the role of the public sector. The correspondent felt that Pandit Nehru would inject political content into the statement and was suspicious that the result might only be an elaboration of the political slogans rather than the enunciation of a clear policy. The suspicion was not baseless, as the text of the resolution clearly shows.

Another, and a better way, perhaps—that depends on one's predilections—would be to describe the result, not as a policy statement but as an enunciation of an industrial, if not an economic philosophy. It is definitely far above the level of party manifestos or electioneering literature; it should be read as an affirmation of faith, whereby the Government affirms that it stands by the promises in the preamble to the Constitution, reaffirms that ours is a Welfare State, and accepts once again the directives of State policy which promise everything to every body, but make no provision for the eventual realisation of those promises, and do not bother to say which ones are to prevail, if the Directive Principles conflict with one another, as many of them do.

The resulting document is not unlike patent medicine literature, in which the medicine advertised promises cure for every imaginable malady. But as a statement of industrial policy, there is hardly any change of substance from the one which has adorned the statute book for all these years.

The list of industries for which all new units, save where other establishments in the private sector have already been approved, the future development of which will be the exclusive responsibility of the State, has been considerably expanded. But the only additions of importance are manufacture of heavy plant and machinery, required for basic industries and heavy electrical plant. Though coal had also been in this category in the earlier statement, the significant change is in the emphasis on the development of minerals, mining of iron, manganese and chrome ores and gypsum, sulphur, gold and diamonds, and in the mining and processing of copper, lead, zinc, tin, molybdenum and wolfram. It is not, however, that all basic industries are reserved exclusively for the public sector. Basic chemicals as well as essential drugs appear in schedule B where co-existence is assured, not only to the existing units but private enterprise will be allowed to set up new units also. But even in schedule A, there is no bar to the co-existence of the existing units. These are not to be nationalised, but no new units will be permitted to be set up in the private sector, except those which have already been approved. Central monopolies are only in railway and air transport, arms and ammunition and atomic energy. Even in industries in schedule A expansion of existing privately owned units is not precluded nor the

possibility of the State securing the co-operation of private enterprise in the establishment of new units when national interests so require. All the remaining industries will fall in the third category which are to be normally left to be developed by private enterprise.

It is then one comes to the third category of industries which are left to be developed by private enterprise that one realises how thin have the lines of demarcation become. It could not have been otherwise, since freedom of enterprise that can be allowed has to be consistent with the targets and objectives of the national plan. The greater the degree of control exercised over industries, the less the difference in substance between one sector and another. The situation is not far distant when there will be only one sector in industry and that the National Sector, which will combine different management patterns according to their suitability for particular undertakings and according to the advantages of organisation.

The policy statement has been welcomed and found reassuring, both by the sections of the public which want the State to go ahead more actively with development of industries and by the private sector on which the sword of Damocles had been hanging so long, since its continued existence in the reserved fields after a period of 10 years of the last policy statement of 1948 had been left undecided. No time limit has been set for the operation of the present policy.

While a more active participation of the State in industry is thus reiterated more strongly than in 1948, a significant omission is about the manner and method of organisation of industries in the public sector. In the earlier statement, it had been provided that "management of State enterprise will, as a rule, be through the medium of public corporations under the statutory control of the Central Government, who will assume such powers as may be necessary to ensure this". The present statement is silent on the form of organisation to be adopted for this purpose.

Though Government has found it difficult in practice to reconcile itself even to that degree of decentralisation which is called for if management of industries in the public sector is to be handed over to public corporations—and if truth has to be told, Parliament must be held equally guilty for it—how much more difficult would it be for it to promote decentralisation, except in the co-operative sector of small industries which has yet to come, when electricity is taken to the villages and small units can compete on their own on the strength of superior technical efficiency. While decentralisation is the key word and prevention of concentration of economic power in the hands of a few is the aim of policy, greater and greater control is leading in the opposite direction and all the plums are falling into the laps of big business which knows how to deal with Government and run industry under control, though we are told that the plums are no longer as luscious as they used to be!

Anglo-Soviet Talks

REACTIONS to the Anglo-Soviet discussions on world problems are ironical reflections of the continuing "cold war". Everybody, except the parties directly concerned, seems to be satisfied or disappointed that the London talks have been barren. Washington was apprehensive that Soviet leaders might wean Britain away from the Anglo-American alliance. Washington seems to be pleased that the Soviet leaders have not succeeded in their seductive efforts. So is Bonn by London's specific assurance that Britain has no intention to reach an agreement with the Soviet Union on Germany, which is contrary to the declared policy of the Western Powers. Paris seems to be disagreeably surprised that the Anglo-American alliance remains unimpaired. London has seemingly convinced Bonn and Washington that Britain has not gone neutralist as a result of the Russian leaders' visit. Cairo seems to resent the Russian concessions in relation to west Asia. New Delhi's reactions are not known. But the Press in this country seems to be unanimous that the London talks have achieved no positive results. Only Sir Anthony Eden, M Bulganin and M Khrushchev seem satisfied with the outcome of their discussions.

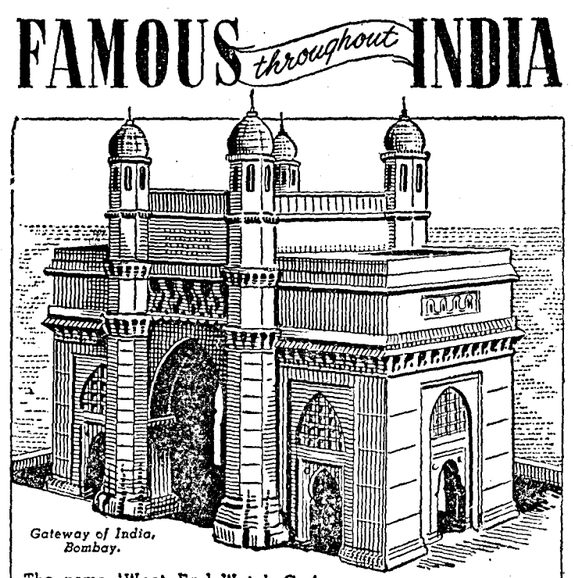
Neither Britain nor Russia has made any secret that each desires more and freer trade between the two countries. It would be cynical to insinuate that the Soviet offer of enlarged trade is a bait offered by Russia to wean Britain away from America. Britain is as much interested as Russia in freer trade between both countries. This is one of the major issues on which there are growing differences between Britain and America. Both China and Russia are potential markets for Britain. Britain hopes to ease her balance of payments troubles by expanded exports to these countries.

During last year's talks with President Eisenhower, Sir Anthony made it clear that Britain resented the trade embargo against China. British industry, it is evident, is eager to enlarge exports by establishing trade relations with the Communist bloc. This is one of the means by which Britain hopes to avert depression in the event of any agreement on disarmament. Similar compulsions explain Russia's desire for freer trade with the world. One of the positive results of the London talks is the mutual undertaking to explore prospects of freer trade between the two countries. It is probable that, as a result of the Russian leaders' visit to Britain, trade relations between Britain and Russia will grow, although the ban on exports of strategic materials will necessarily continue.

On two other major issues, there has been no firm agreement. But the London discussions have enabled Moscow to strengthen Russia's diplomatic initiative. West Asia was the main issue under discussion between Britain and Russia. It would be wrong to interpret the London talks as acceptance by Russia of Britain's oil interests in west Asia. Nor is it correct to infer that Russia is reconciled to the Baghdad Pact. She is as firmly opposed to the Baghdad Pact as ever. She insists that the Baghdad Pact is the direct cause of disturbed relations between Britain and Arab States. But she is not wrong in her implication that the tense relation between Britain and Arab States and the Arab-Israeli dispute are different issues which must be treated separately.

It would be wrong to interpret the Russian gesture on the issue of Arab-Israeli dispute as a concession. Immediately on America's declaration that the Arab-Israeli dispute should be solved under the auspices of the United Nations, it became evident that Russia would accept such a settlement of the problem. By agreeing to co-operate with any UN-sponsored plan to stop or to ration supplies of arms to Arabs and Jews, Russia has shown her willingness to co-operate with other nations to maintain regional or world peace. In making this gesture, Russia is not unaware that the acceptance of any such plan automatically entitles her to have a voice in matters relating to West Asia.

But the Russian gesture poses a problem for the Western Powers. Though the Baghdad Pact and the Arab-Israeli dispute are distinct issues, these are not entirely unrelated. Any UN plan to ban or to ration supplies of arms to west Asian States must necessarily involve liquidation of the Baghdad Pact. It is evident that the Russian concession in relation to supplies of arms to west Asian countries has been influenced by such considerations. But this also raises doubts whether any plan for a general UN embargo on war supplies to west Asia will be accepted by the Western Powers, or whether any such plan can be effectively implemented.



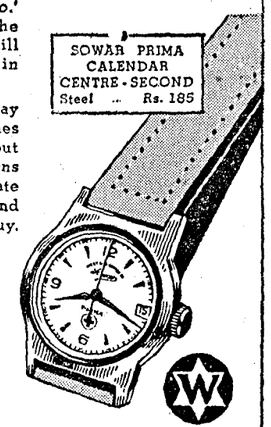
As in west Asia, so in Germany, the Western Powers are in a dilemma. Both Russia and the Western Powers agree that the Arab-Israeli dispute should be settled peacefully and that the German problem should be solved. Even as there are doubts whether any concerted UN policy can be framed in relation to west Asia, there are differences as to how to achieve European peace and security. Russia will not accept any solution of the German problem which involves Germany's inclusion in NATO. Nor will the Western Powers agree to any settlement of the German problem outside NATO.

On disarmament, as on west Asian problems, the initiative is with Russia. Russia's disappointment with the Western Powers' attitude on disarmament is widely shared. Russia has now accepted all the proposals put forward by the Western Powers, including simultaneous reduction of conventional and nuclear weapons. But the continued dealock in the UN disarmament sub-committee's deliberations in London indicates that the Western Powers are reluctant to accept any plan for disarmament in the absence of a solution of the other disputed issues.

This is bad logic. Thinking persons will endorse the French Socialist Premier's order of priorities. Disarmament is the main problem on which both sides must reach an agreement in order to attain and to maintain world peace. Once an agreement on disarmament is reached, other world issues in dispute will be settled automatically. There are strong reasons to believe that Russia is sincere about disarmament. She would welcome an agreement on disarmament so that she can mobilise her resources to fortify her economic strength in her bid to emerge as a major world exporter.

Can it be that America is fearful of this potential economic challenge from Russia? America may be, but her allies, Britain and France, have nothing to fear from competitive co-existence. In the interests of world peace, it is the duty of Britain and France to convince America of the imperative need for an agreed plan for world disarmament. Russian leaders' visit to Britain may not have brought the problem of disarmament nearer solution. But there will be hope that, as a result of London talks, Britain is convinced of Russia's peaceful intentions so that Britain, along with France, can persuade America to pursue a more conciliatory attitude to Russia.

FAMOUS throughout INDIA



Gateway of India, Bombay.

The name 'West End Watch Co.' famous many years before the Gateway of India was built, is still the symbol of superlative value in watches.

Styles range from sturdy work-a-day models to elegant dress watches (and prices vary accordingly,) but all are built—with Indian conditions in mind—to give lasting and accurate service. See the words 'West End Watch Co.' on the dial before you buy.

Wage Boards or Living Wage ?

THERE is a move inside the Indian Trade Union Congress to put up a demand for a living wage as the wage policy of the future. Though a living wage is hard to define, and its determination in particular situations has necessarily to be somewhat arbitrary the fair wage committee which reported in 1946 made it quite clear that it has not only to ensure a measure of 'frugal comfort' to the worker and his family which a minimum wage does not, but the margin over the minimum has to be determined in relation to a number of other factors also, such as

(1) the productivity of the worker, as calculated by time and motion studies,

(2) general level of wages not only in the particular industry under consideration but also in the other industries in the same region,

(3) capacity of the industry to pay, and

(4) the level of national income and its distribution.

Unfortunately, these are also equally important as the working cost of living with frugal comfort.

Now the statistical difficulties of computation are not insurmountable. The Textile Labour Enquiry Committee worked out a living wage for Bombay at Rs 50 to 55 as against a minimum wage of Rs 30. That was in 1938. Based on the findings of these two committees and making some modifications which were necessary, the rates were computed for Bombay textile workers roughly at Rs. 176 for December 1953 when the minimum wage was Rs 98, Rs 30 basic plus Rs 67-14 dearness allowance. (Estimate of Living Wage—for Cotton Textile workers in Bombay City. **Economic Weekly** July 3, 1954.) But then the trouble was to relate living wage to the other factors mentioned above. The study led to the conclusion that,

"Taking the cotton textile industry in the Bombay City as a whole, this living wage is beyond the capacity of the industry to pay. Assuming the average monthly earnings, including dearness allowance of a mill employee to be Rs. 105, the additional monthly cost which a living wage would entail, would be Rs 71 per employee. For the two lakhs of textile workers in the City, the extra expenditure would, therefore, amount to Rs 17 crores per annum, which is more than twice the gross profits of the 38 mills which made profits during the year 1952".

During the last couple of years labour productivity in industries—in the sense in which it had been going down in the earlier years, according to our industrialists—has gone up substantially. In their speeches at the annual general meetings, Company Chairmen are now discreetly silent on the point. But there are many groups in the labour movement who are waiting for an opportunity to take up the issue and press for a rise in wages. Indications are not wanting that the Congress Wing of the Trade Union Movement may be jostled into putting up this demand. Why not ask for the institution of Wage Boards instead, which are in any case overdue? It is in the sharing of the surplus, whether in agriculture or in industry, that rival claims have to be reconciled in a manner that development can be helped instead of being retarded. The Congress Government has its eye on this surplus all the time. With the Congress Trade Union Wing dispute on the division of spoils the situation would be both intriguing and embarrassing. To avoid it, claims for living wage—some one is going to put it up if the INTUC does not—should be forestalled. What is Shri Khandubhai Desai waiting for?

No Panch Shila for Shipping ?

IT was Shri M A Master's thesis in a well reasoned and forthright speech in Bombay recently that there have been in the last few years such crucial shifts and changes in the policy of the Government of India towards private shipping interests as to leave little room for hope that Government really wishes private enterprise in shipping to grow and prosper, despite public declarations to the contrary.

He delineated the fundamental shifts and crucial changes in the shipping policies of the Government since 1947. Government then visualised a Mixed Economy in shipping, as "very few of the shipping companies in the country have the resources to buy sufficiently large number of ships for the rapid expansion of the Indian mercantile marine". In actual fact, in the eight years that have elapsed since then, private enterprise has made for more impressive progress than the State-owned shipping corporation in expanding the tonnage and multiplying the routes of Indian ships.

Government can, no doubt take credit for the enlightened policy of giving loans to the industry at a concessional rate of interest; but Shri Master pointed out that this is no more than the recognised practice of all the great maritime countries of the world, including the United Kingdom. But it is now proposed by some leading congressmen and the Planning Commission that loans given to shipping companies be turned into equity capital. This is surely an example of aid with strings attached!

Shri Master also referred to other developments in the shipping world during the last four years, all of which point to the same conclusion. Thus, on the one hand Government has been appealing to private enterprise to expand the area and scope of its activities, but on the other hand, it not only curtails the area open to private enterprise but also bangs the door by reserving certain trades and routes entirely for State-owned ships. Also, Government is reportedly thinking in terms of reserving the tanker trade for itself. This is no small matter. Here is a question of principle. In a mixed economy, in a sector in which the State and private enterprise are operating side by side, is the State justified in using its power to give itself a monopoly in certain spheres of business?

Shri Master had another grievance. While Government has been magnanimous enough to assure assistance to Indian Overseas Shipping by allocating them as much Government cargo as possible, it expects shipowners to carry this cargo at tariff rates less 30 to 50 per cent and in some cases at tariff rates less 70 per cent. This is surely a peculiar form of assistance! One need not share Shri Master's gloomy conclusions. In his speech, Shri Master did make out a case, however, in support of his view, that nationalisation may not be necessary because the private sector in shipping may disappear without any such drastic step being taken.

The Accent is on Arabic

THOUGH Freya Stark had been trying to build up the young Effendi, West Asia (Middle East and Near East to Western Europe) is still very much a land of Sheikhs and fellaheens to most of us. This is all very wrong and very much out of date, except in one respect, viz in the sharpness of the contrast between the posh hotels and grand boulevards and slums, the lack of all other forms of transport and the fast development of aviation. Nature has not favoured the region even in the matter of harbours but wide stretches of open, level desert land offer excellent scope for air-fields, and long distances that separate the principal cities and favourable flying conditions has put West Asia on the flying map of the world.

On the other hand, only a meagre part of the total area is cultivable. Agriculture is largely subsistence farming with little patches of tobacco or cotton. There is little of specialisation in the cultivation of crops. The disharmony between urban and rural areas is even greater than it is here. The villages are very poor in comparison with the cities and no return flow of goods from cities to villages originates against the significant part of the farm produce that is sold to meet the dues of the absentee landlord and the moneylender.

Above all, barring some parts of it, West Asia is sparsely populated and by far the greater part of it receives less than 8" of rainfall in a year and more than half of it gets less than 4". In consequence, only 5 to 10 per cent. of the total area is cultivable; the area actually cultivated, of course, is even less. All this means, that economic development is as difficult as it is urgent and hope rests largely on the development of dams, irrigation works and multi-purpose projects. A recent UN study takes the optimistic view that almost all the countries of the region are now in a process of rapid economic development and while some have large resources of their own, almost all are receiving aid, technical and financial, from outside, which will help them overcome the difficulties that nature and their present poverty impose.

To salvage the Bagdad Pact, which ended up in a fiasco, an Economic Commission has been proposed for the Middle East for concerted and co-ordinated aid programme. It is to be hoped that the proposed Economic Commission will not turn out to be a pale shadow of the International Islamic Economic Conference which was sponsored by Pakistan in 1949. The headquarters of this long deceased body are still in Karachi and the Pakistan Government continues to maintain an office for it though none of the Middle East countries pay their membership fees. The programme of economic aid proposed for the Middle East is quite an ambitious one, including the proposal for setting up a centre for atomic energy but its main planks are multipurpose projects. Of these, a few notable ones have already been taken on hand and have been making good progress. There is the much publicised Aswan High Dam Project in Egypt. Another is the large Tigris Dam near Samarra in Iraq. There is the Jordon Valley Project, but then Israel is different from the Arab countries and Iraq is favoured in many ways. Curiously enough, the problem of all these countries is as much that of getting water for irrigation as of protection from inundation. The Samarra project, for example, is for diverting Tigris floods and for protecting the land between the rivers from spring inundations.

West Germany has now come on the scene to take a more active part than before in the transformation of these arid lands by major irrigation and drainage projects. German hydraulic engineers have of course had been at it for long, but now West German engineering firms are taking a big hand in the development. Lufthansa German Airlines are going to inaugurate their service in September, connecting Istambul, Beirut, Baghdad and Teheran to their Western link up. **Handelsblatt** has brought out a Near and Middle East supplement in order to bring home to the Arab countries Germany's contribution in the fields of development in which they are specially interested. The accent on the readership is prominent, as the issue has been brought out half in English and half in Arabic.

Indian Aluminium New Issue

IN his address as Chairman to the annual general meeting of Indian Aluminium Company, Ltd., Mr K C Mahindra reveals that the Company has plans to issue new capital for financing the expansion programme at Hirakud. Because of technical and organisational complications, the smelter at Hirakud will be erected first, and the bauxite-alumina expansion plan will be undertaken after the completion of the smelter project. The Hirakud smelter will be in operation by the end of 1958, and the entire integrated plan by the end of 1961.

Because of the heavy investment involved, smelter projects are financed almost everywhere by the issue of fixed-interest debt to cover the greater portion of the total capital cost. Accordingly, the Company proposes to invite from the shareholders and the public only a portion of the capital, the rest being covered by medium-term loans and funds generated within the company. Though the financing plans have not yet been finalised, it has been decided that the new capital issue will be in the form of convertible loan stock. Under statutory obligations, the stock will be offered, in the first instance, to ordinary shareholders of the Company. Aluminium Limited, the Canadian majority shareholder of the Company, has agreed to take up half of the new issue, and to relinquish the remainder of its pre-emptive rights in order to increase participation by Indian capital. Preference shareholders also will, thus, have an opportunity to subscribe to the proposed new issue.

The proposed convertible loan stock will carry a fixed rate of interest, and will confer upon the holders the right to convert it into ordinary shares of the company. "Since this type of stock combines the attraction of a secure rate of interest over a number of years with the option of conversion for possible greater return or capital appreciation which is expected from the equity of a growing and expanding enterprise", Mr Mahindra expresses the hope that the proposed convertible loan stock "will prove to be an attractive form of investment".

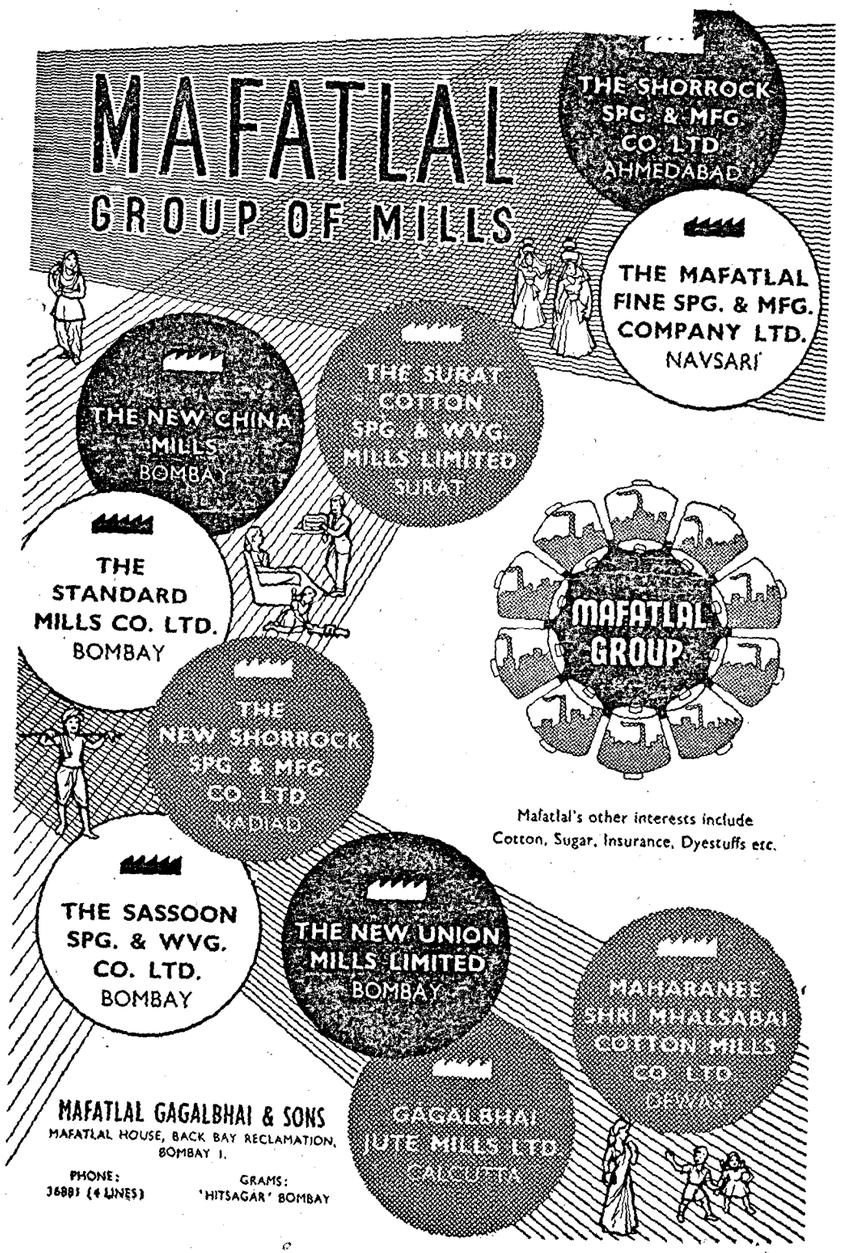
AFPFL Continues in Power

THERE was never any doubt about the election verdict in Burma. U Nu is a revered leader of the people. His Anti-Fascist People's Freedom League has massive popular support. Communist parties are the rivals of AFPFL. But they have lost popular support by their violent tactics. And the changed world strategy of the Soviet Union has caused as much embarassment to the Burmese Communists as to CPI. During the elections, they assured the people that they would pursue constitutional methods. But their failure in the elections prove that either the people have no faith in their assurances, or that the people resist communism.

Burma is as much rural as Ceylon and Indonesia, though not as urban as India. But the Burmese elections reveal a political pattern which has certain distinguishing characteristics. In India, Congress is sure of election victories in rural areas, but not in urban constituencies. This is because the urban people are more intelligent and they lean to Left in politics. In Burma, however, AFPFL has swept the polls in the cities, though the Workers' and Peasants' Party is expected to win some seats in rural areas. This is in seeming contrast to election experiences in Ceylon, Indonesia and India. There are reasons which explain the Burmese political patern. Burma Communists established their strongholds in rural areas. Besides, AFPFL's leftist policies are becoming popular.

From the election results, it is clear that in Burma, as in Ceylon, Indonesia and India, the people reject Communism, but have a preference for Socialism. In Burma, the Communist challenge to the party in power after independence was more formidable than in India, Ceylon and Indonesia. All the newly independent south-east Asian countries have fought the Communist challenge by going further left. This explains Shri Bandarnaike's election success in Ceylon, or Dr. Sastroamidojojo's election victory in Indonesia. This also explains the shift to Socialism in Congress in India. Even as Burma is further to Left in politics than her neighbours, AFPFL alone has a Marxist bias. This is an accident of recent Burmese history. Immediate developments after independence explain the Marxist bias of AFPFL. Premier Nu has succeeded in winning Burma away from Communism. Burma has a lesson for the neighbouring countries.

Off the Record



What About Kaldor's Working Papers?

IN Delhi everything except the budget is secret and "for official use only". The more enterprising newsmen have therefore so much wider scope for scoops and the trained seals get so much more fish. It was amusing, nevertheless, that a financial paper should care to publish Kaldor's top secret working paper on "An Annual Tax of Net Wealth". Kaldor was invited as a visiting Professor to the Indian Statistical Institute. The Finance Ministry has taken no direct responsibility in the matter, lest it be accused of conspiring with a foreign expert to milch the rich of their wealth. So, the papers that he prepared during his visit should rightfully be the property of the Indian Statistical Institute which paid for his passage and for his stay in India. Why should not the Institute turn this investment into some advantage by publishing Kaldor's papers, instead of allowing unauthorised and piecemeal publication to misrepresent his findings and to distort his tax proposals?. When an economist of the calibre of Kaldor goes with his accustomed doggedness into the problems of the Indian Taxation system, it is not to be expected that he would suggest only ad hoc measures. On the contrary, instead of piecemeal proposals, he must have worked out a complete system of taxation, of which taxation on wealth must be only a part. The limelight of publicity is the only effective prevention of tendentious propaganda or disturbing speculation.

The master-key of the Kaldor system, it is common knowledge now, is a personal balance sheet which everyone who has income or property of a sizable amount has to submit. Being a balance sheet, it will be a statement of both capital transactions as well as profit and loss account which, Kaldor believes, will automatically provide a counter-check against evasion and concealment. In theory, therefore, no forestalling action should be possible, if tax payers come to know in advance what Kaldor has in store for them. So, there is no reason to suppose that the publication of the Kaldor papers would precipitate a crisis in the market or create difficulties for the Government which could be avoided by this ridiculous attempt at secrecy, a secrecy which so often means in effect advance information to those who pay or pull the right strings.

There is another reason why Kaldor's tax proposals should be fully publicised before they are accepted or acted upon. This is because unlike in the case of a proposal for a specific tax, or a change in the rate of an existing tax, a complete system of taxation must have the sanction of the people. Wholesale changes in a tax system, it may not be possible to bring about in a day. But people's consent to the principle of the change is a *sine qua non* of the successful operation of any tax system. True, what is currently fashionable may easily pass for what is desirable and productive of real benefit for the people. This applies generally to the deceptive high marginal rates of direct tax on income which win popularity but neither benefit the treasury nor help enterprise, except enterprise of the wrong sort. Calcutta's Rent Act which seeks to persuade critics that the Government is really hard on houseowners is deception of another sort which may win applause but helps nobody, except the rent courts and the Ways and Means balances of the West Bengal Government. Instances can be multiplied, but it is hardly necessary to do so.

In the face of all this, it is an embarassing compliment for the Indian economists to be told that India was the first country in the world to evolve a system of taxation. "Like the sun sucking up water, the king drains away the wealth of the people, only to return it a thousand fold . . ." Now come the experts from the West to remind us that taxation is the beginning of civilisation and Kaldor adds a special note of urgency to it by holding out that a proper system of taxation is the only solution for India, if she wants to follow the middle path between Western capitalism and Eastern socialism. Why not let others have a look at the blueprint that Kaldor had drawn up for the bridge between East and West? After all, it is for the people to decide whether they want such a bridge or not.

Letters to the Editor

Small Scale Industries

Problem of Technological Change

A Reply by K N Raj

IN your last issue, two contributors have commented on my article which appeared earlier in the month. One has done so by explicitly referring to it in a letter addressed to you, and the other by some references in an article which, I have a suspicion, has been provoked by mine. Since both have chosen to remain anonymous, I am compelled for the sake of convenience to refer to them as X and Y respectively, and I hope this will not be regarded by them as another clumsy attempt to make simple things appear complex.

According to X, the simple and obvious conclusion emerging from the article is that "that technique should be chosen which maximises surplus and hence profits", and says in support that Technique II in my example is "the most profitable and would be chosen by any firm which wants to maximise its profits" (emphasis mine). But the point of a good part of the "long-winded argument" was precisely this, that the rate of surplus (or profit) per unit of capital should not be looked at from the point of view of individual firms or even of individual industries. If families are displaced from the handloom industry and are compelled to live on their third cousins who are peasants, the reduction in the surpluses of the latter is a reduction as far as the economy is concerned though not for the textile industry.

The question whether this reduction should "much affect the choice regarding techniques" depends on the orders of magnitude involved, and is not answered one way or the other by taking the case of Technique I and Technique II in my example. Even in this particular case, if the amount initially available for investment is Rs. 160,000, 3200 workers can be provided employment in Technique I as compared to 800 in Technique II; though, by a change-over in techniques, the total value of output will go up from Rs. 9.6 lakhs to Rs. 12.0 lakhs. the wage per worker will also be higher, which would leave in consequence a surplus in the industry of only Rs. 4.8 lakhs; if the workers displaced are already at the subsistence level, and they can cut into the consumption of others only to the extent of one-third of their requirements, the dole of Rs. 200 per worker required to maintain alive the 2400 workers displacd will absorb the whole of this surplus. Aggregate output will of course still be higher than before, but the inequalities of income among the workers is increased and some system of doles made necessary without any increase in the surplus thrown up. So the point that X makes here is not so "evident" from the figures as he assumes.

As for the "implicit" assumption which X has had to search out, and which I am accused of surreptitiously and illegitimately making—that "either the industry or the State (by taxing the surplus) is responsible for providing for the displaced workers"—I am surprised to be told that this assumption is only implicit. If he has the patience to read the article over again, he will find a very forthright statement on this which says that "if labour is displaced on any significant scale through technological change, it will either become necessary for the State to provide relief of some kind for the unemployed or the households still in productive activity, which could otherwise have some surplus (e.g., in agriculture), will be compelled to divert part of it for maintaining the additional dependants". I am afraid that X's tendency to consider in isolation the fortunes of the industry directly affected leads him to believe that, if only politicians could be persuaded not to worry about those displaced from all means of livelihood, nothing will happen to reduce the surplus thrown up by the particular industry.

In any case, if it is true, as X says, that in our institutional set-up this assumption does not hold good, what he is really saying is that, objectively, there is scope for reducing the consumption standards of those thrown out by technological change, as well as of those on whom they may park themselves, thanks to the excellent system of insurance provided by our social structure and values. But presumably, to get rid of this surplus, it would be more politic to make these people believe that they are the victims of some malignant forces they cannot either understand or do anything about, rather than give away (as would be necessary if other means were adopted) that it has something to do with the decisions of their elected representatives. X may well be right, but this is what I meant when I said that it is not an 'economic' consideration but essentially a political and administrative judgment. In any case, from the point of view of our intellectual understanding, nothing is lost perhaps by bringing into the open an assumption, such as the one that X makes, that neither the industry affected nor the State is responsible in our institutional set-up for the displaced workers. It may be of some interest to those who have taken more seriously the 'welfare' objectives of our planning.

I am afraid my statement, that the aggregate surpluses may be reduced if the capital-output ratios are higher, has been torn out of its context. The point made, in the paragraph from which it has been taken, is that improvements in technology "imply certainly more capital per unit of labour employed", that "a larger surplus may be generated per unit of labour employed through improved technology", but that there are various leakages from this surplus to be considered, and that what is left over will be smaller, the higher the capital-output ratio in the new technology. It will be obvious, from the context, that what is said is that, given the capital-labour ratio in the new technique, the surplus will tend to be smaller the higher the capital-output ratio. I am surprised that X is constrained to point out the difference between aggregate surpluses and the ratio of these surpluses to capital costs, because this is precisely the basis of the case made for small-scale industries, in the article, from the point of view of maximising the rate of growth of output.

Lastly, as regards the distinction between the Keynesian and the Marxian categories, which X says he is unable to make any sense of, the point is that there is a difference between saving in the Keynesian sense, which accrues instantaneously and for short periods at every round of income generation, and saving in the Marxian sense (or more correctly, the classical sense) which is the surplus of a less transient character thrown up by the consumption goods sector and available for maintaining a constant rate of investment over a period. If I go on to explain the difference between saving in the instantaneous sense of Keynes (which makes saving always equal to investment, and is the head-ache of all the under-graduates who have to say why) and the propensity to save as Keynes himself uses it, I am afraid X will accuse me of giving him a class-room lecture. But the practical implications of this difference are perhaps still worth underlining, since the issue has been raised.

Suppose the marginal propensity to save is **nil**, there are two rounds of income generation every year due to the time lags in transactions, and we are seeking to raise investment by 100 and to keep it at that level. Output will then have to go up as follows in order to prevent a rise in prices:

Additional Investment.	Additional Output Required. Year			
	1st	2nd	3rd	4th
100 ..	200	200	200	200
100 ..	..	200	200	200
100 ..	..	..	200	200
100 ..	..	..	..	200
	200	400	500	800

In other words, if there are time-lags in transactions (such as one might expect in an agricultural economy in which incomes are received once or twice a year instead of on a weekly basis), and if output is elastic on account of low capital-output ratios, investment can be raised by 100 and maintained at that level even when the marginal propensity to save is **nil**. But it means that a constantly rising level of output per annum is required to maintain this higher level of investment, and this is what is not necessary if the propensity to consume is less than unity. This is not an argument against relying on small-scale industries but one of the points which must be conceded if it is true that they are incapable of throwing up any surpluses in the Marxian sense.*

The reference which Y has made to the "economic pundits" awakening from their slumber, and to the confused erudition of the shastris, are so vague and mysterious (for all their humour) that I am not sure whether I should really stick my neck out and offer him any explanation. But the outline he has given of the subtle reasoning of these pundits and shastris has sufficient (though somewhat ironic) resemblance to what I had said in my article that I have decided to take the risk.

It seems to me that the differences which he sees between my position and his own are due to a misunderstanding of the reasoning put forward in the article. I did not say anywhere that maximisation of output in the short run was a less legitimate 'economic' objective than maximisation of the rate of growth of output. All I was trying to point out was that the two have different implications, and that even if one was inclined to place more emphasis on the rate of growth of output, there was a good case for small-scale industries. Further, the conclusion of the article was that this was so even if, to begin with, some of these industries seemed to need subsidisation and other measures of protection.

If, in the light of this explanation, Y will go over the article again, I have no expectation that he will not be still disgusted with the subtleties of the economic pundits and shastris. But he will at least find that it really represents an attempt to give a systemmatic frame of reasoning to the approach suggested by Professor Mahalanobis (and supported generally by the Panel of Economists), that it is not *inconsistent with anything* Mrs. Robinson has said, and above all that the conclusions are not substantially different, in spirit or in substance, from those Y himself arrives at *from the calculations* which "for the sake of simplicity" he has taken so much trouble to work out.*

Even if my explanations to X and Y are satisfactory to them, it is clear that one implicit criticism of theirs remains. The argument could perhaps have been presented more clearly so that there was no occasion for so many gross misunderstandings to arise. But after being enlightened by the Sanskrit adage quoted by Y, 'How can a mirror help a blind person?', I wonder whether even those who are not blind (like Y) should use mirrors if their purpose is really to see someone else and not their own images. What is more disappointing is that when they do so in privacy even others cannot see their faces.

Delhi-8.
May 1, 1956.

*At one point in my article I had inadvertantly implied that the surpluses in the Marxism sense are the same as the marketed surpluses of particular industries. This, is obviously not correct and is likely to have misled some. As X has inferred, what I had in mind was the surplus of the consumer goods sector as a whole.

Rejoinder by X

I WAS pleased at the frank admission by Dr. K N. Raj regarding the lack of clarity in his exposition, *which according to him led me* to make my comments on his articles rather than faulty reasoning.

I am glad that I have been able to draw him out and make him state his position more explicitly. However he has betrayed his weakness again. I shall therefore state his thesis simply. If a country wants to maximise its rate of growth and at the same time assure the workers likely to be adversely affected by its *policies at least a minimum standard* of living, it would choose such techniques in its industries which would maximise this ratio: Surplus per worker—(amount of dole per head × no. of workers he displaces) ÷ capital cost per worker. Amount of dole will depend upon what standard

*I may add that, whatever criticism I have made of the formulation in Professor Mahalanobis's draft proposals is equally, if not more, applicable to the paper I had submitted at that time as a member of the Panel of Economists. Since then various lines of reasoning relating to this question have been put forward, and I have only taken these into account and considered whether, and how far, the original formulation needs to be modified. May I say that this was done merely as part of what I considered the mundane functions of an economist, without aoy hope or desire to be 'recognised as great as Gandhiji himself'?

of living a country considers as the minimum. In Dr. Raj's example, on this criterion, Technique II would be chosen in preference to Technique I, if the amount of dole is equal to, say, one-third of the Technique I wage rate. (Instead of the frightening examples he gives in his reply, he could have explained it much more simply by showing that one person in Technique II displaces four persons). He did not care to state or work out the amount of dole or the number of workers displaced. That left me free to say that Technique II would be the obvious choice. His attempt to explain all this is quite unnecessary because it would be clear from my statement that I did not misunderstand his thesis, despite his faulty exposition.

Now about Dr. Raj's handling of Marxian and Keynesian tools, I will invite him to consider carefully the following statements.

(1) A certain rate of investment could be maintained if the elasticity of supply of consumption goods were such as to meet adequately the demand for consumption goods.

(2) A certain rate of investment could be maintained if the surplus of consumption goods in the consumption goods sector were enough to meet the requirements of the investment goods sector.

Is there any difference between these two? The first is a statement in terms of Keynesian analysis and the second is in Marxian terms. Now let him examine a third statement:

(3) A certain rate of investment could not be maintained if the elasticity of supply of consumption goods, in spite of, say, a possibility of an infinite increase in their output, were not such as to meet adequately the demand for consumption goods.

What Dr. Raj really wants to say, it seems, is not that (1) and (2) have different meanings but what is conveyed by statement (3). Is it necessary for me to remind him that correct conclusions could be arrived at in this matter by either of the two sets of tools—Marxian or Keynesian—as well as by any type of tools suited for the purpose?

I do not know whether it is his lack of clarity or his faulty reasoning that prevents one from understanding the relationship that he posits between time-lags and marginal propensity to save. If he defines marginal propensity to save as a relationship between income of one period with savings of the same period, and if there is a time-lag between income and expenditure, then, clearly, marginal propensity to save is not nil. However, if he defines marginal propensity to save as a relationship between income in one period with savings in the next period, marginal propensity to save could be nil, **but only because of this lagged relationship.** With either of these two definitions, it is possible to arrive at correct conclusions. But the definitions any way should be explicitly stated.

Let me assure Dr. Raj that I am no less concerned about the welfare of the displaced persons than he is. But I thought and still think that in a logical argument, moral fervour cannot be a substitute for making the assumptions behind one's arguments explicit.

I accept his explanation about aggregate surplus and the capital output ratio. I just misunderstood him.

Finally, a word about Dr. Raj's style of polemics. In a scientific discussion is a person's face more important than his arguments?

Rejoinder by Y

IT is a handsome compliment from Dr. K N Raj that he accepts and understands my simple argument. I am also happy to know from him that the economic experts of the Planning Commission and the Panel of Economists have based their support to cottage and small-scale industries exactly on the same arguments which I have advanced.

Though coming from a member of the Panel of Economists it is difficult, however, to accept Dr Raj's claim to speak on behalf of his colleagues. All those who know the views of some of the Panel Members and of the economic experts of the Planning Commission will experience the same difficulty.

Did not Shri Chintaman Deshmukh couple cottage industries with deficit financing as the two issues on which advice of the economists has been so conflicting that he does not know which way to turn?

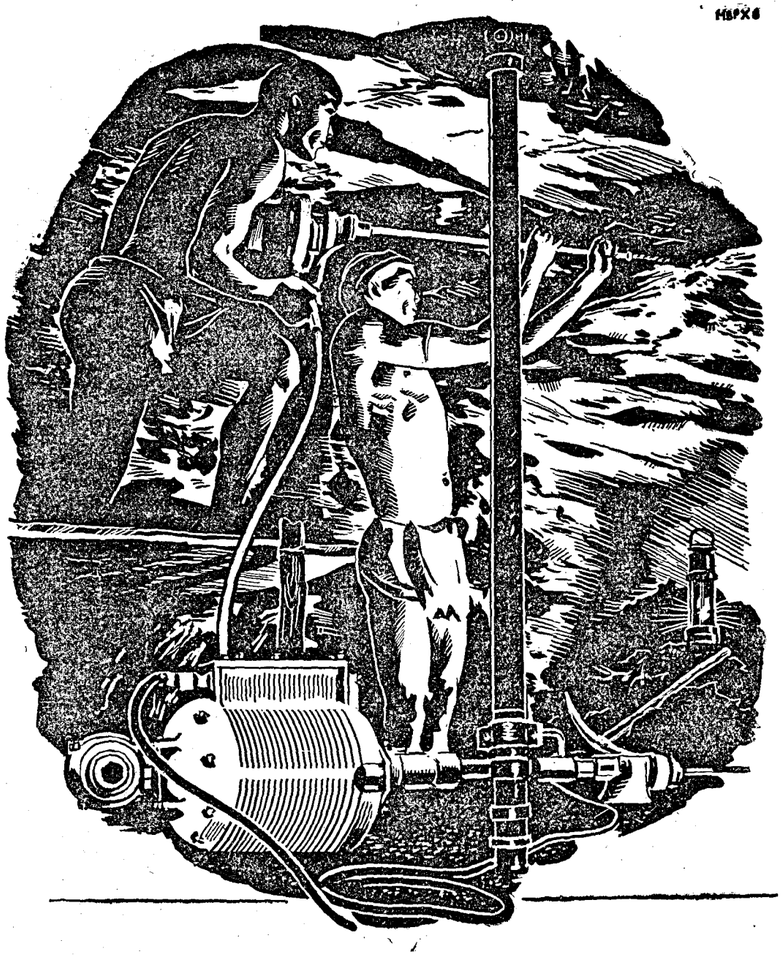
The Reality in Anglo-Russian Relations

THE French philosopher Fenelon, in his advice to the grandson of Louis XIV, gave an account of the different systems of power relations between countries. He bestowed the highest praise on what he called his "fourth system"—a system in which "a power is about equal with another and which holds the latter in balance for the sake of public security." This is an apt classical definition of what we now term "peaceful co-existence." But such a definition of the current approaches to international relations can by no means be appropriate to the state of Anglo-Soviet relations today. Britain by herself is in no position to act as a political counterweight to Soviet might and power. Thus, if for purposes of analysis a description of the governing considerations determining the British attitude is necessary, then possibly the "fourth system" of Fenelon must be coupled with the famous dictum of Bismark that "we want to be, like everybody else, in a party of three in a world of Five Powers." These two concepts combined appear to cover the British stand in the discussions with Marshal Bulganin and Mr Kruschev remarkably well. Conceiving the Atlantic Alliance as being the counterweight to Soviet Russia, and being sure that she remains a party of that alliance, Britain supports "peaceful co-existence."

This approach to the Russians appears to have been well understood long before the Russians reached Britain. Lest the British public should show undue enthusiasm in their welcome to the visitors, the authorities thoughtfully called upon the press to voice, and the press did it remarkably well, the suggestion that nothing new could be expected from the Russians, in spite of the visible easing of conditions in Russia itself. The British welcome was, therefore, tempered—at times cold—and on other occasions lacking in etiquette and courtesy. For their part, the Russian leaders combined a realism and a flexibility which made the Times describe the Russian leaders as "men of the toughest mental calibre, overworked perhaps, but tenacious in argument and retentive of a mass of facts." The grace of Marshal Bulganin and even more his formidable mastery of the situation has suggested some parallel to Queen Victoria's description of an earlier Nicholas, a Czar of that name. As the Times recounts it:

> "He is certainly very striking; still very handsome. . extremely civil—quite alarmingly so. But the expression of his eyes is formidable, and unlike anything I ever saw before."

This recognition transformed what was at first a cold critical welcome into something perceptibly warmer by the time the Soviet leaders were to leave. The utterly discourteous and what the New Statesman called "deplorable" behaviour of the Labour front-bench in flying in the face of protocol when questioning the Russian leaders was smoothed over by the end of the 10-day visit. More remarkable was the British Prime Minister's statement after the visit: "our relations have improved by the visit." Thus the British public attitude was gradually transformed as the Russian visit reached its final stages and this must be considered significant and important.



The changing temperature—from cold to lukewarm and at times, to warm—is, however, not fully reflected in the communique issued after the series of discussions which were the most important of the visit. The combination of concepts, that of Fenelon and Bismark, appears to have dominated the British view and may have thus been responsible for the recognition that "under-water rocks" were encountered in the attempts to find solutions to the problem of European security. This failure has been welcomed by Dr. Adenauer and the New York Times, but to categorise the discussions as a "failure" would amount to wanton deception. As Sir Anthony Eden put it, "war has receded . . . our relations have improved ...we can do more trade." These developments are the result of the talks and as both Marshal Bulganin and Sir Anthony have claimed, it is the "beginning of the beginning".

The reality of Anglo-Soviet relations was for the the first time given recognition. The different positions of the two States in the Middle East were realistically examined and though no solution of the conflict could be found, it was possible for both to agree on a peaceful settlement of the Arab-Israel dispute through the United Nations. So, too, on trade: while the British admitted their difficulty in unilaterally abandoning their controls on East-West trade and the Russians were adamant that discrimination should be ended, both countries were able to exchange trade lists for study which, according to Sir Anthony, "can be executed at least by 75 per cent."

The problems of disarmament were also fully recognized. The reality of the problems were faced, no matter how unpalatable they might be to the Western public. The hypocrisy of the Western proposals—proposals which, when agreed to by the Soviet Union, the "Western Powers at once renounced"—was exposed. These developments have made Marshal Bulganin describe the Disarmament Sub-Committee of the U. N. as the "sub-committee on concealing the Arms Race". The Western attitude was a "riddle to him". And yet the two Governments were able to agree that persistent efforts towards agreement were of "fundamental importance" for the "saving of humanity from the threat of nuclear warfare."

Any estimate of the Russian visit must ultimately be made to depend on its contribution to the pacification of conflicts potential or otherwise in the world. Before the Anglo-Russian talks, the danger of a major conflagration in the Middle East was real. This danger has now receded. While no progress over Germany was recorded, nobody can now conceive of a solution in terms of war. So too in the Far East, peaceful methods appear to have become the approach to the problems in that region. The success of the talks is great if measured in these terms—the talks are no less significant for the several new lines of enquiry opened up by the frank and hard discussion.

Labour and Economic Development

Subratesh Ghosh

IN his excellent study on the problems of economic development Prof. W. A. Lewis has pointed out three proximate causes of economic growth: economic activity, increasing knowledge and increasing capital. (The Theory of Economic Growth p. 23).

This is something refreshing as it emphasises the human element in economic growth, which, despite its great importance, has not always received its proper appreciation from economists and planners who are often more enthusiastic to emphasise the role of capital.

Economic activity, according to Prof. Lewis, means "effort directed towards increasing the yield of a given effort or resource or towards reducing the cost of a given yield". (ibid p 23). Now the possibility of increasing yield or output naturally depends upon the ability as well as willingness to work and the effort directed towards reducing the cost of a given effort. The latter, in its turn, is to a very great extent dependent upon certain attitudes,—for example, whether the people who work find any interest in their jobs or are at all keen to find out means to reduce costs or not. So all these point to the need of seriously considering the ways and means of creating a favourable psychology towards work i.e. to create the willingness of people to make the effort required for economic growth. But what is the clue to make the people do their best? Prof. Lewis himself gives a nice reply to that:

"Men will not make effort unless the fruit of that effort is assured to themselves or to those whose claims they recognise." (ibid p 57). In other words, confidence should be created in the minds of the people to make them believe that the effort they will be making is worthwhile that either they themselves will be benefited by it, or, it would advance the cause of something for which they consider sacrifices would be justified. Thus hope and confidence are as much essential for economic development as addition to the stock of the country's real capital assets. Similarly the creation of a favourable psychological attitude in the minds of the working people is important also for the other two determinants of economic growth.

A developing country requires expanding supply of knowledge and skill of all types—technical, administrative as well as general. To keep pace with rapid development, it becomes necessary to train up people at work to do better jobs and to learn new techniques as well as for performance of new jobs. For underdeveloped countries where owing to lack of adequate educational facilities and poverty, a large majority of the population cannot have the opportunities of even elementary education, fundamental education for the adults also is no less important. W. E. Moore has described at length the role played by ignorance of the actual and potential workers as a barrier to industrialization in the under-developed countries. (Industrialization and labour; Social Aspects of Economic Development). Ignorance not only keeps people blind about the potential alternatives and hence affects the mobility of labour which is so essential for industrial development, but it affects also productive efficiency. A report by the International Labour Office clarifies this point further:

"Industrialization in Asiatic countries . . is hampered by a shortage of the kind of labour required for modern industry. The capacities required differ greatly from those commonly found among workers in agriculture and household industries in these countries. The industrial worker has to be literate; often he has to be able to read blueprints; he has to understand the need of industrial discipline. The countries in question are all short of workers with these qualifications".

Removing the Barriers

Now educational programmes may be undertaken to overcome the barriers of illiteracy, ignorance and low skill. But nothing substantial could be achieved unless the workers are made interested in education. The adult educationists and social service workers know very well how difficult it is to create this interest and to remove their apathy. One of them has related his tale of difficulties in the following words:

"I have been connected with 5 big centres of adult education in the Calcutta industrial belt for the last 10 years, but the progress made is disappointing and the attendance of adult workers at these schools has been very poor. There are many obvious reasons why workers do not come to night classes, fatigue after working hours being one of the main, but that alone cannot account for this dismal failure." (R. M. Sengupta in **Indian Journal of Social Work**, March 1952.)

Absence of Hope

And these other reasons, as any one who has had ever to deal with the Indian workers knows include the absence of hope in the mind of the worker, his poor standard of living and low income which dry up all his interests and enthusiasm, his unfamiliarity with the urban way of life, his failure to adjust himself to the new industrial set-up as well as his preoccupations with his family problems like diseases, indebtedness etc. which increase with poverty. So the barrier of ignorance is connected with the whole socio-economic set-up in which the worker has to live and it cannot be fully removed unless definite steps are taken to better the conditions of the worker, including his standard of living. However, it is also not true that nothing can be done at the present moment in regard to this problem. Some better response can be definitely obtained, provided the workers are made to believe that they have several prospects to gain and to go upward in rank as well as in income if they acquire more knowledge and that the increase in their productive efficiency will benefit not only industry but also themselves as well as the country. So here, also, the problem of creating a favourable attitude comes in.

Similarly capital-formation itself is also no less dependent on the creation of a favourable psychological attitude among the masses. The role of small savings in capital formation is readily appreciated to-day. In fact, the small savers have contributed a good deal for industrial development in India. The large percentage of the middle class among shareholders of joint stock companies shows the role which has been played by the ordinary people and also points to the possibility of getting better response from them if they are enabled to save more and are given better incentives to save.

The Rural Banking Enquiry Committee pointed out that savings may be available from small landholders, tenants and agricultural labourers as well. But proper banking and other institutional facilities must be extended to the rural areas to mobilise such savings and attempts should be made to promote thrift and small savings through adoption of suitable devices. Although workers' savings until now have not been substantial, from the experience of the more advanced countries it may be concluded that here also they would be able to save more and to make their savings available for national development, if they are given opportunities through a better standard of living, better social security, proper organisational assistance and incentives for saving. In fact, apart from the importance of mobilising funds for investments, savings by them as well as by the agriculturists and rural workers are essential for keeping inflation under control. This is particularly important at the moment, since any programme of development worth the name must involve a certain measure of inflation.

Compulsion and Legislative Measures

Development can be continuous and a self-reinforcing process only when an appreciable part of the increment of income resulting from it is put back into it. This can also be done by taking away a part of the new income from the workers by means of indirect taxes. But taxation of the workers is undesirable as it deprives them of the chance of directly enjoying the benefits of work even in the future. So saving by the workers themselves is better. If they may be persuaded to lend these savings to the government, that would directly help capital-formation in the public sector at the same time assuring the workers the enjoyment of their present income in future. In this connection, some may suggest the necessity of compulsory savings schemes. But compulsion is repugnant and compulsory savings may create much discontent among the low paid workers. It is therefore, desirable to rely more on voluntary savings. This again brings us to the necessity of developing a proper attitude; in other words, an understanding of the need of economic development, the role of small savings and the creation of willingness to forgo present consumption for future prosperity.

Thus we see that economic development requires the creation of a favourable psychology, particularly among the toiling millions. But how can such a psychology be created? There are two ways which are by no means contradictory but are in fact complementary. Some measures may be taken at the legislative and administrative levels which would pave the way for more equitable distribution of the national product and improve the standard of living of the masses. Such steps would convince them of the necessity of fully cooperating for the economic development of the country by assuring them that they will also have a due share in the improvements made, according to their contributions and the fruits of their efforts will not be enjoyed only by others who have power and wealth. Secondly, this would also require the active co-operation of the voluntary associations representing the interests and aspirations of the toilers e.g., trade unions and peasants associations.

Role of Trade Unions

Of these two ways, much has been discussed about the necessity and the nature of the first way. Protective labour legislation, minimum wages, social security schemes, land reform measures, etc. have great contributions to make for the creation of the necessary confidence and enthusiasm. To the second, however, comparatively little attention has been given. It is therefore essential that a serious study should be made of the role of trade unions and other associations in economic development. Here we shall try to discuss the role of trade unions in particular but we hope that the discussion will throw some light on the role of other associations as well.

The contributions which the trade unions can make to economic development are substantial. First and foremost, existence of a strong trade union movement capable of defending and promoting the workers' interests through collective bargaining and other methods itself will create confidence among the workers and will remove from their mind the sense of being exploited. Better wages and better standard of living which they may enjoy through the existence of an effective trade union movement will also increase their efficiency. Regarding skill formation and attempts to make the workers better educated also, trade unions can contribute much. For the spread of fundamental education and in the fight against illiteracy, the workers' education programmes, organised and conducted by trade unions, may receive more co-operation and better response from the workers than programmes sponsored by others. As regards vocational training, it may be very difficult for the trade unions in the under-developed countries to organise it from their poor resources. But if their co-operation is sought by the government or industry who may be undertaking such projects, trade unions can do a good deal by encouraging workers to join such training programmes and to attend them regularly.

Workers' Education and Training

Trade Unions may play a very important part in another respect, i.e. to improve the productive efficiency of industry. If workers take interest in their work, they may suggest from their own experience many practical ways of minimising waste of raw materials etc. and of improving efficiency by means of better distribution of work load and minor technical readjustments. The Stakhanov movement which contributed so much to the success of the Soviet Planning in the mid-thirties was to a very great extent nothing but workers' participation in finding out ways and means of increasing productivity and reducing cost through better division of work and minor technical innovations suggested by themselves. But workers must be encouraged to offer such suggestions and be assured that these would be given proper consideration. Joint Production Committees, Works Councils etc. have been developed in different countries to associate the workers with the process of improvement in productive efficiency through their co-operation. Trade Unions, as the natural leader of workers, may make these instruments of workers' participation in improving productive efficiency really effective. They may encourage the workers to think seriously about these improvements, and help them place their views in an effective manner.

As regards capital-formation also, trade unions can be of great help to the government by promoting and assisting small savings schemes, by organising voluntary labour squads for road building and other similar projects, and if indispensible, by persuading workers to accept some less onerous scheme of compulsory savings, like the payment of a part of the bonus or wage increments in government bonds instead of cash.

The trade union can be a very effective instrument for helping workers to adjust themselves to the new industrial environment. As is well known, a very large percentage of the Indian working class are still rural in their origin, background and attitudes. They bring with them the attitudes and work-habits of their village-life, which moves at a far slower pace and where the nature of work and work-habits are completely different. Discipline, punctuality, relation with the superiors and with fellow workers and in fact, the whole environment, are completely new to the uprooted villagers who find themselves transplanted in an alien soil. Outside the work place also, he is always reminded of his alien environment. The appalling conditions of living and housing as well as the insecurity of industrial life with inadequate social security repel him and he longs for a return to his accustomed village-life.

And last but not the least, being deprived of the rich and varied means of folk entertainment and education which the Indian rural communities have ben providing to their sons and daughters for canturies, he very strongly feels the need for some substitute forms of recreation. But in the sophisticated urban life, recreation is also a commodity to be purchased at a price which is often too high for the poor unskilled worker. So not only his body starves, but also his mind. This lack of adjustment to the new set-up on the part of the industrial worker is reflected in its turn in the very high rate of absenteeism, migration to villages whenever possible, high labour turn-over and lack of interest in mastering the techniques of modern industrial production. Apart from its socio-psychological aspects, this lack of adjustment is itself a bar to economic development, as the latter presupposes a more or less stable and disciplined working force, with minimum of absenteeism. If the trade unions can do anything to help the process of adjustment and integration of the workers into the industrial way of life, that itself will be a great contribution.

The trade union movement is not only in a position to maee that contribution, but it is perhaps the most suitable agency for it. The Director General of the I. L. O. Conference has aptly pointed out.

"The Trade Union may be one of the most powerful instruments for creating a new industrial society and for helping the new recruit from the rural community to adjust to the conditions of the industrial life."

Towards this adjustment, the trade union's contribution may take

several forms. The educational-cum-recreation centre may not only make the mind of the uprooted villager informed of the values and requisites of the new way of life, but it may provide substitutes for the rich media of entertainments which the village communities used to provide, without involving him in any extra expenses over and above what he pays to the union by way of his contributions. Moreover, cinema, theatre, musical programmes or watching competitive out-door games which are a few of the recreations open to ordinary urban workers (provided they can pay for them), all keep the spectators or the audience completely passive, there being no way for them to actively participate in them. These recreations not only give workers no scope to make their creative faculties articulate, but actually they make the workers more and more passive. If the union can organise recreational programmes for the workers in which they can actively participate not only would they be refreshed in mind, but their habits, which are so important for a democratic way of life, would be more active.

Besides the provision of recreations, trade unions can also help the process of adjustment by establishing co-operative housing societies with the help of the government and industry which may undertake to build healthy and decent houses for the workers. These houses may be let to the workers at moderate rent with the provision of making them owners of their own houses or flats after a number of years through the payment of some monthly instalments within their means. Thus the workers would find a greater stake in urban society and the process of adjustment will be facilitated. Similar other forms of welfare work may also effectively help towards this end.

Thus trade unions can play a very important part in the process of economic development. But the mere desire to play that role on the part of the unions would not suffice, they must also be enabled to perform their tasks. The community and the government should help the trade unions to develop their strength and effectiveness. This would naturally require a reconsideration of the basis of industrial relations and the place given to trade unions in the life of the community, particularly in thee planning for economic development. Trade unions must be properly represented and associated at all stages of the formulation of the plan as well as its implementation.

At the same time, attempts on the part of the government and the community must be made to build up the pattern of industrial relations in a way which would be consistent with the great role assigned to the movement for economic development. One very important element in the existing set-up of industrial relations in India as well as in some other South and South East Asian countries is the provision for compulsory arbitration for a very wide area which may be extended by the government of the country at its will. Compulsory arbitration, according to its supporters, has the merit that it removes the chance of work stoppage and hence facilitates the fulfilment of production-targets under the development plan. But on the other hand, it tends to suck out the very vital force which strengthens the roots of trade unionism. When workers find that by litigation they can get much without relying on their unions, they become apathetic to the need of strengthening the union. Reliance on courts of law decreases the necessity to rely upon collective solidarity and this naturally weakens the union which becomes less effective to influence or lead the workers towards the desired goal.

Moreover, the sophistication and knowledge about the laws and many other subjects which are essential for putting a good case before an industrial court, cannot be supplied at this stage by the unskilled and the semi-skilled workers in India. Thus they have to rely more upon lawyers or outside leaders in the trade union mbvement who can supply these. Last but not the least, compulsory arbitration hinders the growth of proper employer-employee relationship which alone in the long run can ensure a stable rate of progress. Even if the workers may gain something by way of a favourable verdict from the industrial court, the employers will feel bitter and would try to violate this whenever they find some legal loophole. They may even try to retaliate through some other ways. But instead of this, if the gain is obtained by means of collective bargaining, i.e., through a spirit of give and take, the good employer would feel morally bound to observe the clauses of the agreement and would act according to its spirit and not merely in accordance with its letter.

This, however, does not mean that compulsory arbitration should go in all cases. But what is meant here is the necessity of giving collective bargaining the foremost place and the fullest scope for settling differences. If collective bargaining, after having been given a fair trial, cannot amicably settle the dispute, some provision for compulsory conciliation through mutually agreed third parties or the government may be provided. If this also fails, only then the question of arbitration may be considered. But compulsory arbitration, even at this stage, may not be essential for all industries. In the case of certain basic industries and the public utilities, upon uninterrupted production in which depends much of the success of the development plans, strikes may be substituted by compulsory arbitration in the interest of the community for a temporary period. But in other cases, there is no reason why the matter should not be left to the parties themselves. If both the parties voluntarily agree to submit the dispute to official or non-official arbitration, it is welcome. But if, on the other hand, the workers feel that nothing short of a strike would be able to protect their interests, they should be given the right to strike. For a short period this may create in a few cases some instability, but in the long run it will definitely pay better dividends.

But some facilities should be provided by the state to help the growth of collective bargaining. As the reluctance on the part of the employers to recognise unions and to bargain collectively is to a very great extent responsible for the work-stoppages in many cases, compulsory recognition of unions and obligation to bargain collectively with the representative union may considerably help the cause of industrial peace and the healthy growth of the trade unions. Legal sanction behind the collective agreements also may be of much help, as it would prevent unscrupulous employers from wriggling out of their commitments at an opportune moment. Legal prevention of some types of unfair labour practices by the employer may also be helpful for the growth of trade unionism.

In recent years we have become plan-conscious. But if that leads us only to a realisation of the necessity of increased supply of material capital and not of the human aspects of capital-formation and economic development, our progress will be retarded. It is high time that we became aware of this essential truth as well.

Mahindra and Mahindra Limited

Notice

The 10th Annual General Meeting of the Shareholders of Mahindra & Mahindra Ltd. will be held at the Registered Office of the Company, Gateway Building, Apollo Bunder, Bombay—1 on Monday the 14th May 1956 at 4.30 p.m. to transact the following business.

1. To receive and adopt the Directors' Report, the audited balance sheet and profit and loss account for the year ended 31st October 1955.

2. To declare dividend on Preference and Ordinary Shares.

3. To appoint a Director in place of Mr. C. Mahindra who retires by rotation under Article 110 of the Articles of Association but is eligible for re-election.

4. To appoint a Director in place of Mr. H. C. Mahindra who retires by rotation under Article 110 of the Articles of Association but is eligible for re-election.

5. To appoint a Director in place of Mr. Jal H. Mehta who ceases to hold office by virtue of Article 116 of the Articles of Association but is eligible for re-election.

6. To appoint a Director in place of Raja Maharaj Singh who ceases to hold office under Article 116 of the Articles of Association of the Company, but is eligible for reappointment.

And to consider and if thought fit to pass the following resolution of which special notice as required by Section 281 of the Companies Act 1956, has been received by the Company and the relative explanatory statement concerning which as required by Section 173 of the said act is annexed hereto.

Ordinary Resolution —

"Resolved that the age limit prescribed under Section 280 of the Companies Act 1956 shall not apply to Raja Maharaj Singh who has attained the age of 77 years and who retires under Article 116 of the Articles of Association of the Company and that he be reappointed a Director of the Company".

7. To appoint a Director in place of Sir D. N. Mitra who ceases to hold office under Article 116 of the Articles of Association of the Company, but is eligible for reappointment.

And to consider and if thought fit to pass the following resolution of which special notice as required by Section 281 of the Companies Act 1956, has been received by the Company and the relative explanatory statement concerning which as required by Section 173 of the said Act is annexed hereto.

Ordinary Resolution—

"Resolved that the age limit prescribed under Section 280 of the Companies Act 1956 shall not apply to Sir D. N. Mitra who has attained the age of 65 years and who retires under Article 116 of the Articles of Association of the Company and that he be reappointed a Director of the Company".

8. To appoint a Director in place of Rai Bahadur Isher Das Sawhney who ceases to hold office under Article 116 of the Articles of Association of the Company, but is eligible for reappointment.

And to consider and if thought fit to pass the following resolution of which special notice as required by Section 281 of the Companies Act 1956, has been received by the Company and the relative explanatory statement concerning which as required by Section 173 of the said Act is annexed hereto.

Ordinary Resolution —

"Resolved that the age limit prescribed under Section 280 of the Companies Act 1956 shall not apply to Rai Bahadur Isher Das Sawhney who has attained the age of 73 years and who retires under Article 116 of the Articles of Association of the Company and that he be reappointed a Director of the Company".

9. To appoint Auditors for the Current year and to fix their remuneration.

10. Section 293, sub-section (1) (d) restricts the total borrowing powers of the Board of Directors to the paid-up capital of the Company and its free reserves which amount to Rs. 80 lacs. The Company's borrowings from the various banks amounted to Rs. 9,26,49,989 on 31-3-1956. It is therefore necessary to approach the shareholders for approval of these borrowings by the Company.

And to consider and if thought fit to pass the following resolution as required by Section 293 (1) of the Companies Act, 1956 and the relative explanatory note as required by Section 173 of the said Act is annexed hereto.

"Resolved that the consent of this Company be and it is hereby accorded to the Board of Directors borrowing monies in excess of the aggregate of the paid-up capital of the Company and its free reserves, that is to say, reserves not set apart for any specific purpose and that such borrowing shall be exclusive of the temporary loans obtained or to be obtained by the Company from the Company's Bankers in the ordinary course of business. Resolved further that the Company doth hereby ratify and confirm, all borrowings by the Directors after 2nd April, 1956 which are in excess of the aggregate of the paid-up capital and free rserves of the Company".

A member entitled to attend and vote at a Meeting is entitled to appoint a proxy to attend and vote instead of himself and the proxy need not be a member.

By Order of the Board,
KESHUB MAHINDRA
Director

28th March, 1956

The transfer books of the Company will close from 30th of April 1956 to 14th of May 1956 both days inclusive.

The dividend when sanctioned will be made payable to those shareholders whose names stand on the Register of the Company on 14th May 1956 and the dividend warrants will be duly posted to them on or after the 25th May 1956.

The shareholders are requested to immediately notify any change of address.

EXPLANATORY STATEMENTS AS REQUIRED BY SECTION 173 OF THE COMPANIES ACT, 1956

In respect of Item No. 6 of the above notice of the 10th Annual General Meeting of the Company it is noti-

fied that Raja Maharaj Singh who retires under Article 116 of the Company's Articles of Association but is eligible for re-election is 77 years of age and accordingly the ordinary resolution set out in the said Item is necessary under Sections 280 and 281 of the Companies Act, 1956 to be passed, for his re-appointment as a Director and special notice under the Provision of Section 281 has been received by the Company from a member of his intention to move the said resolution at the said Annual General Meeting.

In respect of Item No. 7 of the accompanying notice of the 10th Annual General Meeting of the Company it is notified that Sir D. N. Mitra who retires under Article 116 of the Company's Articles of Association but is eligible for re-election is 65 years of age and accordingly the ordinary resolution set out in the said Item is necessary under Sections 280 and 281 of the Companies Act, 1956, to be passed, for his reappointment as a Director and special notice under the Provision of Section 281 has been received by the Company from a member of his intention to move the said resolution at the said Annual General Meeting.

In respect of Item No. 8 of the accompanying notice of the 10th Annual General Meeting of the Company it is notified that Rai Bahadur Isher Das Sawhney who retires under Article 116 of the Company's Articles of Association but is eligible for re-election is 73 years of age and accordingly the ordinary resolution set out in the said Item is necessary under Sections 280 and 281 of the Companies Act, 1956 to be passed, for his reappointment as a Director and special notice under the Provision of Section 281 has been received by the Company from a member of his intention to move the said resolution at the said Annual General Meeting.

In respect of Item No. 10 of the accompanying notice of the 10th Annual General Meeting of the Company it is notified that the major portion of the borrowings from the Banks is on account of the financing of import of Steel which the Company has been doing on behalf of the Iron and Steel Controller as well as on its own account as a recognised stockist. In the calendar year 1955 out of the total imports of 520,000 tons of Steel in India by the Iron & Steel Controller the Company imported over 187,000 tons which represents about 36% of the total imports. Each ton of Steel costs on the average between Rs. 500 and Rs. 700. Financing of such large imports needs strong banking credits. The Company has been fortunate in securing such assistance from the following Banks: Lloyds Bank Ltd., Bank of India Ltd., Bank of Tokyo Ltd., Mitsui Bank Ltd., National Bank of India Ltd., Bank of China.

The Government of India has entered into several contracts with Governments of Russia, Belgium, Germany and China for the import of Steel and the Iron and Steel Controller has allotted to the various importers of Steel the commercial handling of such business and the Company is receiving its share of such allotments.

With the advance planning to import three million tons of Steel in the next 3 years, the tempo of purchase will continue to increase and consequently the share of your Company in such imports will also increase. This will require provision of additional credit facilities.

The anticipated increased turnover in Jeeps, Spare Parts, and in manufacturing operations will also require additional finance provisions. Trading for the first five months of the current year is well above the average of the past year in all the divisions. In order therefore to maintain and develop its business it is necessary for the Company to have recourse to large credit facilities from Banks and other institutions.

Economic Thinking: The Basic Malady

Savya Saachi

THE country has of late been flooded with foreign economists. By itself, this is not a bad sign, as there is nothing wrong in consulting experts of proved knowledge and wisdom. Such consultations would be helpful in clarifying our own minds about the means of attaining our declared objective. But as it has happened, it seems that the Government is getting more confused than enlightened, the Finance Minister said at the Planning Forum in Delhi. He frankly confessed that opinions and the advice of different economic experts were so conflicting that he did not know what course to adopt.

It is true that the opinions tendered by foreign economists have often been very conflicting. Dr. Rosenstein Rodan, for example, argued that transport requirements were underestimated in the second Plan, while Prof Galbraith was convinced that there was substantial scope for economy in our expenditure on transport. Mrs. Robinson is of the opinion that so-called 'deficit financing' need not frighten us as long as our plan is properly formulated, while Prof Friedman has argued that deficit financing would be inflationary during the second Plan period, and so on. One could go on multiplying instances.

But the question is: why should these opinions confuse us? If we are sure of the objective and are thinking hard about the best possible means of attaining the objective, we should be conscious of our difficulties. In that case, expert opinion, should be sought for solving a specific difficulty. If those conditions are fulfilled, the right kind of expert should be able to help us to solve our difficulty and show us where we made an error in our analysis. If it does not, it is irrelevant; if it does, it is enlightening. Any expert advice, similarly, on our general approach to planning would be either enlightening or irrelevant.

If, however, as has happened in our case, expert opinion is only creating confusion instead of giving us enlightenment, some of the above mentioned conditions obviously must not have been fulfilled. The fault, then, lies with us. Where have we gone wrong? Are our objectives clear to us? Are we thinking hard on the best means of realising our objectives under our existing conditions? Are we trying to solve the difficulty ourselves, so as to benefit from the advice of foreign experts? Even God cannot help those who do not help themselves. Has not Buddha said, 'nobody can purify somebody else'?

From the controversies that are going on over the second Plan, it appears that the Indian experts are also arguing sometimes at cross purposes. Some argue on the basis of improving the standard of living; others on the basis of attaining full employment; some take maximisation of the rate of growth as our objective, and others speak in terms of a socialistic pattern of society based on equitable distribution of wealth and income. Analysis in terms of only one of these different and conflicting objectives could not possibly give us the right result and discussions at cross purposes would go on endlessly without yielding any fruit. Why then not be clear about the set of objectives we want to realise? If they are conflicting, why is no attempt made to see how they conflict and find out what could be an acceptable compromise? Unless we are clear on these basic issues, no foreign expert can help us, because he also does not know what we are up to. He would merely confuse the already confused minds.

What about the means? How can we think clearly about the means as long as our objectives are not clear? Different sets of objectives inevitably would mean different ways of attaining them. Here also the discussion seems to be carried on on different assumptions, which nobody bothers to mention explicitly.

All this means that we are not trying to help ourselves, not seriously. We are not clear about what we want and how we propose to get it under existing circumstances. We cannot even have honest doubts and difficulties, for, we are not making sufficient effort to clarify our own minds.

What then are our economists, whether in the Government or outside, doing? Are they thinking seriously on the problems that face us? There is no evidence of serious thinking of our problems in our own set-up. Indian economists have forgotten what Keynes said about Economics, that it is a technique of analysis, an apparatus of thought. They seem to be looking for ready made answers to their questions in one authority or the other. Some swear by Keynes and others by Marx and so on. But no one for once tries to forget one's authorities and so apply one's intellect and experience to the solution of the problems that face us. They forget that no two situations can be alike, that each economy has its own unique problems which have to be analysed and solved by the persons concerned themselves. Others can only give a helping hand; one would not know even what sort of help is necessary, if one did not struggle oneself to find the way.

This lack of any serious economic thinking in the country arises in large measure from the unsatisfactory set up of our Universities and Government Research Institutions. Is it not a pity that one hardly finds two or three University Institutions in the whole country carrying on research and that, too, not of a high order? The University staff are depleted and facilities for research inadequate. Even the heads of prominent University Institutions behave like politicians, speak like laymen and write like dilettantes. The Government Research Institutions are better staffed in that they can pay well and attract the most promising material. But research is a delicate plant which hardly thrives in the official atmosphere, whether in the Planning Commission or in the Reserve Bank. Once in the official hierarchy, would be economists soon transform themselves into officials.

People at the top of the official hierarchy cease to have any idea of what research is. Perhaps their metamorphosis has to be complete before they can climb high in the official ladder and it is not surprising that the men at the top should be successful officials rather than inspiring guides in research. One has but to talk to them for a few minutes to find out what spirit of inquiry animates them, what depth of analysis they are capable of and what soundness of judgment they can lay a claim to. The general impression which one forms about these highly placed government economists is no different from that of go ahead, successful civil servants who have neither the will nor the

ability of tackling the country's real problems. One does not even find in them intellectual honesty. Visiting Professors are intrigued that highly placed Government Economists who are members of commissions should make no secret of it that their private views differed from those of the commission or committee in which they serve. But out of regard for good form, or with an eye to future advancement, they keep their own views to themselves and conform to the general opinion. Why don't they write a minute of dissent? Such instances are too well known to merit repetition. All these go to show that whatever else may animate most of these Government Economists, it is not the spirit of enquiry. The Economic Division of the Planning Commission as well as the Research Department of the Reserve Bank of India seem to be functioning more like bureaucratic administrative departments rather than true research departments. What can one expect from those institutions? It is high time that these institutions functioned like true research institutions and changed their set up as well as the staff needed for the purpose.

Prof Galbraith has rightly commented that Indian Economists lack self confidence and are prone to look up to foreign authority. He put the state of affairs mildly and politely when he further commented that it is because of this lack of self-confidence that they have not been able to develop so far what could be termed an Indian economic philosophy. To do this, fresh blood would be necessary. In the atmosphere of intellectual stagnation in which they live, economists in India cease to grow in intellect and wisdom with age. This being the characteristic climate of this country, what should probably be done is to demote rather than to promote men with advancing age. If in all research institutions, the younger element were put above the older one, probably the results would be better today in different walks of life. It is the older elements which are holding back progress and corrupting in turn the younger ones.

But while holding the brief for youth, a qualification is particularly necessary where economists are concerned. This is because economics being a wholly imported science in this country, the latest shipment landed is apt to be regarded as the best and given precedence over the earlier one which may not be any better, but is not necessarily any worse. Time the leveller may help to bring out the more promising material by dulling the meretritious gloss of the brand new.

Education and Unemployment

THE extension of education may not offer a remedy for the problem of unemployment or even for alleviating the acuteness of the existing problem, but at any rate it will help in achieving a very desirable objective while taking care of the problem posed by large additions to the labour force that takes place annually. The extension of education tackles this problem by raising the age of entry into the labour market.

The impact on the labour market of an extension of the period of school attendance is two-fold. First, there is the immediate or temporary effect of reducing the number of new entrants to the labour market in the transitional year or years. If a large number of boys have one more year of school all over the country, the decline in that year in the inflow of young people to the labour market, though small in relation to the total labour force, may yet form quite a considerable proportion of the normal annual additions to the labour force. Estimates that have recently been made in Belgium, the Netherlands and Denmark suggest that the number of new entrants might fall to about half its normal size, if compulsory education were extended by one year, taking into account the fact that many continue in school in any case after completion of the compulsory stage.

Second, there is also the permanent effect of increasing somewhat the size of the inactive population in relation to the active, which would also be useful from the employment point of view. The improvement in productivity that would result from a longer period of schooling would be enough to offset any disadvantages that might follow.

Here, education is compulsory only in a limited number of towns and districts, and then again only between a small range of ages, despite a clear constitutional directive for making education compulsory all over the country and extending the upper age limit to 14. That such extension of education may have its influence on unemployment should be considered an additional ground for implementing this neglected Directive.

Every encouragement must also be given to the extension of voluntary education. In this connection, the scheme for an increase in the number of years of school required for the passing of the SSC examination by one year, which has been proposed by the Ministry of Education, should be looked upon favourably. As the proposal stands, it is combined with the suggestion for the reduction in the graduate course to three years without any separate intermediate examination. The total number of years required for graduation will therefore remain unchanged. Whatever the other merits of these proposals—they have many points in their favour on purely educational grounds—the increase of the number of years of school required to pass the SSC examination is to be welcomed from the above point of view.

In addition to extension of compulsory education, both regionally and to cover a higher age group, and the increase of the number of years spent in school by pushing forward the SSC examination, another step could also be taken. Special three-year technical diploma courses open only to those who have already passed the SSC should be started making full use of all available resources in technical education, as was stressed in these columns last week. This would have the advantage of pushing forward the entry of the students of these technical institutes into the labour market by three years, while ensuring at the same time a supply of technically trained labour to meet the rising neds of industry. To meet more urgent needs, there would also be one year courses. The same could be done in the commercial field by developing three year post-SSC diploma courses in commercial education which would at the same time reduce the number of new entrants into this field and ensure a supply of trained commercial staff in the future.

European Experience

In this connection, it might be interesting to study how the problem of the "war generations" faced by certain countries of Europe was solved by them. This problem arises from the demographic anomalies produced by the last war which are expected to have profound effects on labour markets in a number of countries. As the **Economic Survey of Europe in 1955** shows, four characteristic patterns can be distinguished. In the United Kingdom, Sweden and Denmark, the period of high birth rates was limited to the war years and the first few years immediately thereafter. In Norway, Finland, Switzerland and the Netherlands, the high birth rates of the war years was almost fully maintained during the post-war years. In fact in the Netherlands, the increase in birth-rate in the war years was relatively modest, but was followed by a sharp jump in the post-war period. France, Belgium and Italy actually showed a small decline during the war but like the Netherlands, there was a sharp jump after the war. The fourth group includes West Germany and Austria which also showed violent shifts in birth rates. In Austria, this resulted in the arrival of the war generations at the age of entrance into the labour market from 1953 onwards.

In several countries an increase of 50 per cent. or more in the annual number of entrants into the labour market are anticipated. Since a large number of jobs would be available for persons possessing a high degree of technical training, the problem was even more complex than this figure suggests, for unless these training facilities were provided, jobs would remain unfilled while large masses of unskilled labour remained unemployed. This is in fact something like the situation that is likely to prevail in this country during the next few years, though it is not suggested that the problem is one of the 'war generations".

As has been already mentioned, Austria had to face this problem from 1953 onwards and the way she solved this problem is of special interest, particularly because Austria had to meet this problem when there was already rather heavy unemployment. A ninth year of compulsory elementary school and the introduction of three-year special technical courses are the main features of the programme. The impact of "war generations" on the labour market was planned to be delayed and damped down by these two measures. It is interesting to note that attendance at vocational training schools could be doubled in Austria between 1952 and 1954 through the introduction of parallel classes and special courses as suggested above for India.

The Double Dose of Deception

(From A Special Correspondent at Delhi)

IT is difficult to assess at the moment the impact of Shri K. C. Neogy's "bolt from the brain". His 1200 words, appended "with regret" to the monumental 600-page draft of the Second Five Year Plan, are highly provocative. But whether his criticism that the Plan is "over-ambitious" and "indefinite" will stimulate constructive or facile thinking and generate heroic effort or brave words is yet anyone's guess.

It is true that Shri V. T. Krishnamachari has, in answer to Shri Neogy's complaint about the inadequacy of resources, conjured up the rabbit of higher agricultural output from the magic hat of administrative efficiency. The Chief Ministers gathered in the Council might have wished to swallow the bait, but they could not.

Shri Neogy says:

"The calculation of the financial resources for the public sector of the Plan at Rs. 4,800 crores seems to be characterised by wishful thinking rather than reasonable expectations. Even then there is an uncovered gap; and large as the gap is, it may well prove to be an under-estimate. There are indications that the revenue surplus may prove disappointing. The assumed foreign aid is a measure of our need but that does not make it easily attainable. It will perhaps be idle to expect State Governments as a whole to fulfil their targets of additional taxation. Tax effort even at the Centre will have to recognise its limitations at some point. If the Plan is seriously attempted to be maintained at its present size and the visible domestic resources cannot be stretched to provide more than half the outlay in the public sector, deficit financing of the order of Rs 1,200 crores may no longer be the upper limit as urged by the experts but the inevitable minimum. Once inflationary conditions supervene as a concomitant of this order of deficit financing, all monetary calculations of the Plan expenditure will be upset, cost of projects will be increased—and plan fulfilment reduced in real terms. And in that process, those to be hardest hit would be people in the fixed income groups who number over 5 million and include Government servants at all levels, teachers and other non-Government employees. Thus these classes would be called upon to bear the brunt of capital formation through deficit financing after they have patiently borne the war-time and post-war decline in their standards of life."

To this V T K's answer is:

"I do not think it is possible to reduce the size of the Plan at this stage. The Plan for Rs. 4,800 crores has been before the country for a long time with the approval of the Cabinet and the National Development Council and, as the Plan seeks to initiate large-scale industrial development with emphasis on heavy industry, the country should be prepared to find investment of at least 10 to 12 per cent. of the national income. With the issues placed before the country clearly, the necessary national effort should be forthcoming.

"In implementing the Plan we have to take all steps needed to see that there is no inflation.

"The most important thing from this point of view is agricultural production. . . In the Second Plan some effort is being made to diversify agricultural production. But on the whole agricultural targets stated in the Plan are conservative, even insufficient. With the resources provided in the Plan, it should be possible to achieve higher targets. Increased agricultural production is an important 'resource' for development. If an all out effort is made in national extension and community project areas and elsewhere—and the agricultural programmes are organised efficiently—at the village level, it should be possible to step up production in the third year of the plan to a level at which our agricultural exports can be increased. What I have in mind is an increase of about 40 per cent. in agricultural production by the end of the Plan and a price level of say Rs. 10 to Rs. 11 a maund of wheat. The agriculturist stands to gain if production increases—by 40 per cent. and the prices decline by 20 per cent. His terms of trade should of course be safeguarded so that his net return is not allowed to diminish. For this adequate amounts of short-term finance should be assured. Short-term loans are over and above the allocations in the Plan."

Shri Neogy's thesis is that the provisions in the Plan have been artificially compressed. Rs. 60 crores would be required to raise 12 million tons of coal in the public sector and provide housing worth Rs. 12 crores to the workers. An allocation of only Rs. 40 crores is made "for the present". Oil exploration programme would admittedly need Rs. 30 crores. Only Rs. 11.5 crores have been allotted. Steel townships may cost Rs. 10 to Rs 15 crores. No provision has been made for them The provision of Rs. 35 crores for the 25 different projects to be sponsored by the National Industrial Development Corporation is admittedly inadequate. The Railways will require at least another Rs. 160 crores, despite planning and strict enforcement of priorities, to carry an additional 72 million tons of traffic that is likely to be generated by the Plan against the 60 million anticipated in the Draft Outline.

Further, Shri Neogy points out, that though atomic energy, defence, raising of the salaries of primary school teachers and the like fall outside the scope of the Plan, they would nevertheless require large funds.

Shri Neogy's case, therefore, is that the Rs. 4,800 crore outlay in the public sector will neither suffice for all the development that is envisaged during the Plan period, nor even for the limited number of projects it is supposed to finance. If so, the Planning Commission is administering a double dose of deception to the nation.

Some of the Chief Ministers present at the meeting of the National Development Council agreed with Shri Krishnamachari that raising of agricultural targets was the answer to Shri Neogy. Others stood on the fence. Still others frankly confessed that to raise production without a substantial increase in funds was impossible. The Council inevitably agreed that there should be further consultations on the subject. The Planning Commission and the Ministry of Food and Agriculture would get in touch with the State Governments. What happens next is in the lap of the Gods, presumably the weather Gods. But nothing at Governmental level will happen too soon.

Around Calcutta Markets

Second Thoughts on Industrial Policy

Wednesday, Evening.

INITIAL impact of the new industrial policy was favourable. On second thoughts, investors are less optimistic. Immediately after the declaration of the new industrial policy, equities moved up. At the time of this writing, equities have lost the ground gained earlier in the week. To some extent, Wednesday's fall in equities was due to settlement factors. "Budla" charges continue to be wide. Even so, end-account transactions do not explain fully the reaction in equities after the initial spurt.

In market parlance, the explanation of the initial spurt would be that the new industrial policy was already discounted in the prices for equities. Evidently, the market expected the new industrial policy to be more adverse to the private sector. Any such explanation is rather surprising. Did industry apprehend wholesale nationalisation of industries? There was no reason behind any such apprehension. Why, then, was the impact favourable?

Impact

Initial spurt in equities was due to a feeling of satisfaction that existing private industries would be allowed to function. There was also relief at the assurance that, in cases where both sectors would be active, there would be no discrimination against the existing private industries. That private industries would receive financial aid and other help from the Government, was also a contributory factor to the rise in equities immediately after the announcement of the new industrial policy.

On second thoughts, industry and investors have discovered that some of their optimistic assumptions are not valid. In the industries listed in which future development will be only within the public sector, private industries will be alowed to function, but only for the present. New Delhi has not given any firm assurance that such private industries will never be nationalised. It was on the assumption that private industries even within schedule A would be allowed to develop freely that equities moved up initially.

This raises an interesting issue relating to mixed economy. From an examination of the new industrial policy, it is clear that, despite the extension of State activity, New Delhi adheres to mixed economy. In a mixed economy, some industries are Stateowned while some others are privately owned. There is no objection in principle to both sectors functioning in the same industry or groups of industries. There is a school of thought which is in favour of such a system of mixed economy which operates as a system of checks and balances on both sectors.

There are growing indications that Congress is in favour of such a system of mixed economy. This means that industry may not be wrong in assuming that existing private industries will be allowed to function and to expand. In the iron and steel industry, for instance, this assumption is likely to remain valid for years to come. For one thing, the State has not enough resources to start as many iron and steel industries as will be necessary to create a solid foundation for economic progress. For ten years at least, the existing iron and steel industries will be allowed to function and to expand. What would be the Government's policy after a decade?

The Conflict

Consider, now, the conflict between the organised private sector and village and small-scale industries. It is not news that the latter will be encouraged to expand. Nor is it news that the development of small-scale industries will be at the cost of the organised private sector. But the new industrial policy is emphatic that small-scale industries will be given financial and other forms of protection against the organised private sector. This may be a logical sequel to the policy of developing small-scale industries. But such a discriminatory industrial policy must affect the organised private sector adversely.

Consider, next, the assurance relating to financial assistance to existing private industries. New Delhi is committed to such a policy There are organisations for providing financial aid to private industries. But the recent shift in the means of providing financial aid is not without significance. Some of its sinister implications have been evident since nationalisation of life insurance. In the last two months, custodians of life insurers have, according to reliable reports, bought large blocks of shares of ACC and Tata Steel. There are apprehensions that such purchases have already made the Government the single largest shareholder in these two major companies.

Indirect State Control

This focuses attention on the reoriented policy of State financial aid to the private sector. So far, such aid has been in the form of loans. There are growing indications that the Government prefers financial aid to industry in the form of subscriptions to equities. Such form of financial aid has both advantages nad demerits. It involves indirect State control over management of private industries. This is perhaps resented more than the fact that, through holdings of equities, the Government automatically becomes a partner of the industries concerned and a co-sharer in profits.

Neither the new industrial policy nor the trend towards progressive increases in the taxation of industrial profits is favourable to equities. Rising taxation of industrial profits assumes growing industrial profits. This assumption may not be contrary to the implications of the second Plan. Nor is the new industrial policy necessarily averse to industrial expansion, though the future of the organised private sector now seems less optimistic. Developing events indicate strongly that equity yields will have to rise appreciably to induce investment in industries.

Company Notes

Bharat Line

INSPITE of various difficulties the Bharat Line has maintained steady progress during the year ending December 31, 1955. It is taking a broad view of the future and during the period of the Second Five Year Plan it proposes to acquire nine new ships to be added to its present fleet of fourteen vessels.

The slight decline of gross profits which occurred last year has however, continued this year, the profit being Rs. 30.87 lakhs in 1955 against Rs. 35.25 lakhs in 1954. This was caused evidently not only by the continued delays in loading and unloading of ships etc., but also by a fall in the revenue from freight and charter hire of ships. The revenue which had risen from Rs. 220 lakhs in 1953 to Rs. 261.8 lakhs in 1954 fell to Rs. 233.7 lakhs in 1955.

This fall, according to the Directors' Report, is "attributable to the fact that no chartered tonnage was permitted on the coast during the report year, also to the sale of one of our ships, namely the 'Bharatmata' at the opening of the year, both of which reduced the volume of tonnage employed in the trade. ." The report also refers to the fall in India/Burma trade because imports of Burma rice into India have ceased. If imports of rice are resumed during the year the company will presumably gain in this field.

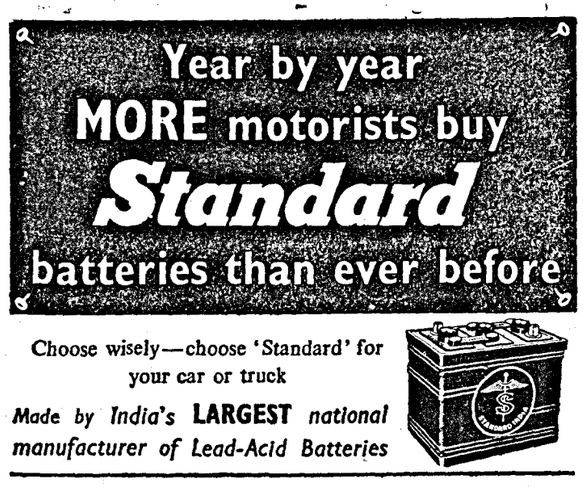
The second oldest ship of the *Bharat Line fleet, s.s. Bharatmata* was sold for scrap value as it had become uneconomic to run. A loss of a little over Rs. 1.29 lakhs resulted and this amount was adjusted against the Fleet Reserve Account. After adjusting also a small amount on account of payment of income-tax, this account stood at Rs. 15.38 lakhs as against Rs. 16.68 lakhs at the beginning of the year.

The Company's Persian Gulf-India-Burma trade was maintained with the three cargo vessels obtained for the purpose, but it has not been found possible to obtain a cargo-cum-passenger vessel for the purpose of starting a passenger service on this route.

The acquisition of nine more ships during the period of the Second Plan, referred to above involves further borrowing from Government to the tune of Rs. 650 lakhs, of which about Rs. 200 lakhs are likely to be drawn during the first year of the Plan. The total loan from Government outstanding at present amounts to Rs. 136.7 lakhs, while other unsecured loans amount to nearly Rs. 9.5 lakhs. As the total paid-up capital of the company amounts to only Rs. 100 lakhs with no free reserves, a special resolution approving and authorising these borrowings is necessary under the new Company's Act and this will be considered at the annual general meeting.

The ship repairing subsidiary of Bharat Line at Bombay suffered a loss of Rs. 1.1 lakhs during the year which increased its total loss so far to a little over Rs. 4 lakhs. To meet the contingency of a fall in the value of the company's investment in the shares of its subsidiaries, the directors of the company have recommended the creation of an Investment Depreciation Reserve beginning with a sum of one lakh of rupees for the year under review. The other subsidiary at Calcutta is making progress and workshop is expected to be ready soon.

After providing Rs. 24.2 lakhs for depreciation, the amount available for disposal including the balance brought forward comes to Rs. 7.55 lakhs. The directors have recommended the maintenance of the dividend at Rs. 5 per share.



Electric Construction

IN recent weeks, Electric shares, listed on the Calcutta Stock Exchange, have been moving up. Spurt in these shares has been due partly to the continued firmness in Electric Construction. In the year to October last, the Company redeemed its preference shares. Its satisfactory working results are encouraging both investors and speculators to take interest in the Company's shares.

In 1945, the Electric Construction and Equipment Company, Ltd., was formed to take over the lease of the workshop of the famous German firm of Siemens (India) Ltd. from the Custodian of Enemy Property. In 1948, this well-equipped workshop was sold to this Company. In 1947, the Company was appointed as the sole selling agents of Schindler & Company, Ltd., one of the world's foremost suppliers of all types of electrical equipment.

Some years ago, the Company started a small factory in Bombay for manufacturing some of the lift components and parts under license from Schindler. It has complete plans for the manufacture of Schindler Lifts in India. Since its start, the Company has organised maintenance and servicing departments throughout the country to render after-sales service to its customers. The original machine shop of Siemens (India) Ltd. has been extended considerably to cope with the increased range of manufacture by this Company.

New expansion programme of the Company includes manufacture of transformers. Orders have recently been placed by the Company for additional equipment, machinery and testing plant for installation at its Cossipore factory. It has also secured some technical assistance by agreement with Tokyo Shibaura Company Ltd. of Tokyo.

Around Bombay Markets

New Industrial Policy Welcomed

Thursday, Morning

WHILE the process of a technical re-adjustment has been under way, the market had been swinging in opposite directions, responding to conflicting versions of the new industrial policy. The actual revision of the policy statement of 1948 has served to restore sobriety in the market. Operators no longer have to contend with financial whims. It has now been made clear how far the Government will go in regard to taking over certain industries to be directly managed by the State. Actually the statement contains no element of surprise. For, the market has been more or less attuned to what was in store for it by a series of measures that the Government had taken in recent months, the most spectacular of which was the nationalising of life insurance. But some of the loose ends have now been neatly fixed up and the released statement not only sums up what the Government has been doing but also makes it clear what the Government may be expected to do in future.

The immediate reaction of the market to the reorientation of the industrial policy has been a handsome rise in equity values. The main factor that seems to have tipped the scales is the absence of any time limit in respect of the currency of the new policy. The first list which comprises what is now the exclusive field of the public sector for future development has been enlarged to include 17 industries. From the point of view of the stock markets, the main industries in this sector are iron and steel, coal, manganese ore, mining and processing of copper, lead, zinc, tin etc. not to mention the generation and distribution of electricity. The market has naturally welcomed the policy whereby in the key industries the private sector is to be allowed to develop side by side with the public sector.

In the early part of the week there were evidences of a shake following the report that the Finance Minister would quit office on the Bombay-Maharashtra issue. The nervousness, however, proved to be short-lived and the industrial policy statement gave a much needed fillip to the markets. Whatever the strength of the bearish factors which momentarily upset the market, there are no two opinions about the outlook for equities. Thanks to the Second Five year Plan and the markedly upward trend of production already evident in so many industries, the economic future of the country is assured and the stock market, as a barometer of a country's economic climate, is bound to reflect this underlying strength, no matter what intermittent weak spots develop.

A notable event of the week was the sudden reversal in Bombay Dyeings. Receding prospects of a bonus was the main cause for this mild setback. Towards the close of the week, however, along with other scrips, Bombay Dyeings also improved on replacement buying which more than served to offset the profit-taking. The other textile shares, and, sugar mill shares ruled very firm.

Cotton

Firm Trend in Spot Market

FOLLOWING the resignation of Shri Purshotamdas Thakurdas, last week, it was feared that even the spot market at Sewri might perforce be closed as a protest against the increasing powers of control assumed by the Forward Market Commission. However, this did not come about and trading in the spot market went on uninterrupted.

The East India Cotton Association Board requested both Shri Purshotamdas and Shri Parikh, the President and the Vice-President of the Association respectively, to reconsider their decision and to withdraw their resignations. Considering the circumstances of their resignation however, it would be futile to entertain any hopes of the EICA being able to persuade them. In this trial of strength with the Forward Markets Commission, the EICA has been so badly worsted that one might well ask why the Association should at all continue to perform a make-believe function.

In the spot market, a generally firm trend prevailed during the week. Thanks to sustained investment buying, most of the styles were around the ceiling. Demand was particularly keen in Khandesh, and Berar Jarillas, Surti, Vijay, Laxmi, Jaydhar, Wagad, Morvi and Kala.

In the foreign section, there was a big spurt in American cotton towards the end of the week. Prominent local mills were keen buyers of Californian Good Middling 1-5 32" as this quality appeared more than a hundred rupees cheaper than comparable East African varieties like Burkhedi or Buega.

California Acala Good Middling 1-5|32" was quoting at around Rs 1415 per candy while East African, Busega and Bukhedi could be had at around Rs 1550 and Rs 1525 per candy respectively. Because of the cheapness of Californian cotton, Indian mills have been reported to have purchased during the last four days about 30,000 bales.

A consequence of heavy purchase of American cotton by Indian Mills was a fall of nearly Rs 20 per candy in African varieties.

Oilseeds

Exemption of Duty Issue

ONE of the grievances of the oil seeds merchants' unsuccessful mission to New Delhi last week was in regard to the outstanding commitments in oils. Their move to have these outstanding commitments exempted from the payment of the newly imposed export levies failed. In the case of linseed oil alone, it would now seem, the outstanding commitments are of the order of about 15,000 tons. If exporters are to honour their commitments, they have to ship this quantity within two months. It is now reported that a British mission is due to meet the authorities in Delhi to persuade them to exempt linseed oil (in the case of outstanding commitment) from export levies. One might ask, why should a British mission take up this subject which is, after all, a responsibility of the exporter here. Contracts are made on the basis of export duty on sellers' account. One cannot help concluding therefore that the shippers here have persuaded British interests to take up this question from their end. On its part, the Government of India is not likely to waive its earlier decision, as it is still of the view that the exporters here should have themselves taken the precaution of ensuring adequate coverage before entering into commitments.

INVITATION

AS one of the leading Exporters and Importers in this country we invite you to make use of all the facilities offered by our Export and Import Departments—with representatives throughout the world

WE IMPORT

★ HEAVY CHEMICALS

★ TEXTILE MACHINERY STORES & SPARE PARTS

★ ARTIFICIAL SILK YARN

★ STAPLE FIBRE

★ ELECTRICAL APPLIANCES

WE EXPORT

★ TEXTILES & YARN

★ OILS & SEEDS

★ JUTE

★ MICA

The INTUC Formula

THAT the acceptance of the goal of a socialist pattern of society for India necessitates a change of attitude on the part of all groups in the community is obvious. What is not so obvious is often the direction and extent of such change. This is particularly so in respect of labour organisations, the **raison d'etre** for which is the need for collective bargaining in an essentially capitalistic society. What position they should take on matters affecting the labourers in a regime of free enterprise is clear enough. Equally, in a set-up such as exists in the Soviet Union, their station may be more or less defined. But when society is moving from one pattern to another and when, moreover, socialism is defined in a loose sense, labour organisations are apt to find themselves in a most embarassing position. This is all too evident from the deliberations of the Indian National Trade Union Congress at Surat this week. Like its spiritual parent, the Indian National Congress, the I N T U C creates the impression of trying to ride several horses at one and the same time. This would not be so bad if all the horses were facing the same way; but as it happens, they do not face the same way.

The primary concern of the INTUC is or ought to be, to better the conditions of labourers coming within its purview. And this means under present conditions not only the obtaining of an increasing share of the national dividend for labour, but also the enhancement of labour participation in working out economic policy in general. The latter is, indeed, a desideratum for a socialist society. But progress in this direction involves the risk of having to relinquish some of the rights or powers to which labour organisations have always attached importance. The most important of these rights is, of course, the right to strike; and when labour organisations are closely linked to the party governing the country it is in regard to the exercise of this right that serious difficulties arise.

For, resort to strikes could be construed as action not only against the specific employers but against government as well. Under the programmes of planned development that we have adopted, the State becomes increasingly a direct employer of labour; it also takes on the moral responsibility for creating proper conditions in the labour market as in others for employers in the private sector, since these have to fulfil specified targets and accept additional obligations. More basically, Government has to ensure that as national output increases, more and more of it is available for capital formation. Should labour go on strike, it will jeopardise the position of Government as much as, if not more than, that of private employers.

But then the INTUC cannot stay put when national output is increasing and when the objective of its spiritual parent is to raise the returns to those who, by the sweat of their brow, add to the flow of goods and services. Its members need concrete evidence that their position is improving; and the evidence that matters to them is the increase in their wages. In other words, the task of the INTUC is to procure for the labourers a higher wage and to prevent them from going on strike to obtain their demands.

This double objective cannot be achieved unless the INTUC is in a position to fix the wages actually paid in the community. Indeed, even if it had such absolute power, it could not always have ensured a rise in wages equal to the increase in the productivity of labourers. Labour will have to create a surplus for the capitalist or the State to invest. How much of its increased product it can claim is, in the absence of bargaining on the market, dependent on the quantum required for investment in a fast developing economy. The INTUC believes that the answer to all this is establishment of Wage Boards regionwise and industrywise. This would mean, in principle, that the proper level of wages would be fixed not by the relative strength of the contending parties to strike or lock-out, but by a body of wise men weighing the needs and claims of every section of the community. But Wage Boards are in practice cumbersome; and such effort will be worthwhile only if it is clearly understood that their awards will be implemented. In the final analysis these awards will have to be taken as binding not only legally but morally. Otherwise, strikes and lockouts will not disappear, but only become illegal. And experience in the U. K. has shown that the so-called illegal strikes may not be rare or ineffective.

Fortunately, the last few years in India have been free from widespread or prolonged strikes save for the Bank Employees' dispute. In this period, there has also been extensive labour legislation and perhaps some improvement in working conditions as well as earnings. But it is in regard to the future prospects that the INTUC has tried to lay down the line. In the next few years, there ought to be a big increase in national income; there also ought to be a substantial increase in employment. The question is whether the labour class should, by and large, be content with the increase in its share of the national product that will result from larger employment. Leadership in the INTUC is itself divided on this issue. Shri Tripathi considers a 25 per cent increase in wages as essential for maintenance of industrial truce. Such an increase in wages clear across the board, together with additional employment, could well mean an increase in the relative share of the national income going to labour, since in the five year period the national income is expected to go up by 25 per cent. Shri Nanda, on the other hand, pleads for moderation in the price demanded by labour immediately, in the interests of future progress. Which of these views will prevail depends ultimately on the influence these men and their views have on the rank and file of labour.

Organised labour will have a propensity to go on strike if it feels that it is being exploited and that it is strong enough to join issue openly. To obviate strikes therefore the INTUC has to generate the feeling that labour is, if anything, getting a little more than its due all along the line. This is not going to be easy, not only because the INTUC is not the sole labour body in the country, but also because the process of equalisation affects at certain stages the wage differentials that are existing. This could well undermine the effectiveness with which the INTUC can muster support for its programme. Labour groups can be ferocious in their defence of existing differentials; and an increase in wage levels of one group might set-off a round of increases, so that the stratifications within labour may be kept intact.

This much is therefore clear. The INTUC cannot, until the nature of the State and Society in India changes more than hitherto, bring about a 25 per cent increase in wages, without fierce opposition from the employers. And, if it abstains from resorting to strikes in pursuance of this objective, it may not obtain a general raise in wages. If the situation is such that conditions are favourable for a strike, other organisations will step in and take the lead. And should this happen, the INTUC will also be drawn into the struggle, willy-nilly.

All this is not to say that the INTUC should have staked its claims for a wage-rise and backed it up by a threat to call a general strike. The point here is merely that the INTUC in its deliberations, has shown the ambivalence which plagues many institutions in this country. This emanates from lack of appreciation of a basic fact, viz. that the right to strike is a weapon appropriate to a particular set of institutions. In order that this right might be considered superfluous there has to be a substitution of this set of institutions by another, in which exploitation of labour is prevented by other means. Unhappily, the tokens of change are considered as the real thing, and instead of definiteness, confusion is being created about the future policy of labour organisations in this country.

NATO's "New Look"

DEEPER influences lie behind the attempt to give NATO a "new look". NATO is a creature of fear. It was born of, and has lived on, fear. As the threat of Russian aggression has receded, this defensive alliance has lost the will to live. To rejuvenate NATO, two doctors have prescribed two remedies. European members of NATO, besides Britain, have welcomed Mr Dulles's unexpected conversion to the concept of "advancing NATO from its initial phase into the totality of its meaning". One of the decisions of the Paris meeting of the NATO Council is the appointment of a committee of "three wise men" to "advise the Council on ways and means to improve and extend NATO co-operation in non-military fields". President Eisenhower, a distinguished strategist, has prescribed a military remedy to revive NATO. These two prescriptions are not necessarily contradictory. But for reasons which are different, both the proposed remedies have been subjected to hostile criticism.

NATO has been in existence for many years. But the NATO Army has yet to be created. France needed prolonged persuasion to ratify the Bonn and Paris Agreements. But the French forces in NATO are now in North Africa, and are not available for the defence of Western Europe. Bonn was enthusiastic about military integration between NATO and Western Germany. But the promised German divisions have yet to be incorporated in NATO. Western Germany is enjoying a business boom. Industrialists are not interested in diverting resources away from industry to military preparations. Bonn is reluctant to pass the conscription law. Because it has not been possible to establish an adequate NATO Army, President Eisenhower has proposed supplies of tactical nuclear weapons to NATO partners. This American offer will enable France, Western Germany and other European members of NATO to discharge their military commitments cheaply and with fewer men.

This strategic aspect of the Eisenhower proposal cannot obscure its sinister implications. Despite the understanding reached between the Heads of State at the Geneva "summit Conference", America has made it clear that she will use tactical atomic weapons to avert threats to aggression. Indeed, Mr Dulles threatened to use tactical atomic weapons on China's military and industrial targets if Peking committed acts of aggression in Indo-China. This is the theory of Gradual Deterrence.

The danger is that, in practice, there is no clear distinction between tactical and strategic uses of nuclear weapons. Either by accident or through concealed design, a tactical use of such weapons may turn out to be a strategic use, and a minor military action may lead to a major war. Because NATO has not even the armed strength needed to maintain mobile units for prompt deployment to strategic points at the periphery, President Eisenhower proposes supplies of atomic weapons to maintain the military effectiveness of inadequately equipped NATO.

But the consequences of such a policy may be explosive. Since the creation of NATO, there have been suspicions that some of the European NATO Powers who still have colonies may try to maintain their hold on their dependencies through supplies of arms through NATO. To be fair to America, it must be admitted that Washington has always taken a hostile attitude to use of American supplies of weapons to NATO partners for the purpose of perpetuating colonialism by some of the colonial NATO Powers.

There is another, and more sinister, angle to the Eisenhower proposal for supplying tactical atomic weapons to NATO Powers. SEATO and the Baghdad Pact are inspired by NATO. Even if the defensive purpose and function of these regional military alliances be conceded, there is an ominous possibility that some SEATO and Baghdad Pact members may urge America to extend her new offer to NATO to them. Like NATO, SEATO and the Baghdad Pact lack adequate and equipped armed forces. Reasons which have influenced President Eisenhower to propose supplies of tactical atomic weapons to NATO Powers can, with equal logic, be advanced by SEATO and Baghdad Pact members for requests for such military aid from America. This is a sinister possible sequel to President Eisenhower's proposal to NATO Powers, and cannot be ignored by peace-loving Asian nations.

If President Eisenhower's proposal to supply tactical atomic weapons to NATO Powers has sinister implications, the efforts, inspired by France and Canada, to extend NATO's activities to political and economic spheres are both redundant and incapable of achieving any positive results. As most NATO members are jealous of their sovereign national rights, there is little scope for political activities of NATO. Nor is there any scope for economic activities of NATO. So far as Europe is concerned, the OEEC performs the function which is now being proposed for NATO. Both Mr. Dulles and Mr. Pearson are opposed to any "NATO aid" plan for backward areas. Poor Asian nations will prefer aid through the agencies of the United Nations to help through NATO, or SEATO or the Baghdad Pact.

There have been suggestions that, even as regional military alliances should be abolished, aid by individual countries and regional plans for assistance should be replaced by world economic co-operation under the auspices of the United Nations France and Russia are in favour of such plans for aiding undeveloped countries. Mr Dulles seems to be in favour of economic aid under the auspices of the United Nations, though President Eisenhower seems to be opposed to such proposals. Instead of trying to revive NATO by extending its activities, or to foster the idea of an "Atlantic Community", France and Canada could further the cause of world peace by demanding the demise of NATO. With the elimination of NATO, the solution of the disarmament problem, the essential condition of peace, would be much nearer.

Weekly Notes

Significant Omission

A SIGNIFICANT feature of the new Industrial Policy statement which has failed to attract much attention is the absence in it of any reference to the form of management of enterprises in the public sector, although with an increasing number of enterprises being run by the State, this question is of no little importance. The need for efficiency and flexibility in commercial activities even when these are carried on by the State, together with the need for general responsibility to Parliament, has marked out the public corporation as probably the most suitable form in most cases, though many problems in connection with such corporations still remain to be solved. The 1948 Resolution had clearly stated that the "management of State enterprises will, as a rule, be through the medium of public corporations under the statutory control of the Central Government . . . ."

Why then does the new statement make no reference to the subject at all? Not that this should really occasion much surprise. It has been clear for some time that high officials in Delhi do not favour the public corporation with its independence from departmental organisation. They prefer the private limited liability company with one share being held by the Secretary of the department concerned and the rest by the President of India. The fact that no less an authority than the first Comptroller and Auditor-General of India had described such companies as a fraud on the Companies Act and on the Constitution carries little weight with them, for while giving the impression of being independent, these private companies offer full scope for departmental interference.

By omitting any reference to the form of management of public enterprises, the issue has perhaps been only postponed. It is time that this question was settled, keeping all the aspects of this very important problem in mind.

Importing Wheat

WHILE India was among the countries to sign the International Wheat Agreement in 1953 when Britain kept out, it has subsequently turned increasingly towards bilateral arrangements for its import of wheat. Under that agreement, its annual import quota was fixed at 10 lakh tons, but in fact in 1954 it imported only 1.97 lakh tons. In 1955, it is true, it imported a somewhat larger quantity, 4.35 lakh tons. Already this year, however, of the total imports, 1.29 lakhs were obtained from USA under that Government's Development Assistance Programme which is outside the international agreement.

Again this year it is reported that 5 lakh tons of wheat are to be imported in order to build up a buffer stock of about a million tons of wheat. Of this amount orders for over 4 lakh tons have already been placed mainly with the US authorities and negotiations for an additional lakh tons are now said to be proceeding. Besides about forty thousand tons of wheat have already arrived from USSR.

It appears, therefore, that the new International Wheat Agreement which was signed recently will not affect this country directly. The position of wheat in world market has in fact changed considerably since the last agreement when it was difficult to obtain wheat bilaterally. The United States which as an exporter is an important party to the agreement has been moving away from the multi-lateral arrangement which is the basis of the agreement. Each year the US Government has been selling increasing quantities of wheat outside the agreement, regarding these sales as abnormal marketings. This means that the International Wheat Agreement now covers less than a third of the total international trade in wheat.

More light needs to be thrown, however, on prices. The new agreement provides for a maximum of 200 cents and a minimum price of 150 cents against 205 and 155 cents respectively under the previous agreement. The prices at which India is obtaining wheat by bilateral arrangements are presumably much lower. It would be interesting, however, to know what price difference exists, for the quantities involved are quite large.

If the position in this country becomes at all more difficult in future, however, and it is no longer possible to obtain large quantities of wheat from USA or other countries which have surplus stocks, keeping out of the Agreement at the moment may not prove to be in her long-term interests. That depends both upon the internal food position and the international supply position in the future.

Damaging Criticisms

IF the principal aim of the community development projects is kept in mind, some of the criticisms made by the Programme Evaluation Organisation must be considered highly damaging. "Efforts at creating a more progressive outlook and educating the people into new ways of doing things," says the third report of the Organisation, "are being given a secondary place in the anxiety to get things done and moneys spent." The report also points out that "even among physical accomplishments, preference in many areas is distinctly for the spectacular as against less noticeable though more lasting and fundamental improvements."

These criticisms raise important questions about the working of the community projects and national extension service blocks and the principles that can be used in their evaluation. It is clear that here if anywhere the criteria of money spent or of physical targets achieved are simply not applicable. Not only are they likely to give misleading ideas of the progress achieved in different areas, but they are actually likely to misdirect the energies of officials concerned into the wrong channels and thus to endanger the future of probably the most promising experiments in social change.

Only a more detailed analysis of the problems posed by the report can show what are the criteria that should be used for judging the progress of this experiment, and can enable a judgment to be made about how it is actually progressing so far. Obviously, there are many good points to note about their progress to date. The Programme Evaluation Organisation stresses for instance that "the people have demonstrated convincingly their desire for progress and their willingness not only to adopt but also to contribute towards any measure about the utility of which they are convinced." The hope with which the community development projects were first started has been vindicated. It is now for the authorities by reassessing the programme in the light of experience obtained so far to decide in what way it can be made more effective.

Hindu Exodus

MANY Indo-Pakistani conferences have been held on the exodus of Hindus from East Bengal. Pakistan has frequently given assurances that steps will be taken to stop the exodus. Despite these repeated assurances, the exodus continues. Few are hopeful that the migration will end as a result of last week's Dacca talks. Until recently, Pakistan has admitted that the migration continues because of the feeling of insecurity among the Hindu population in Eastern Pakistan. In the joint communique, issued after the Dacca Conference, Pakistan re-affirmed the Hindu minority's right to live in East Bengal as respectable and honourable citizens of Pakistan.

But the proceedings of the latest Dacca Conference are revealing in so far as they disclose a new attitude of Pakistan to the problem of migration. Pakistan now seems to argue that the migration is mainly due to "liberal rehabilitation facilities in West Bengal". Based on this assumption, the Pakistani delegation suggested that the border should be sealed so that Pakistan could solve the problem of minorities in her own way. Sealing the border would stop the migration, but will not solve the problem of the minorities.

Though the Indian delegation has been wise in rejecting this suggestion, it has agreed to the other Pakistani suggestion that the issue of migration certificates should be restricted. India has not agreed to the creation of a joint committee, with representatives of both Governments, to scrutinise applications for migration certificates. But the Indian delegation has accepted the Pakistani demand for greater restrictions on the issue of migration certificates. It would be idle to pretend that such clumsy devices can stop the exodus. Many would resent any such compliance by India with Pakistan's insistent demand for stricter scrutiny of migration certificates. East Bengal's Hindus have the right to come to India. Over and over again, New Delhi has given such assurances to the minorities in Eastern Pakistan. Such assurances were repeated only a few days ago in Parliament. And East Bengal's Hindus would like to be assured that the Indian acceptance of the Pakistani demand for closer scrutiny of issue of migration certificates does not involve any disavowal of New Delhi's avowed obligations to them.

Mission to West Asia

PEACE has not returned to west Asia, but Mr Hammarskjoeld, the UN Secretary-General, has been successful in easing the tension on the Arab-Israeli border. In his interim report to the United Nations, he claims that "positive results" have been achieved in his negotiations with Israel and four Arab States to observe a cease-fire. Armed border clashes have stopped. Both sides have reaffirmed their duty to observe the Armistice Agreement. Immediate threats to peace in west Asia have been averted.

Diplomatic developments since the start of Mr Hammarskjoeld's peace mission have helped him in his efforts. By refusing to take any hasty action during the United Nations' peace mission to west Asia, President Eisenhower had lent moral support to the UN Secretary-General. Russia's willingness to co-operate with peace efforts sponsored by the UN had, similarly, helped the Secretary-General in his negotiations with Israel and Arab States. It is a welcome sign that America is now in a mood to concede Russia's right to be consulted on west Asian issues. Recent developments would seem to suggest that Western Powers are now willing to solve the Arab-Israeli dispute under the auspices of the United Nations. This is a distinct achievement. But it would be hasty to conclude that the tension in west Asia has been eased. Only the proper approach to the problem has been defined. Proper remedies have yet to be formulated to ensure peace in that troubled region.

Protection of Publication

THE benefit of the usual privilege enjoyed by legislators in respect of civil or criminal liability for their speeches was confined so far strictly to the legislative sphere. As newspapers or other media of public information did not enjoy the same immunity, statements involving certain legal implications, even though of considerable importance to the public, could not be broadcast. To that extent the very purpose of the privilege of unrestricted utterance extended to legislators was liable to be defeated. Shri Feroze Gandhi therefore deserves to be complimented on his endeavour to find a remedy through the Proceedings of Legislature (Protction of Publication) Bill, which has been passed by the Lok Sabha.

The Bill has no doubt lost some of its original features in the course of its passage through the Select Committee. The measure, as it stands now, limits its protection only to the publication of the proceedings of the two Houses of Parliament, excluding from its purview State Legislatures and Parliamentary Committees. What is more, the protection sought to be extended is qualified by certain reservations. The publication must be without evidence of malice and it must be for public good. Though the intention behind these reservations may be unexceptionable, they are liable to prove restrictive in practice. Again, as the function of newspapers or other media of publicity is only to report what has already been spoken by others, it would not be fair to bring against them charges which would not lie against those who have made the statements in question.

Meanwhile, there does not seem to be much point in limiting the operation of the Bill only to the proceedings of the two Houses of Parliament. The distinction that has been made between proceedings of Parliament and those of State Legislatures lacks justification. It cannot possibly be argued that if the proceedings of Parliament can be allowed to be fully reported, there would be any harm in extending the same rule to speeches and statements in State Legislatures. It is to be hoped that this anomaly will be removed at an early date.

Nepal's Future

WITH the coronation of the King of Nepal, interest has again revived in the political evolution of that State. Thanks to rivalry among political leaders and groups, disunity and several other upsetting factors, there has been stagnation so far. Elections have come to be put off again and again; and this has robbed the political scene of that touch of reality and sense of urgency which could normally have been expected to evolve some unity of thought and action out of the state of discord and dissension prevailing there. In these circumstances, it is but natural that the reactionary forces of the past, smarting under defeat, should again raise their head. A reference to this has been made both by the present Prime Minister, Shri Tanka Prasad, and his predecessor in office, Shri M P Koirala in recent statements. The former, however, was confident that there was no danger of the Rana clan rising

to power again. He said that most of the Ranas had by now realised that their days were over.

Nevertheless, there can be no complacency in the fluid state in which affairs are in the Himalayan kingdom. The dangers facing it are not only internal, but also external; and it is only a sound order of democracy functioning vigorously there that can meet both. Meanwhile, there is cause for hope in the fact that the long-postponed general elections are at last scheduled for next year. This has already set politicians of all camps thinking seriously of the future and revising their old attitudes. The most promising development in this context has been the decision of Shri M P Koirala, leader of the National Democratic Party, to rejoin the Nepali Congress from which he had broken away over the issue of cabinet formation some years ago. This split had in no small way been responsible for the political retrogression of Nepal in recent years. The example of Shri M P Koirala might well be followed by the leaders of other political groups too. If the bewildering multiplicity of parties there, revolving more around personalities than clear-cut political programmes, has done no good to the State in the past, it bodes less for the future. Should the present pattern of political disunity reflect itself in the legislature of the future, there could hardly be any stability.

Shri Tanka Prasad, looking ahead at a press conference recently, said that after the elections, Nepal would have a new constitution with 'a limited monarchy'. But the possibility of such a constitution being drafted and the chances of its working successfully would both depend on the result of the general elections and the strength or weakness of the political alignment that it reveals. Should there be too many small groups pulling in different directions, then the drafting of the constitution cannot but be a prolonged process, and the document that emerges in the end can hardly be of the type that is visualised by the present Prime Minister. And even should it be so in the draft, it may well take a different course in actual operation. If there is not a single strong party or a well-knit coalition of parties to run the administration, then the monarch, though limited in authority in theory, would necessarily have to come more and more into the picture. To that extent the free functioning of democracy would suffer in practice.

Inter-State Sales Tax

THE vexed question of sales tax on inter-State trade which has plagued the country since the inauguration of the Constitution will be settled at last by the Constitution (Tenth Amendment) Bill which has now been referred to a Joint Select Committee by the Lok Sabha. Under this bill, it is proposed to amend the Constitution to place inter-State sales tax within the exclusive legislative and executive power of the Union. The recommendation of the Taxation Enquiry Commission that the spheres of power and responsibilities of the States should end and that of the Union should begin when the sales tax of one State impinged administratively on the traders and fiscally on the consumers of another State, will now be implemented.

The path for this bill was, however, really cleared only by the decision of the Supreme Court in the Bengal Immunity Company case by which the States were debarred from levying a sales tax on goods moving in inter-State trade. Until then such an amendment would have had to face strong opposition from the States which had made it quite clear that they did not intend to give up one iota of the power vested in them by the Constitution. As the position stands at present, the States have nothing to lose from this Bill and have in fact everything to gain, for the entire revenue from the inter-State sales tax levied by the Central Government is to be distributed amongst them. Since in any case the States do not derive any revenue from this trade at present, they will naturally welcome the provision under which without losing any of their powers they will make a gain in revenue.

The present bill will only make the necessary amendment to the Constitution which will of course require the assent of the States. When the necessary change has been made in the Constitution, two further bills are likely to follow. One of these will lay down which items are essential for the community and the other will lay down what constitutes an inter-State transaction. Presumably the latter Bill will also provide for the actual levy and collection of sales tax on inter-State trade.

It has been stated by Shri M. C. Shah, Minister for Revenue and Civil Expenditure, who introduced the Bill, that as a result of the centralisation of the inter-State sales tax, it will be possible for Government to collect about Rs. 112 crores from this source while the present total collections of all the State Governments put together amount to only about half as much. The present Bill will, therefore, make it possible for the Centre to tap an important source of revenue for financing the Second Five Year Plan. Incidentally, the fact that it should be possible to obtain such a large amount of revenue from this source is itself an indication of the great loss that has been suffered by the States as a result of their obstinacy so far in resisting any effort to centralise the inter-State sales tax. The fortuitous circumstance of the Supreme Court reversing its own decision must, therefore, be credited with overcoming an obstacle which has stood in the path of rationalising an important sector of the tax structure in this country.

There is no doubt that a new administrative authority for inter-State sales tax will be added to the already large number of sales tax authorities in this country, but this is a difficulty that has to be balanced against the advantages of the new Bill which can hardly be denied. While welcoming this Bill, therefore, it must be regretted that the opportunity could not be taken to centralise the entire sales tax. It was pointed out in Parliament that the country would gain from the uniformity in sales tax legislation in all the States. Some of the more obvious changes for making the sales tax laws of different States more uniform have no doubt already been taken, but obviously a complete uniformity, which would facilitate trade and improve administration, can only result through complete centralisation. It is unlikely, however, that this will be resorted to in view of the opposition of State Governments.

The Englishman's Reaction

A CORRESPONDENT from London writes:

I recently heard B & K over the radio at their final press conference. The diplomatic correspondent of the BBC was almost lyrical about this conference after the questions. I thought I had tuned in to Radio Moscow by mistake. It is extremely interesting to compare their visit to India with that to Britain. In the former the whole thing was treated as a game, at least openly. Because Nehru had received the kisses of countless young Komsomols therefore the Russians must also receive the embraces of (probably equally grubby) children of high Indian civil servants. Indian crowds also reciprocated. If the USSR can produce so many thousand people to order, then Indians ought to be able to produce twice the number to order. In Britain, however, there is not and never has been the idea of diplomacy as a game at least among the common people. Crowds standing almost dead silent; a few enthusiasts either for or against the Russians performing their customary antics but completely unrepresentative of people at large. One would almost say that the people were uninterested by their lack of movement. But this would be quite wrong. The British crowds are a peculiar lot because in my mind they will never let themselves go unless they feel that the people they are cheering are sincere. And there is no doubt that everyone was thinking: Stalin yesterday, B & K to-day, but the system is the same.

I think that is perhaps why the diplomatic correspondent became so lyrical at the end of the BBC broadcast because he began to feel that perhaps B & K were showing their sincerity instead of being stuffed dummies at the top of a system completely alien to the British system. Similarly with the Labour Party dinner. The feeling against Mr Brown has nothing to do with the release of the Russian imprisoned social democrats but entirely with the issue that Mr Brown by his un-English rudeness had betrayed the traditions he ought to have protected.

These moral rules of behaviour are really pretty strict. I was in England soon after the war and remember very well the spontaneous anti-Russian feeling which suddenly arose when Stalin refused to allow certain Russian wives of British subjects to come to England on the ground that the State had priority over the family's rights. The "Daily Worker" was frightened to print this announcement for several days and in one place the foreign born wife of a member of the Communist Central Committee who was giving a speech was stoned by the crowd.

I think that this is the attitude that one should take towards the visit of B & K to this country, one of detachment and watchfulness to see whether the Russians are now prepared to act like civilised (i.e. British) people. If they do, then world peace is assured and Britain will certainly assist the USSR to intervene with the USA or anyone else. But if not, then no amount of concessions by the Russians will make any difference. Public opinion in Britain is a funny thing, very difficult to estimate or mobilise, but once organised it is like a steam hammer. British politics is littered with the trails of Prime Ministers and others, who failed to take this into consideration.

Off the Record

Reflections on Reflections

THE reflections of so eminent a banker as Shri B T Thakur should be meat to anyone interested in commercial banking in India. The fact that he is retired makes no difference; even the best of them have to lay down their responsibilities some time. Indeed, having retired, he can speak with greater freedom and without any fear of embarrassing the institution he so ably built up. But like all freedoms, this one is double-edged too. To merit serious consideration, it should be indulged in with a sense of responsibility and fairness. There is, after all, a difference between reflections and outpourings of personal annoyances. When somebody does a thing which is not to one's advantage or liking, it is all too easy to call the other man incompetent or power-drunk or ignorant. But to do so is not cricket except in clearly demonstrable cases. Even worse, it invites others to impute motives of a none-too-decent character, especially when the accusations are directed against those who, whatever other advantages they might have, are unable to defend themselves in the columns of a journal.

If one were to be as facetious as Shri Thakur, one could say that the sum and substance of his reflections is this. Banking policy can be framed and implemented only by a special body of people, hereinafter called 'bankers'. Since the Reserve Bank of India is staffed by officials and not bankers, they cannot be expected to do good to anybody, least of all to commercial banking. And yet more and more power is being given to that institution. The only way to remedy this situation is to have a panel of bankers advise the Reserve Bank, especially on what it ought not to do. Because no such check exists on the Reserve Bank, the commercial bank, the money market, indeed all the big and good things so selflessly built up by the bankers in this country, are in danger of disintegration.

India is mercifully a free country and is accustomed to the Hyde Park variety of free expression. And as a retired banker, Shri Thakur does not have to bother too much about what he says. For him, the good days are the old days, when for reasons well-known, a central bank was little more than an issuer of currency and a banker to Government. And Government itself was concerned less with economic affairs than with law and order. It needed, under these conditions, no special knowledge of banking, such as Shri Thakur has, to manage the Government's bank account. Little wonder that with such an attitude Shri Thakur sees nothing but evil in the Reserve Bank as it is today. What matters if we are a country developing according to plan? Why should that be an excuse to vest the central bank with all manner of powers? Surely the Bank of England stayed an old maid while Britain advanced rapidly. Why then should we turn our central bank into a drill-master?

For those of a later generation than Shri Thakur's, it is not difficult to see why institutions and their functions should change with the times, and from country to country. He of all men should know what distinguishes the British commercial banks from their Indian counterparts. And that, on commonsense grounds, ought to be a good reason for the differences in the controlling powers vested in central banks in the two countries.

In the present climate, it is the fashion—and perhaps it pays in some cases—to label things one does not approve of as grave curtailments of freedom. Shri Thakur rages at the controlling power exercised by the Reserve Bank. Curiously enough, Shri Thakur is frightened of deficit-financing leading to the misery of the middle classes and implicitly recognises the need for monetary and credit control. But how does one in fact control credit if one has no authority to check the credit-creating institutions, viz. banks? It should be possible, believes Shri Thakur, if the bankers are taken into confidence and given discretion. This works in the U K, doubtless with some 'persuasion' by the Treasury and the Bank of England. So, must it be in India, according to Shri Thakur. Doubtless, the Reserve Bank has potent reasons to believe why things here cannot be the same as in the City of London; and possibly the Reserve Bank could also point out that resort is often had to 'persuasion' rather than order. But Shri Thakur does not believe the Reserve Bank, and bemoans the curtailment of economic freedom by that institution. Karl Mannheim has it that 'the Plutocratic concept of freedom and discipline upholds basically the investor's right to invest and speculate freely and the owner's right to use his property without restraint.' If this is the meaning of economic freedom, the loss of which Shri Thakur deplores, he is like the soldier who, being out of step with the rest of the company, thought the company to be on the wrong foot.

It is true that the rise in bank-deposits has been less than the rise in the notes in circulation. From this, Shri Thakur has jumped to the conclusion that the reason for bank deposits falling behind is the unjustified peeping into the bank-customer relationship by the Reserve Bank and consequent loss of confidence in banks. According to him cash transactions have risen recently because the customer does not feel sure that his transactions will any more be kept secret. The implications of this could be as damaging to the banks and their clients as to the Reserve Bank or anybody else. What are these large-scale secret transactions that ought not to come to the notice of a Governmental or semi-Governmental agency? If they do take place, what moral justification would there be for banks to assist them? After all, he who has nothing to hide has nothing to lose from somebody probing into his affairs. If banks lost business from those who do not care to work in the open, some might think it business well lost. And in any event, the reasons for lack of confidence in banks is not just the Reserve Bank's doing. It might indeed be otherwise, as the Shroff Committee of which Shri Thakur himself was a member pointed out barely two years back.

Shri Thakur's tirade against the Reserve Bank for having made unjustified advances to banks facing crisis cannot be discussed in the absence of full particulars of the cases. Moreover, is he quite sure that all the advances of commercial banks are based on correct judgment? Fortunately for Shri Thakur advances made by his brothers-in-faith are often shrouded in secrecy and cannot be called to question.

It is strange to see Shri Thakur, the champion of 'Economic Freedom', accusing the Reserve Bank of not preventing the mad scramble for funds among the banks. Will not such interference be construed as restriction of freedom? But, Shri Thakur prefers to eat the cake and have it too.

Shri Thakur's plea for investing the Indian Banks Association with the status of an adviser to the Reserve Bank does that Association little good. Compared to the Reserve Bank's well-equipped Research Department, about which Shri Thakur has something good to say, the Indian Banks Association's resources are limited except perhaps in respect of practical experience. Further the Association has done not much more than create a platform for the Indion Banks to voice their grievances from. It has not done much by way of rationalising banking practices and procedures so far. If the last annual speech of the Chairman is any evidence of the work done by the Association, it must be admitted that this Association with its limited influence on banks themselves cannot hope to influence the Reserve Bank on matters of banking and finance.

It is perhaps wrong to probe into the logic of each of Shri Thakur's contentions. They are, after all, his reflections and one can take them or leave them alone. One cannot, however, help feeling that Shri Thakur's retirement has perhaps not come too soon.

Our Delhi Letter

Ceiling on Holdings

THE Government and the Planning Commission have done fresh thinking on the problem of fixing ceilings on land holdings and, in consequence, the observations of the draft Second Five Year Plan on the subject are likely to be substantially modified.

The Panel on Land Reforms, appointed by the Planning Commission, had recommended that the upper limit of land to be held by a family should be fixed at three "family holdings" for an average family in which the number of members does not exceed five. One additional "family holding" should be allowed for each additional member subject to a maximum of six "family holdings." A "family holding" was defined as the area of land which yields a gross average income of Rs. 1,000 or a net income—including remuneration for family labour —of Rs. 1,200 and is not less than a plough unit or its multiple in area.

The draft Second Five Year Plan generally adopted this recommendation but permitted greater flexibility. It said: "Since different classes of land have to be dealt with, it will be necessary to translate the concept in each region into a given area of land which may be expressed in standard acres or in terms of the principal classes of land. What is proposed is not the determination of the actual income of each individual holding or the working capacity of a particular family but a broad judgment regarding the average value of the produce on different classes of land in a certain region and average expenses of cultivation. The determination of farm incomes and the application of the concept of family holdings is not without its difficulties and it may be of value to States if a small group of experts with practical experience of settlement work or agricultural statistics could assist them in working out the concept in detail".

Since then, the figure of Rs. 1,200 has been attacked in many quarters. Several chief ministers made the point at the National Development Council's meeting recently that to fix such a ceiling would be to condemn the peasant to permanent poverty. Why should his income be limited, it was argued, if no ceilings were proposed for people in business, industry and trade? The members of the Rajya Sabha criticised the concept on much the same grounds but with greater vehemence last week.

The Minister for Food and Agriculture, Shri Ajit Prasad Jain, is believed to hold the view that the suggestion of translating the farmer's income into monetary terms is basically wrong. The quality of land, as the Planning Commission itself seems to realise, varies enormously from place to place. A small acreage may give a better income in one area than a much bigger acreage in another. Besides the crop patterns are changing. To what crop is the ceiling to be related? Cotton is four times as paying as wheat. In many areas the farmers have the choice between sugarcane and cereals. How will you work out the maximum area to be held by a family in terms of its income? Shri Jain also points out that the ceiling on land holdings has also to be related to the density of population. If the pressure on land is great in a given State, its ceiling will be lower than that of another State which is sparsely-populated in comparison.

It is Shri Jain's view that an absolute norm for ceilings on land holdings should not be defined. A ceiling should be imposed but each State should do so according to its own circumstances. The States may form committees to tackle the problem. Their recommendations could be studied and incorporated in legislation to be enacted separately by each state.

The Government is understood to have accepted the Food Minister's thesis and the chapter on land reform in the draft Second Five Year Plan is likely to be modified accordingly.

Food Targets of the Plan

Is Shri V. T. Krishnamachari changing his views? He pleasantly surprised the Government and the Planning Commission by his thesis that food production could be raised by forty per cent, as against the 15 per cent envisaged in the Second Five Year Plan, without a corresponding increase in outlay. He argued that this would take care of the inflation to be generated by deficit financing and called for a series of meetings between the State Governments, the Central Government and members of the Planning Commission for an upward revision of the targets. He also wanted mobilisation of public effort to make their attainment possible. Shri Krishnamachari's glib and attractive reasoning deceived many Governmental bigwigs who were looking for arguments to demolish Shri K. C. Neogy's sound, if pessimistic, criticism of the Plan.

There have been second thoughts since and the Food and Agriculture Ministry as well as the officials of the Planning Commission have cautioned against the flamboyance implicit in V T K's thesis. Rationalisation, people's support and weather, it is conceded, can make a difference but the first two factors by themselves will not ensure more than 5 per cent increase in output over the volume expected with the present allotments. The target of ten million tons of food output, it is stated, is merely an arithmetical total. It consists of the targets set by different States in the light of central allocations. These allotments and targets were individually vetted by the Planning Commission, the officials of the State Government and the Central Ministry of Food and Agriculture. How could V T K turn round suddenly now and say that all that was a miscalculation? Report has it that V T K himself finds the logic of this stand unassailable and is prepared to concede that he has been "misunderstood"!

Another point made by the Ministry of Food and Agriculture is that short-term loans envisaged by V T K by themselves will not make any difference to crop output if the peasant cannot buy better seeds, better agricultural implements and more fertilisers. The capacity for the production of these requirements of improved agriculture in the country is limited and has been fully accounted for in working out the targets set in the Draft Plan.

The upward revision of targets contemplated in the plan is therefore not likely to be more than "marginal" unless emphasis is suddenly shifted from industry to agriculture which is unlikely. The Food and Agriculture Ministry however welcomes the controversy generated by V T K's note inasmuch as it highlights the problems of a sector that was being virtually treated as the Cindrella of the Second Five Year Plan.

Future of Life Insurance Employees

(From a Correspondent)

PUBLIC discussion on the nationalisation of life insurance companies has been confined largely to the effects of the measure on policyholders and shareholders; the reactions of insurance employees, their problems and hopes and fears have attracted little or no attention. The total strength of life insurance employees (not including insurance agents), is estimated at about fifty thousand. They are spread all over India, with some degree of concentration in the cities of Bombay and Calcutta; the majority of them are young and university-educated. They thus form a sizable and important group of white-collar workers. They will naturally judge the Nationalisation Act brought forward by our Welfare State by its impact on their own welfare.

Certain Misgivings

The assurances given by the Finance Minister in his broadcast speech on the night of January 19, as also later on the floor of the Lok Sabha during the debate on the Life Insurance Corporation Bill, have been heartening. On the other hand, a careful reading of Section 10 of the Bill raises misgivings in the minds of employees regarding the security and terms of their service in the future set-up. The Section says:

> "Every whole-time employee of an insurer . . . shall become an employee of the Corporation, and shall hold his office therein by the same tenure, at the same remuneration and upon the same terms and conditions and with the same rights and privileges as to pension and gratuity and other matters as he would have held the same if this Act had not been passed, and shall continue to do so unless and until his employment in the Corporation is terminated or until his remuneration, terms and conditions are duly altered by the Corporation".

The sting, it is obvious, is in the tail. While it cannot be denied that the Corporation must have these powers since there are some sinecures to be found in the industry, it is equally essential to have an early and authoritative definition of the principles on which decisions to terminate the services of employees or revise the terms of their employment would be based, so that workers who may be drawing high salaries by reason of merit may feel assured of their position and may continue to give of their best.

This question assumes importance because the 150-odd companies taken over by Government have among them a great variety of service conditions and scales of pay. Now clearly, the Life Insurance Corporation must evolve a uniform pattern of service conditions and emoluments in place of the heterogenous variety obtaining at present. Service conditions, by which is meant here working hours, leave privileges etc., should present no great problem; any reasonable set of rules framed by the Corporation in this regard is likely to benefit the employees of small or badly-managed companies, without curtailing the amenities and privileges of those working in large and better-managed companies.

But what about scales of pay? At one end, there are many small Companies which were paying low salaries to their men with no defined grades or scales of pay; at the other end, there are one or two Companies which, in order to attract the best available talent from universities and elsewhere, were paying much higher salaries to their staff as well as officers, than are normally offered by more conservative concerns. How does the Corporation propose to do justice to the employees and hold the scales even between them? This is the root of the problem of integration of staff.

Striking a Mean

It is being suggested that in evolving a uniform pattern of salary scales, the Corporation should strike some kind of mean between the highest and lowest salary scales now obtaining for different categories of work. Such a course would mean financial loss to the employees of large and better-managed companies. This is neither fair, nor desirable, nor even necessary. It is not fair because it would be tantamount to penalising, for no fault of their own, those who accepted service in these companies. It would be undesirable because it would leave dissatisfied some of the best trained and most experienced of the personnel in the industry. Finally it is not necessary because the Corporation will certainly be able to achieve substantial economy in other directions like office rent, stationery etc to bring down the overall expense ratio.

Sinecures should be put an end to, but these will be found as often in the smaller companies as in the larger ones. There is, therefore, no self-evident case for lowering the salary scales of the better-managed companies. The lesson of progressive and prosperous business enterprises all over the world is that there is economy in high wages. Is it too much to expect that a Government Corporation run on 'business principles' would be sufficiently free from conventional Governmental practices to undertake the bold and beneficial experiment of actually raising wages further to take advantage of this economy?

Service Commission

Once the salary scales are laid down and jobs blue-printed with clear lines of responsibility and authority, there is next the question of fitting the employees into these jobs and salary scales. It is reported that data have already been collected by the Finance Ministry of the educational and service qualifications of all the present employees of life companies. This is a good beginning, but there are further steps to be taken. Government must appoint an Insurance Service Commission to sift all this mass of data impartially and imaginatively, and where necessary, call the personnel concerned for interview before a final assignment of duties, especially in the officers' cadres. It may be pointed out that wherever there is a sinecure there is also usually a first class person occupying a lower position who has been deliberately kept down and who in fact carries the holder of the sinecure on his back. It is therefore not enough to weed out the sinecures; under the new dispensation their more deserving underlings must be given the opportunity which is their due. This twofold task can only be properly fulfilled by a Service Commission appointed specifically for this purpose.

After the Service Commission has completed its task of placing the right man (and woman) in the right

job, it would still be necessary to have a permanent department whose function would be to attend to all the problems of the staff. Every successful business corporation, large or small, in western countries has such a Personnel Department. A Personnel Department does for the men engaged in an institution what a Maintenance Department does for the machinery and equipment installed in a mill or factory: it keeps the men in good spirits, and by maintaining their morale, makes for better industrial relations.

It is good to find that the Joint Select Committee of Parliament has recommended the creation of an Employees' and Agents' Relations Committee to look into staff problems. Scanty newspaper reports do not indicate what the composition and functions of this Committee will be; but if they have in view something similar to a Personnel Department, it should be most welcome. It is to be hoped that Parliament will accept and enlarge upon this recommendation during the third reading of the Life Insurance Corporation Bill.

It is significant that insurance employees at all levels have unreservedly welcomed nationalisation. The Insurance Companies' Staff Unions passed resolutions, soon after the promulgation of the Nationalisation Ordinance, in which they publicly declared themselves to be in favour of nationalisation. Again, the men selected by Government to be Custodians of Life Companies are all hand-picked from trade—men who until the other day were the trusted lieutenants of the men in control of private insurance companies. The fact that all these men, without exception, agreed to serve Government as Custodians shows that they cast their vote in favour of nationalisation. It therefore behoves Government (and the Corporation when it takes over) to show as much anxiety for their interests as for the interests of policyholders. It should be the aim of Government policy to see that insurance employees are at least as well off as their brethren in commercial banking—a comparable industry which is likely to remain in the private sector, according to the latest ministerial pronouncements on the subject.

In particular, it is to be hoped that the Corporation will not readily consider any proposal to deprive its employees of their right to a share in the profits of the industry, which is a well-established one in insurance. This bonus privilege acts as a potent incentive to efficient work, especially in the present economic circumstances. If, however, there is any insuperable objection to the payment of bonus by the Corporation to its employees, then their basic salaries must be upgraded to compensate for this loss, since in the past bonus was always being kept in view, while fixing salaries.

One final consideration. In an era of steadily rising prices, it pays to be a debtor if you can channelise the borrowed funds into capital-appreciating investments. Since the Life Insurance Corporation is in such a happy position, it is but right that it should strive to give a fair deal to its employees, especially since it is in a monopolistic position.

Choice of Technique

M N Ghosh

DR RAJ has made an interesting study of the problem of technical change and the place of small scale industries in a recent issue of the **Economic Weekly.** Some of his ideas may be traced to Soviet economic literature, specially to the writings of Strumilin, Mstislavsky etc on the choice of techniques; but there are also new and many useful suggestions regarding the working of the capitalist system, which are possibly nearer the real state of affairs than text book theories.

Thus, his conjecture that capitalists are often more concerned with reducing the labour force in their establishments by adopting capital-intensive techniques (which also enables them to pay relatively higher wages to their workers) to avoid conflicts with labour, even though this does not lead to maximisation of profits, sounds realistic enough especially for the foreign investor in India. However, his analysis and conclusions are faulty in some respects as we shall see.

Secondary Criterion

The problems of economic development are in essence those of increase in productive capacity and accumulation of capital; and employment is only a secondary criterion. In an advanced economy maximum economic growth even under capitalist management may coincide with full employment of labour and capital. In an underdeveloped economy such a happy situation may not be realised without central management of the economy; but even under State management, as in the Soviet Union during the post-Revolutionary period, unemployment in the working class remained a big problem and actually increased for some years before it could be tackled seriously. The reason possibly is that owing to an overall shortage of means of production, the marginal productivity of labour is less than the wage level in organised industry at present, if employment is pushed up sufficiently. Of course, the political effect of large-scale unemployment may be serious and Tomsky, the Soviet trade union chief, paid dearly for it. But it is proper to disentangle economic questions from political ones, so that the implications of policy decisions are well understood.

The central problem of economic development, which is the accumulation of capital over a period of time, has two different aspects. One is to realise a surplus from existing industries, which forms the investible fund and the other is to fix the pattern of investment that would make the best use of this fund. The second aspect is taken into account in the capital-output ratio while the first is traditionally the concern of capitalists and business managers out to secure maximum profits and of nationalised industries. In a purely capitalist economy, with a well-organised capital market, the two are linked together by the interest rate which is a charge on the use of capital. This is not to suggest that the interest rate, as it is determined by many institutional factors, does serve the purpose in the best possible way; but when the state undertakes forced savings, the capital market is distorted and the interest rate ceases to have its economic significance; and patterns of investment should logically be guided by the State in the light of its expansion programme.

More Appropriate

In a planned economy, in the calculation of the surplus, it would be more appropriate to consider the surplus per unit of output or surplus for the industry than surplus per employed person as the volume of output is planned. In the criterion for choice of technique suggested by Dr Raj, if the surplus per worker is replaced by the surplus for unit of output, we get the criterion of the rate of economy suggested by Bettelheim as a modified version of the one used by Emelyanov in the Soviet Union (see Bettelheim: **Principes des Planifications**). This is only one of the criteria used by Soviet economists, and it has not been universally commended as a criterion for choice of investment techniques. Considering the hypothetical example of the textile industry, given by Dr Raj, we find the 'rate of economy' given below for the techniques II and III, when the net value added per yard is four annas.

Thus according to the criterion, technique II would be superior to technique III. However, to secure the maximum growth of the economy as a whole, the total surplus realised should be maximised as this is the amount available for investment in the next period. It is customary to consider the surplus realised in relation to the volume of capital to be invested. But the total surplus realisable from a given volume of output in an industry by using different techniques has nothing to do with the return of capital, for a given level of output. Thus for a given level of incomes and productivity of industry, the demand for a commodity is determined and therefore the amount of capital that may be invested corresponding to a given technique is determined, when the price and therefore the volume of output are fixed.

Thus if 2,000 million additional yards of textile are to be produced during the second Five-Year Plan and if the net value added per yard is four annas, considering prices, wages etc to be stable, then the

Rates of Economy

	Technique II	Technique III
Capital cost per loom	Rs 200	Rs 10,000
Output per loom per day	20 yards	80 yards
Capital cost for production of 10,000 yds per day	Rs 1,00,000	Rs 12,50,000
(Number of looms)	500	125
Net value added	Rs 7,50,000	Rs 7,50,000
Wage per worker	Rs 900	Rs 1,500
Number of workers	500	7.8
Total wages	Rs 4,50,000	Rs 11,700
Surplus	Rs 3,00,000	Rs 7,38,300
Rate of economy	300%	59%

volume of capital that would be necessary for technique II is about one-tenth of what is needed for technique III; and the surplus for this additional volume of production if technique III is used would be greater than if technique II were used. However, the surplus per unit of output is higher for technique III than for technique II, so much so that in about three years the extra capital needed for technique III over technique II is realised from the surplus. Thus if the calculation is made for the Five-Year Plan as a whole, the surplus realised by technique III will be much higher than by technique II. This surplus which is realised by the displacement of workers would not be a moral burden if it is not frittered away on imports and high-level living of the owners of the plant, but is reinvested simultaneously to absorb a part of the displaced workers. (All the displaced workers cannot be employed as wages in the new plants may be higher than before).

Again if textile machinery should be produced 100 per cent within the country, a large capital investment would only mean more employment in this industry. However, if capital is scarce in the initial period or has better alternative uses, e.g., in developing steel plants or railways, then technique III has to be abandoned; but this would at the same time reduce the total surplus investible funds available during the whole Five-Year Plan period (Mr Krushchev in his recent report to the 20th Congress of the CPSUB observed that the electrification of railways was justifiable because the revenue surplus realised during the sixth Five-Year Plan from this project would much more than cover the capital costs, and so it should be undertaken).

Price Situation

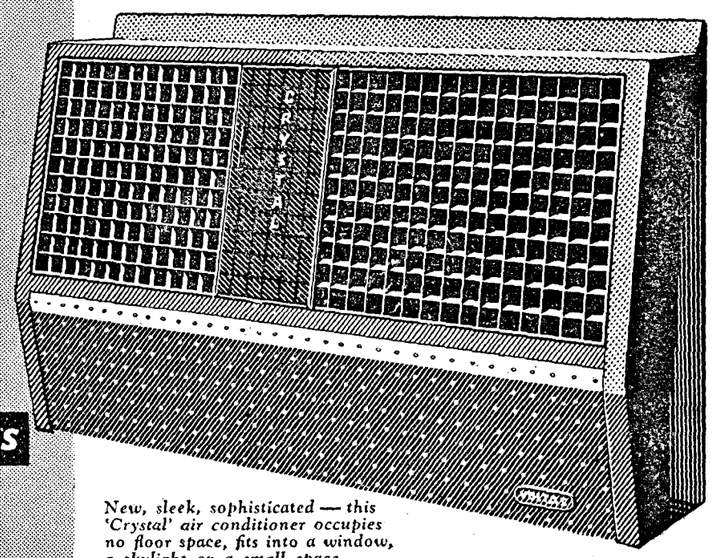
So far we have not considered the price situation at all. Let us now consider what happens if the net value realised by manufacture per yard is only two annas instead of four. We then have

	Technique II	Technique III
Net value added for manufacture of 10,000 yds	Rs 3,75,000	Rs 3,75,000
Total wages	Rs 4,50,000	Rs 11,700
Surplus	—75,000	Rs 3,64,300

Thus when the price drops, the advantage of technique III becomes apparent. Here is the reason why competitive capitalism takes to higher techniques. Historically in the USA every depression has been a harbinger of new labour saving techniques to face lower prices; and the weaker competitors who realise this too late or cannot secure the necessary capital have to close down. The reason for adopting an apparently costlier technique is not in the main imperfect competition or insufficient private enterprise or reluctance to maximise profits on the part of the capitalists, as alleged by Dr Raj. Of course, if the capitalists could be persuaded to believe that the market would be expanding and the price of manufactured goods would not fall in relation to wages and prices of raw materials, then the impetus for costly investment would recede also. However, this is not to suggest that the interests of the capitalist-investor and society as a whole coincide entirely. In a planned economy, the transition to a new capital-intensive technique would be more smooth so that the capital consumption due to obsolescence would be smaller, while in the capitalist economy of the USA this has assumed tremendous proportions in times of depression.

Again in the case of the individual capitalist, capital is reckoned only in terms of interest rates as an item of cost. In the above example, if the net value added per yard is four annas, a monopolist with indefinite borrowing power would surely prefer technique III as long as the interest rate plus depreciation remains less than roughly 40 per cent, which is a very high figure. The same would hold under oligopoly too. Under perfect competition, those who are able to borrow easily, but for whom the volume of sales and the size of the unit are limitations, would prefer technique III (the situation considered by Dr Raj) while those whose capital is limited would prefer technique II. There are many examples of small producers catering for the market with inferior techniques in the phase of expansion during the last war and some of them survive even now because large-scale industry is not yet able to cater for the whole market. It would be uneconomic, however, to keep them going through some kind of subsidy or protection for the only reason that they have performed a useful task at a moment of need.

As we have already noted, owing to institutional arrangements and mainly because of the forced savings policy of Government, the interest rate as a tool for regulating the intensity of investment has lost its force in our mixed economy and does not measure the scarcity of capital in relation to its reproductivity in a proper way. An interest rate of 5 or 6 per cent in a period of rapid increase in industrial production and national income (of the order of 10 per cent) probably underscores the reproductivity of capital and makes it too cheap. A check on investments may be instituted by calculating the surplus for each of the possible variants or techniques, taking into account a fictitious high rate of interest, say 10 per cent or 15 per cent even though the market rate of interest is much lower.



Rentability

This has been one of the methods used by Soviet economists and is called the criterion of rentability ('rentabilost'). Like the criterion of 'rate of economy', this has not been universally approved and adopted in the USSR. However, in the context of a mixed economy, where private investment decisions will also be important and the State cannot fully control these, the criterion of rentability may perhaps be useful as a check on unnecessary capital-intensive investment technique, though the administrative feasibility of such a scheme has to be investigated. It will be impossible to lay down such a general rate of interest from theoretical considerations only. A trial and error method will have to be followed. Thus, if for a given level of rentability, the volume of investment that may be undertaken falls short of the investible funds, which will depend on the possibilities of various kinds of profitable investments, then the rate should be lowered just enough to enable all such funds to be invested. Simultaneously, a vigorous effort should be made to remove imperfection of the capital market by extending credit facilities to a wider circle of business men.

Here's the NEW model

Crystal

It's smarter,
it's smaller
—and costs
much less
and it's got
7 plus features

New, sleek, sophisticated — this 'Crystal' air conditioner occupies no floor space, fits into a window, a skylight or a small space in the wall.

THINK of it! Cool, filtered air to breathe; a quiet atmosphere to work or sleep in; a fresh invigorated feeling — you get them all from the new model 'Crystal', the finest room air conditioner yet made for the Indian climate.

Write to Voltas Limited for details of the new, wonderfully inexpensive 'Crystal'.

For better HEALTH and greater COMFORT

Crystal ROOM AIR CONDITIONER

Full 1 ton capacity

The Problem of Technological Choice

A Rudra

DR RAJ, examining the much-debated question of small scale industries in the context of the second Five-Year Plan, arrives at the conclusion that even if increase in employment be not made an objective in itself and maximisation of the rate of growth of the economy be made the guiding consideration, a case can be made out for small scale industries: that the optimum technique in the sense of one which, when adopted, makes the maximum contribution towards increasing the tempo of development can very well differ from the most advanced technique.

Very few people will differ from the view that the optimum technique, as defined above, is not necessarily the most advanced technique. We, however, differ from Dr. Raj on three things. We differ from him on the method of analysis that leads him to his conclusions; we differ from him on the formula he proposes for the choosing of the optimum technique in any industry; and we differ from him on the point that there is any inevitable contradiction between the choice of advanced techniques and a desire to enlarge employment opportunities.

New Orientation

To start with, we shall give a new orientation to the problem by calling it the problem of technological choice rather than the problem of technological change. Dr. Raj treats the problem in a way that permits him to discuss the introduction of such technical innovations as may further aggravate the employment situation by 'displacing' some workers. While the introduction of new techniques in existing units of production is by no means ruled out in planned development, the problem of 'change', when it may mean a further worsening of the employment situation, is not one which in our opinion is being debated in India in the context of the second Five-Year Plan. The problem relevant to the Plan, as we see it, is as follows. The Plan visualises increased production of different quantities in different industries. The existing units of production are by and large supposed to continue as before. As to the margin of additional production, the question that arises is: 'through what means to realise this?'. There are certain industries where the same production can be obtained through different technological variants promising largely different volumes of employment. It is here that the 'problem of technological choice' arises and expresses itself in the question: which technological variant to choose?

Before we set out on an examination of the problem, we deem it important to clarify two points which Dr. Raj unfortunately leaves a bit vague: firstly, how to measure the 'advancedness' of or want of it in a technique; secondly, what the scope of the problem is like.

A Definition

As to the first, we lay down as a definition that technique A be considered more advanced than technique B with regard to the production of commodity C, if the production of an equal quantity of commodity C (measured in physical units) requires a smaller number of man hours of labour, direct and indirect, if technique A is used than if technique B is used.* Thus, if the commodity C is textile, we have to compare the number of man hours of labour spent to produce a yard of textile through technique A and B, taking into consideration direct labour in weaving as well the indirect labour involved in such input items as yarn, coal or electricity, transport etc. as also in the depreciation of capital.

As to the scope of the problem, theoretically, the question of choice arises in all productive activities. There may be different degrees of automatisation in the manufacturing of steel or in the construction of steam locomotives. This, however, does not come within the range of the present problem, which concerns industries wherein the differences in employment resulting from the adoption of alternative techniques are significantly large and what is more, the employment-giving techniques are such that they allow of small scale production, possibly in tiny units scattered in villages. This, in practice, severely restricts the scope of the problem; as a matter of fact, hardly any other industry except spinning, weaving, food processing, pottery and some leather crafts satisfies the specifications.

It is as well to point out here that the 'scale' of production of a unit and the 'technique' used are not the same thing. Both Dr. Raj's problem and the problem discussed in the present article concern 'technique' and not 'scale'. There seems, however, to be considerable confusion in the proposals made by the protagonists of small scale industries as to 'scale' and 'technique'. It is evidenced by the multiplicity of terms used, viz., "small scale industries', 'cottage industries', 'household industries', 'village industries', 'hand industries' etc. Hand pounding of rice by peasant women in villages and engineering enterprises using power and machine tools, but employing less than ten people (and, therefore, not regarded as factories under the Factory Act) are both being considered as illustrations of what they desire.

Question of Analysis

We shall now come to our difference with Dr. Raj's analysis. According to him, if the objective be the maximisation of the rate of growth of the economy, variant A is to be regarded as superior to variant B if the proportion of the surplus per worker in A to that in B is larger than the proportion of capital per worker in A to that in B; and the optimum technology should be arrived at by subjecting all the competing variants to this comparison.

This criterion is not, however, applicable to our problem for the following reason. The criterion must obviously be applied to industries separately and individually, irrespective of the technological choices made and amounts of investible funds allocated to the other industries. It must therefore be supposed that there is a given **amount of investible fund** allotted to the **particular** industry in question **before the choice is made.** If it be so, the result of the application of Dr Raj's criterion will be to maximise the surplus obtained from the **particular industry in question.** One is, of course, not interested in the surplus accruing from any one industry, but that obtaining in the entire economy. Presumably, Dr. Raj would say that if the same criterion be applied in every field where there is scope for choice, the overall surplus will automatically be maximised.

*There can, however, be several other alternative definitions, all of them being more or less correlated. The capital-output ratio and the capital-labour ratio are two other measures often used as explicatum for the vague concept of the "advancedness" of a technique.

This is correct provided one starts by making an allocation of investible funds to different industries before the technological choices are made. This, however, is not possible. The impossibility can be demonstrated through Dr Raj's own illustrative example. He compares the surpluses to be obtained by investing an equal amount, viz., Rs. 160,000 through three different techniques in the cotton textile industry. He shows that in the case of variant II, there will be employment for 800 workers and a surplus of Rs. 480,000, while the more advanced variant III will give employment only to a single worker and produce a surplus of only Rs. 94,500. What Dr. Raj, however, overlooks is that his calculations imply that the production of cotton textile per day through variant II is 16,000 yds, while that through variant III, is only 1280 yds. Now surely these very different quantities of the same commodity cannot be absorbed by the same market **at the same price.**

Market not Altered

To be accurate, the market does get altered by a change-over from technique III to technique II. Thus, the production of 16,000 yds. through variant II instead of 1,280 yds through variant III means an additional income of Rs. 11,04,000 in the community. But this additional income of Rs. 11,04,000 will not surely be spent all on textile only; for the additional supply of textile in the market is worth precisely this amount, namely, Rs. 11,04,000. Only a part of it would be spent on textile and the rest would make a demand on sundry other consumer goods, including food. The supply of these other consumer goods cannot, however, be made to match this changed demand, as we have assumed that the allocation of investment fund to, and choice of technology for, the other industries are made independently of the textile industry. We have carried out the argument in terms of a closed economy; but generalisation for an open economy is not difficult, as we can similarly argue that the amount of a commodity that the foreign market will absorb cannot change with a change-over from one technology to another any more than the home market can.

The root of the trouble lies, in our opinion, in Dr. Raj's unexplained assumption that the rate of growth of the economy is maximised if one obtains the maximum amount of surplus from a **given industry** to which a given **investment** fund has already been allocated. Before we pass on to what we think is the correct approach to the problem, we give an example of another faulty criterion which also is meant to be applied to industries individually, and is, therefore, very convenient. We have seen that the difficulty in using Dr Raj's criterion is that it ignores the fact that a market can absorb only a given quantity of a commodity at a given price.

Supposing one keeps the production targets fixed and tries to choose technologies in such a way that the pooled surplus from all industries taken together is the maximum, then the criterion of optimality for any given industry will be to choose that technology which yields the maximum amount of surplus **per unit of output.** This criterion will very often lead to the adoption of the most 'advanced technique' in the sense of our definition. Thus, in Dr. Raj's example, if indirect labour per unit of output be assumed to be the same between variants II and III, the latter is more 'advanced' than the former. If we assume that the fixed production target of 1280 yds. per day has to be realised, it can be seen that variant II will yield a surplus of Rs. 38,400 whereas variant III will yield the same amount as before, namely, Rs. 94,500.

But if this criterion does not treat production targets as a function of the choice of technology, it treats the investible fund in the particular industry in question (and therefore the total investible fund) as being determined by the choice of technology. It has, therefore, to be rejected likewise; for the total investible fund is not really variable. It is usually given before the problem of choice of technology is faced.

The problem has, in our opinion, to be posed in the following manner. Given a volume of investible fund for the current year, it must be so distributed in the different industries and a **collective choice** of technologies so made in the different industries that

(i) the industries can grow in a balanced way and
(ii) the aggregate surplus of all the industries, taken together, can grow at the fastest rate.

If industrial surplus be considered the main source of investment, then the rapidest growth of the economy means the rapidest growth of surplus year after year. The investment fund for the current year, therefore, has to be so utilised as to conform to the rapidest possible growth of the surplus. But it cannot be used in any way whatsoever. It must be so distributed as to allow the different industries to produce in a balanced fashion.

Thus, the production of fuel, power and raw materials must equal their input requirements; producer goods must be so produced that they fit in with the allocation of investment funds to different industries as also the replacement requirements of different industries. Then, a given allocation of the investment fund and a given collective choice of technologies in the different industries determine the income generated amongst different classes of consumers; and that determines the amounts purchasers will wish to spend on different consumer commodities. The supply of different consumer goods in physical quantity must maintain certain **proportions** amongst themselves so as to be in harmony with the proportions between different consumer demands.

Optimum collective choice

It is therefore not possible to give any formula for individual choice of the optimum technique for individual industries. There will be an **optimum collective choice,** which will depend on such ratios as the surplus per worker, capital-labour ratio, capital output ratio, rate of amortisation etc. for all the industries and all the different techniques taken together.

It is not, however, our position that nothing can be said as to the particular problem of choice which is being debated in the context of the second Five-Year Plan. We have already seen that the range of industries covered by the problem (e.g. textiles, leather craft, pottery, food processing etc) is very small indeed; further, they are mostly consumer goods industries. As far as these industries are concerned, it can be safely suggested that the choice in these cases must be in favour of 'advanced' technologies. The reasoning is as follows.

In a closed economy where savings amongst wage earners are negligible, the surplus in the consumer goods industries must roughly equal the wages and salaries paid out to the

workers in the producer goods industries. While the share of the national surplus going into the producer goods industries can be and should be increased by reducing wastages of the surplus through unproductive activities of all types, capital export etc., it is fundamentally through the increase of surplus in the consumer goods industries that the number of workers employed in the producer goods industries has to be increased.

The techniques should therefore be so chosen for those consumer goods industries wherein scope for choice exists that the net surplus of the consumer goods industries increases. This will most probably mean choice of such techniques in these industries as will increase the net surplus per unit of output.* This is so because we have to assume that for these selected industries investment have to be so made that the fixed production targets are realised. We have already seen that the industries, where our problem of choice at all exists, are few in number and not very important, compared to the basic industries of the economy, which are agriculture and the heavy industries.

Investment in these two sectors has to be made year by year from considerations of long-term planning; the growth of these two sectors almost completely determines the rate as well as the pattern of growth of the entire economy. The growth of the other industries has to conform to this overall pattern. The investment maturity period in these basic industries being very much larger than in the subsidiary industries, it follows that investment in the latter industries has to keep in view more or less fixed levels of production in the industries in the next few years.

We shall now come to the question of employment. It is curious that only small scale consumer goods industries are discussed in the context of expanding employment opportunities. Yet, if there are economic activities where labour and capital can really substitute each other, they are more to be found in the producer goods industries than the consumer goods industries. Thus, earthenware pottery is not really a substitute for chinaware, and khadi cannot be deemed to satisfy the same consumer needs as mill cloth. But a well dug or a piece of land levelled by human labour is indistinguishable from one dug by a driller or one levelled by a bulldozer.

There is actually plenty of scope for employment in the building industries. Mass application of paid human labour to such activities as building of roads, houses, dams, etc. digging of wells and canals, clearance of forests, filling up of swamps etc. has not been considered seriously as an economic proposition until now.

Let us suppose that we have found out the optimum collective choice of technologies and that they are being applied. The economy is growing in a balanced way, and the overall surplus is growing at the maximum speed subject to conditions of balance. Now year by year the surplus can be utilised for capital formation in two ways: it can be converted into capital goods through the international market or it can be converted into capital goods through local production.

There is, however, a limit to the production of capital goods via the international market because of the objective situations obtaining there; there is also a limit to the local production of capital goods of the type of tools and machinery imposed by the amount of capital stock available in the producer goods sector. If the entire amount of surplus is not at all absorbed in these two ways, the rest can be utilised to give employment through labour intensive activities in the producer goods sector, i.e., constructional activities, and through the expansion of social services. The first will give employment to under-employed peasantry and other unskilled workers; the second to the unemployed middle class. As the fruits of their labour do not enter the market as competing commodities, difficulties of balance will not arise as in the case of consumer goods.

Thus, while the second Five-Year Plan protagonists of small scale industries want to solve the unemployment problem through the introduction of less advanced technologies in a certain number of consumer goods industries, our method of attacking unemployment consists in expanding the surplus in the consumer goods industries rapidly, which, as we have seen, means the very opposite, i.e., the introduction of advanced technologies in the same industries.

If an objection be raised that building activities offer scope to a very specialised type of labour or only to unskilled labour, and therefore cannot be considered seriously as an employment giver, the answer can be that industries like weaving and spinning, which are being currently considered as employment givers, do not offer any wider scope either.

*We have been cautious to use the qualification 'most probably' and not make the flat recommendation that the optimum technique for any one of these industries will be the most advanced available; for, such a definite opinion will contradict our own earlier standpoint that one can only have an optimum collective choice and no optimum individual choices. While, by investing in advanced techniques in the consumer goods industries, we ensure a larger surplus from the consumer goods industries in future years when investments have matured, it may (though not necessarily) mean allocating a larger share of the current investible fund to the consumer goods industries at the cost of the producer goods industries, and that may mean (though not necessarily) retarding the pace of growth of the economy.

THE CENTRAL BANK OF INDIA LIMITED

(Established December, 1911)

Head Office : Mahatma Gandhi Road, Fort, Bombay 1.

Authorised Capital	6,30,00,000
Issued Capital	5,77,50,000

Official Papers

High Investment in Africa

Review of Economic Activity in Africa 1950 to 1954. Department of Economic and Social Affairs, United Nations, New York. Pages 146. Price 11 shillings.

Available from Oxford Book & Stationery Co., Scindia House, New Delhi.

WHEREAS there are separate economic commissions for Europe, Latin America and Asia and the Far East, the United Nations does not have an independent commission of this type for Africa or for the Middle-East. The result is that the department of economic and social affairs of the United Nations is saddled with the responsibility of reviewing economic activities in these areas. The present report has been published as a supplement to "World Economic Report 1953-54" and covers developments for the period from 1950 to 1954. It is a staid document and contents itself with describing rather than analysing the economic developments in the region during that period. One misses in this document that vision and analytical depth which make the economic surveys of Europe and Latin America so delightful to read.

Nevertheless there are two features of the present report which make it particularly interesting. First, it throws light on the expanding volume of investment taking place in this continent and shows how the process of planning started during the war years in many colonial territories has continued during the post-war period with large inflows of capital from the metropolitan countries. Second, the report contains little to indicate an appreciation by the authors of the need to measure development in the region in terms of the welfare of the indigenous peoples. The entire study speaks in terms of agricultural and mineral productions, of fuel and power, and foreign trade and public finance. Of the fact that these are significant only in terms of their impact on the welfare of the people there is little awareness.

One further point might be made. It is well known that in most of the countries or territories that go to form this continent there is a small ruling group of whites and the rest of the population consists mainly the negro or other African peoples. In some of these countries also there are Indians who play a peculiar role in the economy. The report does not even attempt to show what part these different groups of people played in the economic development during this period or what portions of the programme were designed to assist particularly the people of the region itself rather than those who must after all be considered as outsiders.

The report brings out clearly the dominating position of the Union of South Africa in the continent in the sense that it is the most advanced country in the region. More than half of the total electrical power generated in Africa for instance —in spite of the fact that the first phase of the Oven Falls hydro-electric schemes in Uganda has been completed and new hydro-electric plants have commenced operation in Northern Africa—was generated in the Union of South Africa. Again, while there has been a significant expansion of manufacturing activity since 1950 throughout the continent a greater part of this expansion took place in South Africa with the Federation of Rhodesia and Nyasaland where also industrialisation was already well establishd coming a poor second.

The study ascribes the expansion of economic activity in Africa primarily to two factors, the generally well sustained demand for African exports, and the comparatively high level of investment, both public and private. The role played by the Korean hostilities in raising the prices of primary commodities all over the world is well known but the prices of commodities in Africa appeared to have been maintained even thereafter and the African territories have gained substantially from this. It is the high level of investment which, however, attracts attention from the point of view of economic development. The report devotes a separate chapter to an examination of the sources of funds for such investment and the patterns of investment that prevailed during this period.

The total volume of investment in Africa could not be estimated for lack of data but there are indications that there has been an appreciable increase since 1950. The upward trends became evident particularly from 1951 but the fact that private investment also showed an upward trend during this period makes it difficult to estimate its actual impact. Various foreign countries directly interested in African territories played a large part in supplying funds but some amount of capital was also available from the United States which has no direct stake in this continent. African territories also received loans totaling over 200 million dollars from the International Bank of Reconstruction and Development during this period.

The high level of public investment in most African territories was itself linked to the favourable trade position which these countries enjoyed. Some of these countries through their marketing boards absorbed a large part of the difference between high prices prevailing in the world and the low prices which were stabilized within the territories. Even otherwise since many of the tax sources of African Government are related to the state of foreign trade these governments were able to obtain large budget surpluses which were increasingly turned inwards towards internal development. The report notes, however, that in some cases the surplus of funds did not assist these countries to extend investments because of shortages of qualified personnel and other essential factors of production. This is a point to which the report refers more than once. As a result, these surpluses were held abroad, mainly in the respective metropolitan countries.

Since it is often argued that colonial territories are being exploited it is interesting to note to what extent metropolitan countries proved to be sources of funds for investment in their territories. France, it appears, accepts responsibility for all scientific research, two thirds of the social development expenditure and one half of the economic development expenditure. While the remainder is provided by the territories themselves, even this portion is frequently financed at low rates of interest from a special Fund for Overseas Finance which in turn is assisted by grants and advances

from the metropolitan budget. This fund, together with certain French banks, also makes loans to private and semi-public companies in French African areas. In 1952 and 1953, France provided 76 and 80 per cent respectively of the investment in its overseas territories. In British territories the greater part of current capital development is being financed from resources of the respective territories or from loans made from the Colonial Development and Welfare Funds, which accounted for one fifth of the total investment during this period. Only Belgium does not play any significant part in financing development investment in its territory in Africa, the Belgium Congo.

The development plans undertaken in African dependent territories since the war aim to develop existing production and to encourage new forms of wealth with the object of raising the living standards of the indigenous inhabitants. In the initial stages, emphasis was placed on the development of basic facilities such as energy resources, communications and port facilities. This was as it should be, for it has been repeatedly pointed out that inadequacies in this field have caused bottlenecks holding up other projects. This initial investment therefore has given these territories a certain elasticity which will enable them to respond quickly as demand increases under pressure of investment.

In the future, however, while further expansion in this field is undoubtdly required, it has been found necessary to shift the emphasis to other fields in which returns will be larger and quicker. The reason for this shift is to be found in the recurrent charges on the economy which arise from the already implemented plans and the programmes of social service which have already been started. It is essential obviously to balance these recurrent items of expenditure by new sources of revenue in order to ensure that the programme does not falter in the future.

While the approach of the report to these problems of investment seems to be on the right lines, there is, one must repeat, no attempt to relate the pattern of investment to the peculiar needs of the indigenous peoples themselves. There is no attempt to show in what way these programmes and projects will help the people of the region to lift themselvs to higher levels of living. No attempt is made, again, to indicate how these people can play a greater part in the process of social and economic change which this investment must stimulate if it is not to be ultimtely frustrated. Speaking in terms of the amount of money that is to be invested or has been invested or in terms of increase in the volume of exports or imports of mineral production or power supply, it does not throw light on the advantages that these people can derive from these changes or how this will help them to be a little better off than they are today.

Symptomatic of this lack of feeling for the humanity that is to undergo the process of economic development is the treatment of problems of labour in the separate chapter devoted to the subject. The report merely brings together what little data are available about trends in employment, wages and levels of living during this five year period. It points out for instance that in all territories the proportion of wage earners in the total population tends to increase as cash earning activities increase.

What significance, one may ask, should be attached to this fact? Should one consider it a desirable objective of economic policy to bring a larger proportion of the total population into the wage-earning class? Or for that matter, should one necessarily conclude that because a large proportion of activities in advanced countries are carried out through the money economy that it is desirable in itself to increase cash earning activities? And, if it is true as this report points out that one is linked to the other, in what way would it be possible to allow for an approach to the problem of economic development in which one could consider it desirable to increase the proportion of cash earning activities and yet not necessarily approve of an increase in the proportion of wage earners? The authors of this report do not appear to be troubled by any question of this kind.

The study of this report, therefore, leaves one to wonder what purpose is served by the publication of a report which describes but does not analyse. No doubt the facts are made available for others to analyse if they so desire. But surely that is not enough. One would like to hope that the economic problems of Africa would obtain the same kind of treatment that those of Europe have had so far under the masterful direction of Prof Gunnar Myrdal. In the meantime one has to make do with this purely factual survey.

Erratic Movements

Wednesday, Evening

THREE factors have helped the stock market to steady up in the last few days. Industrialists are happy that existing private industries will not be nationalised. This has encouraged scrips. Speculative activity has been encouraged by the introduction of the Bill to amend the Reserve Bank Act. Technical factors have helped the spurt in equities in the current week.

A feature of recent trading on the stock market here has been the activity in mining shares. Since the assurance, contained in the new industrial policy, that existing industries will not be nationalised, mining shares have met with buying enquiries. There were fears that, in consonance with the Government's policy of nationalising mining and mineral resources, even existing mining companies may be nationalised. With the removal of such fears, mining shares are being bought.

By far the most important influence behind the recent spurt in equities has been the Bill to amend the Reserve Bank Act. Provisions of the amending Bill have been interpreted to mean that the monetary authorities are making active preparations to expand currency. Even as the proposal to revalue gold has had a psychologically bullish effect on the bullion market, the move to enable the Reserve Bank to expand currency according to the needs of the second Plan has had an inflationary impact on stock markets.

There is, however, the other side of the coin. Under the amending Bill, the Reserve Bank is empowered to change the reserve requirements of scheduled banks. Even now, certain percentages of demand and time liabilities of scheduled banks have to be kept as balances with the Reserve Bank. These reserve regulations will be tightened to immobilise excess banking resources as well as to enhance the Reserve Bank's direct control over bank audits.

Some weeks ago, the Reserve Bank issued a directive to scheduled banks to submit fortnightly details about their advances. This directive was meant to ensure qualitative control of bank credits. It might not be a mere coincidence that the fall in equities started immediately after the issue of this directive. But recent banking statistics confirm the need for quantitative control over bank credit also. This is the aim of some of the provisions of the amending Bill. So far stock markets are concerned, the Bill's clauses relating to banks' reserve requirements would seem to cancel out the implications of currency expansion.

Few will question the need for effective control over bank credits. In this context, a significant development may be discussed. Since the end of 1953, bank deposits have started to increase along with currency expansion as a sequel to deficit financing. In the last ten months, however, the rate of increase in bank deposits has lagged considerably behind the rate of currency expansion. There is the problem of leakage which has to be tackled. And the provisions of the amending Bill are not likely to stop this leakage.

In the main, the spurt in equities is confined to speculative scrips included in the forward list. It is natural that speculative shares will respond promptly to expectations of massive currency expansion. But there are other factors which are helping the rise in forward shares. In the last few months, "budla" charges have been heavy. This has discouraged bullish activity. After the end of the last settlement, "budla" charges disappeared suddenly. In consequence, bears were forced to cover their sales.

What has happened to Indian Iron, is an interesting technical factor in relation to stock markets. During the fall in Indian Iron in the last six months, a considerable bear position has been built up in this scrip. A bull syndicate recently decided to take delivery of their purchases. This has led to a bear squeeze. Bears are being forced to cover their sales in order to square up their books. Indian Iron are, therefore, moving up. But it is of interest to note that other forward shares are not moving up as much or as fast as Indian Iron.

Since the announcement of the new industrial policy, there have been some buying enquiries for jute shares. Jute is one of the few industries which is not included in the current or prospective nationalisation plans of the Government. This may have caused the revival of demand, after a long time, for Jute shares. But the demand is neither firm nor consistent. In recent months, stocks of jute goods are piling up. Increasing mill stocks are having a depressing effect on both goods and Jute shares.

In the last few days, there has been demand for Papers and Coal shares also. Opinion differs as to whether the scope allowed to private colliery-owners for expansion during the second Plan period is adequate. There may not be a further fall in Coal shares, but the prospect remains uncertain. More encouraging are the prospects for Paper shares. These shares have been moving up in the last few days. Investors are still cautious. But they seem to be in a mood to acquire Paper shares at all set-backs.

"One has no protecting power save prudence."

Juvenal.

Operators Reconciled to New Policy

Thursday, Morning.

THE performance of the market during the week under review demonstrated clearly that operators have reconciled themselves to the new Industrial Policy despite the admitted fact that it has thrown open a larger area to the public sector. The absence of any rigidity in implementing this policy within a given time limit and scope given to the private sector to contribute its quota to the development of the country seem to have tipped the scales in favour of investors.

The stock market also derived inspiration from the rising trend in prices at the Ahmedabad share market, as also from strong advices from Calcutta. The result was that industrials advanced on professional support and in almost all cases, particularly in textiles, they reached the highest levels previously established this year, which in most cases were recorded on the last day of March.

The new bullish fervour in the Ahmedabad share market has been mainly attributed to the appreciable reduction in the managing agency commission of companies. It is well known that textile mills have been doing well with most of them having sold their products upto August. Although the price of raw cotton has been rising, the performance of the textile mills is not expected to be adversely affected, at any rate not to a marked extent, thanks to the steadily rising prices of piecegoods.

The new account from Monday commenced on a strong note. Bulls were encouraged to tighten their holdings, thanks to sustained support from Ahmedabad and Calcutta. The fear that "budla" charges would be high did not materialise and fed speculative instincts in the market, with the result that gains were recorded on a wide front.

A notable event during the week has been the announcement by the Board of Directors of the Associated Cement Companies that they have decided to issue new shares of Rs 100|- each at a premium of Rs 20|- per share in the proportion of one such share for every two shares. This is in accordance with the conditions specified by the Controller of Capital Issues, but is subject to the approval of the shareholders. As a result, the shares of ACC went up from Rs 215, the ruling rate at one point during the week, to Rs 224 which is only one rupee below the highest reached on March 31, 1956.

Another feature of the market was the sudden spurt in Indian Irons on the last day when they closed at the highest level of Rs 37|1. Business to the extent of 100,000 shares is said to have been transacted during the week.

While all the leading scrips were uniformly strong, the exception was provided by Ahmedabad Electrics, which made history during the week by quoting below par at Rs 96|14. The utter indifference of investors to these shares was evidenced by the absence of any demand even at this low level. Sentiment seemed to have been dampered by the increasing control that the State has been exercising over the electricity industry. With such a low return as that provided by the standard rate of 5½ per cent, the industry cannot be expected to raise the required finance for its expansion programme which is estimated to cost Rs 50 crores. It is no wonder, therefore, that electric shares which were once regarded as equivalent to gilt-edged, have had now to succumb to the humiliating position of quoting below par.

Cotton

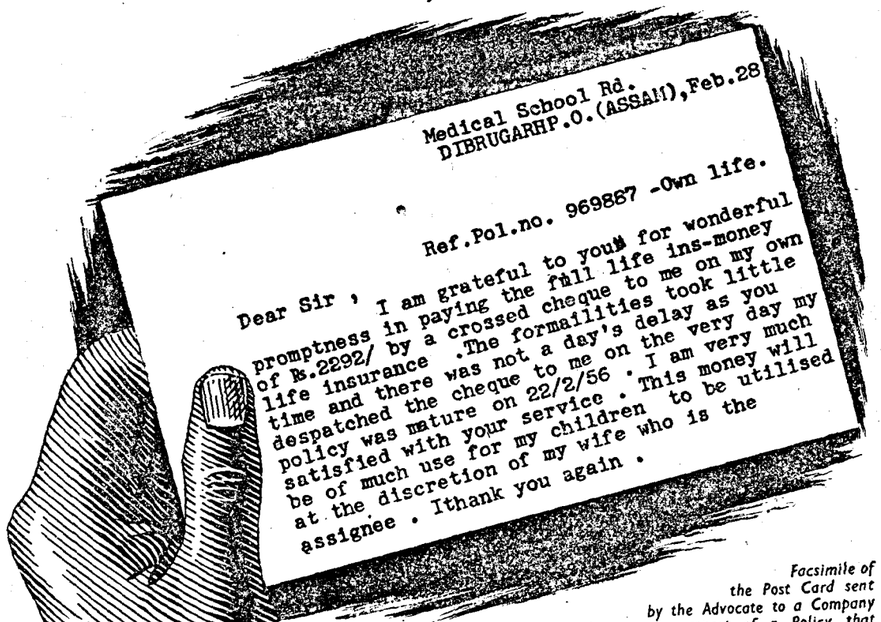
Controversy Unresolved

WITH the resignation of Shri Purshotamdas Thakurdas and Shri Chimanlal Parikh, the President and Vice-President respectively of the East India Cotton Association, it is now generally believed that it would be easy for the Forward Markets Commission to effect a resumption of forward trading in cotton, if it so chooses. From the now familiar, "eleven letters", which incidentally seem to hold the key to the solution of the cotton problem, it is clear, however, that the differences of opinion between the Forward Markets Commission and the East India Cotton Association are so strong and on such vital and fundamental issues that it is hardly likely that the two bodies would be able to arrive at a compromise.

The Forward Markets Commission has now issued to the press what is styled as a background note to the cotton controversy. The underlying object of this note is obviously to clear the Forward Markets Commission from ony responsibility for the cotton crisis and to put the blame for everything squarely on the East India Cotton Association.

Whatever the merits of the arguments advanced for and against the view expressed by the two parties to the controversy, it is clear that serious thought should be directed towards finding a lasting solution of the problem. If the Commission has really never taken a rigid stand on any proposal and has been prepared to modify it in the light of discussions, the trade would be justified in expecting it to come forward with constructive suggestions now for evolving a "pattern of organisation and trading which would be in the best interests of the trade and in the public interest."

Oilseeds



Firm Trend Again

IN sharp contrast to the position during the past two weeks, the oilseeds market presented a firm trend during the week. Thanks to strong speculative support, prices of groundnut, linseed and castor-seeds advanced steadily. Castorseeds in particular, worked up to new peaks on speculative support following keen demand from America for castor oil even at rising prices. Although export business cannot be expected to be of considerable size, thanks to the rise in export duty on castor oil, the mere fact that America is willing to go for Indian oil at rising levels was a factor bullish enough for prices to improve by leaps and bounds.

In the case of linseed oil, there were hopes, dismissed as wishful thinking by knowledgeable quarters, that the authorities would shortly reduce the export duty on linseed oil. This gave a fillip to linseed prices which moved up to make handsome gains. Towards the close of the week, some damper was applied when it was strongly rumoured that Government might altogether ban the export of castor oil. Consequently, there was a setback, but prices in general were well above the previous week's closing level.

Company Notes

Brooke Bond

ONE of the possible consequences of the new Companies Act may be that Brooke Bond India Private Limited, while continuing in the office of managing agents of Brooke Bond Estates India, Ltd., or its associates, may not be entitled to buy teas for the Company either in the Calcutta auctions or elsewhere. If Brooke Bond India Private Limited, or companies of the Brooke Bond group do not function as buyers of the Company's teas, the prices realised may be adversely affected. That is why Brooke Bond India Private Limited have resigned from the office of managing agents from March 31, 1956.

Over fifty per cent of the Company's shares are still owned by the Brooke Bond group of companies. They will continue to own their holdings. It is proposed by the directors that the Company should enter into a selling agency agreement with Brooke Bond India Private Limited, so as to retain its valuable tea-tasting and marketing services, under which the latter would be the sole selling agents of the products of the Company.

Brooke Bond India Private Limited will be paid one per cent on the gross sale proceeds, less brokerage incurred, of all teas sold by the Company. This arrangement, it is assumed will be less costly to the Company in comparison with the remuneration previously payable by it to Brooke Bond India Private Limited as managing agents, or with that which would have to be paid under the provisions of the new Companies Act had the former managing agents continued to function as managing agents.

Bharatia Electric

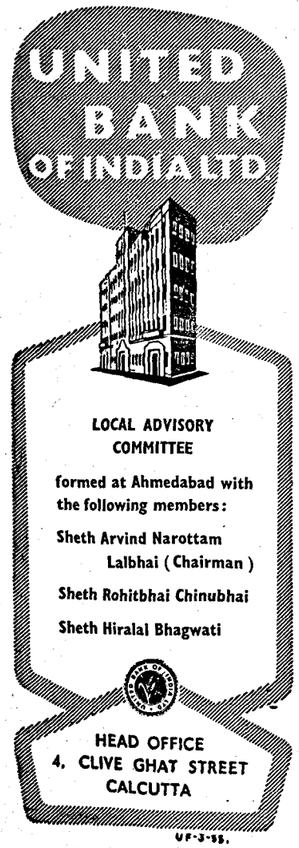
IN the report of the Bharatia Electrical Steel Company, Ltd. for the year to December last, the directors observe that the steel foundry division of the Ballygunge works has made progress. Due to growing requirements of wagon builders, the demand for steel castings is expanding. During the year under report, there was further capital investment at the Khardah works. This plant is expected to manufacture 10,000 tons of finished goods per month.

Bharatia Electric's profits were higher. There was an increase in the dividend of four annas to Rs 1-4 per share. Depreciation allowances was higher. So was the carry-forward. But the allocation for taxation reserves was lower.

Air-Conditioning Corpn.

MESSRS. Gillanders Arbuthnot & Company Limited, have relinquished the Managing Agency of The Air Conditioning Corporation Private Limited, from the 1st of April, 1956. The Corporation has now become a wholly owned subsidiary of The Orient Paper Mills Limited (Managing Agents: M/s. Birla Brothers) and is being run as a director controlled company. Mr J C Kapur will continue as a Director of the Corporation.

The Corporation was founded in the year 1930 and has since played a pioneering role in the development of the refrigeration and air conditioning business in India. In view of its recent re-organisation, and large financial backing, the Corporation proposes to expand considerably its Engineering, Contracting and Manufacturing activities. The manufacturing programme includes room air conditioners, railway air conditioning equipment, industrial blower fans, and other items of heavier refrigeration and air conditioning equipment. To implement these plans, the Corporation is entering into manufacturing agreement with their principals, Messrs. The York Corporation, U.S.A.; Messrs. Buffalo Forge Company, U.S.A.; and Messrs. The Safety Car Heating & Lighting Company, U.S.A.



The recent re-organisation of the Corporation promises to be an important step in the development of the refrigeration and air conditioning Industry in India.

Dunlop Rubber Company of England

The following are the trading results of the Dunlop Rubber Co. of England for the year 1955.

	1955	1954
Net Profit after taxation	2,857,531	2,902,972
Transfer to General Reserve	850,000	1,000,000
Preference Dividends	451,447	364,506
Ordinary Dividend	14 per cent*	14 per cent
Carry forward	1,498,490	1,494,523

* of which 4 per cent was paid as an interim in the month of December in each year.

Kerb Trading In Shares

K D Umrigar

KERB trading in stocks and shares, particularly in Bombay and Calcutta, has been on the increase for the last four years. It is, in fact, being carried on vigorously by operators because of the inability of the stock exchange authorities to take any action against them. It is "another form of stock exchange" where business, albeit illegal, in only selected scrips, a dozen or so, is transacted almost every day without hindrance. The volume of business is quite as large as that which is normally done inside the trade halls of the Stock Exchanges.

Unauthorised business before and after the official hours of transactions is bound to continue so long as speculators wish to gamble. It is true that there are a fairly large number on the Bombay and Calcutta Stock Exchanges. It is also true that these persons many a time ensnare unwary investors.

"We do not at all recognise illegal transactions and have repeatedly warned bona fide investors to keep away from the place where unauthorisd persons do business", said a Bombay Stock Exchange official. He told me that kerb trading could not effectively be stopped so long as the present law was not amended. "At present, it is beyond our control to check this sort of trading." That being the position, irresponsible speculators continue to play ducks and drakes with other people's monies. There have been instances in the past when the authorities have levied fines on certified brokers found guilty of doing such transactions, but the punishment has had no effect whatsoever on the culprits.

On the other hand, it is felt in business circles that it is because of the leniency being shown by the authorities that excessive speculation is increasing day by day. In other parts of the world unauthorised business is kept within narrow limits because of the constant vigilance of the officials who are empowered to check illegal trading.

Stringent Clauses

Stock Exchange authorities are most anxious to abolish illegal business lock, stock and barrel, and have actually suggested that stringent clauses be inserted in the Securities Contracts Bill (1954), now before Parliament. The effect of the suggestion, if adopted, would be the absolute prevention of persons from joining, gathering or assisting in gathering "at any place other than the place of business specified in the bye-laws of a recognised exchange, any person or persons for making bids or offers or for entering into or performing any contract in contravention of any of the provisions of this Act." And this offence will be punishable for "a term which may extend to one year's imprisonment or with fine or with both."

Proposal Rejected

I gather that such a clause was, in fact, proposed by the Bombay Stock Exchange to the Bombay Government in 1947 when the Act, which provides for the regulation and control of forward contracts for prohibition of options and certain other transactions in the Province of Bombay, was before the local legislature, but the proposal was, for some reason or other, turned down. From this, it is clear that there is no question of leniency being shown by the Stock Exchange to kerb traders. It is because of its utter helplessness to take action against them that lucrative business is being carried on in Dalal Street. It is the earnest desire of every one interested in genuine trading that Parliament should not lose further time in passing the Securities Contracts Bill so that the new Act may strengthen the authorities in exercising better control over "street trading".

Some years ago, kerb trading was not so brisk as it is today. In those days, such business was mainly transacted on the telephone between certified brokers and outsiders, and it was only when sensational news saw the light of day that they gave vent to their feelings by carrying on their transactions in the open. As this went on persistently, the Stock Exchange appointed a vigilance committee, but the "rank speculators"were more than a match for the committee, with the result that it had to give up its detection activities.

It appears that it is very difficult to detect really guilty parties, who might either be certified brokers or outsiders. Very often, it is the outsiders, who take undue advantage of unauthorised business done through intermediaries. Moreover, such transactions are seldom recorded in the books of the parties concerned in the usual way. Hence, it is impossible to take any steps against the "street traders" who are beyond the control of the Stock Exchange.

It must be within the recollection of business men that some time ago the Bombay Police rounded up a party of speculators in Dalal Street for causing obstruction to traffic; they ran helter-skelter and some of them evn tried to seek refuge in the compound of the Stock Exchange, but were driven out by the authorities.

Two Questions

Is it possible to extend the official hours of trade so as to minimise street gambling? Should not the local newspapers refrain from giving publicity to kerb quotations, as these tend to encourage more and more "street traders?" These questions are, indeed, relevant to the problem with which the Stock Exchange is faced. I am told that if the period of official business were extended even by an hour, it would lead to accumulation of work and also inflict unnecessary hardship on the brokers' clerks. Some years ago, the clerks threatened to go on strike as they were asked by their employers to complete their work within a specified time. Fortunately, the crisis was averted by the timely action of the Stock Exchange.

If the newspapers stopped publishing kerb quotations, which cannot possibly be relied upon, there would be, to some extent, less encouragement to "street traders" and consequently less illegal transactions. One wonders whether the press will co-operate with the Stock Exchange which strongly feels that such publicity should be stopped in the best interest of healthy trade. About a decade ago, few newspapers ever published kerb quotations. It is, therefore, suggested that nothing would be lost if they respected the wishes of the Exchange; "let them try out an experiment at least for some time and watch the result."

On their part, the Government of India should also speed up legislation which will undoubtedly have effective control over what is nothing short of "street gambling".
