However, according to Mr Li Fu-chin, Vice President of the State Council and Chairman of the State Planning Commission, proportion of investment in the first Five Year Plan to national income would amount to 22 per cent and not 11 or 12 which is, it is admitted, lower than the proportion in the Soviet Union (25 per cent) but can bear comparison with the latter and also with similar ratios in the Eastern European countries. The basis for this calculation are not given in the report of Mr Li Fu-chin, and it is therefore not possible to check how correct it is; but assuming that this calculation is not far out (and we have no reason to make a contrary assumption), it gives a more dependable basis for comparison than the one which Dr Raj has taken in the statement referred to above. As stated later historical and the existing conditions in the two countries are so very different that any comparison of this sort cannot but have inherent in it serious reservations. It is but fair that the magnitude and scale of China's effort in carrying out her development programme should receive its due appreciation and the reasons why she has been able to rise to the needs of her national economy understood, with insight into the process at work in that country.

In Absolute Terms

In absolute terms the volume of investment in China is even more impressive than the rate of its value to her national income. China has invested (in terms of Indian currency) in construction i e acquisition of production material assets from 1950 to 1955 Rs 10,452 crores and including the estimated expenditure for 1956, Rs 13,534 crores. If it is assumed that the expenditure on construction in 1957 would be of the same order as in 1956—in fact it is likely to be higher—the total expenditure for 8 years (1950 to 1958) may be taken to be Rs 17,000 crores, and in the first five year plan period, about Rs 14,000 crores. The value of Soviet aid during this period (and that is the only foreign assistance which China has received) was less than one-seventh of the total expenditure, which in fact is largely counterbalanced by the aid China has given to Viet Nam and North Korea. Therefore it may be assumed that her total expenditure on capital assets under the First Five Year Plan would amount to Rs 12,000 crores.

This is not, however, her total expenditure on development. Of the estimated expenditure under the plan, construction accounted for 55 per cent of the total development expenditure, and if this proportion is taken to hold good for the actual expenditure, the total planned development expenditure for 1953-1957 may be taken to be nearly Rs 22,000

crores. If the Chinese Planning Commission calculation of the rate of development expenditure to national income is taken to be correct, China's total national income for the plan period may be taken to be Rs 100,000 crores and average annual income Rs 20,000 crores. China, during this period can be taken to have spent Rs 4400 crores every year on development which is only Rs 400 crores less than the development expenditure in the public sector proposed under our plan; and if the investment in private sector is added, development expenditure in China's first five year plan is three times the proposed development expenditure in the second five year plan in India.

Expenditure Matched by Revenue

This expenditure is being almost entirely met from the revenue receipts of the Chinese Government, and more than two-thirds of these receipts are accounted for by the profits and tax-payments of public or semi-public enterprises. There has been no deficit financing in China. All the budgets have been surplus budgets since 1952 and the surpluses have been largely used to build up revolving fund and reduction of bank loan incurred during 1949-50. These are rough estimates, but as no better estimates are available or can be framed, broadly speaking they do give a measure of the accumulation of capital and investment of resources in the Chinese economy.

The Chinese view is that the key to the understanding of the reasons which have made this scale of investment in the national economy possible in China lies in the revolutionary changes which have occurred in the social structure of the country; and that, investment on this scale has involved a large measure of abstinence on the part of the Chinese people, but it has not involved any serious deprivation; and that, in spite of this scale of investment, there has taken place very material improvement in the standard of living and well-being of the chinese people. This view is entitled to serious consideration, and unbiased approach to the development programme of China requires that the factual basis of this view should not be treated with undue skepticism.

Defence expenditure of China has greatly added to the strain of this large-scale investment. The ratio of defence expenditure to total expenditure has fallen from 26 per cent in 1952 to 19.5 in 1956, but in aggregate, the expenditure has increased by nearly seventy per cent during this period and in 1956 it amounted to nearly Rs 1,200 crores or nearly six times the size of defence expenditure in India. Assuming that this heavy defence expenditure is an incident in the risks to which China has been and is exposed owing to the international situation being what it is, its burden is a measure of the surplus for development which could be made available if there is a real and lasting relaxation of international tensions. At present it is an index of the serious limitations under which China is carrying out her development programme, and also a measure of the capacity of her people to contribute to the promotion of their social well-being.

Compare the Targets

The other points made by Dr Raj in regard to the comparison of the two plans also call for examination, but have to be dealt with even more briefly owing to the limits of space. The targets for specific commodities are of importance, but it is desirable to take the quantities and not the rates in appraising the comparative position.

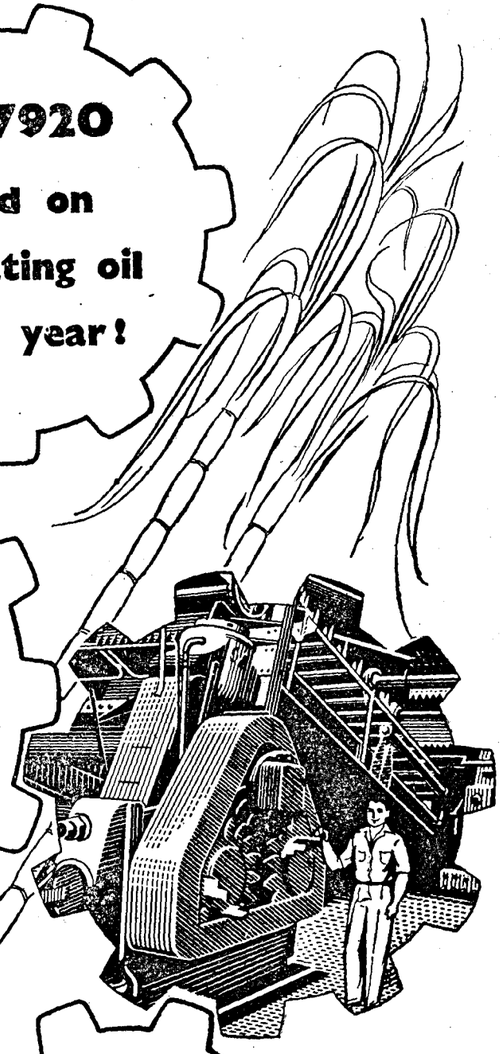
Taking food grain for example, the contrast between the position in India and China is very significant. Even the pre-war output of foodgrains in China was estimated to be 150 million tons. It fell to 113 million tons in 1949, rose to 163 million in 1952 and to 184 million tons in 1956 and the target for 1957 is 192 million tons, an increase of 17.6 per cent above the 1952 level and, what is more significant, by 29 million tons. Our target of production of food grains including pulses for 1961 is 75 millions, which means an increase of 15 per cent or 10 million tons. Even if the target is revised and an increase of 25 per cent is in fact attained, the additional production would be only 16 million tons. India's population is nearly three-fifths of the population of China, but target of production of foodgrains in India four years after the completion of the 1st Chinese plan would be only two-fifths of the output in China in 1957. Targets for the production of cotton, jute, tobacco, sugar cane and beet and oil seeds in China are lower than the Indian targets, but a very rapid rate of increase has been and is being maintained.

Rural Economy Transformed

In assessing the agricultural position, the fact of effective public control over distribution and prices of agricultural commodities in China has also to be taken into account. There are no problems of large-scale hoarding in China, speculation has all but disappeared, prices of agricultural and non-agricultural commodities have since 1951 been stable and regulated with a view to changing the terms of exchange in favour of the agriculturist and what is most significant, 90 per cent of the agricultural households have already joined the co-operatives, of whom over 60 per cent are in the collectives i e socialist transformation is complete in their case and property rights have been practically extinguished.

The content of the agricultural plan for all these reasons in China and India are very different even though percentage increase of production may, in some cases, be nearly the same. The whole rural economy of China has been re-organized, the old relations have been re-placed by now and far healthier relations and new patterns of re-actions, responses and behaviour is being developed. Time will show whether the rapidity with which this change has been brought about means to any extent forcing the pace and use of coercive methods. Voluntary basis of this change is being affirmed and re-affirmed though, it is admitted, lapses in this respect have occurred and are occurring. Assuming, however, that by and large, the transformation is based on consent, its significance from the point of view of conception and execution of the the Plan obviously is profound and it makes all the difference even if the ratios of planned increase in agricultural production are about the same. This change has meant in practice extension of irrigation on local initiative and with local enterprise,large investment not included in national figures of investment and, release of energy and more efficient use of manpower for various projects of local importance and for health, education and other social drives. The new spirit which is at work in the villages of China is, it need not be said, of fundamental importance for economic development but cannot be measured in financial terms. All this is in the Plan, but most of it is in the region of the

Rs. 7920 saved on lubricating oil every year!



A REQUEST to Standard-Vacuum took one of our lubricating engineers to a sugar mill in Northern India. There he found that 40 lb *of the wrong kind* of mill roll oil were being used every eight-hour shift — to keep the bearings running cool.

Our expert recommended the proper MOBIL Lubricant, and today the mill uses just 12 lb every eight-hour shift. The savings over one year come to Rs 7920 — and the bearings run cool as ever!

Choosing the right grade

Our experts are backed by the world's greatest lubrication experience, 90 years of it. Besides, they have the right oils to work with — a full range of MOBIL Industrial Lubricants! No wonder they can give you correct lubrication, with the right grade of oil.

MOBIL Lubricants have been developed through tireless research, and they are constantly being improved. When our expert says: "Use MOBIL Lubricants", he is offering your machinery the finest protection that science can devise, or money can buy.

Correct lubrication is a matter for experts.

Our advisory service is free — why not ask us to help you?

STANDARD-VACUUM OIL COMPANY (Incorporated in the U.S.A. with Limited liability)

intangible and is the more significant on that account.

Pattern of Industrial Development

In comparing the targets of industrial production again, the element of socialist transformation is also of basic importance. The private sector accounted for only 16 per cent of total industrial production in 1955, the rest being accounted for by state (63 per cent), co-operatives (5 per cent) and joint enterprises with effective public control (16 per cent). Private enterprise in March 1956 was further reduced to 8 per cent and by the end of the year it will practically cease to exist in China in her industrial economy and large-scale organized industries would be completely integrated in the socialist economy in the making. The priority scale in India also places heavy industries on top but heavy industries like automobiles, cement, heavy chemicals, sugar, textile and paper machinery are mostly in the private sector and for a long time private enterprise would retain a dominant position in regard to them. Targets of industrial production in the more important industries in China for 1957, as compared with those of India (in brackets) for 1961 are for steel 4.12 million tons (4.3 million tons), coal 113 millions (60 millions), cement 6 millions (13 millions) and mill sugar 0.69 millions (2.3 millions) and mill made cloth 6,520 million yards (5,500 mn. yds.)

There is provision in the Chinese Plan for producing, as Dr Raj has pointed out, tractors, power generating equipment, various types of mining and metallurgical machinery and equipment for setting up integrated iron and steel works. This gives to the Chinese plan an advantage which is sure to give cumulative results of great importance, and the fact that these industries are all in the public sector would, of course, strengthen the regulatory power of the state over the entire national economy. The targets of industrial production for 1957 are, as a matter of fact, expected to be revised in 1956 and the development in China in the next four years would have to be taken into account in order that our level of industrial production in 1961 and her achievements may be really comparable. If the present rate of industrial development is maintained (the rate for the first four years is estimated to be 18.7 per cent) China could very well catch up with India in regard to the industries in which it has to make up the leeway and in major industries like steel, coal, chemicals and machine making, it would be very much ahead of us.

Apart from the fact that public enterprise would be comprehensive in industries, active participation of labour in industrial development, rapid promotion of work to managerial positions in industries, which carry salaries less than one-tenth of the scales common in this country, and geographical decentralisation of industries are other features of the planned industrial development of China which give it a deeper significance from the stand-point of the development of socialist economy. Productivity of labour is rising rapidly and this is due, besides material improvement in technical equipment and planned provision for raising the technical attainments of workers, to the role which has been assigned to labour in the development and operation of industries. Labour not only carries out the programme of development but supervises its implementation and plays an important part in developing technique and reduction and avoidance of waste.

China Co-ordinates Transport

A legacy of the past, communications have been particularly backward in China, but thier importance is duly appreciated. Though in China transport and communications would in the first five year plan account for 19.2 per cent of the total outlay as compared with 28.9 per cent in India's second plan, the total expenditure on this head would amount to Rs 1,640 crores compared with Rs 1,385 crores in India. China is not only going to spend large amounts on communications, but it will utilize them to the fullest advantage and realise a very large measure of co-ordination in the process between different means of transportation. Freight traffic is receiving greater attention than passenger traffic. Even so, the increase in passenger traffic in 1957 as compared with 1952 will be 59 per cent on railways, 78 per cent on inland waterways, 140 per cent on coastal shipping and 300 per cent on motor lorries. Increase in freight on railways would be 100 per cent by 1957, on inland waterways 300 per cent, on coastal shipping 190 per cent, and on motor transport 300 per cent. In India Rs 900 crores out of Rs 1,385 crores are to be spent on railways, Rs 246 crores on roads, Rs 17 crores on road transport, Rs 48 crores on shipping and only Rs 3 crores on inland water transport.

We have not as yet realised the importance of co-ordination in the development of transport and have only come to the stage, according to our Planning Commission, of having the problem examined by an expert committee. In India 842 miles of new lines are to be laid under the second five year plan and 900 miles of national highways are to be constructed. In China 4,625 kilometres of rail line would be completed by 1956 and 13,664 kilometres of national highways. This programme includes the important railway from Lanchow to Sinkiang and the two highways from China to Tibet. Even after the implementation of this programme, China will be more backward than India in respect of communications. Being keenly aware of this, China is carrying out the programme of transport development with vigour and determination and using the available resources with great skill and understanding.

Hesitant Trend

Wednesday Evening

PRICE fluctuations in equities in recent days indicated lack of fresh buyers. There has been some sizable set-back in clearing shares. Demand for Jute shares has subsided. Tea shares have, again become inactive. Engineering shares remain quiet but steady. Only Paper shares and some groups of Miscellaneous scrips like Aluminium shares continue to be firm. Easiness in speculative shares is partly due to settlement considerations. As clearing shares climbed down, equities in general turned hesitant.

Apart from settlement considerations, it is somewhat surprising that share values have declined in the last few days For one thing, the Suez Canal crisis persists. The Cyprus build-up is ominous. Though talks are going on between President Nasser and Mr Menzies, the former has made it clear that international control of the Canal is out of the question. At the same time, Mr Menzies has taken pains to emphasize that he has no mandate to discuss any alternative plan for the solution of the Suez Canal crisis.

Canal Crisis

Political commentators do not seem pessimistic about the Canal issue. They have doubts about Egypt's acceptance of the 17-nation plan for international control. But they do not anticipate any armed clash on this issue. For one thing, this is the election year in America. That is why, Washington is so anxious to evolve a peaceful solution of the Canal crisis. Nor does Russia seem interested in fanning war flames in west Asia. But Britain and France seem determined to have international control even at the risk of a war.

May be, Britain and France are hoping that a limited war would achieve the end. It is, futile to speculate whether the Canal crisis would lead to war. But if war starts, it is highly unlikely to remain limited. Arab States are solidly behind Suez. There have been threats of stoppage of oil supplies if Egypt is attacked. Be that as it may, the effects of any war on the Canal issue on the Indian economy are likely to be adverse. That does not mean that stock markets would also be adversely affected. Unlike the national economy, stock markets thrive on scarcity and adversity.

There is, of course, one obvious reason for the current weakness in equities. Increases in excise duties on cloth have had an adverse effect on equities on the Bombay Stock Exchange. Dalal Street's weakness has had a sympathetic effect on Lyons Range. Strange as it may seem, Dalal Street has recovered the lost ground partially. But Lyons Range seems subdued. Higher excise duties on cloth need not necessarily affect cotton mill shares. Cloth prices have risen consequently. So, the profits of the textile industry are likely to be maintained.

Calcutta has reacted unfavourably because it is a big consuming centre for cloth. There have been many public demonstrations here against the rise in prices of food and of essential necessities of life. Dearness allowance of Government employees have been raised. There is demand for a further increase in dearness allowance. Industry apprehends that the rise in cloth prices will further raise living costs; that, this may enhance payments for dearness allowance. Reaction of Lyons Range to higher cloth excise duties is understandable.

Tax Burdens

One of TTK's remarks during the debate on the Bill to raise excise duties on cloth has created some disturbance in stock markets. TTK has hinted that he may have occasion to request Parliament in the future to vote further revenue-raising proposals. That the Second Plan will involve further taxation, is not unknown to markets. But TTK was not referring to this aspect of taxation. His observations indicated that tax proposals in the current budget might have to be supplemented to ensure the estimated revenues.

Strange as it may seem, Lyons Range is behaving true to type. In the last two years, the Calcutta Stock Exchange has repeatedly turned quiet at about the Puja time, and remained subdued for the rest of the year. This year this trend has appeared rather early. It should have made its appearance only after the reopening of the market after the Puja holidays. There is still time for the market to reverse the current trend. There may be a revived spurt in Jute shares. This may lead to a resumption of the upward trend in equities.

Jute Shares

Jute shares have developed an irregularly lower trend in recent days. But jute goods remain firm, while raw jute has softened. This should have had a "bullish" effect on Jute shares. It may still have a sustaining influence on Jute shares, if the trend persists. So far as raw jute is concerned, the immediate outlook depends on developments in Pakistan. Soon, new crop arrivals will start in full swing. Sellers have been less reserved in the last few days. That is why, despite continued mill buying, raw jute prices continue to decline.

After a sudden spurt at the time of the settlement at the beginning of the week, jute goods remain irregularly firm. By the time these lines appear in print, the changes in mill stocks of jute goods during August will be known. Expectations are that mill stocks will show decreases. Data for September are likely to be more encouraging. In the absence of any untoward event, jute goods are likely to continue to be firm. This should have a healthy effect on Jute shares, the more so as raw jute prices may soften further.

Market Outlook

The hunt for small-priced Miscellaneous shares continues. In the latter group, Aluminium shares continue to be firm. Cement shares also remain steady to firm. In the current week, Aluminium and Cement shares have constantly remained steady even on the days when equities in general have eased on occasional "bull" liquidation. These shares are likely to remain steady.

Immediately, market outlook depends on the behaviour of clearing shares. Easiness in these shares has started the set-back in equities. Speculators seem reluctant to lend support to clearing shares. Nor is there much of "bear" selling in these shares.

Around Bombay Markets

Sharp Reaction to Excise Duty

Thursday, Morning

TRADING on the stock exchange during the short week reflected the sharp reaction of the market to the announcement by Shri Krishnamachari, on the eve of becoming the Finance Minister, namely, the heavy increase in the excise duty on all varieties of cloth. Textile shares, particularly shares of the mills producing fine and superfine cloth, were heavily hit by the announcement. Other sections, like steel and miscellaneous, were also bearishly affected. Shares that lost heavily were Finlay, Swan, Century, Kohinoor, Khatau, Bombay Dyeing, Standard and Swadeshi: Finlay slumped from Rs 385 to Rs 355, Swan from Rs 481-8 to Rs 450, Century from Rs 600 to Rs 565, Kohinoor from Rs 595 to Rs 565, Khatau from Rs 286-4 to Rs 255, Dyeing from Rs 695 to Rs 653-12, Standard from Rs 490 to Rs 465, and Swadeshi from Rs 272 to Rs 250. Other Textile scrips too dropped substantially. The weakness in Khatau was accentuated by the announcement of a dividend of Rs 10 per share—the same as last year, as against expectations of Rs 15.

The increase in the excise duty, so argue the authorities, is needed to meet the possible contingency of a shortage of supply in relation to a growing demand, and the consequent rise in prices. The Finance Minister's intentions are, doubtless, noble and praiseworthy; an increase in excise duty, while promising adequate supplies for home consumption, would also help Government to get some much-needed resources for the implementation of the Second Five-Year Plan. This is at least what is expected to follow from Government's action. What actually will happen, however, if past experience is any guide, is that while the duty will fill the Government's coffers (though Government does not claim this as of right!), it is doubtful if it would succeed in bridging the gap between supply and demand which the Government seeks. And as long as there is not enough cloth to go round, the price-trend must perforce continue to be much the same as it has been for the greater part of the period since last Diwali. In fact, a predominant characteristic of this period in the piecegoods markets of Bombay and Ahmedabad was the hardening of the price trend. Naturally enough, the authorities smelt money in this trend. They promptly saw that some mopping up of profits was called for, and, quickly came out with the enhanced excise levy.

What they did not foresee, however, was the fusillade of criticism, particularly that the increased levy would be imperceptibily but surely passed on to the consumer. This goes ill with the socialistic pattern of society. In an economy where demand tends to outrun supply, there are two possible remedies. The more obvious of the two courses would be to increase supply to catch up with demand. The other alternative, though of doubtful efficacy, is to restrict consumption. Raising the standard of living and forced restriction of consumption of an essential necessity like cloth is, to say the least, a sad commentary on the Plan. But, then Shri Krishnamachari thinks that consumption must needs be restricted, and, he is not prepared to step up mill production due to ideological commitments on the handloom front. To effect a harmony between ideology and hard facts, it is good to remember, is as difficult as that of trying to strike a balance between the demand for, and supply of, textiles by higher excise duties.

While addressing the shareholders at the annual meeting of the Bradbury Mills Ltd. during the week, the Chairman, Shri Ramnivas Ruia referred to the increase in the excise duty, and refuted the charge that mills were making excessive profits. In fact, he pointed out that several mills turning out coarse and medium counts were getting a smaller margin of profits than in 1955. Arguing that the trend towards higher prices was due to the supply being unable to meet demand, Shri Ruia pertinently declared that if there was no substantial rise in production the prices were bound to remain at a high level. He suggested that for the guidance of the industry the Government would do well to indicate what constituted a reasonable margin of profit, and what rates it would consider fair in respect of the popular varieties of textiles.

Market News

The Stock Exchange has officially enlisted the shares of the Azamjahi Mills Ltd. and Oosmanshahi Mills Ltd. in the forward list of the Exchange.

The directors of the Industrial & Prudential Assurance Co. Ltd. have recommended a higher dividend of Rs 3-4-0 per ordinary shares for 1955 as compared to Rs 2-4-0 last year.

Estrella Batteries Ltd has declared a dividend of Rs 3 on ordinary shares, and Rs 2-8-0 on the preference shares, for the year ended March 1956.

Hind Cycles Ltd. has applied to the Stock Exchange for permission to enlist its shares for official trading.

New Central Jute Mills have declared an interim dividend of Re 0-12-0 per share.

Shares of Gnanoday Sugar Ltd. have been enlisted on Exchange, and business would be done in cash in lots of 100 shares each.

Empire of Life Assurance Company Ltd. has declared a dividend of Rs, 25 per share.

The fifteen States' 4 per cent loans opened for subscription during the week. Out of these, up-to-date ten States' loans, namely, Bombay, Madras, Madhya Bharat, Saurashtra, Rajasthan, Andhra, Mysore, Travancore-Cochin, Uttar Pradesh and Punjab have been fully subscribed.

Meanwhile the business in loans and securities was at a very low ebb. But, paradoxical though it may seem, the 1986 Conversion Loan moved up by as much as four annas to Rs 75-5 as against Rs 75-1 last week.

Cotton

Recalling the Past

COTTON market opened the week with the announcement of the signing of the Indo-American agreement relating to imports of food grains, cotton, tobacco and other commodities at an estimated cost of Rs 170 crores in the next three years. This agreement will undoubtedly play a significant role in India's Second Five-Year Plan, especially in the context of the rising trend in food grains prices.

As far as cotton is concerned, however, the Agreement has not much to commend itsef. Presently importers do not seem to be keen on getting US cotton. In fact, even the lifting of the ban on imports of sterling area cotton has not produced the desired result. The reasons for the apathy towards US cotton are not far seek. In the first place mills and importers may still not have got over the episode of imports of damaged cotton in 1952-53. Secondly US cotton forms only a small proportion of India's total cotton imports. Further in the light of the well-known US campaign to dispose of her surplus cotton, it is natural for importers in India to be sceptical about the US surplus cotton especalily because it has now become quite common for one to hear about dumping in association with the export sales programme of US surplus cotton.

The increase in the excise duty on cloth, and reports from the interior of favourable weather, forced down cotton futures during the week. Spot prices, however, ruled firm owing to lower stocks of quality cotton with the dealers. Demand was centred on good lots of Vijay, Surati and quality Jarilla varieties.

Oilseeds

Selling Pressure

OILS and oilseeds moved downwards during the week with increased speculative offerings, and in the absence of any appreciable demand from millers and Vanaspati manufactures. Owing to the unwillingness on the part of the longs to accept tenders, selling pressure increased towards the close of the week.

Total tenders issued against the September castor contract amounted to 69,000 candies. Castor, groundnut and other seeds lost further ground during the week.

Company Note

National Carbon

FOR the year to December 25,1955, The National Carbon Company (India) Ltd, declared a dividend of 32½ per cent. On December 23, 1955, the Company was converted into a public limited company, and the share capital was increased to Rs 1.60 crores. Forty per cent of the shares are now held by the public in this country.

In the report, the directors furnish details about the Company's expansion plans. Besides the establishment of a zinc rolling mill, these plans include the erection of a flashlight case plant and a chemicals plant. Construction of the zinc rolling mill was started in West Bengal last year, and the construtcion work is proceeding satisfactorily. This mill will be operated as a metals and ores Company, a division of the National Carbon Company (India) Ltd. It is expected to commence production during the latter part of 1956. Both the flashlight case plant and the chemicals plant are in the design stages, and negotiations for sights are proceeding.

Suez Crisis Deepens

THE situation is still fluid as we go to press, but it is clear that the D day for Suez is drawing near. That day may have arrived before these lines are in print. At this writing, the full report of the emergency session of the British Parliament which had been called to discuss the Suez issue is not available. So what moderation Labour is able to exert on Sir Anthony Eden is not known, but it can be guessed. The pilots and other employees of the Suez Canal Company which has been displaced by Colonel Nasser, but continues to operate from Paris, had been asked by their previous employers to quit by the 14th. British and French ships which pass through Suez pay their toll to the old company and these payments are blocked by their respective Governments. Americans pay cash on the spot, but not many American ships pass through the canal. So a situation has been created where Egypt has neither the money—the daily cost of managing the canal exceeds two-thirds of the toll—nor the trained personnel to run the canal services and yet Egypt has not so far shown any signs of giving up. And ships wanting a passage through the canal have neither been refused entry nor have they complained of bad service.

Britain, however, has been spoiling for a fight. Sir Anthony Eden has talked himself into a war, and a shooting war, not merely a war of nerves or attrition, through economic blockade, though at this writing P & O shipping lines have announced that their ships are being re-routed via the Cape of Good Hope, and doubtless other British and French shipping lines will follow suit. Sir Anthony is too puny to make a tragic figure in history. He is no man of destiny. History has passed him by and so the war he is going to have will only be a little war. Unfortunately, it will not be localised. The British Government left no one in doubt about its intentions. Few even in Britain have any doubts either, about what the results would be, should Britain go to war.

'The Manchester Guardian' had warned that "The Government seems to be preparing to go to war immediately if the Menzies mission fails". It had also answered, what the cost of such a war could be: "a damaged American alliance, a broken Commonwealth, the waste of many British and Commonwealth lives, economic isolation of Britain and France or the end of the United Nations, no oil and an open door to Russia in the Middle East. Sir Anthony will have made Britain truly great".

All this could not deter the Tories who do not want to lose their hold on the Middle East and its oil and have no faith in anything else except force. They are suspicious of the Americans, who too, have their eye on this oil and may double-cross. But sober opinion in Britain, knowing full well which way things were going, had nevertheless expected that Sir Anthony would need an 'incident' before he started off. Not that incidents would be hard to come by, or difficult to manufacture, if need be. The demands of good form are now being met. The users of the canal would use the canal. What could be more simple? A Suez Canal Users' Association has been formed, consisting of the representatives of Britain, France, and U S. They will take their ships to Suez and operate the canal. If Egypt refuses entry, no further talk will be necessary. To this Mr Dulles has added the rider that if Egypt objects, American ships

will be diverted to the Cape route. There are variations on this theme e g the proposal by the Users' Association of sending battle ships to the Suez to man the canal.

The element of the comic in the situation would be irresistible had it not unfortunately been overshadowed by the tragic. India is as much concerned about the Suez as any other country, not excluding Britain. For by far the greater part of her foreign trade has to pass through the Suez which means that if this route is interrupted, even temporarily, her Plan would be held up and development very nearly blocked. India has not got the shipping resources to afford the longer Cape route.

But the step announced by Sir Anthony Eden to assume operation of the Suez Canal, as Pandit Nehru pointed out in a statement in Lok Sabha on Thursday, "which purports to be in the interests of the users of the canal and to maintain freedom of the use of the canal, seems, to say the least, surprising and the consequences that may flow from it may well be grave".

Though he did not minimise the gravity of the situation, Pandit Nehru still refused to believe that the issue could not be settled peacefully through negotiation, as Egypt has never declined to safeguard the interests of the users of the canal and to maintain freedom of navigation through the canal. The acceptance by the Egyptian Government, Pandit Nehru stated, of all international obligations and its invitation for negotiations opened the way for settlement. Once the sovereignty of Egypt is accepted without any mental reservation, a solution should not be impossible. "To seek to impose a settlement by force or by threats of force", Pandit Nehru finally warned, "is to disregard the rights of nations even as the failure to observe international treaties and obligations would be".

But Pandit Nehru's faith that Britain will respect the sovereignty of Egypt is no longer unshaken for he also warned, before Parliament went into recess, that an emergency session might be called at short notice, should the situation make it necessary to do so.

Calcutta Milk Scheme Under FAO Auspices

HOW best to dispose off farm surpluses is a world problem, though it has been overshadowed by the magnitude of the problem which America has to face, in pursuit of its policy of supporting agricultural prices and farm incomes. The paradox of unsaleable (i e at the sellers' price) food stuffs and dairy products running to waste or the mounting cost shouldered collectively by the people of the country concerned of carrying the burden of unsold stocks, has persisted too long to excite anybody particularly. But it has not ceased to perplex those who have to carry the surplus. They are searching for the best possible means of disposing the surplus. The FAO has been studying this problem for a number of years, with a view to devising a method of utilising these surpluses for helping economic development in underdeveloped countries, subject to the condition that the disposal of surplus do not depress either domestic or international prices.

Now surplus milk and milk products, for example, can be used for helping those who need special care, for feeding school children or expectant mothers; surplus food grain can also be used for relieving famine or distress as an emergency measure. But utilisation of agricultural surpluses for helping continuous development needed special study, and India agreed to serve as a 'guinea-pig' for the experiment. 'A Pilot Study in India' was published by the FAO in June last year. Many individuals and institutions assisted by carrying out special surveys for the purpose or in other ways. Dr V M Dandekar, acting as Consultant to the FAO, produced a report on the subject, drawing largely upon the findings of the Agricultural Labour Enquiry, which has also been published.

A big deal, perhaps the biggest in recorded history, has just been put through for the imports on concessional terms of US farm surplus, foodgrains and cotton, to meet shortages in the Second Plan period, as part gift and part loan. The details of the agreement, however, remain to be worked out, and an examination of the deal has to be postponed pending publication of the final agreement. It may be noted, however, that this was not under the auspices of the FAO.

The first programme to use surplus agricultural products under the auspices of the FAO is expected to be in action in India before the end of the year, according to an FAO press release issued during the week. The product concerned is primarily dried skim milk; the supplying countries are US, Australia, New Zealand and Holland. The deal is a package deal, for besides the dried skim milk to be supplied, there is a grant of £175,000, or its equivalent, towards equipment and expert advice for using the milk powder for making toned milk. The first scheme that has gone through is for the Calcutta Milk Scheme; similar schemes for assistance to other dairy centres in India are under contemplation.

Though not as well advertised and as attractive as a show-piece as the Aarey Milk Colony of Bombay, Calcutta has also its milk colony at Haringhata. A smaller colony has been started in Fulia and Kalyani is to have a dry farm. But the programme that has to be put through, if Calcutta is to have a reasonably good supply of milk produced under hygienic conditions, has only been begun; much of it still remains to be done. The problem is the usual one of all large cities; naturally it is a great deal more acute in Calcutta than in most. The supply of milk is inadequate and its price high. Most of the cattle are housed within city limits, in horrible 'khatals' which breed mosquitoes and spread dirt and disease all around; yet nearly 80 per cent of the milk supply of the city comes from them. There is then the problem of dry cattle, the difficulty of maintaining them, the high rate of mortality among calves, engineered or connived at by the 'gowalas' leading to the infamous practice of 'phooka' the sight of which made Gandhiji give up cow or buffalo milk for life.

A milk team from the FAO visited Calcutta to examine the West Bengal scheme and found it to be technically and economically sound. However, in view of the magnitude of the project and the manifold technical complications, the team provided for:

(1) a direct grant of £150,000 to the West Bengal Government for purchasing equipment;

(2) a sum of £25,000 for services of qualified technical staff; and

(3) the supply of dried skim milk on concessional terms for a period of three years.

At present the Haringhata dairy factory is able to use only 120 tons of dried skim milk per year, as against 1000 tons in Aarey Milk Colony, for the manufacture of toned milk. The dairy factory to be set up at Calcutta under the auspices of the FAO will initially consume 1900 tons of dried skim milk (for production of toned milk) but later its capacity may be expanded by another 1000 tons per year. This will be in addition to treating cows' milk and producing ice cream, butter and ghee.

Toned milk forms only a minor part of the milk supply of cities. It is important that in view of its advantages—nutritive properties and low cost—its supply should be augmented. This requires both technical assistance and specialised equipment and through FAO, these are now being made available. Now among the agricultural surpluses, the disposal of which has been a problem, skim milk no longer figures prominently, as unsold stocks of skim milk have been going down with its increased use as animal feed. So the countries which have come forward to assist the utilisation of skim milk may not be primarily interested in building up a market for this export of their's. In fact, among the schemes awaiting finalisation, there is at least one for the manufacture of skim milk in India in some chosen area where the disposal of fresh milk is unremunerative.

The main function of the FAO is to help food and agricultural production all over the world and to improve their distribution, without affecting adversely the normal channels of trade. How difficult it is to convince member countries that a particular scheme of assistance does, in fact, meet this rigorous test, by matching concessional imports with additional consumption! Every proposal that is put up is discussed at several sessions, and has to pass through several stages at each of which the hawk-eyed representatives of the exporting countries, particularly of the countries which stand to suffer from the subsidised export of others, raise objections and obstruct. To be fair, even recipient countries have their own domestic markets to guard. India which generally welcomes assistance in the form of surplus food and agricultural products had nevertheless to reject, after a trial, the offer of surplus US butter to be sold as ghee. The Government of India found it difficult to sell it, because the appearance of American ghee on the market immediately brought down the price of Indian ghee below the economic level.

It is not surprising, therefore, that the input-output ratio of schemes submitted to FAO and schemes finally passed by it should be so high. This is all the more reason to welcome this particular form of assistance for toning up the milk supply in one of our cities which badly needs improvement.

Shipping Oil via Cape

THAT the centre of gravity of world oil has shifted to the Middle East is, of course, not a new discovery. But how fast the dependence of the West on oil and on this source of supply has been increasing is not often realised. Even for U S, its own and Carribean oil is not enough. By the late '60s, it is estimated that Western Europe will be needing 200 million and U S 70 million tons of Middle East oil per annum. This presents a formidable problem of transport, for only 68 million tons could pass through the Suez Canal in 1955. And yet, oil tankers constituted 65 per cent of all shipping passing through the canal. So if by 1960, the present plans to increase the canal capacity to 48 ships a day are completed, it would not be able to carry more than 100 million tons of oil a year, as against estimated requirements of more than double this volume. And until atomic energy substantially substitutes coal and oil—this it may do only in the last quarter of the century—the problem will get a great deal worse, for the annual requirements of Western Europe alone are expected to exceed 300 million tons by 1975. Transport to U S, however, does not pose a similar problem, for the bigger tankers carrying oil to the States are already being directed via Cape of Goodhope, Suez being too narrow for them.

Britain's stake in Suez is twofold: control on oil and its transport. To yield to Nasser would be the beginning of the end of Europe's control on oil in the long run and forced diversion via Cape in the near future which would call for huge investment in tankers and in expanded capacity of shipyards which will raise the price of oil.

Some figures have been cited which help to size up the problem. To carry 100 million tons of oil from the Persian Gulf to Europe by Suez requires 14 million tons of deadweight tankers; to carry the same quantity by the Cape would require an additional 7.5 million tanker tons, at a capital cost of £500 million. It will also mean doubling West Europe's tanker fleet every 10 years and proportionate expansion of shipyards. A second canal, it is estimated, would cost only £120 million and would present no major engineering difficulties. Extension and duplication of pipelines would cost a trifle, compared to the capital cost of building an adequate tanker fleet to carry oil via the Cape. But all this requires peace in the Middle East and co-operation of the Arab countries. Oil companies will not risk their capital in so risky a venture; they are now reported to be determined to switch from fixed transport investment which would be exposed to the wrath of growing Arab nationalism, to mobile investments the safety of which can be safeguarded by the Western Naval powers. The way shown by Onassis will be followed and super oil tankers will be built. But resumption of the Cape route will mean higher cost and will be to the detriment of both the Arab States who will lose their share of transport earnings and European consumers of oil who will have to pay more.

The assumption behind these explorations in the economics of oil transport both in the columns of 'New Statesman and Nation' and the 'Financial Times' is that Arabs may successfully interfere with the transport of oil but they would be powerless to stop the extraction and export of oil by foreign interests. In other words, the politics which obstruct the transport of oil will not interfere with its production and disposal. This is a curious assumption to make.

Better Hope in Pakistan

WITH the East Pakistan Cabinet persistently refusing to face the Assembly and the Governor, in the interest of his party, supporting the Chief Minister in flouting the Assembly, it was on the cards that a strong President like Iskandar Mirza would act. A similar constitutional crisis had also overtaken the Centre where the Prime Minister, Chaudhuri Mohammad Ali, had lost the support of the Muslim League members who had put him in office. On both fronts, therefore, immediate action was overdue and the President has acted in a manner which has happily belied the fears of those who had anticipated a dictatorial move on his part. He was close to the Army and the army group had been moving too close to politics in Pakistan to rule out such possibilities altogether. The popularity which food administration in East Pakistan, handed over to the Army by Iskandar Mirza, had won from the people, strengthened the suspicion.

Happily, recent developments have completely belied these fears. Those who interpret political developments in Pakistan primarily in terms of foreign influences, however, would not admit that they have been proven to be in the wrong. Even Dulles, they say, does not care any more for another Bao Dai or Synghman Rhee.

What has happened in the last few days is the final exit from Parliamentary Government of the Muslim League, which had been overdue for years. In fact, the instability of successive Governments in Pakistan has been due mainly to the tenacity and persistence of the old guard, who continued to dominate, even after the League had been routed in the general elections in East Bengal.

What was accomplished in East Pakistan by a general election was accomplished at the Centre by regrouping of parties. The emergence of the Republican Party was forced by necessity. The League had lost all popular support and yet it wanted to be in power. The Republican Party was led, significantly by the most consistent opponent of the League in West Pakistan, who had fought against the very idea of Pakistan at one time—Dr Khan Saheb.

Among the groups which defeated the League, the Awami League has shown the greatest cohesion and its leader, Mr H S Suhrawardy, now heads the Government at the centre with the support of the Republican Party which is, however, numerically the stronger. It is not exactly a coalition, for The Republicans have not yet gained the cohesion of a proper political party and still remain as an ad hoc group.

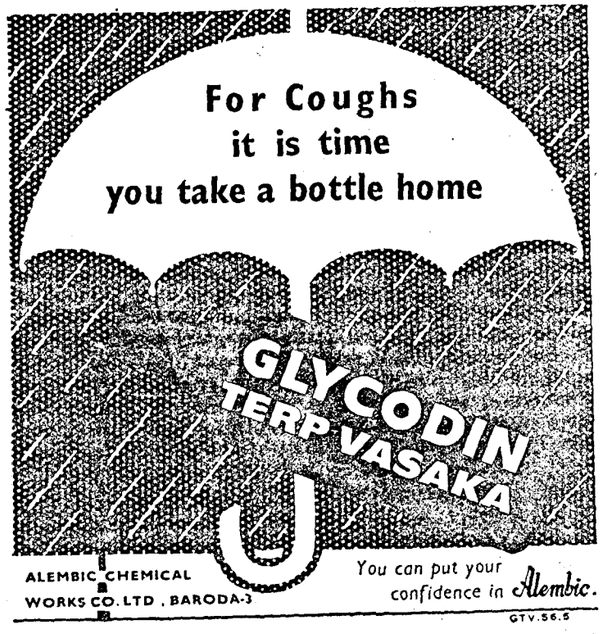
The East Bengal Cabinet offers better promise of stability but it cannot function smoothly, unless the Government at the Centre is stable and amenable to Parliamentary discipline, as well as wise enough to meet the just claims of the Eastern wing of the State. True, Mr Suhrawardy would be himself there to press these claims, but how far he will succeed will depend on the somewhat heterogeneous following.

Statistics in the Plural

WHILE moving the bill to raise the excise duty on cloth, the Finance Minister circulated a "Note on Supply and Price Trends of Cloth" to the members of Lok Sabha which was also released to the press. In this Note, among other things, the figures of exports of mill-made cloth in 1954 and 1955 are given as 810 and 693 million yards respectively. In the authoritative Report of the Ministry of Commerce and Industry, circulated at the time of the last budget, the figure of export for 1955 had been put at 824 million yards. Lest it be suspected that this figure includes handloom cloth, it was explained:

> "Exports of cloth continued to be licensed freely and the total quantity exported in 1955 was about 824 million yards. To this may be added exports of handloom cloth totalling 60 million yards and export also of manufactured fabrics". (Report 1955, page 54).

In the same publication, in Appendix III, the figures of cotton piecegoods exported during 1954 and 1955 are shown as 867 and 752 million yards. The Finance Minister could not be deliberately understating exports in order to impress upon Parliament the necessity of stepping them up. The Cotton Textiles Export Promotion Council which he had set up as the Commerce Minister has been publishing in the "Texprocil Bulletin" a much larger figure than the one given by the Finance Minister. How does this wide disparity arise? Those who have a stomach for statistics, particularly foreign trade statistics, may contemplate on the table alongside showing different figures for exports of cloth that have recently appeared in different places. The list is only illustrative.



The data in Shri Krishnamachari's Note circulated in the Lok Sabha agree fairly closely with those in the monthly Accounts relating to Foreign Trade, with but minor differences. The real conundrum is with regard to the other four sets of figures items II, III, IV and VI of the table. It has been mentioned above that the Ministry's Annual Report gives figures which do not agree with the figures in the Finance Minister's Note. The discrepancy is not fully covered by including handloom cloth with the latter. But what about rows III and IV? They both relate to the Bombay Port only and are in excess of the all-India totals!

A possible explanation might be that these figures are for the piecegoods passed for shipment. Between the amount entered in a shipping bill and amount actually shipped, there is often some difference. This short shipment escapes recording. The next shipping bill is drawn up afresh, and without taking into account the shortfalls in earlier bills of the same party. There may be a similar difference between goods passed for shipment and goods actually shipped. But surely the Commerce Ministry is not ignorant of all this?

Really, what is one to make of the statistics released by the Joint Chief Controller of Exports? The statement issued over his signature purports to give figures of export of millmade cotton piece-goods, and not of piece-goods passed for shipment, either in Bombay or all Indian ports!

TABLE SHOWING EXPORTS OF COTTON TEXTILES

	(million yards) 1954	1955
i. Ministry of Finance—"Note on Supply & Price Trends of Cloth". Exports of mill made cloth	810	693
ii. "Ministry of Commerce & Industry—Report for 1955-56." App. III(b) Cotton Piecegoods Exports	867	752
iii. Texprocil Bulletin, 5-4-56. Cotton piecegoods exports from Bombay Port (Source: Daily Trade List, Bombay Customs)		783
iv. Texprocil Bulletin, 5-4-56. "Mill made cotton piecegoods passed for Shipment from Bombay Port". (Source: Office of the Jt. Chief Controller of Exports, Bombay)		825
v. Accounts relating to the Foreign Trade of India (D G C I S Calcutta) Millmade	804	691
Mill and Handloom	862	747
vi. "Statement showing comparative figures of exports of millmade cotton piecegoods from India, U K and Japan", (cyclostyled) issued by the Joint Controller of Exports, Bombay	898	815

More on Shipping

REFERENCE has already been made in these columns to the important speech delivered by Shri Lal Bahadur Shastri at the Indian Steamship Owners' Association, and the programme of shipping in the public sector was mentioned in the last issue. One can see in it a faint glimmer of the reflection of the Bandung spirit in the extension of shipping services to India's neighbouring countries. There are some other points in the speech also which deserve consideration. There is nothing in the programme, as he outlined it, to suggest that the intention is to drive out Indian shipowners out of business or to impinge on the field which the latter have developed. Shri Shastri, while resenting loose talk about the fancied battle of sectors in shipping, was at some pains to convince the shipowners that neither of the two shipping concerns in the public sector, the Eastern and the Western Shipping Corporations would poach on their domain, and that they would open services which either the shipowners were not interested in taking up or which they had decided to abandon. The present programme, therefore, contains no threat to it; the private sector may only complain that scope for expansion into these hitherto untapped fields, which may prove profitable in the future, would now be closed to it. To that extent, it will affect their future prospects.

Scindia's ceased to be the managing agents of the Eastern Shipping Corporation from August 15 "as a result of the provisions of the new company law". Though Shri Shastri said that the matter is receiving consideration, indications are that this Corporation will become a fully State-owned undertaking. The circumstances under which private participation in the Western Shipping Corporation fell through, however, were not disclosed. This Corporation starts as a full fledged Government undertaking, right from the beginning. The Indo-Polish Service, however, has made the ship-owners uneasy. Not that the ship-owners are interested so much in the Indo-Polish trade. But what about picking up cargo from the intermediate ports? This route would be passing through some of the most paying centres of traffic and if the Western does that—the route may not offer full load both ways—it may cut into what the Indian shipping companies consider to be their sphere. Overseas trade has been much the more profitable to them. They have been getting Government business too, as much as they can carry. And there is also heavy accumulation of goods awaiting shipment to India, for the phasing of which steps are seriously being taken. But business is business and the shipping companies will naturally want to be assured on this point. Shri Shastri did say that unlike in the India-Soviet service, the proposed service to Poland does not have a clause restraining the Western from lifting cargo from intermediate ports. But the shortage of shipping being acute, the Government may not be in a position to commit itself and so the Indian shipping companies have to take Shri Shastri's assurance that care will be taken while finalising the details of the India-Poland service that their interests "do not suffer unduly".

All this, however, does not mean that the Government is going to slacken on its assistance and encouragement to the shipping companies. Far from it. The terms of loans are to be liberalised; it is conceded that shipowners have a case for it, active assistance is promised to shipping companies in securing a greater portion of import and export cargo on Government account. Coastal shipping has been allowed an increase of 5 to 10 per cent on freight rates, pending the results of the enquiry by the Rail-Sea Co-ordination Committee. Even the suggestion made by Shri Ramaswamy Mudaliar, the Chairman of the Indian National Steamship Owners' Association, that freight rates for newly built ships should be fixed somewhat higher, has been accepted for the consideration of this Committee.

Plans for the development of ports and measures for speeding up loading and unloading of ships were set out in detail but this contained nothing new, nor did the Transport Minister seek to play down the difficulties that lie immediately ahead, that is until the expansion is completed by 1958. Congestion and hold up, therefore, despite the improvements achieved, are not ruled out and foreign shipping lines were politely told not to make too much fuss about it.

Secretarial Blinkers

ALTHOUGH coastal shipping has been entirely reserved for Indian shipping since 1950 and expansion has been financed through Government loans, yet no commensurate improvement has taken place. While tonnage in overseas shipping had exceeded the First Plan target by 55,000 tons, the Transport Minister complained that "those who were interested in developing coastal shipping would not, for various reasons, expand to the extent expected." Whether the complaint was justified or not, the tonnage in coastal shipping had fallen short of the target by 63,000 tons. No statistics of coastal shipping is published by the Government, but now that the Shipping Directorate is going to have a 'statistical' cell; this deficiency may be made good.

The data supplied by the shipping companies go to show that the quantity of dry cargo handled fell from 2.9 million tons in 1953 to 2.3 million in 1955. Obviously if the freight offering was on the decline, there would hardly be any inducement to expand, even if loans were offered on attractive terms and 4½ per cent for coastal shipping compared to 2½ per cent charged for overseas shipping was not attractive. But all this has undergone a sea change. Coastal traffic is now running at the annual rate of 2.8 million tons and co-ordination or no co-ordination, it is expected to go up by 50 per cent in the Second Plan period.

On the question of co-ordination of transport, however, despite his sparkling honesty, it is to be suspected that secretarial blinkers have completely blinded Shri Lalbahadur Shastri. Had it not been so, he would not have expected so much from the Standing Committee of the Central Board of Transport, merely because this Committee has been re-organised "so as to include at secretary level representatives of all the Ministries" concerned. Far from being re-assured, his final assurance that there was "no need for the apprehension that any one form of transport will be developed to the detriment of the other" leaves one gaping with wonder whether the Minister in question and his opposite numbers really know what they are talking about? It is no longer a question of snatching business from one another but pooling of resources to do a job that should strain to the full all forms of transport that could be pressed into service, for the implementation of a big size plan.

A Calcutta Diary

A Port in Storm

THE frequency of the storms visiting the Port of Calcutta has done much to blunt popular reaction. One hardly knows when there is a state of emergency in the port and when there is not; the interval between the lifting of an emergency and its re-imposition may not be more than a few hours. In the past few weeks, for instance, there have been strike notices by both dock labour and port labour, and twenty-four of the port's assistant harbour masters just resigned. There has since been a settlement with the latter, and the port is again receiving ships; but unless the administration of the port has undergone basic changes in the meanwhile (including perhaps the most urgent of them, namely the appointment of a more competent Chairman) there will probably be a strike in the middle of next month. Calcutta is already among the most unpopular ports in the world, and ships visit it mostly under protest. One can be sure that other parties have much to say against the shipowners of the world, but it is apparently rather expensive to hang about sandheads for weeks. The daily cost of waiting runs into hundreds of pounds.

The recent agitation of the assistant harbour masters suggests that trouble is not confined to labour, easily dubbed intransigent. If technical personnel at the level of assistant harbour masters is obliged to threaten strikes, offer resignations, and risk going to jail, there is clearly something wrong with the administration. The assistant harbour masters were fighting for what in Britain has come to be known as 'differentials', for their basic wage—which reaches Rs 1,750 a month—has not been under dispute. What is significant is that even at this level of employment negotiations failed to achieve what was eventually effected under duress. It is no secret that the Chairman's methods of negotiation are not the best, and this has now had to be driven home by what is indistinguishable from a defeat for the Chairman. To speak to a labour leader, as I have just done, about the more serious threat of a strike in mid-October, is to be persuaded to the gloomiest view of the port's future. Violence on the waterfront has been seen outside Hollywood films, even in Calcutta; and this is an additional reason for not being complacent.

To enquire into the many causes of trouble in the port of Calcutta is to come up against a vast network of vested interests, some of whom serve the port, if at all, only by taking some money out of it. The shipowners are a pretty closed ring, and even if they had no additional vices (which labour freely attributes to them) the very fact of their being so united would enable them to impose on the rest a larger measure of dictation than those affected could help resenting. Ten years ago, these presented no problem. The shipowners then knew their strength (part of which was derived from the then rulers in Delhi) and labour did not know its. There has been a change since, and labour is doubtless asking for more than they had done before. The employing agencies — shipowners, stevedore contractors, the Port Commissioners — are also, one may be sure, paying more. That there would be a lag between the two, between what one would give and the other would keep asking for, is also to be taken as an essential part of modern industrial relations. What may be amiss in the port of Calcutta is that although the aforesaid modern industrial tensions obtain here the other lessons of modern labour relations have not been learnt. One reason may be that a bureaucracy is always less responsive, being at once less affected by the consequent monetary losses and more influenced by the authority of the State behind it.

Labour speaks louder, for obvious reasons, but there have been complaints against the port administration from almost every party concerned. One hates to bring into these discussions questions of personality, but they are of inescapable importance and relevance. It is doubtful whether Shri R Gupta, ICS, looks back upon his term as Chairman of the port with much satisfaction, but he certainly enjoyed the respect of the men and interests who worked with him. One has to add it with regret that, in one's conversations with various people who ought to know, one has failed to discern the same degree of respect for the present incumbent, Shri R Mitra, ICS, whose previous record of service as Home Secretary in the Government of West Bengal was not very distinguished either. With what truth it is impossible to establish, it is widely suggested that Shri Mitra was placed in his present position by Dr B C Roy, so that the latter would be able to direct matters in an organisation quite outside his purview. If anyone believes this story ,it is because it is not flatly contradicted by what is known of Dr Roy's insatiable desire for taking more and more work under his wings. From what is known of Shri Mitra's temperament, acceptance of this position would also be, as the dramatic critics say, 'in character.'

It was an unfortunate choice. But it is a thankless job at the best of times. Not everyone is agreed on the indispensability of master stevedores, and they are by no means the only middlemen against whom prejudice is strong. At almost every level there are sardars, contractors, and such folk, who stand between (in more senses than one) the Commissioners for the Port of Calcutta (itself composed of a variety of unreconciled interests) and their workers. It is not easy to maintain contact with thousands of workers(many of them casual) but it is probably true that the paternalism of old has gone without an efficient impersonal organisation arising to take its place. There is discontent, and the employers' response to it is almost always delayed. If there have not been more crises in Calcutta, in fact if the port has not come to a complete standstill so far, in spite of coming pretty near that point more than once, it may be more because of frequent declarations of a state of emergency, which entail penalties for strikers, than because of much efficiency in the administration of the port.

It is not beyond the wit of an efficient and strong administration to remove these anomalies smoothly. The trouble is that the present administration is neither strong nor efficient. And there are obvious dangers in making it stronger before making it efficient.

From the London End

The Trade Unions in Revolt

THE spell of Sir Stafford Cripps over the British trade union movement is now broken. In 1948 the Trades Union Congress responded to the call of the then Labour Chancellor of the Exchequer for an acceptance of the "wage freeze". This gradually gave way to "wage restraint" when the Conservatives attained power in 1951. Now, eight years after, the TUC meeting in conference at Brighton has resolved to throw off the shackles which have so far moderated the wage demands of the trade unions. In a significant sense this development amounts to nothing less than a formal TUC renunciation of its connections with the Government and with official policy.

The break with official policy is complete. Prior to the conference Mr Macmillan, the Chancellor of the Exchequer, issued an appeal not only for a continuance of restraint in wage demands but he also wanted to be invited to address the Conference—a privilege which was accorded only to Labour Ministers. In what must have been the worst snub in British domestic politics for many years, the TUC ignored the Chancellor's appeal and opened the way for the preparation of a frontal attack on the Government's policy to establish what it calls a "price plateau".

A close reading of the transcripts of the speeches at the TUC conference suggests that the trade union movement has come to understand the Government's economic policy as a challenge to be met by power and the force of power alone. No delegate at this conference was able to raise a single argument favouring either the official policy or the continuance of wage restraint. Indeed, as one delegate remarked, the Conference witnessed a "demonstration, not a debate" on the wage question. The General Council had decided to leave the question to a "free vote", that is, not to advise the conference on the policy it would wish it to adopt. This decision was crucial to the outcome. In the General Council itself, a serious disunity on the question was evident. Mr Frank Cousins, who took over the leadership of the Transport and General Workers' Union from the very right-wing Arthur Deakin, was in favour of a policy of militancy while the TUC General Secretary, Sir Vincent Tewson wished for a continuance of the 1951 agreement on "amicable relations with the Conservative Government." This evident clash of opinion being left unresolved in the General Council, it was transferred to the Conference floor without the usual advices and trappings which have hitherto hamstrung the effective expression of opinion at TUC conferences.

The argumentation at the conference that led to this vital reversal on wage policy reflected a curious understanding of the country's economic problems on the part of the trade unions, though it must be stated that the viewpoints expressed arose from thinking no less rigorous than can be expected from any other quarter. Mr Cousins who led the "wages fight" and who must have, therefore, been responsible for turning the conference in favour of his fight, argued that ". . . . this plateau which Mr Macmillan talks about is one which goes up and up . . . . he says it will stay. Of course it will, if we do nothing about wages and if he can balance his economy at the expense of the workers." Two possible inferences can be drawn from this argument. It can mean that the trades unions are so irresponsible that they are prepared to wreck any price stability that is achieved at the existing wage level. Alternatively, it can mean that the trade unions are only asking for a fairer share of any increases in productivity that take place—a demand which need not impinge on whatever price plateau Mr Macmillan establishes. Mr Cousins' speech did not indicate which of these possible inferences he had in mind—his statements were certainly not specimens of clear thought or of sound reasoning—and it is certain that when the Conservative commentators come to study the Conference transactions, they will give the first of these inferences all possible publicity.

To the trade unions the inflationary problems in the economy have been the result of a rapid dismantling of controls and the government's implicit sponsorship of a "free for all' attitude. One delegate referred to the Chancellor's knowledge that in 1955 dividends rose by 21 per cent and "in the first seven months of this year ,in spite of his pleas for stabilisation, dividends had increased by another 11½ per cent." The warning from the Railway Union leader, Mr Campbell, was couched in ominous words:—

> "....the **laissez-faire** philosophy is completely *incompatible* with wage restraint. We say to Mr Macmillan: if you want a free for all, you can have it. Return once *again to a planned* economy and you might create a climate in which trade unions will not be compelled to seek further wage *increase to* adjust the prices which have been foisted upon us."

This certainly is some choice for a Conservative Government. It augurs the most desperate wage battle the country has seen since 1945.

This was not all. The Conference in the new mood of militancy, rejected the advice of the TUC General Council and resolved to fight for a "40-hour week". The short-time working in the motor industry and the sudden declarations of redundancy were understood by the Conference to be expressions of irresponsibility on the part of the owners of capital and the Government. In this situation "a 40-hour week has become a necessity....it is a safeguard against the declared intention of the British Employers' Federation to establish a pool of 750,000 unemployed."

If the Conference proved to be a historic turning point on economic matters, it was less so where questions of a political character were concerned. The Suez crisis was dealt with in an emergency resolution—its content recognized the trend in public opinion against force but conceded that force was a possible solution after "reference to the UN and with its consent." It rejected a resolution calling for a peaceful settlement over Cyprus and for the return of Archbishop Makarios. But the economic decisions are so overwhelming that it can truly be said that the TUC is "no longer what it was." And Conservatives in and out of the Government can now only remark in the succinct words of the Times ". . . . it is a pity."

Profile of West Bengal

(From a correspondent)

FOR West Bengal "profile" is the appropriate word for it is a State from which the body has gradually slipped away. When the first Indian Census was undertaken in 1872 Bengal's area was 248,231 sq miles, in 1901 it was 189,837 sq miles, in 1941, 82,876 sq miles and in 1951 no more than 33,524 sq miles.

Now the head remains—Calcutta, the most industrialized city of India, perhaps also the most unpredictable, undoubtedly one of the least happy cities. And part of the trunk—15 districts grouped under two administrative commissioner's divisions, predominantly agricultural, where the average density of population was 799 per sq mile in 1951, varying in the southern district from 817 to 2,877, one of the highest in the world; too high certainly to be maintained in a land-hungry State even if there were not the burden of refugees streaming in since 1948 at a rate, accelerated in recent months, to an average of between 20,000 to 30,000 a month.

What is the sharpest feature in the "profile"? Perhaps a sense of unfulfilment and lack of direction manifesting themselves in the present hyper-sensitiveness and nostalgia for the earlier years of the century when the leadership of India rested largely with Bengal.

Francis Bernier, describing his Travels in the Mughal Empire wrote that if there was any other country in the world where there was such abundance as in Bengal, it was probably Egypt (which he had not visited). But these and other enthusiastic details are from portraits of yesterday and the day before; in todays' profile the ancestry is recognizeable but the expression has altered.

Probably the biggest problems today for the State are the economic —how to sustain in the second-smallest State in India a large population, now about 28 million.

Complicating Factors

The situation is complicated by other factors. One is that the people of the State itself own no more than a fractional part of the enterprises which make West Bengal the most industrialized State in India. This is reflected also in the employment situation where only 37 per cent of the total of 6.3 lakh labourers in organized industry is Bengali. In Jute mills, for instance, Bihar contributes 36.98 per cent of the labour and U. P. 19.52 per cent.; Bengal's share is 22.04 per cent. In his Budget speech in the Assembly two years ago West Bengal's Chief Minister, Dr B C Roy, estimated that employment from development expenditure leaked about 50 per cent. to competitors from outside the State. So that if Rs 1 crore were calculated as investment necessary to give employment to x numbers, say, in actual fact the investment in West Bengal would need to be Rs 2 crores.

Partly at least this is due to a rigid refusal of Bengalis to enter certain occupations. In the large city of Calcutta the conservancy, plumbing, house-building and (until lately) transport are in the hands of workers from outside the State; the myriads of "pan" and cigarette booths are owned by people who have come from other States to make a living; even in the more sophisticated trade of catering and hotel-management the story is the same.

Land and Houses Changing Hands

Apart from some traditional business firms the people in West Bengal have, as a whole, been totally unable to adjust themselves to the conditions and opportunities of modern business. Any solicitor could confirm one of the results: his conveyancing records would show that land and houses in Calcutta steadily but inexorably change hands from the Bengalis to the Marwaris. Another index is the loans and advances registers of large banks where Bengali names hardly figure.

In this trend in trade the only exception is small business which is almost wholly controlled by Bengalis, outside participation being negligible. But this refers to an occupational area where the total annual value added is Rs 48 crores compared to Rs 124 crores added by organized industry and where self-employment covers considerable under-employment.

To a sociologist this background of the control of economic life of Calcutta and West Bengal would yield a rich harvest if he were studying social tensions. In a big city of about 3 million inhabitants, not including the industrial suburbs which are in reality a chain of cities, the social structure remains unresolved, the linguistic and national groups earn their living in common fields but the pattern of their lives does not mix. A large part of the wide trunk road through the heart of Calcutta, Chittaranjan Avenue, is almost exclusively Marwari. In South Calcutta South Indians live in the interstices of Bengali households but yet form a self-sufficient community of their own, the foreign business community continue to chase their socially fatal objective of in-bred exclusiveness. This is what makes Calcutta an unhappy city and accounts for much of the trouble among industrial labour, and the undercurrent of violence that runs through all expressions of public dissent.

Society Lost its Integration

The willy nilly transition in the character of the economic life of the State has robbed West Bengal's society of its integration. Even before the zamindari system was legally abolished its economic fabric was riddled with holes. The middle class, the enlightened middle class, which had the virtues, the perseverence, and the constructive vision of the Victorians is almost dead. They provided the leadership in politics, the professions and the arts.

Uncertainty in politics is now to be expected from the social elements which compose its scene. Previously the political community which was ably led and made its opinion felt was the middle-class community of the intelligentsia. The political community is now much diluted but is still incomplete as it only imperfectly includes large segments of occupational life (industrial labour, for instance) and this very lack of cohesion and comprehensiveness in the political community reflects the lack of cohesion in the political structure. One of the indices of the dilution is the changed character, standards and attainments of Calcutta University, though its plight is also partly due to sectarianism and internal intrigue.

In the professions the pioneering advantages are over and the lack of social integration makes itself felt. In those professions ancillary to economic life, accountancy, the law and engineering, for instance, the fact that the control of banking and

business is largely in the hands of exclusive *non-Bengali* groups inevitably makes itself felt. Gradually this even affects the human professions, like medicine, though the *effect* is slower and less potent. Provincialism is a powerful factor in Indian life.

Decline of Middle Class

To these two forces within the middle class, its economic decline and its inability to adjust itself to the changes forced upon it by time can be traced a significant proportion of the inner conflicts and contradictions in Bengal today. Of course there are many natural causes—the dislocations and stresses of World War II; communal frenzy and finally the Partition of 1947, the final blow to possibilities of an integrated nation-consciousness. In a Union of large States, small West Bengal can never commend significant influence.

Since partition, the biggest single problem has been the influx of refugees from East Pakistan, 2,890,400 of them upto April-May 1955 and still pouring in; they depress the standard of living of the State and create a litter of problems which makes the struggle for economic development seem like fighting with one hand strapped behind the back. A problem like unemployment among the educated, fraught with grave implications for social morale, is made infinitely worse by the pressure of refugees.

Peering into the future, the prospects of this State give scope for speculation between the probable and the possible. First, one should consider politics because the grievances and the feeling of being neglected offer no hope of a stable society which can plough its own furrow without paying much heed to political parties and their manoeuvres.

Scornful of Authority

A fairly recent survey carried out by a private gallup poll organization concluded that support for the Congress party has increased considerably in West Bengal since the last general election. This is surprising for there is much dissatisfaction with the Congress. Part of it is undoubtedly due to the temper of the people which, as the Chief Minister once described grew "scornful of authority" because of the bitter experience the State underwent. But a substantial part also can be ascribed to the uninspiring condition and leadership of the party in power and the hint of corruption and inefficiency that invests it. There is a natural streak in favour of Leftist parties (it is worth remembering also that the Communist Party of India is now the only party in which Bengalis are prominent) but much more important than the sympathy is the irritation with the administration in power. If therefore, the opposition parties can erect some durable united structure with which to oppose the Congress in straight fights, its strength in the Assembly is likely to be considerably improved. The question of Bihar territories which West Bengal claims is bound to be reopened in the election campaign and will be used vigorously by the Opposition.

The main question, however, for a commentator scanning the future is the economic policy which the State will pursue. Repeated socio-economic surveys, the latest being one by Calcutta University's Department of Economics and Statistics, have drawn attention to the low level of income and amenities enjoyed by West Bengal's population. Unemployment, high generally in the State, is particularly so among Bengalis (in Calcutta for instance Bengalis are 50 per cent of the population but over 70 per cent of the unemployed); another worrying index is the high rate of unemployment among the educated which a West Bengal Government survey and other inquiries revealed. For any responsible and well-employed individual in West Bengal today, nothing is more mortifying and frustrating than to have no suitable advice to give to dozens of bright young people anxious to earn a living and retain their self-respect.

Vision in Planning

Dr B C Roy's Government, or more truthfully, Dr B C Roy himself has shown encouraging vision in planning West Bengal's economic future. For an impoverished state the performance during the first plan period when Rs 77.75 crores were spent on development was commendable, and this did not include the Rs 49.92 crores advanced to the Damodar Valley Corporation and the Rs 35 crores spent on refugee rehabilitation. The Second Plan provides for an expenditure of Rs. 153.44 crores, more than the Planning Commission considers the State as capable of achieving. Refugee relief will continue to demand large additional sums.

The commendable part of Dr Roy's effort is not so much in these targets and figures but in schemes of lasting benefit such as the *Mayurakshi Project*, the Ganga Barrage, the Durgapur Project, the reclamation of Salt Lakes round Calcutta and so on. These give evidence of vision and are praiseworthy even if other schemes like that of fishing trawlers have been a flop.

But vision, though indispensable is not enough and the drive of one person, however able, is also insufficient. So much of the capital, management and economic control rests in other, and not always sympathetic, hands that a laissez faire solution to unemployment, underemployment and the burden of refugees is difficult to contemplate. The lack of confidence and security makes a solution even more difficult.

Perhaps the best and most equitable method is to apply planning and controls much more stringently and organize the development of the State's resources through State enterprises. This would solve the problem of capital and management and ensure that the resources were utilized primarily in the interests of the State and its people. It would also provide the basis of a technical revolution in the State's educational system and leave a significant impress on the unemployment problem. State enterprise has many pitfalls but in West Bengal the peculiarities of the situation make it the method most likely to be fruitful.

Time and the Choice of Technique

Sukhamoy Chakraborty

THE choice of techniques appears to have become something of a choice *theme* for the Indian economists today. This is possibly as it should be, since we are no longer ready to delegate the crucial investment decisions to the so-called impersonal forces of the market. The problem of technological choice, properly understood, is only one aspect of the more comprehensive problem relating to the determination of the amount and pattern of investment that would in some sense maximize whatever is taken as our target variable. The problem gets more complicated if we have more than one target variable. For example, in the case of India two target variables appear to be regarded as equally crucial, namely, the quickest possible elimination of unemployment and the maximum possible rate of growth of income. In both cases, the solutions have to be worked out under the constraints of a more or less unchanged structure of private property rights. Mathematically, the question is capable of being answered if the number of instrument variables is equal to the number of target variables. The problem, then, becomes one of finding out the appropriate instruments in a concrete economic setting.

But what leads us to think that the two target variables are independent of each other? Surely, employment cannot be regarded as a determinate magnitude from the economic standpoint unless we specify the type of production function into which employment enters as one of the independent variables. In the thirties, Keynes was in a position to isolate the problem of employment because he assumed away technical progress and changes in the production function. But, here, the situation being the precise opposite, it is difficult to see how the problem of maximising employment irrespective of its effects on productivity may be regarded as an economic problem by itself. Employment problem, viewed properly, is the problem of distribution of national income between profits and non-profits income, once given the level of real wages. But the basic problem in India is not one of distribution, but of growth.

This is not to assert, however, that the way the national income is distributed has no relevance from the growth standpoint. As a matter of fact, increase in the share of income going to the classes having investment propensities is likely to affect the rate of growth of income quite favourably. On the other hand, if employment is sought to be created through paying subsidies to workers in those lines of production where the net value added per unit of labour falls short of the level of real wages, the result will be only a temporary increase in employment at the cost of slackening in the rate of growth of the economy. The long-run effect on unemployment will, however, be quite adverse and will be in the same direction as the effect on the rate of growth of income. Correctly viewed, therefore, the rate of growth of income and the rate of growth of employment are not antithetical objectives. The two target variables, therefore, reduce to one.

From that viewpoint, the choice of techniques has to be geared naturally to maximise the rate of growth. The discussion that has taken place in the pages of 'Economic Weekly' has emphasized many relevant factors involved in this choice. But the whole discussion has been sigularly lacking in any explicit reference to time. The variable that has been emphasized are no doubt the correct ones, namely, output per worker, the level of real wages per worker, and finally, the capital cost per unit of labour. Questions have, however, been raised regarding the method of calculating the capital cost involved, in the case when money-cost cannot be regarded as the appropriate index of real cost or when international transactions in goods are involved. But they do not get down to the question of time, which is of the very essence of the problem of capital and investment. Time appears in this context in three different ways. Firstly, there is the time that elapses between the first application of investment effort and the emergence of the capital good usually known in economics as the gestation period. Secondly, we have the so-called fruition lag, consisting in the time-interval between the first application of the capital-good and the emergence of the flow of consumable products. Finally, we have the question relating to the time for which the capital asset may be expected to work.

Since no decision on the technological form of investment can be taken without considering how much of the national income is to be devoted to investment and how the total amount of investment is to be allocated between the different branches of production, it becomes essential to introduce time explicitly into our scheme of inter-relationships. The so-called fruition lag and the gestation period have however been mentioned often in this connection in economic literature. It may therefore be enough to point out their significance quite briefly. Consider a case where the planners decide to go in for capital-intensive projects as against labour-intensive ones where the technological nature of production at all permits of such a choice. A capital-intensive project will naturally entail a large so-called fruition lag. What is more, it also presupposes the existence of capital goods in requisite quality and quantity, the availability of which is conditioned by the prior distribution of investment among the several sectors of what is technically known in the Marxian terminology as the Department I and also by the basic decision relating to how much to invest. If, therefore, the choice of techniques is to be effective, the aggregate demand for consumer goods must be equal to the aggregate supply of consumer goods. In case we are dealing with a thoroughly planned economy, the adjustment may be brought about through rationing of scarce consumer goods, prices playing a role completely subservient to the target for accumulation. If, however, we deal with a so-called mixed economy, the extent of the lags has to be correctly ascertained as much as the productivity coefficients in arriving at equilibrating magnitudes. So much for the first two ways in which time enters into the picture. But the significance of the third way namely that relating to the age-distribution of the capital assets has not often been clearly understood in this context of choosing one's techniques.

Any significant investment programme is likely to affect the age-distribution of the capital assets of the economy. If the programme emphasizes capital-intensive techni-

ques, the corresponding structure of producers' durables will help raise the average life-span of the capital asset. Now, with a larger average life of capital, the ratio of depreciation to gross investment will fall, assuming a given rate of growth of national income. Further, this will mean that not whole of the depreciation will be needed to replace the old assets. In this context, depreciation obviously means current provision for amortization. As a matter of fact, depreciation will exceed replacement by a certain percentage which varies directly with the average life of the capital assets. This follows directly from the fact the economy is not stationary. In the nature of the case, therefore, the ratio of replacement investment to gross investment will fall. The extent of fall in the ratio of replacement to gross investment will, however, exceed the amount of fall in the ratio of depreciation to gross investment. This leads to a higher share of new investment in the investment total. The effect on the rate of growth of national income will be highly favourable since it is precisely new investment that helps in increasing productivity as against maintaining it. Other things remaining the same, the choice of capital-intensive projects would then lead to an acceleration in the rate of growth of the economy. A very good illustration of the above mode of reasoning is provided by the Soviet experience in economic development. Norman Kaplan's (Kaplan in Soviet Economic Growth) data as well as the data provided by the recent Economic Survey of Europe in 1955 go to show that the phenomenal growth of production in U.S.S.R. is as much due to a high ratio of investment to national income as to a high ratio of new investment to total investment. The advantage of choosing capital-intensive methods, therefore, consists not merely in the savings in wage-costs that accrue in the course of successive rounds, but also in making a larger total of new investment possible.

The rationale of the above line of reasoning has been explicitly worked out in mathematical terms by E D Domar and Robert Eisner on the assumption of straight-line depreciation.

Domar, for example, gives the following formula for calculating the ratio of replacement tongross investment:

$$\frac{R}{G} = \frac{I}{(I+r)^m}$$

where R=replacement, G=gross investment, r=rate of growth of gross investment and m=average length of life of fixed capital.

If for example, r=10% per annum, m=30, $\frac{R}{G}$ is nearly 5% while if r=10% and m=10, $\frac{R}{G}$ is approximatly 40%. It is evident from the above that a change in the life-span of the capital assets alters significantly the ratio of new investment to gross investment. A very clear recognition of the factor is also to be found in the writings of a Soviet Economist A I Notkin.

(Ref. A I Notkin: Ocherki teonii sotsialicheskovo vosproizvodstva and Voprosi opredelenia ekonomicheskoi effeklivnosti kapitalnykh vlozhenii v promisohlennosti SSSR. —Essays in the theory of Socialist Reproduction and Problems relating to the determination of the effectiveness of capital investment in the industries of USSR). Our purpose in this short note was only to point out the significance of the above factor in the matters relating to the choice of capital-intensity. A further discussion would entail several technicalities which are rather ill-suited in the present context.

Farnborough—1956

(From a London Correspondent)

IN January, 1954, one of BOAC's Comets was lost with all on board off Elba. In April, 1954, a second Comet crashed into the Mediterranean. At about the same time, a turboprop Britannia crashed into the Severn. In that year, export sales of British aircraft slumped by ten million pounds. All Comet deliveries ceased. Production of the Vampire and Meteor was declining, with fewer orders. To what extent have these series of disasters affected the British aircraft industry of 1956?

Farnborough, 1956 leaves a very different impression from the display your correspondent attended in 1952. In 1952 there was an air of excitement which permeated down even to the spectators. All delta-shaped planes flew high over the aerodrome at a sober, secret pace. There was a feeling of great things to come and even the misfortune of a jet plane disintegrating over the aerodrome and killing many of the spectators could not dull the thrill of looking into the future. To-day, much of the promise has been falsified. Yet, in a more sober sense, the British aircraft industry is still very much a competitive industry. Since the war, Vickers-Armstrong has sold £ 35 million worth of its Viscounts including 32 to Capital Airlines and 18 to Trans-Canada Airlines in North America. Rolls-Royce has sold £.88 million worth of orders overseas for its engines. Whereas Farnborough 1952 emphasised the new Comet and the new fast fighter aircrafts, Farnborough 1956 emphasises progress already made with the new medium size passenger aircraft and in the sale of engines.

Two of the most noticeable things about the display were the marked divergence between aircraft designed for civilian and military use and the rapidity with which military aircrafts are outmoded. In military aircraft, the jet engine is the dominant means of propulsion. In civilian aircraft, the turbo-prop is the main from of propulsion. In military aircraft, the emphasis is on speed and yet more speed. The FD2 has the world air speed record of 1,882 km. per hour. But in civilian aircraft, economy of operation is combined with a design for a specific route and payload. Within civilian aircraft, a plan for internal operation must have markedly different characteristics from aircraft on international routes. This difference extends even to the training of pilots. A pilot trained in the RAF is unsuitable as a civilian pilot.

The rapidity with which military aircraft are outmoded is surprising. It seems doubtful whether on purely commonsense grounds, it would be worth while keeping more than a token force of aircraft in existence. By the time an aircraft is thought of, had its prototype made and is put into production, new methods of defence will already have been devised to make the whole progress useless. As long as research is as advanced as possible, there seems little point in putting the results of it into production at enormous cost. It is no secret that there have been several suggestions that the British Fighter Command should be abolished on the grounds that they would be no protection against ICBMs (Inter-continental Ballistic Missiles). The Javelin F(AW)7 had a device by which rockets shot from the plane would automatically link themselves on to an enemy at a signal from the pilot. But under these conditions, why send up a plane at all? It is possible that within the next ten years, missiles could be launched from a platform revolving around the earth above the gravitational field. The question is already being discussed as to how far into the sky do a country's territorial rights extend.

Besides the large military and civilian aircraft, there were also exhibited several new designs of helicopters and small cabin planes such as the Auster and Pioneer. Being of simple construction, their manufacture can still be undertaken by firms with small capital. It is exceptional however for a modern jet fighter to be built by a small company. The Folland Aircraft Company has constructed a jet fighter, the Gnat, only 29ft 9in in length and 22ft 2in in span which, by sound design and careful considerations as to weight, has succeeded in equalling the performance of a jet fighter three times its price. In 1954, negotiations began between the Company and the Government of India to manufacture the Gnat under licence in India. In July this year, the agreement was finally concluded. Work on the design of the Gnat was started in 1951. Owing to the refusal of the British Government to consider the original design, the capital and support for the initial development of the plane was provided privately. The engine for which it was originally designed did not become available and a smaller model, the Midget, with a smaller engine, had its first flight trials on August 11, 1954. Later, a better engine, the Orpheus, was used, and the first new engined Gnat flew on July 18, 1955. The following month the Ministry of Supply ordered six Gnats. All the original design, organisation and capital were provided outside any of the big aircraft firms and without Government support. The production costs are at least a third of a similar, more orthodox jet fighter and this economy results from the design. For example the wheels and wheelcovers are part of the same mounting. It has been estimated that a company with a total payroll of only 3,000 and with slightly less than 50,000 sq ft of floor space could build at least 20 Gnats a month. It is individual enterprise of this sort which gives hope for the British aircraft industry. It is greatly to be regretted that the high initial capital cost and the organisation of larger and larger units, makes an achievement such as this more and more difficult in the future.

Farnborough was duller this year than for a long while. Perhaps it is only the breathing space before a bigger effort on new fronts. The fight between jets and turboprops on civilian routes has only just commenced. Newly designed aircraft have not yet reached the exhibition stage.

Indian and Chinese Plans

(Continued from last issue and concluded)

Gyan Chand

AS stated by Dr Raj, the problem of unemployment remains unsolved in China as in India—particularly the problem of rural unemployment and under-employment. The latter problem cannot but acquire great urgency in China, owing to the programme of rural reorganization which is well under way. Through large works of prevention of soil erosion, afforestation, water conservancy, local projects of public utility, development of auxiliary industries and handicrafts, every effort is being made to find palliatives, even if the solution of the problem cannot be taken to be in sight. Surplus labour in rural areas is being utilized in an organized manner and planned transfer of population from congested areas to under-populated provinces and newly reclaimed areas has already been undertaken. Internal re-distribution of population is inevitable in China for its present distribution is known to be extremely uneven; but even then, it is not certain that through re-distribution, development of agriculture and industrialization, complete success will be achieved in solving this problem. There is a growing understanding of its importance in China and it is not unlikely that revision of existing theories and assumptions would be clearly indicated by the empirical considerations and may in fact be undertaken.

Exit of the Small Trader

In one respect, however, Dr Raj's statement in this regard needs to be corrected. The fear of aggravating the problem of unemployment has not deterred the Chinese planners from going ahead with the programme of nationalization of retail trading. The latest position in this respect is that of 2.4 million households in retail trade, the business of nearly 75 p c has already been nationalized and they have been absorbed in jointly operated enterprizes, state trading corporations, trading co-operatives and as agents on commission basis for these commercial organizations. Twenty-five p c of pedlars and small traders have, however, not yet been provided for and in order to alleviate their position, they are now being organized into co-operatives and public trading organizations have been specifically assigned the duty of (a) raising loans from the banks for these co-operatives, (b) supplying commodities to them, and also (c) collecting taxes from them.

Private retail trading would practically disappear by the end of 1956 and the distribution of commodities down to the lowest level become entirely a public function. It would take some time before these changes are fully carried out, but it is clear that private enterprize in industry and commerce will be eliminated at all levels and replaced by state or co-operative undertakings.

Trade is expanding owing to the expansion of production, agricultural and industrial, and distributive functions would increase in extent and importance; but they are being rationalized and socialized even when they have not been nationalized. The small trader in China, as elsewhere, was a symbol, an instrument and an efficient cause of exploitation and also its victim. His exit now need cause no regret; he is himself better off on that account. The fear of unemployment has not prevented the helmsmen of the new Chinese economy from carrying out their programme of nationalization and rationalization of commerce, both wholesale and retail. Waste and anarchy, which the small independent retail trader represents, are incompatible with the development of a planned economy.

Small Scale and Village Industries

Handicrafts, as stated by Dr Raj, have been given an important place in the development programme and are being organized and developed rapidly to play their role. The craftsmen have already been largely organized into co-operatives and the trading co-operatives and state trading corporations have undertaken the responsibility of supplying their raw materials and marketing their products. Their production is expanding fast and in 1955 it expanded by more than 16 p c. There is an autonomous Federation of Industrial Co-operatives and it is functioning at national, provincial, county and Hsiang or basic level. Apart from the speed and vigour with which this integrated programme is being carried out, it has certain features, which make it different from our programme of the development of small and village industries. These features are:

(a) There is no competition between these industries and large-scale factories and there is no need for subsidies and reservations, as distribution of both craft and factory made commodities is made through the same agencies and their production is, as far as possible standardized.

(b) Construction and expansion of factories and mills is being proceeded with, along with the development of the small and village industries and expansion of their output.

(c) Production of these industries is being mechanized as a matter of policy and wherever possible, power is being provided and is utilized in production.

(d) Local needs are, as far as possible, being met by local industries, and unnecessary transport of goods is being avoided.

(e) Development of these industrial co-operatives is being combined with social education of the craftsmen i e they are being given an understanding of their place in the changing economy and exhorted to play their part with a clear knowledge of the changes that are in progress.

(f) Research and training institutions have already been established for the benefit of the craftsmen and are being utilized with advantage. In other words, owing to standardization of commodities, pooling of costs and prices, effective and rational distribution of goods, China has already introduced a common production programme, a common price policy and an all-embracing social purpose. We in India have been talking about all these for years, without understanding their implications in regard to industrial production as a whole and without taking any practical steps to realize these objectives. Even in the execution of the Second Five Year Plan, the prospect of this being done with success is rather remote. Our whole policy in this respect is full of contradictions and is not taking us anywhere. Differences between the Chinese and our plans in this respect are far more significant than their similiarities.

Why Rationing?

There are two other points in Dr Raj's article which cannot be passed over. For, a clear understanding of these points is essential for a correct comparative view of the Indian and the Chinese plans. The first of these relates to inflation and inflationary pressure. It is not possible for me to cite figures, but there has been, in spite of enormous development expenditure in China, no deficit financing, if published figures of public revenue and expenditure are dependable. Since 1952, all budgets have been surplus budgets, i e receipts have been in excess of expenditure, including development expenditure. China does not publish figures of currency in circulation and it is, therefore, not possible to assess the position with reference to the money supply of the country. There has been no price inflation, prices having been remarkably stable since 1952 and as costs and wages are also under public control, there has been no cost inflation on account of a rise of wages. Figures of the value and volume of trade are again not available, but according to official sources, inter-national account has been in equilibrium, in spite of rapidly expanding foreign trade.

And yet, as Dr Raj points out, it has been necessary to introduce rationing of rice, wheat, oil and cloth on a nation-wide basis, and the quotas, though reported to be adequate, are by no means liberal. What are these shortages due to and what do they indicate? The peasants, of course, have their own supply of foodgrains and possibly oil, but monopoly procurement has been introduced all over the country, surplus of the peasants assessed on the basis of estimates of their produce and needs, and grain deliveries are being collected regularly, which of course, means indirect rationing also of the rural population. The official explanation of this development is that per capita production and consumption of the essential commodities has gone up considerably all over the country and in some parts, very rapidly; and yet the appetite for these goods is growing on account of the growth of the purchasing power of the people and production of goods cannot keep pace with it. There has been shift of demand from coarse to finer grain, from lard to oil and from coarse to fine cloth. That is why 'planned purchase and supply', which is the Chinese phrase for monopoly procurement and general rationing, has had to be introduced and has to be maintained.

Inflationary Pressure?

Does it mean inflationary pressure? This question cannot be answered without a detailed consideration of the whole problem and without more data than are available at present. The crux of the matter is, whether the people are getting enough to satisfy their essential needs without being reduced to unduly low subsistence or even austerity level. The general level of nutrition in the country appears to have been greatly improved, and most reports bear out the view that acute distress is rare, if not non-existent, and the people psychologically can stand the strain.

The programme of development now in the process of implementation in China cannot but mean abstinence on a mass scale and the latter would do no harm if the people are not unduly hard pressed and understand that rapidly increasing investment has to mean willingness to wait for the 'pie' in the future. Balance has to be struck between reasonable needs of the people and urgency or rapid development. Recent experience of planned economies in Europe makes it clear that this balance has in practice been upset and is being redressed with great effort. Answer as to whether there is inflationary pressure in China depends upon this vital consideration. The Chinese authorities are alive to its importance and are learning from the experience of other socialist countries.

The Fundamental Contradiction

A few words need to be said also about "the fundamental contradiction" to which Dr Raj refers in the last concluding paragraphs of his article. He writes that impetus from land reform is running out, and the contradiction between the needs of a fast growing population, rapid industrialization and the limits inherent in the Chinese economy remain unresolved. The Chinese would not agree that revolutionary impetus is running out and the pace of socialist transformation does not seem to indicate any slackening of the impetus. And yet the problem remains as to whether the economy can sustain the increase of 12 million of population every year with the present man-land ratio in the country. (There is per capita less than ½ acre of cultivated land in China).

The contradiction arises out of the pace of development but even more out of the existing pressure of population and its annual growth. The rate of the latter, which is 2 per cent at present is likely to be accelerated. The death rate in China is at present 17 per thousand and the birth rate 37. The latter can and will be reduced in the next five years—it has been reduced from 27 to 17 in the last five years. The death rate in countries like Peurto-Rica and Ceylon has been reduced to 9 to 10 per thousand and even in Formosa, it is not much higher; and if that happens in China also, the annual rate of growth will probably go up to 2.7 per cent, which means roughly an increase of nearly 16 millions every year. Population will double itself in about less than 25 years if it continues to increase at this rate. Are the Chinese aware of this great contradiction?

Scope for Land Reclamation

According to Dr Raj, they are clinging to their 'illusions' as 'hard-boiled Marxists' and there is not even the recognition of the need to make a beginning with family planning. The Marxist ideology is supreme in China and according to it, the danger of over-population is an exploded Malthusian fallacy—a bogey of which China, being in a process of rapid socialist transformation, is not and need not be afraid. This view is being freely expressed and is the basis of official economic policy.* This position

* Both in regard to land reclamation and population policy, there has been some change. Mr Chou-en-Lai told the Indian Agricultural Mission which has just returned from China that:

"Although there may be some reclamation here and there, the main emphasis in China was on intensive cultivation and there was not likely to be much reclamation of new lands during the next few years. ....Reclamation was not only costly, but also raised very difficult human problems of colonisation.

"The Chinese were getting convinced that the population there was getting unduly large and that there was an urgent need of family planning. Family planning was necessary both for the health of the mother and the future education of children."—Ed.

can be disquieting even from the point of view of China, but there are two or three considerations which suggest that it is not necessary to take a gloomy view of the matter. In the first place, it is not a fact that there are no virgin areas available for extension of cultivation in China. Vast open spaces of the Soviet Union are not available in China, but there are areas in which very considerable extension of cultivation is possible. In the last four years China has reclaimed about 8.5 million acres of land and rapid reclamation is going on. Our Second Plan provides for reclamation of 1.5 million acres. In North East, Mongolia, Kansu, Sinkiang and Shenshi, Qhinghai and other Western provinces of China, large areas are reclaimable and are likely to be reclaimed. No authentic estimate of 'cultivable waste land' is available, but according to an American estimate, this area is likely to be of the order of 300 to 400 millions—nearly equal to the cultivated area of China at present.

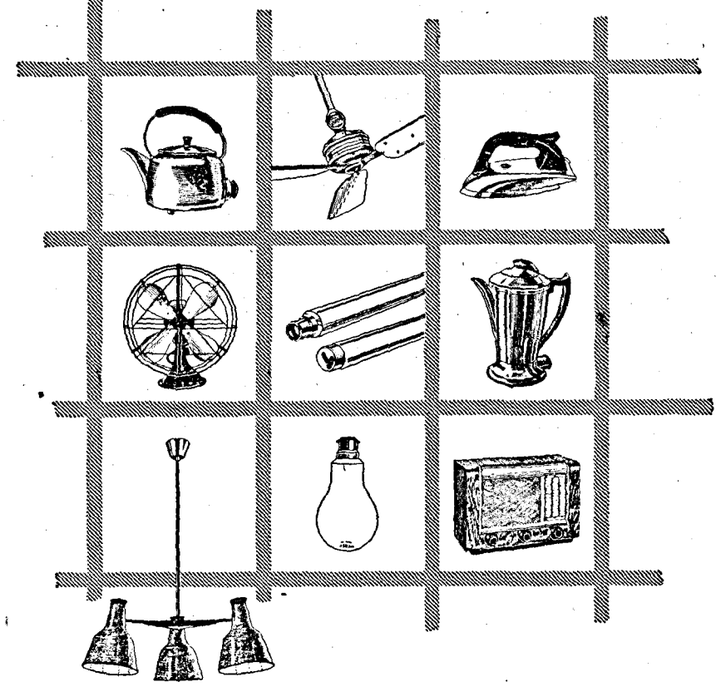
Planned transfer of population to these areas has, as stated above, already commenced and is being speeded up. In these areas large scale mechanized farming, it need not be added, would be the rule. Moreover, though yield per acre in China is among the highest, yet it is not as high as in Japan, Italy and Egypt and there is considerable scope for raising the yield through scientific cultivation and improved farming practice. The yield has in fact greatly increased in the last four years and can be further increased. A combination of sound social economy and modern technique of agricultural production can deal with the 'fundamental contradiction'—at least for a good while yet.

Changing Policy on Population

Further, rigidity of Marxism is, in practice though not in theory, being lessened and in China knowledge of contraception is being freely imparted and contraceptives are being freely distributed through the public health services, and according to my information, no barrier to the acquisition of knowledge on contraception and contraceptives are being put up or maintained. This is more than token recognition of the need for family planning; and Dr Raj will perhaps agree with me that neo-Malthusian view on population is not an essential condition of the successful implementation of the programme of family planning.

Another change, which has occurred in China and is of great significance from this standpoint is the revolutionary change in the status and role of women in that country. This change is an event of far-reaching importance and has clearly an important bearing on the practice of contraception. Minds of the men—even more of the women—are being moved very deeply in China and taboos and inhibitions cannot stem the tide of a new sex-code and a new sex ethics in the making. Family planning in China will really mean much more than merely the use of contraceptives. It should and possibly will mean a new conception of the family and its place in personal and social relations. More is being done in China in practice for family planning than in India and profound changes in actual behaviour cannot be prevented. Even in the Soviet Union, the birth rate in two or three decades has fallen from 40 to 25 per thousand and is no higher than in the USA, in spite of rigours in action of Marxism and Stalinism. After the great 'thaw', which is a fact, similar decline in the birth-rate in China can well be postulated and may take place more rapidly than in many countries—including the Soviet Union. That does not alter the fact that the Marxists every where—more in China because of the context of their specific situation—have to do serious re-thinking of the premises of their views on population. This change also may come, and whether it will precede or succeed the change in practice no one can tell. In the next ten years the population of China will most likely continue to increase at least at the annual rate of 12 millions. That means that the population of China in 1963 will be well over 700 millions. From that there is no escape and that is not at all a frightening prospect. If China can realize the manifest possibilities of her existing situation, she will also realize her hopes without running into any formidable difficulties. She will before long have to think in terms of stabilizing her population at some desired level and make this thought the basis of her economic approach, policy and practice. This, she can, in my opinion, do without abjuring her Marxist faith.

Limitations of Comparison



In conclusion I want to add a few words on the limitations of comparing the Indian and Chinese plans. My view is that much more can be done in the way of planned development of our country and more should be done; and implication and obligations of social revolution, to which we are committed, have to be clearly understood and acted upon. This, however, does not imply that the line of development in China can or should be reproduced in this country and we should aim at establishing the political or economic institutional framework of China. We can and should learn a lot from her experience; but our solutions have to be framed in terms of our own history and concrete problems. It is not the purpose of this article to disparage our own achievements, but to indicate the need for right understanding of the planned development of the Chinese economy and its mainsprings.

We in India have in our own way to bring about a change of the same order and set up a pace of development not significantly below that of China. We have to do so in our own way, but if our way cannot relieve misery, open out vistas of real hope, and enable our people to rise to the best in them and the need of the situation, our way would necessarily cause frustration and serious revulsion, and therefore would have to be abandoned. Let us hope that that will not happen and we too will blaze new trails. I do not want to say more. I hope that I will not be misunderstood. I am thankful to Dr Raj for having provided me the occasion for writing this article. Besides having warm personal relations with him, I greatly value his writings and his integrity even more than his undoubted ability.

Book Review

Village Exchange Scheme

Industrial Development—A New Approach By Sushil Dey, ICS. Thacker Spink & Co, Calcutta. 1955. Pp IV, 82. Price Rs 5.

Reviewed by **R K Hazari**

THIS neat little book by a distinguished member of the ICS "claims to furnish in broad outline the key to the solution of a seemingly intractable problem." Its objective is "intensely practical, and the real value of the thesis is to provide a correct guide to concrete action."

Shri Sushil Dey opens with the story of Kulkuri, a village of 581 inhabitants in Birbhum district of West Bengal. It is one of the 185 contiguous villages contained in a community development project. The contribution of Kulkuri to history lies in the simultaneous creation of new wealth and new markets without displacement of any persons or products. This has been achieved through the Village Exchange Scheme, the objective of which is to base welfare on wealth and to provide more employment to artisans. It is not to be confused with barter because its purpose is not confined to mere exchange; it is concerned with increasing reciprocal demand, stopping or diminishing the cash outgoings from the village and to give a psychological impulse towards self-generating cumulative growth. It seeks to make for creditworthiness through self-help, without the use of cash as far as possible.

How has Kulkuri set out to fulfil these objectives? This is how the process works. A carpenter longed to possess a razor of his own. He had no means to buy one in the market. It was ascertained that the village blacksmith could make a crude razor blade with a spare bit of rusty steel he had. What did the smith think its price should be? Fitted with a handle, he thought, it would sell for As 5 but he did not think he would have a buyer for such a crude product. It was then suggested to the smith's wife that she would be glad to have a little stand to set her lamp on before the family altar. She readily agreed but had no money to buy one. The carpenter was got to carve a small wooden stand and a grooved handle out of a piece that was being thrown away as fuel, and he thought that the two together would be worth As 5. But he had no chance of selling them in the market. The lamp stand and the razor were then exchanged for what both parties thought was an identical price. They also thought it was a fairer price than what they could hope to get in the market, if there were a market at all for such things. Both felt that production and exchange had cost them nothing except a little labour, of which they had plenty to spare. This process had worked with ease in the case of multilateral exchange as well, since the appearance of barter about the transactions is only an illusory one. Every commodity or service offered in exchange is first evaluated in money by common consent in the village meeting and only then is the transaction effected and accounts squared. The form of barter that prevails here is, in other words, of the international type with facilities for multilateral clearance and short credits. The ultimate aim is to improve productive techniques continuously and to raise real incomes by making full use of the possibilities of trade within the village.

This scheme is not to be taken as a programme for village self-sufficiency. Its basic purpose is to extend the market for the present crude and unimproved products of rural industry. "This cannot be done on any appreciable scale by taking away the existing market from competing factory products. The market we are looking for must be (a) new or additional market". In other words the scheme is devoted to the idea of complementarity of large and small industries without cumbersome taxes, cesses, restrictions on production, etc.,

The author derives theoretical support from a note (which one supposes, is also a clean bill of health) by Mrs Joan Robinson who compares the scheme with the EPU and considers cash in the former case as the equivalent of dollars in the latter.

Obviously the scheme which enables villagers to make productive use of surplus labour and of materials which would in its absence have been thrown away, is beneficial. But what is not obvious is the author's claim that "the story of Kulkuri is the first tremor of a deep industrial upsurge starting in .... our economy".

Whether the scheme can start such an upsurge depends on the amount of unused resources in villages, not only of labour but also of materials and tools. The wasted resources need not be diversified: even if the village carpenter is fully occupied selling to towns, if the village weaver has idle looms, he can add both to his and the carpenter's wealth by offering more cloth per table than the carpenter could obtain from the towns (assuming that either of them can obtain the raw materials).

Whether the scheme will succeed depends on the amount of organisation required. Village groups could probably do the work of the more formal organisation that would be required in less close knit societies. But even so, some outside help appears to be necessary. Mere demonstration of the benefits to be received may not be enough: the carpenter's wife may have to be persuaded to use handloom instead of mill cloth. The EPU expedient, to continue Mrs Robinson's simile, of bargaining or restricting dollar imports is not open to villages.

Whether the scheme should succeed depends on the relation between village and urban costs of production (including the social costs of transfer, housing etc.). EPU is clearly beneficial to Europe (and it could be argued to the world as a whole) even if American industries remain idle instead of their less efficient European counterparts, since only restricted numbers of European workers can emigrate to America. But Indian villagers can move to Indian towns, and millowners can build mills in rural areas, and it may increase total wealth to do so.

None of these points are criticisms of the scheme—they only raise problems for the detailed research and planning, the need for which the author himself stresses.

Around Calcutta Markets

Uncertain Outlook

Wednesday, Evening

THERE is more than one reason for the set-back and the subsequent upward rebound in equities in the last few days. Fall in equities was initiated by the increase in excise duties on cloth. To be more precise, the set-back was aggravated by the Government's decision to raise cloth excise duties. For, equities had developed an easier trend even before the announcement of the decision to increase cloth excise duties. A corrective set-back was widely anticipated. It has come, though it is yet too early to say whether it is over. At the moment, equities remain hesitant at levels slightly above the recent "lows".

In the recent set-back, some of the speculative scrips reached the bottom levels recorded during the crisis on Lyons Range months ago. Indian Iron, for instance, were "done" down to a level which was only two annas higher than the bottom touched during the crisis. This was not entirely due to the higher cloth excise duties. There were troubles about the settlement on Dalal Street. Doubts about the settlement aggravated the fall in equities. There is a market saying that, even in a secondary "bull" market, the earlier "low" is repeated twice.

Market Technique

On this technical theory, it is not without significance to note that the present "low" in Indian Iron is two annas above the crisis bottom. It would be unsafe to stress this point. But there is some technical point in it. Nor is it without significance that, on both the occasions, the "low" in Indian Iron was witnessed during kerb dealings. But this latter fact has a "bearish" implication. There is another market saying that "lows" and "highs" in kerb dealings are repeated in official trading hours. Does this mean that the outlook is still uncertain?

Wednesday's recovery in equities is mainly technical. It is due to replacement buying. There has not been much of fresh buying. But "bears" have been prompted to cover their sales because of developments relating to the Suez Canal crisis. That President Nasser would reject the 18-nation plan was not unknown to stock markets. But reports of the Anglo-French reaction to the failure of the Cairo talks have revived fears about the dangers of war and some responsible papers in London have been openly warning Britain about war danger. Though the Press in India is not, stock markets seem alarmed at the possible turn of events.

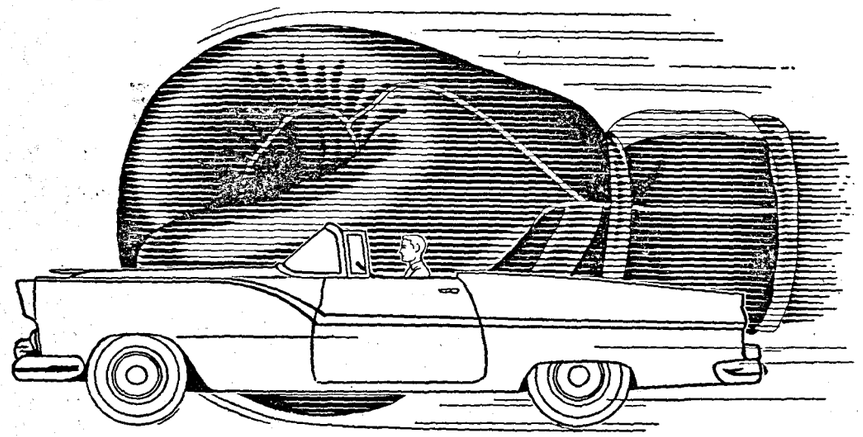
War Fears

Besides revival of war fears, some other factors combined to enable equities to recover a portion of the ground lost earlier in the week. There is considerable inter-trading between Bombay and Calcutta mainly on speculative accounts. It is, therefore, natural that apprehensions about the smooth passage of the settlement in Bombay would affect equities in Calcutta. With the end of the Bombay settlement troubles, equities have resumed the upward trend. But, in the absence of fresh buying support, the upward movement remains technical.

Any deterioration in the situation in west Asia may cause a sudden spurt in equities on Lyons Range. Wars have always had a "bullish" effect on stock markets. It is rather academic to argue that any disruption of traffic through the Suez Canal, as a sequel to war, will only raise import costs of the Second Plan. In wartime, imports are costly, and goods are not always available. These are the very reasons why stock markets move up. There is no reason to believe that stock markets would react otherwise to any worsening of the situation in the Middle East.

But if war dangers are the only factors responsible for the revived spurt in equities, the stock market steadiness may not last long. Because the Cairo talks have failed, it does not mean that war is inevitable on the Canal issue. Both America and Russia are in favour of solving the crisis under the auspices of the United Nations. President Eisenhower may have conceded the Anglo-French right to use force, but this is conditional on aggressive acts or designs by Egypt. Cairo is determined not to provoke any war-like action. This aspect of the situation must not be ignored.

Apart from war troubles, the market outlook is not gloomy. Inflationary trends still persist. But latest price movements are not discouraging. Food prices are not moving up. There has been a slight fall in food prices. Living costs remain high because of the rising trend in cloth prices. But the recent Indo-American Agreement about supplies of agricultural products by America to India may have a sobering effect on prices. Those who are aware of the incidental monetary repercussions of the American wheat Loan will appreciate how the latest Agreement may have similar effects. With lower prices for food and for industrial raw materials, some of industry's troubles may be over.



Firm Jutes

In an otherwise "bear" market, Jute shares have been consistently firm. Steadiness in Jute shares is more than justified. By the middle of July last, 2½ per cent of looms were re-sealed. During August, mill stocks of jute goods declined considerably. Not only has output fallen, exports have also gone up. By the middle of this month, another 5 per cent of jute looms will be re-sealed. Mill stocks of jute goods may decline further during this month. These stocks will certainly decline heavily during the next month. But the gunny and stock markets are anticipating these developments.

Besides Jute shares, Burrakur Coal did not fall while equities in general were slumping. At the time of this writing, the outcome of the amalgamation project is not known. But the revived spurt in Burrakur in the last few days indicates that the amalgamation plan will go through. In that event, Burrakur may rise further. There is no difference of opinion that the amalgamation plan is favourable to Burrakur. Despite the spurt in Burrakur, Coal shares remain inactive. There is growing gloom about Coal shares. But it is of interest to note that sellers are not active.

A disturbing development is the quiet trend in Engineering and Miscellaneous shares. These groups of shares are not falling, but there is not much of activity in these counters. Meanwhile, Paper and Cement shares remain steady, and attract investment support at all set-backs.

Around Bombay Markets

In Jitters over Excise

Thursday, Morning

THE Stock Exchange is on trial, as it were. It is not only that the market has been in jitters, especially the cotton mills section, ever since the announcement of higher excise duty; the Finance Minister's threat, that controls might be imposed as a last resort to check undue price inflation, has led to some rethinking. The facile argument that controls will mean flourishing business for the mills, as they did in the past, does not carry conviction any longer, for not only the economic situation, but also the political climate has changed so much. At least the operators will be kept guessing when the Finance Minister will strike next, in order to mop up surplus mill profits.

In the circumstances, it is natural to talk about bear markets. But there are other considerations, the Suez canal issue, for instance, which is a "very, very grave situation". Britain might be inviting trouble, but market operators stand to gain from it, if she does. There is also the Reserve Bank Report for the year to June 30, 1956. Its broad finding that India has been able to combine in a substantial measure economic development with financial stability, cannot be dismissed off hand. The growing foreign exchange shortage is yet another factor which must boost domestic industrial production, by forcing further cuts on imports of a variety of goods. This is certainly a bullish point.

Whether the market will derive strength and support from these bullish factors is anybody's guess at the moment. But as there has been a forced technical correction in the last fortnight, a reversal in trend may not be ruled out altogether.

Indicative of the landslide in prices, industrials succumbed to long liquidation, with Tata Ordinary losing over Rs 6 as compared to the previous week but they improved to close on a steady note at Rs. 196-8. Indian Iron also suffered a sympathetic decline to Rs. 35-1 but closed better at Rs. 35-9, compared to the highest during the week of Rs 35-14. Textiles, however, experienced a precipitate drop.

In the miscellaneous section, conditions were no better. Bombay Burmah recorded a heavy drop of Rs. 30 to be placed at Rs. 718-12 but recovered at the close of the week to Rs. 742-8. Some replacement buying was noted in Tata Chemicals, Scindia, Premier Construction and National Rayon all of which had suffered in the general decline in values.

Cotton

Still Higher Targets

THERE was nothing of note in the cotton futures which continued to show a bearish trend. The annual meeting of the Indian Central Cotton Committee, Bombay, served to focus attention on the need for an appreciable increase in the production target for cotton in the Second Plan. Some other points which were taken note of by the ICCC were: (i) the constitution of State Cotton Committees in all the important cotton growing States, for reviewing the progress of cotton extension schemes and other related problems; (ii) the need to bring about uniformity in legislation relating to cotton in various States; and (iii) the constitution of Regional Research Stations to deal with problems of cotton vis-a vis crop rotation and other allied subjects.

Shri M. S. Randhawa, Vice-President, Indian Council of Agricultural Research, who presided over the last meeting of the ICCC, made a strong plea for raising the target for cotton from 58.6 lakh bales to 65 lakh bales during the Second Plan. Judging from the phenomenal increase in mill consumption of Indian cotton during the First Plan from 25.17 lakh bales in 1950-51 to 43.47 lakh bales in 1955-56, the need for an acceleration in the tempo of production is obvious. This apart, there is also the question of raising the textile production target to be taken into account. This naturally presupposes an intensification of the production campaign.

The Committee reports that the work done under the cotton extension schemes has been generally satisfactory, although there is still need to improve per acre yield by judicious use of manure, fertilisers and improved seed, intensive cultivation, adoption of improved cultural methods and more irrigation. An area of 2.13 lakh acres have been already brought under irrigation and it is expected that 10.54 lakh acres would be brought under irrigation in the projects which are now on hand.

Here increase in acreage will not of course ensure a commensurate increase in output. Expanded acreage should be supplemented by intensive cultivation and scientific application of fertilisers. Thus, improved seed, use of fertilisers and improved agrnomical practices should be combined to bring about the desired increase in production to 65 lakh bales. It may be noted here that at the Conference of State Ministers of Agriculture at Mussoorie in June last, a working target of 58.58 lakh bales was accepted with the recommendation that the States should strive hard to raise it to 61 lakh bales. The ICCC has proposed the target to be raised to 65 lakh bales, taking into consideration the increased target of textile production and allowing for exports, extra-factory consumption and the need for a comfortable carryover.

It is all very well to indulge in target practices of this kind. But care should be taken that in an attempt to raise production, the supply-demand equilibrium is not lost sight of. Should that come to pass, the price of cotton may become so unremunerative as to restrain the cultivator from putting his land under cotton, which would eventually hit the production target pretty, badly. Discussing relative prices in agriculture has been a favourite pastime of the Agriculture Minister. It is to be hoped the Agricultural delegation may learn from Chinese experience and do some thing about it.

Oilseeds

Quietly Steady

QUIETLY steady trend prevailed in the oilseeds market during the week under review. Traders are looking forward to the middle of October when it would be possible to form some idea of the statistical position from the trend of arrivals. It is felt that production will be considerably larger than last year's unusually low output. In view of the vague crop prospects, the market tended to be influenced more by technical considerations than by the sentiment of the spot market at a given moment.

Arresting Price Rise

ON Delhi's Cotton Textile Policy, there has always been sharp differences of opinion within the Cabinet. Considering that these differences arise from fundamental and irreconcilable differences in outlook, which are often ascribed, somewhat euphemistically, to differences in economic philosophy, one should be prepared for sudden and unpredictable changes. The Finance Minister modestly claimed to have outwitted the market when excise duties were raised. For once, Bombay, and Ahmedabad could not get advance information or even anticipate what was coming, and forestall Delhi. The timing also, the Finance Minister claimed with the same modesty, could not be more strategically accurate. The increase came at a time when stocks with the mills had gone down to a record low.

But need the Finance Minister have been so modest? He had raised the excise duty not because Government wanted more revenue but because cloth consumption had to be restricted. If he had outwitted the market, he has more than outwitted both Parliament and his critics outside who failed to see that when he said restrict consumption, he really meant increase, for Delhi is now agog with the news of a fresh expansion of mill capacity, issue of additional licences for spindles and looms intended to raise the ceiling of cloth production by another 800 million yards. Surely, if restriction of consumption was the object and an appeal had to be made to Parliament and the people to sacrifice and contribute their bit to the success of the Plan, it could not have been better worded. After all, the excise duty was not a threat aimed at anybody, certainly not against the mills. If latest reports from Delhi are to be believed, it was a harbinger of more plentiful supply of cloth to come and eventually of lower cloth prices also, via increased mill production. Verily the path is narrow and as sharp as the razor's edge; deprivation and self-denial lead but to untold bliss.

It is a pity that the Finance Minister cannot make the period of transition from denial to plenty any shorter than the couple of years which would be needed to issue the licences, get the plant and machinery, largely through import, install new capacity, and expand the flow of supply. But wait, one can never tell. If the Food Minister can get emergency imports of U S surplus foodgrain, why cannot the Minister of Consumer goods industries get long cloth woven in other countries which have the needed manufacturing capacity from surplus U S cotton? Mills from Manchester would any day be a better stick to beat the mills with than the threat held up against them of further raising the excise duty.

There are unfortunately some who are congenitally incapable of taking the dynamic view of things and acting according to the need of the moment. They complain if their apple cart topples in the general hustling which is inevitable in the display of dynamic energy. Elsewhere in this issue an esteemed correspondent writes about the discontent among handloom interests, if not consternation, at what appear in retrospect to be the milder and already out of date changes contemplated in the textile policy of an earlier day. Handloom interests, he writes, have threatened to go on strike and withdraw from Government Boards, if the Government persists in implementing its programme of phased introduction of power looms. The contributor argues persuasively that this

change over in technique is ultimately in the interest of the handloom weavers themselves and that the latter should not obstruct what is after all a desirable and an inevitable part of the programme for their rehabilitation.

The place given to handlooms and village industries in the Plan has always had its critics. It did not, however, argue on the part of the planners a preference for inferior techniques as such. Partly it was a political concession, but it did not lack rationale because it offered scope for employment and could be exploited in the period of waiting inevitable in planning until the capital base of the economy had been properly built up, and the foundation firmly laid for the widest use of improved techniques of production. This sector could be exploited, so it was felt, also for supplementing mill production during this period of waiting. The employment potential of industries was not perhaps examined very carefully and was accepted more or less on trust. Is it now to be inferred that the capacity of the handloom sector to contribute significantly to the supply of cloth has also been found to have been grossly overestimated?

The rise in cloth prices which has been going on since the later half of last year, lately at an accelerated rate is most likely the result of rising money incomes the impact of which, it had always been known, would first fall on the demand for food and cloth. On the supply side it is possible that the handloom production has not increased at the expected rate. In any case, demand for cloth has certainly not risen faster than supply.

The target of per capita consumption for the Second Plan period, we are now told, may have to be stepped up from 18 yards to 20 yards. This limited measure of increase in planned consumption will be welcome. No caveat need be entered against it. But misgivings arise that in providing for this warranted increase in consumption, the Finance Minister may be taking a line which takes us away from the basic problem of planning. Macro-planning is not merely a matter of size or scale. Neither is it a matter of filling up details. There might be a definite departure from the basic fundamentals. So far as the objectives are concerned, it is a question of altering the Plan. Headines in the newspapers that the Plan is being re-written may be sensational but they may also be true.

It has all along been accepted without reservation and as fully recognised that the Plan will never succeed unless the price line can be held. If prices could be maintained unchanged by allowing supply to increase then, of course, there would be no problem. It is precisely because supply, even of the essential consumer goods, cannot be increased beyond a point without destroying the pattern of allocation of resources which had been decided upon, after a great deal of deliberation, that one begins to feel puzzled. The outlook is not made any clearer when, instead of exploring lines of action for holding prices, the Finance Minister goes in to dilate on the merits of higher duty on cloth as a substitute for a rational programme for making cloth available at reasonable prices to the general body of consumers.

Fair Price Shops appear to have been discussed by members of Parliament at one stage but there is danger of this proposal as well as sanity being swamped by wild promises. Free markets and planned allocation of resources cannot be made to co-exist happily together. To argue that restriction of consumption through taxation could be a possible alternative to controlled distribution on the ground that taxation in general is dis-inflationary —if they cut into savings, even taxes on income may be inflationary— and therefore it does away with the necessity of interfering with free markets overlooks the proviso that such taxes must not raise wage costs, that is they should not be imposed on 'wage goods'. Taxes on wage goods inevitably lead to fresh rounds of cost increase. The academic controversy whether some direct taxes can also be passed or not may not have been settled yet. But there has been little difference of opinion on the effects of a tax on essential consumer goods. So raising prices of cloth would not help to hold the price line, whoever may pay the tax, mills or consumers. Grand strategy may require that he hold up his tax proposals yet a while; the country is waiting for the Finance Minister to say something about his price policy.

Balancing the Two Wings

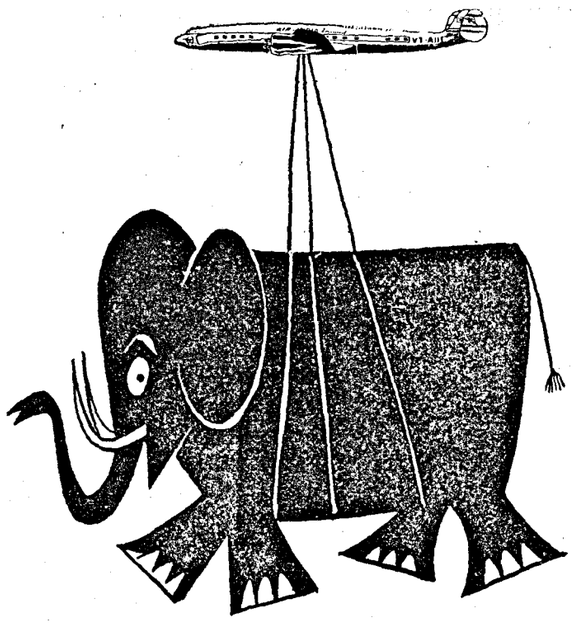
PARLIAMENTARY LIBRARY 25 SEP 1956

EIGHT years ago, the Muslim League celebrated its spectacular achievement in establishing Pakistan as a separate, sovereign State. There are not many instances in history of such phenomenal success of any political party in any country in such a short time. Today, the Muslim League, in its hour of crisis, must be bewildered at its swift loss of glory and prestige. In less than nine years, the Muslim League has so disintegrated as to cease to be the party in power in the State of its own creation. Disruption of the Muslim League has been swift, but not sudden. It lost its hold over Eastern Pakistan during the last elections. Dacca was not the only challenge to Karachi. Soon, Lahore emerged as another rival. Already ousted from Eastern Pakistan, the Muslim League also lost its hold over Western Pakistan. The Republican Party wrested the power from the League in Western Pakistan just as the United Front had done earlier in Eastern Pakistan. But the League was still supreme in Karachi, though it had to accommodate the United Front as a junior partner. And now the Muslim League has also been ousted from Karachi. It is not even a party to the new coalition cabinet for Pakistan.

If the rise and fall of the Muslim League have been so swift, the emergence and the disintegration of the United Front have been much more sudden. There is a close parallel between the rise and fall of these two political parties. Even as the Muslim League lost prestige as it ceased to represent the wishes of the people, the United Front went into sudden eclipse as its desire to cling to power forced it away from its popular moorings. No one except the party members concerned will mourn the political eclipse of these two parties. Both lost popularity as each disowned the interests of the people. Disintegration of the Muslim League is a welcome reflection of Pakistan's rejection of reactionary politics and parties. It is a development which will be hailed by all those who wish well of Pakistan. It is to be deplored that the United Front has lost a glori us opportunity by deviating from its original roots. But the United Front can take solace that one of its constituent groups is now the dominant party in the central coalition cabinet. Like the withering away of the Muslim League and of the United Front, the emergence of the Awami League as the dominant, though not the majority, party in Pakistan is a tribute to the political consciousness of the people of that State.

Two deep influences have shaped Pakistani politics since its birth. Dacca has always resented Karachi's dominance. This was not the only, but the main factor which led to the fall of the Muslim League in Eastern Pakistan. Lahore resents, no less than Dacca, the supremacy of Karachi, but for reasons which are entirely different. Lahore is symbolic of Punjab's determination to dominate Pakistan. Like the Muslim League, the Punjabi elements in Pakistan (who are not necessarily Punjabi Muslims) are in favour of a strong Centre. Unlike the Muslim League, Lahore knew, and knows, that it can never be popular in both wings of Pakistan. Creation of Western Pakistan as a single unit is an achievement more of the Republican Party than of the Muslim League. While Lahore has been shrewd in exploiting the Muslim League to curb the separatist tendencies in Eastern Pakistan, it has never made any secret of its ultimate design to dominate Karachi. In Mr Suhrawardy's Coalition Cabinet, the Republican Party is in the majority. Time may yet reveal that Dr Khan Saheb has stooped only to conquer. It is already clear that, uncertain of solid support from the East Pakistan Awami League, Mr Suhrawardy will have to lean heavily on the Republican Party.

Mr Suhrawardy's emergence in Pakistani politics has been widely welcomed on political grounds. Since the death of Quaid-e-Azam, the Army and the Bureaucracy have been competing with each other to gain supremacy. Since the assassination of Mr Liaquat Ali Khan, the politician has been under eclipse in Pakistan. Loyalty of the Army or of the Bureaucracy is not in question. But political parties have, naturally, resented the machinations of both in the triangular struggle for power. Faced with this dual challenge, politicians and political parties pursued intriguing means to hold the balance even. General Iskander Mirza was lured into politics in the politicians' efforts to woo the Army. Mr Ghulam Mohammed was successful in his tactics. President Mirza is an assurance against any Army revolt. But Mr Ghulam Mohammed was essentially a bureaucrat. So is the outgoing Premier. Since the death of Mr Liaquat Ali, the Bureaucracy has taken advantage of continuing political instability and of personal jealousies among politicians to emerge as a powerful element in Pakistan. Both the late Mr Ghulam Mohammed and the outgoing Premier have, unwittingly, encouraged this development. Mr Suhrawardy is the first Premier since Mr Liaquat Ali who is essentially a politician. Mr Suhrawardy is able and ambitious. He knows how to play party politics. Re-emergence of politicians in Pakistani politics is not an unwelcome event. There are not a few who have doubts whether Mr Suhrawardy's personal trumph can have any other significance either for Pakistan or for her neighbours.



Mr Suhrawardy, leader of the Awami League, leads a Coalition Cabinet in which Republican Party members are in a majority. This may be a democratic gesture by Mr Suhrawardy to the Republican Party which is numerically superior in the National Assembly. In the near future, the Coalition Cabinet will be enlarged. Mr Suhrawardy may find it convenient then to increase representation of the Awami League in his Coalition Cabinet. But it is evident that he and his Awami League will have to depend for their survival on the Republican Party. On two major issues, there are basic differences between these two coalition parties. While the Awami League is committed to regional autonomy and joint electorates, the Republican Party is for a strong Centre and supports the system of separate electorates. President Mirza has shown diplomacy in asking Mr Suhrawardy to form a Government in the hope that the latter may succeed in creating cordial relations between the two wings of Pakistan. Dacca is pleased that the Awami League leader has become the Premier of Pakistan. But Eastern Pakistan has not reacted favourably to Mr Suhrawardy's selection of his

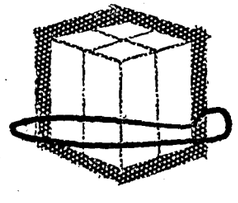
Coalition Cabinet. Specifically, Dacca resents the inclusion of Mr Feroze Khan Noon because of his attitude to the language controversy.

Mr Suhrawardy has every reason to congratulate himself on his spectacular personal triumph. It is no mean achievement for him to have been selected as the only political leader who has the competence to ensure stability in uneasy Pakistan. Reasons which influenced Mr Ali to stand down in favour of Mr Suhrawardy are somewhat obscure. Mr Suhrawardy owes his present exalted status to Mr Ali's humility and Dr Khan Sahib's tolerance. Had Mr Ali not refused the offer to form a Ministry, Mr Suhrawardy could not have become the Premier. Without the support of Dr Khan Saheb and his Republican Party, Mr Suhrawardy could not have formed a Government. Karachi's acceptance, as well as the continued acknowledgement of Dacca and Lahore, of Mr Suhrawardy's leadership is an emphatic tribute to his iron determination and magnetic personality. But there are already indications that Mr Suhrawardy may have overshot his mark, while the calculations of those who have helped him to fulfill his ambition may not materialise. Both Karachi and Lahore are hoping that Mr Suhrawardy will succeed in softening Dacca's attitude to regional autonomy. There are reasons to assume that Mr Suhrawardy is confident that he can function as a bridge between Dacca and Karachi. It may not be long before Mr Suhrawardy discovers that he remains suspect in Eastern Pakistan. In due course of time, both Karachi and Lahore may also discover that Maluana Bhasani, and not Mr Suhrawardy, is the leader of the East Pakistani Awami League.

Dacca is not likely to abandon its demands for joint electorates and full regional autonomy. Nor will Dacca disown its forward policy of economic and social reforms. Though the Awami League is now in power in both Dacca and Karachi, its position at the Centre remains delicate. In Karachi, it rules and exists at the mercy of Lahore. And Lahore can , or will, never accept Dacca's major political and economic demands. Lahore represents vested interests. Though Dr Khan Saheb is the leader, the Republican Party is an organisation of zamindars and industrialists. It will not be easy for even so wily a politician as Mr Suhrawardy to assure smooth relations between the two wings of Pakistan, or to ensure internal political stability. In his first broadcast address to the people, he has assured the Republican Party that Pakistan's foreign policy will remain as it is. His references to Kashmir were for consumption in Western Pakistan, and in Lahore in particular. His tirade against corruption is a sop to Maulana Bhasani. His declared aim to solve the food crisis in Pakistan and his announcement that the next session of the National Assembly will meet in Dacca have been welcomed in Eastern Pakistan.

Mr. Suhrawardy remains suspect in both wings of Pakistan. There are indications that Western Pakistan is more hostile to him. He is aware of his dilemma. He knows that he will have to perform hazardous balancing feats to keep Dacca and Lahore in step. He cannot be unaware that both Maulana Bhasani and Dr Khan Saheb may be interested in using him as a pawn. He does not lack political acumen. He was clever in telling the people, in his first broadcast address, that his prime concern was to prepare the country for the next general elections. While Dacca and Lahore will tolerate him for the transitional period, he is playing for time to outmanoeuvre both. In the struggle for power, Mr Suhrawardy will have scope to expolit, at least, two sets of alternative combinations of political parties. He will not lack ingenuity. But the people of Pakistan as well as her neighbours will hope that Mr Suhrawardy will have the statesmanship to choose his political alliances in such a way as to further the cause of progressive and prosperous democracy in that country.

Carried any elephants lately?



WE transport some pretty fascinating stuff about the globe...take the case of the lovesick elephant that had an urgent date with a Zoo or someone in London. Then there was the ripe Gorgonzola, the film star wanted in a hurry, we were as keen to deliver it; you know how noisy a cheese can get! And of course, we're forever rushing merchandise from place to place — to make sure our customers get on the market before the other man does.

By the way, have *you* any cargo for any place? There are a thousand good reasons for sending it by Air-India International.

CARGO BY AIR is quick, convenient, saves money on transit insurance, gets you on the market first, brings you the goods *when* you want them, enables you to fulfil urgent contracts...we're out of breath, but you get the idea!

Weekly Notes

Election Prospects

A FEW weeks hence, nationl executives of both the Congress and the PSP will be in session in Calcutta. Election issues will be the main topics under discussion in both these conferences. Spokesmen of the rival parties in West Bengal have confidently predicted the results of the election in this State. Shri Atulya Ghosh, President of the West Bengal Pradesh Congress Committee, has no doubts that the Congress will win more seats for the Assembly this time. Dr. Suresh Chandra Bannerjee, Chairman of the West Bengal Praja Socialist Party, is less dogmatic about the chances of his party. But he thinks that West Bengal "is tired of Congress rule". Many other States presumably are. But it does not necessarily follow that the people will not vote Congress.

Shri Atulya Ghosh's analysis of the position of parties is interesting. His calculations are not entirely without basis. Neither the Jan Sangh nor the Hindu Mahasabha is any longer active in this State. Nor are these parties popular in any other State. Some of the influential members of the Forward Bloc in this State joined the Congress some time ago. Without any dynamic leadership, the Forward Bloc is no longer a political factor in this State. Shri Atulya Ghosh is not worried about the PSP. Neither the Socialist Party nor the KMPP was successful in the last general elections. They are not likely to fare better this time. Shri Atulya Ghosh admits that the CPI is the only rival party which the Congress will have to fight in the coming elections. But he argues that the CPI has lost some of its safe pockets. Constituencies have been delimited in such a way that the CPI will not be able to exploit the labour vote this time. But the WBPCC President concedes that the CPI has gained some hold among the middle-class office employees.

Dr. Bannerjee pins his faith on an agreed arrangement among the parties of the Left for electoral "adjustments". There is nothing surprising in the Bombay decision of the PSP to reject plans for any "united front" with other Opposition parties. Socialists can never form any "united front" with the Communists. But there is nothing unholy about some form of electoral "adjustments" so as to avoid triangular contests. Though an influential group in the PSP is opposed to even such co-operation with the Communists, Socialists in this State are planning their election strategy on the assumption that electoral "adjustments" will be concluded with the other Opposition parties. It is a reflection of the optimism of the WBPCC that its President welcomes such an electoral arrangement so that the people can exercise their votes decisively.

Live Issues

WEST BENGAL PCC Chief's optimism may be based on his confidence that the people may dislike Congress, but will still vote for it. There is something in this negative aspect. But current political trends indicate that, with an agreement on electoral "adjustments", the parties of the Left may capture enough seats to form a strong Opposition. Such an eventuality will be welcomed in the interest of democracy. But the Congress is hoping that the issues now agitating the people will be solved, or will be nearer solution, by the time of the elections. Only in a few States is the problem of reorganisation of States still a live issue. But the rising trend in prices is spreading discontent among the people. Parties of the Left in this State, and the PSP in particular, are concentrating their energies on this problem. They have issued a call for a general strike on September 25. On this issue, all the parties of the Left are united. There is considerable resentment against the rise in cloth prices, as a sequel to the new excise duty, as the Puja demand for cloth approaches.

Unemployment, rising prices and refugee rehabilitation will be the main issues on which the Congress will be fought. Refugees will have the right to vote this time. There is discontent among them. They are not satisfied with the Government's policy. Though the parties of the Left have always exploited this source of trouble, it is doubtful whether they can rely on the refugee vote. Unemployment is equally a menace in this State. But both labour and the white-collared workers know that the parties ef the Left cannot give them jobs unless they are in power. There is abundant evidence that the rising trend in prices is causing serious economic and political trouble. If food and cloth prices do not start falling by the time of the next elections, the Congress chances may be prejudiced. Congress may win

the next elections. But, if the prices of necessities do not fall, it is not likely to win the elections with such a comfortable majority as in the last elections.

Stamp Out These Dying Embers

THE Semitic as well as Mosaic injunction against idolatry, which was taken over by Islam, applies to idols carved from wood or stone or cast in metal. The injunction could also cover images, pictures and paintings, but happily it does, except in the very special case of the Prophet of Islam. A publisher in Calcutta paid with his life for publishing a book in which the author had reproduced from one of the well known collections in Europe what was supposed to be the image of Prophet. This happened some twenty years ago, about the same time that Swami Shraddhanand was assassinated for his book on the life of the Prophet.

The injunction, unfortunately, does not cover the much more dangerous form of idolatry where idols are carved from words. Experience has shown how deep rooted and disastrous such idolatry can be. It is not that Indian Muslims alone are susceptible to such idolatry. People and large masses of people anywhere in the world can be aroused and their emotions can be worked up to white heat by clever and mischievous exploitation of symbols and words that go by the name of shibboleth or slogan so that they completely lose their reason and act in the manner of lunatics. And the best in man can also be inspired by the same device. What else is the flag, but a symbol, to defend which man will die cheerfully; what else is fatherland or socialism? The ideas for which men live and die, how else are they communicated and concretised except by images, whether formed in words or painted in line and colour or carved out of wood or stone?

When a particular image is associated with other images, by long association the mind comes to identify the one with the others. The agitation that is being formented by some Muslims over a book that was published in America 15 years ago is made up of all these. But the image formation behind it must have required considerable skillful construction and could not have been spontaneous. In all the reports on the book 'Religious Leaders' that has appeared in the 'Dawn' for example, it is nowhere mentioned that the publication by the Bharatiya Vidya Bhavan is only a reproduction of a series and that the book was written by an American and was published many years ago in the U S A. The nettle should have been grasped firmly and pulled out by the roots. Instead of that, the agitation has been allowed to be engineered from State to State and some of the State Governments have unwittingly played into the hands of the mischievous organisers of the agitation by banning this reprint in their respective States. According to the law of the land, expression of opinion is free, unless the motive can be established of deliberately inciting hatred against a particular community. Surely this could not be the intention of the American author of the book?

It is not to be expected that, however great the individual, whether it be Christ, Buddha or Mohammed, that he will be held in the same respect or that his personal life would be regarded in the same light by different people. Many Western historians and popular writers have written about the Prophet in a vein which the followers of Islam do not like. They have written in similar vein about all other historical characters and among others, naturally of the characters, legendary or historical, whom Christians, Hindus or Buddhists regard as divinities or saints. It has not led to assassination, murder or civil commotion.

That there is method behind this madness is becoming increasingly clear day by day. That this engineered agitation happens to synchronize with the final eclipse of the Muslim League in Pakistani politics is not a chance coincidence is equally beyond doubt. There is more to it than cherished images and idolatry. This could be inferred from the behaviour of the students of Aligarh Muslim University. The farewell address of Dr Zakir Hussein, the Vice-Chancellor, brings it out clearly and effectively. The dying embers of the fire that scorched the land in the past have still to be stamped out.

Ministry of Community Projects

THE transformation of the Community Projects Administration, which had so long been a wing of the Planning Commission, to a full fledged Ministry of the Government of India and the elevation of the Community Project Administrator, Shri S K Dey, to the status of a Minister with a cabinet rank, but without cabinet membership, are both events of unusual interest.

The first ends an anomaly in that the CPA, an administrative department, was under the Planning Commission which did not otherwise have any administrative function. This is as it should be, for the change leaves the Planning Commission a purely recommendatory body, with supervisory, but no executive functions. The significance of the new set up depends, therefore, on the hope it holds out for more effective functioning of what has been held to be the most potent of the agencies for transforming rural India. More than community projects, however, it is the National Extension Service which has become the key to the success of the Plan in that it is expected to step up agricultural production far beyond what had been aimed at in the Second Plan and that, too, without any additional investment.

Because of the vital role that has now been given to agricultural extension, the question had naturally been asked, who was to remain in charge of it? If Shri A P Jain was to be responsible for stepping up agricultural output through the help of the NES, but the latter were still to remain under the Community Projects Administrator, would not the division of powers and functions seriously impair the ability of the Food and Agricultural Ministry to deliver the goods?

In his report on China, Shri P N Thapar, Secretary, Ministry of Food and Agriculture, had stressed two features of Chinese agriculture, the significance of which could hardly have been missed. One was that area for area, agricultural services in China were several times as deep as in India and the second was that China had not only price support but also fixed relative prices for different agricultural produce. So proper planning of agriculture was possible. Translated into the language of Delhi, the lesson clearly was that Shri Thapar's Ministry should be placed in charge of extension and that it should be given adequate funds to operate a price support and integrated crop planning programme. Speculation on the first has been laid to rest by the formation of a separate Ministry for Community Projects; the reaction of the Ministry of Finance is still awaited with regard to the second.

Fishery as Income Generator

SHRI M V KRISHNAPPA, the Deputy Minister of Agriculture, who led the agricultural delegation to China and Japan sums up his impression as follows:

Turn away from the West and look to China and Japan, particularly Japan, for increasing yields. What impressed him most in China was the use of night soil for manure and he came away convinced that "we must also destroy all the enemies of crops—harmful insects, rats, sparrows, monkeys, stray cattle etc." In his righteous indignation against all destroyers of crop, the Honourable Deputy Minister from Mysore may want stray cattle to be destroyed. One would be curious to know whether his constituency would be prepared to go that far with him.

Another of his interesting findings: "The Japanese agriculturist, in particular, with an average of 2½ acres of land, has proved to the world that fragmentation does not come in the way of increased production—rather it has helped them to increase production." Shri Krishnappa found the development of fisheries in Japan even more striking. This is not surprising. The macro-economics of fishery, regarded as a powerful income generator, has been described as follows by a contributor to the Indonesian Economic Journal, "Ekonomi Dan Keuangan Indonesia":

"It stimulates the growth of a very large number of subsidiary industries, such as ship building and repairing, fishing gear production, ice manufacture, cold storage, transport etc. In some countries fishery has contributed to the development of several new industries, such as artificial fibres industry or electronic industry. In the Far East, Japan provides the best illustration of this thesis: her rapid growth of the output of fish-finders, employing either sound (echo) or visual (radar) methods is really phenomenal. Fourteen universities concerned with teaching and research in all aspects of Japanese fisheries are both the outcome and the lever in this all-embracing process of income-generation.

"Fishery can provide employment to a great number of people, covering all types of occupation, with outlets to all kinds of human skills; at sea or under the sea, on land or in the air; in rural and in urban areas; in daytime as well as at night; to craftsmen, mechanics, entrepreneurs, financiers, scientists, economists, sociologists and social workers. Musicians, painters and writers have discovered the stimulating effect of fishery long ago. Actors are finding employment in the entertainment halls often attached to big modern aquaria."

The West Bengal Government had tried to reverse this 'chain-reaction'. But the trawlers which it imported are all lying idle, because trained personnel is not available to man them, special berths for trawlers have not been built, manufacture of fishing gear has not been developed, dry ice factories have not come up etc etc. The conclusion that the Development Department has naturally drawn from its limited experience is that modern fishery cannot be developed on a small scale or taken up piece-meal. This does not justify the neglect of fisheries in India which has drawn pointed attention from many foreign experts. Shri Krishnappa is the first front rank politician in this country to draw attention to it.

Exports of Engineering Goods

IN his speech as Chairman of the Jay Engineering Works, Ltd., Shri Shri Ram, the Chairman, expressed the opinion that there was no considerable scope for expanding the export of general engineering goods. He suggested that the Government should call a conference of railways, industry, trade, labour, etc., to consider seriously as to how such exports could be encouraged and helped.

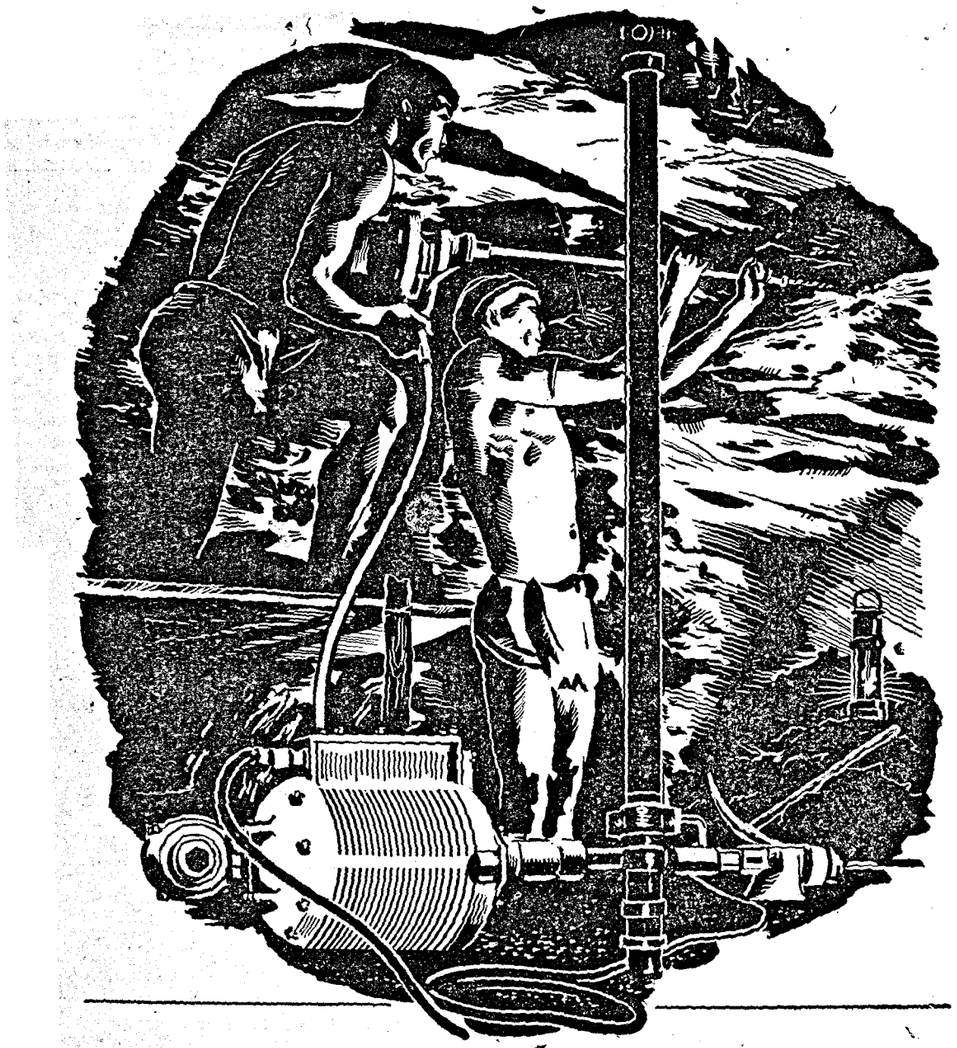
During the year to March last, there was an all-round increase in production. The average monthly production of sewing machines was higher. During the year, the manufacture of hurricane lanterns was discontinued. During the year, the Company put on the market table fans costing Rs 60. The Government issued licence to the Company for expansion of the fan factory capacity from 10,000 to 26,500 fans per month and of the sewing machine factory from 10,000 to 25,000 a month.

For the expansion of factory capacity, more finance was needed, and the Industrial Finance Corporation sanctioned another loan for Rs 30 lakhs. Orders have already been placed for the requisite machinery to expand the fan factory, and the balancing of the existing sewing machine factory. The needle plant has already been shipped from Europe, and will be in operation by the end of the current financial year.

Though the cost of raw materials for sewing machines has gone up by over 20 per cent. and that of raw materials for fans has increased by over 10 per cent., the Company has not raised the selling prices of its products. The very poor and unstable quality of pig iron and of hard coke is creating difficulties. Recently, the Government has announced uniform prices for steel and pig iron, both Indian and imported. This has helped the industries which are away from port towns. Shri Shri Ram suggests that, so far as exports of engineering goods are concerned, the prices of raw materials, whether pig iron or steel, should be charged on the basis of indigenous prices. This suggestion, if implemented, will encourage exports of engineering goods.

Chiselling Epstein's Picture

"MAY be that when a man draws a pencil drawing on a board, it resembles more like Epstein's effort, than anything which is very clearly and precisely delineated which looks beautiful. It is massive, it is huge in shape and is something mysterious. I would therefore claim that when we, as a Government, accepted the Plan-frame, we intended it to convey nothing more than what Epstein's work conveyed to the man who sees it.



"The Plan-frame is again an attempt at what is called 'macro-planning', a word which my predecessor used in the other House, that is, a plan on a big scale leaving the details out, the details in various degrees to be filled up after precisely evaluating each sector.

"If in an attempted macro-planning, we presented a particular picture and thereafter we started chiselling it to give it a proper shape, I don't think we can be blamed for it. Besides, there was no positive or definite attempt to depart from the basic fundamentals, so far as the objectives are concerned".

—Shri T T Krishnamachari in Rajya Sabha

"Stalin thought that now he could decide all things alone and all he needed were statisticians; he treated all others in such a way that they could only listen to and praise him".

From the London End

The Divided Nation

THE debate on the Suez question in the recalled Parliament was by every count a historic occasion. Never was the British nation more divided on a foreign policy issue as important as that of Suez. Britain's power in the international field in the past was largely the consequence of the British people's unity of view on matters of external security. This source of strength is now gone. On a long view, it is this feature which gives the present situation in Britain a historic significance. On a short-term estimation of the Parliamentary and national debate, it now appears that there are prospects of a serious Cabinet crisis, of a crisis in the national economy, possibly calling for a new Autumn budget, and finally, of a serious exacerbation of the differences between the two leading parties, making the legislative process more difficult.

The actual course of the debate in Parliament and the nature of the "concession" extracted from the Prime Minister are now known throughout the world. What appears to be less known was the turbulence of the debate, the sharp division among influential opinion and, most important of all, of the recognition by many thinking persons that insofar as Britain's international status is concerned, the vital issue is no longer whether force will be used against Egypt but whether there is any opportunity left for re-uniting the British people and Parliament on matters of foreign affairs. Some days before the debate, when the opposition to the employment of force became widely evident, it became necessary for even that staid "defender of British interests", the **Times**, to call for some recourse to the Security Council. Instead, the Government presented to Parliament a piece of blatant provocation in the form of a Users' Association — a provocation which was so quickly recognised that the division in national opinion hardened irretrievably.

There is now a growing feeling in the country that the blame for this "tragic" division must be placed fully on Sir Anthony Eden. He has pursued a personal policy, the true nature of which was never made clear to the country and the world. All his talks of a settlement included courses of negotiation and "other means of settlement". It is these "other means" which have aroused the gravest fears. The military preparations which were taking place on a gigantic scale had all too plainly suggested that diplomacy of the "gunboat" type was foremost in Sir Anthony's mind. His speech before the recalled Parliament contained curious assertions—assertions which could only have been made by a desperate man preparing for a desperate course of action. His statement that the Egyptian Nationalisation Act had disturbed the "balance" of the whole Suez system has already been dismissed in Britain as "rubbish", unless, of course (and it is this which suggests a desperate course of action) a "balance" is to be secured by the return of British forces to occupy the Canal Zone. Further, the Prime Minister's attempt to equate Nasser with Hitler is regarded generally as a cheap piece of spohistry designed to give validity to an infamous policy. As Mr. James Cameron of the **News Chronicle** put it, ". . . . . it is like equating sour grapes with cyanide ....this is murky short-cut symbolism."

Even those who believe that the last-minute concession of reference to the United Nations has diminished the chances of war, continue to find Sir Anthony Eden an unacceptable leader of the Government. The liberal **News Chronicle** spoke of the "tragedy of Eden". The **Manchester Guardian** went further and said that the Prime Minister's policy was leading "to disaster." It will be remembered that Sir Anthony closed his first speech to Parliament on what he called "a personal note." He stated that he had "constantly in mind" the parallel between events of today and the events before the last war. Apart from showing how false such a parallel was, the **Manchester Guardian** thought it remarkable that a British Prime Minister could have drawn such a parallel.

The danger of war has by no means receded. Few have troubled to read the full text of the Prime Minister's speech at the close of the debate. It is true that Mr Gaitskell extracted the concession: ". . . if the Egyptians are in default (of the 1888 Convention) we should take them to the Security Council." This was followed by an interruption from the opposite side of the House and as Mr Gaitskell now says in a letter to the **Times**, Hansard does not put a full stop at the end of the concession sentence. The Prime Minister may have added a proviso which is believed may have been drowned by the interruption. But more remarkable was the subsequent statement of Sir Anthony: . . . . it would be our intention if circumstances allow, in other words, except in an emergency, to refer the matter to the Security Council." Equally important was the blank refusal of the Prime Minister to give a guarantee that force will not be used. These statements certainly make the concession lose much of its value. Nobody is clear what would in British eyes constitute an "emergency". Already something in the nature of an emergency has arisen with the withdrawal of foreign pilots from the Suez Canal and in the slowdown of convoys proceeding through the Canal.

The behaviour of the American State Department and of Mr Dulles throughout the period of the Suez crisis has been the subject of much comment. In the Parliamentary debate, Mr Emmanuel Shinwell of the Labour Opposition, "suspected" an American policy which was designed to exterminate British influence in the Middle East. He believed that the manner in which Mr Loy Henderson, the American member, "went over the head" of the Menzies Mission made America a doubtful ally to Britain. More important, Mr Dulles' assertion that the United States would not go to war if the Egyptians refused facilities to the Users' Association has, as one M P put it, "taken the steam out of the project". Most significant of all has been the ease with which the United States has announced the availability of US oil and dollars to Europe.

UNITED ASIA

International magazine of Asian affairs, 12, Rampart Row, Bombay 1, India.

People the world over have certain basic things in common. For instance the need for food. A good harvest is reason for rejoicing everywhere.

As in agriculture, so in many fields of human endeavour, a good harvest is the result of joint effort. In India today, man and machine are harnessed to produce bountiful harvests in every field.

A constant supply of our petroleum products to such endeavours is fundamental to progress.

Book Review

Background to Bandung

India's Economic Relations with the Far Eastern and Pacific Countries in the Present Century. By B N Ganguli. *Orient Longmans 1956. Pp 348. Price Rs 9-8-0.*

Reviewed by **R K Hazari**

THE vogue of the day is planning, with its esoteric models, input output ratios, investment and income targets, and all that. Some sort of a Gresham's Law has enabled these fancy goods to drive painstaking economic analysis of facts practically out of circulation. It is therefore some relief to find an eminent economist digging deep into facts instead of launching into a set of half-baked prescriptions. The present work of Prof Ganguli does not attain the abstruse heights which one normally associates with him. It is welcomed for precisely that reason, at any rate by the reviewer, for it fulfils the rather urgent need of rearing a younger generation of economists on the basis of facts instead of fanciful concepts.

The book "seeks to present a survey of India's economic relations with the Far Eastern and Pacific Countries in the present century." This is carried out by analysing our relations with each one of the countries in this region. The author traces the colonial pattern of trade in Southern Asia from the arly days of bilateral trade through the days when tropical goods came to be used to multilaterally balance intra-European payments and what is more, Europe's accounts with North America. The author opines that anti-Japanese tariffs were partly responsible for the impetus to industrialisation in pre-war Asia. He deals briefly with the post-war urges of the people against the West as well as the Chinese and Indian minorities.

Apart from the able presentation of a massive array of facts relating to different commodities and periods, Prof Ganguli has a number of pertinent remarks to make about intra-regional trade. For instance, he points out htat while Burma finds India an almost natural market for her products, Ceylon, Malaya and the Philippines are in a different position on account of the composition of their exports, and the last mentioned country lies in a different currenc yarea, in addition. Conversely, however, India is in a position to export to all these countries so long as her exports are competitive. Multilateral balancing of accounts is, therefore, essential to this region. The author, unfortunately, does not compare the extent of intra-regional trade here with that in other underdeveloped regions so as to place these facts in their proper perspective. In this connection the results of a calculation made by the present reviewer are shown in the table below.

Intra-Regional Trade

(As per cent of total export trade)

	1951–53 (average)
Africa	10
Latin America	9
Asia & Far East	37
Middle East	22
Europe	64

Source: Direction of International Trade.

The figures include trade with advanced countries within the same region.

Note: To prevent bias caused by the weight of a few leading countries, the above figures are calculated as averages of country-data on the proportion of intra-regional exports; they are not computed from the total quantum of trade of a region. The under-developed regions are defined as follows:

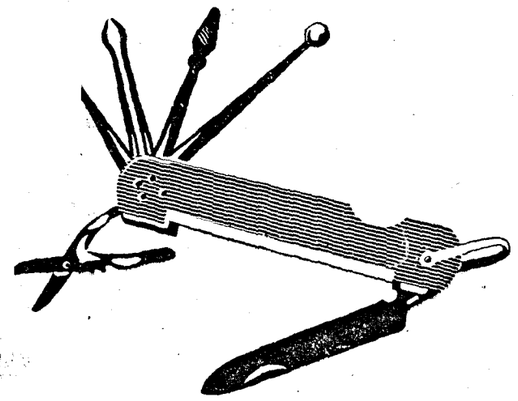
Africa—the whole continent except Egypt and Sudan.

Latin America—Middle and South America.

Asia & Far East—the whole of Asia, excluding the Middle East and Turkey, and Oceania.

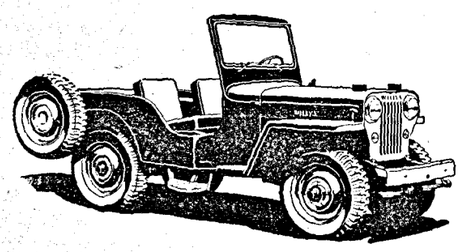
Middle East—Egypt, Sudan, Iran, Iraq, Israel, Jordan, Lebanon, Saudi Arabia, Syria, Aden and Cyprus.

Europe—Greece, Italy, Portugal, Spain, Turkey, and Yugoslavia (data for Eastern Europe are not available).



Compared to other under-developed regions, therefore, Asia and the Far East puts up a better show—though this is attributable largely to the trade in rice and the presence of Australia, and New Zealand—together with the Indian colossus in the region.

There are two further significant points in this context to which Prof Ganguli does not draw adequate attention. One is the fact that on account of fluctuations in incomes and external accounts which are, as we all know, generally greater than those of advanced countries, greater intra-regional trade may not be a sound bit of advice. The other is the fact that the countries in this region differ very widely in size and in degree of industrialisation; as a corollary, a small country trading with India, for instance, finds that the latter takes 80 per cent of her exports but sends only less than 10 per cent of hers in return, to the great detriment of her bargaining strength. These two points taken together give rise to the crucial question: is it (hypothetically speaking) any consolation to Burma, dependent on the fluctuating Indian market for rice, that it is trading with a neighbour and not with a distant country outside her region? The case for greater intra-regional trade—Prof Ganguli would probably agree though he does not say so in this book—rests not so much on its innate virtues, if any, but is merely an aspect of the wider case for general and simultaneous economic growth ,which would create new markets and widen old ones. The author himself gives an example of this in pointing out the simultaneous development of motor transport in India and the increase in the exports of motor vehicles from Canada to India, and of gunny bags in the reverse direction, to pack Canada's increasing surpluses, during the inter-war years.



The 1948 Census of India's foreign liabilities and assets disclosed that she was a net creditor, largely on long-term and government account, in this region. In connection with this and the presence of Indian traders and labourers, the author rightly considers that the pattern of trade and contacts in the future

would have to be different from the past. Human pipelines of earlier days have obviously to give way to export of goods and services. It would have been interesting to know Prof Ganguli's views ,based on his experience, inter alia, of international conferences, on how other countries in this region would look upon India's (and Japan's) inevitable 'leadership' in trade in future. Our philosophical foreign policy apart, is it not likely that other countries will view India as Latin American countries view the USA at present?

To conclude, Prof Ganguli's present work, though delayed in publication by nearly half a decade, is a valuable addition to our stock of knowledge on India's foreign trade.

Export Credit Guarantee

Sukumar Chakrabarty

EXPORT trade has to face various risks, not only after export is actually effected but in many cases, long before shipment takes place. Of these, credit risk is the most important. From manufacturing to the final payment by the foreign buyers, there is a long range of credit risks. A large part of these risks has now been taken over by banks under the cover of their letters of credit, but a sizable portion of credit risks, both commercial and political, have still to be shouldered by exporters themselves.

In persuance of the policy of expanding Indian exports, the Government of India had appointed an Export Credit Guarantee Committee to report on the feasibility of establishing an institution which will give the exporter insurance cover against the risks that they carry at present. The Committee has recommended that export credit insurance being an important export promotion measure, it should be started without delay and that for working the scheme, an Export Risk Insurance Corporation should be set up. The Corporation should have an authorised capital of Rs 5 crores, and should be wholly owned by the State. The Committee recommended that both pre-shipment risks which start as soon as the exporter enters into a commitment with the foreign buyers and post-shipment risks which become operative after the goods are despatched from India, should be covered by the Corporation.

Cancellation of export licence, ban on exports, ban or restriction on import of raw materials required for the manufacture of goods to be exported, increase or imposition of new export duties, non-availability of transport, strikes etc, are some of the pre-shipment risks which impede expansion of exports. Post-shipment risks, on the other hand, are those arising during the transit period or after the goods reach destination. For example, if the goods are directed from the port contracted for to some other port for some reason or other, charge for re-transporting the goods cannot be shifted to the buyer by the shippers. Even after the goods reach their destination, there is no certainty that they will be paid for cover against changes in export duty and the amount will be duly remitted to the exporter. The buyer may repudiate his obligation to take up the goods or may refuse to pay after having accepted the goods or may become insolvent. Even if the buyer is willing to abide by his commitment, expiry or cancellation of his import licence or total ban on import or refusal of the exchange control to permit remittance of the value of the goods may stand in his way to fulfil his obligations. War may break out between the exporting and importing countries and the export consignment may be seized and confiscated.

Thus the risks borne by the exporters are various. To offer cover against every such risk is neither feasible nor desirable. The exporter cannot expect to shift every risk and always sail in smooth waters. The Committee has therefore accepted the principle followed by export insurance organisations abroad that only those risks should be covered (except some pre-shipment risks) which are beyond the control of the exporter and occur outside India.

Cover for the following risks, the Committee recommends, should be made available to the exporters.

A. Post-shipment Risks

(1) Diversion risk.

(2) Import control risk, except when the importer has no valid licence when the order is placed or if his licence is cancelled for his own fault.

If, however, the buyer is a public body which cancels the contract unilaterally, the risk may be covered.

(3) When the buyer repudiates contract and is adjudged insolvent.

(4) War and civil war risks.

(5) Transfer risk, including moratarium and freezing of debt imposed by the buyer's government.

(6) Omnibus risks including risk of port strikes overseas, dock clearance delays and natural calamities in the buyer's country.

B. Pre-shipment Risks

(1) The post-shipment risks enumerated above should also be covered when such risks arise in the buyer's country before shipment, except in case of:

(a) repudiation of contract by a private buyer, and

(b) Cancellation or non-renewal of an import licence of the buyer for his own fault.

(2) Export control risk, provided the exporter is in possession of valid export licence when he enters into the contract.

This is a measure of protection against sudden changes of export policy though, the Committee was aware, it would mean that a Government organisation would have to pay compensation for the action of the Government. The Committee, however, declined to recommend cover against changes in export duty ("To cover this risk will, to some extent, frustrate the object of the Government action") or against non-availability of wagons, shipping space and shipping berth.

Cover against the risk of ban on imports of raw materials necessary for the manufacture of exports contracted for was not recommended, because there was not much demand in the country for such cover. But the Committee wanted the position to be re-examined later as demand for such cover might arise in the future.

C. Risks of Special Transactions

1. C I F risks of increase in insurance and freight charges after the C I F contract is entered into by the exporters.

2. Risks of exports on consignment basis and goods sent for display in foreign fairs, except those of devaluation and exchange fluctuation.

3. Risks pertaining to non-receipt of money for services.

4. Risk of non-recoupment of expenses incurred on market surveys, stock building, publicity and other promotional measures should be covered in special cases.

There are many questions of detail. Should the proposed Corporation cover the whole risk or should the exporter also be made to bear a portion of the burden? If the portion of the risk covered by the Corporation is small, it will not encourage the exporter to obtain such cover. On the other hand, if it is too big, it will destroy the zeal of the exporter to be discriminating in his selection of buyers. Depending on the practice followed abroad,

the Committee has recommended that commercial risk may be covered upto 80 per cent, and political risk up to 50 per cent of the unrecouped expenses. This percentage may be changed according to the experience of working the scheme.

Period of Coverage

The period for which insurance can be offered, it is recommended, should be determined by the nature of goods. Perishable goods cannot be covered for a long period. Demand and consequently price of raw materials of one season may be adversely affected by the supply of the next season. But no such short period risk attaches to the export of durable manufactured goods. Demand for capital goods changes only in the long period, depending on developments in technology. Economic and political conditions of the country of import also affects the risk involved in such exports. Thus exports to a country suffering from economic and political instability carries higher risk than exports to a country which is more stable. Foreign competition in particular goods and our need for promoting particular exports should also affect the period for which insurance cover is offered.

The Committee has recommended that export risk should be covered for the following period from the date of shipment for different category of exports:

Raw materials—3 to 4 months.

Consumer goods—upto six months.

Light capital goods—upto 2 years.

Heavy capital goods—upto 3 years.

Pre-shipment risk may be covered for a period of 4 months preceding the date of shipment.

These recommendations are too general to be of much help to the proposed Corporation in fixing the terms of its policies. Detailed market research will be necessary in order to determine the period of credit necessary for different types of exports. If credit is extended for too long a period, it entails pressure on the country's resources and may also encourage buyers to overtrade. On the other hand, in special cases, as rightly pointed out by the Committee, the period may have to be extended in order to strengthen the competitive position of the exporter, but extension in such cases should be given with due caution. It is not on the subject of period of cover, however, that the Committee is too general. True, the Committee did not undertake the actuarial valuation of the various export risks. But without a proper assessment of risks, it could not offer the exporter much of a choice. As had already been mentioned, the Committee recommended separate policies only to two types of policies (A) and (B) above.

It is over the question of the spread of risks that the Committee encountered the greatest difficulty. Should credit insurance be made compulsory or not? All the big exporters opposed compulsion; the smaller ones in a body demanded it. A member who failed to see how the Corporation could function unless its policies were made compulsory wrote a note of dissent; the rest of the members yielded to the unanimous opposition of the big exporters. Whether this recommendation was based on expediency or on an actual estimate, however, is not clear from the report.

Should the exporters be allowed to cover any one or more of the risks allowed by the Corporation according to his own discretion or should he be compelled to cover all the risks without any choice? A wide choice cannot be granted in the case of credit risk insurance, because of the loss due to more than one specific cause. But to force the exporter to cover all types of insurable risks is rather hard on the exporter, especially when he is reasonably sure that certain risks do not arise at all in a particular transaction. For example, the exporter definitely does not run any transfer risk while exporting to the UK. Enforced cover against such risk is unjustified. So the Committee has rightly allowed the exporter a limited scope for choosing the risk covers. The issue of separate policies has been recommended in respect of:

(a) Commercial and political risks together.

(b) The following political risks together:

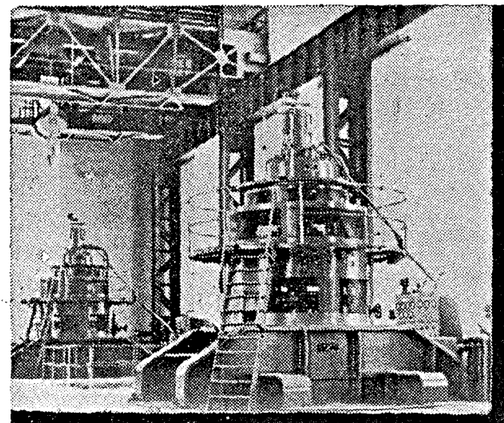
(1) Import control risk,

(2) Diversion risk,

(3) Risk of non-transfer, provided that payment has been made within 30 days of the due date,

(4) C I F risks,

(5) Change in the standard imposed in the importing country on import of food and other products after the goods are exported,



(6) War between the buyer's and exporter's countries, before expiry of 30 days of due date,

These are the broad recommendations. Now let us examine the foundation in which the Committee proposes to raise this super-structure of export credit guarantee. It stands to reason that unless one knows the handicaps of the exporter, one cannot possibly advise how best these handicaps could be removed, to the extent that they can be removed by a suitable insurance cover. The Committee proceeds on the assumption that 60 per cent of India's exports are effected under letters of credit and therefore require no credit guarantee; the scheme of insurance is therefore only for the balance of exports which are shipped without adequate cover.

After consultation with banks and exporters, the Committee came to "believe" that out of the total export of India valued Rs 600 crores in 1955 export to the extent of Rs 250 crores was effected without coverage under letters of credit. It based its estimate of the capital requirement of the Export Credit Corporation, on the above figure. Of course, it covered itself against any attack on its estimates, with the remark that it was not possible to make an exact estimate of such business.

For many years now, ever since the institution of exchange control in fact, all exports have to be routed through a bank. Enquiries made by the Committee from banks elicited some information about the manner in which bills drawn against exports are negotiated. These have been tabulated in Appendix VIII to the report. Half a dozen exchange banks (excluding such banks as the Mercantile, Hong Kong & Shanghai, Lloyds, the Bank of Middle East, Bank of Tokyo, Mitsui Bank) submitted returns. Similar returns were submitted by half a dozen Indian banks. What proportion of the total exports are handled by these 12 banks has not been mentioned or sought to be ascertained. The results are shown in Table I which show that of the bills handled by the exchange banks, only 40 per cent on an average are covered by L/C. The percentage for the Indian banks is even smaller. How did the Committee, then, conclude that approximately 60 per cent of all exports are covered by L/C?

trade, there has never been much information. Committees of enquiry had never been able to elicit much from the exchange banks. Now-a-days, of course, the Reserve Bank is in a position to get much detailed information, but no statistical data regarding the method of financing of exports by category of bills have yet been given out to be public. It is possible, the Reserve Bank may not have them. Otherwise why should the Committee have to carry out an independent investigation? The poor results suggest that the job should have been left to the Reserve Bank. The tables published in the Appendix leave much to be desired, as the categories are nowhere precisely defined. Considering the differences from bank to bank in these matters, of practice and procedure, this is not an unimportant detail. But even so, students of foreign exchange problems should be grateful to the Committee for letting out some information on a subject which has been largely a closed book to them so far. Table II gives a commodity wise breakdown of export bills and Table III gives the breakdown by destination of exports.

In the absence of a clear indication, one cannot be sure whether the figures in Table I are those of the percentage of different types of bills of total bills routed through the banks, or they are percentage of total of only those bills which were negotiated by the banks. If the former interpretation is correct, then doubt arises about the correctness of the estimate made by the Committee about the value of exports not covered under letters of credit. Exports covered under letters of credit form only 40 per cent of the total export business passing through the six exchange banks included in Table I. Even this average would be on the high side, as the very high figure of the Comptoir National (which does not belong to the Big Five among the Exchange Banks) appears to have inflated the average figure of the group. The average for the six Indian banks stands at 33 per cent only.

On the basis of such data, how did the Committee come to "believe" that export worth only Rs 250 crores were not covered under letters of credit? If the experience of the dozen banks is any guide, the value of such exports should be placed above Rs 350 crores and not at Rs 250 crores.

If, however, the figures in Table I are those of the percentages of various types of bills, not to total bills handled by the banks but to total bills negotiated by them, the table does not help us to judge the correctness of the estimate made by the Committee about the value of exports not covered under letters of credit.

The table, however, discloses a very interesting feature. D A Bills (obviously not under letters of credit) form 23 per cent of total bills (or negotiated bills?) routed through the six exchange banks whereas in the case of the six Indian Banks who entered exchange business only lately, such bills form 26 per cent of the total bills (or negotiated bills?). May we deduce from this that the Indian banks, though new in the field, are helping the exporters to offer better terms of credit to their overseas buyers than the exchange banks? Such a deduction, damaging if true, however, is not warranted in the absence of more precise detailed and reliable data.

Doubt regarding the correctness of these figures are strengthened when the figures of the Chartered Bank of India, Australia and China are compared with those of the National Bank of India Ltd. The Chartered Bank is shown to have 50 per cent of total bills (or negotiated bills?) covered under letters of credit while in the case of the National Bank only, 20 per cent of total bills (or negotiated bills?) are on D A terms. Of course, types of business and clientele differ from bank to bank but competition surely brings about a certain measure of similarity, particularly among the top ones.

Is it not possible that this wide disparity has arisen because different banks have interpreted the questions asked by the Committee differently? It will be readily admitted that too large a scope was left for individual interpretation in the inquiries in the questionnaire. Different accounting systems among the banks may also have contributed to this disparity and marred the value of the Committee's findings.

TABLE I

Proportion of Goods Sold to Foreign Buyers on the Basis of :

Developments in Nepali Currency and Exchange

Y P Pant

ON April 16, 1956 the Finance Ministry of the Nepal Government announced that Nepali currency would be accepted at all Government treasuries in the Tarai districts where hitherto it had not been accepted even for the payment of land revenue. The exchange rate was fixed at 128 Nepali for 100 Indian rupees. Indian rupees, however, would continue to be accepted in Government treasuries. The communique added:

"The falling rate of Nepali rupee is being improved both by short-term and long-term measures, which are directed to the general economic development of the country, for the last few months. But even then, results obtained not being so much satisfactory, the Government has decided the implementation of the following measures immediately." The measures which followed were—acceptance of the Nepali currency in payment of land revenue, fees, fines, market tax, customs, wireless and telephone charges, railway-fare, postage and so on.

After 10 days of this announcement, on April 26, the State Bank was inaugurated by the King of Nepal. In his inaugural speech, the King expressed the hope that the State Bank would coordinate the economic activities and help, in general, in building up a sound economy. The Bank has taken over the issue and management of currency from the Ministry of Finance. Its other important functions as laid down in the Bank Act are as follows:

1) To act as the Government's banker, agent and financial adviser,
2) To mobilise savings and capital and manage Government loans,
3) To act as the controller of foreign exchange, and
4) To promote the expansion of the banking system as a whole in the country.

The State Bank was to have separate Issue and Banking Departments.

To develop banking habit among the mass of people in Nepal, which had so far only one commercial bank worth the name is a difficult task. Absence of transport and communication, illiteracy and a primitive system of production both in agriculture and industry are hard enough obstacles; added to these, the complicated system of monetary circulation and issue hitherto prevalent in the country made the development of a proper banking system almost impossible. Whatever the monetary reform the State Bank may undertake, however, will have to be one of gradual change. Hence there is not much scope for any radical measures or hopes of overnight developments.

The steps taken by the State Bank for the stabilisation of the exchange rate deserve some notice. The State Bank was scheduled to open immediately after its establishment, about 21 depots (exchange offices) at different centres in the Tarai for exchanging Indian rupees for Nepali rupees at the rate of 128 Nepali for 100 Indian rupees. At these depots, Indian rupees are purchased from the public at the official rate, but Indian rupees are not given in exchange for Nepali rupees. This one way conversion, needless to say, did not help to stabilise the rate of exchange. The official rate being so far below the free market rate, there has naturally been no rush to convert Indian rupees into Nepali rupees at this rate. Though about 10 depots have been opened by the State Bank so far at different places in the Tarai, transactions at these depots have hardly exceeded Rs. 1,000.

It appears to me that the very basis of this policy is defective. On the one hand depots have been opened without taking necessary action for banning the activities of private money changers who fix the real exchange rate, which is always higher than the official rate; on the other hand, nothing has been done to push the circulation of Nepali rupees in Tarai. Why should any body buy Nepali rupees from Government depots at an unprofitable rate when they can get them freely in the open market at a much more favourable rate? Another reason for the unsatisfactory outcome of this policy is that it was announced at a time when 75 per cent or more of the land revenue of the year had been already paid by the people to the Government. Consequently nobody, in fact, wanted Nepali rupees in the Tarai.

Subsequently the State Bank raised its official rate, particularly in the Kathamandu valley and other Nepali currency using areas, from 128 to 145 Nepali for 100 Indian rupees. The Government has also assumed the responsibility of supplying Indian rupees at its official rate for 'essential' imports. Some 12 commodities eg stationery goods, petrol, clothes etc have been listed as essential. It is reported that for the implementation of this policy, the Government of Nepal has shelled out about 50 lakhs of rupees so far. The open market rate, however, has not come down to any substantial extent, the market rate at the time of writing being 153 Nepali rupees for 100 Indian rupees.

The steps taken by the State Bank have not been able to bring about any improvement in the exchange rate, or in the Nepali currency system. The present policy, which may be conveniently described as one of 'a system of multiple exchange rates', has been helpful in one direction in that for the last few months, the exchange rate has stabilised at around 155, but the maintenance of this rate has cost the treasury about 50 lakhs of rupees. The free market rate has varied during the last few months between 165 and 145 ie even at its lowest, it has been 5 points above the official rate. Therefore, what we want today for Nepal is a more coordinated and better thought out policy, rather than haphazard measures which fail in practice.

The problem of stabilization of its currency that Nepal has to face is is complicated by the fact that both the Nepali and Indian rupees continue to circulate in the country, with an exchange rate varying from time to time and place to place. Therefore ad hoc measures like the extension of the system of multiple exchange rates, together with its readiness to provide Indian currency for essential imports, ban on unessential imports etc introduced by the Government in April 1955, however, cannot quite solve the problem. Indian currency is interwoven with Nepal's fiscal arrangements, its commercial transactions and, in fact, the very life of the people. The composition of the monetary circulation and minting arrangements are just as important for controlling

exchange fluctuation, since currency devaluation has its bearing, to a considerable extent, on the minting arrangements and the supply of currency, both coins and paper.

System of Coinage

Nepali coins are of various denominations—rupee, 'mohur' (50 pice), suki (a quarter rupee), a pachanli (20 pice), 10-pice piece, 5-pice piece, 2-pice piece and pice. The minting arrangements are primitive, and the public are not in the know of the basis for putting coins in circulation. As late as 1943, Nepali coins had 80 per cent silver content. The content of silver was progressively reduced to 70 per cent in 1947, 60 per cent in 1948 and 33 per cent from 1949. On February 18, 1954, on the occasion of the National Day, cupro-nickel coins were issued and in the words of the then Prime Minister, "the inauguration of minting a new set of coins ushers in the era of effective economy and fruitful use of our foreign resources." Thus for more than a year, the coinage has had no silver content. The coins with 80 per cent silver content were melted and sold in the Bombay bullion market during the war years. Some of these coins have also been hoarded and some have been melted by the Government mint and used for minting coins with a lower silver content. The issue of coins from the mint may be estimated as follows:

Year.		Rs lakhs
1949-50	..	87
1950-51	..	84
1951-52	..	1,07
1952-53	..	98
1953-54	..	45
1954-55	..	43
1955-56 (to date)	..	4
Total	..	4,68

There are no official statistics of coinage; the above figures have been computed from estimates made by the authorities and knowledgeable people. These figures indicate the volume of coins currently in circulation. How much of the coins minted in the period from 1949-50 to the present was in replacement of coins withdrawn from circulation and how much was a net addition to the coinage, it is not possible to say. However, the amounts shown in the budgets as revenue from the mint (Rs 59 lakhs and Rs 61 lakhs in 1951-52 and 1952-53 respectively) confirm the above estimates. Thus only a little over half of the coins minted from 1950-51 to 1952-53 represented revenue to the Government.

Paper Money

Paper money in 100-rupee, 10-rupee, 5-rupee, and 1-rupee notes is issued by the Central Treasury. It was first issued after the outbreak of the Second World War, presumably to replace in part the loss due to melting of silver coins. There was no formal backing of currency notes until recently. Statutory reserves have now to be held against note issue, 50 per cent in gold or silver and 50 per cent in Nepali or other Government securities.

Notes Issued

Year	Rs lakhs
1945-51 ..	1,15
1951-52 ..	60
1952-53 ..	100
1953-54 ..	94
1954-55 ..	80
Total ..	4,49

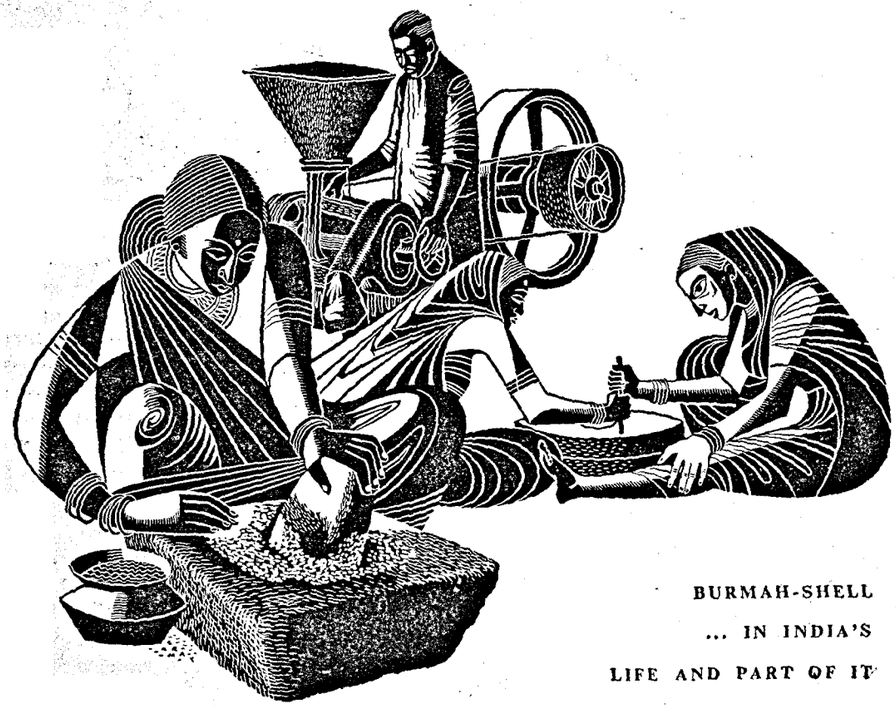
These are figures of additions to paper currency year by year. It is reported that damaged notes of about Rs 20 lakhs have been exchanged at the Treasury for new ones. The notes in circulation may therefore be estimated at about Rs 4.29 crores.

The total Nepali currency in circulation is thus about Rs 4,68 lakhs in coins and Rs 4,29 lakhs in paper, or Rs 8,97 lakhs in all.* It is not possible to make a similar estimate of the volume of Indian currency, which circulates freely in the Tarai and other parts, covering more than half of Nepal. The Indian rupee is accepted as legal tender and the bulk of Government revenues is paid in it. Because of the higher rate of economic activity in the Tarai, it may be safely assumed that the volume of Indian currency in circulation must be at least equal to that of Nepali currency.

Nepal seems to have been surprisingly indifferent about one of the most cherished prerogatives of sovereignty, viz. of putting its own currency into circulation. If she wants to do it today, she must begin with unification of the currency and end forthwith the present system of dual circulation. The authority entrusted with this task should undertake the responsibility of adjusting the money supply so as to serve the fundamental ends of economic policy, viz.:

1) expansion of domestic output, employment and income,
2) maintaining a high and stable level of production and employment, and
3) maintaining equilibrium in the balance of payments.

It is quite impossible for the Government to meet budgetary deficits (which exceed on an average Rs one crore annually in a budget of about Rs 5 crores) by issuing paper notes, without inviting disastrous consequences. The establishment of the State Bank can be a landmark in Nepal's currency history, if the Bank takes up and discharges the above functions of a proper currency authority.



*Taking Nepal's population,

The Power to do work

Energy means the power to do work, and India needs all the energy she can get if the targets of the Second Five Year Plan are to be fulfilled. The proportion of *commercial* energy—that is to say, coal, electricity and oil—to the whole energy system is still extremely low in India. Nevertheless, it is beginning to have its impact on traditional methods and ways of life, even in remote rural areas.

The contribution made by oil in the commercial energy pattern in India has increased by 100% since 1948. Oil is the most flexible source of energy available... it is, in fact, 'packaged power' in an easily handled form. It is our job to maintain and extend a distribution organization which will ensure that *energy from oil* flows to all parts of the country cheaply, efficiently and in sufficient quantities.

BURMAH-SHELL

... IN INDIA'S

LIFE AND PART OF IT

From the Chair

Jay Engineering Works Limited

Sir Shri Ram Reviews All-Round Progress

THE following is the text of the speech delivered by Sir Shri Ram, Kt., Chairman of The Jay Engineering Works Ltd., at the Annual General Meeting of the Shareholders of the Company held at Calcutta on the 14th September, 1956:—

Gentlemen,

With your permission I will take the Balance Sheet and Profit & Loss Account and the Directors' Report as read.

We are meeting almost after a year, and I am glad to say that the past year has been of continued greater success and greater service, which is evident from the figures given below:—

Particulars	Year ending 31st. March, 1955	Year ending 31st. March, 1956
Sales	Rs 2,23,95,049/-	Rs 3,05,31,764/-
Profits	Rs 18,78,517/-	Rs 27,26,497/-
Payment to Labour	Rs 54,27,552/-	Rs 63,52,919/-
Number of Workers,	2639	2934
Number of Usha Embroidery and Tailoring Schools AND Students	120 8000	150 11000

Rising Production

The average of monthly production last year of Sewing Machines was 9026 Nos and the highest in one month was 12,012 Nos as compared to the monthly average of 6,476 Nos in the previous year and the highest of 9241 Nos in a particular month. The average production of Electric Fans last year was 6939 Nos as compared to 4478 Nos in the previous year.

During this year the Directors decided to discontinue the manufacture of Hurricane Lanterns. The building and most of the machines have been utilised for other purposes.

The Bhela Enamel factory has been shifted to Chhindwara and has started working there.

I told you last year that the definition of Section 23A of the Indian Income Tax Act was so modified, as to create serious difficulties, in paying back our loans even to the Industrial Finance Corporation of India. We had applied for exemption. So far no decision has been arrived at.

Last year I said that we intend to produce a Table Fan and sell it for about Rs 60/-. I am glad that these Fans have been put on the market. We hope within the next few months to put a 36" Ceiling Fan on the market for about Rs 100/-.

Expansion of Plant Capacity

I am glad to say that we have acquired about 75 Bighas of land at a distance of about 3 miles from our present site, at a cost of roughly about Rs 4 lacs. We have already built the necessary roads, boundary wall, and a bridge, and covered an area of about 1¾ lac sq ft. The machinery is being shifted there, and it is hoped that by the end of December we will be making there about 6,000 Fans per month, in addition to about 8,000 Fans in the existing factory. The Fan Section will be completely shifted to the new site by next year, when we hope to be making about 25,000 Fans a month.

During the year the Government of India have been good enough to give us licence for expansion of the Fan Factory capacity from 10,000 to 26,500 Fans per month and of the Sewing Machine factory from 10,000 a month to 25,000 a month.

For the expansion of these factories more finance was required, and the Industrial Finance Corporation of India have kindly sanctioned another loan of Rs 30 lacs.

Orders have already been placed for machinery for the expansion of the Fan Factory, and the balancing of the existing Sewing Machine Factory.

The Needle Plant has been shipped from Europe and we hope that before the end of this financial year it will be in full swing.

A four storied building has been put up for housing the Tool Room, Design Office, Development and Research Dept and Training School, etc.

Although due to increase in the price of various raw materials the cost of raw-materials of Sewing Machines has gone up by over 20% and of Fans by over 10%, we are however selling these at the old prices and have not increased the rates.

Pig Iron and Hard-coke

I have to point out that very great difficulty is being experienced since sometime on account of very poor and unstable quality of the Pig Iron and of Hard-Coke.

The Government of India recently announced its policy about uniformity in the prices of Steel & Pig Iron of both Indian and imported. While this has helped the industries which are away from port towns and is welcome, but so far as the exports are concerned, I would suggest that on the engineering goods exported, the prices of raw-materials, whether Pig Iron or Steel, should be charged on the basis of the indigenous prices. While the difference in cost to the Pool will be negligible it will be a great help towards export of these goods.

While the Government of India have been good enough to accept the principle of a draw-back of customs duty on goods exported, but the procedure is so complicated and so difficult that it is almost impossible to get any refund. It entails a lot of work for the Government without doing any good to the industry. I, therefore, suggest that it should not be very difficult to devise on an ad hoc basis the amount of draw-back duty paid on such articles as are exported, whether they are Fans, Sewing Machines or Oil Engines or any other items. This would very considerably reduce the complicated procedure, which is being followed now, and make it possible for the industry to get the Drawback-Duty amount.

Export of Engineering Goods

We, Industrialists, owe a duty to our country in helping it to secure as much foreign exchange as can be possible. I feel that there is room

for considerable increase in the export of general engineering goods. The markets should be explored for proper assessment and every effort made to increase the exports.

Like various other countries, it would be a good thing if the Government of India called a Conference of Railways, Industry, Trade, Labour, etc., to seriously consider as to how exports could be encouraged and helped. I do hope that the authorities will give the suggestion of mine due thought.

I am conscious of the small contribution at present of the general engineering industry to our export trade, but I am sure that in our national drive to conserve and augment our foreign exchange resources, we cannot afford to neglect even a small contribution, and I am equally certain that there is very great scope for proper encouragement and for the export of engineering goods.

Employment Policy

The earnings of our workers are steadily going up, and for the last year they received in the shape of Puja Bonus & Profit Sharing an amount equal to 5½ months wages, which is the highest in India.

A few years back we started giving work to poor families and Refugees outside the factory. It helped them in making a good living. In other places men skilled or unskilled find employment, and the number of such people has greatly increased and may be in the neighbourhood of about 1500 working outside our factory premises.

We are also going ahead with our policy for recruiting educated people. In the previous year we had 358 Matriculates and now on 31st August, 1956 we have 600. We think the scheme has been very successful.

In the end, I have pleasure in conveying my thanks to and my appreciation of the work done by all my colleagues.

After the speech of the Chairman, the Audited Accounts of the Company for the year ended the 31st. March, 1956, were passed. A dividend of 10% per cent, free of Income-tax was declared in respect of the equity or ordinary shares of the Company.

Thereafter the following resolutions were passed unanimously.

I. As Ordinary Resolutions:

(a) Mr L P Singhania and Mr M G Bhagat, who retired by rotation, were re-elected as Directors of the Company.

(b) M/s. H P Khandelwal & Co., Chartered Accountants, were re-appointed Auditors of the Company for the year 1956-57 at a remuneration of Rs 20,000/-

(c) Declaring that the age-limit prescribed in section 280 of the Companies Act, 1956, shall not apply to Shri D N Sen.

(d) Approving and consenting to the renewal of the agreements and/or appointments of 146 Sole Selling Agents in India and abroad, a list whereof was included in the notice to the shareholders;

(e) Consenting to the Board of Directors contributing and/or subscribing amounts to any national, political, charitable, benevolent, public, general and other funds, not directly relating to the business of the Company or the Welfare of its employees, the aggregate whereof in any financial year may exceed Rs 25,000 or 5% of the average of the Company's net profits during the immediately preceeding three financial years, whichever is greater; and

Providing that various books, registers and documents of the Company shall be kept open for inspection by shareholders and others during certain hours.

2. As Special Resolutions:

(a) Electing and appointing Mr M G Bhagat a Director of the Company and approving the appointment of Mr D N Sen, Shri K L Poddar and Shri B K Rohatgi as Directors of the Company, and providing that the said gentlemen do continue as Directors until they retire.

(b) Authorising the Managing Agents and the associates of the Managing Agents to retain commission and other remunerations, etc., in terms of section 359 of the Companies Act, 1956; and

(c) Approving the contracts which are or may be entered into between the Company and India Electric Works Limited, for supply of goods by the latter under Section 360 of the Companies Act, 1956.

Quiet But Steady

Wednesday Evening

TOWARDS the close of last week, equities were trying to resume the upward trend. Under the lead of Indian Iron, speculative scrips were firming up. There was evidence of interested buying in Indian Iron. Reports were current that influential parties were accumulating Indian Iron because of the near approach of the right issue. According to plans, this Company proposes to issue right shares any time after November, 1956. So, investors were trying to buy Indian Iron as cheap as possible so as to make the purchase worthwhile despite the obligation to pay a premium of Rs 3½ per share for acquiring right shares. But the spurt was short-lived. Indian Iron has fallen during this week. Equities in general have also developed a downward trend.

Many explanations are being offered for the easy trend in equities. One is that speculators are trimming their accounts because of the near approach of the Puja holidays. Recent fluctuations in Indian Iron indicate a heavy "bull" position. Some weak "bulls" have liquidated their holdings. In consequence, the technical situation is now healthier. Technical reasons may have accentuated the recent set-back. But the longer period of the next settlement is a favourable technical development. In any case, there is still a long time before the Puja holidays start. So argument that the recent set-back is due to pre-holiday liquidation does not seem to be convincing.

Kerb Trading

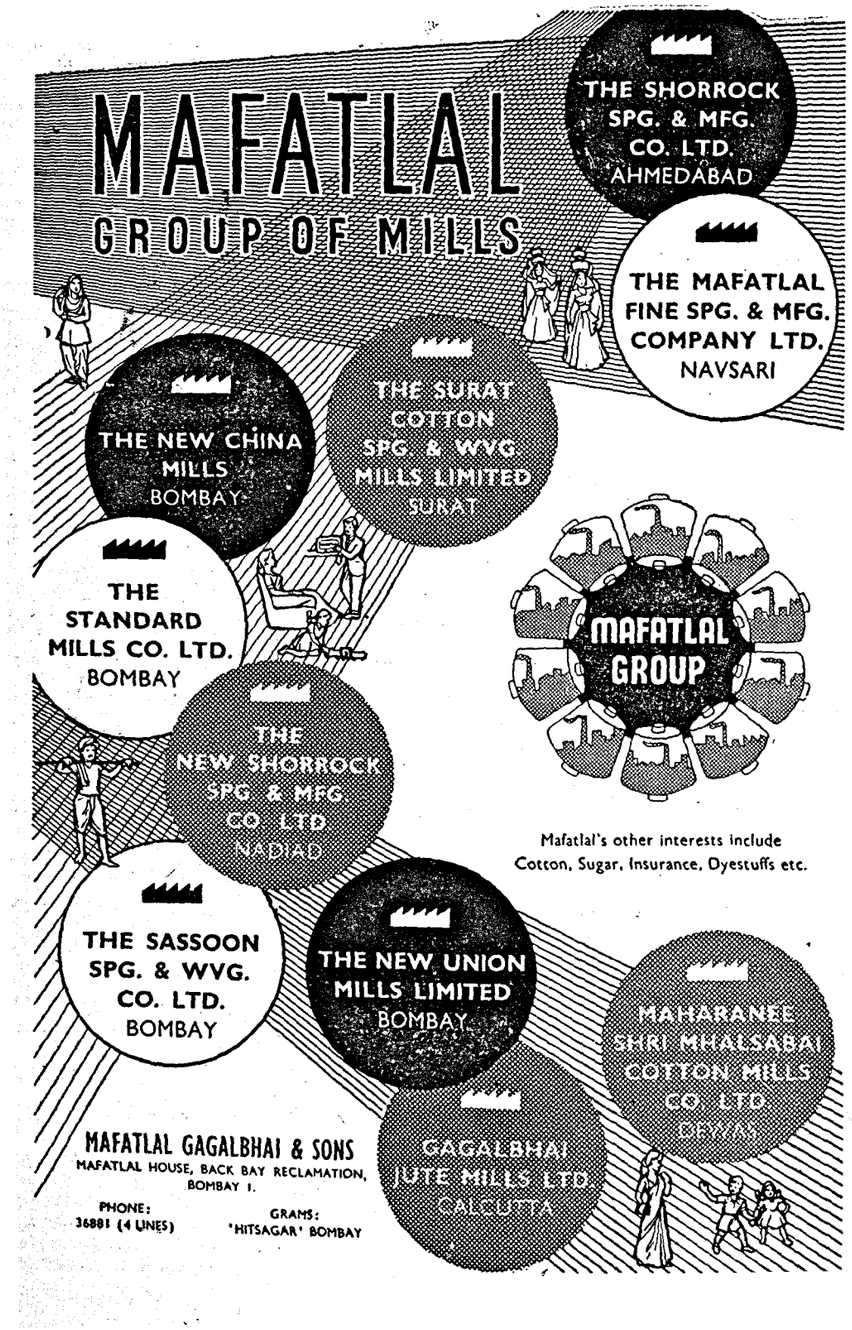
There have been some psychological repercussions from the Government's decision to appoint inspectors to discourage illegal futures trading. This affects mainly "fatka" in jute goods and raw jute. There is kerb trading in shares also. But the elimination of kerb trading need not necessarily be a "bearish" factor for equities. It will help the Government's revenues. But it is arguable that, simultaneously, it will discourage speculative activity. This is a possibility. But this raises the wider problem of tax evasion. On this ground alone, there is a case for a stricter attitude to illegal futures trading.

This tax evasion argument is applicable to kerb trading as well as to "fatka" business. But there are other valid reasons for checking illegal futures trading in raw jute and jute goods. For too long, the Government has denied legal futures trading facilities to the jute trade. There is extensive futures trading in both raw jute and jute goods. Mills use these unofficial trading facilities fully. There can, therefore, be no sense or logic in not legalising futures trading in raw jute and jute goods. Many expert committees have recommended such trading facilities. It will be a desirable development if the stricter check or illegal futures trading compels the Government to legalise futures trading in raw jute and jute goods.

Suez Crisis

It will not be denied that the developing Suez Canal crisis has had repercussions on Lyons Range. Equities moved up as the crisis deepened. Relative steadiness in equities during the major part of last week was due to the aggravation of the crisis. Rising insurance and freight rates are likely to have chain consequences which may have "bullish" impacts on stock markets. It is possible that this week's set-back is partly due to the growing realisation that the Suez Canal crisis may not be allowed to lead to war. Even so, it would be unwise to ignore the repercussions of the rising trend in insurance and freight rates.

Taxation fears continue to disturb stock markets. TTK unnerved stock markets by raising cloth excise duties. Fears that excise duties may be exploited further to check consumption are impeding stock market activity. There were hopes that the slightly downward trend in food prices will lower production costs. But the rising trend in cloth prices may falsify these hopes. Without any decline in living costs, industry's payments for dearness allowances must continue to be high. This is a background factor which may have depeened equities in the last few days.



Jute Shares

Despite the falling trend in equities in general, Jute shares remain relatively steady. There was a further spurt in jute goods in the last few days. It was partly due to reports of foreign enquiries and to the increase in burlap consumption in America in the last month. Rising insurance and freight rates were automatically reflected in higher prices for jute goods. But, on second thoughts, it was realised that foreign buyers might not be interested to buy Indian Jute goods at too high prices. This had the effect of halting the uptrend in the goods. But another recent disturbing development is the revival of the upward trend in raw jute. Inspite of lower consumption, and of prospects of a further decrease in consumption, raw jute remains firm. This is an adverse development for Jute shares.

Tea shares have been irregular. Recent auction prices have been satisfactory. Quality tea is fetching good prices. Average export auction prices have also been crawling up. But good auction results are not encouraging buying of tea shares. For one reason, the Northern Indian crop is too heavy. This is the main factor which is causing apprehensions that auction prices may not be maintained. There are also fears that the tea industry's prospects may be damaged if the Plantation Enquiry Commission's recommendations are implemented. Speculators remain aloof from this counter. Investors lack courage to add to their commitments.

Coal Strike

The coal strike has had a disturbing effect on not only Engineering shares as a whole, but on industry in this City. Industry in Eastern India, including Calcutta, is coal-based. That is why the coal strike is having an adverse effect on industrial production in and around Calcutta. Not only is output being affected, but industry's production costs are rising. This is one of the reasons for this week's set-back in shares. After today's settlement, equities seem to have steadied down at the lower levels. Technical considerations are unfavourable. And, in the absence of any further deterioration in the Suez Canal situation, equities may remain steady till the closure of the market for the Puja Holdays.

Handloom Industry and Powerlooms

(Contributed)

PROBLEMS of the handloom industry tend to thrust themselves on public attention time and again and recent rises in cloth prices and the proposal of the Union Government gradually to replace handlooms by powerlooms have once again brought them to the forefront. While the rise in cloth prices brings into focus the role of the handloom industry in the textile economy of the country, the proposal to introduce powerlooms has roused the handloom interests to furious protest, including threats of non-co-operation by non-official members of the All-India Handloom Board.

The problem has to be considered in the context of the admitted need to expand cloth production not only to meet the growing demands of a growing population for cloth but also for export. These two objectives are inter-related, because a rising standard of living necessarily means a larger per capita consumption of cloth, and makes it imperative that cloth production should be increased and that simultaneously the export trade should be kept up. Both these have to be achieved, of course, without adversely affecting the interests of those engaged in working about 7,50,000 handlooms in different States and their dependents. Fundamental to the solution is the need to avoid unemployment among handloom weavers.

The Official Policy

These diverse considerations necessarily influenced the official policy. The principal elements in that policy were:

(i) freezing of cloth production in the mill sector at 5,000 million yards during the next five years, any additional spindlage to the mills being permitted only to produce cloth for export and to meet the potential demand for larger supplies of yarn;

(ii) encouragement of the handloom industry by allocating to it the production of an additional 1,700 million yards of cloth;

(iii) introduction of powerlooms in the decentralised sector to facilitate fulfilling the demand for additional production made on them; and

(iv) utilisation of the **Ambar Charkha** to produce the larger quantities of yarn required for handlooms.

Thus the Second Five Year Plan assigned to the handloom industry an important task, the successful accomplishment of which calls for vast organisational effort to bring idle looms into use, working for a larger number of days in the year, raising the output per loom and improving side by side the texture and quality of handloom products. From the point of view of the handloom weavers, a significant proposal made by the Kanungo Committee, and blessed by the Planning Commission and woven into the Union Government' policy, was that Government should take appropriate measures to ensure that every weaver was supplied enough yarn of the counts needed to employ himself gainfully for at least 300 days in the year, instead of the average of 200 days that is possible with the yarn supplies available to handlooms at present.

Opposition to Powerlooms

It is in the implementation of the recommendation of the Kanungo Committee regarding the introduction of powerlooms that Government's policy is encountering opposition from handloom interests. The proposal is an important aspect of the policy for rationalising and rehabilitating the handloom industry on a permanent basis instead of as at present, feeding it continuously on the artificial diet of rebates on sale of handloom cloth and collection of cess on the production of mill cloth, from which the rebate is largely paid.

The possibility that introduction of powerlooms would result in the displacement of handloom weavers and in unemployment among them was indeed envisaged by the Government. The Kanungo Committee, for instance, estimated that the displacement would be of the order of 1,25,000 looms in six years or about 20,000 looms every year; but the Committee had felt that it would not be difficult to absorb the displaced weavers in the expanded programmes for handlooms themselves or in allied employments and trade, which would come up under the Second Plan. The Committee did anticipate, although not in specific terms, a time when the cess collections would either stop or begin to yield progressivey diminishing returns, reducing the funds available for subsidising handloom cloth.

The apprehension that the policy of substituting powerlooms for handlooms would bring about unemployment among weavers cannot be dismissed as altogether baseless. In the immediate future, this is almost a certainty. This is because handloom weavers, as a class, are not accustomed to any other work and cannot readily adapt themselves to other vocations. The replacement would ,therefore, be so phased or would have to be so phased that it would not cause undue hardship to the weavers and would take into account the essential need to absorb the displaced or unemployed weavers in suitable alternative employment. In any case, it would be a process which has to be spread over a number of years and State Governments would have to be consulted at every stage in order to ensure that the policy was implemented smoothly.

Relief and Assistance

Side by side, the Second Five Year Plan provides for a number of other measures intended to bring relief and assistance to the handloom weavers. These measures include arrangements to ensure regular and increased supplies of yarn to the handlooms, the continuance of rebate on the sales of handloom cloth, and assistance to weavers to increase production per day from the present average of 4 yards to about 6 to 8 yards per day.

True, these benefits would be available mainly to weavers who have joined handloom weavers' co-operatives; but then, it is an integral part of Government's policy to encourage co-operatives which, ultimately, would be highly advantageous to the weavers themselves. In fact, it is proposed to increase the number of handlooms in the co-operative sector from one million to 1.45 million. Weavers' co-operatives have already amply justified their existence by enabling them to secure adequate supplies of yarn. They have been playing a conspicuous and successful part in the marketing and sale of handloom cloth and in regulating production according to the consumers' preference for particular varieties and styles.

Change over to Powerloom

Two other important considerations are involved in the immediate problem confronting the Government and the handloom interests at pre-

sent. Firstly, the handloom industry, accustomed for generations to operating on a non-mechanical basis and to the use of a particular kind of equipment, cannot indeed change over to mechanical processes without a period of preparation and training. But provided adequate safeguards are provided and steps taken to prevent the hazards implicit in the transition from the existing to a new kind of technique and to cushion upsets likely to occur in the way of life of the weaving community, there can be no justification for opposition to the change over. In the next few years, rural electrification schemes, for instance, would be stepped up and power would be available to large rural areas. The question is: would it be desirable to prevent the handloom industry and the weavers from taking advantage of the benefits that power facilities bring in their train?

Secondly, the whole basis and justification for the proposal gradually to replace handlooms by powerlooms is that it is a measure for the permanent rehabilitation of the industry, as a long-term policy. Government's policy of helping the handloom industry during the last few years, and particularly since the crisis through which the industry passed some years ago, has been one way or the other at the expense of the mill industry—and indirectly also at the expense of the consumer of mill cloth—which has had to bear the burden of the cess.

Long Term Programme

The collection of the cess cannot be a permanent feature of the fiscal system; in any case the proceeds from the cess cannot go on increasing indefinitely when mill production cannot expand beyond a point prescribed by the Government. This would automatically limit the yield of the cess for subsidising the sale of handloom cloth and prices of handloom cloth are likely to go up unless, in the meantime, handloom or powerloom production in the decentralised sector expands correspondingly and consumers get the varieties of handloom product which they want. From these points of view it would be a shortsighted policy for handloom interests to attempt to stall measures for rationalisation and rehabilitation of the handloom industry.

On the other hand, it is the policy of the Union Government not to force the pace of introduction of powerlooms or to compel State Governments to accept the quota of powerlooms allotted to them. There is every likelihood that if some of the States oppose the introduction of powerlooms their quota would be taken over by some others. The result will be that while handloom production would inevitably be unequally distributed, there would be nothing to prevent the sale of the additional handloom production in the State which does not accept the powerlooms.

The potential threat to weavers' interests implicit in the proposed introduction of powerlooms and the counter-threat of disassociation by representatives of those interests from official bodies established to safeguard handloom interests, are creating an unpleasant situation. But in between, there is the threat of cloth prices continuing to spiral upwards to the detriment of the consumer. A clear assurance seems called for from both the parties concerned—the Government and the representatives of weavers that nothing would be done which would be prejudicial to consumer interests and everything to insure fair prices of cloth. The Madras Government, for instance, have already proferred the assurance that, so far as that state is concerned, if it was found that the interests of the weavers were jeopardised by the introduction of powerlooms, they would not hesitate to withdraw the scheme.

Concessional Return Tickets During Dussera Holidays - 1956

During the period from October 1 to October 14 1956 concessional return tickets for first, second and third classes at 1 ¼ (one and three-fourths) single journey fares will be issued in local and through booking with all railways between two stations situated at a chargeable distance of 150 miles apart or more. Concessional return tickets will also be issued between stations less than 150 miles apart, as for a distance of 150 miles, provided the concession return fares as for 150 miles are lower than 2 single journey fares.

The return tickets will be available for completion of the return journey within 15 days including the date of issue or date of commencement of the journey in the case of return tickets issued in advance. **No break of journey will be allowed on the return journey. Passengers are requested to present the return half of the ticket at the booking office before commencement of the return journey for dating the actual date of the commencement of return journey.** Passengers, if found travelling on the return journey without having their tickets so dated, or found breaking their journey on return trip will be treated as travelling without tickets.

Tickets will be issued according to rules and conditions in force. Full particulars can be obtained from the Station Masters concerned.

CENTRAL AND WESTERN RAILWAYS

Around Bombay Markets

Getting Over Jitters

Thursday, Morning

AFTER last week's jitters, the market naturally opened weak and on an uncertain note. Even the most active of market leaders were completely neglected and there was hardly any activity on the opening day (Thursday). As it was, prospects were not inviting for the operators; the Finance Minister's sabre-rattling while dilating on possible official action (to check rising cloth prices by taking profits?) did not help to make them any better.

However, as the week progressed, the market showed some signs of slowly getting over its jitters. It is bound to be a long drawn process. By judicious and selective support, operators managed to tone up an otherwise anaemic market. Of course, the climate of investment also underwent a perceptible change when evidence became available of the prospects of an immediate change in New Delhi's cloth policy. It is not that wisdom has dawned all of a sudden that the simplest and the most effective means of checking rising cloth prices is to increase the output of cloth. The market has been left guessing, TTK delights in this sort of game; he is now changing his line. The Karve Committee's recommendation of freezing cloth production at 5,000 million yards has been thrown overboard and the authorities are now inclined to give a sympathetic hearing to the cotton mill interests' repeated protests against the official ceiling on cloth production. Official blessing to expansion of mill production may follow in due course. All that the market has now to consider seriously is the time lag between a decision to expand mill output and its actual implementation.

It may be recalled that according to the new textile policy enunciated by Shri T T Krishnamachari at a Press Conference in Delhi last June, loomage remained to be allotted for 150 million yards. It was stated at that time that the allottment would be made in the light of the consumption trend of cloth.

Expansion of capacity is such a bull point for cotton textiles that the latter can take in their stride the Commerce Ministry's efforts in the direction of educating the public on fair prices of cloth. When the Union Minister for Revenue and Defence Expenditure met the Committee of Bengal Millowners to discuss the question of supplying cloth at reasonable prices, the latter pointed out prices were neither economic nor correct. This is for the first time that the cloth trade or industry has challenged the validity of the fair prices advertised by the Government. We are sure to hear more about it—this only the first round.

Sentiment in the textile section was also helped by rumours to the effect that the authorities would consider granting rebate on excise duty to mills working a third shift.

All these bullish potentialities, however, are too far in the future. The stock market has not yet reacted to them, equities in general continued to display hesitancy and trading remained restricted throughout the week. It may be reasonably expected, however, that fuller appreciation of these factors would be evident in the course of the next few weeks and the resulting improvement will not be confined to textiles, there should be an all round improvement.

Stock Exchange List

Orissa Cement: The old shares of this company have been entered on the cash list of the Bombay Stock Exchange. Business in these shares will now be done in lots of 100.

Adoni Spinning and Weaving: The ordinary and preference shares of this company have also been entered on the cash list. Dealings will be in lots of 100 shares.

Jaypur Udyog Ltd.: The management of this company has applied to the stock exchange for enlisting their shares.

Ajamjahi and Oosmanshahi Mills: The shares of these two companies have been entered on the forward section of the stock exchange, and business will be done in lots of five shares.

Cotton

Mills are Eager Buyers

THE cotton futures market, which had only an abridged version of the normal week's trading, due to intervention of holidays, reflected a firm trend. The Jarilla contract was specially prominent and moved up from the opening day's quotation of Rs 688-8-0 to Rs 695, the highest level for the week, on Saturday and closed at Rs 691-8.

In the spot market at Sewri, trading was brisk and prices tended to firm up. Mills were keen buyers of the new crop and quite a scramble was noticed on Friday and Saturday when quality cotton were eagerly sought after by mills and traders at high levels. As a result of this sustained mill demand, bases of such styles as new crop Berar, Khandesh and Vijay firmed up perceptibly. The eagerness on the part of mills to cash in on the prevailing price trend

New India Ins. ..	45- ½	46- 8	45- 8	46- 8

and meet all their requirements was so keen that some mills even made purchases 'on the lines', as a result of which prices at up-country centres also hardened.

Statistics of cotton exports, which are now available for the whole of the 1955-56 cotton season, make interesting reading:

	(In bales of 400 lbs)	
Destination	1955-56	1954-55
Japan ..	223,484	143,541
Continent ..	81,927	76,490
U K ..	58,095	46,821
China ..	57,484	14,979
Hong Kong ..	30,094	25,239
U S A ..	3,755	18,960
Others ..	2,514	2,762
Total ..	457,353	328,692

It will be seen from the above table that there has been a phenomenal improvement in raw cotton exports during the last season. In fact, the aggregate exports at 457,353 bales was the highest in any year since Partition. Again, for the first time since Partition, India became a net exporter of cotton. This was due to the realistic export policy pursued by the Government throughout the season.

Some of the features of the exports during the 1955-56 season may be noted here. First, the volume of exports increased by more than a lakh bales. Secondly, Japan topped the list, accounting for an offtake of nearly half of the total at 223,484 bales, as against 143,541 bales in the previous season. In this connection, it is good to remember that Japan is the country which has threatened and continues to threaten India's hold on her traditional markets for cotton textiles. The considerable decline in the export of Indian cotton to US which is burdened with a surplus of cotton explains itself.

Oilseeds

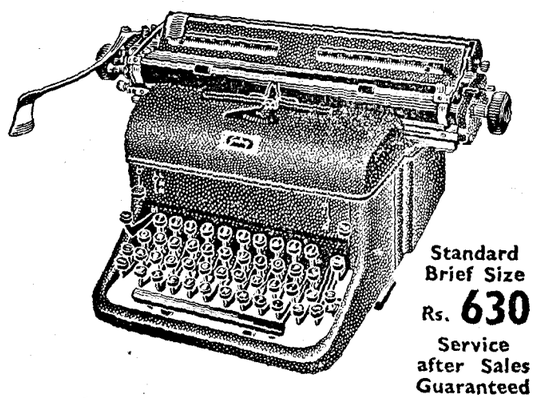
A Smaller Crop

THE statistical position of groundnut continues to impart firmness. According to latest trade estimates, the groundnut crop has been revised downwards from about 28 lakh tons to 24 lakh tons. Apart from the prospects of a smaller crop, the recent rise in groundnut futures has also been due to bear covering and bull buying. Besides, even in exports, there has been good progress.

The price trend of castor and its oil remained very steady throughout the week. Despite lack of enquiry from overseas for Indian oil, castor ready and oil displayed steadiness, mainly on the strength of their statistical position.

Tenders issued against the castor September contract todate aggregate 14,500 candies. They have been readily absorbed by millers and shippers. According to market gossip, longs have made arrangement to absorb orders up to 20,000 candies against their contracts. Scared by such talks, bears covered, and the contract closed firm.

A notable development in the oilseeds market during the week under review was the resumption of forward trading in groundnuts in Adoni after a lapse of 13 years.



Equipped with the confidence, resources and experience gained from 59 years of pioneering achievement, Godrej present for the first time a Typewriter made in India, at a very remarkably low price.

The all-Indian Typewriter embodies the latest advances in typewriter engineering to ensure ease of operation and efficient performance.

Of the 1,800 components only 4 items: the types, key tops, rubber platen and one spring are imported, costing a negligible Rs. 30. All other parts are manufactured from the very best materials available.

The Godrej Typewriter will, in due course, be available in Hindi also.

Reorganisation of Services

LITTLE known to the public, a departmental committee has been set up to go into the question of the reorganisation of the services. The members of the committee are the Departmental Secretaries at the Centre and a Bihar ICS has been named the Secretary. The terms of reference are seemingly unexceptionable—to study and report on the reorganisation of services. The problem is not exactly new nor has it been apprehended for the first time. Passing references to it may be found in many places. In fact, no discussion on administrative reforms has failed to refer to the problem. But hardly any serious study has ever been made. Why, then, this sudden urgency to tackle the problem? Thereby hangs a tale.

The problem is not new, but the solution may not please some of the topnotchers in the services. The status quo is to their benefit; they brought it about. And this may well have made them averse to a study of the problem. The result was that the allied question of procedural reform monopolised the attention of the Government, experts and the public alike. Even the Appleby report skirts round this problem and concentrates its fire on procedural reform and the method of recruitment of personnel. And this probably would have continued, but for Sardar Panikkar.

As a member of the States Reorganisation Commission, Sardar Panikkar had to look into the position of linguistic minorities in the States. This probably led him to the question of the services. There is nothing unusual in this. Here was a man interested in the study of the administrative system from the point of view of the minorities and he was naturally struck by the discrimination against minorities in the matter of recruitment to the services. Being the thorough-going man that he is, Sardar Panikkar put together his observations and suggestions in a note and submitted it to Pandit Nehru. This note was duly forwarded to Shri Pant who shelved it and set up the Secretaries' Committee to suggest measures for the reorganisation of services.

In order to appreciate the issue involved and judge the competence of this committee to tackle them, it is necessary to recapitulate what Panikkar has to say on the subject. Federal Government is essentially a government at two levels, the federal Centre and the federating units. The jurisdictions of the Centre and units are different, their spheres of activities and the subject they have to deal with are clearly demarcated (except in relation to the concurrent list) and one does not interfere with the other. Administrative methods and requirements at the two levels are thus different.

This difference has been further accentuated by the new emphasis on welfare and economic activities. The administrator today must be a specialist. Specialisation in administrative jobs has become as necessary as in the field of science and technology. Indiscriminate transfers from the Centre to the States or from the latter to the former do not help widen experience nor do they make for efficiency.

This is not to suggest that all transfers are to be stopped. On the contrary, Sardar Panikkar suggests planned transfers. Specialisation in one branch of administration presupposes some experience in the other field. The experience gained in the States provides a better basis for work at the Centre, and conversely, experience of the Central administration widens one's views and equips one with an all-India outlook. If for nothing else, at least for facilitating such transfers, the recruitment and general training of the administrative services have to be the same for the Centre and the States.

Such uniformity in the recruitment and general training will raise the standard of State services, and parity in the administrative efficiency of the different States will be ensured. Besides, this will end once for all a most odious form of 'caste' distinction in the services. Rigid stratification and lack of mobility that characterise the services today will make room for flexibility and mobility so much needed in a country wedded to democracy and rapid development.

These, in short, are the issues involved. How could the Secretaries be expected to bring an unbiased mind to bear on them? They have too many interests to protect, too many friends to oblige, too many social ties to respect. Will it be very unexpected if they succumb to these pressures? As a matter of fact, it is apprehended in some quarters that the whole thing may result in increasing the quota of men in the State services to be promoted to the all-India services. The need for rapid expansion of the services dictated by ever expanding Government activities will provide a good opportunity for pushing such a solution. And all that the committee will then do may be to upgrade some officers in the State services and larger representation of members from linguistic groups which are in a minority will only lead to a lowering of the efficiency of the all-India services. If this forecast comes true, non-specialisation will continue, efficiency go down and 'caste' distinctions persist.

United Nations on Trial

MOVES and counter-moves relating to the Suez Canal are so bewildering as to create confusion. Each side has lodged complaints with the Security Council against the other. While the issue is under reference to the Security Council, the belief spreads that the war threat has been averted. Time may yet reveal that such hopes are premature. Pandit Nehru was too optimistic in interpreting the Anglo-French move to refer the issue to the United Nations as a "turn away from war". Cairo's prompt appeal to the Security Council to consider "actions against Egypt by some Powers, particularly France and the United Kingdom, which constitute a danger to international peace and security" is a clever counter-move. Not only the Powers directly concerned in referring the Suez Canal issue to the Security Council, but all member-States will keenly watch the developments within the United Nations. Because the Security Council is seized of the problem, it is optimistic to hope that the danger of war has been averted. Never since its inception, has the United Nations faced a graver crisis. Nor has the world, since the second world war.

Certain facts emerge clearly from developments since the beginning of the Suez Canal crisis. There never has been, nor is there now, unanimity between America and her Western allies on this issue. Britain and France have always been, and still are, determined to use force unless Egypt accepts a dictated solution of the crisis. There is no disagreement between America, Britain and France about the solution of the crisis. All want international control over the Suez Canal. But America is opposed to the use of force, while Britain and France are united that a solution by force may be inevitable under certain circumstances. It would be premature to conclude that Britain and France have agreed to the American recipe of forcing a solution of the Suez crisis through economic pressure only. For once, Mr Dulles has shown himself to be an accomplished diplomat. It was at America's firm insistence that Sir Anthony Eden had to abandon the original Anglo-French manoeuvre to use the plan for a Canal Users' Association as a provocation designed to create a **casus belli** against Egypt.

Though the Canal Users' Association was a plan originally mooted by Mr Dulles as a face-saving formula, which would also prepare the ground for an Anglo-French appeal to the Security Council, both Britain and France made an initial blunder in jumping to the conclusion that America had been reconciled to the bellicose Anglo-French policy to Egypt. As Britain and France realised their mistake, the original provocative plan for the Users' Association was modified substantially during the second Suez Conference in London. This was as much a triumph for Mr Dulles as for those among the participating users in the second London Conference who were for a peaceful solution of the crisis through negotiation with Egypt. But it would be wrong to assume that there was any disunity about the ultimate aims and functions of the Canal Users' Association. America endorses the Anglo-French demand that this Association, and not Egypt alone, must replace the former Universal Suez Canal Company as the authority which will be responsible in future for the operation, maintenance and development of the Canal.

Because Sir Anthony has fulfilled his commitment to the House of Commons that he would refer the Suez Canal issue to the Security Council under certain circumstances, it does not follow that Britain or France has abandoned the policy of a forceful solution of the crisis. On the contrary, the manner in which the British Prime Minister made his concession in the House of Commons debate to the Opposition demand for reference of the issue to the United Nations would seem liable to the interpretation that such a reference would certainly be made when the time would be opportune for the use of force in Egypt. There are indications that Britain and France may have decided to refer the Suez problem to the Security Council as a prelude to the use of force. Mr Dulles's statement on his return to America after the second Suez Conference in London lends weight to such a pessimistic interpretation of the Anglo-French complaint to the Security Council against nationalisation of the Canal by Egypt.

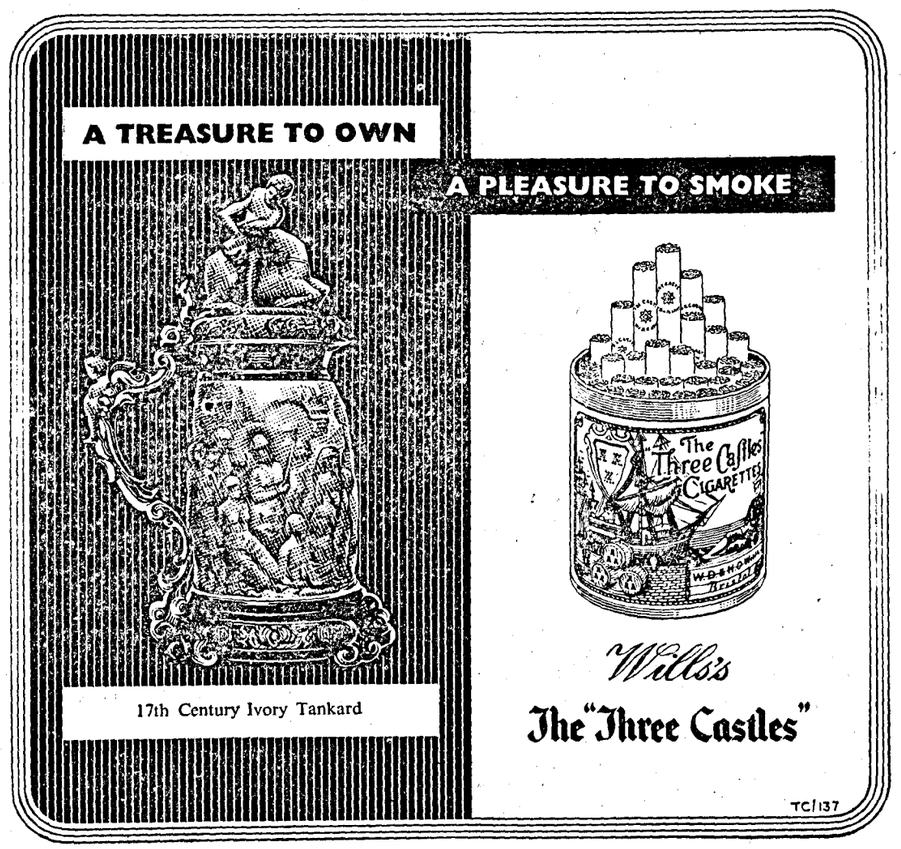
America prefers a policy of economic boycott of the Canal to force Egypt ultimately to accept the Western Powers' solution of the Suez Crisis. Britain and France are only too eager to pursue a policy of economic sanctions to compel Egypt to accept their terms as well as to provoke the latter to some action which may justify their going to war. Though Mr Dulles has succeeded in exercising a restraining influence on Britain and France, the latter seem to have wrested a concession from America which is not only a constant threat to world peace, but may endanger the existence of the United Nations. From the very beginning of the Suez crisis, Britain and France have repeatedly insisted that circumstances may arise which may justify resort to force by some Powers or by some combination of Powers. Not only the Labour Opposition in Britain, but some Canal users and most of the member-States are vehemently opposed to any such use of force as an instrument of policy. So is, apparently, Washington. But Mr Dulles concedes that one "cannot always count on nations not using force unless there is some alternative which conforms to international law and justice".

Neither Britain nor France has ever recognised Egypt's right to nationalise the Suez Canal Company. America does not like the way the Canal Company has been nationalised, but she does not openly deny Egypt's sovereign right to nationalise the Canal Company. Only on one vital aspect of the Canal crisis, that of international control over the Canal, is America in agreement with the Anglo-French policy to Egypt. Sir Anthony's speech before the House of Commons, after the recall of Parliament to debate the Suez crisis, makes it clear that Britain's basic attitude to the Canal crisis is that Egypt has sought to disown the international character of the Canal by nationalising the Canal Company. Britain is firmly opposed to such an act of "de-internationalisation" by Egypt. So is France. Both Britain and France have made it clear that the Canal issue is a "test case" for the United Nations. Both have referred the problem to the Security Council mainly for its verdict on the issue of nationalisation of the Canal Company by Egypt. Britain's Foreign Minister has openly declared that Britain and France have referred the Suez crisis to the Security Council in order to test whether the United Nations have the will and the power to uphold justice and international obligations. What Britain and France want is quite clear. They expect the United Nations to give a verdict that nationalisation of the Suez Canal Company is an unjustifiable unilateral action by Egypt. But if the verdict of the United Nations is different, Britain and France will resort to force on the excuse that such a verdict creates circumstances which justify use of force by some Powers. "Unless there is a just system", Mr Dulles seems to endorse the Anglo-French tactics, "I do not think you can go on for ever asking people not to resort to force".

These are dangerous doctrines with sinister implications. Member-States will anxiously await the deliberations of the Security Council to find out whether the United Nations will stoop down to the dictates of Britain and France to ensure the survival of this world organisation. It may even then continue to exist, but without any moral influence or prestige. This is the major issue at stake. Implications of the Anglo-French policy are obvious. If the Anglo-French policy is endorsed by the Security Council, the United Nations will cease to function as an organisation for world peace. This is not the only reason why Indonesia's call for greater co-operation among the Afro-Asian member-States will be supported. There is another implication of the Western Powers' policy to the Suez Canal which is no less sinister. "It is", to quote the **New Statesman and Nation**, "that where resources regarded by the Western Powers as vital to their continued military or economic supremacy are developed by Western Capital, the assets resulting may never be taken into the ownership and operating control of the nation in whose territory they lie". As under-developed countries, all Asian and African nations must feel concerned about such a policy of the Western Powers. Increasingly it becomes obvious that the Anglo-French reference of the Suez crisis to the Security Council has not averted the danger of war. Threats to world peace and to the United Nations persist.

Britain and France mean war. America has been brow-beaten into conniving at the Anglo-French policy without actual participation in war. Within the next few days it will be known whether the time has come to bury the United Nations. That possibility, unfortunately, cannot be dismissed altogether any longer.

Why Not Free Transport?



FOR some time past Delhi has been toying with the idea of equalising coal prices in order to remove the disadvantages of areas situated at a distance from the main coal producing belt which is still in Bengal and Bihar. This was first suggested by the Railway Equipment Committee which reported last May. The Committee was concerned with the question of the development of the additional capacity for the manufacture of railway equipment. It found that with the exception of grey iron foundries, engineering capacity in the country was fully booked, and whatever idle capacity existed, mainly due to inadequate and irregular supply of raw materials like steel, pig iron and hard coke. The biggest single factor which prevented the rapid growth of engineering industry the Committee was convinced, was the shortage of steel and pig iron and it therefore recommended a substantial increase of imports of both as also adequate stocking at "dumps" at suitable places in the country, in order to ensure steady supply of these raw materials.

But this was not all. The Committee went further. It recommended uniform prices for basic raw materials in order to encourage "equitable industrial development in the country". The Committee presumably was not unaware, however, that equity would be expensive and that Government might not be willing or able to go so far. It therefore suggested something corresponding to trading estates, viz that at least one centre in every State should be declared to be a "port" where steel, pig iron, coal and coke would be made available at "uniform price".

The purpose of the Committee, it may be recalled, was to report how India best could achieve expansion of manufacturing capacity for railway equipment. It interpreted its terms of reference somewhat more widely so as to include self-sufficiency. It did not accept the reduced financial allocation to railways in the Second Plan as final and advised that the programme should be devised with the original demand of the railways as the target in view. There was no harm in this because the Committee felt that while planning expansion, it was not desirable to be circumscribed so narrowly and it also took the possibility of India some day developing exports of railway equipment into its reckoning.

Soon after this, the Estimates Committee, examining the Coal Commissioner's Organisation and State Collieries in the Ministry of Production, reported in June that it considered that "rail freight rates for coal should be the same by freight adjustments, whatever be the distances of the consuming centres from the colliery". Coal being vital for the development of industry, the present "pricing policy of differential freight rates on coal places the distant localities at a disadvantage". One may be puzzled at the use of the word 'differential' in this particular context; but the idea is clear enough: freight rates on coal should not differ, whatever the distance the coal is carried and whatever the cost of carrying the coal. The Committee recommended "that this handicap should be removed by freight adjustment and a pooled rate should be worked out for coal, chargeable to all consumers equally wherever located". If there was difficulty in giving effect to so simple a recommendation, the Committee was prepared to offer an alternative solution. What could be more simple than to levy a surcharge on freight rates on coal for short distances, in order that the benefit accruing to areas nearer to the colliery is minimised to that extent, receipts from the surcharge being utilised to subsidise freight rates by sea which are substantially higher. This, the Estimates Committee felt, "would also have the additional benefit of diverting coal movement which the rail authorities are finding it so difficult to fully undertake at present".

The possibility of moving more coal by coastal ships by modifying the present structure of freight rates is being examined at an expert level. Shipping interests have always maintained that railway freights on coal

are uneconomic; that they contain an element of subsidy and that the rates will be higher if they are based on a proper assessment of cost. This has also been the view of the Railway Board. In a case of joint cost as in railway transport, it is difficult to apportion costs to particular categories of traffic; and the question cannot be answered definitely one way or the other.

From "adjustment of rates" which are bound to be minor compared to what is now under contemplation, to uniform prices of coal at all rail heads, is a very big jump indeed. The Railway Equipment Committee was not a very high powered committee; its recommendation of uniform prices did not attract much serious attention. The Estimates Committee, however, is politically more influential. It does not always know its own mind; it can be easily led and is sometimes briefed by particular interests within the Government. But if it takes something into its head seriously, it can make its influence felt. There is reason to believe that the Estimates Committee has been actively pushing his idea for Shri K C Reddy, the Minister for Production, stated in Rajya Sabha on August 30 in reply to a question that "the proposal to have a uniform price for coal all over the country was being examined by Government". If there can be postage rates for cement and steel, why not one for coal.

The engineering industries of East India are still recoiling from the blow that postage stamp rates as applied to steel has dealt them. To quote so well informed an observer as Shri D C Driver—". . . this raised the price of steel per ton for Bengal factories by Rs 25, whereas it reduced the price of steel for Kanpur and Amritsar by Rs 35 per ton. Thus with one stroke Delhi has neutralised the natural advantages of West Bengal in Engineering industry, devitalised the industry, disabled its chances for further advancement and damned its exports to the competitive markets—South Asian countries. But frustrated Bengal has raised no cry".

While every country in the world has tried to reduce transport costs, none has yet thought of eliminating it altogether. This can be easily done, with untold benefit to all the under-developed areas of this not so under-developed country, provided this cost is transferred to the State. On a high plane of abstruse theory, the hypothesis may be considered, how the resulting increase in the gross national product will compare with the transport bill, when this bill is transferred to society. The only snag is the frequent complaint that railways are not able to carry all the traffic that is offered for transport. True, the demands on transport may further expand, if transport is provided free, but it cannot be all one way. For if the handicaps for the more developed areas and more favourably located industries are adjusted properly, the latter should have much less demand to make on transport. The brighter idea, however, is not tax-cum-subsidy but to transfer the whole of the cost to the State. After all, present goods traffice does not fetch much more than Rs 150 crores. Even the sales tax brings nearly half as much. A mere Rs 150 crores of additional taxes for so great a benefit as free transport might be worth experimenting with. The timing of the experiment, however, should be done carefully. No cost transport may be announced right now; but taxation to meet the transport bill need not be discussed until after the elections!

Weekly Notes

Financial Know-how for Nepal

THE latest issue of the United Nations Weekly News Letter published by the U N Information Centre, New Delhi, still refers to the State Bank of Nepal as one which, "soon to be launched, is being patterned on that of India". Only last week, Prof Y P Pant, our Kathmandu Correspondent, wrote in these columns that the State Bank was inaugurated by the King of Nepal on April 26. It could not, therefore, be still "to be launched", soon or late, when this news letter was issued viz September 21. According to this news letter, the Government of Nepal intends to establish a single currency in the country, which would mean putting an end to the circulation of Indian and Nepali rupees side by side, though primarily in different parts of the State, which has gone on for centuries. It is doubtful if this can be done without putting up a customs cordon around the State, strict vigilance on the movements of goods, and what is even more difficult, on remittances of all sorts including movements of capital. To enforce all this in the Terai which is both geographically and economically a part of the Gangetic plain, is bound to be vexatious in the extreme and not worth the candle, unless the people of Nepal feel that their national pride demands a national currency, different from the currency of her Indian neighbours.

The same issue of the News Letter further reports that Mr F W Gray, a Britisher from the U N Technical Assistance Administration is coming to advise the Ministry of Finance, Government of Nepal, on banking and currency and it is in connection with this particular assignment that the paper refers to the Government's intention of establishing a single currency. The purpose behind the UN programme of technical assistance is certainly unexceptionable and laudable indeed, but in actual execution one sometimes comes across such odd assignments that one cannot help wondering if the funds spent on such assistance could not be utilised to better purpose in helping the development of underdeveloped countries. The allocation of resources on technical assistance is rarely optional and in this particular instance, it is as unfortunate as any that one can think of. The expert who is being called to advise Nepal on her banking problems was the Treasurer of International Monetary Fund from 1950 to 1953. Is there anything very special about Nepal's currency which could not be set right by a banker of the ordinary or garden variety or by some economist available in Nepal, if he were given the chance to do it? Mr Grey, however, is not coming alone. His "assignment is an integral part of a United Nations Survey Team which will serve in Nepal during the same period and will include experts in the general economic field, banking, public administration, public finance and possibly in other fields. The Economic Adviser, already in Nepal, will act as the coordinator of the Team".

To fire a cannon in order to kill a mosquito is not a particularly elevating example of sensible utilisation of scarce resources!

Between Millstones

TATAS now advertise their soap as "100% INDIAN — Capital, Management, Labour." Thereby hangs a tale. What attitude would the soap factories now take, sandwitched between the two layers of the industry—one pressing from above and the other from below? They would, to begin with, welcome not only the introduction but genuine implementation of minimum wages in the cottage sector of the industry. They would also welcome the particular slant in the Government's cottage soap industry programme of using non-edible oils as raw material which the All India Khadi and Village Industries Board has taken up during the current financial year. These are the high lights of the programme of Central assistance:

Wholetime employment to 4,000 workers in the cottage soap industry, using non-edible oils. The programme will also provide employment to a lakh of workers for two months.

Financial assistance amounting to Rs. 46.41 lakhs by the Union Ministry of Production to the All India Khadi and Village Industries Board for implementing the programme during the current financial year.

165 compact oil-crushing and soap-making units of three different sizes. This is in addition to 67 units, which were sanctioned in the last two financial years. Some of these have started production while others are under construction.

Of the 165 units, fifteen will have four oil crushing centres each, 30 units two oil-crushing centres each, and the rest one oil-crushing centre each. Each unit will also have a soap-making centre. The units will be set up by statutory State Boards, cooperative societies and registered bodies, who will receive from the All India Board loans and grants for meeting the capital cost. They will also be given loans for providing working capital for the units.

A loan of rupees five lakhs has been sanctioned to the Board for being disbursed to existing soap-making and oil-crushing centres as against rupees four lakhs in the last financial year. The new loan will be given to the existing centres, which had repaid earlier loans advanced to them within the stipulated period, for expansion of works or for collection of non-edible oil-bearing seeds etc.

A production subsidy on neem and other non-edible oils at the rate of one anna per seer is to be given and a sum of Rs. 2,23,000 as grant has been sanctioned for the purpose.

This is the third year in which large sums are being sanctioned for the development of soap making as

PC.8472(A)

How banking serves the RUBBER INDUSTRY

RUBBER was first planted commercially in India in 1902. Today Indian rubber plantations, concentrated in Travancore-Cochin and Malabar, produce 20,000 tons of rubber every year, valued at four and a half crores of rupees. More than 250 Indian factories depend on this output for their production of finished goods.

Without banking, this growth could never have taken place. The facilities and guidance offered by a good bank, such as the availability of ready funds when needed and the collection of dues in any part of the country, have become part of the structure of the rubber industry.

We at Palai are proud that so many important rubber producers, and indeed leading firms in every field of business and industry in South India, employ the *complete* banking service we offer.

Current Accounts—Demand Drafts—Telegraphic Transfers—Bill Collection Letters of Credit—Deposits—Investments—Loans & Overdrafts—Confidential Credit Reports, etc.

* * * *

If you have business interests in the South, it will pay you to open an account with us. Our 25 branches are strategically located, 23 in important South Indian business centres and two in Delhi and New Delhi; and we have correspondents in all important Indian cities. We offer a fully comprehensive banking service at each office.

Our clients can make deposits at any of our correspondent banks, situated in all important Indian towns and have the amounts credited to their accounts at any of our branches.

PALAI CENTRAL BANK LTD.

Head Office: PALAI, TRAVANCORE
Branches at: Madras, Cochin, Quilon, Trivandrum, Madurai, Mangalore, Bangalore, etc. *Also at:* Delhi & New Delhi.

A LEADING BANK IN SOUTH INDIA

a cottage industry. But it is not clear from the hand out on the subject whether or not and to what extent financial assistance is earmarked for making soap from non-edible oils, nor is it possible to judge what results have already derived from past investment in this field. It is possible that a programme of development scattered over many States will not have anything tangible to show within the space of a year or two, which enables an assessment of the returns against the expenditure incurred. But something more concrete than vague promises and expression of aspirations are necessary before one can fairly judge how worthwhile expenditure has been and is likely to be in a particular field. This is necessary, not merely to avoid waste, but above all as a guide, providing a criterion for planning development in a sphere in which lack of concentration and ready results make the choice of alternatives more than ordinarily difficult.

Giving away is good but surely it is better to give for a productive purpose and one that is productive of greater good should certainly get the priority?

European Railways Wagon Pool

THE most telling argument against centralisation, since the days of Kropotkin, has been the international post and the operation of European railways. The argument still holds for the railways of Western Europe: through trains still run traversing many national frontiers, rolling stock and locomotives are returned to the respective countries and are accounted for accurately through a central clearing house without any central authority. The argument has been strengthened a great deal by the recent developments of pooling and 'hire purchase' of wagons through the EUROFIMA, a joint stock company owned by the nationalised or Government controlled railways of the countries of Western Europe and financed by a number of European banks.

The economic recovery of Western Europe from the ravages of war has been complete except in one respect: railway transport. Rehabilitation of rolling stock is still a pressing and an intractable problem, because railways, badly worsted in the competition from road transport, do not earn enough to pay for replacement, not to speak of expansion. Yet expansion of production and substantial increase of intra-European trade since 1950 have been making heavy demands on railways which have heavier load to carry, with steam locomotives and wagons which are largely over-age and whose replacement has been long overdue.

In the case of locomotives, however, the change over to diesel and electrical locomotives somewhat complicates the situation and makes a straightforward comparison in terms of over-age locomotives difficult. The number of steam locomotives has been progressively decreasing, with an increase in other types of motive power. Even so, "the relatively high proportion of over-age steam locomotives was, at least in part, attributable in several countries to a projected change over to other forms of traction, making it undesirable to replace locomotives about to become redundant because of the introduction of electric or diesel traction. In Switzerland, the steam locomotive stock which was 100 per cent over age was used on the few remaining non-electrified lines; it also served as an emergency reserve, to make good temporary shortages of electric units"—ECE, Annual Bulletin of Transport Statistics for Europe, 1954.

Generally speaking, however, there is no longer any serious shortage of motive power. As steam locomotives are replaced by diesel or electric or by rail motors, the total horse power required for a given volume of traffic is smaller, because electric or diesel units require less time out of operation for servicing than do steam units.

It is in wagons that shortage has been crippling. A survey carried out by the International Union of Railways in 1954 showed that out of a total of 940,000 wagons, 140,000 or 15 per cent were more than 45 years old, and 390,000 or 42 per cent were more than 35 years old. As freight wagons have a normal life of 35-40 years, nearly half the wagons on Western Europe's railways were due for replacement. The state of passenger cars was no better. Rehabilitation was, therefore, a major problem.

The short term solution lay in fuller utilisation of wagons. In 1953, the railway administration of ten western European countries agreed as an emergency measure to form a pool of railway freight stock for common use. By the "Europ-agreement", 160,000 wagons were pooled for use wherever required within the contracting countries. This eliminated the return of empties to the country of origin and freight haulage increased considerably. The arrangement worked smoothly, but old wagons wore out faster and the problem of renewal became even more acute!

Trucks on Hire Purchase

IN October 1955, 14 European countries, Germany, France, Italy, Belgium, Switzerland, Holland, Sweden, Spain, Luxemburg, Yugoslavia, Portugal, Austria, Denmark and Norway agreed to form a joint stock company to be called the European Company for the financing of railway rolling stock (EUROFIMA). Its first object is to renew the 160,000 wagons used under the Europ-agreement. Eurofima is a brain child of the French State railways which had proposed in 1951 that all the railway administrations of Europe should cooperate in financing the purchase of new rolling stock jointly. But, Switzerland excepted, none of the countries could provide the necessary capital for it.

At a meeting of the representatives of the railways concerned held at Brussels in 1952, a plan was put up for forming an "Equipment Trust" along the lines existing in the US. The plan was submitted for examination to a Study Group (1953) which included the representatives of ten great European banks, besides the representatives of seven railway administrations. The latter recommended that a joint stock company should be formed with ample resources "to place orders with the truck building industries for the construction of new rolling stock, that the member railways of the group would be able to buy on the hire purchase system". The member railways are to pay an annual rent for the use of rolling stock supplied, plus a charge to cover depreciation. This will pay for the rolling stock in twenty years after which it will pass into the ownership of the railway concerned. The Eurofima has been constituted on these lines. It is to be registered in Switzerland with headquarters at Basle—Switzerland has offered fiscal concessions to avoid multiple taxation.

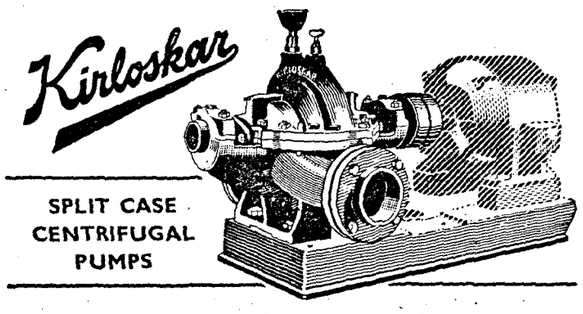
The life of Eurofima has been fixed by statute at 50 years. The share capital of the company will be Sw Fr 50,000,000. The shares, which have to be fully paid up, are of two kinds, those paid for in cash and those in the form of wagons contributed to the pool. The cash assets of Eurofima will be Sw Fr 127 mn while the assets in rolling stock will be equivalent to Sw Fr 37 mn in value. At the outset, Eurofima is to use its own capital amounting to SW Fr 127 mn. Later, a programme will be drawn up periodically fixing in advance the volume of orders to be placed for wagons. The orders, it has been estimated, will come to Sw Fr 100 mn per year. This amount will be raised through long term loans, mostly in Switzerland.

The scheme is expected to work smoothly enough, but it will not go far enough. To replace 4,000 wagons every year, it would cost Sw Fr 100 mn. Even at this rate, replacement of 160,000 wagons used under the Europ-agreement would take 40 years. Of the 940,000 wagons in Western Europe in 1954, nearly half needed urgent replacement. "The scarcity of investment capital in Europe", the Swiss Bank Corporation points out, "prevents the renewal of old trucks being made any quicker", and concludes somewhat plaintively that "It does not seem to be possible for the time being in Europe to mobilise more investment capital than this yearly for this purpose."

A Neglected Exchange Earner

JUTE manufactures, tea and cotton textiles are our major export earners. But there are others also which bring in a substantial amount of foreign exchange. Lac is one such; 95 per cent of the lac produced in the country being exported. Our main buyers are the UK, USA and Germany. Together these three markets take up about one-half of the production in the form of seed lac, shellac (including button lac) kiri lac and refuse-lac. In 1955-56, 5.69 lakh cwt of lac, worth Rs 11.71 crores, were exported. The highest export so far, in terms of quantities, was in 1936-37, 8.34 lakh cwt. In terms of value the peak was reached in 1951-52: Rs 15 crores. The variations of quantity are generally less than those of value eg in 1939-40 although 7.55 lakh cwt were exported their value was only Rs 1.73 crores! Since 1946, however, the value of exports has always been above Rs 6.5 crores.

Shellac is used in a number of industries, but in relatively small quantities. The demand for it is elastic, and synthetic substitutes constantly threaten to displace it more and more. Lately Thai lac (which used to be imported into India for re-export) has established direct contacts with markets in the USA, UK etc. This has seriously affected India's virtual monopoly in this commodity. The position is worsened by the speculative 'fatka', market, in which prices offered fluctuate widely. Although all forward contracts of seed lac and shellac, except those on non-transferable specific delivery basis, have been prohibited by Government since 1954, the Minister of Agriculture still considers it "necessary that this control over speculation should be rigidly exercised in future as well".



The Bihar Shellac Enquiry Committee suggested some time ago that in order to foster internal production and export demand, the maximum and minimum prices, of both seedlac and shellac, should be fixed periodically at the export stage. The Committee assumed that prices at the manufacturing and cultivation levels would adjust themselves to the two sets of regulated prices at Calcutta, viz the selling price for delivery to shippers and the export price for shipments. But the demand for the product is elastic and largely foreign, and it has been questioned if any attempt to regulate prices could succeed unless Government were prepared to build up a reserve stock and operate on it to regulate prices. Nothing, however, has been done as yet.

Lac is produced in Bihar, Madhya Pradesh, Assam and West Bengal, mostly by Adivasis or 'backward classes'. It requires altogether about two months' work in the field in the whole year, at separate periods. It is a first-rate source of subsidiary income, but there is hardly any incentive to produce. At present the primary producer gets less than his due share due to a multiplicity of intermediate transactions. Unlike oher agricultural crops, the output of lac is only 3 to 4 times the seed (brood lac) used. Production is dependent on both the host plant and the insect, and the full exploitation of both without detriment to either calls for substantially improved methods, as well as dispersal of scientific knowledge. There is also a shortage of brood lac due, among other causes to the premature cutting of the crop for fear of theft. Despite an adequate demand for it, these difficulties have brought about a decline in its production, especially of kusmi lac, which is one of the best qualities of lac.

Development Programme for Lac

TO remove these difficulties and to increase the production of lac from the present 14.2 lakh cwt to 21.7 lakh cwt in 1961, a provision for expenditure of Rs 31.81 lakhs has been made. The measures to be undertaken are:

(1) To set up 50 brood farms of which 20 would be in Bihar, 10 in Madhya Pradesh, 4 each in U P, Vindhya Pradesh, Orissa, West Bengal and Assam. These Farms would supply brood lac to cultiva-

Sturdy construction and efficient performance for many years have made KIRLOSKAR Centrifugal Pumps extremely popular with agriculturists and industrial concerns all over the country. Available in sizes up to 5,000 gallons per minute.

KIRLOSKAR BROTHERS LTD.

KIRLOSKARVADI, DISTRICT SOUTH SATARA.

Q-7 (R)

tors at concessional rates. They are also to serve as demonstration centres for improved methods of cultivation. These Farms are expected to pay their way from the sale of brood lac.

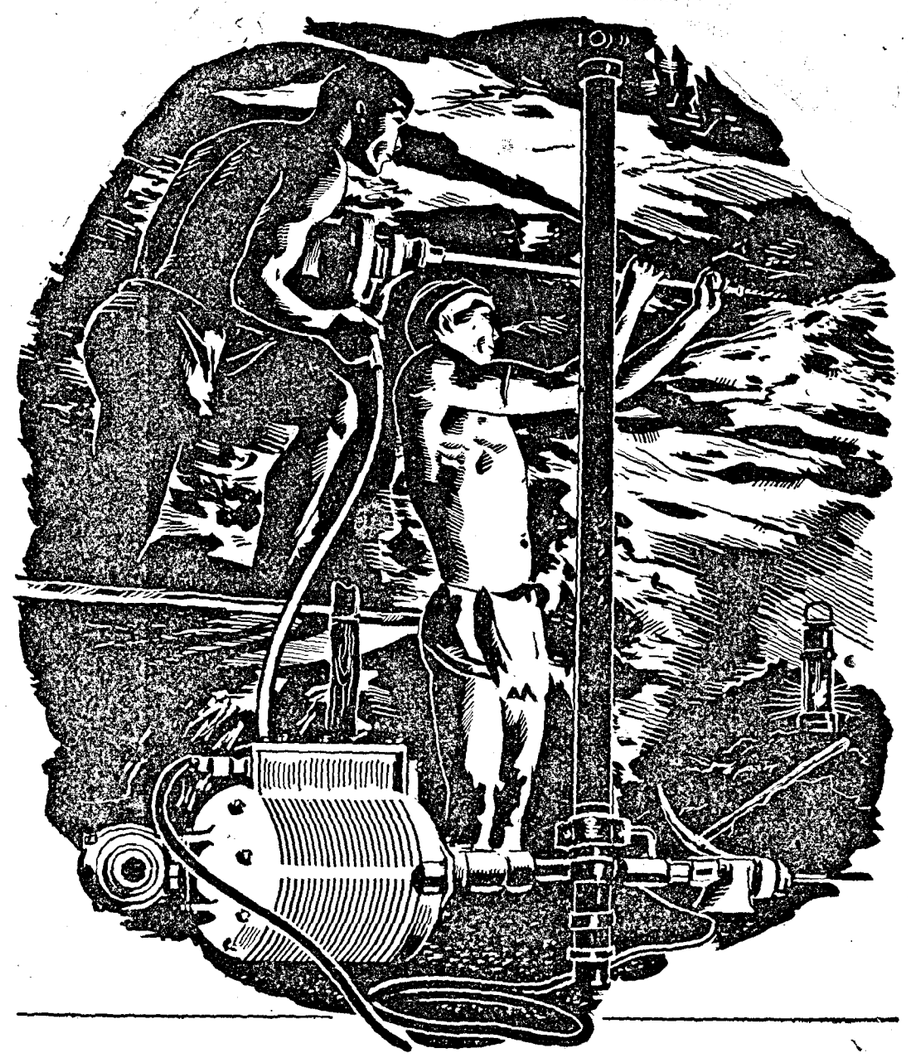
(2) The Vikas Mandals (Co-operative purchase and sales societies) to be formed under the programme. Community Projects in the lac growing areas will also undertake the purchase and sale of stick-lac. At important sticklac marketing centres, however, separate co-operative societies will be formed, exclusively for lac, along with warehousing facilities. Two air-conditioned godowns are to be constructed for storage of seedlac and shellac.

(3) Agmark and an Export Promotion Council for Shellac will be responsible for the regulation of quality.

There is scope for developing lac, provided plastics do not push it out from wider commercial exploitation. At home, lac is used for a variety of purposes. Besides bangles and sealing wax, it is used for manufacturing paints and varnish etc. If these industries could be dissuaded from using synthetic substitutes in favour of indigeneous lac, much will have been achieved. Another bulk purchaser of lac is the Government. Dr P S Deshmukh has urged "Railway authorities, transport organisations, Defence services establishments to use shellac in as many of their requirements as possible". The appeal will be heeded, only if technology and research also help to devise the means of substituting lac and lac products for synthetics and demonstrate its superiority.

Freedom Comes to Ghana

SIX months hence, the Gold Coast will emerge as the first free nation in the Dark Continent. Ghana will be an inspiration to all African countries to demand freedom from colonial domination; it is the beginning of the end of colonialism in Africa. Not only colonial Africa, but free Asia will doubly rejoice at the independence of Ghana. Both the continents will hope that Ghana will also be the beginning of the end of racialism. Racialism has never plagued the Gold Coast, but it is a menace to the whole of Africa. There have never been European settlers in the Gold Coast. This has hastened the independence of the Gold Coast. But it would be uncharitable not to acknowledge the leadership of Dr Nkrumah. He and his Convention People's Party have forged the battle for freedom with purposive determination.



Ghana will be the first "Black Dominion" within the Commonwealth. Since 1947, the racial composition of the Commonwealth has changed. With the entry of Ghana as a member, the Commonwealth will be a symbol of full racial equality. Cynics will insinuate that the British policy of "creative abdication" in the Gold Coast has been influenced by ulterior economic motives. Ghana will be a valuable dollar-earner for Britain and the Commonwealth. It is a large producer of cocoa. It has rich deposits of gold, manganese and bauxite. Simultaneously, the sterling link will help Ghana's trade and economy. Britain has promised financial assistance for the Volta project, Ghana's DVC. Not only Britain, but the whole Commonwealth has an obligation to aid and to encourage economic development in Ghana, as also in Malaya, so that the Commonwealth link can be mutually beneficial.

Dr Nkrumah's achievements are spectacular. Within less than ten years, he and his associate "Prison Graduates" have won freedom for their country. But Ghana's political leaders have much more to achieve. They owe a responsibility to the people of the Gold Coast to ensure good Government and economic prosperity. Dr Nkrumah is a popular leader. It is a tribute to his democratic leanings that an active Opposition functions. There are two issues on which his political opponents differ. Dr Nkrumah is for a unitary type of Government, while the Opposition demands a federal constitution. On this issue, he has the support of the "Black House of Commons". It is good news that he has promised co-operation and prior consultation with the Opposition on the issue of the future Constitution of Ghana. No less significant is the other political issue in dispute. He, his party and Administration have been widely accused of nepotism and corruption. Dr Nkrumah has lessons to learn from the fate of the political parties which won independence for Ceylon and Pakistan. Well-wishers of the people of Ghana will hope that Dr Nkrumah will learn his lessons quickly.

The Campaign Starts

PANDIT NEHRU may be "something more than a Prime Minister". But even he has to talk politics on occasions. Pandit Nehru is no longer the Congress President. But he knows that he is the Congress. He is no less aware that, as in the last general elections, he will have to do the major campaigning for Congress this time also. On the eve of his departure for Saudi Arabia, he started his election campaign for the Congress. He knows what to say when. Recently, there have been communal outbursts in some parts of the country. Some other types of incidents and disturbances have caused worry to New Delhi. Pandit Nehru is too clever a party politician to miss the opportunity. In his address at the Ramlila Grounds—Bombay's Chaupatty or Calcutta's Maidan—he warned the people of the threats by communalists and communists. He did not say so openly, but he implied that a vote for them is to invite chaos.

Many others will endorse his views. But only a few will support his opinion on electoral alliances or adjustments without mental reservations. He does not see any logic in any united front. He welcomes a strong Opposition. But he is critical of the PSP's flirtations with parties of the Left. He is ingenuous in stating that the Congress is not opposed to enter into some electoral arrangements with the PSP. But he is aware of the possibility of electoral adjustments between the PSP and the CPI in some States. He is conscious such an electoral combination can be a formidable threat to the Congress in some States. So, he warns the PSP of the futility of basing its policy on a negation. Jayaprakash will reply that he is in favour of an electoral arrangement with the Communists as he has lost faith in the proposed socialistic aims of the Congress. This does not mean that the PSP has an ideological affinity with the CPI. But how can the PSP hope to gain power or form a strong Opposition without any electoral arrangement with the CPI? In a democracy, such electoral adjustments are inevitable in the efforts of political parties to gain power. There is nothing negative in such a policy.

The Future of Eden

THE passing of the Suez crisis into the "Suez question" may now very well anger a crisis in the career of Sir Anthony Eden and his Government. The outcome of the second Suez Conference is certainly the greatest of possible rebuffs which any British Government has had to take from the hands of its closest ally. This alone is serious enough. More serious is the manner in which the rebuff was made. In the Commons debate the Prime Minister expounded the nature of the intended Users' Association which at about the same time was being denied by Mr Dulles in Washington. Further, the mobilisation of a vast British war machine in the Mediterranean has now turned, at least in Middle Eastern eyes, to have been a bluff—a meaningless demonstration, the result of the pursuit by Eden of a wholly personal policy.

There has been a lot of talk about a serious split in the Cabinet. It appears that the group most prominent in demanding a quick military solution was led by Mr Macmillan and Lord Salisbury. Their pressure and their influence predominated in the opening phases of the Suez crisis and there was then a real danger of war. On the other side stood Mr Butler and Sir Walter Monckton (the Minister for Defence) who believing that the world had changed over the past 50 years, suggested solutions in terms of the United Nations and negotiation. Eden himself favoured the militarists and their approach but was concerned how far he could carry the Americans with him. He certainly now knows the answer to this. But his problems have become more complex and both wings in his Cabinet and his Party have lost their full confidence in him.

It would appear that the Macmillan wing (now that the vague and virtually meaningless Users' Association has been formed) are charging the Prime Minister with vacillation. Had he acted in the first instance when the Labour Party was far from clear on a solution, the whole country would have become united in what would have been publicized as a "patriotic war". The Butler group also believe that Eden is a weak Prime Minister—his vacillation has led to a considerable loss of British prestige. Had he adopted a liberal solution he would have had a united country behind him and the whole of the Western world supporting any British case before the United Nations. They charge him with sabre-rattling and with a military mobilisation which frightened Britain's allies (instead of Nasser) and made virtually the whole of the non-European world antagonistic to Britain.

Apart from contending with these opposing but influential factions in his Cabinet, Eden will necessarily make an honest appraisal of his own worth as a First Minister. He placed his government in a position of unprecedented rigidity. He declared more than once that the United Kingdom will never allow the Suez Canal to be subject to the policy of one nation. Even when this approach first seemed to stand in jeopardy because Mr Dulles had a different idea of a Users' Association, he tried and did give the idea a content which to the world at large seemed to be a means of confirming the British stand. And now when all seems over, when no mention is made of "pilots" in the Charter of the Association or for that matter of the Associaion receiving "the payment of all dues", the British policy is completely destroyed.

So far as the question of leadership is concerned, he will come to understand that the absence of a united government is the result of two possible factors: the lack of a clear sustained policy commanding the support of broad sections of the country and, secondly, of weak leadership. He will see that these failings are serious enough where they concern questions of internal policy. Where the issues are of international significance, such failings are disastrous. There can be no question that Britain has suffered greatly in status and prestige. The Prime Minister will certainly realise the gravity of the consequences to his personal position.

Many serious commentators are examining the chances for alternative candidates to the Prime Minister's office. The choice is invariably being placed on Mr Macmillan and Mr Butler. Mr Macmillan has the support of the vocal "Suez group" of Tories and this is construed to be a matter of some importance. But Mr Macmillan, to clinch his reputation, has yet to solve the critical problems of the British economy. Mr Butler, in contrast, has been under a cloud for some time: he is yet to live down his 1955 "election" budget and some in his Party have charged him with "treachery" for having held up a military solution when the moment was most opportune. It is certain that Mr Butler has less support in the Conservative Party than Mr Macmillan. And as J P Mallalieu puts it in the New Statesman, "Eden remains". It has been suggested that the Suez setback will bring in its train a cruel reaction on the part of the Government and the Tory Party. They may now stiffen their policy in Cyprus and court open battle with the TUC. Whatever the reaction, Sir Anthony Eden faces a grave personal crisis.

Post-war Currency Experience

International Monetary Fund, Annual Report of the Executive Directors for the Fiscal Year ended April 30, 1956.

Reviewed by **R A Jahangirdar**

THE world has moved a long way since March 1947, when the International Monetary Fund started working, from exchange restrictions, but has not come anywhere near the goal of the Fund. The Fund Agreement (Act XIV) provided that three years after it started working, the Fund was to report on exchange restrictions still prevalent and after five years, it was to assume active jurisdiction over exchange control of member countries. It is now four years that the transition period of five years ended but the Fund has not trodden on the authority of national governments.

In its Report for the year ended April 30, 1956, released early this week, the Fund presents a picture of international payments situation with many bright spots, but one which hardly approximates its ideal. Productive activity in most of the countries has by now recovered from the dislocation caused by the war, and the world payments position as a result has improved. World industrial output, outside the Soviet area, rose by 10 per cent in 1955; in 1954, it had shown no rise over 1953. The rate of increase in output in the United States was 11 per cent over 1954, while in the United Kingdom it was only 5 per cent. In the United States it was a recovery from the 1953-54 recession; in the United Kingdom the 1955 rate of increase was lower than the 1954 rate—5 against 7 per cent; and the rising production in 1955 of most West European countries came on top of an unprecedented growth in 1954. As a result, the U S recovering from the recession of 1953-54 experienced little supply difficulties while Western Europe came up against limitations of productive capacity.

Employment and wages increased in these circumstances but not prices. In fact the United Kingdom experienced labour shortage and because its rate of increase in 1955 was less than in 1954, the rising spiral of wages tended to push up cost of living. Sweden shared this experience with the U K. In West Germany unemployment fell below the safe limit of 3 per cent, thus no longer providing "a cushion preventing further expansion of demand from being translated into price increases".

Trends in Trade

This high level of economic activity had its effect on international trade. In the case of industrial countries the volume of imports rose by 12½ per cent—more than in proportion to industrial production. In the U S A, because a large part of increased demand was taken up internally and demand for foodstuffs rose slowly, imports rose by 10½ per cent while in the O E E C countries, as a result of high demand pressure and relaxation of import restrictions, the rise in imports was higher at above 14 per cent.

As regads composition of trade, two trends are to be noted. First, imports of manufactures rose more sharply than those of other commodities—this is explained by rising production and incomes. Even in the U S A the volume of imports of manufactures increased by 20 per cent, of semi-manufactures by 11 per cent and of foodstuffs by only 4 per cent. Secondly, the industrial countries exhibited a tendency to trade among themselves even in semi-manufactures and foodstuffs—a tendency also confirmed by the G A T T Report on International Trade of 1955.

Share of Primary Producing Countries Reduced

The combined effect of these two trends was to reduce the proportionate share of primary producing countries in world trade. Further, such factors as declining importance of food in aggregate consumption, increasing agricultural production in industrial countries by State support, and the substitution of synthetic for natural raw materials have also contributed to the continuous decline since 1950 of share of primary producing countries in world trade. The impact of this development has, of course, differed with the different categories of these countries—those exporting foodstuffs suffering more than those exporting oil and exporters of rubber and non-ferrous metal actually faring better than most of the industrial countries.

Another significant development of the year was the increase of the trade of U S S R and associate countries with the rest of the world consequent upon the relaxation of the cold war. Most of this increase was confined to trade with industrial countries; Soviet trade offensive with less developed countries may come later.

Does Dollar Problem Persist?

Did the dollar problem persist in 1955? There are certain factors which point that it did, though not in the same severe degree of early postwar years. First, as the Report points out (p 16), the rise in gold and dollar reserves of non-dollar countries was more due to higher current production of gold, private dishoarding and sales from international organisations than to the rest of the world's surplus account with the U S A. In fact there has been continuous decline in the payments surplus of the rest of the world with the U S A since 1953, partly because of greater increase in incomes in the rest of the world. Secondly, the U S A itself in 1955 provided to the rest of the world by way of grants and loans nearly $ 2.6 billion which was more than the increase of $ 1.2 billion in the gold and dollar holdings of the other countries. It may be assumed that there will be no sudden interruption of such U S aid in the near future; but no government can base its foreign trade policy on such an uncertain assumption. Under these circumstances, discriminatory exchange restrictions against dollar are not likely to be speedily dismantled.

There is on the other hand another pointer which belies fears that slackening U S economic activity may upset the economies of other countries—particularly of those in Europe. The U S recession of 1953-54 did not have any significant adverse effect on other economies. Those who had apprehended that a recession in the U S would impede recovery in Europe had also maintained that one great service the

U S could do to the rest of the world was to keep its production at an even level. In practice, however, U S imports have in recent years remained stable irrespective of the level of U S economic activity.

Shortage of Foreign Exchange

Broadly speaking it has been a period of shortage of foreign exchange rather than of dollar. The shortage has widened from the particular to the general, which makes the situation amenable to internal corrective measures. The key to convertibility is the convertibility of sterling and it was precisely sterling which showed signs of weakness during 1955. Sterling was repeatedly subjected to pressures, not only on account of trade deficits but also on account of speculative flights. Adequate reserves are needed for protection against such pressures for two reasons: to tide smoothly over periods of strain and to discourage speculative movements.

From the Charters of the Fund and the Bank, one can see that capital movements were expected to play an equilibriating role. "The experience of 1955", however, reports the I M F, "is not very encouraging", to such hopes. The U K and Canadian experiments of dear money showed that exchange risk, rather than profitability, continue to determine the course of capital movements.

Corrective Measures

The early postwar prejudice against financial measures has by this time considerably weakened. No longer do countries resort to commercial or exchange restrictions as soon as a slight disequilibrium is noticed in the balance of payments. The difference between the prewar and the postwar situations is now better appreciated. The I M F reports that preference continues to be given to internal and external financial measures over commercial and exchange restrictions. The emphasis on monetary policy, especially during 1955, was prompted by two reasons. First was the belief that inflationary pressures were coming from private expenditure financed by credit expansion. Secondly, these pressures were expected to be temporary, and monetary policy, being flexible, was regarded as the best instrument to deal with them.

The experience of the United Kingdom showed that these pressures were not so short-lived. The bank rate was raised in U K from 3 per cent to 4½ per cent early 1955 and again to 5½ per cent early 1956. Since this was ineffective in preventing the decline in gold and dollar reserve, several other steps had to be taken, eg increased taxes (Autumn Budget), limitations on public borrowing, persuasion of banks to limit their advances and restrictions upon hire purchase. Other countries in the Sterling Area like Australia, New Zealand and the Union of South Africa also followed monetary and fiscal policies to restrict credit and restrain demand. On the continent, Scandinavian countries and West Germany took restrictive monetary measures, Austria tightened control on credit institutions, and France and Italy, because their increase in money supply was matched by increase in production, took no important restrictive measures. In Japan, the Central Bank had been able in the past to exercise control by varying the terms of rediscounting by commercial banks; this proved inadequate and a new technique of selling government bonds to the Banks was introduced. Both the U S A and Canada adopted similar measures of raising bank rate and restricting bank credit.

Less developed Countries

The less developed countries could not rely upon disinflationary measures to achieve external balance. Nevertheless, there was also no eagerness to use import restrictions. Rather, they relied upon adjustments in exchange structures or in export-import duties, sometimes supplemented by monetary measures. Some countries like Australia, Burma and New Zealand, however, did use import restrictions. Argentina and Pakistan devalued their currencies while Chile introduced a system of flexible exchange rates. India provided an example where a developing country, not too much dependent upon foreign trade, could finance large development expenditure without giving rise to undue inflationary pressures. The year 1955-56 marking the end of the First Plan showed no signs of inflation or balance of payments deficit. Current trends indicate, however, that we are likely to run into both difficulties during the Second Plan.

An assessment of these developments leads the IMF to belive that prospects for 1956 are bright. If Europe can keep inflation in check and expansion continues in the USA for which there is scope, the payments position of the European countries may continue to improve. But other factors must be borne in mind before one can generalise: First, the recent improvement has been made possible by U S Government expenditure abroad. These expenditures have helped other countries in two ways—they have made possible increased dollar purchases and strengthening of reserves. Export earnings of primary producing countries continue to be subject to severe fluctuations and, therefore, these countries must maintain strong reserves to protect the external value of their currency. On the other hand, they must use an increasing part of their foreign exchange for imports of machinery and even foodstuffs and raw materials for an accelerated economic development. The U S policy of disposal of agricultural surplus will vitally affect the export earnings of countries which export agricultural produce, and some of which are burdened with similar surpluses.

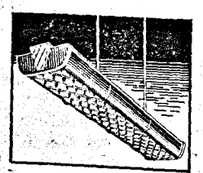
Failure of the Fund?

The persistence of multiple exchange rates and exchange restrictions more than a decade after World War II and the still far away goal of convertibility are apparently not a convincing advertisement of the success of the I M F. True, the I M F can say that it has not failed; the conditions of success were denied to it. It came into existence in a world of sovereign states which were unwilling to share their authority in the matter of external payments. Nationally planned economies would not and could not concede jurisdiction to extra-national authority. Secondly, no attempt was made at rationalising the structure of world exchange rates, partly because national governments would have resisted such an attempt. There was, thirdly, a reluctance on the part of governments to use internal financial measures to correct external payments disequilibria. Still inhibited by the pre-war memories of depression, they failed to realise that the postwar situation was one of internal inflation rather than that of potential deflation. As a result commercial restrictions were freely used to guard the balance of payments which brings us to the fourth reason why the Fund failed. The ideals of the Fund were linked with those of I T O which was still-born. Relaxation of exchange controls can have no meaning in the context of restrictive trade practices. Finally, the reserves of the Fund have always been hopelessly inadequate

to cope with a convertibility experiment.

The Fund has relaxed terms of its loans to member countries. The latter, however, have not availed of these liberal terms. The volume of loans and grants extended outside the I M F clearly shows the insufficiency of the Fund pool; the Fund can make its resources available, at best, for overcoming temporary balance of payments difficulties.

These observations should not lead one to conclude that the prospects of international payments are bleak. There have been in recent years encouraging developments such as high level of economic activity in most countries, progressive relaxation of exchange and trade restrictions, the arrangements made under the auspices of G A T T for tariff reduction, and greater supply of gold and convertible currencies. Though convertibility of world currencies remains still far off, more and more of its essential features are being introduced in the world payments situation, but along lines not contemplated in the I M F Charter.



Make your office many times brighter

— AND WATCH OUTPUT INCREASE!

A well lighted office means extra benefits for both staff and employer. Work improves, since good lighting reduces eye-fatigue. Further, output increases because efficient lighting eliminates the errors due to bad lighting.

That's one reason why Philips Fluorescent Lamps are revolutionizing office lighting everywhere. They give a kind light — never a harsh shadow! And they are economical; they give more than three times more light for the same electricity consumption as filament lamps: result — low electricity bills!

Install Philips Fluorescent Lamps and watch output go up—costs come down. Philips Fluorescent Lamps last on an average 7,500 burning hours!

PHILIPS

'TL' FLUORESCENT LAMPS & FITTINGS

— make light work for you!

Can we be of service to you? The Philips Lighting Service Bureau will be glad to advise you on any aspect of lighting designs and installations in your office—free of charge and without obligation. Please write to Philips Electrical Co. (India) Private Ltd.

Farnborough and Indian Airlines

K W Newell

QUITE different problems need to be considered with an internal air transport network from those of long haul passenger and freight services. Long distance transport is necessarily coupled with questions of prestige, currency restrictions and the need to have a pool of large distance aircraft, and the technical staff to maintain and fly them, for strategic purposes in an emergency.

In the past decade there has been a popular misconception that this type of airline is in direct competition with other transport services by road and rail. This has however been conveniently and finally exploded and today's transport operators agree that a healthy and efficient air service caters for and encourages a new type of travel and develops a freight service in commodities which previously had a restricted or no outlet. In the early stages airlines catered to the market for luxury goods such as cray fish from Australasia to America or the year round supply of rare fruit and flowers but now these experimental stages have passed with the advent of cheap and regular scheduled flights. Although it may necessary for short periods to run a service uneconomically to develop an area or a trade there is no justification in continuing a total network which cannot pay its way.

India, with its large centres 500 to 1000 miles apart is geographically fitted for an efficient and widespread internal service, if suitable planes for its conditions were available. To be efficient and economically viable these planes must have certain characteristics which are already quite clearly defined.

They can be considered under five different headings: Speed, punctuality, cost of operation, engine efficiency and comfort.

There are various types of aircrafts already in production with speeds ranging from 250 mph to 550 mph. But the efficiency of an aircraft decreases as speeds increase. The speed suitable for an Indian service appears to be one sufficient for a businessman or executive to be able to travel between countries and yet have sufficient time to make contacts in the same day. This speed range would be in the 350-450 mph group.

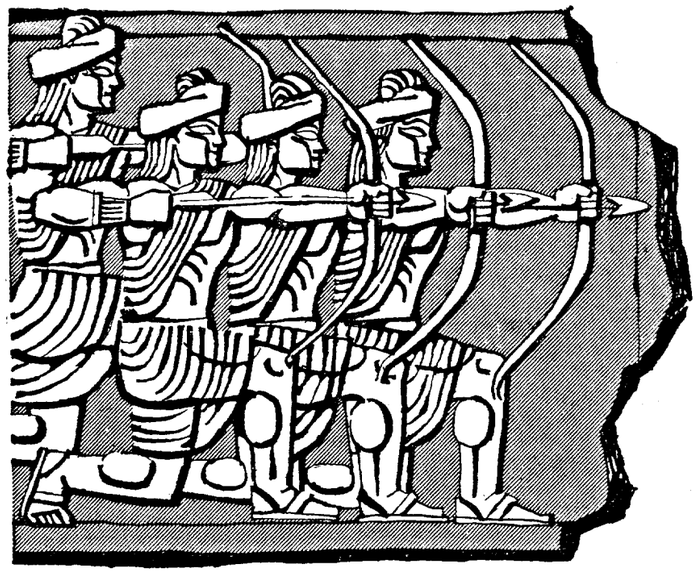
Flexibility is probably the most important single factor. Although the cost per ton mile or passenger mile is important for economic running, costs are even more dependent upon utilisation, that is, how many hours per day the aircraft is used and how much fuel is consumed per flight in passengers and freight. At present it has been necessary to use special aircraft for passengers which cannot be easily converted to freight or which have not the extra airframe capacity to carry sufficient freight if the passenger load is low. This is wasteful and inefficient and results in night flights or off-peak periods being run at a loss. A suitable airframe would be one which could accommodate up to 100 passengers and yet at off peak periods could hold sufficient freight to be 80 per cent to 100 per cent utilised.

Cheapness in operation must be mainly a comparison with both aircraft projected or at present in service and surface transport cost. At present it appears that they should be under 1½ d per passenger mile (against a little above As 3 per mile charged on Indian Airlines) with an 80 per cent utilisation.

The revolution in power units for aircraft has passed with very little public appreciation. The concept of reciprocating engines was suitable for experiment in the early days of aviation but at no time were they considered efficient and basically sound. Now that the gas turbine has passed from the drawing board into regular operation there seems little justification for further investment in power units of a past age.

Comfort must also be considered. However it should no longer be necessary to tempt people into the air with food and seats which are unnecessairly lavish and which are wasteful in space and weight. Aircrafts must be pressurised if they are flying at heights above the level for comfort; noise and vibration must be cut to a minimum but let this be the type of comfort demanded and not sleeping berths and individual windows.

In the light of these five factors what sort of a plan is required for trunk services in India? It must be an aircraft capable of cruising at 350-450 miles with 500 to 1500 miles as the efficient stage distance. It must be capable of holding up to 100 passengers in tourist class seating at peak periods and yet the airframe must be large enough to hold sufficient freight to reach 80 per cent utilisation in the evening, night or off-peak flights without requiring any major change or adaptation. It must have gas turbine engines which have been proved in operation to be efficient and easy to service and maintain.



Examining the selection of airframes and engines on show in Farnborough this year with this specification in mind, one is forced to conclude that so far Britain has not produced an aircraft which is in any way suitable. Although in many ways this exhibition appears to be but little in advance of previous years however there are a number of designs this year which need to be carefully considered and not just noted as interesting experimental advances.

It appears that Britain is the only country at present producing as standard equipment gas turbine engines of proved efficiency and economy through all the power ranges. The only two airframes designed for gas turbines are the Bristol Britannia and the Vickers Vis-count. Both have disadvantages as they are basically passenger and not passenger-freight aircraft. The Britannia is designed for larger distances than India would require. The Viscount is too small. Specifications are available for the Vickers Vanguard which is a larger plane than the Viscount with a 'double-bubble" fuselege, capable of carrying freight or up to 115 passengers. The first Vanguard is not scheduled to fly until 1958 but it appears to fit in quite closely in airframe and power units for the requirements of Indian internal air traffic. But picking up a plane from a drawing board is a bad policy.

Although it is disappointing that it was not possible to see in the air an airframe that would be suitable, it is clear that engines for the internal services must be British gas turbines. Until some country can produce a suitable airframe it seems necessary to gain experience locally in the operation of aeroplanes powered with these engines and the most efficient and tried aeroplanes of this type available at present is the Vickers Viscount.

Surprise at Thermopylae

When Xerxes, the mighty Persian emperor, invaded Greece in 480 B.C. he had with him a company of Indian archers. These Indian archers used a new weapon—a steel-tipped arrow which had been brought all the way from India. History records that the Greek army was surprised by the superior arms of Xerxes and was defeated in the battle of Thermopylae.

Today, once again, steel is very much to the fore in the nation's thinking, but with a different intent. The country's steel-making capacity is being rapidly enlarged, not for purposes of war, but for peace and development.

Labour Cost and Economic Growth

Amartya Kumar Sen

ON what principles should the cost of labour be estimated for a developing economy, is by no means an easy question to answer. It is, however, a very vital question for economic development, as a lot of decisions, e g, the choice of techniques of production, depends on the costs of labour.

The Concept of Cost

The theory of factor-costing which enjoys most prestige today in the economic literature is that of opportunity costs. Labour, according to this theory, should be valued at the alternative use to which it might have been put to. In an underdeveloped economy with large-scale disguised unemployment, e g, in India, the opportunity cost of labour is nil, though the wages have to be equal at least to the level of subsistence. That is why no less an authority on growth and planning than Prof W A Lewis argues for valuing labour at less than its wage cost in economies with surplus labour. "Special care has to be taken in those countries which have a large surplus of unskilled labour, for in such circumstances money wages will not reflect the real social cost of using labour. In these circumstances capital is not productive if it is used to do what labour could do equally well; given the level of wages such investments may be highly profitable to capitalists, but they are unprofitable to the community as a whole since they add to unemployment but not to output" (The Theory of Economic Growth, p 386). "It is then (when there is surplus labour) arguable that the real cost of using labour in cottage industry is zero, whereas factory production uses scarce capital and supervisory skills." (Op cit p 140).

Prof A E Kahn makes the same point in connection with his "Social Marginal Productivity" criterion for tackling the problem of choosing between techniques (Investment Criteria in Development Programs, Quarterly Journal of Economics, Feb 1951, see specially p 24). Labour should be valued, according to him, at its opportunity cost, and in areas where it is nil, labour should be treated as cost-less whatever the wage rate.

It can easily be realised that if labour is valued at its opportunity cost, we get a good idea of the changes in total output. If however, we are interested in the rate of growth of the economy, given by the rate of surplus of production over immediate consumption, labour has to be valued at the additional consumption which an additional unit of industrial employment induces. Thus the problem of valuation of labour turns out to be another way of looking at the old controversy about the rate of income and the rate of growth of income.[1] When we are interested in growth, labour should be valued at the increase in consumption due to additional employment, even if the opportunity cost of labour is nil. This necessitates considerable change in the economic recommendations (eg of Prof Lewis, Op cit specially p 207 and p 386) based on the opportunity-cost-valuation of labour.

Mr Hollis B Chenery in his article on "The Application of Investment Criteria" (Quarterly Journal of Economics, February 1953) confuses the problem. His theory is basically one of Social Marginal Productivity with a 'welfare function' embracing 'effect on national income' (along with effects on balance-of-payments and income-distribution). Now, when one is interested in total national income (as with the Social Marginal Productivity criterion) one should value labour at its opportunity cost. Instead he values labour (equations 4 and 5) at the 'increase in consumption' (pp 82-3). "The effect on national income, Y, can be aproximated, by applying a set of correctives to the businessman's calculation of the annual **rate of profit.**" (p 24, emphasis mine). This is a confusion between the rate of surplus and the rate of net income flow. There is no reason whatsoever why in national income measurement the increase in the consumption of wage earners should not be included. The concept of opportunity cost is legitimate for income calculation but not for calculating the rate of growth; the concept of surplus of production over consumption is legitimate for the latter but not for the former. To save confusion, the distinction has to be appreciated.

Measure of Cost

The relevant question for growth then, is what determines the increase in consumption due to the transfer. Should it be equal to the full wage rate? The normal tendency seems to be to answer the question in the negative. The increase in consumption, it is argued, will surely be given by the difference between the industrial wage rate and the average rural consumption of the labour transferred from rural disguised unemployment to industrial employment.[2] Armed with this piece of theory, Prof Vakil and Brahmanand have developed their thesis of the "Consumption Multiplier", given by $\left(\frac{W}{W-d}\right)$, where 'W' is the industrial wage rate and 'd' the average consumption of the disguised unemployed.[3] If d = ¦W, an investment made with Rs 1,000 worth of wage goods, leads to that transfer of labour from disguised unemployment to industrial employment as to release Rs 500 worth of consumer goods previously consumed by the transferred labour force. That when invested releases Rs 250, and so on. So total investment that can be made with Rs 1000 worth of initial wage goods is Rs 2000 and the "multiplier" is 2. All these are based on the assumption that while the newly employed labourers spend all their **new** wages, the amounts which they were consuming previously are now saved.

This is a questionable assumption. In all probability, as an individual leaves the village for industrial employment, without affecting the output there—this is so by definition, as marginal product has been assumed to be **nil** in rural areas his relatives will be only too glad to eat his pancakes. In a country like India, where the rural income when

---

[1] For an account of the "old controversy" referred to above, see W Galenson and H Leibenstein, "Investment Criteria, Productivity and Economic Development", Quarterly Journal of Economics, August 1955, and K N Raj, Economic Weekly, April 7 and 14, 1956.

[2] To use Dr A K Das Gupta's nomenclature, the difference between the "wage unit" and the rural "consumption unit", "Disguised Unemployment and Economic Development", Economic Weekly, August 25, 1956.

[3] Vakil and Brahmanand, "Planning for an Expanding Economy", Vora & Co., 1956. See specially, pages 262-3 and 215-6. "Assuming that the money value of the wage-goods consumed by the disguised unemployed is Rs 200, and that the level of real wage is Rs 400, the money value of the wage-goods necessary to increase employment in investment by an additional worker is Rs 200." (p 215)

divided by the rural population even after some considerable town-ward *drifts, would remain* far below a comfortable figure it would not be wise to assume that the rural population would start practising thrift as they waved their handkerchieves at their town bound relatives. The position can be illustrated with a simple example. Let us assume that a rural family of five has an income of Rs 100, ie of Rs 20 per head. One of the five leaves for the town, where he gets say Rs 30. The result is a rise in the total income of the family from Rs 100 to Rs 130, and as, with low income groups all over the world, this would mean a rise in the consumption expenditure almost equal to Rs 30, the marginal propensity to consume being very near one. Thus from the point of view of growth, the relevant cost of labour (in terme of increase in consumption) is approximated by the wage rate, and not by the difference between the wage rate and the average consumption of the man in disguised unemployment. This fact makes the foundation of the Vakil Brahmanand thesis of the "Consumption Multiplier" rather dubious.

Recovery and its Implication

It may now be asked what happens if the previous consumption of the newcomer to the industry is taxed away as he moves out of disguised unemployment. It is of course likely to affect his movement, if he has any sense, since the movement which is worth doing for an extra Rs 30 for the family, may hardly be so for an extra Rs 10 (Rs 30 minus Rs 20). But if he still does move, the relevant cost of labour would be less. This would have some interesting results. The more complete this is, the stronger would be the case for substituting less capital-intensive techniques for more, as the effective cost of labour to society would be less.

If p is the net product per unit of labour,
w is the wage rate "
and C is the capital cost "
the rate of surplus is given by

$$r = \frac{p - w}{C},$$

where there is no recovery of previous consumption.

If k is his previous rural consumption and q the proportion of it recovered,[4] the new rate of surplus becomes

$$r = \frac{p - w + k.q}{C} = \frac{p - w\,(1 - f)}{C},$$

putting $f = \frac{k.q}{w}$.

Combinations of a lower p and a lower C may now become relatively preferable as a result of this fall in the effective labour cost. This can be illustrated with a numerical example:—

	(Figs except % are of Rs) Technique I	Technique II
C	100	300
p	10	20
w	5	5
r	5%	5%
k	4	4
p	½	½
r'	7%	5.7%

With the recovery, technique I (less intensive) becomes superior. Thus a strong policy of "compulsory delivery", or taxation, linked with the exodus from the rural area should make the urban industries less capital-intensive, if such a choice existed.

Conclusions

The conclusions reached at the various stages of this paper could be summarised as follows:—

1) The relevant industrial cost of labour from the point of view of development and growth is given by the increase in consumption due to the transfer from disguised unemployment to gainful occupations, where the disguised unemployment is the main source of labour supply. The opportunity cost of labour is a valid guide only when we are interested in the immediate rate of income and not in the rate of growth of income.

2) The increase in consumption as a result of the transfer is not approximated by the difference between the industrial wage and the rural average consumption, but by the full industrial wage (unless the State intervenes with taxation, or with other income-leakage-mechanisms). This reveals the basic weakness of theories like the one of the "Consumption Multiplier" of Prof Vakil and Brahmanand.

3) The more successful the State is in siphoning off the previous rural consumption of the new labourers, through taxation or other means, the less becomes the relevant labour cost, and hence, the less is the degree of capital-intensity, that is best for economic growth, if a choice of techniques exists. A practical conclusion from this, I suppose, is that the technological plans and the fiscal policies must be co-ordinated.

[4] Vakil and Brahmanand deal with the limiting case where q=1, and that is somehow brought about without the help of any means like taxation.

Fertility Pattern of Women

In some Rural Centres of West Bengal

Jyotirmoy Roy

THE present study is about the fertility pattern of some village women in West Bengal. The population covered is very small, namely 140, nor can the writer claim a representative character for the population studied. But as the expectant mothers come from all walks of life and belong to different age groups, the results may reasonably be expected to indicate at least a rough trend. The author did not have the resources and the time for enlarging the scope of the study; some resourceful individuals or organisation should now enter this hitherto unexplored field of investigation.

The data were obtained from the three centres Belakoba, Panikauri and Shikarpur of the Samaj Kalyan Parsat in Jalpaiguri district in West Bengal. But for the kind co-operation of Dr S K Ray, Medical Officer and of Miss Chatterjee, Organiser of these centres, this study would not have been possible and I must acknowledge my indebtedness to them at the very outset.

As the data were obtained from the registers of the centres by the author himself, a high degree of reliability can be claimed for them. This is not to say that there were no inaccuracies in the data. Some obvious inaccuracies were detected, but for this analysis, they were left uncorrected. For example, the age of a mother who was confined for the tenth time was recorded as 25 years, which appeared highly improbable. With little difficulty, the correct age of the mother was ascertained by a reference to the present age of her first born. But for this analysis, the entry, as recorded in the register, was not altered. As elsewhere, women tend to under-state their age in India. In view of this universal practice, it matters little if one corrects one or two cases from one's personal knowledge.

One important difference from past experience in reporting ages was noticed in course of the investigation. It is usual for villagers to report their ages in 5s and 0s; but no such tendency was noticed in the present enquiry and records of ages 17, 18, 19, etc. were not infrequent. None, however, went beyond 40, though in certain cases under-estimation was apparent.

Pregnancy was found to cluster round the age gronp 20-26. Table shows the number of pregnancies reported in different age groups.

Table I—No of Pregnancies by Age Groups

Centre	Below 20	20-25	26-30	31-40	Above 40	Unspecified
Belakoba	15	38	14	6	—	1
Panikauri	4	7	4	3	—	—
Shikarpur	8	30	4	4	—	2
Total	27	75	22	13	—	3

Age of the mother at the time of her marriage could not be ascertained in the absence of any relevant information with the Samaj Kalyan Parsat. But it appeared that inspite of the Sarda Act, early marriage was pretty common in view of the reported confinements at the age of 14 and 15. The same conclusion is further confirmed by the occurrence of 5th to 10th pregnancies in the age group of 20-25. None of the mothers in the age group 31-40 was confined less than five times.

Table II—No of Child births by Age Groups

Below 20		20-25		26-30		31-40	
m	c	m	c	m	c	m	c
		12	1st	3	2nd	3	5th
18	1st	29	2nd	4	3rd	1	6th
		13	3rd	2	4th	4	7th
9	2nd	14	4th	7	5th	2	8th
		5	5th	4	6th	1	9th
		1	7th	1	8th	1	11th
		1	10th	1	10th	1	13th

m=No of mothers c=Confinement.

No mothers reported their age above 40. There were three mothers of unspecified age; in their case, number of confinement was also unspecified.

From Table II it is clear that villagers bother very little about family planning; in fact, the very idea is hardly familiar to an average villager. The data recorded above are mostly of uneducated and semi-educated section of the people and therefore may give no indication how the insignificant number of educated families residing in the villages may behave under similar circumstances. Even if they behave differently, one can hardly feel complacent when it is remembered that they do not form a significant part of the population of rural India.

No of Births and Income

Some correlation could be established between the number of births in a family and its standard of living, if the latter is meant to signify income. It contradicts the prevalent belief that with an increase in the standard of living, the number of births tends to diminish. Before proceeding any further, however, the concept of income of the villagers as referred to above needs some clarification.

Income of the parents as entered in the registers was taken as the guide in the absence of any other source of reliable information. For obvious reasons, no attempt was made at these centres to verify it. As the primary object of the Samaj Kalyan Parsat is to render assistances, it may be apprehended that the income recorded was deliberately under-stated. But as under-estimation must have been common in all cases, the relative position of different families in the income scale was not probably affected by it.

Perverse Correlation

It is commonly acknowledged that an enormous increase in the standard of living in some western countries has brought in its wake the baffling problem of decreasing population. But here the situation was different. In course of this investigation, it became evident that those in the higher income group have more children than their less fortunate neighbours. It must, however, be conceded that the result of an inquiry based on a small population like the present one can lay no claim to universality. The true picture of the income-fertility relations in rural India can only be gauged by undertaking wider inquiries covering the rural population.

In all, there were only 3 still-births, 2 abortions and an isolated

case of post-natal death. This does not show that infant and maternity deaths in our villages are high. The expectant mother registers herself under the care of the Welfare Board with a three months' pregnancy and continues to remain under its care till her new-born baby attains the age of six months. The data in the register are, therefore, comprehensive and record in detail the condition of health of both the mother and the child for a pretty long time. As this low rate of mortality was obtained during the first few months of the inception of the Samaj Kalyan Parsat, it is naturally to be expected that the mortality rate will further decline as time passes, with the activities of the Samaj. A good number of women who could not afford medicines and nutritive diet during their pregnancy and lactation were provided with both these items free of any cost. These free aids would be further extended in the near future to all those who might be in need of them. When this materialises our villages will see more healthy babies.

The number of barren parents could not be known from the data under reference because by hypothesis, the Parsat had dealings only with fertile women. One interesting thing, however, deserves mention here. Altogether three cases of pregnancies—two in the age group of 26-30 and one in 20-25—were reported which on examination by the medical officer of the Parsat were found to be fake. The mothers concerned had previous confinements and hence it appeared rather curious that they should fail to ascertain the particular state of their health. According to the medical officer, however, such cases were not uncommon and he had himself come across similar cases in the course of his private practice.

Need for Family Planning

The rate of fertility is alarmingly high in the villages covered in this study. Table II indicates that the average number of children to mothers in the age group 31-40 is more than 7.5. On the other hand, the rate of post-natal mortality is satisfactorily low. With the spread of education and extension of social welfare activities, the death rate will go down still lower. No nation can thrive when its productive resources are increasingly being surpassed by its population. All our efforts and endeavours are bound to be futile if we cannot tackle our population problem right at the beginning. All our acivities in this direction have so long been confined to the cities and towns where the population was already showing reluctance to be over-burdened with babies.

With increasing persuasion and vehement propaganda from the Government, villagers are adjusting themselves to the march of time. Nobody now grumbles to send his daughter to school or to get his family inoculated. Yet both met with utmost resistance when they were first introduced. There can, therefore, be no reason why villagers should dislike planned parenthood when its benefits are explained to them and they are not asked to spend much for the purpose. Of course, mere propaganda alone would not do. Simultaneously with it, scientific contraceptive materials have to be made available in the villages at a nominal price even if the danger of abuse of contraceptives may lurk behind such a move.

Public opinion should also be aroused against parents who bring too many children to the earth. Shri Gopalaswami's plea for the reduction of improvident maternity in India to three deserves wide support, at least for the time being.

Ceiling on Mill Stocks

Thursday, Morning

IF the first blow directed against the textile industry, namely, the imposition of the increased excise duties, generated a nervous breakdown in the textile shares followed by other scrips in the market, the second blow, namely the imposition of certain ceilings in respect of stocks of cloth which can be held by mills and wholesale dealers resulted in no less panic. We are also, it seems, soon to witness a varied and rich fare of controversy over this latest official move towards squeezing the textile industry.

Already opinion is sharply divided as to how Government proposes to realise its objective by this blanket ban on stocks beyond a certain level. Such sudden administrative decisions are bound to have serious repercussions on the textile industry in particular, and on other sectors of the economy as well. At least in the days of control, prior consultation had been held between the Government and the trade which had been singled out for 'special treatment'! If the interests affected do not join hands now and take some action, it is not improbable for the authorities to spring newer and brighter ideas of controlling the industry,

The order that a mill should not stock more than the average production of one month will have practically no effect at all—according to knowledgeable circles. For, mills having a large number of retail depots could easily distribute the stock to thwart the Government's intention. In the case of wholesale dealers, the blanket ban seems to have been put with a view to wreaking vengeance. Already their capacity to keep sizeable stocks has been considerably reduced following the credit curbs imposed by the Reserve Bank of India. In the circumstances, they feel aggrieved that they should have been singled out for this double punishment.

It is relevant to note that even in regard to sharing the additional excise burden with the consumers, the trade and the industry have yet to find a common ground, The trade is naturally not at all disposed to bear even a part of the additional burden of excise duty. Thus, a resolution passed by the Bombay Piece-goods Merchants' Association states categorically that they cannot bear any part of the excise levy, and further that if the mills are not agreeable to bear the levy in full, they must be permitted to cancel their orders placed with the mills.

Following the restriction on mill stocks of cloth, the stock market—which seemed to have assumed a sombre course of trading—once again succumbed to uncertainty and apprehensions. The textile shares were of course the worst hit by the official order.

Textile shares which fell earlier, recovered later on technical considerations. Leaders in this section closed higher over the week, But Kohinoor, Swadeshi, Simplex and other issues in the cash section ended with a subdued note.

In the steel section, Tata Ordinary opened the week around Rs 195 and after fluctuating around that level and touching the highest of Rs 199-4, closed the week at Rs 199. In the case of Indian Iron, sentiment was adversely affected at the commencement due to reports that a higher dividend was not forthcoming and that a decision in this behalf would be taken only a week hence. However, they improved towards the close at Rs 36.

Cotton

Futures Trading on Trial

THE pattern of trading in the cotton futures market during the week has been rather puzzling. Even those who are not strangers to the whims and fancies of this market are intrigued at its behaviour, which failed to reflect the true statistical position of cotton. In sharp contrast, the spot market reported brisk activity giving ample testimony, in the process, of the scarcity of quality cotton.

Shrewd market observers explain that the reasons why futures trading in cotton seems to be on the leash are not far to seek. In the first place, they point out, traders and operators have become rather uneasy, and are watching with concern and anxiety the growing inroads made by the authorities in respect of regulating the trade. The excise duty on cloth, the latest measure to pull up recalcitrant mills which hold more than a fixed quantum of cloth stocks, and other regulatory threats expressed off and on are all pointers to the tendency of Government to control the market. In the circumstances, it is natural for operators—who have not forgotten the crisis of last December—to be almost scared of 'doing' anything for fear of giving room to the authorities to pull them up for 'overdoing'.

It might be asked whether there are not enough bearish factors to keep the market so depressed. It is true there have been reports of favourable weather in the cotton growing belts promising an increased supply. The credit curb imposed by the Reserve Bank is also there.

Over and above these, of course, is the announcement limiting the stocks of cloth in the hands of mills. These show which way the wind is likely to blow. But, as against these, there are also pronounced bullish factors that outweighed the adverse influences. Thus, even the estimated increase of the crop to 52 lakh bales falls far short of the required volume of production to keep pace with the steadily rising tempo of consumption. Further, the chances are that consumption would increase in the coming months if the ceiling on mill production of cloth is relaxed. It is the combination of these factors that prompted the Indian Central Cotton Committee to call for a higher target for raw cotton.

It appears, therefore, that the bull factors outweigh the bears. Yet the futures market failed to reflect this. The critics may ask—Why? There could be only one answer. It is, as stated at the outset, the fear, suspicion, or call it what you may—of Government intervention in the market. If only the authorities would indicate, directly or indirectly, that they would not take recourse to extreme steps, the market would receive the tonic to lift itself up from its present state.

The spot market at Sewri tells an entirely different tale. Sustained buying support at the hands of mills has become a regular feature. Mills are, evidently, keen on accumulating stocks to be prepared for a possible removal of the ban on mill production. The daily turnover in the market was put around 5 to 6,000 bales. With the keen interest evinced by some South Indian mills, the ready delivery contracts, the bases of which improved by ten to fifteen points per candy, also displayed a distinctly bullish trend. Activity was no less brisk in the export section. China and Japan were reported to have enquired for sizeable volumes of Indian cotton.

In the import section, however, a stalemate has been created in respect of the import of US cotton. Some business was done by local Spinners in Peruvian, Sudan, BP 52 and Tanganyika, cottons. Ahmedabad mills were also in the picture.

Oilseeds

Maturing Contract

Sentiment in the oilseeds market continued to be rather depressed throughout the week. As a result of weak advices from the ready section, consequent on heavy and timely rains in the interior, and also of the issue of more notices against the maturing castor contract, the bearish trend of the market was particularly evident. In fact, both the bulls and the bears seemed engaged in a stiff tug-of-war, as always happens at the time a maturing contract is closed. A notable event during the week was the abolition of export duty of Rs 250 per ton on linseed oil. While the immediate reaction was a sharp rise in the price of linseed oil in the local market, this proved only nominal as foreign prices, particularly those in the U K, were immediately brought down following the abolition of the export duty. In the event, prices came down.

Groundnut prices ruled easy following favourable weather report.

Dunlop Expansion

THE Dunlop Rubber Co. (India) Ltd. have announced important extensions to their manufacturing facilities in India.

The existing factory at Sahaganj near Calcutta is being expanded to give increased output of truck and bus tyres, cycle tyres, cycle rims, general rubber goods and Dunlopillo.

An entirely new plant is to be established in South India, probably near Madras where sites are at present being surveyed. It is planned to manufacture truck, bus and cycle tyres there, principally for the needs of the South Indian market. The factory is expected to be in operation in about two years' time.

You're safe with a

Standard

Because the STANDARD Battery is so good, its makers do not hesitate to give a genuine twelve-month guarantee with every car battery that's sold

A battery is only as good as its components; we therefore make every component in our own factory. To ensure uniform high quality, we conduct a number of tests every step of the way—from raw material to finished product—in what is the largest national battery manufacturing plant in India.

'Standard' pioneered the use of long-lasting hard rubber containers for batteries. And the use of synthetic separators gives maximum life to *your* STANDARD Battery.

STANDARD BATTERIES LTD., BOMBAY

Company Note

Tata Electric Companies

AFTER providing for taxation—Rs 10.5 lakhs, depreciation—Rs 6.2 lakhs and managing agent's commission—Rs 8.8 lakhs and other expenses, Tata Hydro Electric made a net profit of Rs 27.9 lakhs in the year ending June 1956. Last year net profits amounted to Rs 25 lakhs.

From the net profits of this year the directors have made these important appropriations:—

Rs 2.4 lakhs to Contingency Reserve,

Rs 1.0 lakh to Deferred Taxation Reserve,

Rs 3.25 lakhs to General Reserve,

Rs 1.35 lakhs to Gratuities Reserve, and

Rs 11.54 lakhs to the Dividend Reserve.

The Company paid interim dividends on preference and ordinary shares up to December 1955, at 7 and 3 per cent per annum respectively, which absorbed Rs 10.32 lakhs. The Directors have now recommended the payment of a final dividend on preference shares for the half year to June 1956 at the rate of 7 per cent, and on Ordinary shares at the rate of 4½ per cent (making 7½ per cent for the whole year. These will absorb Rs 11.52 lakhs.

The total sales of energy during 1955-56 amounted to 271.3 mn units as compared to 253.7 mn units last year, and the revenue earned amounted to Rs 84.3 lakhs (Rs 75.7 lakhs in the previous year). Expenses were higher by Rs 7.8 lakhs, largely accounted for by the increase in the cost of thermal power purchased, and interest on short-term loans.

In line with the Company's expansion plans, the 100KV overhead lines from Trombay to Sewree Fort were completed. The work of laying two 100 KV underground cables, each 4.75 miles in length, between Sewree and Carnac Receiving station site, will be completed and connected by the end of 1956.

To keep pace with the rapid industrial development in the Bombay-Poona region, and the consequent higher load demands expected with the Commissioning of the Trombay Thermal Station, various measures have been taken to build up the transmission and distribution capacities.

The Andhra Valley Power Supply Co, Ltd, after providing Rs 17.9 lakhs for taxation, Rs 12.9 lakhs for managing agents remuneration and other expenses, and Rs 9.6 lakhs for depreciation, made a net profit of Rs 34.3 lakhs in the year ending June 1956, as against 28.8 lakhs in the previous year.

From these net profits, Rs 3.1 lakhs have been provided for contingencies reserve, Rs 2.0 lakhs taken to Deferred taxation reserve, Rs 5.0 lakhs to general reserve, Rs 1.9 lakhs to gratuities reserves and Rs 11.8 lakhs to Dividend Reserve.

The Company paid interim dividends on Preference and Ordinary shares at 7 and 3 per cent per annum respectively for the half year ending December 1955. These absorbed Rs 10.8 lakhs.

The directors have now recommended the payment of a final dividend of 7 per cent on Preference Shares and 4½ per cent on Ordinary Shares for the half year ending June 1956. These will absorb Rs 11.8 lakhs.

The total sales of energy during the year was 408 mn units, as against 365 mn units in the previous year. The revenue derived from such sales amounted to Rs 126.8 lakhs as compared to Rs 108.9 lakhs in the previous year.

The progress on the construction of the first 50-62 MW Unit at Trombay has been satisfactory, and it is expected that the first unit will go into commercial operation in November 1956, to be followed by the second unit in April 1957.

The Tata Power Co, Ltd, after providing Rs 22.1 lakhs for taxation, Rs 30 lakhs for managing agents remuneration and other expenses, and Rs 16.6 lakhs for depreciation, made a net profit of Rs 65.1 lakhs for the year ending June 1956.

The Directors have taken Rs 3 lakhs to Contingencies Reserves, Rs 2 lakhs to Deferred Taxation Reserve, Rs 6 lakhs to General Reserve, Rs 16 lakhs to Reserves for special repairs and Rs 2.6 lakhs for Gratuities Reserves.

The Company paid interim dividend on Preference and Ordinary shares at the rates of 7½ and 3 per cent per annum respectively for the half year ending December 1955, which absorbed Rs 18.7 lakhs.

Directors have now recommended the payment of a final dividend on Preference shares at 7½ per cent and on Ordinary shares at 4½ per cent for the half year ending June 1956. These will absorb Rs 20.5 lakhs.

The sales of energy during 1954-55 and 1955-56 amounted to 644 and 715 mn units respectively and the revenue earned in the two years were Rs 192 and Rs 222 lakhs respectively.

Two 30,000 KVA transformers were commissioned into service at Parel Receiving Station, thus ensuring adequate 22 KV supplies to the BEST sub-stations. A third 16,000 KVA transformer was brought in to service at Trombay to cater for supplies to the Oil Refineries, Indian Rare Earth and the Atomic Reactor Plant in that area.

Around Calcutta Markets

Irregular Trend

Wednesday Evening

LYONS RANGE is behaving true to type. As the Puja holidays approach, the Calcutta Stock Exchange develops an uncertain trend every year. This year has been no exception. Even when the primary market trend is "bullish", Lyons Range develops a quieter trend. Weak "bulls" square-up their accounts before the holidays commence. So do weak "bears". This is understandable. There has been some pre-holiday liquidation in the last few days. But it is rather strange that liquidation has started so early this year. Lyons Range will be open up to October 9. There is, therefore, enough time for "bulls" or "bears" to square-up their accounts.

Some other factors have intervened this year to accentuate the uncertain trend in equities. Lyons Range's weakness is being aggravated by the downward trend in Dalal Street. Ever since the imposition of higher cloth excise duties, Dalal Street has been depressed. Cotton mill shares have declined considerably in the last few days. With a downward trend in cotton mill shares, Dalal Street can never succeed in remaining steady. Consistently lower Bombay advices have had an adverse effect on Lyons Range in the last few weeks.

Retention Prices

A few days ago, Dalal Street seemed to be influenced by speculation about steel retention prices. This is a factor which will certainly influence fluctuations in Steel shares. Expectations are that steel retention prices will be raised. Strange as it may seem, Calcutta did not seem to be as much interested as Bombay in steel retention prices. Not that Calcutta is pessimistic about retention prices. But other developments have overshadowed the question of steel retention prices.

Calcutta is more interested in certain allied issues. It will welcome a rise in pig iron prices. Engineering industries in and around Calcutta are more interested in securing a rebate on exports of engineering goods by way of compensation against uniform steel prices. These industries are also interested in securing freight concessions on long-distance movements of their products, now that the price advantage they enjoyed no longer exists. There are problems which are worrying Calcutta's engineering industries. Engineering shares have remained subdued ever since the Government's decision to have uniform steel prices throughout the country.

Indian Iron Dividend

While Bombay shows interest in steel retention prices, Lyons Range is immediately concerned with the forthcoming Indian Iron dividend. Since Friday last, the market had been thick with rumours that the Indian Iron dividend would be announced within a few days. In the current week, these expectations have influenced fluctuations in Indian Iron. According to reports, the board of directors met on Wednesday, but no decision was taken about the dividend. In any case, the dividend announcement is due shortly. Indian Iron have weakened slightly as market expectations about the dividend declaration has not materialised.

Toward the end of last week, reports were current that the Indian Iron dividend would be stepped-up. According to reports, the dividend would be maintained at rupee one, but the Company would declare a bonus of four annas. If the dividend, including bonus, does not exceed a rupee, the chances are that Indian Iron may develop a downward trend. It does not require any imagination to forecast that Indian Iron will move up if current market expectations about the higher dividend materialises.

Right Issue

Production at the Burnpur Works for the year to March last has been quite satisfactory. Contrary to warnings issued both by the Government and the Company that output might be affected because of machinery re-adjustments, production has not suffered. Also, the Company has had the benefit of higher retention prices. But the question is whether the Company can use the higher earnings, as a sequel to higher retention prices, to distribute higher dividends.

Tata Steel Company did not distribute higher dividend. So, pessimists argue, that Indian Iron also will not be allowed to pay a higher dividend. But some argue that there are some special factors so far as the Indian Iron dividend is concerned. Since the announcement of the right issue a few months ago, Indian Iron have been irregularly lower. So, the Company may be allowed to raise dividend disbursements so as to facilitate the proposed right issue. There is something in this argument. But it is doubtful whether the Indian Iron dividend would be stepped-up.

Spinner's Margin

Jute shares are not falling, but the upward trend seems to have been halted. In recent days, jute goods have developed an easier trend. This is partly due to uncertainties about the Suez Canal crisis. Higher freight and insurance rates should have had a "bullish" effect on jute goods. But there are fears that foreign buyers may not be interested in buying Indian jute goods at unduly higher prices. There is something in this argument. But the fall in jute goods in recent days cannot be explained away by these factors.

Along with the set-back in jute goods, raw jute prices have also declined. This is not an unfavourable development. Despite the weakness in jute goods, the spinner's margin continues to be favourable. If this trend continues, Jute shares are not likely to suffer. It is likely that the present hesitancy in Jute shares is a reflection of the quieter trend in equities in general. By the end of this month, the output of jute goods will fall further. Mill stocks of jute goods are also likely to decline further. There are possible events which should have a sustaining effect on Jute shares.

Economic Alignment

TO look at international economic relations from the stand point of India one has to travel along several different planes all at the same time. And these are not planes of competing abstraction either, but different facets of reality, which cannot be reconciled at sight. Judging from the currency, trade and financial policies which we have been pursuing or from the activities of our various delegations and representations abroad it does not seem that we are consciously attempting to reconcile or seriously bothered about it. Nevertheless, a pattern is evolving which is interesting to watch and it is filling up the gaps, bringing in its wake organisational and institutional changes.

The immediate occasion for these reflections are India's participation at the annual meeting of the International Monetary Fund and the World Bank and the talks in Washington at the end of this meeting of the Commonwealth Representatives at which Britain's Chancellor of Exchequer, Mr Harold McMillan, submitted the proposal for a closer association of the Commonwealth countries with an European Common Market. Details are lacking but official reports suggest that the Commonwealth reaction to this proposal has not been unfavourable. The idea of a free trade zone for Western Europe has often been discussed in the past but Britain has kept out from it all long in order not to risk her Commonwealth ties, in the shape of imperial preference which, though much attenuated, is still in operation. As exporter of raw materials, India has nothing to lose from a West European Customs Union; how her manufactured exports will fare in such an union cannot be surmised off hand. But whatever may be her position, eventually India has not been either the prime mover nor has she been interested in working for a free trade zone in West Europe. The urgency behind the move which Britain had resisted so far on the ground of her Commonwealth ties must obviously be to forestall trade expansion of the West German Republic which may well oust Britain from the West European markets if she keeps aloof. Another motive behind the move is also equally obvious, viz to counter the rouble drive.

As a member of the I M F which, never very active, has now become completely ineffectual, India subscribes to the aim of multilateral convertibility, which I M F was supposed to foster as also to the Gatt which aims at freer world trade. While disavowing bilateralism, India has also entered into a series of trade agreements with a number of countries and in keeping with her policy of neutrality, some of these agreements have been made with communist countries. But these agreements, particularly with the communist countries, have brought us so little trade, partly because of the difficulty of bringing the gap between state trading at one hand and private trading at the other, that the newly formed State Trading Corporation has been pressed into service. The Corporation has struck some spectacular deals such as securing a contract from Soviet Russia for the supply of shoes worth a crore of rupees and purchase of a ship from Yugoslavia and selling handicrafts to Soviet Russia. At the moment, it is engaged in negotiating the sale of a million tons of iron ore to the Japanese Industrial Mission, which will be in addition to normal exports through usual trade channels. This sale is being negotiated against imports of steel and machinery from Japan.

These are, then, the several planes along which we are trying to travel simultaneously, one international and multilateral, the secon

Commonwealth and Imperial Preference which is now sought to be widened to bring in some countries of Western Europe into the common market, and a third which is trading between the two worlds, for it includes not only the Soviet Union and the communist countries of South Eastern Europe but also China. There is also a fourth one arising from India's eagerness and obligation to cultivate closer economic ties with her neighbouring countries in South East Asia. The Bandung spirit has already found a reflection in our new shipping programme. This is as it should be. For India is a firm believer in and an active member of the United Nations. She remains a member of the Commonwealth, she is one of the Colombo Powers. The economic implications of neutrality are just as important as are the political implications. Also, it must not be forgotten that India was one of the *sponsors* if not the sponsor of the Bandung Conference.

But while keeping her gaze firmly fixed on free world trade and free convertibility of currencies, she has also to pursue a programme of planned development, earn foreign exchange and diversify her trade, which has led her, not very reluctantly either, to protective and restrictive trade practices on the one hand and bilateral trading on the other.

The brochure on India's Trade Agreements recently published by the Ministry of Commerce and Industry which gives the texts of the bilateral agreements, entered into by India with twenty countries, as in force on December 31, 1955 helps to picture the situation. Eight of these countries are from the Communist orbit, five are from Europe outside the Curtain and the remainder are, with the exception of Egypt, all Asian, including such close neighbours as Burma, Ceylon and Pakistan. Agreements with the Communist countries provide for settlement of accounts in rupees or sterling; in the case of others, net payments are to be made in sterling alone. Czechoslovakia and Finland are specifically placed in the soft currency area for the purposes of import regulation. With the exception of Asian countries, the general pattern of trade envisaged is the export of Indian raw materials in exchange for manufactures, particularly machinery. In the case of Asian countries and Egypt, however, the roles are reversed, India being the exporter of manufactured consumer goods, including light engineering goods, and importing raw materials and/or foodgrains, e g, Ceylon is to export tobacco to India in return for bidis; Burma would exchange rice and timber for gunnies, cloth and, under the latest amendment, engineering products for the first time.

The text of such Agreements is usually a model of diplomatic protocol—and in most cases, unfortunately, nothing more than a declaration of commercial friendship and willingness to trade. Only the agreements with Austria, Burma, Pakistan and West Germany can be described as workable covenants of trade for they alone lay down the physical or value targets for either exports or imports or both. The lists of exports and imports appended to the other agreements are, by comparison, long and detailed and though they include, for instance, prospective export of goose and duck feathers from China, there is no mention of physical quantities or value. In the event, these agreements are at best no more than permissive; they give little idea of possible availability of the listed goods on either side. The other notable omissions are: (i) the absence of any reference to the organisational aspects of creating new channels of trade between countries which have hardly ever dealt directly with each other before, and (ii) the absence of provision for shipping. While no one will question the need to diversify the composition and destination or source of our foreign trade, arranging the movement of goods is considerably less easy than the movement of trade, financial cultural delegations. Importing machinery, for example, involves the problems of specifications and performance, guarantees of service and spare parts, delivery and credit terms, the reputation and past contacts of the parties concerned, bank facilities, freight and insurance terms, and relative price quotations, to mention only the major items. Even the entry of the State Trading Corporation at our end cannot overcome all of these problems.

The broader problem of bilateral vs multilateral trade remains. What do we stand to gain from bilateralism? That question has been raised off and on but never satisfactorily answered. Leaving aside the usual arguments against bilateralism, it has to be noted first of all, that there is nothing like an organised rouble area comparable to the sterling area or the dollar area or the EPU, with the result that in trading with Communist countries we are likely to be in for more or less strict bilateral balancing of accounts, which may not be a convenient state of affairs, particularly since our sterling resources are under severe strain. While we know how a short term unfavourable balance of payment is met under present conditions, we do not know how the Communist countries would, either individually or as a whole, like to settle accounts. Secondly, if the possibility of an unfavourable balance is avoided by resort to barter or specific deals, shall we always be able to get competitive terms? Thirdly, in view of the fact that these agreements hold good for only a few years, what would be done to assure a modicum of stability of reciprocal demand? True, trade under private auspices also fluctuates a lot but trade with countries which have a fully planned economy can fluctuate from zero to near infinity. Fourthly, there is the crucial question of the availability, regularity, and economies of operation, of shipping.

On the credit side, most of the above arguments apply to Communist countries only. In the case of others, viz Finland and Indonesia, we are able to provide for some expansion of trade with countries which lie outside the main currency areas, thus enabling us to secure the supply of and/or the demand for particular commodities and also to make use of the transferable sterling offered in London. Moreover, it is in our interest to establish trade contacts in all parts of the world, in advance of the actual flow of trade, if necessary. Further, it is desirable to place as many countries as possible on the soft currency list even if our trade with specific countries is on the whole nominal. Lastly, the greater the amount of trade done in rupees, the higher will the international prestige of our currency be. It would be useful to have an evaluation of our trade agreements in the light of these and other arguments.

To get back to where we started from. This being the pattern of the trade relations we are developing, when our delegation to the Joint Fund-Meeting returns from Washington, it will not be a story of Dick Whittington and London. But what did we send them for?

Asia and the Arab World

WHILE the debate in the Security Council on the Suez Canal crisis continues, some of the deeper issues involved deserve emphasis. Some observations of Pandit Nehru, prior to his departure for Saudi Arabia, have caused misgivings. Not only within the country, but in the entire Arab world there is growing suspicion about New Delhi's Suez diplomacy. Pandit Nehru's statement, that New Delhi does not approve of the manner in which Egypt has assumed control over the Canal, seems to have deepened these suspicions. More than once, the Prime Minister has emphasised that any disruption of traffic through the Canal will hamper economic progress in many countries, including India. He has had occasion to express fears that, if the crisis provokes war, or in the absence of freedom of navigation through the Canal, the progress of India's Second Plan will be impeded. These are legitimate apprehensions. Not only India, or Britain, or the Commonwealth, but the whole world will suffer in the absence of freedom of navigation through the Canal.

To entertain such apprehensions is not to argue the case for international control of the Canal, though India is, naturally, concerned that the rights and interests of the users of the Canal must be protected. These rights and interests are guaranteed by Egypt's acceptance of the right of all countries to free navigation through the Canal on payment of reasonable dues. This aspect of the problem is rightly stressed in the joint communique issued by King Saud and the Prime Minister. Those who entertain suspicions about India's Suez diplomacy ignore the emphatic opposition of King Saud and the Prime Minister to political and economic pressures by the Western Powers to resolve the crisis.

Pandit Nehru is conscious of "the urges that move the world". Those who discern certain conflicts of interest between south-east Asia and west Asia also stress these international political and economic trends. Both within this country and in the Arab world, there is some disappointment over India's hesitant attitude to the Suez Canal crisis. Whether India's policy to the Canal crisis is positive or not, is discussed later. Before this problem is analysed, it is necessary to consider the alleged sources of conflict of interests between south-east Asia, including India, and the Arab World. Nationalism, it is argued, is no longer an active force in south-east Asia, but it is the main current influence in the Arab world. South-east Asia, including India, emerged out of colonialism nine years ago.

Colonialism continues to be a threat to peace in the whole Arab world. Many countries in Africa have yet to emerge as free nations. Semi-colonial conditions prevail in many countries in west Asia. This region's economy and oil resources are dominated by the Western Powers. Britain and France have "imperial" and strategic outposts throughout the Arab world. There is constant conflict between Arab nationalism and "collective colonialism" of the West. Countries in south-east Asia, including India, are independent nations. But these countries have cordial economic and political relations with the West. Independence in south-east Asia has heightened the awareness of economic inter-dependence between this region and the West. Cordial economic relations exist between south-east Asia and the West. South-east Asian countries are sympathetic to the nationalist movement in the Arab world. On any situation like the Suez Canal crisis, where the West is in conflict with the Arab world, south-east Asia is confronted with a dilemma, it is implied, because of its dual affinities with the West and the Arab world.

With the exceptions of Burma and Indonesia, all newly-independent south-east Asian countries are members of the Commonwealth. But all these south-east Asian countries are, along with the Arab world, committed to the Bandung principle. But it is wrong to assume that there is any inherent contradiction between Commonwealth membership and adherence to the Bandung principle. Need for Arab-Asian solidarity is emphasised by the economic implications of the Western Powers' policy to the Suez Canal. "Collective Colonialism" is a developing threat which cannot be ignored. Refusal of Britain and America to finance the Aswan Dam, the Western Powers' demand for international control over the Suez Canal and the veiled threats issued by the British Chancellor of the Exchequer, and endorsed by the President of the World Bank, during the annual meetings of the Bretton Woods twins intensify the menace of "collective colonialism". This is a growing menace which not only threatens peace in the East, but also economic progress in under-developed countries. South-east Asia, including India, is as much concerned about this new menace as the Arab world. Threatened by a common peril, the countries in both these areas are under a compulsion to formulate a joint policy to overcome the developing menace.

India's efforts to eliminate racialism and colonialism to ensure world peace are widely acknowledged. Indonesia had the active support of India in her fight for independence. India's sympathy with the nationalist movement in the whole Arab world, including Africa, is equally widely appreciated. But, as the threat of "collective colonialism" grows, it becomes necessary for India to intensify her efforts to eradicate colonialism. There is no possible source of conflict of interest between India, or any other south-east Asian country, and the Arab world. On the Suez Canal crisis, Egypt has the solid support and sympathy of India, Ceylon and Indonesia. Membership of the Commonwealth, of India, or of any other south-east Asian country, can be no bar to her friendship or alliance with Egypt, or with any other Arab country. India and those other Commonwealth members who are also Bandung nations have both a responsibility and an opportunity to act as mediators in the Canal dispute between Egypt and the Western Powers. Since the start of the Suez Canal crisis, New Delhi has made efforts to reach a negotiated solution. These efforts are as much appreciated in London and Washington as in Cairo. During the debate in the Security Council on the Canal crisis, India will have further opportunities to act as a bridge between the two sides. She faces no dilemma, as insinuated in some quarters, but is confronted with the most delicate diplomatic mission since her emergence as a free nation. There will be hope that India, in co-operation with like-minded nations, will succeed in her efforts to reach a negotiated solution of the crisis.

Weekly Notes

Coal, Steel and Engineering Industries

THERE was a serious error in the comment on Lala Sri Ram's speech at the last Annual General Meeting of Jay Engineering Works which appeared in the issue of September 22 under the caption "Export of Engineering Goods". What Lala Shri Ram had actually said was that "there is room for considerable increase in the export of general engineering goods". In fact, the whole of his speech reflected this sentiment and so did the note, which detailed the steps which could help the exports of such goods e.g. supply of steel at lower prices and improvement in the quality of pig iron and hard coke supplied to engineering industries. But an unfortunate slip crept into the line as it was printed and Lala Shri Ram was credited with the opinion that "there was 'no' considerable scope for expanding the export" of these goods. The intrusion of a negative was an unfortunate accident.

Lala Shri Ram also voiced on this occasion the universal complaint of all exporters of manufactured products viz the difficulty of getting draw back of customs duty. If this is the experience of his company, the plight of the smaller fry who cannot afford to run up to Delhi every now and then and maintain contacts at the top levels can well be imagined. As rightly suggested by him, it should certainly be possible to devise a simple procedure, on an ad hoc basis, which would remove the present hardship of the exporters. In fact, some time ago, the Commerce Minister himself expressed surprise that so few of the exporters came forward to ask for the refund to which they were entitled. He should have known what was the reason for it.

As Lala Shri Ram was more concerned with supply of steel at the retention price paid to the Indian producers which is still considerably lower than the pool price, he did not dilate on the difficulties which are now being experienced by engineering industries in Calcutta and Bombay after the equalisation of the price of steel at all rail heads. At the time when he spoke, the possibility of uniform prices being extended to coal which would mean higher prices for another major raw material of the engineering industries where they happen to be concentrated, was not looming large on the horizon. A Calcutta correspondent, annoyed that this threat should have been treated as a joke in the editorial which appeared last week with the 'flippant' title, "Why not free transport?" writes:

> "One can understand New Delhi's anxiety. Coal is a basic raw material, and certainly anything that could reduce its price in centres far removed from the collieries would eliminate one of the underlying obstacles to industrial development in such areas. But, and this is vital, is there no way of achieving this other than by dislocating seriously the economies of the numerous industries which buy coal within a short distance from where it is raised?"

These are only the primary effects. A series of secondary chain actions will follow.

Finally, the correspondent twits us for not quoting Shri D C Driver in full. For Shri Driver had not only drawn attention to the heavy blow struck by higher prices of steel to the engineering industry in West Bengal, he had also asked in despair:

"Will the Central Government in line with its policy to decentralise industries and reduce disparities in the levels of development between different States, equalise the price of cotton all over India at rail heads so that the States of Madras and Bombay will pay more for their cotton and Bengal will pay less?

"If Government cannot consider this logical outcome of their policy, such discrimination against Bengal that her gainful industries like the engineering industry should suffer by Delhi's price equalisation policy but her weak industries like cotton textile should be denied its benefit hurts Bengal and makes her suspicious.

"With the jute and engineering industries deprived of the natural advantages by act of Government and its cotton textile industry enfeebled by high price of cotton, the only hope for Bengal is to nurture the chemical industry based on coal.

"There is only one hope, and that hope is the Raniganj coalfield, its development and the processing of its coal into raw materials for a great chemical industry."

That hope will vanish if coal costs the same in the coalfields of Jharia or Raniganj and in Bombay or Ahmedabad.

Uneasy Coalition

BY an overwhelming majority, the East Pakistan Assembly has voted for a joint electorate. Soon, the Pakistan National Assembly will be in session in Dacca. Judging from press reports, Mir Abdul Quaiyum, Secretary-General of the Republican Party, has made it clear that Lahore will insist on separate electorates. If necessary, the Republican Party, will co-operate with the Muslim League to defeat the Awami League plan for joint electorates. In combination, the Republican Party, the Muslim League and the Nizam-e-Islam party can be sure of a majority in the National Assembly. Mir Abdul Quaiyum has hinted that Mr Suhrawardy remained at the mercy of his Party. Dr Khan Sahib, the Party President, has disowned the sentiments expressed by the Secretary-General of his party. But it becomes increasingly obvious that the Republican Party is manoeuvring to become the Party in power.

An analysis of the numerical strength of parties in Pakistan suggests that the situation is likely to remain delicate. Except on the issue of the system of elections, there is no point of agreement between the Republican Party and the Muslim League. These two parties can combine to oust Mr Suhrawardy from power. But a united front between these two parties is not likely. It is easier to visualise a united front between the Awami League and the United Front. On the major political issues, such a coalition is likely to be supported by the minority political interests as well as by politically conscious elements.

Shaheed Suhrawardy is adept in party politics. But the relative numerical strength of political parties and popular combinations is such as to perpetuate political instability in Pakistan. There will, however, be hope that a progressive single party or a combination of progressive parties will emerge out of the elections to fill the political gap created by the eclipse of the Muslim League.

Return of the Saar

RE-INCORPORATION of the Saar into Germany was a foregone conclusion. This rich territory has been in dispute between France and Germany throughout modern history. Its alliance has been a source of irritation between the two countries. But the Saarlanders have never shown any doubt that their affinity is with Germany. They do not favour either an autonomous status or incorporation with France. Last October, a referendum was held in the Saar. It rejected the proposed statute for Europeanisation of the territory. In January last, the Saar Parliament voted decisively in favour of political and economic integration with Germany. France and West Germany started negotiations about the future of the Saar. Agreement has now been reached for the return of the Saar to Germany. Both Bonn and Paris have expressed hopes that the return of the Saar to Germany will further cordial relations between the two countries.

Conditions to-day are different from those prevailing in 1935. Then, the Nazis exploited the Saar plebiscite as a symbol of militant German nationalism. No such fears are now entertained by France, as NATO and EDC are guarantees against any revival of German militarism. Return of the Saar to Germany will mean some economic loss to France. But France has been assured of coal from the Saar. With the European steel pool in operation, the Saar's steel reserves are not likely to cause any worry to France.

Tobacco Excise and Cigarettes

IF people in Britain did not smoke or drink, it is hard to imagine how the Government would manage to meet its expenditure, so intimately has the revenue system been associated with the taxes on tobacco and spirits for generations. Drink is out from reckoning in the Indian tax system, without even so much as by your leave from the Finance Minister. Tobacco, however, occupies a position in the Indian economy which does not enable it to be used so readily as a major prop of the Indian tax system. The Taxation Enquiry Committee (1924-25) was struck by the fact that though the use of tobacco in India was even more widespread than in many of the countries in which it was one of the main props of the tax system, it had not been subjected to any internal taxation whatsoever. Indeed, the Committee found that the lack of reliance on this tax, which could be borne so easily was the feature which distinguished the fiscal system of India from those of most other civilized countries.

Tax on tobacco is not open to the usual objections against indirect taxes but there are other difficulties. For the very reason that the use of tobacco is so widespread, its end uses are so many—tobacco can be made into cigars, cigarettes or bidis; it can be smoked in hookhas; it can be chewed. Though different varieties of tobacco are particularly suited for these different uses, the possible range of substitution among them makes it difficult to charge different rates for different types of tobacco without the risk of the varieties being shifted to other uses. This alone calls for very fine adjustment of rates. But the situation is further complicated because India also happens to be one of the largest growers of tobacco and a sizeable exporter. The necessity of maintaining exports and of relating the duty to fluctuating prices makes the adjustment of rates of tax extremely complex.

Well, those days have passed, the Central Excise on tobacco has proved a fairly productive source of revenue. It was not until the war, however that the excise duty was was imposed on tobacco. In the first year of the duty 1943-44, the revenue collected was Rs. 9.65 crores. In the very next year, the rates of duty were raised and collection jumped to Rs. 20.82 crores. And it went on rising until Rs 35.39 crores were collected in 1951-52. Then there was a slight decline, following the general recession of 1952. This illustrates another aspect of tobacco duty; in the absence of any change in duty, fluctuations of revenue from this source are a good index of sales and of money incomes in the country. The collections of 1951-52 remains a peak. Another peak seems to be in the offing, judging from the increasing sales of cigarettes, to which the Chairman of the Imperial Tobacco Company referred in his address at the Annual General Meeting of the Company last week. The point that the Chairman seems to make, though he does not say so in so many words, is that taxing tobacco is a specialist's job to which manufacturers of cigarettes have a valuable contribution to make. He concedes the right of a Government to tax tobacco and its products and suggests that his company and the Government have a common interest in developing it into a sound revenue producing source, which should not be damaged. And it can be damaged permanently, if due attention is not paid to the incidence of this tax on different types of tobacco and grades of products.

Mopping Up Excess Income

EXCISE DUTY on cigarettes, graduated according to quality and price, is a most civilized manner of painless extraction of income from consumers and it could be made to yield the most, if the principles of scientific extraction are followed carefully. Too many changes are bad and the tax has to be adjusted to the buying habits of the people which follow a fairly stable pattern. A high proportion of the sale of cigarettes, for instance, is in the form of a single cigarette for a single coin. The scale of duties has to be adjusted to these habits, the strength of which is the basis of taxability. Growth of demand, however, observed everywhere in the consumption of habit forming commodities like tobacco is a factor that operates by itself. And its effect has to be eliminated, before one can judge the effect of other factors e.g. variations in duty or money incomes, on revenue from this source.

From the expanding volume of sales reported by Imperial Tobacco, despite recent increases in duty, the inference is not unwarranted that barring the general growth factor demand for cigarettes is income elastic rather than price elastic. But a priori deductions are of very little use and the Chairman's suggestion that experience of manufacturers like the Imperial Tobacco should be drawn upon for devising changes in the tax on tobacco can be endorsed without reservation. Unfortunately, central excise is not the only tax on tobacco; much greater complications are created by sales taxes, the varying rates of these taxes imposed by the States and the different conditions attaching to them. A greater uniformity is desirable in the case of all sales taxes, but in a vital revenue earning item like the tax on tobacco, its utility can hardly be exaggerated, if its full potentialities are to be exploited. With increasing money incomes and threat of inflationary pressures, this convenient and highly effective device for mopping up excess purchasing power certainly needs to be exploited much more fully than has been attempted so far.

Letters to the Editor

The Warp of Ideology
—In a Punjab Village

I HAVE read the article "The Warp of Ideology" by R K Hazari which appeared in your issue of August 18 carefully. Barring certain details about counts, I have followed the line of reasoning in this article in the light of my personal experience in my village in Ludhiana and find myself in full agreement with the views expressed. I have been making attempts to introduce hand spinning in my village and the surrounding areas with help of Gram Sevaks lent to me by the Kasturba Trust. These attempts failed mainly because the earnings per day did not come up to the expectations of the poor spinners. We have had also to face many other difficulties such as non-availability of charkhas, supply of cotton and irregularities in the matter of working of the spinners. Not a single male came forward to spin or could spin. They take it as below their self-respect to spin. And women would spin only when they have time. This they can never easily find. They have to cook, bring up children and also do the menial services for the cattle which are a necessary part of the family duties. To make two ends meet, they would go out for pickings in the fields during the wheat and cotton harvests, collect fuel and assist the males in harvesting the crop, and finding grass and fodder for the cattle. My personal observation is that they are very much overworked and if and when they find time, they are much more interested in their cattle than in the Charkha.

One evening while I was sitting at the fountains near the Mahatma Gandhi statue on the Mall, during a recent visit to Patiala, there was a woman sitting close to me persuading some other women to join the Ambar Charkha Centre. I also talked to her and asked her to show me the women of her Centre. Next day I went to her and saw about half a dozen Ambar Charkhas at work. The old women and some girls who were learning were finding it difficult to ply the Charkha and to spin the yarn without a break. They could not even make hanks of cotton with ease. The Lady Worker told me that in spite of the allowance offered and free distribution of milk powder to attract them, sufficient number of women were not coming forward to learn this art. I came back greatly disappointed and my belief, which had already been shaken by my experiences in the past, was further weakened and I am almost convinced that investments on a large scale to make this venture a success in the commercial field would be a complete waste.

As a household hobby or a side occupation, charkha may have some value but it cannot supply national needs or compete with textile mills. When people go to the market, they want the best of materials and the maximum value for their money and not one in a thousand would buy an inferior stuff or an unattractive product.

"Statistics in the Plural"

WE have read with much interest your note on 'Statistics in the Plural' published in your Journal 'Economic Weekly', Volume VIII—No. 37, of September 15, 1956.

We find you have quoted the statistics published in our Texprocil Bulletin and we draw your attention to your statement which reads as follows:

"But what about rows 3 and 4 (3 and 4 relate to Texprocil Statistics) they both relate to Bombay Port only and are in excess of the all-India totals. A possible explanation may be that these figures are for the cotton piecegoods passed for shipment".

In row 4 you have mentioned these figures as passed for shipment, then there is no need of a possible explanation which is clear. In row 3 these figures relate to exports from Bombay Port as published in the daily Trade List issued by Bombay Custom Authorities and they are distinctly different from the figures relating to those passed for shipment.

This Council, no doubt, publishes statistical information in respect of cotton textiles exports for the benefit of trade and industry. In order to do so this Council collects various statistical information primarily collected by the Government Agencies as you are already aware of. Perhaps you have noticed that in our Bulletins we invariably mention the source from which these statistics are collected. However, we thank you very much for bringing out this apparent anomaly in our export statistics for cotton textiles on the surface through your valued Journal.

P Nagersheth,
Secretary,
The Cotton Textiles Export Promotion Council.

Cecil Court,
26, Lansdowne Road,
Apollo Bunder,
Bombay-1.
October 1, 1956

[Figures of cloth passed for shipment are certainly "distinctly different" from those which "relate to exports". That is why they were shown in two separate rows. But where do we go from here? Are we to understand that the Cotton Textiles Export Promotion Council still regards this anomaly as "apparent" and not real, though we are thanked for bringing it out "on the surface"? In his otherwise illuminating analysis "Pattern of India's Export Trade in Cotton Textiles" in 1955, Shri P K Bhaumik, Statistical Officer of the Council, takes through the highly inflated figures of cloth export issued by the Jt Controller of Exports (Texprocil Bulletin, April 5, 1956, page 1). So does Shri Neville N Wadia, Chairman, in his presidential address to the Annual General Meeting of the Council (Texprocil Bulletin, August 1, 1956, page 1).

Why they do so, is not explained. Perhaps Government communications are not intended to communicate and Government agencies merely pass on what others collect; it is none of their business to look into what they pass on.—Ed.]

Our Delhi letter

Manufacture of Raw Film

A CONTRACT is about to be signed for technical collaboration between the Government of India and the East German firm of Agfa for setting up a film producing plant at Ootacamund. This would conclude the long-drawn negotiations between New Delhi and East Berlin on a project which would fill a glaring gap in the industrial map of the country. The Governments of U P and Mysore have been interested in the scheme for some time but, since film manufacture requires a high degree of technical competence, the Central Government has been curbing their enthusiasm. Preliminary talks on the venture were held with a number of European film manufacturers when Shri L K Jha, Managing Director of National Industrial Development Corporation, visited the continent last year. At one stage, even the Japanese entrepreneurs appeared to be interested. The project however made considerable headway when Mr Gerhard Weiss, Deputy Minister of Trade and Leader of East German Trade Delegation visited New Delhi during the Indian Industries Fair. Shortly afterwards, a team of experts, including Dr Eugen Guehring, Chief Chemist, and Mr Kurt-Dreschler, Chief Designer, Agfa Wolfen Film Factory, and Mr Werner Pholand, Engineer to the Ministry of Chemical Industry, Berlin, arrived in India to survey possible sites. They looked for comparatively cold climate, dust-free atmosphere and proximity to plentiful supply of skilled labour and cellulose-yielding quality woods. From all points of view, Ootacamund was the best choice.

Negotiations were finally clinched during the last tour of Shri H V R Ienger, Secretary of the Ministry of Commerce and Industry, when he visited the Agfa factory in East Germany. It was proposed that the Ooty plant should to begin with, confine itself to the manufacture of films for the Indian cinema industry, reputedly the second biggest in the world. Special films for still cameras and colour photography would continue to be imported. India has 3,000 cinemas, 350 film producing units and 44 studios. The country consumes about 200 million feet of raw film per year. The raw film imports cost the country about Rs 2 crores a year. The proposed factory will have an annual capacity for the manufacture of 150 million feet of film. It will take 3 years to construct. The plant may cost Rs 5½ crores but the chances are that the price of the "turn key" job may be reduced during the final phase of negotiations with the East German Government.

Copper Mining Project

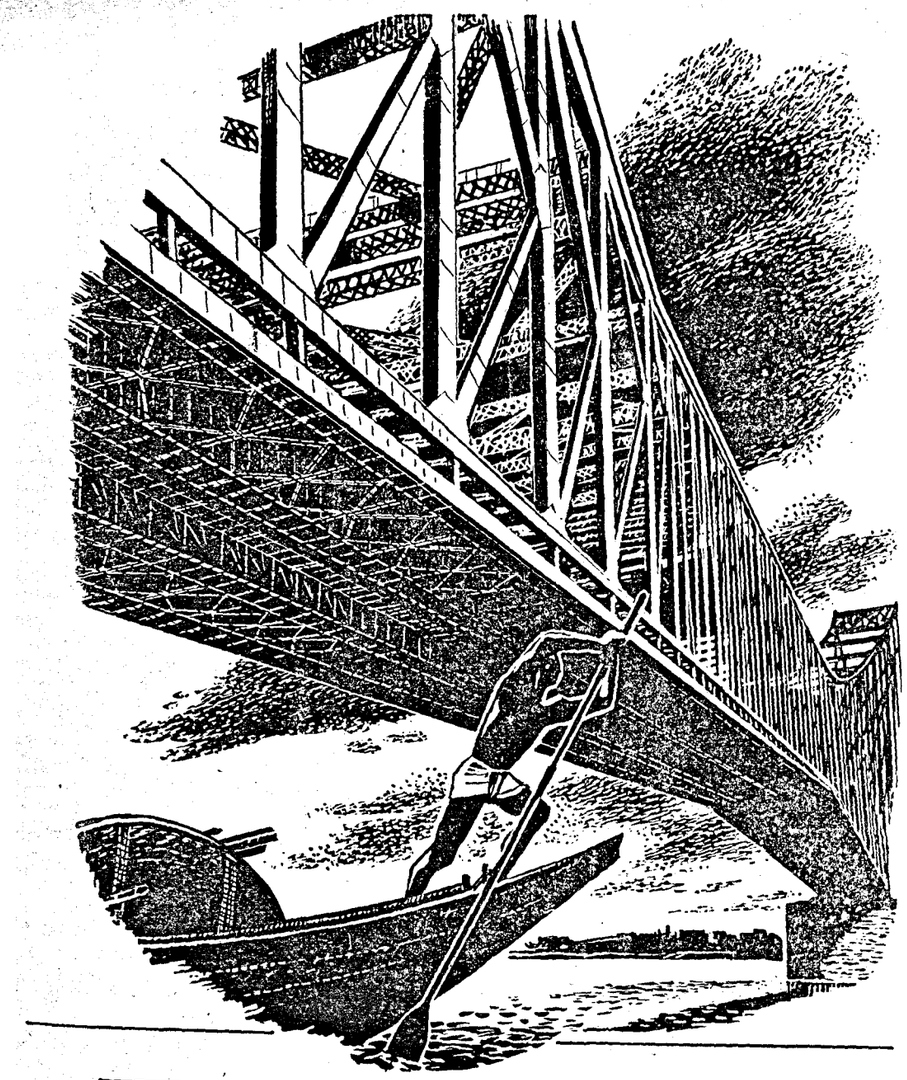
The Government of India is considering the establishment of a copper mining project in the public sector. The Minister for NRSR Shri K D Malaviya, announced in Parliament last April that a copper mine may be nationalised. Shortly afterwards, the Government stated that there was no intention to take over the Indian Copper Corporation. This British-owned concern is working three mines at Badia, Mosabani and Surala in the Singhbhum Dist. The Corporation has an issued capital of £914,000. Its annual production in 1955 amounted to 3,95,415 tons of ore and 7,281 tons of metal. While the development of other copper deposits in the Singhbhum district is contemplated—the Indian Bureau of Mines is already engaged in exploratory work in the area—the Government of India is thinking of opening a mine on its own in Khetri near Jaipur.

Khetri is held on a mining lease by Messers Jaipur Mining Corporation, Ltd. The concession which began in February, 1949, is valid for 60 years. The Geological Survey of India has undertaken a certain amount of pitting, trenching and drilling in the area. The team of Russian experts which visited India recently estimated that the Khetri copper belt contains ore reserves of 50 million tons with a metal content of one per cent. This means that about 500,000 tons of copper can be extracted from the Khetri deposits. The Ministries of N R S R and Law are discussing the termination of the lease of Messers Jaipur Mining Corporation and floatation of a state-owned company to take over the lease.

Russian Planes for Indian Airlines

The purchase of 6 Ilyushin aircraft by the Government of India is baulked by the inability of the Russians to furnish reliable data on the subject of maintainance costs. It appears that the Indian Airlines Corporation is not very enthusiastic about the deal. The machines have proved to be technically sound; compared to the Dakotas, the Ilyushins have certain definite advantages, such as higher speed and the ability to reach a greater altitude with a bigger load. But the I A C believes that the trouble and expense of setting up separate servicing units for a small number of aircraft may not be worthwhile. People may like to save an hour or so in the flying time from Bombay to Delhi but not at the expense of a 50 percent increase in fares.

According to the Russians, after normal operation for a period of six months, the engines of Ilyushins should be entirely changed. Such drastic overhauls have not been effected even in the U S S R but the Russians seem to be keen that their product should not get a bad name in India.



"One has no protecting power save prudence."

Juvenal.

A European Custom's Union

THE drive towards the creation of a West European Custom's Union including Britain is gathering a new momentum. In Paris, for the first time, British experts are actively co-operating with OEEC officials in working out the details of "common market", and on October 10th there is scheduled to take place a crucial meeting of Ministers from the six "common market" countries at which the establishment of a free trade area between France, Western Germany, Italy, Belgium-Luxembourg, Holland and the UK will be discussed and if possible for an agreement, on principles, to be reached. In the meantime the Treasury has called for the views of the Trades Union Congress and the Federation of British Industries and there can be little doubt that the opinion of the Commonwealth countries is now being canvassed. By the end of the year, it is hoped, the OEEC working party will have completed its work and submit a draft treaty for acceptance by each of the six countries concerned.

The creation of a West European free trade area has been given a new impetus by the present international situation. The strengthening of the **Entente Cordiale** following Sir Anthony Eden's Paris visit and the announcement of a forthcoming State visit to France brings the United Kingdom more closely to the problems of the European continent. The problems in the Middle East too have some relevance. Dr Adenauer when in Brussels last week made certain thoughtful comments on the future role of European countries in world affairs. He suggested that the existence of "European States" did not provide the basis for the "continued fulfilment of Europe's destiny". There have emerged during the past 10 years, according to his estimation, new nation states like India and China which together with the Russian and American giants "swamped the separate European states". The Suez crisis have shown how ineffective was the Western European (divided as it was) role when the giants believed or pursued policies that were different. He therefore drew the conclusion that renewed efforts at European integration be made. It may be possible that Britain is, for once, coming round to give a more visible appreciation of this estimation.

The idea of a European Custom's Union is by no means a new one. Ever since the days of Marshall Aid in 1948, the idea has been canvassed but all along the policies of the UK have been the biggest stumbling block on the way to its realisation. Even when a partial common market was established in the nature of the Coal and Steel Community, this achievement was of limited consequence in view of the absence (within the community) of one of the principal coal and steel producer and user. The British policy hitherto (and may be now) took more the character of a dilemma than anything else. The UK hesitated to include herself as an integral part of Europe fearing that this might endanger her impartial interests. At the same time she showed little wish to see an integrated Europe formed without her participation. In a word the British dilemma was as a Latin poet put it: 'nec mecum, nec sine me'. It may now very well be that the dilemma has been resolved by the inexorable forces which have been at work to produce the current international situation. It is reported that the IMF Conference at Washington is being used as an opportunity for a meeting of Commonwealth Finance Ministers at which this new view will be presented and discussed.

The absolute economic arguments favouring a custom's union are overwhelming. It will contribute to the achievement of a higher level of industrial and commercial specialisation, to a levelling of living standards in the free trade area and to an increase in trade. The gains from trade will thus be considerable. These arguments however require some application to the European scene. And here a number of difficulties exist (though it must be said that some of the arguments are invalidated thereby). As your correspondent sees the European economic situation, some six crucial difficulties exist against the creation of a European common market. The first two are primarily political and concern, the well known reluctance of European Governments to renounce their sovereign rights and the British attitude as examined above.

The third difficulty is offered by the absence of any marked degree of complementarity among the six West European economies. There can be found a whole range of economic activities in which the countries concerned are competitive to each other and it is certain that in at least one of these fields i.e. agricultural products, an exception will have to be made in any planned custom's union. The classicists will argue that where production costs do not differ widely between countries it may still be possible for some gains from trade to take place —the tendency for each country to specialise in activities to which it is best suited may offset any losses that arise from the existence of competitive industries. In reality the employment of large slices of the working population in these competitive industries may make it difficult for any European Government to agree to a full-scale custom's union.

A fourth difficulty arises from the firm possibility that a West European Custom's Union may not solve the balance of payments problem of any of the union countries. Any European union must still depend greatly on raw material imports from non-European sources. And the balancing of these imports can only occur by a corresponding value of exports the nature of which is made uncertain when the Union portends a greater commodity specialisation—a type of specialisation which need not necessarily correspond with the import demands of the non-European world. This is certainly a real long term difficulty.

The fifth difficulty is found in the already complex economic structure of each of the six European countries concerned. The integration of countries with already diversified economies—at once, agricultural, commercial and industrial—is difficult. Many supporters of a Custom's Union claim that the integration of the states that led to the formation of the United States and the establishment of the German Zollverein in the 19th century contributing to the formation of a German state are pertinent examples to follow. But the example is out of date: the structure of European eco-

nomies in this second half of the 20th century is very different to that of earlier times.

The sixth difficulty is a general one. The period since 1930 has witnessed a process of diversification and disintegration of the international economy. National policies have tended to emphasise differences and there has correspondingly developed an ever increasing share of the state in economic matters.

These difficulties have often been raised in European discussions but little is said on how these could be resolved. The OEEC working party are however experts and their forthcoming draft treaty will no doubt reflect a consciousness of these difficulties. It is not easy to see how in the face of the foregoing problems a complete union can be set up. It may very well be that a certain partial or sectional customs union is visualized in the hope that, once Britain becomes involved, other sectors of the European economy can gradually be included in the free trade area. In this way Britain may not have to face the unenvious task of indulging in a wholesale dismantling of imperial preferences. Indeed, a complete European Custom's Union looks very much like the Confucian Gods: "....They may be respected as long as they are kept at a distance".

Lockheed—IBM Machine To Write Books

HIGH level thinkers at Lockheed Aircraft Corporation have taught an electronic accounting machine to write a book—not just any old book—but the vital maintenance and spare parts catalogues which are required for each airplane built.

Responding to the military service's call for faster ways of incorporating latest technical data in the manuals, the Lockheed specialists devised a new method of using IBM punched cards. About the size of two playing cards, the punched pasteboards replace an old method of writing the books on the Varityper, a big brother to the office typewriter, which was so slow that outmoded information frequently crept into the manuals.

Besides permitting additions, deletions and revisions at the last minute, the tab method also reduces composition costs by 80 percent, according to D S Stevenson, spare parts division manager. A typical Varitype page costs $ 25.00. The punch-card page costs about $ 5.00.

An operator punches the necessary information into a series of cards. The IBM machine then shuffles and deals the cards, sorting them into correct order and reproducing their contents on paged sheets. Revisions at the last minute? Just punch a card. The machine does the rest fast.

The final sheets are photographed, and, from the negatives, the book is printed by offset press.

Catalogues for all the latest Lockheed airplanes are being written by the tab method, including the F-104 Starfighter, the world's fastest combat airplane; the T2V-I SeaStar, Navy carrier-based jet trainer; 1649A Super Constellation, world's longest range transport; and the new propjet Electra, America's first turboprop airliner.

A Calcutta Diary

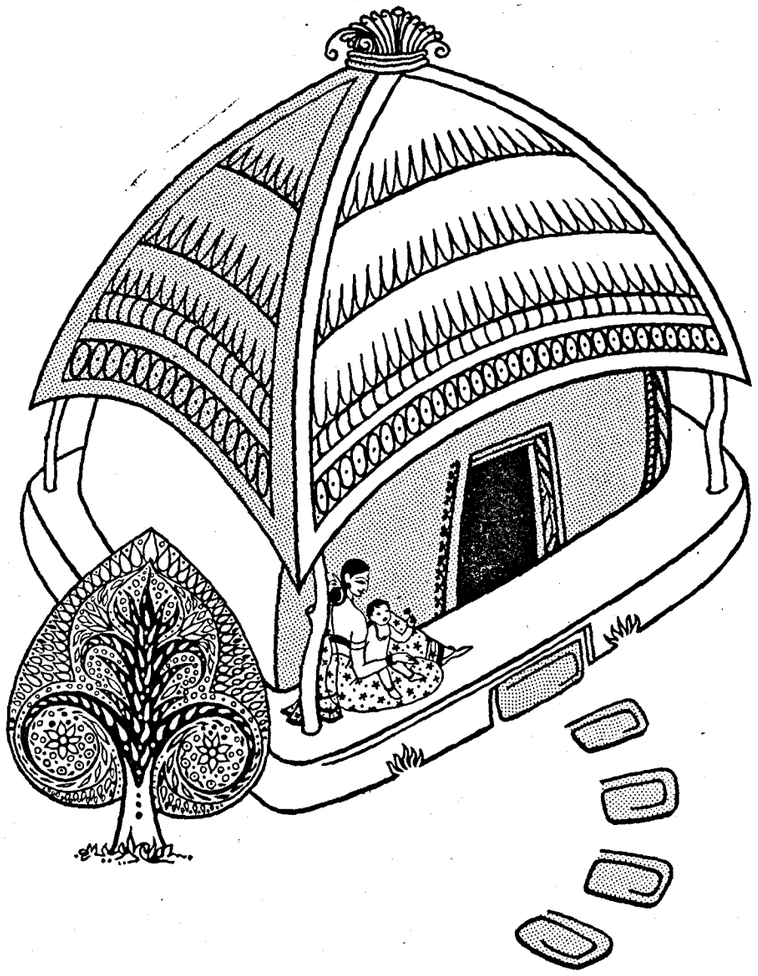
This Frankenstein ...

THE Relief and Rehabilitation Department of the Government of West Bengal has provided an easy target to anyone who wanted to fill up a column or secure a vote. Actually, it has become an old chestnut. A report of the activities of this Department from 1946 to date reveals that during the course of the years, 30,92,944 displaced persons have found their way into this State. From 1952 to July 1956, the number that has sought refuge is 5,75,480. The machinery of the State had to be geared to receive and accommodate these persons and devise ways and means to rehabilitate them.

The problem of rehabilitation will baffle anyone who pauses to give it some thought and plan for the future. With a population density of about 800 per sq mile, the immensity of the task becomes apparent. In addition notice has to be taken of the fact that the majority, and that is 90 per cent, have had no previous training in any vocation or calling except tilling the land. To train and equip even a small percentage of these people, to find them suitable employment in industry and commerce raises big issues. It must be stated at the beginning that assistance, advice and help from the industrialists in solving the problem, has been negligible. The number that has been absorbed in factories and industrial undertakings comes to a bare 28,000. The weavers started out well but with the control on yarn, they never managed to get regular supplies and had to find alternate ways of livelihood. The table showing figures of employment gives the number of teachers, in government sponsored schools, and colleges as 10,000. The total number employed in other categories including the teachers comes to about 90,000 out of a total influx of 31 lakhs!

What has been lacking is a constructive approach. The State government and the centre, seemed to have forgotten one important factor in dealing with millions that is discipline. These refugees have been pampered to a degree when they feel that it is the duty of the Government not merely to feed and clothe them but also to find them employment where there will be no competition—they insist on reserved categories in every walk of life. The Government has given in on all these points and now no industrialist dare employ refugees for fear of their paralysing the entire machinery. The refugees refuse to go outside the state, they refuse to work hard and inspite of all high flaunting praise to the contrary about the willingness of refugees to work and all that, it is time it was fully realised that they are pretty useless. But so is clay, unless it is moulded and shaped.

The Government after years of pampering and giving in to all demands, now finds that it cannot manage this Frankenstein of its own creation. Don't let us be bluffed and misled by figures, which by themselves are most impressive. The amount spent by the Rehabilitation Department since its inception totals to date Rs 68,97.29 lakhs. During the financial year 1954-55, the amount disbursed was Rs 10,40.58 lakhs and for 1955-56 the budget is 18,53.50 lakhs. When one comes to think that the annual expenditure under this head is equal to the total revenue of some States, one can gauge the vastness of the issues involved.



Yet a large percentage of those that moved into West Bengal has not sought or taken any governmental aid. The Government figures show that rehabilitation benefits or assistance in some form or other has been given to 19.80 lakhs persons. The only tragedy is that this figure is not correct. The people receiving aid in the shape of agricultural land, house building loans, built houses, business loans are not all rehabilitated. The actual percentage that have been rehabilitated in the sense that they are capable of earning a livelihood, is small. Some subsist, others manage to wheedle extra loans or doles and the exact figures of such persons are not easily available. The purpose of this diary is not to blame anyone in particular but to appeal to the Government, both Centre and State, and to the public at large to set about the business in a thorough and business-like manner, without wasting pity or sentiment and make decisions and see that they are carried out.

The snag lies there, the decisions are never fully implemented and the fault lies with the attitude of those in power, who are always willing and eager to relax the rules for reasons best known to them. They are more concerned with doing small favours to individuals and forgetting the bigger issues involved. If anyone does not want to live outside Calcutta but is in a scheme that involves such movement, let him approach someone in power and lo and behold, it is done! These relaxations are made every hour of the day in every scheme. Somewhere, someone seems scared. There are bigger issues involved. The department is still manned by temporary officers who have worked for almost ten years and are yet not sure of the future. This psychological uncertainly does more harm than is realised and the Department is overrun with frustrated workers who realise and see that other political peddlers get the better of them. It is understood that the present Minister for Relief and Rehabilitation has promised that all who worked well would find permanent berths but these are promises that are not so readily kept.

One has to think in terms of the future and this has not been done. Why is it not possible to insist on the millowners in West Bengal to absorb a certain percentage of the refugees and train them for future employment? This source has never been tapped, instead there are projects of starting new industries in refugee areas. These projects will take time while the existing mills can certainly absorb a large portion of unskilled and semi-skilled labour. This can only be brought about by the Government.

It is understood that Dr Roy has already addressed the industrialists to employ Bengalis but that does not ease the situation. It has to be seen through and not padded with statistics of employment. Concerted action is required but there are no signs of this to date. Bengal has suffered another set-back with the recent floods and though the exact numbers that have been rendered homeless are not yet available, the figures already put out in the newspapers, are staggering. Courage and straight thinking can do something but these are not to be seen. So it will go on, for goodness knows how many years, providing material and jibes to all that want to make a cause of it.

—Narad

A roof over our heads—a place to rest, to shelter our families from the heat of the sun, from cold winds and driving rain—that is what we all need. Like food, a home is a basic necessity common to peoples of all countries.

A happy home, cherished by everyone, is founded on the common aims and efforts of all members of the family. In India today, a new outlook is born in the family—an outlook devoted to progress. Rapid industrialization is bringing about more employment, a higher standard of living, and more and better homes.

A constant supply of our petroleum products to fast developing industries is vital to this progress.

Larger Yield in the Community Development Areas?

Rabi Crop Estimate Survey 1954-55—A Report on the Community Project and National Extension Service Areas. By the Directorate of National Sample Survey, issued by the Community Projects Administration, Government of India.

Reviewed by **B H Joshi**

OVER-FULFILMENT of the target for food production during the First Plan period has given rise to much speculation. Widely divergent views have been expressed regarding the role of favourable monsoons and the effectiveness of the measures for agricultural development in realizing these higher levels of output. It is not possible to estimate directly the increase in production due to implementation of agricultural programmes independent of the influence of favourable monsoons. But a comparative study of yields in similar regions with different rates of outlay per acre over a series of years can be of great value in ascertaining the contribution of various developmental measures to higher production.

A survey on these lines has been carried out in the Community Development areas under the guidance of the Directorate of National Sample Survey for estimating yield rates of principal rabi crops in 1954-55. The survey was spread over 14 States of the Union covering 36 Community Project Blocks (C P) allotted in 1952-53, 24 Community Development Blocks (C D B) allotted in 1953-54, and 74 National Extension Service Blocks (N E S) allotted in 1953-54. The sample thus included, in all, 134 blocks, out of a total of 291 blocks. Altogether, 6,110 crop-cutting experiments were planned of which 2,953 were for wheat, 770 for barley, 2,141 for gram and 246 for rabi-jowar. The results of the survey were compared with the average yields of the districts in which the sample blocks were situated. The table below gives a summary of the important results.

The above results would not have attracted much attention but for the controversy raging over the adequacy of the targets for food production for the Second Five-Year Plan. As a compromise between a 40% increase in food production suggested by Mr Nehru, and 15% increase as originally provided in the Plan, the Agriculture Ministers gathered at the Mussorie Conference have decided upon an increase of 25% in food production. When the planning for consumption goods is production potential-oriented, the coincidence between the target fixed at Mussorie and the results of this survey in the C D P and NES regions do not appear to be merely accidental.

The consolidated figures for all the three development regions, show (last row of the table) in general, a 25% increase in yields of rabi crops. There is, however, a great divergence in the percentage increases in yields in the three types of development blocks. For instance, the increase in yield of gram and barley in the Community Development block is very much more than the increase in the Community Project blocks. When subjected to test of significance, the yield rate for gram in the latter is found to be significantly lower than either of the other two. This only shows that the increase in yields is not always commensurate with the increase in total outlay per acre. The only explanation for this apparent contradiction can be either that an inappropriate set of weights were assigned in the preparation of the survey estimates or bias in sampling or a non-optimal utilisation of resources.

The authors of the Report are good enough to have pointed out the serious limitations of the survey. Among these are a large degree of non-response, and the lack of adequate supervision. Only about 62.4 percent of the total number of crop-cutting experiments initially planned were actually carried out. Much of the success of crop-cutting surveys depends upon timely arrangements which, unfortunately, the project administrative machinery was slow to realise. The lack of co-operation between the revenue and project administrations has also detracted from the value of the results. A serious non-response cannot but affect the representative character of the estimates. The data obtained as well might not be wholly reliable, because of inadequate supervision of the field work by the block officers. But the most important shortcoming of all is that the set of weights used in preparing the overall estimates was based on information obtained only from the sample blocks and not the entire population of blocks. When the average yield in the development areas have been found to vary from 607 lbs in Madhya Pradesh to 1386 lbs in PEPSU in the case of wheat, from 476 lbs in Madhya Pradesh to 1873 lbs in Punjab in the case of gram, and from 774 lbs in Bihar to 1214 lbs in Rajasthan in case of barley, unless an appropriate system of weightage, is chosen the findings of the survey may either greatly exaggerate or grossly underestimate the overall rise in yields. In view of the large regional variations, the data must be carefully sifted, together with proper regional adjustments, before the results can be utilized for gauging the production-potential of the country for food-grains.

Appleby Again

R Dwarkadas

DEAN PAUL APPLEBY, after three successive visits to India, is surely no novice on the subject of Indian Public Administration. He brings to bear on our problems the dispassionateness and impartiality of an outside observer. His technical competence, academic bent of mind and experience as a Director of the Bureau of Budget of New York State, make him eminently qualified to pass judgments on our administrative problems. Appleby is not one those Americans who either doubts the democratic character of our government or questions the necessity of our planning for economic development. As a matter of fact, he commends our Plans: "The two Five Year Plans have been brilliantly conceived in their analyses of needs and their balancing of values". If he has to say something harsh about our administrative machinery and methods, it is only to highlight the difficulties rather than from "American arrogance", as some of our parliamentarians thought mistakenly.

Frankly, some of the criticisms of the parliamentarians show either a lack of understanding of the problems of our administration or are motivated by extraneous political considerations. For too long we have been fed on illusions and myths; it is time we rationalized less and came to grips with facts. It is really hard for those who have been in the habit of making sweeping criticism, to appreciate the nuances and methods of administrative improvement. Besides, it is so easy to use the expert's strictures for partisan purposes; but, obviously, it needs an open mind, to be able to brush aside political affiliations and get down to the task of cleansing our administration and making it into a dynamic organization, suited to the requirements of speedy development.

Publicity and Terminology

It is unfortunate that Appleby should have said that his criticisms ought not to be made and and discussed publicly. This makes mystery out of an administration. The tendency of administrators to keep everything confidential and their allergy to publicity have contributed not a little to the prevalence of misconceptions in the public mind about administration. It is prudent not to be so secretive, particularly when the rank and file ought also to be conversant with the administrative system for its effective functioning.

We do not seem to have as yet recognized the value of terminology in public administration. Words like 'centralization' and 'decentralization', 'staff and line', 'companies and corporations' are not properly understood in terms of their local application. This calls for careful attempt at clarification of terminological usages.

Volte Face

Appleby discusses at length the concept of autonomy of nationalized ventures. In his first report, he emphasised the governmental character of public enterprises rather than their autonomy. It is refreshing to note that he now concedes that "advocacy of autonomy simply highlights the need to educate responsible top organs of government in the ordinances of self-denial which would restrict their intervention to really important concerns". Appleby also makes a **volte face** when he says that "There is no danger whatever that grants of power to Indian enterprises will be too great....the danger is that the government and parliament will be much too fearful and will grant insufficient 'autonomy'."

It is agreed on all hands that autonomy of public enterprises is destroyed if there is too much control over the day-to-day affairs of administration by Ministers and/or Parliament, but to draw the line where control should end is indeed very difficult. Post-war experience in Britain shows that ministers issue directives to public corporations for the purposes of policy-coordination. However, there is a difference between ministerial action for a coordinating policy and ministerial interference affecting the flexibility of public corporations. Dr John Matthai's resignation from the Chairmanship of the State Bank has highlighted the danger in ministers getting bogged down in details of administration of public corporations. Besides, an inquisitorial parliament may make public corporations more cautious and less action-minded. The qualities that ought to be stimulated in public corporations are initiative, drive and enthusiasm for action, rather than caution, circumspection and fear, which frustrate action. It is possible to devise methods and patterns of restraints whereby freedom of action is carefully blended with responsibility to democratic agencies. By and large, the considerations of greater delegation of responsibility, rapid decision-making and rapid action buttress the arguments in favour of strengthening the autonomy of public corporations. Perhaps, there is a clear case for a deeper examination of the questions involved in the accountability of nationalized industries and it may well be examined by a small expert commission.

Need for more Government

Appleby strikes at the heart of our problem when he says that while thinking is big about social objectives, the thinking is small about the government whose increasing size and complexity is the **sine qua non** for the translation of social objectives. He highlights this aspect in these impressive words: "What India needs more than anything else, what Parliament needs most, is more government by joint secretaries, more government by deputy secretaries, more government by under secretaries, more government by managing directors and their subordinates".

Decision-making and Delegation

Great social objectives imply more government, more government implies widening and deepening of hierarchy and proliferation of hierarchy implies delegation of responsibility. Appleby rebuts the view that greater delegation results in erosion of responsibility. Far from eroding responsibility, greater delegation strengthens it. It is not delegation, moreover, which will endanger the realization of public purposes, but small thinking, perfunctory application, concern for precedent, rupee-pinching, etc, which will most positively thwart public good.

High authorities, if they mean to function effectively, ought to concern themselves more and more with higher policy decisions. They have to achieve a 'new intellectual orientation' which will keep them tied to higher policy concerns of government, instead of frustrating their

effectiveness and utility by getting tangled in details of routine. Basically, there are levels of authority which ought to be matched with levels of responsibility. If each level keeps itself to its tasks, and respects the delegated pattern of governmental functioning, you get the government most suited to the complexities of modern age; but, if there is constant blurring and trenching of responsibility by incursions, specially from the top, there will be corrosion of responsibility with its concomitant, timidity of junior officials, who will shun taking decisions, which ought to be legitimately taken by them. This leads to the tendency of pushing smaller decisions to higher elevations of authority, with consequent danger of congestion of petty embroilments at higher levels. This not only destroys the capacity to take decisions at lower levels but also destroys the outlook of 'bigness' at higher levels. By not delegating responsibility, the higher levels get stunted and stymied by routine irrelevancies which leave little time to executives for larger concerns and policy issues. In other words, the conditions for effective decision-making at all levels, and the fruitfulness of delegation of responsibility, have to be clearly comprehended by administrators and politicians for ensuring success of the nation's developmental plans.

Performance of Parliament

These are some of the considerations which are at the back of his mind when Appleby indicts Parliamentary performance. He accepts the representative, policy-sanctioning role of Parliament. As a matter of fact, he, admires the debates on policy matters concerning legislative proposals. As for the performance of Parliament in relation to administration, he perceives a "negative approach". He says, "over and over again, cases of parliamentary criticism of small decisions made a year or two or three previously are used to explain the impossibility of taking expeditious action". Considering Parliament rightly as high-level, political, representative policy-sanctioning agency, he thinks that it ought to concern itself more and more to the manner and direction of action rather than with control of specific actions. He notes that there is a baseless fear that parliamentary responsibility is being undermined. Authorities, usually in their zest for expansion, transcend the limits of their capacities and concerns. This gets Parliament bogged down in details and particular actions.

There are other failings of Parliament also which need special mention:

(a) Parliament ought to give more attention to the development of good budgeting.

(b) Government proposals are too often and too rigorously examined and amended.

(c) Parliament's chief competitors are the States and not the Central Secretariat of which it always makes a bogey.

(d) It relies too much on the judgment of businessmen. "The business world is far from an ideal place from which to derive administrators of public enterprises". Parliament is too ready to concede the interests of narrow, small but influential business interests. This charge is pretty serious, coming as it does from an American!

(e) Parliament endorses the small and narrow approach of Public Service Commission, undermining thereby the responsibility of ministries. It ought to be developmental in its outlook in regard to personnel. Interference with or criticism of particular actions is not the mission of Parliament.

Positive Responsibility

The agitational role of Parliament pales into insignificance before the constructive, positive responsibility for large-scale operation of a dynamic government. There is, unfortunately, a growing volume of evidence to the effect that legislators trespass the boundaries of discretion, confuse and disturb the effectiveness of official decision-making and action, drive a wedge in the chain of administrative responsibility, invoke through partisan devices ministerial interventions which tend to destroy morale and promote partisan individual and business interests, even at times to the detriment of public welfare. In an earlier report Gorwala had made many references to glaring damaging cases of legislative and ministerial incursions in the Civil Service's sphere of discretion. The prejudices of the legislature against the Civil Services are well-known. It is time Parliament acted up to the advice of Appleby: "The simple way in which Parliament could reverse its influence on administration from a negative one to a positive one would be for it to stop looking for things to criticise and to begin looking for things to praise". Parliament has to learn much on Administration for the success of the nation's developmental plans. It must cease limiting the Civil Servants to the confines of 'rigid processes of colonial administration' and help make them creative tools of a developmental State.

The Role of Audit

By far the most important and severe of Appleby's criticisms is against Parliament's predilections to exaggerate the importance of the role of the Comptroller and Auditor General. Audit authorities in many parts of the world tend to arrogate to themselves powers which ought not to belong to them. Audit functions, more often than not, as if it were an end in itself. Audit is a means to good administration; it ought not to hamper the end product of administration, viz action.

Audit may be defined as "an examination made on behalf of a Principal of the transactions of an agent as recorded in an account". In this case, the principal is Parliament. Audit gives to parliamentarians a comforting and illusory sense of security. The scope of audit review shows a steady tendency to widen. Audit tends to substitute its determinations for those of operating officials on questions of fact as well as of law, involved in rulings on the availability of appropriations. The direct consequence of these tendencies is to draw attention to arguments over jurisdiction and to paper work about details handled at a point too remote from their programmatic origins, to the detriment of good management. It is not in India alone that audit tends to extend its scope unduly. An American expert, Mr Mansfield, writing on the powers of the Comptroller General of U S says: "the Comptroller-General's independence left a good deal of room within the interstices of the law for the expression of views on public policy to social and economic fields. Such expressions did not necessarily concide with prevailing attitudes to either the executive or the legislative branch". Mansfield, Harvey, C— The Comptroller General, Yale University Press, 1939. That is exactly what Appleby means when he says dramatically that. "Into the vaccum thus left, the auditor has moved".

Apart from repressive and negative influences of Audit, which are roundly condemned, the Comptroller and Auditor General's right to review administrative decisions is challenged. Appleby questions the competence of Auditor-General to appraise objectives and performance of administrators. "What is Cabinet for, what is Prime Minister for, what is Parliament for, what are the individual ministers for, what is a Secretariat for, and what is a bureaucracy for?". It has also to be noted, however, that nowhere has Appleby taken exception to the normal functions of the Comptroller General, as 'watch-dog' of public revenues.

Rights of Personnel

A damaging concern for the 'rights' of personnel, the cadre and rank consciousness, the negative outlook of the Ministry of Home Affairs, the Public Service Commission's stringent procedures all these hamper the development of an imaginative personnel policy. The expert is all in favour of keeping 'large registers of eligibles' rather than follow the tedious procedure of special examination, advertisement and selection. In the words of Appleby, the "present practice imposed on Home Affairs and Public Service Commission have made for pettiness, unimaginativeness and inflexibility and a tempo in which a calendar has more relevance than a clock". There are not many persons capable of serving well at high levels: they must be sought wherever they may be found, in business or Universities or in Government. As for salaries, he feels there is too much of rupee-pinching, and that it is time that the people as well as Parliament realised that they must be willing to pay for an adequate and successful government, without wasting their time searching for small economies, mulcted out of the not-very-high salary earners.

Planning Commission

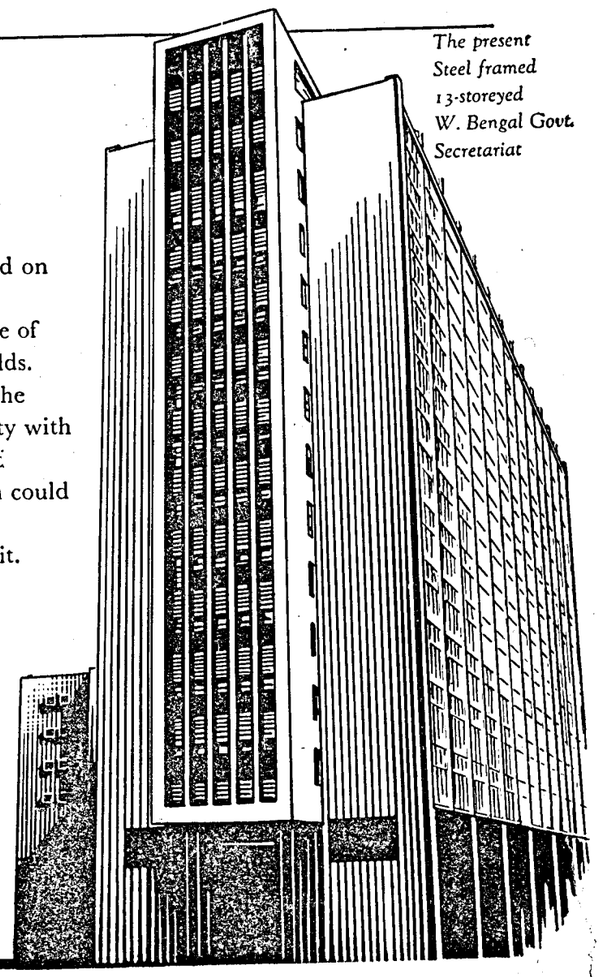
Appleby has a good word for the Planning Commission. Planning is recognised in our system as an essential part of administrative policy-making, not one which functions in a political or administrative 'vacuum'. He commends the idea of making members of the Commission as a "small edition of the Government itself". This makes the plan co-extensive with the development of policy and programme of the government. That the Planning Commission has not assumed direct responsibility in the execution of the Plan, and it is constantly endeavouring to evaluate the performance of the plan, all point in the right direction. Thus, the recent elevation of the Community Projects Administration into a ministery is a move in the right direction. The location of Public Management Studies in the Planning Commission, however, is questioned by Appleby and the Cabinet Secretariat is suggested as a good choice.

He feels, and that rightly, that programme agencies should come into their own, and rely less on the Ministries of Finance and Home Affairs. The review agencies have functioned stringently, and this is stifling the creativeness of programme agencies. The ministries of Finance and Home ought to move steadily to higher levels of responsibility, exercising more general, and less specific, controls, allowing programme agencies to build internal competence in management and financial programming. The system of having a financial adviser in programmatic ministry is undermining departmental responsibilities.

Business Management

Appleby recommends an office for Business Management in every Ministry, and in every attached operating administration, to develop and maintain accounts necessary for administrative control, formulate budget estimates, project forward expenditures, keep expenditures within the limits of appropriations, see whether the plan objectives are realised, supervise planning of personnel, its recruitment, placement and promotion, study and propose procedure and structural changes, etc. There seems to be a careless blend of control and O & M functions charged to this business management office. Whereas there is a clear need for devices for internal control, within a department it does not appear expedient to mix O & M functions with control functions. O & M functions, i e, matters like structural and procedural analyses, office machines, review of methods and practices, etc, ought to be in charge of an O & M Division, located in each Department. This might fall on expert help from the Central O & M division located in the Central Cabinet Secretariat. To mix advisory, staff functions on the one hand, with that of budgetary, personnel control apparatus of the Department would be derogatory to the effectiveness of O & M agencies, which must always remain consultative. I hope Appleby will give this suggestion a thought.

Programme Expediter



His other suggestion for a top level Programme Expediter or Plan Expediter sounds good, though ambitious. The expediter is to serve as an 'Umpire' trouble-shooter, bottleneck breaker, procedure reformer and structural adviser. In other words, he must be a top level, Cabinet supported, grand co-ordinator, umpire, O & M expert, Development enthusiast, all rolled into one. A development enthusiast must be one with a streak of aggression about him. An umpire should have the sobriety and impartiality of a judge. An O & M expert ought to be a statesmanlike consultant. Can all these qualities be found in one single person? If one could find one such person, this suggestion ought not to be lightly treated. There is another valuable recommendation—to accelerate decision-making in the Ministry of Finance, it is good to have a special aide to the Secretary in charge of expenditure.

Appleby's suggestions, on the whole, are in the direction of elevating concerns of policy-making bodies, and cutting through the maze of reference-cross-reference and detailed-review-pattern of administration. He wants to strengthen departmental integrity and responsibility and recognises the necessity of expanding hierarchy. Enlarged delegation of responsibility and permeating the whole administrative mechanism with what he called as "action-mindedness', are his recipe for success in developmental administration.

These are the suggestions, which are most controversial. There are many others which are no less sound and no less worthy of immediate implementation. Undoubtedly, Appleby has done a very good job this time. If he, has enraged Parliament and the Comptroller General, that is not his fault. He has thrown searching light on what has been ignored so long. Instead of being sore at his remarks, it would be prudent on our part to set to work on cleansing the augean stables.

" Where now the city stands,

there was once naught but the city's site. " OVID

The present Steel framed 13-storeyed W. Bengal Govt. Secretariat

Calcutta

On August 24 1690, when Job Charnock stood on the banks of the Hooghly, he saw before him a depressing landscape of mud hovels, swamps, and paddy fields.

On that very site has risen in the course of the years a pulsating city with heavy industry, modern transport and busy docks—a metropolis which could have made little progress but for STEEL—thousands of tons of it.

From the Chair

The Imperial Tobacco Company of India Limited

Speech by the Chairman, Mr. G. H. J. Clarke

THE following is the speech of the Chairman, Mr. G. H. J. Clarke delivered at the Forty-fifth Annual General Meeting of the Company held on the 27th September, 1956.

Ladies and Gentlemen:

I have pleasure in welcoming you to this Forty-fifth Annual General Meeting of the Company.

The meeting was originally convened for the 14th September, 1956 and I wish to express the Board's regrets that the accidental omission of the hour of the meeting in the original Notice made deferment advisable in the interests of the shareholders. An explanatory statement has been sent to you.

With your approval we shall take the Notice convening this Meeting, the Report of the Directors and the Accounts which have been circulated, as read and the Assistant Secretary will now read the Auditors' Report.

Since the last Annual General Meeting, Mr. E. H. Hare has resigned from the Board after serving your Company for over 30 years, latterly as the Chairman of the Board.

Mr. W. E. Nicholson, who had served, mainly in the tobacco growing areas of Southern India, for over 33 years, resigned from the Board early this year.

We wish them both much happiness in well-earned retirement.

Following Mr. Hare's resignation, I was elected Chairman in December 1955.

In April of this year, Mr. C. N. Kirkus, Mr. N. Shiva Rao and Mr. E. G. Willis were appointed to the Board.

These three gentlemen bring to their new duties and increased responsibilities an extensive experience and expert knowledge of your Company's business in its various aspects and they will, I know, make a substantial contribution to the progress of your Company.

The Accounts in your possession give a comprehensive picture of the financial results of the Company's trading during the year under review and I believe you will regard these results as most satisfactory.

In the tobacco industry, as in many others, the volume of sales is a decisive factor in contributing to a company's financial prosperity and I am pleased to report that the increase in sales volume, to which Mr. Hare referred in his speech last year, was fully maintained throughout the whole of the year now under review.

That increase has called for further investment in both fixed and current assets as reflected in the Balance Sheet, although in the case of fixed assets some element of the increased investment was occasioned by higher costs of new machinery.

Having regard to the fact that the bulk of the Company's investments are short-dated, that item on the Balance Sheet read with the cash position indicates a satisfactory degree of liquidity.

Consequent upon the introduction, under the Finance Act, 1956, of a tax on distributed profits, provision has had to be made in the Accounts now presented for the tax liability in respect of the profits distributed by way of dividend out of the profits for the year to 31st March, 1955 as well as in respect of the two interim dividends for the year under review, all of which were distributed during the year to 31st March, 1956. The additional tax burden arising from these distributions amounts to Rs 13,26,500 and is included in the charge for Income and Super Tax in the Profit & Loss Account, a charge which in total approximates very closely to the amount left available for disposal by the Board out of the results of the year's trading.

The appropriations made by the Board and their recommendation as to the Final Dividend are set forth in the Report of the Directors on page 4 of the Report and Accounts, and at this stage I need only say that these appropriations continue to reflect the application of the Board's financial policy to which Mr. Hare referred in some detail in his speech last year. The final dividend of 4%, if approved, will now be payable on 28th September, 1956.

There are already evident to us all signs of a mild inflationary tendency in the country's economy and whilst we welcome the broad aims of the Second Five-Year Plan, with its promise of a better standard of living for all in this land, it behoves us to have clearly in mind the implications that the execution of the Plan carries in the way of possible inflationary pressure at some points in the economy. It will therefore continue to be the policy of your Board to ensure that the Company's Reserves are maintained at a level adequate to safeguard the real capital position.

I have referred earlier in my speech to the increased volume of sales during the year under review and to the benefit derived therefrom by the Company.

The revenues of the Central Government have also benefited directly through the medium of increased collections of Tobacco and Cigarette Excise Duties on that greater volume of sales.

It has always been the contention of the tobacco industry and of your Company in particular that frequent increases in the rates of taxation of tobacco products were bound to have an adverse effect on consumer demand. That point of view has been supported in the past when sudden, too frequent increases in Tobacco and Cigarette Excise Duties have severely inhibited the natural growth of sales in following years, with consequent adverse effect on the overall yield from such taxation to the revenues of the Central Government.

In the year under review, the benefit accruing to the Central Government from increased collections of the duties has arisen, as I have said, directly from the increased volume of sales and gives support to the further contention of the industry that a satisfactory measure of increase in tax collections will arise naturally from an expanding volume of sales.

There can be no question of challenging the right of a Government to tax tobacco and its products, but I do wish to support, most strongly, the point made by Mr. Hare in his speech last year that, in fairness to the consumer and in order to avoid any permanent damage to a sound revenue-producing source, Government should consult with the tobacco industry as to the best method of applying the incidence of this type

of taxation. Failure to do so not only harms the tobacco industry, as well as those it employs and those it serves, but also defeats the intention of Government.

During the year under review, the States have continued to levy Sales Taxes on tobacco products at varying, though high, rates and it is greatly to be regretted that tobacco and tobacco products, already subject to high duties imposed by the Centre, have not yet been totally exempted from sales and local taxation.

A high proportion of your Company's sales is made in the form of a single cigarette for a single coin and there can be no question but that a multiplicity of State and local taxation rates, on top of the Central duties, seriously hampers the growth of our industry and greatly restricts the yield from taxation to the Central Government.

An example of a type of State taxation damaging to the tobacco industry as a whole and to the economy of this country is to be found in the Andhra Act of 1955 amending the Madras General Sales Tax and the Madras Tobacco (Taxation of Sales and Registration) Acts as applied to the State of Andhra. The 1955 Act imposed a tax at the rate of 7½ pies in the rupee on first purchases of certain varieties of raw tobacco. Not only does this impose an additional and heavy burden on cigarette manufacturers in this country but, at a time when competition in overseas markets is unusually keen, it places Indian grown tobaccos at a price disadvantage in these markets and may therefore seriously affect this country's valuable export trade in that commodity. The Government of Andhra State promised to review the operation of this tax; and it was greatly hoped that the tax would be removed in the overall interest. Such hopes however have been considerably dimmed by the passing of a further Act imposing a tax on country varieties of tobacco, formerly excluded; but however logical it may be to extend the application of the tax to all varieties of tobacco, the tax remains damaging to the industry as a whole and to the economy of this country.

I have intentionally laid considerable emphasis on this subject of taxation of tobacco products because, whilst of vital interest to your Company, the effects of its application and incidence are of equal interest to the Central Government.

The first five months of the current trading year again record an increase in sales volume but I would remind you of the following factors which are likely to affect our costs and so offset the financial benefits of that increased volume.

The effects of rising raw material costs have yet to be fully reflected in our production costs; in particular, we had to pay higher prices for leaf tobacco in Southern India this year and grade out-turns are likely to be disappointing.

Furthermore, the mounting costs of wages and of the provision of amenities for our workers have an inflationary effect on production costs and unless these increased wages and amenities are matched by increased production on the part of those receiving them, the Company's prosperity, and theirs, must suffer.

Relations between the Management and the workers have been very good throughout the year. Nevertheless, your Company, no doubt in common with other manufacturers, has suffered an occasional loss in production through the ill-advised tactics adopted by small groups of workers, often without the support of their recognised labour union.

In an industry so highly mechanized as ours, we have always set great store by the maintenance of a high standard of working conditions, of good relations with labour and the provision of adequate amenities; all of which further the aims and objectives of the Second Five-Year Plan; but we are entitled to expect that all workers will reciprocate by giving of their best to increase production.

I must say that there is increasing and encouraging evidence that both workers and their representatives are beginning to share our conviction that such differences as may arise from time to time between factory managements and workers are more readily capable of settlement by direct negotiation rather than by the adoption of tactics which not only adversely affect overall output but also the earnings of the individual worker.

Whilst, therefore, I am hopeful that rising costs of production will not offset the benefits of expanding sales, I would be failing in my duty to you if I did not warn you of the significance of the upward trend in costs. Your Directors have felt justified, however, in the light of the results of the first five months' trading of the current year, in declaring an Interim Dividend of 2%, free of income tax.

I now beg formally to move the adoption of the Report and Accounts for the year ended 31st March, 1956 including the payment on the 28th September next of a Final Dividend of 4%, free of income tax, on the issued Ordinary Shares of the Company.

I shall now ask a member to second the Resolution and when that has been done, if anyone has any question to put or comment to make on the Accounts, it will be a convenient time to do so.

Indian Agriculture in Brief

A useful and pocket-size book-let has been recently brought out by the Economic and Statistical Adviser, Ministry of Food and Agriculture, Government of India, with a view to meeting primarily the need of those who wish to have a snap shot picture of Indian Agricultural Economy as revealed by the current Agricultural Statistics, certain essential data in allied spheres; e.g., population, national income etc. needed for an understanding of the Agricultural Economy in its broader perspective have also been included in this booklet.

Price per copy As 8.

Notice

NOTICE is hereby given that the Annual General Meeting (being the thirty-seventh Ordinary General Meeting) of the Company will be held at the Registered Office, 12, Mission Row, Calcutta at 11 a.m. on Friday the 2nd November, 1956, for the following purposes:

1. To receive and adopt the Audited Accounts for the year ended 31st. March, 1956 and the Directors' and Auditors' Reports thereon.
2. To declare Dividends. The dividends if declared, will be paid to the shareholders whose names appear in the Company's books on the 2nd November, 1956 or to their mandatees.
3. To appoint Directors in place of those retiring. In this connection notice is hereby given that Special Notice as defined in Section 190 of the Companies Act, 1956 has been received by the Company under Section 281 of that Act, to move the following resolution at the Meeting:—

   "That Sir P P Ginwala who has attained the age of 81 years be and is hereby appointed a Director of the Company and that it is hereby declared that the age limit laid down in Section 280 of the Companies Act, 1956 shall not apply to him."
4. To appoint Auditors and fix their remuneration.
5. As special business to consider and if thought fit to pass with or without modification *the following resolutions* which will be proposed as special resolutions. (A) "That subclause 3(17) of the Memorandum of Association of the Company be deleted and substituted by the following two sub-clauses:

   "(17a) To subscribe, contribute or guarantee money for any national, charitable, benevolent, political, public, general or useful object or fund or for any exhibition".

   "(17b) To establish and support, or aid in the establishment and support of associations, institutions, funds, trusts and conveniences calculated to benefit persons who are or have been employed by or who are serving or have served the Company or its predecessors in business or the dependents or connections of such persons and to grant pensions and allowances and to make payments towards insurance".

   (B) "That Article 151 (17) of the Company's Articles of Association be deleted and substituted by the two following sub-clauses:—

   "(17a) Subject to the provisions of Section 293(1)-(e) of the Companies Act 1956 to establish maintain support and contribute or subscribe to any national, charitable, benevolent, political, public, general or useful object or fund and any institution, society or club, which may be for the benefit of the Company or may be connected with any town or place where the Company carries on business".

   "(17b) To give pensions, gratuities, allowances, bonuses, profit sharing bonuses or benefits or other charitable aids payments or monies to or for the benefit of persons who are or have been employed by or who are serving or have served the Company or its predecessors in business or the wives, children, dependents or connections of such person or persons as may appear to the *Directors just and proper* whether any such person his widow children or dependents or connections have or have not a legal claim upon the Company".

The Share Registers and the Transfer Books of the Company will be closed from the 23rd October, 1956 to the 2nd November, 1956, both days inclusive.

A member entitled to attend and vote at the Meeting is entitled to appoint a proxy to attend and vote on a poll instead of himself and a proxy need not be a member.

By Order of the Board
MARTIN BURN LIMITED
F G Liversedge
Managing Director
Managing Agents.

Calcutta,
28th Sept. 1956.

Explanatory Statement As Required by Section 173 of The Companies Act,1956.

Item No 3

Sir P P Ginwala who retires by rotation and is otherwise eligible for reappointment, has attained the age of 81 years and Section 280 of the Companies Act provides that he can not be reappointed a Director of the Company except by a resolution of which special notice has been given in accordance with Section 281 of the Act. The Company has received such a special notice from a Member notifying his intention to move the resolution set out in the Notice. Sir P P Ginwala joined the Board of Directors of this Company in 1944 and has rendered valuable assistance to the Board as a technical expert. It is in the interest of the Company that the Board should continue to receive the benefit of his long experience and able guidance.

Item No 5

Clauses 3(17) of the Memorandum and Articles of Association at present reads as follows:—

"To establish and support, or aid in the establishment and support of, associations, institutions, funds, trusts and conveniences calculated to benefit employees or ex-employees of the Company, or its predecessors in business, or the dependents or connections of such persons, and to grant pensions and allowances, and to make payments towards insurance, and to subscribe or guarantee money for charitable or benevolent objects or for any exhibition, or for any public, general or useful object".

This sub-clause deals with two different classes of objects to which the Company may contribute funds, the first relating to associations and funds for benefit of employees and their relatives and the second relating to charitable and public objects. These being two distinct objects it

is desirable that they should be set out separately and it is accordingly proposed that the first object should be repeated without enlargement of its scope as a new separate sub-clause 17(b). As regards the second object the existing clause in so far as it relates to subscriptions to public objects is stated in a form too restricted to suit modern conditions. The industrial policy of the Government of the day is of vital importance to most industries and particularly to your Company, the principal buyer of whose products is the Government. It is common ground that industrial policies are influenced by political parties who form the government of the day. It is therefore in the interest of the Company to be able to contribute to the funds of political parties which in the Company's opinion will serve the interest of industries in general and of your Company in particular.

Shareholders might be interested to know that under section 293(1)(e) of the Companies Act 1956 the right of a Company to contribute to funds not directly relating to its business or the welfare of its employees is clearly recognised and it is provided therein that the contributions made by the Board of Directors of a Company in such case shall not exceed 5 per cent of its average nett profits or Rs 25,000|- whichever is the higher.

In the existing clause in the Memorandum it is not quite clear whether the Company could contribute to a political fund and it is desirable that a specific provision in the Memorandum to contribute to such political objects and purposes should be included. It is therefore proposed that the second object above referred to should be set out separately in more explicit terms as a new sub-clause 17(a).

The existing Article 151(17) of the Company's Articles of Association sets out the power of the Board of Directors to carry out the object contained in clause 3(17) of the Company's Memorandum of Association. It is proposed to delete this sub-clause and substitute therefor clauses as detailed in the notice conforming to the proposed alterations in the Memorandum of Association.

The Directors and Managing Agents of the Company have no interest in the business represented by the foregoing resolutions other than in their capacity as shareholders.

Around Bombay Markets

Cautious Undertone

Thursday, Morning

BUSINESS was small and the price trend was irregular during the week under review, operators being chary of extending their commitments. Even the implied exhortation by the Chief Minister at the Bombay Shareholder's Association meeting early in the week, that it was not proper to suspend trading on the excuse of undue speculation (he warned, of course, against excessive speculation) failed to enthuse the market. However, towards the end of the week, as though to compensate for the earlier lethargy, industrials did stage a slow recovery, due largely to bear covering and replacement buying. Yet, confidence is still far from being restored.

The nervous bull liquidation in the textile section following the prohibitory order on mill cloth stocks continued during this week and mill shares suffered a further setback. The reported move on the part of the Government to further tighten back credit aggravated the jitteriness.

The steel section received a jolt when Indian Iron declared a dividend of just one rupee, against higher market expectations. The Company has taken a loan from the Government of India, free of interest, for financing expansion and is likely to go in for a further loan from the World Bank for which the Government of India has agreed to stand guarantee. In the circumstances, it is natural that the Government should disapprove that the Company declare a higher dividend. In the event, Indian Iron which quoted at one time Rs 36-4 on the last day of the week, suffered a loss and hit the lowest for the day at Rs 34-14-6 and closed at Rs 34-15-6. There were sellers, but practically no buyers.

In the miscellaneous section, cement shares were down because of the Government's announcement of a lower selling price for cement. ACC declined from Rs 204-4 to Rs 199. Digvijay, despite the declaration of one share for two shares by the Company, slided from Rs 207 to Rs 197.

Sugar shares, as also small priced engineering shares, ruled lower, the only exception being Mahindra and Mahindra, which ended the week at the highest level on yield considerations.

Cotton

Easy Trend Continues

THERE was hardly anything of note in the cotton futures market. The continued bearish trend is helping neither futures trading nor, indirectly though, the cotton cultivator. It is more than a little intriguing, as already remarked in these columns, that cotton futures should remain lethargic when the statistical position of cotton and other factors justify a rising price trend. Attention has also been drawn to the psychological pull that seems to be working in the minds of the operators, against the distinctly bullish pattern of the cotton trade and industry.

A feature, which had not been in evidence last week, is the sympathetic reaction on the spot market, which, too, has now developed a bearish trend. Market observers, however, offer a ready explanation. They point out that this trend is the result of the anticipation, on the part of the traders, of a much reduced or no export quota. More often than not, export quotas are announced either in the month of October or in early November. This has been the case with cotton in the past two seasons. Also, at this time of the year the new crop movement gathers momentum, especially of Punjab cotton. In view of this, mills are naturally biding their time. Their hands are also tied by the ceiling imposed on cloth stocks. They cannot hold more than one month's stock. They have to bear the whole brunt of the additional excise duty, to boot. In the circumstances, they are naturally chary of entering into fresh commitment. If there were some who were in two minds about the present situation, they were converted to the majority view when reports came of consumer-resistance in the piecegoods market!

A word here about the recent Indo—U S Agreement on Farm Surplus, particularly about India's import of U S Surplus cotton. In view of the inflationary potential of our large-scale deficit financing, the provision that India could pay in rupees for her cotton imports from the U S A, it must be conceded, is of a far-reaching significance. Importers of cotton here, however, complain that as yet the procedural details have not been made available to them. This is unfortunate, because cotton prices currently ruling in the U S are considered attractive by purchasers here. Importers are also worried over the import of U S cotton through Burma under the Indo-Burma-U S Tripartite Agreement concluded much earlier than the Indo-U S Agreement. Under this, India is scheduled to supply Indian textiles to Burma for which the latter would pay with U S Sur-

plus cotton. The stipulation that import licences would be issued only after a certain quantity of Indian textiles had been exported to Burma is the main source of headache, and those who have applied for export licences do not know when the Government would release licences for the import of U S cotton through Burma. Thus whether through Burma or direct from America, U S cotton imports have yet to materialise. The sooner the authorities clarify the whole position, and facilitate the flow of U S cotton into India, the better for all concerned.

Meanwhile, Jarilla and Vijay futures lost about ten points per candy during the week. Ready delivery contracts for several varieties like Morvi, Khandesh, Berar, 216F and 320F Punjab eased considerably. At botton prices, however, a leading group of Delhi Mills bought a couple of thousand bales of Walad Cotton, either for December or January delivery. Local mills bought Pima and Sudan Cottons.

Around Calcutta Markets

Oilseeds

Linseeds Look Up

THE oilseeds market presented a mixed trend during this week. There was a relatively better undertone in the linseeds section as against a generally depressed sentiment in, e g, castorseed and groundnuts.

The strength of the linseed and linseed oil sections has been mainly attributed to the reported deal, the first after the recent abolition of the export duty of Rs 250 per ton. Sentiment has also been helped, to some extent, by better advices from the U K where prices have been revised upwards. London prices have improved by as much as £4 per ton, and shippers here have naturally taken advantage of this. A business of some 200 tons, for October-November delivery, is reported to have been concluded by a leading shipper here. While it is believed that linseed oil prices in the U K may be lifted further, in view of the increasing demand from East European countries, some Indian shippers feel that even at the current London rates, the U K quotations are out of parity with the internal prices. It is suggested, in effect, that the booking done by the shipper in question must have been in anticipation of a further fall in domestic prices. To what extent prices would decline further is anybody's guess. But, as things are with the continued shortage of ready supplies and the prospects of better buying enquiries from Communist countries, the trend promises to turn bullish shortly.

With the expiry of the castor September contract, there has been little or no activity in this section. In view of the likely increase in the supply of castorseeds and following beneficial rains in recent weeks, traders and shippers are biding their time to guage the volume of foreign demand. In the meanwhile, the tendency for any further decline in prices has been checked promptly by the reported business in castor oil to the tune of of 1000 tons done with the Continent last week.

Indian Iron Dividend

Wednesday Evening

DEVELOPMENTS relating to Indian Iron continued to influence fluctuations in equities. Towards the close of last week, equities steadied-up on expectations that the Indian Iron dividend would be announced on Monday last. Though the dividend was not announced, the circular letter issued to shareholders by the Chairman of the managing agents of IISCO made it clear beyond the shadow of any doubt that the dividend would not exceed one rupee per share. This had a depressing effect on Indian Iron. As Indian Iron fell, equities in general developed a downward trend.

On Monday last, as the contents of the circular letter came to be known, Indian Iron dropped eight annas on liquidation by weak "bulls". There was a subsequent recovery due to technical reasons. Monday last was the settlement day. Unduly wide "budla" charges indicated a considerable "short" position in this scrip. There was some "bear" covering, and the rate improved. Subsequently, in kerb dealings on Tuesday and Wednesday, Indian Iron lost ground again due to "bull" liquidation.

Delhi Refuses

In a circular letter to shareholders, the Chairman of managing agents of IISCO explains the grounds on which the Government has refused requests for a higher dividend. From a perusal of the circular letter, it also appears that the Government is not interested in revising the terms and conditions of the proposed right issue. Representations were made by both shareholders and management, as in the last year, on both these issues. As in the previous year, the Government has turned down requests for a higher dividend. It is now clear that the dividend will not exceed one rupee per share.

Until Monday last, Lyons Range was expecting a higher dividend and/or a modification in the terms of the proposed right issue. Representations made to the Government were based on two arguments. One was about the inadequacy of a dividend of ten per cent. Some were hoping that, even if the request for a higher dividend were turned down, the Government might be induced to revise the terms and conditions of the proposed right issue. There is some relation between these two issues from the shareholders' viewpoint.

Arguments For

At present the nominal value of each share of Indian Iron is Rs 10. But the shares were originally issued at Rs 100 each. There have been many subsequent reductions in the nominal value of these shares. But one of the arguments for a higher dividend is that, at rupee one per share, the yield is negligible so far as original shareholders are concerned. This is a technical argument which cannot be stretched too far. Original shareholders have been compensated in each of the various readjustments of the share capital. Alternatively, it is arguable that either there are no original shareholders at present, or that those among them who are still holding are confident of bright future prospects.

At Rs 10 per share, the dividend of a rupee is not illiberal. So, it cannot be argued that genuine investors are being penalised by the Government's decision not to allow a higher dividend. But the argument for a higher dividend is supposed to be based on the alleged unfavourable terms and conditions of the proposed right issue. In May last, the company sought permission to issue ordinary share capital to finance expansion plans. New Delhi consented, but only on the condition that right shares should be issued at a premium of Rs 3½ per share.

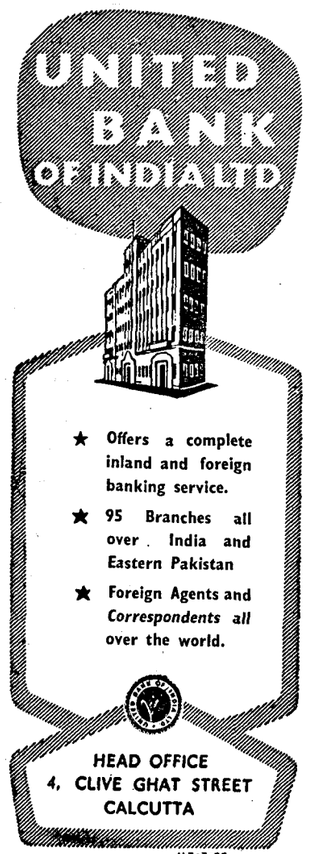
Arguments Against

In effect, the arguments advanced by shareholders and management boil down to this: Since the announcement of the terms of the right issue, Indian Iron have developed an irregularly lower trend. To make the right issue a success, it is, therefore, necessary to raise the dividend payment so that investors will be induced to subscribe to the right issue. Terms of IISCO's proposed right issue are favourable in comparison with those of Tata Steel Company's new issue. IISCO's prospects are quite bright. There is, therefore, no valid reason to assume that the proposed right issue will not be taken up by investors.

New Delhi's refusal to allow a higher dividend distribution or to modify the terms of the proposed new issue is based on good logic. A higher dividend would involve enlarged payments out. Therefore, retained profits would be lower. To enable the Company to finance expansion plans, the premium of Rs 3½ per share has been fixed. This will help the Company to secure the needed capital for expansion. Two loans, one free of interest, advanced by the Government have yet to be repaid. Soon, the Company will again approach the World Bank for another loan which will have to be guaranteed by New Delhi. Impartial observers will endorse the Government's view that a higher dividend is, thus, not in the interest of the public or of IISCO shareholders.

Tea Shares

Tea shares steadied-up by the middle of last week, only to slide back in sympathy with the downward trend in equities in general. Last week, the Tea Regulation Committee decided to curtail output. North-east Indian planters are represented in this Committee. North-east India is the major tea-producing region in this country. So, the Committee's decision is likely to be enforced and effective. It has also decided to improve the quality of the tea output so that inferior grades are not offered at the auctions. As equities in general resume the upward trend, Tea shares are likely to move up appreciably.



In recent weeks, industry in Calcutta has been worried by the coal strike. This has affected the output of jute mills. Many engineering concerns are also experiencing difficulties. Besides, the Government's decision to enforce uniform steel prices throughout the country has also affected engineering concerns in port towns like Calcutta. These are the main reasons for the recent hesitant trend in Engineering shares. Latest reports indicate, however, that the coal strike may be called off. Industry in Calcutta will welcome the end of the coal strike.

Jutes Steady

It is only natural that Jute shares will develop a downward trend in sympathy with the easiness in equities in general. Weakness in jute goods has had a depressing effect on Jute shares. Jute goods are falling partly because of speculative selling pressure, but mainly due to lack of fresh foreign orders. There are also apprehensions that the Suez Canal crisis, and the consequent increases in freight and marine insurance rates, may deprive the industry of some of the advantages of increasing exports at rising prices.

These fears are not altogether without basis. But it should not be ignored that the full effect of the re-sealing of looms will be felt only from this month. Output in September will be lower than that of August.

In October, the first full month when the industry will be working with the unsealed looms re-sealed, the output will decline further. Therefore, mill stocks of jute goods are likely to decrease gradually. Further, raw jute prices are also falling. Prospects for Jute shares are not unencouraging. These shares are worth the consideration of investors at all set-backs.

Hopes and Fears

LONDON and Paris may feel aggrieved that Washington is reluctant to defend its allies, though America expects her NATO partners to support her in her struggle for power against Russia. On the Suez Canal issue, Washington has had a restraining influence. Mr Dulles is in agreement with the Anglo-French plan for the solution of the crisis. But he is opposed to the policy of use of force to solve the dispute. At the instance of America, Britain and France have been forced to modify their Suez policy considerably. Only after Sir Anthony Eden discovered that America was unwilling to endorse the Anglo-French proposal for forcing the way through the Canal that Britain abandoned the idea of using Anglo-French pilots for navigating ships through the Canal as a direct provocation to war. With America's support, Britain and France would have implemented their combative policy without referring the Suez issue to the Security Council. Credit is due to America for averting war so far on the Suez Canal issue.

But all those who desire a negotiated settlement of the crisis will be dismayed that America is in agreement with Britain and France on the solution of the problem. Washington insists that the crisis must be solved through peaceful means. But Washington is in agreement with London and Paris that the crisis can only be reconciled by Egypt's acceptance of the Anglo-French plan for solution. America is opposed to the use of force. She has repeatedly warned Egypt of her stubborn attitude. But she has never raised any objection to the massive Anglo-French concentration of forces in the Eastern Mediterranean. During the Security Council debate on the Suez Canal issue, M Shepilov disclosed the extent of such military concentration. His statement was not challenged by Britain, France or America. Nor is America opposed to a policy of exerting economic pressure on Egypt. Indeed, Mr Dulles would seem to have made efforts to convince Britain and France that a policy of economic sanctions would be as effective as military action.

Time, it should not be ignored, is on the side of the Western Powers. Egypt has so far maintained freedom of navigation through the Canal. But a time may come when Egypt may experience difficulties in maintaining navigation through the Canal. Her inexperienced pilot force may break down under the heavy stress and strain in the winter months, when navigation is not only difficult, but the volume of traffic may expand considerably. Indications are not lacking that Britain and France are hoping that such an opportunity will arise. In the event, the users' association will offer to Egypt the services of its trained pilot force. If such offers of help are rejected by Egypt, "the moment for a decision about the use of force", the **Sunday Times** concludes, "will have been reached." Behind the proceedings of the Security Council, threats to use force loom large. In Paris and in London, a section of the Press is blunt in its reminders that resort to the United Nations is a procedure, not a policy. M Shepilov has drawn the attention of the Security Council to the ominous shadows that hang over it as it debates the Suez Canal crisis. He has been honest in forewarning the Security Council that Russia will veto the Anglo-French resolution which urges the Council to recommend that Egypt should negotiate on the basis of the 18-nation proposals for international control of the Canal.

Contrary to the dictatorial Anglo-French policy, Egypt's attitude is conciliatory. Dr Fawzi, Egypt's Foreign Minister, has informed the Security Council that Egypt cannot accept the Anglo-French proposal as a basis for negotiation. But he has been wise in proposing a small negotiating body to devise the basis for a negotiated settlement of the Suez Canal issue. In endorsing Egypt's proposal, M Shepilov has elaborated the aims and objections of such a negotiating committee. Even those who may not accept all the detailed principles enunciated by M Shepilov will endorse the Russian Foreign Minister's plea that the composition of the proposed negotiating body should be balanced in such a way "as to forestall the prevalence of one point of view". Even as Mr Dulles has shown diplomacy in his attitude to the Suez Canal problem, acknowledgement is due to him for inducing Britain and France to start direct negotiations with Egypt. Such an opportunity will arise during the secret session of the Security Council. If "cold war" experience be any guide, there are reasons to hope that secret diplomacy may succeed where open diplomacy has failed to bridge the gap.

One of the conditions of a negotiated settlement is that both sides must agree to the basis for negotiation. Dr Fawzi is not wrong in complaining to the Security Council that Egypt has never yet been asked to negotiate, but has been offered an ultimatum. By calling upon the Security Council to recommend that Egypt negotiate on the basis of the 18-nation proposals, Britain and France are only insisting on a dictated basis for negotiations to solve the crisis. Broad objectives and principles will have to be enunciated. M Shepilov has elaborated the general aims and objections of an agreed solution of the crisis. Mr Dulles is more diplomatic in his reference to "the heart of the Suez problem". An agreed solution of the problem must be based on the "acceptance of the principle that there should be a system to ensure that the Canal could not be used by any country as an instrument of its national policy". Britain, which along with France, now demands international control of the Canal, has not always honoured the basic principle enunciated by Mr Dulles. In wartime, freedom of navigation through the Canal has never been ensured or accepted by Britain. Nor has Egypt ever accepted Israel's right of freedom of navigation through the Canal. Despite the 1888 Convention, the international character of the Canal has not always been accepted when it has clashed with "national policy" of the authority which has so long been in control of the Canal. This calls for certain modifications in the Convention as to ensure freedom of navigation through the Canal for all time and under all circumstances. Egypt will not accept any plan for international control of the Canal. But she does not seem unwilling to accept some arrangement, under the auspices of the United Nations, which can ensure the rights and interests of the users. Fears of war on the Suez Canal issue still persist. But there is a faint ray of hope that, at the instance of America, Britain and France may yet adopt a conciliatory attitude. Egypt has indicated her willingness to accept a compromise solution. There will be hope that such a compromise formula will be evolved as a result of discussion during the recent session of the Security Council.

On the Carpet

THE Second Plan did not start under the same happy auspices as the First Plan. This might sound paradoxical when everyone agrees that the First Plan has been a great success and all foreign observers, experts as well as lay, have expressed their admiration for the progress that India achieved. The World Bank Mission which visited India some time ago said that and Mr Eugene Black, the President of the World Bank, has been fulsome in his praise "for solid achievements in the economic field which have been recorded in India during the past five years." The First Plan achieved what it set out to do viz lay the base for further development by improving agricultural production, removing transport bottlenecks and large scale power production. Now these are the very things on which a more ambitious programme of development can be firmly based. This is precisely what the Second Plan proposes to do. Where, then, is the catch? Why should the Second Plan have to start under less favourable auspices?

There are critics, of course, who complain that the progress achieved during the first five years was not really as solid as it appears to be, because in an agriculture based economy, agriculture is the foundation of all development and it is not possible to say definitely how much of the improvement in agriculture was the result of permanent improvement and how much of it was fortuitious, being the gift of favourable monsoons. That the crops this year have not been so good or that even last year they were not as good as in the previous year lends point to what they say. A sizeable decline in foodgrains production is a fact that cannot be denied; it has created some difficulties which happily have now been met through arrangements concluded for substantial imports. This will enable us to build up strategic stocks and on present showing, these stocks should be able to counter the consequences of fluctuations in food supply.

Freer sales from stocks, whenever the situation warrants it, it is hoped, will keep food prices in check. The target for foodgrains production in the Second Plan has also been stepped up in order to eliminate all possible risks of a food shortage. It has been possible to remedy what might have turned out to be vital deficiency through imports of surplus wheat and grain from U S which will not cause a drain on our foreign exchange resources. In the case of cloth also, the economy has shown some signs of strain, but the situation is somewhat different in that there has been no decline in cloth production. On the contrary, production has substantially increased, and something is being done to step up production even further, by a rebate of excise duty on mill production which has been just announced on the additional production above that in the base period, by introducing power looms and by organising handloom production.

By and large, therefore, the inadequate supply of basic necessities is no longer a crippling handicap for launching a big programme of development. How big that programme could be, however, is a

different matter. Here the question is not only how big we want it to be or the people think it should be, but how big we can make it which will depend on our ability to mobilise resources in men, money and organisation. To the latter, naturally there could be no definite answer. No one has yet said that we are incapable of the needed effort or that we are not trying hard enough, though naturally there may be criticism both about the aims and policies as well as performance in particular fields.

From an assessment of the situation in real terms, therefore, there is no reason to think that the Plan has been launched under unfavourable auspices. The situation differs, however, sharply in two vital respects. Though the Planning Commission was apprehensive of the existing inflationary pressures in the economy when the First Plan was launched and proceeded with extreme caution—the target of investment was first put at the modest figure of 1493 crores, to be supplemented by a programme of investment of another 300 crores, if the situation should so warrant—inflationary pressure did not prove baffling in this period. More detailed examination of the projects included in the First Plan raised the figure of investment to some 2,069 crores when the final Plan was published. The Planning Commission had been apprehensive of the inflationary pressures in the economy but it could not ignore the popular pressure in the country for a larger Plan. As a result, the target was no longer broken into two parts, one of which was a 'must' and the other optional. By the time the plan got half way through, far from inflationary pressures presenting a severe handicap there were signs of recession which had to be met and a supplementary programme was added in October 1953 of Rs 185 crores. The popular pressure for a larger Plan is much stronger today than it was five years ago. And as the Plan is built up from the botton, it grows in size and as coordination is effected at the top and gaps are filled in to give structural unity to it, the Plan grows even bigger.

The difference between the first and the second plan, however, is that in addition to the popular pressure for a bigger plan, because of the phasing of the first, much of the investment had to be incurred in the last two years. Therefore in addition to the popular pressure, there is also some inflationary pressure in the economy which unfortunately cannot be ignored. Not that remedial action is impossible and is not under contemplation but such action will take time and political conditions, such as the re-organisation of the States, stand in the way of such measures being pushed through speedily.

There is another difference compared to the situation when the first plan was launched in the matter of foreign exchange reserves. The First Plan did not have as large a foreign exchange component, and accumulated sterling balances which we could not spend quickly enough in the beginning, provided a comfortable cushion which we lack today. In fact, we have begun with an acute foreign exchange shortage, which must be worrying the Finance Minister no end. In the first six months of the current financial year, we have drawn down our foreign balances by Rs 130 crores which is not an inconsiderable amount, since the total drawings on sterling releases during the entire Second Plan period are not to exceed Rs 200 crores. At this rate of withdrawal, the economy is bound to experience a severe jolt unless foreign assistance is obtained and obtained on a substantial scale.

For external finance, the Government had banked on substantial assistance from the World Bank. It had in fact expected, on what basis it is futile to ask today, a loan of at least Rs 200 crores or 400 mn dollars. The World Bank some years ago seemed to be interested in helping our development though the loans it had approved in the first plan period did not exceed Rs 12 crores of which only Rs 9 crores were actually utilised. Following the report from a World Bank Mission which came out to make a preliminary survey, there has been some correspondence between the Finance Minister and the President of the World Bank which suggests that our chances of obtaining assistance from this source may not be very bright.

There were many points of criticism in the Mission's Report, some of which are undoubtedly both cogent and valid. Of these however, Mr Eugene Black has taken up India Government's attitude to private enterprise as the one most open to objection and while doing so, he comes perilously near to passing political judgment, which the Bank is debarred from doing while considering grant of loans. On the other points, as for example, reservations on deficit financing, and the need to push exports, etc there can be no disagreement, though the Government may be in no position "to resist the pressure in the tea estates for higher wages, bonuses and social advantages" in order to push tea exports, as advised by the World Bank Mission nor even to remove the restrictions on replanting, that are enforced under the international Tea Agreement. Whether this agreement is any longer beneficial or not, of course, is another question. Similarly, neither is the Government in a position to bow to the Mission's judgment that "restrictions on exports of commodities such as groundnut oil, in order to conserve supplies for domestic consumption, is generally a misguided one". A democratic Government has to maintain certain minimum standards of consumption for the people.

Week after week, Delhi reports negotiations with foreign firms for collaboration in the development of industries for the fulfilment of the industrial targets in the Plan. The inflow of foreign capital from capital participation in schemes of collaboration does not amount to any large figure. It cannot contribute much to our foreign exchange budget. Substantially larger capital participation may be possible, if development is left to the free judgment of the investor. Indian of foreign, and the latter is given a free hand, but that is simply not possible.

Much depends on the World Bank whether India's Plan succeeds or not. By withholding the measure of foreign assistance it is in a position to give, the Bank may force India into a direction which will be still less acceptable to the American protagonists of free enterprise. It may not be such a bad thing after all, for self-reliance is the best tonic for individuals as well as for nations. If India has to fight with her back to the wall, she will do it. But in the process, the social structure will undergo a much greater change than India had bargained for when she joined the Fund and Bank, offering at least formal adherence to a system of international exchange and economic co-operation. But would Mr Eugene Black like that? One cannot help sympathising with the Finance Minister who is in position to "tell the truth and shame the devil".

Weekly Notes

One More Audit?

WITH all the emphasis on the programming in preference to the review agencies of Government, and audit singled out for attack as the villain of the piece which slows down progress and spreads frustration all around, it may appear ironical that one more audit should be sought to be planted on the developmental activities of the Government. Internal efficiency audit, however, which the Planning Commission has in mind, is not just one more audit, in addition to all the rest, or a substitute for the Auditor-General's audit. If carried out properly, it should go to the root of development by compelling the agencies concerned to 'economise' in the proper sense of the term viz by utilising resources to optimal advantage. Accountants do not do that; they only check that against every expenditure there is a voucher and proper sanction of the appropriate authorities. They have no other criterion. Whether the same thing could be achieved more economically from the wider standpoint of national resources, by using less resources quantitatively, or by a different combination of resources which might call for the adoption of an alternative technique are beyond the ken of the auditor. There is, we are told, such a thing as 'higher audit' which studies different ways of doing the same thing and suggests the best means of achieving a given end, e.g. by comparing cost data in similar project. But it does not go very far and its application has nowhere been conspicuous or successful.

Even the usual test of efficiency does not quite apply to Government enterprise. The private producer has to quit, if he loses sight of cost in relation to the selling price of the product, which he cannot control unless he happens to be in a special position of advantage. No Government enterprise in the field of industry is under a similar compulsion to earn profits and many of these enterprises are in a field where cost price relationship cannot be established directly and can, therefore, never be enforced; hence the need for efficiency audit. Along with annual plans and perspective planning and state trading, it was one of the germinal ideas in the Draft Plan-frame which is now being given effect to, or is expected to be given effect to by the Committee which has been appointed by the Planning Commission to develop "a system of internal audits of projects included in the Second Five Year Plan".

The purpose is to ensure that the money spent on projects yields the best possible results. In order to achieve this purpose, "all means of securing economic and efficient use of technical manpower resources, materials and equipment will have to be explored. For convenience of investigation, all the projects, industrial and non-industrial, have been divided into six groups and as the Chairman of the National Development Council, Shri Nehru has nominated the Chief Ministers of Bombay and Uttar Pradesh for the group investigating agriculture and Community Development Projects while Chief Ministers of Andhra and West Bengal will be the members of the committee for the Public Works and building group.

Exodus from East Bengal

MR ZIAUDDIN, Pakistani High Commissioner in India, is a realist. New Delhi hopes against hope that the exodus of displaced persons from Eastern Bengal will end as the situation improves. Karachi has repeatedly assured that its policy is to stop the exodus, and that it will pursue such a policy to the minorities as to discourage their influx into West Bengal. But the migration continues. Mr Ziauddin has expressed his opinion that it is likely to continue. His candid admission will be endorsed by all those who have the honesty to accept a realistic assessment of the problem. To stress this is not to concede the promises on which Mr Ziauddin's opinion is based.

Mr Ziauddin absolves Karachi of all responsibility for the Hindu exodus from East Bengal. "If, in spite of oft-repeated assurances from the Government, the minority community feel that they have no future in Pakistan", Mr Ziauddin asks, "what more can be done?". Karachi has repeated its assurances of fair treatment to the minorities. But it has not succeeded in implementing its assurances. This cannot be denied as the Hindu exodus continues. Nor will it be disputed that the migration continues because the minority community does not feel secure in Pakistan. Mr Ziauddin would seem to question this basic assumption. He seems emphatic that "however much a Government, or the two governments of India and Pakistan might try jointly", the Hindu exodus will not stop. He explains away the continued exodus to be due to the "psychological make-up" of minorities.

Mr Ziauddin has not elaborated the implications of his explanation, but the Muslim League will echo his views for entirely different reasons. Some time ago, Karachi seemed to accept, by implication, that the Hindu exodus was due to a feeling of insecurity. That was why it gave assurances that it would follow such a policy as to remove the misgivings of the minority community. In recent months, it has more than once indicated that it accepts Mr Ziauddin's explanation for the exodus. This begs the whole question. Psychological factors are involved. But the oft-repeated assurances about a change of policy to the minority community should have eliminated the psychological factor, if these assurances were truly implemented. This is the main problem. In Pakistan, the minority community has not the same status as the Muslims. In the Islamic State of Pakistan, Hindus have inferior rights of citizenship. This is the main reason why the Hindu exodus continues. Political, administrative and economic discrimination aggravates the outflow of Hindus from East Bengal. It can, perhaps, never be ended, but the outflow can be minimised with the gradual progress of democracy in Pakistan.

Expanding the Commonwealth

LORD WOOLTON and Mr Butler can take credit for the return to power of the Conservative Party in Britain after its eclipse in the immediate post-war period. If the Conservative Party loses the next general elections, it will be because of bellicose blunders of Sir Anthony Eden and Mr Macmillan. The Party has lost popular support by Sir Anthony's aggressive Suez diplomacy. But the Butler-Monckton group has considerable influence within the Conservative Party. There is a progressive element within the Party which is reconciled to Britain's changed world status since the last war, but is anxious to gain moral prestige for Britain. In the Commonwealth, Britain has an organisation which can be extended and improved to enhance Britain's international status. Evolution of the Commonwealth since, and as a sequel to, the transfer of power to former Asian dependencies has been one of the major contributions of the Labour Party to Britain's efforts to regain world prestige.

It is as much a reflection of the changing international conditions as of the progressive elements within the Conservative Party that a group of Conservative MPs have sponsored a plan for extension of the Commonwealth. Soon, the Gold Coast will be a member of the Commonwealth. In the immediate future, Malaya and the Caribbean Federation will be Commonwealth members. Along with the completion of these developing events, it is now proposed that the Sudan, Burma and Norway should be included within the Commonwealth. At the Labour Party's annual conference, there was a resolution to expell South Africa from the Commonwealth for its policy of racial discrimination. It is clear that the Commonwealth will increasingly become a multi-racial, non-British, non-white association. But the sponsors of the plan for extending the Commonwealth seem to be influenced by the possibility of the Commonwealth emerging as a "third force". Two recent developments would seem to be against the "third force" idea. Russia and America still remain the two giants in conflict. But, since the understanding among Big Powers not to wage an atomic warfare, the "third force" concept has lost much of its appeal. Nor can Britain, with the Conservative Party in power, inspire the Commonwealth to emerge as a "third force".

Half Sufficiency in Oil

IN his Presidential address at the last Annual General Meeting of the Geological Mining and Metallurgical Society of India, Shri W B Metre, Senior Geologist of the Assam Oil Company, summed up the position of oil in Assam as follows:

"The proved and probable reserves in the Nahorkatiya area are sufficient to plan a production target of two and a half million tons of oil per year together with about 45 million cubic feet of gas per day, equivalent to about 0.6 million tons of fuel oil per annum, a large part of which could be utilized for industrialisation of Assam".

On the basis of current consumption, Assam alone, therefore, should be able to meet 56 per cent of the present estimated crude requirements of the country as against only 8 per cent at present. True, the consumption of oil is also going up fast. But even after allowing for increased consumption, Shri Metre thinks that we can count on meeting about half of our requirements from domestic productions. It should be noted that this estimate is based on "proved and probable reserves". It excludes the proved but unestimated pools of part of Hugrijan near Nahorkatiya and in the Moran area, in both of which exploration work is being pushed as rapidly as possible, as also of possible strike in other areas in the Assam Valley which look promising. Conditions in India are similar to those in U S where also "the number of prolific fields is limited" and "a substantial proportion of the production is obtained from a large number of scattered small pools, involving extensive exploratory drilling to cover a very wide area". This is borne out by the recent experience of the Assam Oil Co at Moran and parts of the Hugrijan area, "where only one oil-bearing sand is present, compared to more than five oilsands in the Nahorkatiya area", which go to show that "we must be prepared to investigate a very large number of favourable structures to discover more oil".

Why has it taken so long to find all this oil? Shri Metre gave an interesting explanation. Geophysical work in the Nahorkatiya area was actually undertaken as early as 1925 when this method of exploration was in its infancy. "It was known that wells deeper than 10,000 ft may be required to explore this area and the drilling technique was not sufficiently advanced in those days to contemplate drilling to such depths. In fact the first well below 8,000 ft (in California) was not drilled until 1927. Though in those days exploratory effort was first directed towards exposed structures, the alluvial areas, which involved very heavy expenditure on geophysical prospecting, also received due attention. As soon as the possibilities of drilling to well below 10,000 ft were visualized, some seismic work was carried out in the Nahorkatiya area during 1938-39 to locate the most favourable site for drilling the first well. Unfortunately, soon afterwards the Second World War intervened and on account of the restrictions imposed by the Government, it was not possible to undertake any drilling in this area".

Like all other geologists, Shri Metre, warns that geophysical surveys cannot give any indication of the presence or absence of oil. "They only help us in giving a general picture of the alignment of the various rock formations, without indicating what rocks are involved. However, these methods are very useful in locating the test wells in the most favourable positions". But unlike most geologists, Dr Krishnan, for example in his Presidential address at the last Science Congress, Shri Metre is not unhopeful. Besides Assam, he said, "there are several large alluvial areas in the country, where we can now expect to find oil. These areas include part of West Bengal where S V O C are carrying out much geophysical work and the extensive Ganges Valley and the alluvial tracts of Rajasthan, Saurashtra, etc. There are also several exposed areas where the Oil and Natural Gas Commission have carried out very systematic geological and geophysical surveys and are due to undertake drilling operations". And like all good geologists, he advises plenty of patience and an over-dose of optimism; it is only the drill, however, which can give the answer!

Don't Gamble with his Future!

WHEN LIFE IS AT STAKE, one cannot take a gambler's chance. Yet many persons allow disease to get a stranglehold through ignorance, prejudice or *false* economy and self-medication. While they follow ignorant friends' "advice", carry out quack "treatment", experiment with quack remedies ("cheap and nasty") the patient's vitality is steadily draining out. Even if the patient is lucky enough to pull through, the disease has been severe enough to leave permanent crippling effects, wrecking his whole future.

At the first sign of trouble, send for a qualified doctor. With his knowledge, training and experience he can accurately diagnose and treat your trouble.

Obey his instructions.

Our Delhi Letter

Checks and Balances

THE Finance Minister, Shri T T Krishnamachari, this week touched the zenith of power and the nadir of unpopularity. He was the most effective and yet perhaps the most hated Minister in the Cabinet of Pandit Jawaharlal Nehru. He had annoyed the Food Minister, Shri Ajit Prasad Jain, by talking of possible restrictions on inter-zonal movement of grains. He had embarrassed the Minister for Commerce and Consumer Industries, Sardar Swaran Singh, by theatening to manipulate excise duties on cloth in the interests of a policy of which the latter was almost innocent. The two not so junior ministers (at least one of them was a Minister in his own right in the first Congress Cabinet in Orissa nearly 20 years ago!) in the former Ministry of Commerce and Industry did not relish the idea of serving, apparently owing to T T K's insistence, under Sardar Swaran Singh, who was a parliamentary secretary in a State while they held their present offices at the Centre. The Nanda-Khandubhai-Jagjivan Ram school of thought has always suspected T T K to be the most insidious antagonist of the socialist pattern and one of his recent utterances, and much less his performance, has been calculated to remove their suspicion. All the colleagues are more confused than silenced by T T K's facile facts and figures.

Finance and Food

A senior member of the High Command remarked the other day that the Finance Minister was "over-reaching" his brilliant self. At least Shri Jain has a good reason to agree heartily. It is T T K's contention that food prices fall within the jurisdiction of Finance Ministry; he, therefore, wants the Food and Agriculture Ministry to concentrate on stepping up agricultural output and, if it must, distribute food according to the dictates of Finance. No wonder that Shri Jain's Ministry had to issue an unofficial handout almost to say that food policy was still its concern; Shri Jain himself was constrained to write a letter of protest to the Prime Minister. All that, however, does not mean that T T K has given up his advocacy of the policies he maintains; by his tremendous gusts, capacity to take pains and an equal readiness to invent a problem and its solution, TTK continues to win on points. To Pandit Nehru, he is indispensable—for the time being; there is not enough talent available in the Congress ranks to man the jobs at the top level and the Government of the day must function, even if a part of its energy is to be dissipated in personal wrangles. The fact that T T K privately regards members of the Planning Commission for instance, "as so many ninnies" and the latter think that the Finance Minister is trying, quite successfully, to be "just that", is perhaps merely an exuberant expression of the democratic checks and balances.

Inter-zonal Movement

Indeed the controversies that assail the Central Government today would be more appropriately the subject for a review in the "arts and entertainment" columns of a newspaper than for serious discussion in an economic journal, if they did not have important practical bearing on the future supplies of the nation's cloth and food. One view, deserving sympathy of course, is that the question of their relative scarcity and prices had better be left alone. The next crop would be coming into the market by the end of November; large-scale food imports have already begun to materialise. The Government has opened 15,000 fair price grain shops. They are being stocked adequately. The intention is to establish more. There is no particular merit in control of inter-zonal movement; after all, not much grain is moving from Madras to U P or vice versa; nor is Kerala receiving its food supplies from Kashmir. The fact is that inter-zonal movement of grains is extremely limited as it is and such other curbs as are necessary can be imposed, quite easily, through the mechanism of railway booking. After all, the major towns, including Bombay, Calcutta, Madras and Delhi, are already living almost entirely on imported grain. The reserves are not very low. Many more food ships are on the high seas. We can draw on the bulk of the imports that have been contracted for at short notice, particularly in an emergency. The U S would not allow the purpose for which the wheat loan has been given to be defeated merely by routine delays in procuring the necessary ships or for like reasons.

Futile Controversy

Similarly, the less said about cloth the better. The key to the cloth problem is higher production. The handloom versus organised industry debate, by itself, cannot relieve the shortage. What is required is to reserve a certain minimum for the cottage industry in the interests of social justice and employment; beyond that the organised sector can be allowed to expand capacity as much as it can. Presently, 14,000 automatic looms and nearly 2.1 million spindles have been sanctioned for installation. Judging by the fact that, of the spindles, nearly 1.8 million were sanctioned long ago and licenses for about 1.5 lakh spindles were either revoked or had to be cancelled, the progress of installation is extremely slow. Nor does the pace at which rehabilitation of worn out machinery is taking place give any hope of a vigorous expansion of the mill industry. Any discussion of new targets therefore would tend to be academic and would be unfortunate if it leads to bitterness and inaction.

Delhi Studying MacMillan Plan

The Finance Ministry is currently studying the MacMillan Plan for free trade in Europe. The British Chancellor's views on the subject did not come as a surprise to the Commonwealth Finance Ministers, as Washington reports suggested about a fortnight ago. Actually a memorandum from London was received in New Delhi a couple of days before Shri B K Nehru, India's representative at the annual meetings of the International Monetary Fund and the World Bank left for Washington. The communication indicated U K's intention to join the "Messina" group of powers in a free trading area and sought the Government of India's reaction to the proposed move. Parallel letters were sent to the other Commonwealth Governments. Since then U K has apparently decided that the area should include not only Belgium, France, Germany, Italy, Luxembourg and the Netherlands but also such other member countries of the Organisation for European Economic Co-operation as wish to join. Besides, the free trade area is not designed as an "exclusive

organisation" and if other countries wanted to join, Mr Macmillan had no doubt that something could be worked out to extend the scheme. "The Commonwealth countries would each have to decide whether it would be in their interests to become a part of the area".

From Mr MacMillan's subsequent pronouncements, a few facts are clear. Firstly, it is intended to promote exports within the area of finished goods only; raw or manufactured foodstuffs, raw materials, drink or tobacco would be excluded from the scheme. Ninety per cent of Commonwealth exports to Britain are of these commodities and Commonwealth interests, embodied in the system of Imperial Preferences, would be preserved.

Secondly, within the area, tariffs, except for purely revenue purposes, would be reduced by stages and ultimately abolished over a period of ten years or more. Each country would be free to preserve its own tariffs against other countries outside the area.

Thirdly, production in each country would be gradually reoriented on the basis of specialisation and natural advantages, so that each country has a larger market. The idea is to build internal prosperity and reserves of capital for export to underdeveloped countries.

India May Keep Out

In principle there is nothing objectionable in the scheme if India is not to join it; indeed certain advantages would flow from it to Britain and if Britain becomes a member of the free trade area, it is largely her own concern. A reply in these terms is believed to have been sent to Mr MacMillan's first communication to New Delhi. With the enlargement of the concept, however, the Finance Ministry is wondering what would be its repercussions on the pattern of trade that India is evolving. Of course there can be no question of scrapping the bilateral agreements that India has signed with the communist nations, some of the Bandung powers and her neighbours. Nor would India be interested immediately in giving up the advantages of Imperial Preferences though the idea of getting out of GATT and the Imperial Preferences system has been mooted often and was indeed recommended by the Fiscal Commission. India's sizeable exports of cotton textiles to the U K may be affected if India decides to join the free trade area but these could be protected through a "protective quota". Understandably the British Chancellor of Exchequer has not welcomed the idea of keeping protective quotas but equally understandably, if India at all countenances a scheme whose aims are so manifestly political, would like to eat her cake and have it too!

Growth of Cities

AMONG interesting data and observations about urbanization in Asia discussed at the Joint U N-Unesco Seminar held at Asia were the following:

(1) There are more large cities and a larger city population in Asia than either in Europe or North America. Asia has 289, Europe 261, and North America 116 cities with 100,000 or more inhabitants. Of the world's city dwellers, one-third live in Asia, one-fourth in Europe, one-seventh in North America.

(2) The process of urbanization began in Asia much later than in Europe or North America, and the proportion of city dwellers is smaller in Asia than in any other continent, except Africa. Thus, while in the world as a whole 21 per cent of the population live in cities of 20,000 or more, the corresponding figure for Asia is only 13 per cent as against 21 per cent in Central America and the Caribbeans, 26 per cent South America, 31 per cent USSR, 35 per cent Europe (excluding USSR), 42 per cent North America and 47 per cent Oceania.

(3) While in the West industrialization and the attractions of the city have been to a large extent responsible for the exodus from the country to the city, the population move in Asia has been caused mainly by the overcrowding of the countryside, low living standards in villages, and sometimes conditions of physical insecurity e.g. war, civil disturbance, political partition, refugee movement.

(4) Urbanization in Asia, especially since the last war, has been so rapid that it has outdistanced the rate of economic development. This has caused an "over-urbanization", which in turn has brought with it a multitude of social and physical problems. Symptoms of the malady caused by over-urbanization are inadequate housing, the almost complete absence of mass sanitary facilities, the presence of filth, squalor, repugnant odours, disease and high mortality. The last, however, is not borne out by Indian experience. Indeed the death rate in some of the Indian cities are today low enough to compare favourably with the mortality experience of the cities in Western Europe.

Housing problem has assumed such proportions in Asia that governments have had to assume increasing responsibility for the planning and construction of housing and community improvement programmes. But housing is also deeply involved in the process of saving and investment. The desire to own a house of one's own is almost universal but on the other hand, in under-developed economies aiming at rapid development, productive projects claim a higher priority in the allocation of scarce resources e.g. steel, cement, other construction materials and transport.

Indian Agriculture in Brief

A useful and pocket-size book-let has been recently brought out by the Economic and Statistical Adviser, Ministry of Food and Agriculture, Government of India, with a view to meeting primarily the need of those who wish to have a snap shot picture of Indian Agricultural Economy as revealed by the current Agricultural Statistics, certain essential data in allied spheres; e.g., population, national income etc. needed for an understanding of the Agricultural Economy in its broader perspective have also been included in this booklet.

A Kabul Diary

The Importance of Being an Indian

A DAY in Kabul is an at once interesting and instructive experience today, and I recently went through it. Two days would be one too many, and this too is going to be my lot on my way back from the Soviet Union in another three or four days. Now then, here in beautiful Leningrad, I must seat myself at the typewriter and make a few general, very general, observations on Afghanistan and, inevitably, India. In spite of the travails of travelling with a mixed bunch of tourists, who are just bearable in the air but boring beyond belief on terra firma, I rather enjoyed my day in Kabul. It was not very hot, and in the evening it was distinctly cool. The city, for so it must be called, has a rugged kind of beauty of its own. There are hills all around, and they are reliefs in more senses than one, especially for one used to the monotone of the plains of Bengal. There is no dearth of flies and dirt (about the only two things in generous supply), but the boys are healthy and handsome (as Ian Stephens found them) and this almost makes up for the rather unsavoury smell some of the men emit. I can say nothing about the women, for the country is in strict purdah. One hears stories though that the women are rather more intelligent than the men, and that underneath the burkha can be seen—if only one could see—fashions in nylon and Max Factor as would not shame either Paris or New York.

The city itself resembles neither; it is in fact a Middle Eastern capital—poor, dirty, proud of its independence, unashamed of its many deficiencies, and almost totally unaware that things could be better. One says these things with more sorrow than anger, for Afghanistan is friendly towards India and I would like to see the Afghans take their rightful place in the world. It is to a country like Afghanistan that an Indian should go for a boost to his national ego. The Indian rupee is a respected thing in this part of the world and, in defiance of the phoney official rate of 4 or 5 Afghanis to a rupee, you can get anything between ten and fifteen in the nearest tea shop. And, of course, being an Indian, you are received well almost everywhere. All this is most flattering, especially because not only does Afghanistan love India but she also hates India's one hater, Pakistan. Most flattering indeed.

* * *

It is not easy to discover the centre of authority in this land-locked country. It is said that the Prime Minister is a liberal sort of man, cautiously reformist. The mullahs cannot still be ignored in matters spiritual, and for them there are not many matters which are wholly temporal. There is also a feudal element, not entirely powerless. Its endless ramifications are often ridiculous; it is possible to meet ticket collectors who have to be addressed as Their Excellencies because of their connections. How any kind of balance is maintained among these three forces—secular, religious and feudal—I cannot claim to have discovered within a matter of less than twenty-four hours. One explanation offers itself. Perhaps what we are describing as forces aren't forces at all. Perhaps all three are so many static quantities. Things in motion collide, not things stationary. That I myself was on the move should make the country appear to me as in motion, as trees look from a moving train. It may not have been an optical illusion on my part that I saw very limited evidence of movement in Afghanistan.

Writing after seeing something of Tashkent, it is necessary to record the opinion that there may well be a very different destiny for the Afghans, a very likeable people for those who love the Afghans. The Kabul Hotel, where we were installed, is the perfect setting for a novel by Mr Graham Greene, but it being the setting of a work of fiction is not the only objective of a country. Afghanistan must clearly do a few things to be taken seriously by the world outside. The first thing to do is to recognise that there is a world outside. Because this is being written in Leningrad, the first commercial port opened by Peter the Great to connect Russia with the West and to start the process of modernisation still being carried on by the Communists, I consider Afghanistan's proud isolationism particularly unfortunate. Geologists think Afghanistan has rich mineral resources. To get them out of the bowels of the earth ie beyond the Afghans as they are now. Why not invite foreign technicians? The jet age also makes a difference. If there could be a direct and regular air service between Moscow and Delhi via Kabul, and also between Western Europe and Asia (which would save much unnecessary detour) Kabul could once again be an important place. Our knowledge of how the early Aryans went out in different directions is speculative and imperfect, but Kabul must have been a sort of a junction. It can be so again, if Pan American Airways and Aeroflot choose Kabul as their airport of call. For both, I gather, efforts are afoot, and it is for Afghanistan to avail itself of the opportunity. What Afgnanistan has to do is to make up her mind that she will once again be the gateway of a number of migrating or proliferating civilisations. She may even herself be a civilisation in the process. There is, however, one serious obstacle to that happy consummation.

* * *

The one decisive factor in the affairs of Afghanistan today is an invisible one which is also very real—the ghost of Amanullah. For students of revolutions—successful and otherwise—Afghanistan may well be the most interesting case. Talk to anybody who is somebody in Afghanistan, and you will find that he disapproves purdah and most other things in his country. Why isn't anything done about them still? Because all of them, the Prime Minister included, are afraid that the fate of Amanullah awaits them. It is the glib belief of many that a revolution which has failed is a pillar of later success; there are instances in history to support this view. This, however, is no reason for ignoring the example of Afghanistan, where a leader's attempt to go too fast has put the clock back by nobody knows how many decades. Was Amanullah too daring? Hair-splitting argumentation is unnecessary. History records that he failed to carry the country with him, and the result has been the demoralisation of all later reformers so far. I had often criticised Nehru for being too slow. Kabul has been a chastening influence. I can no longer say whether Nehru has delayed urgent reforms—or

averted decades of extremer reaction and orthodoxy.

The rivers and canals of Leningrad will be freezing shortly; my fingers are beginning to anticipate the process right now, and this discourse must be brought to an end as early as possible. Well, I was happy to see that Afghanistan was friendly towards India, for I like friendship. Most of my friends are utterly useless in the sense that they are incapable of doing much good or harm; I like my friends that way. It may still be doubted whether a nation's foreign policy can be, or should be, governed by the same Forsterian principle of personal relationships. Which is the Power among what we like to call the Colombo Powers? As for Bandung, only three or four countries really believe in the India line on international affairs—Burma, Indonesia, and possibly Ceylon. Not one is a Power in any significant sense. Germany could afford an Italian ally; the United States can enlist the useless support of such dubious allies as Formosa, Korea, Viet Nam, or Portugal. Can India afford the same luxury? I do not know the answer, but there in the Paghman gardens in Kabul I was wondering whether India was not acquiring the habit of picking up friends whose capacity to do India much good is nil and whose chances of receiving much help from India are not immediate. The windfalls now accruing to India from the continuing conflict between the Soviet Union and the United States are all welcome, and let's drink a toast to Nehru. But these profits are adventitious, and a long-term foreign policy for India still awaits formulation.

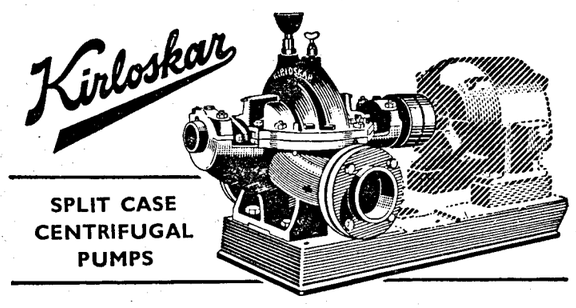
Letter to the Editor

EQUAL FREIGHTS AND NATIONAL INTEREST

THE observations of the Estimates Committee regarding equalisation of the freight on coal, reported in your issue of September 29, are fraught with grave consequences for the country. The purpose of a freight rate structure is not merely to raise revenue, for which a uniform rate should be simple and admirable to administer, but also to regulate economic activity with a view to reduction of costs, including cost of transportation. In the present Indian context, it is also a question of minimising investment in transport which is already large in the Second Five Year Plan.

Now what exactly is the long range effect of uniform freight rates on coal? Uniform freight presumably aims at uniform spatial consumption of coal, so that production requiring coal may develop with as much ease in Travancore, Punjab or Assam as in West Bengal and Bihar. However, if this kind of situation develops, then the haulage of coal will very likely much more than double its present average of 300 miles, since most of the coal is mined in the corner of a quadrilateral (the approximate geographical shape of India) with arms 1500 miles long. The same thing will happen to steel also, which will annul any advantage of location in the production of articles consuming steel. Since coal traffic constitutes about 40 per cent of the total goods traffic in ton-miles, this would enormously increase the transport commitment of the Plan, leading to a big increase in the requirements of rolling stock and investment in track. If, as is likely, foreign exchange needed for the resulting increase in investment is not available, an overall reduction in the size of the Plan would be inevitable.



However, in the short range, established industries are not likely to shift to new locations to take advantage of freight rates, because for most manufactured articles, transport costs form a small part of the total and the products of these industries (mainly engineering) being in short supply, and prices being competitive, the burden of higher freight rates can be shifted to ultimate consumers. Thus unless the rates of freight on manufactured articles are also made uniform, the relative advantage of consumers in different geographical areas will remain unchanged, and there will be only an upgrading of average prices.

It is also very unlikely that a transition from the short range to the long range situation described above will make a substantial difference because the investor, staking his capital, will hesitate to believe that experimental official policies will really nullify natural differences.

It seems therefore that the relative advantages of geographical location cannot be so easily annulled. If it can be done at all, it must be at the cost of national interest. However, to regard equality as desirable even at the sacrifice of national interests is to seek equality with vengeance and this we believe is against the spirit of the Union into which the States of India are banded.

From the London End

The New Opposition

THE British political situation possesses all the appearance of having undergone a major transformation in the past month. In the industrial field, it is now recognized, the abandonment of wage restraint and a new demand for a 40 hour week, has made the Trades Union Congress (in the words of The **Times**) "once again an opposition body." And the last time the House of Commons met "the two great parties were ranged, solidly and bitterly, against each other." The post-war honeymoon in British politics now appears to be over and, following in its train, are the serious possibilities of the revival of those industrial and political battles that once characterised the Baldwin years in the 1930's. In spite of qualms among the militant Left about Mr Gaitskell's qualities when he was appointed Labour leader, a new feeling and understanding has come to infect the great majority of this year's delegates to the Labour Party Conference (at Blackpool from October 1st to 15th). This feeling appears to have come from the ease with which the Labour Executive and trade unions have succumbed to the demands for militancy and a "return to the socialist solution."

The post-war political bi-partisanship between Labour and Tory, the wage truce in industry and the front-bench co-operation in Parliament has had a stifling influence on British politics and on efficient government. It has certainly made the British people a less-informed nation. The political dynamism which stimulates creative and new thinking has been absent; the vitality and understanding that comes from open controversy is no longer a feature of British politics. All this has been responsible for what in your correspondent's view is the colourless character of British public life today. The government has been able (at least up to the time of Suez) to pursue policies which increasingly give the impression that it is the Cabinet and not Parliament which is sovereign in the country. True, many constitutionalists would argue that this has always been the case. But never has Cabinet Government been more explicit in Britain than it has been since 1951. One has only to recall the speeches of the Colonial Secretary to appreciate the degree of contempt with which Parliament is currently treated by Ministers of the Crown. These tendencies have made the Government a less answerable institution and has, therefore, made for possible inefficiency in the administration.

New Unity

The apparent new unity expressed in the proceedings of the Labour Party Conference may very well provide the basis for a return to Parliament of a "new" opposition. Indeed, this is the overwhelming impression one gets of the Labour Party Conference. The unanimity that emerged on all crucial questions and above all the election of Mr Bevan to the position of Treasurer and thus to that of **de facto** deputy-leader of the Party portends a political "collaboration" in the Left which is likely to be of decisive influence in the immediate future.

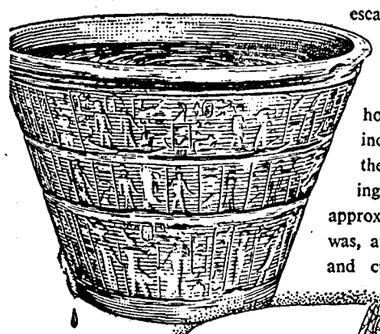
It is well to examine the possible causes which have contributed to this "new" situation. The crisis in the Labour Party over the last three years (indeed ever since 1950) has taken the form of a political estrangement of Mr Bevan from the leadership. More fundamentally, this was a reflection of the conflict over policies espoused on the one hand by the then Mr Attlee and by Mr Bevan on the other. The Attlee leadership, though a spent leadership, was clear on the policy the Party was to follow: it was one of rank revisionism in the sense that much of the "social changes" worked out in 1945 had become permanent features of British life and thus there remained little to be done which was fundamentally new. The Bevanite alternative was not as clear as this —it was more in the nature of an instinctive revulsion against the apparent bankruptcy of the old leadership. And this revulsion was at the same time being experienced by many of the rank and file members. For three years, a sharp bitterness enveloped the Labour Party. It contributed more than any thing else to the course of the last two general elections in Britain.

Gaitskell and the Working Class

The resignation of Mr Attlee and his elevation to the peerage coupled with some pertinent changes in the leadership of a number of trade unions has since presented Labour with a wholly new situation. The choice of Mr Hugh Gaitskell was natural to the old leaders. It at least did mean that no major leftist trend was being let loose; indeed it was logical that a policy of "respectability" should call for such a choice. And it was equally natural that the Bevanite wing should regard the appointment with the utmost derision. In the eyes of the Bevanites, Mr Gaitskell was a perfect example of an imperfect leader for Labour: he was academic and middle-class, and his philosophy was not in the British "socialist tradition". It was said that Mr Gaitskell was a Keynesian and thus more concerned with a policy of gradually implementing his notions of equalitarianism rather than socialism as such. And so ever since 1950 Mr Gaitskell and Mr Bevan have been at odds with each other. According to the **New Statesman** "for six years these two men have fought one another and giving no quarter". The untenability of this position is now recognized in influential Labour circles, not because of the need to provide the old platform for Mr Bevan but because Mr Gaitskell is yet to establish himself in the Party and among the working class. The continuance of disunity can spell doom to the Labour Party. The delegates at Blackpool recognise this anger and this has fostered the idea of "collaboration", viz, of giving Mr Bevan a place in the Labour hierarchy. It is now being suggested that Blackpool, like the Conference of 1935 and 1945, will prove an historic turning point in the fortunes of the party.

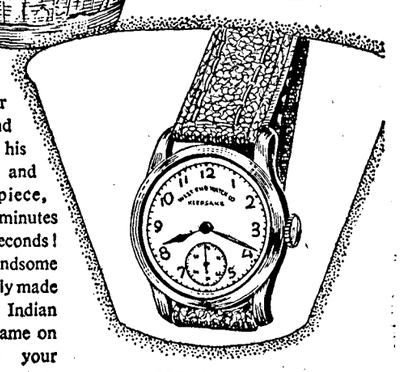
The prospect of "collaboration" between Messrs Gaitskell and Bevan holds out an equal prospect for the Labour opposition in Parliament to take on a new character. The course of events at the T U C Conference and the Labour attitude on Suez seemed to assure the emergence of a virile opposition once again. The Labour Party Conference further strengthened this prospect. In spite of certain drawbacks and weaknesses (which were reviewed in this Journal), the policy statements on 'Equality', 'Personal Liberty' and 'Colonial Plural Societies' represent a certain step forward. The Conference adopted these with the undertaking by Mr Gaitskell that Labour, when in power, will tax

capital gains and revise the whole taxation system so that the alleged current tax evasions by business enterprises will be suitably countered. On the Colonies, an undertaking to gradually abolish colour bar practices was agreed and some fine sentiments were expressed for the proposal (and it remains no more than a proposal) that one percent of the national income be devoted to the financing of colonial economic development. On Suez, the Conference decided on negotiation and a pacific settlement. And some ideas are being worked on retirement pensions and social welfare facilities.



There have been published in a short space of time the Socialist Union's 'Twentieth Century Socialism', Mr. Gaitskell's pamphlet, 'Socialism and Nationalisation' and the more fundamental works by John Strachey and C A R Crossland entitled 'Contemporary Capitalism' and 'The Future of Socialism' respectively. From a different point of view, G D H Cole's 'World Socialism Restated' challenges certain contemporary policies of Labour and pleads for some international socialist-communist cooperation. All these publications reflect a deep intellectual ferment in the Labour Party. For once a serious search for a long- term programme suitable to the times and yet maintaining a continuity with the policies of Keir Hardie is being undertaken.

Of all these publications the most pertinent, in your correspondent's view, is that written by Mr C A R Crossland, M P. It is certainly one of the most thoughtful expositions of Labour's future policy. It combines a severe social, economic and political treatment with a remarkable unity. It suggests that the questions which worried earlier generations of socialists are no longer of relevance today. The contemporary society is in Mr Crossland's view, "not capitalism" and, therefore, the "ownership of the means of production" is no longer a question for Labour policy. In contrast "Equality" should be the principal aim of contemporary socialism and Mr Crossland undertakes a lengthy analysis of the various ways in which this can be achieved. By and large, the analysis turns on fiscal and educational measures. And yet the tax reforms suggested appear to be directed at the owners of wealth; thus while in a fundamental sense the whole existence of Capitalism is denied, the elaborate set of fiscal and educational proposals suggested (for equality) are in fact directed at the main economic arsenals of power in the country—the "owners of the means of production."



This possible inconsistency is not peculiar to Mr Crossland. The search for equality is destined to become the main aim of the Labour Party. So far, it appears to be divorced from the crucial questions of social ownership and state leadership in commerce and industry (and this is a feature of Mr Gaitskell's pamphlet). How far then can Labour's concept of equality be different from that of the Conservatives who speak in terms of a doubling of the standard of living in the next 25 years and who are still pursuing a tax system which remains progressive and continues to redistribute incomes? It may very well be possible for Laour's equalitarianism to become indistinguishable from that of "Butlerian Conservatism."

It was not expected that the Blackpool Conference would examine so important and complex a matter as this. Even the "old-time Socialists" like Mr Frank Cousins (who dominated the recent TUC Conference with such devastating effect) and Mr Bevan did not speak or argue for increased nationalisation. The intellectual ferment in the British Left has just started and resolution of conflicts wil take some time. The Conference itself appeared to tilt the balance of power within the Labour leadership in favour of the "keep left" wing.

WATER CLOCKS
were all very well—

—in Ancient Egypt! Water escaped at a fairly even rate from a small hole in the base of a large vessel. A scale of hours painted inside indicated the time by the level of the remaining water. This gave the approximate hour, but it was, at best, an uncertain and cumbersome method.

Today the owner of a West End Watch carries on his wrist a compact and accurate timepiece, recording time in minutes and even in seconds! These strong, handsome watches are specially made to withstand the Indian climate. Our full name on every watch is your guarantee of value, whatever the price you pay.

From the Chair

Industrial Finance Corporation of India

Speech of the Chairman Shri K R K Menon

THE following is the full text of the speech delivered by the Chairman, Shri K R K Menon, at the Eighth Annual General Meeting of the Shareholders of the Corporation held on September 29, 1956:—

Gentlemen,

I have pleasure in placing before you the Accounts of the Corporation and the Report of the Board of Directors for the year ended the 30th June, 1956. Printed copies of the Accounts and the Report are before you. These have also been circulated to all the shareholders. I shall, if you agree, take them as read. I would, however, make some observations on a few points.

Profits Transferred to Reserve

The working of the Corporation for the year ended the 30th June 1956 has resulted in a profit of Rs 32.68 lakhs which shows an increase of Rs 8 lakhs over that of the previous year. After setting aside a sum of Rs 10.18 lakhs as provision for taxation we are left with a net profit of Rs 22.50 lakhs. The whole of this amount, however, has had to be transferred to the reserve for Bad and Doubtful Debts in view of the anticipated loss in the account of the Sodepore Glass Works Ltd, to which I made a reference in my speech last year. We have, therefore, had to call upon the Central Government this year also to pay us a subvention to enable us to pay the entire guaranteed dividend amounting to Rs 11,25,000/-. We hope that with the further provision that we shall make from the current year's profit towards bad and doubtful debts, there will be no need to set apart any amount in the succeeding years on this account. As we shall make a substantial saving in our tax liability on our current year's income, depending on the size of the amount that we are obliged to write off in the account of the Sodepore Glass Works Ltd, we anticipate that we will have sufficient balance left out of our profits this year to meet the guaranteed dividend to our shareholders without having recourse to a subvention from Government. You will observe that I take quite an optimistic view of the future. I do so, relying particularly on two major factors, namely, first the increasing measure of appreciation on the part of the industrialists of the country, and also of co-operative Societies engaged in industrial enterprises, of the ability of the Corporation to meet their needs in the matter of long-term loans, and second, the marked increase in the volume of industrial investment that is likely to materialise during the period covered by the Second Five Year Plan.

Record Loan Applications

Evidence of the first named factor will be found in the figures relating to our activities furnished to you in the Annual Report which is in your hands. It wil be noticed that the amount of loans applied for in the year which has closed reached the record figure of Rs 27 crores 70 lakhs as compared with Rs 11 crores 27 lakhs for 54-55 and Rs 9 crores for 53-54. The average for all the previous 7 years put together is Rs 8 crores 62 lakhs. I venture to think that this is a fair indication of the increasing amount of confidence that the industrial public is now placing in our institution. To deal, effectively with this enormous increase in the demands made on us, and at such short notice, has been no easy task, and the measure of the modest success we have achieved in this direction is indicated by the fact that the total amount of loans sanctioned by us during the year under review was Rs 15 crores 13 lakhs as against Rs 7 crores 34 lakhs in 54-55 and Rs 5 crores 27 lakhs in 53-54. The yearly average for all the previous seven years put together was only a little over Rs 4 crores. I see no reason why this very satisfactory record for 55-56 should not be maintained in the succeeding years if our administrative machinery is geared adequately to cope with the increasing load, and our relations with the industrial and commercial sector of the public continue to be as close and cordial as they have been during the past year.

Public Relations

In connection with this last named factor of public relations it is my very pleasant duty to take this opportunity to acknowledge the assistance that we have received during the year under review from the various Chambers of Commerce & Industry whose representatives were good enough to meet me and my colleagues on the Board of Directors on several occasions for free and frank discussion of various problems of mutual interest. These discussions greatly facilitated our work during the year, and have helped in particular to focus our attention on ways and means of simplifying our procedure to the advantage of our clients as well as ourselves. I feel sure that the steps we have already taken in pursuance of these discussions would bear fruit in the near future in the shape of better business for us and more cordial relations with our clients.

A Separate Legal Branch

I will refer to just one or two of the more important measures that we have adopted in connection with the drive that we embarked upon in the year under review for quickening the pace of work and effecting other general improvements. A measure of great significance, was the institution of a separate legal branch of our own, manned by full-time officers under the control of the Corporation, in our head office as well as in two of our branch offices. This measure, which has been introduced as an experiment for the present, will be extended to all our branch offices after we satisfy ourselves that there are no snags to it. It is designed to quicken the pace of work at various stages in connection with the examination of title deeds and the execution and registration of mortgage documents. This will also cut down to a very considerable extent the legal charges now incurred by us and passed on to borrowers. Many of our clients have expressed great satisfaction at this long over-due reform in our administrative set-up. We have also succeeded in considerably simplifying, and standardising to as great an extent as possible, the terms and conditions incorporated in our mortgage deeds. The previous practice of our sending for our clients' representatives all the way to the Head Office in Delhi to discuss and finalise the terms and conditions

of loans was given up and branch Managers were delegated authority to deal with our clients on the spot on our behalf. We have also liberalised to an appreciable extent the conditions under which interim loans are granted, particularly in cases where, pending the finalisation of the legal formalities concerned with the execution and registration of the formal mortgage deeds, machinery etc. ordered by our clients has to be paid for or documents relating to which have to be retired.

Four Different Auditors

Before I leave the administrative and organisational aspects of our work I should like to mention one or two salient facts in regard to the audit that has been done of our accounts. We have now four different auditors carrying out audit throughout the year, and I shall refer briefly to each of them. Firstly, there is our own internal audit, the machinery for which has, in the course of the year, been put on a satisfactory working basis. This has been found to be of very great value to us. Secondly, there is the audit done by a firm of Chartered Accountants who are elected by the shareholders. Thirdly, another firm of Chartered Accountants appointed by the Central Government in consultation with the Comptroller & Auditor General also conducts an audit. No serious irregularity has been brought to notice by either of these firms of Chartered Accountants. Certain relatively minor matters to which our attention was drawn by them have been looked into and set right. Fourthly, there is the audit carried out by the Director of Commercial Audit under the auspices of the Comptroller & Auditor General. In the course of the year under review the Director of Commercial Audit conducted his audit in two instalments, the first one extending from the last week of September 1955 to the first week of February 1956, covering our official year ending 30th June, 1955, and the second extending from the first week of June 1956 to the first week of August 1956, covering the first half of the year 1955-56. In the audit of the accounts for the first period a large number of formal objections were raised by the audit party and, after we had commented upon them, only a few of these objections are now understood to be in the process of finalisation. We are hopeful that a few more of these items also will be withdrawn or modified as a result of further discussions. The audit of the second period is still in the process of completion.

There is no doubt that in the existing set-up we have a multiplicity of audit, somewhat in excess of real requirements. One might also be tempted to take the view that if the bulk of the items of orginal audit objections was withdrawn there must have been created quite an appreciable quantity of work at all levels most of which would have been eventually proved to be infructuous. These and other related matters have engaged our close attention and we have brought these to the notice of Government.

Prospects During Second Plan

I now turn to the second important factor, which I would describe as the external factor—as distinct from the internal factors about which I have been speaking to you till now —which, in my opinion, should give us ground for hope of an even greater volume of business for the Corporation in the future. This factor is centred round the spurt in industrial investment in the private sector that it is anticipated will materialise during the Second Five Year Plan period.

The Planning Commission in their report on the Second Five Year Plan have given detailed figures of some of the overall targets of industrial investment in both the public and the private sectors which, they state, will show that the Second Plan period will be one of "intensive and many sided industrial effort." During the first Five Year Plan period there was a short-fall of investment in the private sector in certain industries, though, in the aggregate, the investment target of Rs 230 crores for expansion programmes was bettered in actual performance to Rs 340 crores. The lag in private investments occurred, according to the Planning Commission, in industries which required heavy capital investment and offered a relatively small profit margin. It is this kind of indusry which might not be able to attract adequate equity capital from the investing public that would claim our special attention during the coming years, with due reference of course to the industrial priorities drawn up by the Planning Commission in their report. The general scheme of priorities in the private sector as envisaged by them places Iron & Steel first, then heavy and medium engineering industries, including structural fabrication, automobiles, railway rolling stock, castings & forgings, industrial machinery, bicycles, sewing machines, motors and transformers etc, followed by fertilisers, chemicals, cement, refractories, jute and cotton textiles, sugar, paper and a wide range of consumer-goods industries. The programme of over-all development envisaged in the private sector during the 2nd Plan period is estimated to involve an outlay of Rs 720 crores, comprising Rs 570 crores of new investments and Rs 150 crores on replacements and modernisation. Of this total estimate of Rs 720 crores a provision has been made by the Planning Commission for Rs 55 crores for the activities of the National Industrial Development Corporation and Rs 15 crores for us, leaving a balance of Rs 650 crores to be raised from other sources. While our figure of Rs 15 crores is near enough to the average of our disbursements during the past seven years, our achievement during the past one year leads me to think that we should be able not only to reach this target quite easily but to improve on it to an appreciable extent in the next five years. We, therefore, propose to address Government on the subject of the feasibility of increasing this figure.

State Governments

In spite, however, of the fact that these figures relating to the industrial development in the private sector during the Second Five Year Plan that I have given you do augur well for an institution like ours which may well be described as a hand-maiden of the private sector, I think it is just as well that I invite your attention also to one or two factors which we shall have to take into account in assessing our ability to rise to our full stature in the coming years. Firstly we must take note of the fact that we have other institutions like the Industrial Credit and Investment Corporation of India and the National Industrial Development Corporation whose fields of activity converge on ours, and indeed, overlap with ours to some extent. Secondly, it is important to bear in mind the fact that both these institutions have a greater measure of freedom in the matter of financial operations than we have, and they enjoy certain special facilities which we do not share. Thirdly, though the Central Government have so far implemented the policy of utilising the Corporation as the main channel

for processing their own industrial loans, and we may hope with confidence that this policy will continue to be followed, we cannot be sure that the State Governments have been, or will be, equally helpful to us in this matter. I mention this as we have been given to understand that certain State Governments have sanctioned loans directly to certain industrial concerns, and, according to a statement contained in the Annual Report of one of the State Financial Corporations, the State Government concerned have been "offering loans at rates of interest which are only about half of those charged by us and on the basis of security which are also very much easier than those observed by the Corporation." You will agree this is a matter of vital importance to both ourselves and the State Financial Corporations.

Monetary Resources

The fourth, and, in a sense, the most important factor which is likely to come in the way of expanding our activities to the fullest extent otherwise possible, is the fact that, if we succeed in inviting business at the present rate and dealing with applications for loans at the pace that we have achieved last year, our own monetary resources will soon be tapering off, thereby accelerating the advent of the day when we shall perhaps be forced to borrow under conditions which might leave us little or no margin of profit after meeting our tax obligations and our working expenses. This matter is engaging our serious attention already, and we hope that we should be able to find a satisfactory solution in collaboration with the Central Government who have been apprised of the matter. It will take some time before a final decision is taken; I mention it now merely to reinforce my point that if the outlook is on the whole bright and we could be quite optimistic regarding the future, it behoves us also to take note of other factors which we shall have to take into account.

Assets of Defaulters

In my speech last year I said that we had been obliged to take over possession of the assets of certain concerns who had defaulted in their obligations to us. The position in this regard is explained in our Annual Report. You will have observed that there has been considerable progress in this matter. I am glad to inform you that one of these factories, which we sold, and another which we leased, have both now gone into production. It is gratifying that these concerns which had virtually closed down business for considerable periods have been set on their feet again and brought into full production, thanks to the intervention of this Corporation. We are taking appropriate steps with the same objective in regard to the other concerns also, and we hope it will be possible to achieve our ojective consistent with the safety of the funds invested by the Corporation

Sodepore Glass Works

You will no doubt also recollect that the Board of Directors had decided to sell the factory of the Sodepore Glass Works Ltd, another of our defaulting concerns, to the Asahi Glass Company Ltd of Tokyo and that the vendee concern were to form an Indian company to take over the assets and work the plant. This Indian company has now been formed, and necessary action in regard to the execution of the sale and mortgage deeds is well under way. Steps have also been taken by the company to make necessary arrangements for bringing the factory into production as early as possible. We expect that this factory will start working before long.

Loans to Co-operative Societies

Another noteworthy feature of our activities in the year under review was that we sanctioned loans to Co-operative Societies of a total amount of Rs 5 crores 50 lakhs. I should like to mention in this connection that apart from the impetus that this has given to the Co-operative movement as such the fact that as a condition precedent to our loans, the members of these Societies, drawn mostly from the lower income groups, have been made to subscribe towards the industrial schemes financed by us, a total sum by way of share capital of the order of Rs 2 crores 20 lakhs, has contributed appreciably towards helping Government's efforts at promoting savings and drawing them off for investment purposes.

A large majority of the concerns to whom we have lent money did quite well during the year under review, and, in the case of a number of concerns, we saw no reason to withhold the permission asked for to declare dividend in excess of the normal maximum of 6%. This very satisfactory position in regard to production and profits is reflected in the figures relating to progress of repayments furnished in the Annual Report.

Policy to Sugar Industry

You will have noticed from the industry-wise figures given in the Annual Report that our loans to the sugar industry aggregated Rs 11 crores 58 lakhs at the end of the year under review. We have been advised by the Central Government that we should continue to finance Sugar Co-operative factories on the scale that we have been doing hitherto, and that as regards loans to sugar factories other than Co-operative Sugar Factories our policy in regard to their financing should not be unduly restrictive in view of the recent enhancement by the Government of the target of production for the industry.

We dealt with the large majority of loan applications in consultation with our Advisory Committees of which we have had four working in the course of the year viz those for the Textile, Engineering, Chemical and Sugar industries. These Advisory Committees are now in the process of being reconstituted so as to include a larger number of technical experts in each, and also so as to provide for a wider territorial representation.

State-wise Distribution

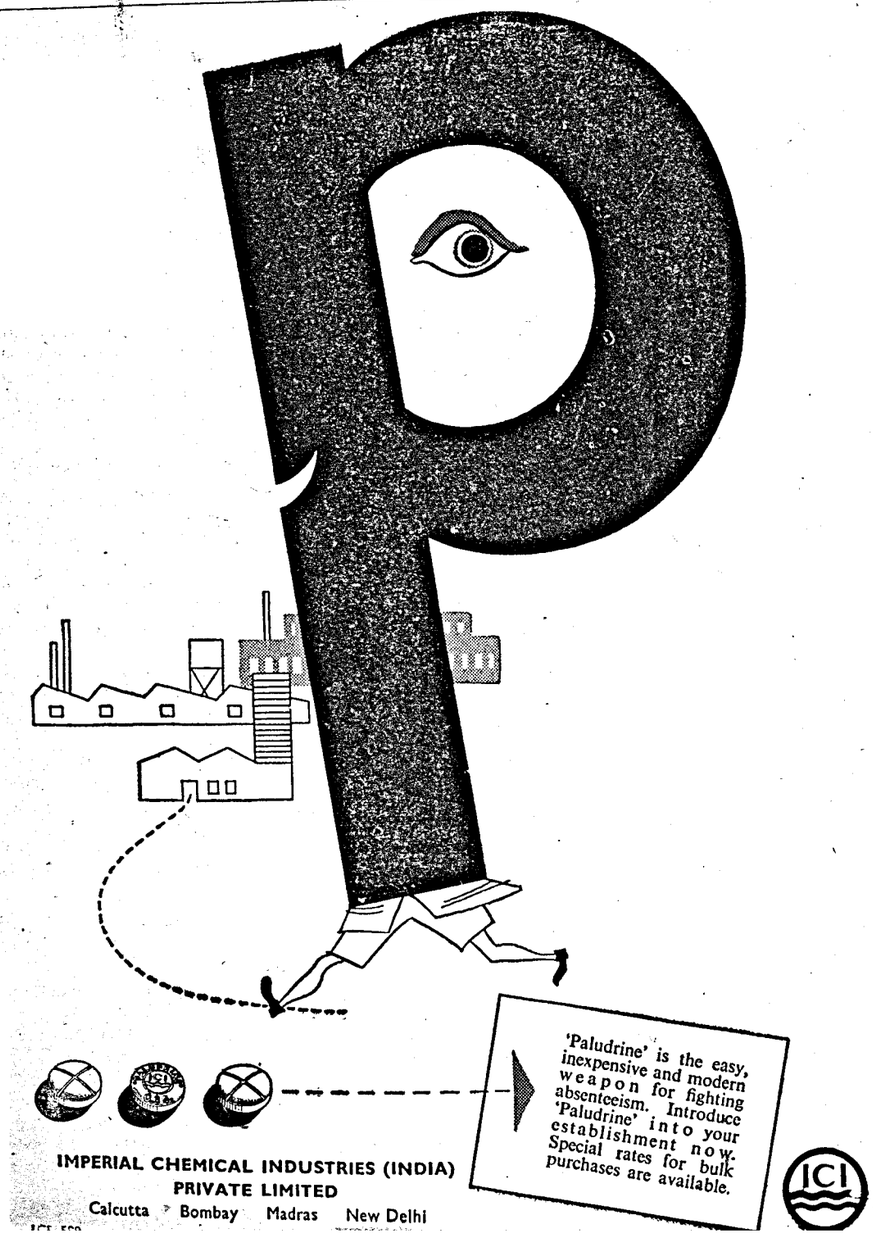
The figures given in Appendix E to the Annual report showing the State-wise distribution of the loans sanctioned by us in the year under review as well as in the previous years will show that as compared with the position as it obtained on 30th June 1955, there has been a marked increase at the close of our financial year in June 1956, in the loans sanctioned to concerns located in certain States. Excluding those States which, relatively speaking, may be described as industrially advanced, the figures relating to the progress in some of the other states are, I think, worth inviting your special attention to. These are:—

(i) Andhra: Increase from Rs 4 lakhs upto the end of 1955
to Rs 1 crore 29 lakhs at the end of 1956.

(ii) Assam: From nil up to the end of the 1955
to Rs 45 lakhs at the end of 1956.

(iii) Punjab: From Rs 1 crore 10 lakhs up to the end of 1955
to Rs 2 crores at the end of 1956.

(iv) Travancore-Cochin: From Rs 1 crore 12 lakhs up to end of 1955
to Rs 3 crores 18 lakhs at the end of 1956.



(v) Uttar Pradesh: From Rs 1 crore 30 lakhs up to end of 1955 to Rs 2 crores 95 lakhs at the end of 1956.

Efforts are being made to effect substantial increases of this kind also in other States similarly situated.

Delay Cut Down

The ministerial and officer staff of the Corporation was augmented to some extent to make good deficiencies which had existed since long. On the procedural side, certain measures were adopted which have resulted in the cutting down of delays in the day-to-day work of the Corporation to an appreciable extent. This matter continues to engage the personal attention of myself and my General Manager, and we are hopeful of effecting further improvements as soon as the additional staff to be newly recruited are in position.

Before resuming my seat, I should like to convey my sincere thanks to my colleagues on the Board of Directors and on the various Advisory Committees for their co-operation and guidance in all our deliberations. I should also like to convey on behalf of the Board and on my own behalf our thanks to the General Manager and the entire staff of the Corporation, both here and in the branches, for their very loyal and devoted work throughout the year in spite of the exceptionally severe strain that had been placed on them as a result of the marked expansion of the activities of the corporation in the year under review.

Book Review

Light on the Dark Continent

Inside Africa by John Gunther. Hamish Hamilton, 1955. Pp 960, Price 30 shillings.

THE latest book in the 'Inside' series is undoubtedly John Gunther's greatest work. Gunther himself says that he worked on this book much harder than on any that he has ever written before. As a matter of fact, he has been collecting material on Africa for about 25 years. He has also travelled widely in Africa more than once, spending several months in 1952-53 in particular, covering more than 40,000 miles and talking to over 1,500 people. The result of all these efforts is extremely gratifying. It is a heroic job to attempt to cover in a single volume—though a comparatively big one running to 960 pages—such a vast and extremely complex continent like Africa but Gunther has done it admirably.

Of the Colonial Powers in Africa, namely, France, Britain, Portugal and Belgium, different patterns are to be seen as regards their approach to the colonial problem. But basically, Britain has believed in preparing the Colonies for eventual self-government, whereas the other three have been endeavouring to achieve the so-called assimilation of the Colonies with the Metropolitan country, politically as well as culturally. The British approach seems to have been much more successful and suited to the taste of Africans than that of the other powers. Gunther regards that all in all, British rule is the best in Africa, though the British do not give as much economic opportunity as perhaps the Belgians do nor as much political and racial equality as the French. This is because the British have given opportunities to two things which Africans need most, namely, education and justice. Whatever be the means, there is little doubt that a Continent in which out of a population of nearly 200 million only about 5 million are whites, political freedom and freedom from the domination of the whites cannot be delayed for long.

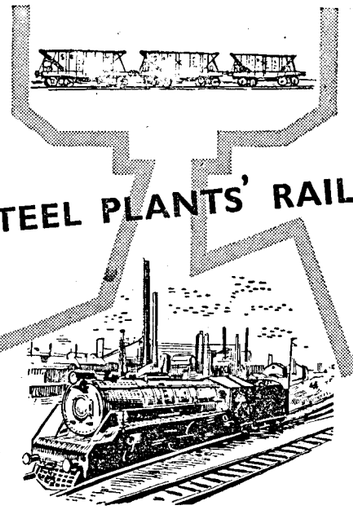
Gunther starts his African survey with the French territories in the North, namely, Morrocco, Algeria, Tunisia, then proceeds to Libya, the youngest independent country of the world, then to Egypt and what he calls its enormous step-child, the Anglo-Egyptian Sudan. Thereafter Ethiopia, British East Africa and South Africa are covered; then the Portuguese and Belgian parts of Africa are surveyed and finally he goes into the "promise and sunshine, of the West Coast, where experiments of great germinating forces are taking place, particularly in the Gold Coast and Nigeria". After giving historical account, he has discussed with great detail and objectivity, current political and social issues in each of the countries and regions, such as for instance, the Mau-Mau problem in Kenya, Apartheid in South Africa, Medicine Murder in Basutoland and uranium exploitation in the Congo. Gunther is very severe on colonialism and is even more so on apartheid. He has recorded that in some respects the South African government is the ugliest he has ever encountered in the free world. Of course, he is not without some praise for the good work, albeit to a very limited degree, the Colonial Powers have done to develop Africa economically and politically, and Gunther thinks that one of the most important things which they did, was to introduce Christianity.

As mentioned earlier, it is obvious that colonialism is dying in Africa. The whole Continent is in ferment and the White man is beginning to be mainly on the defensive; in fact he is frightened and he is trying to prolong his rule by a process of what Guther calls 'amelioration and concession.' It is true that there is not much of pan-African movement in the country. But even so, there are a number of unifying factors, especially the desire to be free from Colonial rule. It has now been amply demonstrated that colonialism is not necessary for the economic prosperity of any nation. Nay, the opposite is true. In exploiting the very rich natural resources of Africa, the end of colonial rule will undoubtedly stimulate economic growth both of Africa and the other countries, not the least important the present colonial powers themselves.

To the oft-repeated question, whether the Africans are capable of self-government or not, Gunther replies:

"Of course not in many areas. But the question no longer has much relevance, strange as this may seem. I met many Africans, particularly on the East Coast, who conceded frankly that they were not remotely ready for full self-government as yet. The question is nevertheless irrelevant because, whether they are fit or not, nationalist Africans feel that they must start somewhere, sometime, and learn government by practising it. They would much prefer to have bad government of their own than good government by a white outsider. The only way to learn how to walk is—to crawl."

There are all kinds of impediments, arising in particular from the multitude of tribes and languages, but there is no question that these difficulties can be and are being overcome.



Being the American journalist that he is, Gunther naturally devotes some space to the question of Communism in Africa. While certain tendencies, such as poverty, ignorance, abuses of Colonial Powers, do make for Communist advance, by and large there are other factors which are tending to operate against Communist advance. The Russians themselves have not yet taken much interest in Africa, except very recently in Egypt. Further, religious and tribal factors help to restrain the spread of Communism. Gunther concludes, therefore, that the most sensible way to discourage Communism in Africa is to give political opportunity to the local population, and in the short run, give them at least good government.

Gunther's appraisal of American policy in Africa is also candid and realistic. The U S A began taking interest in Africa only during World War II. Gunther observes that American policy towards Africa is double-edged, namely, "to sympathise in the abstract with the Colonial people in their desire to be free, but to do nothing that will embarrass their European masters". The U S A is of course interested in maintaining naval and air bases on the African Continent, especially on the West and Northern Coasts. Incidentally, Gunther gives quite a few

particulars about the aerodromes which the U S air forces control, including such details as the length of the runaways etc. The U S is also interested in uranium and other atomic metals in Africa. American influence is particularly considerable in Ethiopia, Liberia and Congo. His advice is that his country has to take a much bolder position by announcing its complete faith in freedom for all people and by enormously expanding its assistance to Africa. But he notices that as in many other parts in the world, anti-American sentiment is often pronounced in Africa, and he says that

"Jawaharlal Nehru is more likely to be the spiritual father of the new Africa than Dwight D Eisenhower. Africa is awake, Africa is alert, it has seen the example of Asia, even if its circumstances are different from those of Asia and for good or ill, it is marching with the times".

It is impossible to do justice to this great and fascinating book in a short review. It does not of course pretend to cover exhaustively all aspects of the African Continent, but in this busy world when even the scholar cannot find time to read even a part of the material that is available, 'Inside Africa' provides a self-contained and eminently readable account of a Continent that is going to be in the forefront of world politics in the second half of this century. Its usefulness is further enhanced by the very exhaustive bibliography and a tabular statement giving data on area, population, political status, racial composition, etc, etc.

THE 'STEEL PLANTS' RAILWAY

Not a new Railway, but a new name by which we may call the South Eastern Railway—and for good reasons too.

The South Eastern serves the gigantic Steel Plants at Tatanagar and Burnpore. Two new ones, each with a million-ton capacity, are now going up at Rourkela and Bhilai on the South Eastern Railway and another at Durgapur. To Tata Plant alone, the Railway carries daily on an average 850 wagon-loads of iron-ore, limestone, dolomite, manganese and, of course, coal. And from there, again, the Railway moves out 150 wagons a day carrying finished steel. Imagine the colossal requirements of all the five plants put together, specially when the old ones will have doubled their capacity and the new ones gone into production by the end of the second Plan period. Before then, the South Eastern Railway should be ready with many new lines and doublings, remodelled yards, crossing stations, modernised goods sheds and whole new townships.

SOUTH EASTERN RAILWAY WILL DELIVER THE GOODS

ISSUED BY THE PUBLIC RELATIONS OFFICER

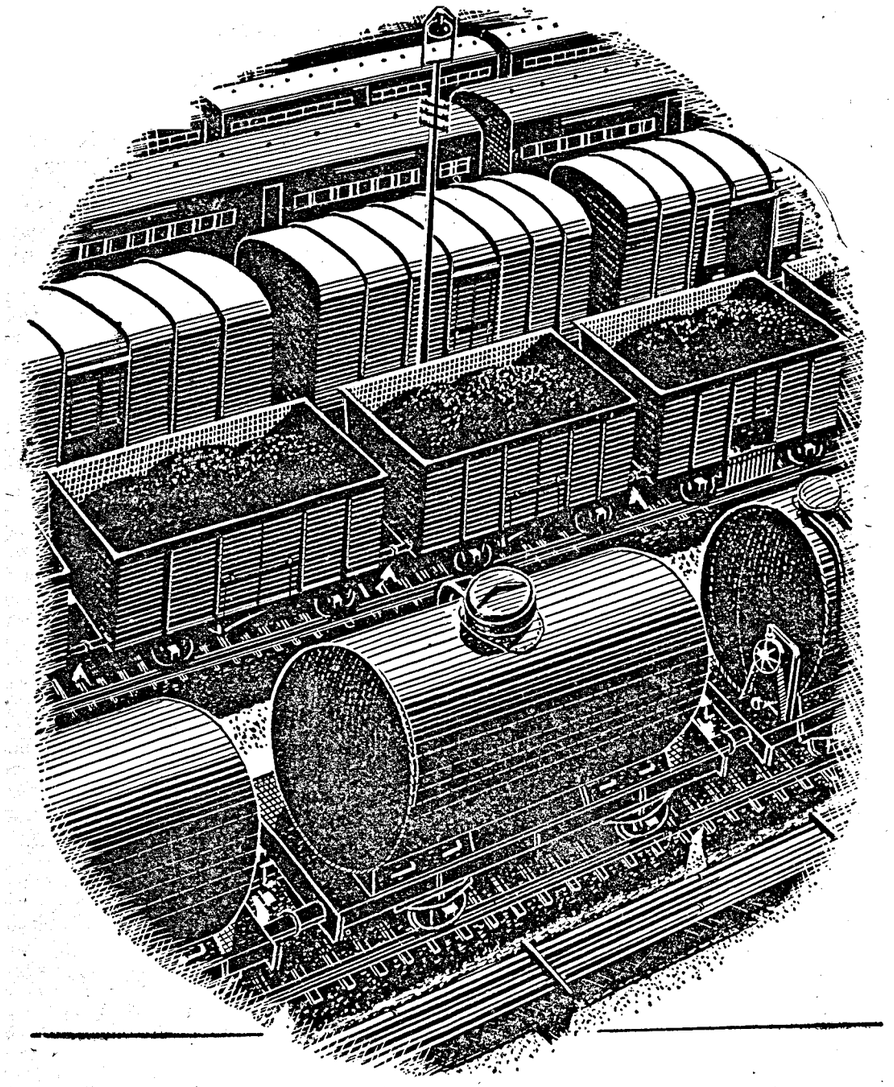
Labour Cost and Economic Growth

P R Brahmananda

IN his article, Labour Cost and Economic Growth (Economic Weekly, September 29), Mr A K Sen argues that the foundation of the thesis of Consumption Multiplier is "dubious", because of the possibility that the rural population would tend to raise its consumption as and when the disguised unemployed are transferred to the investment sector. Mr Sen, therefore, pleads for effective fiscal measures with a view to minimising the extent of such additional consumption. In the course of the same article, Mr Sen also argues that if the consumption multiplier thesis is accepted, there would tend to be a predominant bias in favour of techniques with a higher degree of labour intensity. The example given by Mr Sen in this connection is reproduced below:

	(Figs except % are of Rs) Technique I	Technique II
C (Capital) ..	100	300
P (Production) ..	10	20
W (Wages) ..	5	5
r (Rate of profit of the firm) ..	5%	5%
k (Consumption of the disguised unemployed) ..	4	4
p (Proportion of recovery of k) ..	$\frac{1}{2}$	$\frac{1}{2}$
r' (Rate of profit of the economy) ..	7%	5.7%

Let us examine each of the contentions of Mr Sen.



1. The generalised formula of the Consumption Multiplier as given in **"Planning for an Expanding Economy"** is: $\frac{1}{g+(d\times mpc)}$, where **g** is the difference between the wage (**w**), and the consumption of the disguised unemployed (**d**) and **mpc** is the marginal propensity of self-consumption of the rural population. In the illustration given by Mr Sen above, if **w** is equal to 1, **g** is $\frac{1}{5}$ **d** is $\frac{4}{5}$ and **mpc** is $\frac{1}{2}$. The value of the consumption multiplier would be unity only if we assume that **mpc** is equal to unity. The problem of reducing the value of **mpc** through fiscal and other measures has been duly emphasised in the same book which Mr Sen criticises.

2. It is not correct, however, to assume that **mpc** would always be unity. There are periodic bumper harvests during which considerable expansion in the investment sector can take place without encountering the difficulties to which Mr Sen refers. In any given period, **mpc** would tend to decline with expansion in output. The larger the range of output expansion, the lower would tend to be the value of **mpc**. Herein lies the possibility of overcoming unemployment and of initiating a self-sustaining cumulative process, provided appropriate policy measures are adopted.

3. There is a subtle incompleteness in the illustration given by Mr Sen. Let us assume that the economy has a choice between the two techniques. In each case, the cost of fixed equipment is Rs 100. Technique I takes up 5 units of liquid capital (wage-goods) and Technique II, $1\frac{1}{3}$ units. Technique I produces 10 units of output and Technique II, $6\frac{2}{3}$ units. The profit rate to the firm would tend to be 5 (or 5 per cent) in either case. Mr Sen's contention here is that as in Technique I, 5 units are expended on wage-goods and as **k** is 4, and as the proportion of recovery is $\frac{1}{2}$**k**, there would tend to be a release of 2 units of wage-goods to the economy. Hence, the surplus to the economy is 5+2, viz., 7 units (or 7 per cent) in the case of Technique I. In Technique II, the release as a result of the disbursement of $1\frac{2}{3}$ units of wages, would tend to be only $\frac{2}{3}$ of a unit, and hence the rate of profit to the economy would be about 5.7 per cent. Obviously, Technique I should tend to be superior, according to Mr Sen. The above contention does not stand a deeper examination. As pointed out earlier, the value of the Consumption Multiplier in the above case is $1\frac{2}{3}$. Hence the figures of recovery are higher than those indicated by Mr Sen. In the case of Technique I, the recovery would be $3\frac{1}{3}$ and in the case of Technique II, it would be $1\frac{1}{3}$. Apart from this, even a glance at the above illustration would indicate that whereas in the case of Technique I, the economy is utilising 5 units of wage-goods as liquid capital, in the case of Technique II, only $1\frac{1}{3}$ units are being utilised for this purpose. Hence, by adopting Technique II the economy is saving $3\frac{2}{3}$ units of wage-goods which will be available for other purposes. If the supply of wage-goods happens to be a limiting factor in the economy, and the objective of policy is to derive the best advantages from given resources, the $3\frac{1}{3}$ units saved to the economy as a result of the adoption of Technique II in preference to Technique I, will be available for employment in the investment sector, Hence, the aggregate amount of employment would be the same, whatever the technique adopted.

4. In the case of Technique I, the profit to the economy, following Mr Sen, would tend to be $8\frac{1}{3}$ per cent. In the case of Technique II, the profit rate to the economy would be $5+1^{1}+(3\frac{1}{3}\times 1\frac{2}{3})$, viz., $11\frac{2}{3}$. At the end of any given period, therefore, Technique II would show up an amount of surplus which would be more than in Technique I. Actually, given the limitation of real liquid capital (wage-goods), the rate of profit to the economy on capital is higher in the case of Technique II. The conclusion therefore, is exactly the opposite of that of Mr Sen. His contention, however, would be correct only if we assume that the economy does **not** suffer from any deficiency of wage-goods and/or that the capital investments themselves are concerned with a quick expansion of output of wage-goods.

The choice of techniques does not generally affect the volume of employment in an optimally planned economy, and that, other conditions being given the degree of capital intensity would tend to determine the rate of growth of accumulation as well as of employment in the long period. Techniques implying a high labour intensity are generally at the cost of accumulation and hence, would tend to lower the proportion of resources going in for accumulation, and would further tend to keep the rate of growth of employment lower than what would be the case otherwise. If there are feasible alternative techniques with a higher degree of capital intensity in the economy, their non-adoption does not lead to any additional gains in the short period; worse still, such a policy (of non-adoption) can be justified only on the assumption that the future should be discounted at as high a rate as possible in all policy matters!

Commonsense Made Difficult

M Srinivasan

PROBABLY, the definition of economics most germane to our experience in this country is the one which defines economics as commonsense made difficult. Nowhere would this definition be more appropriate than in the two articles* which appeared recently in the Economic Weekly on some aspects of economic growth. Simple economic truths, easily perceptible and still more easily understood, are curtained off by a thick veil of economic jargons and cliches, so much so that attention is focused on inessentials and superfluous explanations. The difficulties of the reader are further enhanced when the theoretical ruminations are cluttered with seeming contradictions and circular arguments.

Now, take the article of Mr Sen. The main core of his argument, as I understand it, is that the additional cost of labour in terms of his consumption consequent upon his transfer from the pool of disguised unemployed to the new investment being smaller, there is a pronounced bias in favour of labour-intensive techniques of production. This is based on the fact that the disguised unemployed can be induced to work in new investment only if he is offered a wage rate higher than his previous consumption, so that he can maintain himself in good working condition. Since the disguised unemployed was already consuming a certain amount of wage-goods, it would mean that to the society, the cost of labour is equal to the difference between the wage rate in new investment and his average consumption prior to his transfer. Given the input combinations at any given point of time, when the price of one input falls in relation to those of others, naturally, the use of cheaper input on a larger scale would be beneficial from the community's point of view. In this scheme of ideas of Nurkse, the additional cost of labour is nil, as he assumes that the disguised labour can be transferred to new investment at the same level of wage rate. Whichever way one may look at it, the fact remains that labour-intensive techniques would be more advantageous from the point of view of economic growth.

So far so good. All this is simple enough to appear to commonsense, and it does not require invoking a principle of opportunity cost to prove or disprove it. Mr Sen believes that the opportunity cost principle which implies that the value of labour is determined by what it would earn if it is put to alternative use is not a helpful guide in an economy with a large-scale disguised unemployment. as the opportunity cost of labour in that situation would be nil, though actually as we have seen above, the labour has to be valued at the additional consumption required by the disguised unemployed in new investment. This is clearly a misstatement of the principle of opportunity cost, because the interpretation which Mr Sen puts on it ignores the fact that the labour has a choice to work or not to work at a given wage rate. For instance, if a disguised unemployed could not get additional wage-goods in return of his transfer to new investment, he would prefer to stay where he is rather than work on the same level of consumption. This means that the labour has his reserve price, so to say. It would easily follow then that what the worker coming out of disguised unemployment desires to get in new investment is his opportunity cost and nothing else. There is, therefore, no difference whatever between Mr Sen's method of valuing labour and the opportunity cost proper, and his relevant industrial cost of labour in terms of additional consumption is the same thing as the opportunity cost of labour in its alternative use. Thus, it will be seen that the opportunity cost theory does not deny what Mr Sen wants to prove and in fact, proves what he wants to deny.

Mr Sen's criticism of consumption-goods multiplier as that of Prof Das Gupta is misdirected and arises from their misunderstanding of the concept. The concept of consumption goods multiplier is based upon the release of consumption goods of the disguised unemployed when they are transferred to new investment. Which means that in the absence of any such release, the multiplier would not simply function. If the goods released by the employment of disguised unemployed are absorbed in consumption by those who stayed behind, there would not be any scope for realising the savings potential. But who has ever denied this possibility? And how can it make the foundation of the consumption goods multiplier dubious? If the Keynesian Multiplier can continue to remain a valid and operationally useful tool of analysis in spite of the possibility of the marginal propensity to consume being zero, there is no earthly reason why the consumption goods multiplier should be rendered useless in the event of a non-release of wage-goods consequent on the transfer of the disguised unemployed. Mr Sen himself does not deny the possibility of release of goods; his only fear is that they may be consumed unless the State steps in to siphon them off, through taxation. If he had again carefully gone through the text of the book of Prof Vakil and Dr Brahmananda, he would have found for himself that the authors also envisaged those fiscal measures which he has in mind.

The main point of Mr Sen would have been equally clear without the use of elaborate arithmetical examples which he has worked out to prove the profitability of labour-intensive methods of production. Such arithmetical examples are quite deceptive and one may as well arrive at the conclusions opposite to that of Mr Sen, with different but equally plausible sets of figures. Apart from this, his example does not take into account the duration of the capital equipment under the two techniques. The duration of capital equipment in Technique I is bound to be shorter than that in Technique II and this is likely to vitiate the results which Mr Sen has tried to arrive at through these examples. My objection is not to the point which Mr Sen has made because it can be easily accepted, but to the way in which he has argued it.

Prof Das Gupta, though he seems to be aware of the implications of wage-goods for capital formation, embroils himself in such a bundle of contradictions that it is really difficult to make out what he is driving at. After stating that the extent of employment in the invest-

* "Disguised Unemployment and Economic Development" by A K Das Gupta, August 25, 1956.
"Labour Cost and Economic Growth", by A K Sen, September 29, 1956.

ment-goods section is determined at any point of time by the availability of wage goods, he curiously argues that the wage-goods being also a function of the stock of capital, an increase in the latter would extend the scope for employment of labour. This is nothing more than begging the very question which all underdeveloped economies are trying to solve. The crucial problem, as Prof Das Gupta himself points out, is how to increase the stock of capital and as it is limited by the availability of wage-goods, if you cannot raise the stock of capital unless wage-goods are increased. What is important in the initial stages of economic development is the "wage-goods gap" or a marketable surplus in the consumption goods sector which alone can bring about a rise in capital stock. It is therefore pointless in this context to emphasise that output of wage-goods is also a function of the stock of capital. Without realising this apparent contradiction in his argument, he tries to reconcile the 'wage-goods approach' of Prof Vakil and Dr Brahmananda with the 'logic' of the Planning Commission, emphasising the need for fixed capital, and states that the former refers to the short run and the latter to the long run scope for employment. It passes one's understanding how short-term and long-term distinctions can be brought into this discussion at all. There is nothing as short-term in the long-term setting of economic growth as capital formation itself extends over a long period of time. It is therefore misleading in the extreme to take 'wage-goods gap' as referring to only short-run scope for employment. In fact, when Prof Vakil and Dr Brahmananda refer to 'fixed capital', they emphasise indirectly the inelasticity of supply of wage-goods in an underdeveloped economy as being a bottleneck in the formation of fixed capital. And when one tries to hit upon a target of 'fixed capital' beyond the limit set by the available supply of wage-goods, it is but natural that it would end in frustration. In view of this, how can one credulously persist in the belief that there is no contradiction between the theory of wage-goods gap as envisaged by the authors of this theory and the Planning Commission's 'logic' employed to justify a high order of fixed capital.

As an economist steeped in the traditions of classical economists, Prof Das Gupta, one expects, should not have made a categorical statement that the disguised unemployment and the unemployment generated by new labour force as a result of population growth, are not two separate entities. Coming as it does from one who is quick enough to grasp the implications of disguised unemployment for economic development, it is really surprising. Disguised unemployment differs from the other in that the former carries with it the 'savings potential' which assists the cumulative growth of the economy, while the latter reduces that saving potential by increasing the number of mouths to be fed with it. The two types of unemployment stand as apart from each other as saving from consumption and surely, no economist worth the name has yet suggested that "saving" is an alias for "consumption"? Indeed, it is strange to argue that "saving potential" would remain unaffected in the face of a growing number of people. The difference between the two is fundamental and this very distinction forms a central core of economic growth as emphasised by Nurkse and others. Had it not been so, our economic problems would have been very much simplified. What is more baffling is that Prof Das Gupta himself jumps to contradict his own stand on the matter when he maintains that new savings are required to be created to meet the wage-bill of additional labourers, drawn from this newly emerging labour force, while relief is obtained in the form of release of wage-goods which is nothing but savings, where labourers from the disguised unemployed are utilised.

One gets an impression from the article of Prof. Das Gupta that he still prefers to analyse the problems of growth with the aid of existing tools of economic analysis. The question is: can one do so? Admittedly, the conditions like disguised unemployment, choice of techniques and the pattern of investment, etc., call for a treatment on an altogether different plane. Devotion to the existing tools, howsoever commendable, does not serve the purpose adequately. The manner in which Prof Das Gupta has confused the problems of growth by his adherence to the old tools provides sufficient justification for new tools of economic analysis to interpret and to explain the economics of growth.

Cotton Hedge Contracts

V C Poojara

AFTER the forced closure of the futures market by the Government in December last year, the entire trade was seized by a sense of uncertainty and frustration. In the heated atmosphere that followed, the issues were taken to the Court of Law, where after protracted hearings the action of the Government was legally upheld. Though from a strictly legalistic view, the authorities justified their stand, the trade at large has not been convinced of the justness of the Government action and continues to have serious misgivings about the role of the Government in trade affairs.

Suspension of futures trading market naturally stimulated efforts to reorient the basis of futures trading that would ensure its smooth working. Faced with the threat of increased State intervention, deliberations continued for nearly six months for framing a Futures contract that would be a correct barometer for the cotton market. As soon as these deliberations took concrete shape, the East India Cotton Association Limited framed proposals for restoration of futures trading; and in June last with the approval and blessings of the Forward Market Commission, Futures market started once again its operations in the newly devised twin Indian Cotton Contracts.

Two Contracts Instead of One

Thus in the place of one Indian Jarilla Contract embracing almost all important cottons produced in the country, we have now two contracts: (1) Indian Cotton Contract No. 1 known as Jarilla Contract with basis Fine Jarilla 25/32" staple; (2) Indian Cotton Contract No. 2 known as Vijay Contract with basis Fine Vijay 27/32" staple. Jarilla Contract covers cottons ranging in staple lengths from ¾" to 27/32", whereas Vijay Contract is designed to cover cottons ranging in staple lengths from 13/16" to 31/32".

The rationale behind the two contracts appears to be fundamentally sound, for it accepts as its basis the vastly changed production pattern of cotton in the country. It is a matter of common knowledge that during the past few years, efforts of the Indian Central Cotton Committee have yielded rich dividends by way of increased production of improved varieties of cotton of higher staple length. In the scheme of any hedge contract, emphasis has always been laid that it should cover within its orbit all principal varieties of cotton grown in the country. A single futures contract seeking to cover all varieties of cotton ranging in staple length from ¾" to 1" would be by its very nature an extremely broad contract, impotent to function as a proper hedge contract because of the innate danger of such a contract breaking loose from the spot market. These dangers were pretty well exposed by the working of a single hedge contract during the past few years.

To Absorb Price Changes

Two contracts are designed to serve different Indian Cotton qualities by grouping them into compartments based on their relative staple length and indirectly their end-use. Thus under Jarilla Contract are brought together cottons that would spin upto 18s. Cottons that will spin from 18s to 32s are grouped together under Vijay Contract. Creation of two contracts would thus considerably narrow down the extent of uncertainty as to the quality of tender from the view point of spinners or buyers of the contract. Cotton merchants would also be able to select a contract to hedge their stocks according to the quality of the stocks they hold.

It was hoped that creation of two contracts would go a long way in fulfilling aspirations of the trade as well as industry to have a futures market that would correctly feel and reflect sentiments of the spot market and be able to absorb the risk of price changes to the largest possible extent.

Results of the Experiment

The new contracts have now been in operation for over three months. This experiment is being watched with keen interest by many. An attempt is made here to assess the value and utility of these contracts on the basis of their operation during this period.

Have the new contracts been able to establish liaison between the spot market and the Futures market? Have the new contracts succeeded in restoring the confidence of trade and industry in the soundness of the Futures market as an instrument of effective hedge operations?

Liaison with Spot Market

We shall first examine the working of Futures market in relation to the spot market. Spot premiums for the basic quality of the contract can be taken as a rough indicator of relationship between Futures and spot markets. The greater the tendency over a period for larger spot premiums, the greater the disparity between the two markets and vice versa. The greater such disparity, the lesser is the utility of Future market for effective hedge operations.

It should, however, be borne in mind that there would always be some spot premiums for ready cotton in the market. A purchase of a futures contract, if held on till maturity, would at the most guarantee a delivery of cotton from a number of qualities tenderable against the contract. In some cases even this may not be possible and the buyer of the contract must satisfy himself with some sort of monetary compensation by way of penalty from the seller of the contract who tenders either unknowingly cotton which is rejected or may even fail to tender any cotton. It is therefore, obvious that ready cotton would always command some premium over the Futures contract; and the mere existence of a premium, therefore, is not a sign of any malady in the trade. It is the **continuous** tendency over a period for **larger** spot premiums that would indicate some measure of disparity between Futures and spot markets.

In Table 1 are given prices of Jarilla Contract representing Futures value of 'Fine Jarilla cotton of 25|32" staple and corresponding premiums prevailing in the spot market for the same quality. A persistent tendency for substantially large spot premiums is clearly revealed by the figures in this table.

Table II gives the comparative price statistics for Vijay contract. It shows tendencies which are even much more perplexing. As compared to the Futures value of basic quality of Vijay contract namely Fine Vijay 27/32", Fine Vijay 13/16" commands sizeable premiums in the

The Second Five Year Plan tells us that of the 54 million houses in rural areas a large number need reconditioning or rebuilding. During the Plan period a sum of Rs. 120 crores will be spent on housing, which together with housing expenditure in the private sector, will produce 1,900,000 *new* houses by 1961.

Wanted: machines for living in

What has oil got to do with all this building? Land levelling and transportation of materials call for fuels and lubricants... pumps and generators on site require diesel oil... in almost every stage of building, Burmah-Shell petroleum products have their part to play.

Oil is the most flexible source of energy available... it is, in fact, 'packaged power'. It is our responsibility to see that *energy from oil* flows to all parts of the country cheaply, efficiently and in sufficient quantities for the job on hand.

spot market. Furthermore, 320F cotton, a quality which is usually considered inferior to Vijay cotton also attracts good spot premiums. Such anomalies clearly indicate existence of large cleavage between the Futures market and the ready cotton market.

Thus even after the introduction of two contracts to rationalise trading in futures the trade is unluckily faced with the same unhealthy tendencies that led during the past few years to the undermining of confidence in the Futures market.

One can well visualise temporary situations leading to disequilibrium between Futures and spot markets, but when such disequilibrium tends to persist, it clearly indicates the absence of a corrective mechanism in the working of the Futures contract. This aspect of the contract has been the subject of careful study by many during the last two years; and these studies have revealed that such a corrective mechanism is very closely related to the mode of fixing tendering differences at the time of maturity of contract.

Corrective: Tendering Differences

If the tendering differences are fixed in such a manner as would pass on the benefit of any prevailing spot premium (or loss in case of spot discount) to the holder of unliquidated contract who receives the tender, the corrective values would automatically start operating to restore equilibrium between the two markets. Assuming that disparity is in the form of high spot premiums, with the approach of maturity of the contract obviously the buyers of the contract would be induced to hold on, the sellers would be induced to lift their hedges and to sell their ready stocks to avail of high spot prices, the benefit of which would otherwise go to the holders of the contract. These actions on the part of operators in the market would naturally tend to reduce disparity and gradually restore the equilibrium between the two markets.

Provision is made under the present Futures Contracts for fixation of tendering differences on the basis of the premia or discounts, as the case may be, for varieties other than basic cotton over or below the hedge contract prices. Evidently under this rule, the benefit of the spot premium is passed on to the holder of the unliquidated contract in the case of tender of basic quality but in the case of tender of all other tenderable varieties, such a benefit is retained by the sellers of the contract. When, therefore, the quantity of basic variety forms but an unimportant portion of the total volume of tenderable cottons, the corrective mechanism is not left with sufficient motive power to go into automatic operation.

Conduit Pipe Blocked

It is also essential that in case of failure to tender or tender being rejected, the benefit of the spot premium should pass on to the holders of the contract. The application of this principle would demand that invoicing back in case of rejection of tender or of failure to tender should be on the basis of spot rate of the contract. In this respect, the present Hedge contracts provide for invoicing back of cotton rejected in tender on the forward rate; and penalty for rejection is fixed at Rs 10 per candy. This provision also militates against the principle enunciated above. It has not been explained on what principle a fixed penalty is established. Such an ad-hoc provision can never be a workable substitute for a sound principle. Rejection of this principle thus blocks the very conduit pipe which is meant to allow free flow of influences between futures and spot markets.

Over and above this basic defect in the construction of Futures contracts, another factor that contributes to maintenance of existing disequilibrium between the two markets is a sort of "fear complex" that has afflicted the trade ever since the forced closure of the futures market referred to above. There is a strong feeling that Government's treatment is highly discriminatory in respect of the two markets. The trade is not averse to the rational use of various powers vested in the authorities; but it regards it as absolutely essential that both the futures and the spot market should be allowed to operate freely under identical set of circumstances; codes of behaviour applicable to the two markets should be as far as possible uniform. After all, the two markets are complementary to each other and must operate in close liaison to attain the ultimate objective of smooth marketing of cotton. A categorical assurance on the part of the authorities that they have no intention of interfering with the normal functioning of either of the markets, so long as prescribed ceilings and floors are respected, would, therefore go a long way towards restoring confidence which has suffered a severe setback.

Amusing Anomalies

We now wish to refer to certain amusing anomalies — that are full of potential trouble — created by the peculiar construction of present futures contracts. Most of these anomalies appear to result from the following inadequacies in the construction of the contracts:

(1) Defective manner of fixing tendering differences which is common to both the contracts; and (2) Defective basis of the contract which is peculiar to the Vijay Contract. Look to the Jarilla Contract. In the Hedge Schedule which specifies tenderable qualities, Jarilla quality has been divided into two groups, namely (1) Jarilla (A) basis Fine 25/32" staple which is the basic quality of Jarilla contract and (2) Jarilla (B) basis Fine ¾" staple. From the qualitative view point, this grouping appears to be rationally based; but at the time of fixing tendering differences, this very fact will place the committee for fixation of tendering differences in a very embarrassing position. Under Jarilla (A), if Fine 25/32" Jarilla Cotton is tendered, being the basic quality of the contract, it will have to be tendered at the contract price, irrespective of the prevailing spot premium for the same. On the other hand, if Fine ¾" Jarilla is tendered under Jarilla

(B), whatever spot premium over the contract it may command in the market, the tenderer will receive the benefit of such spot premium merely because he chooses to tender Jarilla cotton belonging to Jarilla group which is different from the Jarilla group of basic quality of the Contract.

The Committee for fixation of tendering differences will have to guide itself by the provision that tendering differences should be fixed on the basis of premia or discounts, as the case may be, for varieties other than basic cotton over or below the Hedge Contract Prices. In the illustration, we have taken above, basic quality of Jarilla (B) group is Fine ¾" which is other than the basic quality of the contract; i.e. Fine Jarilla 25/32" staple of Group 'A' and therefore, application of the above rule would surely compel the Committee to fix the tendering difference for Jarilla ¾" Fine belonging to Group 'B' on the basis of prevailing spot premium over the contract.

Further, if 25/32" cotton is tendered under this group, there will be added allowance for 1/32" staple length. If the above analysis is correct, the result would be that Jarilla Fine ¾" and 25/32" quality belonging to Group 'B' would fare better at the time of the tender as compared to basic quality of the contract, namely Group 'A' Jarilla Fine 25/32". This would indeed be a highly anomalous situation.

Case of Vijay Worse

Anomalies in respect of Vijay Cotton are even more glaring. Basic quality of the Vijay Contract is Fine 27/32" Vijay Cotton. On maturity of the contract, tender of Fine 27/32" Vijay cotton will take place at the Contract Rate. In the face of this fact, the spot market quotes at present Fine 13/16" Vijay Cotton at a substantial premium on the contract. Fine 27/32" Vijay Cotton would, therefore, be at an even greater disparity with the contract. (See Table II.)

Again, take for instance Punjab 320F quality. Spot market quotes Fine 27/32" 320F at a substantial premium over the contract. (See Table II.) On maturity of the contract, this is sure to create another anomalous situation. Against the tender at contract rate of Vijay cotton, it being the basic quality of the contract, tendering difference for 320F cotton will have to be based on prevailing spot premium. In other words at the time of the tender, Vijay quality, which normally fetches better price as compared to 320F cotton, will be undervalued for tender purposes. Consequently, this will have the obvious effect of driving Vijay cotton out of the Vijay Contract.

Is It Unsuitable?

How far this anomaly is due to the unsuitability of Vijay cotton to serve as a basic quality of the contract and whether this anomaly could be rectified or not, say, for instance, by substitution of 320F cotton for Vijay cotton as a base of the contract, are some of the points that are in need of further study and consideration. Whether as a result of such study, modification of the basis of the Vijay contract is found necessary or not, it appears certain that rectification of the defective manner of fixation of tendering differences would go a long way in removing a number of anomalies in the working of the Futures contracts. For, the method of fixation of tendering differences on the basis of spot value of the futures contract ensures uniform treatment to all the cottons tenderable under the contract including the basic quality, not only at the time of tender but also in cases of rejection of tender or failure to tender.

The foregoing is an attempt at analytical probe into the working and constitution of the present Hedge Contracts. There would indeed be other possible analytical approaches. It is hoped this attempt would stimulate further thinking on the subject from as many angles as possible. It is no doubt terribly disappointing that after all the serious efforts and labour that went into restoration of Futures trading, we should still be in the midst of a whirlpool of problems, old and new. Is this not in itself a challenge to our ways of thinking and approach?

Around Bombay Markets

Mill Shares Under a Shadow

Thursday, Morning

THE stock market opened on a dull note and both Tata Steel and Indian Iron remained quiet, despite budla rates being low at about As 6 for Tata Steel and As 1½ for Indian Iron. The disappointing dividend in Indian Iron was partially responsible for this. Steadiness returned during mid-week when the market attempted to stage a recovery. But the irrepressible TTK chose just this moment to threaten from Bangalore that Government would not hesitate to take stricter measures, if cloth prices did not come down. He said in effect, though not in so many words, that the State would take over, should the textile industry and trade fail to co-operate with the Government in bringing down prices. Not that the market always believes all that TTK says, it can also play at the game. But the morale of the market, particularly the textile section, had been shaken and the bearish trend in mill shares was further accentuated by apprehensions that mill profits would be affected in the next year by the increase in excise duty. A gradual liquidation of textile shares has been going on and sellers are predominant. Till now, spinning mills, like Gokak and Madura, were attracting some support. But even this will disappear, in view of the reported move on the part of the authorities to fix fair prices for yarn.

In the miscellaneous section, cement shares became jittery on Government's decision to reduce ex-factory prices in the case of several companies. This apart, technical considerations, viz. end-of-account adjustments, also imparted a weak tone to cement shares. The reduction in price will certainly cut into the profits of some of the new units and such units may not be able to maintain their dividends.

Sugar shares also displayed a generally easy trend with Belapur dropping two to three points and Phalton one to two points.

Bombay Burmah registered a heavy fall from Rs 745 to Rs 710 before closing steady at Rs 728-12. Tata Chemicals remained steady in view of the proximity of dividend announcement. The company is expected to announce a dividend of annas twelve per share and also to increase its capital.

In Brief

The Vishnu Cotton Mills Ltd has announced an interim dividend of Rs 2-8-0 per share, free of tax, on its ordinary shares. The transfer books of the company will remain closed from 22nd October to 1st November, 1956.

The Laxmi Cotton Manufacturing Company Limited has announced an interim dividend of Rs 12-8-0 per share, free of tax, on its ordinary shares. The transfer books of the company will remain closed from 22nd October to 1st November, 1956.

Larsen and Toubro Ltd is to issue fresh capital of Rs 5 lakhs, by issuing one new share of Rs 10 at par for eight shares held. The shares are at present quoted at around Rs 19.

Standard Mills Ltd, it is reported, has plans to establish a cement factory friend from its own resources. Its shares have been currently quoting around Rs 471-4.

The shares of the Bank of Jaipur have of late been attracting much attention in the stock exchange. They have found buyers up to Rs 36 as against only a nominal quotation of Rs 30 a month ago. The demand, it is reported, emanate's from either Delhi or Calcutta.

Cotton

Erratic and Uncertain

COTTON futures continue to be erratic and uncertain. Early in the week, particularly on the opening day, the tendency was to wind up each day's trading, resulting in a distinct improvement of rates over the opening level. This, however, was soon reversed and there has been a sharper fall between the opening and the closing levels. The trend at the end of the week was downwards.

As has often been mentioned in these columns, market observers are unable to explain this unsatisfactory state. Under normal circumstances, falling prices in any commodity might be welcomed. Conditions obtaining at present, however, are far from normal. The cotton grower naturally expects to get a good price for his cotton and would very much appreciate a rising trend just now when he has started marketing his cotton. Government seems to have different ideas and persists in taking measures which adversely affect the price trend. In these circumstances, cultivators are left with only one alternative, that is, to hold on to their stock until prices are attractive enough. If they

New India Ins. ..	44- 4	45- 8	43- 8	45-12

succeed in this, the resulting scarcity of cotton would inevitably raise prices. But will the growers be able to hold on?

The morale of the trade, already pretty low, has been further affected by the threat to yarn prices, which have caught the attention of the authorities. Should the present hardening trend in yarn prices persist, Government, it has been reported, would not hesitate to declare fair prices for yarn as it has done in the case of cloth. The series of steps that Government has been taking in recent weeks indicate that state trading may not be far off. If yarn prices are fixed by Government, it would certainly benefit handloom interests who were the first to complain against high prices of yarn.

Statistics relating to raw cotton imports for the cotton season 1955-56 now available show that as against 529,579 bales of cotton imported in 1954-55 consisting of both sterling and dollar area cottons, 598,030 bales were imported in 1955-56. Imports licensed, however, were much larger, being 649,280 bales and 893,428 bales, respectively. Among cotton from the sterling area, East African topped the list with 223,037 bales (actual arrivals) and Egyptian followed with 219,263 bales. India's offtake of Sudan cotton was also sizeable. Imports of dollar cotton, however, were only a meagre 14,783 bales!

Oilseeds

Not Smooth Sailing

As compared with the last week, better sentiment prevailed in the oilseeds market during the week under review . Ready as well as future castor rallied on firm foreign advices. Both America and Britain quoted higher rates, although no sizable deals were reported early in the week. Towards the end, however, traders were believed to be making arrangements to charter a ship for exporting a large consignment of castor oil.

Groundnuts presented a quiet steady trend. Local expectations of a large groundnut crop, together with adequate availablility of groundnut oil overseas, evidenced by the sale of 3000 tons of African groundnut oil to Britain, affected sentiment adversely. Fresh purchases were, therefore, limited. There was, in addition, the fear that government might extend to oilseeds the credit squeeze now working in respect of cloth. The oilseeds market did not witness a precipitate fall despite the operation of these bearish factors because of the sustained support it received in the Punjab, Rajasthan and other places. The ready section was increasingly supported by buying from crushers and vanaspati manufacturers.

The firmness in linseed noticed in the previous week continued. Reports that government had called for tenders for export to a communist country also imparted some strength to this market.

Bullion

Silver from Tibet

Bullion market remained steady at the close, after moving either way earlier in the week.

The gold section remained fairly firm throughout the week, due to the emergence of good demand in connection with Pooja, Dassera and Diwali festivals.

Silver, however, eased towards the later part of the week on the reported deal with Tibet for the import of about 11,000 bars of silver for which import duty, it is reported, has already been paid by bullion importers in Calcutta. Prices of silver, therefore, fell by nearly Rs 2 from 174 to Rs 172 on heavy bull liquidation. At the close of the week, however, rates steadied up.

Company Note

Indian Standard Wagon

Along with other Engineering shares, Indian Standard Wagon moved up recently before Lyons Range climbed down under the impact of the fall in Indian Iron. This Company has, in common with other engineering concerns, fared well in recent years. In view of the rapid extension of business, it has become necessary to reorganise capital so as to ensure a proper balance between share capital and working funds. It has a plan to capitalise reserves to the extent of Rs 19½ lakhs. Permission has been sought of the Controller of Capital Issues to issue bonus shares on the basis of one share for each share held.

Directors of the Company have informed shareholders that the Company's plans for rehabilitation and expansion are making rapid progress. Expansion projects will cost Rs 32½ lakhs.Current provisions of Rs 7¾ lakhs for financing expansion plans are adequate so far as present requirements are concerned. But the directors assure that further allocations to reserves will be made in the near future so that the expansion plans are not hampered by lack of finance.

Indo-German Trade Agreement

Talks between the representatives of the Ministry of Commerce and Consumer Industries and the Trade Delegation from the Ministry of Foreign Trade and Inner German Trade of the German Democratic Republic have been concluded and a fresh agreement has been drawn up to replace the agreement made in 1954 which is to expire on October 15, 1956.

Included in the list of exports from India to the German Democratic Republic are tobacco—manufactured and unmanufactured, mica, chrome ore, ilmenite, iron ore, kyanite ore, manganese ore, shellac, vegetable oils, cashew nuts, cashew shell oil, textiles, (cotton, silk and art silk, woollen and jute) coir, coir manufactures, handicrafts and products of India's chemical and engineering industries.

The important imports from the German Democratic Republic to India are various kinds of machinery, locomotives (electric diesel and steam) plant and equipment for cement and sugar production, and appliances, wireless communications equipment, newsprint and raw films.

It has been agreed that all payments between the two countries will be settled in rupees.

Uncertain Trend

Wednesday, Evening

LYONS RANGE remains closed for the Puja holidays. But kerb trading continues. Equities remain hesitant in the absence of buyers. But the selling pressure seems to have subsided. Indian Iron are steady at the lower level. So are other clearing shares. Official trading during the first two days of the week indicated a quietly steady trend in cash scrips. In recent days, the behaviour of equities has been influenced mainly by the long Puja holidays. Buyers are reluctant to add to their commitments. Sellers, too, remain scarce.

On current indications, however, equities may remain steady as Lyons Range opens after the holidays. There are possibilities of an early end of the coal strike. That should be welcomed by industry in and around Calcutta. By the time the market reopens, the effects of the higher excise duty on cotton mill shares will be over. Dalal Street may start looking up. That should have a sustaining influence on Lyons Range. Over here, the adverse effects of the Indian Iron dividend are likely to be over.

IISCO Dividend

On Tuesday last, it was announced that the directors of IISCO had recommended a dividend of one rupee per ordinary share. This did not come as a surprise to the market. Last week, the Chairman of the managing agents of the Company issued a circular letter to shareholders in which the Government's reasons for not allowing a higher dividend were included. In recommending that the dividend be maintained at one rupee, the directors refer to the Government's directive to the Company to conserve its resources, instead of wasting the resources in paying a higher dividend.

Financial data released by the directors are highly impressive. Net profits of IISCO for the year to March last are slightly lower at Rs 65.18 lakhs. It would be wrong to jump to the conclusion that last year's earnings and gross profits were also lower. Earnings were much higher, as indicated by figures. Allocations to depreciation remain unchanged at Rs 120 lakhs. But the provision for reserves is Rs 78 lakhs higher at Rs 281 lakhs. It was not without significance that, as these figures were released on Tuesday, Indian Iron steadied down to the lower level.

Prospects

IISCO has heavy prior changes. It has taken two loans from the Government. It will again have to approach the World Bank for a fresh loan which will require to be guaranteed by the Government. But its own resources are now ample. Adequate provisions have been made to service and to repay the loans in due time. It has decided to raise fresh capital by the issue of right shares. That means that the Company has decided to execute the second plan for expansion.

Shareholders will expect the Chairman to discuss the issue of dividends in his annual address. It is evident that the dividend can be maintained even though the right issue will involve a doubling of the share capital. On the present share capital, the dividend of a rupee absorbs about Rs 52 lakhs. After the right issue, the same dividend will absorb Rs 104 lakhs. As against the extra Rs 52 lakhs which the Company will require, one should take into consideration the additional Rs 78 lakhs provided for reserves this year.

Right Issue

At the moment, Lyons Range is more interested in the forthcoming right issue. As in the case of the dividend, it is also now clear that the right issue will have to be offered at a premium of Rs 3½ per share. Will the issue be successful? That depends, to some extent, on certain factors. Lyons Range hopes that the Chairman will give some assurance, in his annual address, that subscribers to the right shares will receive some preferential treatment so far as next year's dividend is concerned. It is hoped that the right share-holders may be assured of a higher dividend on the *pro rata* basis. That should have a tonic effect on Indian Iron.

Such an assurance will be welcomed on the eve of the flotation of the right issue. Other developing factors are not unencouraging. During the slack season this year, there has been a larger return of funds into the banking system. Currency contraction continues. As money flows back, banking resources are expanding. By the end of November, when the right issue is expected to be offered, money market conditions are likely to remain congenial for the IISCO right issue.

Teas, Steady

One of the features of recent trading on the stock market here has been the steadiness in Engineering shares. There are prospects of an early end of the coal strike. This should have a "bullish" effect on Engineering shares. Among Engineering shares, the Mundra group has been consistently firm. Strength in this group is partly due to interested buying support. Some of the companies in this group are doing well. So, market expectations may materialise.

Even while equities in general were falling under the impact of the set-back in Indian Iron, Tea shares were firm. This was mainly due to the rising trend in weekly auction prices. But the bumper northern Indian tea crop may have a softening effect on auction prices. To some extent, the higher auction prices may be due to the fact that there would be no weekly auctions during the Puja holidays. Even so, Tea shares may continue to be steady after the holidays if equities in general resume the expected upward movement.

Jute Outlook

Jute shares are not falling. But the activity in this group has subsided. This is partly a reflection of the downward trend in jute goods. Sackings are relatively steady because of reports of Government purchases of heavy goods. But hessian prices are relatively quieter. Mills have ceased to be active buyers of raw jute. That indicates that the industry is well stocked with its requirements of the raw material. This is one of the reasons why raw jute prices are quiet. There are indications that restrictions on exports of raw jute from Pakistan may be gradually lifted. As Pakistani raw jute arrives in adequate quantities, raw jute prices may fall further. Therefore, despite the falling trend in jute goods, Jute shares may remain steady.

Concessional Return Tickets

DURING

DIVALI HOLIDAYS

★ During the period from October 30, 1956 to November 4, 1956 (both days inclusive) concessional return tickets for Divali Holidays will be issued provided the chargeable distance between the Stations is 150 miles or more,

★ Tickets are available for completion of return journey within 15 days including the date of issue or date of commencement of the journey, in the case of return tickets issued in advance.

★ No break of journey is allowed on the return journey.

★ Passengers are requested to present the return half of the tickets at the Booking Office before commencement of the return journey for dating the actual date of the commencement of the return journey. Passengers, if found travelling on the return journey without having their tickets so dated, or found breaking their journey on return trip, will be treated as travelling without tickets.

★ Full particulars can be had from Station Masters concerned.

Suez Deadlock

FOR the 78th time, Russia exercised her veto in the Security Council against that part of the Anglo-French resolution which endorsed the 18-nation plan for international control of the Suez Canal. Foreign Ministers of Britain, France and America have admonished the Soviet Union for using the veto. But informed world opinion will approve M Shepilov's action as a positive gesture of peace. This is not the first time that Russia has succeeded in easing the tension, or averting war, by the use of her veto. Even without the Russian veto, the second part of the Anglo-French resolution could not have been enforced by the Security Council or by a combination of the supporting Powers without resort to force. By using the veto, Russia has succeeded in enhancing the prestige of the Security Council as an organisation whose prime function is to attain and to maintain peace.

Five years ago, the Security Council issued a directive against the Egyptian blockade of Israeli ships through the Suez Canal. That directive went unheeded, and was not enforced. Through the Russian veto, the Security Council has been able, this time, to maintain peace in West Asia, instead of exhibiting its ineffectiveness, as in the case of the Egyptian blockade of Israeli ships. Only on one occasion, when the Russian boycott deprived the Security Council of the safety-value of the veto, it took a decision, which later information had proved unjust. Experience confirms the continued necessity of the veto.

Both Mr Dulles and the British Foreign Minister have emphasised "the strong moral force" behind the Anglo-French resolution. This is a biased interpretation of the voting in the Security Council. It is absurd to maintain that the nine affirmative votes for the Anglo-French proposal for international control of the Canal mean a moral victory for Britain and France. America has voted for this proposal in return for the Anglo-French acceptance of Washington's policy of restraint. Britain and France are the two main aggrieved nations. Apart from Britain, Australia is the only other Commonwealth nation which actively supports the Anglo-French plan for international control of the Canal. Belgium's vote for the Anglo-French plan is more a reflection of her European origin and association than liberal inclinations of her Foreign Minister. Formosa and Peru and Cuba, along with other Latin American countries, are tied to the apron strings of America. This detailed analysis of the voting in the Security Council disproves the Western Powers' claim that the majority vote in favour of the Anglo-French resolution is a moral victory for Britain and France.

Like the World Bank and the Monetary Fund, the United Nations have not fulfilled the original optimistic expectations. On many occasions, the United Nations have fallen short of the ideal. Even so, the Suez Canal crisis has, again, demonstrated the utility of the United Nations as also the justification for continuing the right of veto in the Security Council. It would be unjust not to appreciate America's efforts toward direct negotiation between the parties directly concerned in the dispute. It would be equally unfair to ignore that direct contacts between Britain, France and Egypt could not have been possible had Britain and France not referred the issue

to the Security Council. One of the main assumptions behind the United Nations is that there can be no dispute which cannot be reconciled through negotiation. Egypt has not accepted the whole of the Anglo-French resolution. Russia has vetoed the second part of the proposal. There are still fundamental differences between the two sides on the Suez Canal issue. But it is to the credit of the United Nations that, under the auspices of the Security Council, the basic principles of an agreed solution of the crisis have been formulated through direct negotiations between the two sides. Even those who feel disappointed with the United Nations will concede that the agreement reached on the general principles which should be taken into consideration in devising a solution of the crisis is no mean achievement for the Security Council.

Egypt's conciliatory attitude will be widely appreciated. In recognising the principle that "the operation of the Canal should be insulated from the politics of any country", Egypt has conceded the main issue in dispute. Britain's Foreign Minister is right in echoing Mr Dulles that this is the 'heart of the problem". Egypt has also yielded on two other important matters relating to tolls and charges and to provisions for development of the Canal. While Britain and France recognise the sovereignty of Egypt, the six principles indicate clearly that Egypt respects the rights and privileges of users, and that Cairo is willing to co-operate with them in ensuring their legitimate interests. From the deliberations of the Security Council, it would appear that Egypt is not unwilling to co-operate with some form of association of users. But it is clear that not only Russia and Egypt, but many other users of the Canal will regard the Suez Canal Users' Association, sponsored by Britain and France during the London Conference, as a narrow organisation which does not represent all users of the Canal. M Shepilov accepts the principle behind SCUA, but rejects it in its present form as an unrepresentative association. Russia's attitude to SCUA is shared not only by Egypt, but by many other users, including India, of the Canal.

Once Egypt accepts the principle that "the operation of the Canal should be insulated from the politics of any country", it is difficult to appreciate the Anglo-French insistence on international control of the Canal. In demanding internationalisation of the Canal, Britain and France disown the principle of sovereignty of Egypt, which both have explicitly endorsed as one of the basic requirements for an agreed solution of the crisis. Even while the British and French Foreign Ministers were endorsing this principle, Sir Anthony Eden informed the Conservative Party Conference that Britain will never accept unfettered control of the Canal by any one Power. It will not be denied that the Canal cannot be left in "unfettered" control of Egypt alone. Cairo must agree to co-operate with a representative association of users in operating, maintaining and improving the Canal. Such co-operation has been accepted by Egypt. Such acceptance involves Egypt's readiness to refer any dispute about the rights and privileges of the users, under the 1888 Convention, to an organisation which must consist of users and function under the auspices of the United Nations. With the creation of such a machinery, the main purpose behind the Anglo-French demand for internationalisation of the Canal can be attained without any prejudice to Egypt's sovereign rights. At the instance of Iran, Britain and France have agreed to consider any alternative proposal to the 18-nation plan for international control of the Canal, which can ensure the six requirements as effectively as the Anglo-French plan for internationalisation of the Canal. Egypt has made certain concrete proposals to satisfy the Anglo-French demands. There will, therefore, be hope that further negotiations will continue. But neither Sir Anthony's address before the Party Conference nor the reaction of the British and French Foreign Ministers to the Security Council debate on the Suez Canal issue encourages hopes about a negotiated settlement of the crisis. But the world now knows that if the Canal crisis continues, or the tension increases, it will be because of the combative Anglo-French policy to the Suez Canal.

Shifts in Cabinet Set-up

THERE have been some important changes in the organisation of ministries at the Centre. The Ministries of Commerce and Industry, which had been separate in the past and had been combined for better co-ordination of policy and more efficient working, have now been split up, but not into two separate ministries of Commerce and Industry as in the past. By stages, several fissions and reformations have taken place. In the process, some of the responsibilities of the Ministry of Production have been detached and tagged on to those of the Ministry of Industry to form two separate ministries, the Ministry of Heavy Industry and the Ministry of Iron and Steel. When heavy industry and iron and steel separated from it, Commerce and Industry still continued as one; at least the designation of this ministry was not changed. And as all four were represented in the Cabinet by one and the same minister, growth by fission was a natural as well as a logical development.

The changes that occurred when the minister in charge of all four took over the finance portfolio, however, did not follow the same logic of growth by fission. When the Minister of Commerce and Industry became the Minister of Finance, he did not relinquish his charge over the Ministry of Iron and Steel. Now this should have been normally the responsibility of the Minister of Production from whom it had been taken away on the ground that as import and distribution of steel was an important responsibility of the Minister of Commerce and Industry, the latter should be made responsible for the production of steel also, in order to ensure co-ordination of policy in regard to steel. Finance and Steel cannot be combined very well for purpose of administration. but in view of the keen interest the Minister in charge had taken in his new baby and the competence with which he had handled it made it undesirable to risk a change. Nevertheless the combination is rather unusual, and does not follow any logic of organisation.

But iron and steel apart, the other functions which had come to be grouped together under the Minister of Commerce and Industry had both cogency and logic. The ministerial changes, however, did leave the existing arrangements undisturbed. There followed a series of splits—heavy industry came to be represented in the Cabinet, 'of people', by the Minister of Home Affairs, whose present charge of Home and Heavy Industry is as unusual a combination as that of steel and finance, but lacks the justification which past association and experience provide in plenty in the latter case. In fact, the present arrangement makes so little sense that it is difficult to tolerate it except as a stop gap.

The story does not end here. Along with the above changes the designation of the Ministry of Commerce and Industry has been changed into that of the Ministry of Commerce and Consumer Industry. This is perhaps as it should be, for what else is left of the Ministry of Industry when heavy industry is taken out from it? When the ministry is left only light industry, the more popular appellation for it could well be that of consumer industry. But after the separation of heavy industry, were the responsibilities of this Ministry any more onerous than in the past? Why, then, this change of name? Again, it makes little sense that the Ministry of Commerce and Consumer Industry should be represented by a Minister who has other and fairly heavy responsibilities. And it could only be a makeshift arrangement. Indeed, all this is so unintelligible that it may give the impression that the Government is showing the usual inhibition of a care-taker Government in that it is reluctant to attempt a more logical organisation of its business. This impression, however, would be misleading in the extreme. For at the same time certain changes have been effected relating to food, agriculture and community projects which are becoming more and more the focal points of attack against stagnation in agriculture which suggest a sensible build-up in striking contrast to the steady and deliberate weakening of the commerce and industry set-up.

The series of changes in food and agriculture began when the Community Projects Administration was made into a separate Ministry. It ended the long standing hiatus which had been created when the Planning Commission, otherwise an advisory body, had come to assume the responsibility of administering these projects which was an executive function. The change is not merely a matter of correct form. The success of the Second Plan has come to depend more and more on the achievement of a higher target of food production without a corresponding or even a substantial drain on resources. This naturally demands the closest coordination between the Ministry of Food and Agriculture on the one hand, and the newly formed Ministry of Community Projects and National Extension Services on the other, agricultural extension being the vital means of attaining this objective. By making the Minister of Food and Agriculture represent the latter ministry in the Cabinet, unity of policy has been largely assured.

The announcement this week of the separation of the Ministries of Food and Agriculture, as in the past may be unwelcome in that it takes us back to the days when food problem was acute and needed a separate set-up for its proper handling. But it does not presage any weakening of the administration of food and agriculture, as the same Minister continues to be in charge of both Ministries in the Cabinet and there is thus no division and, therefore, weakening of responsibility. On the contrary it is a case of strengthening by fission since all questions relating to food will be concentrated and will have, the advantage of having a Secretary devoting his undivided attention to food alone.

The explanation of the apparent divergence in the developments relating to commerce and industry on the one hand and food and agriculture on the other have unfortunately to be sought in the present uneasy balance of power within the Cabinet. No one pretends that the Prime Minister is the **primus inter pares** or that any of the ministers in the Cabinet are there in their own rights, ie to say by virtue of their standing in the party or on the strength of their following in Parliament. The shifts in the Cabinet and transfer of portfolios, therefore, follow no principles at all. The present shifts, however, are particularly unfortunate in that they leave Commerce and Industry very poorly represented in the Cabinet to which may be traced, for example, much of the confusion and lack of consistency in the textile policy of the Government. One can see an attempt at working out a policy in food, but none at all in cloth. The unexpected shifts in the latter, moreover, spell dissipation of resources which need to be carefully preserved and directed to the fulfilment of Plan objectives.

Two-Nation Theory

TWO questions arise out of the Pakistan National Assembly's decision to introduce joint electorates in Eastern Pakistan but to hold elections in Western Pakistan on the basis of separate electorates. This dual basis of elections for the two wings of Pakistan has, for the moment, averted a political crisis in that State. But the implications of the decision need to be appreciated. In defending the system of joint electorates, Mr Suhrawardy emphasised the sinister consequences of the system of separate electorates. Such a system of electorates can only be based on the two-nation theory. Mr Suhrawardy had the wisdom to warn the Assembly of the dangers of such a conception. Insistence on a system of separate electorates may, in the long run, force the exodus of four and a half crores of Muslims from India. Rightly, though belatedly, Pakistan's Premier publicly confessed that such an exodus, as a logical sequel to the Pakistani insistence on the two-nation theory, can only drive Pakistan into the seas. This aspect of the two-nation theory is not widely realised either in Karachi or in the capitals of some Western countries.

By accepting a compromise formula, Mr Suhrawardy has been able to secure the support of the Republican Party. But Dr Khan Saheb's recent announcement that the Republican Party is committed to a system of separate electorates poses certain significant problems. To carry Mr Suhrawardy's arguments to their logical conclusion, the two different systems of electorates for the two wings can only lead to the eventual emergence of two nations in Pakistan. Spokesmen of the Muslim League have emphasised this aspect of the Assembly's compromise decision. They have stressed that they will continue to agitate for a system of separate electorates in Eastern Pakistan also.

In his speech before the Assembly, Mr Suhrawardy was in a confessional mood. There are, Mr Suhrawardy admits, political, economic and administrative discriminations against the minority community in Pakistan. Insistence on separate electorates by all the major political parties, with the exception of the Awami League, is a visible reflection of the inferior status of minorities in that State. That is why, the migration of Hindus from Eastern Pakistan continues. One hopes that Mr Suhrawardy's emphatic assurances will minimise the outflow of Hindus from Eastern Pakistan.

Weekly Notes

Enter Shri Chavan

IT is a pity that the Congress Party in the Bombay Legislature should have come to be deprived of the high-principled, mature leadership of Shri Morarji Desai, and that too at a time when the State is about to embark on its bigger, bilingual enterprise. Shri Desai's stand that, he would not be the first to break the 19-year old practice of unanimous election in the Party certainly does credit to his sense of tradition and concern for Party cohesion; but it has little significance to the sound evolution of democratic processes as such. Indeed, from the latter angle a contest may have more to commend it than a unanimous choice; and the fact that Shri Desai's self-denial has not succeeded in preventing a contest or preserving an established convention leaves the gesture with no more than its intrinsic value. And if this act of self-denial has had any positive result, it is to be seen in the emergence of a very young politician as leader of the Party. Shri Y B Chavan, the new leader, is just 42; but he has to face responsibilities greater in magnitude than those tackled by his predecessors in office, Shri B G Kher and Shri Morarji Desai, both of whom had more years of experience to fall back upon.

Shri Chavan however, does not enter upon his new duties without certain advantages on his side. For one thing, he has been known to enjoy the confidence of his former leader, Shri Morarji Desai, and also the benefit of close association with him, which may well ensure a certain degree of continuity in policy in the enlarged State. He has also earned the good opinion of other top leaders and of linguistic minorities in general by refusing to yield to parochial extremism and courageously striving to put national interests above those of particular regions. The large majority of votes he won over his rival, Shri B S Hiray, in the contest for the leadership of the Congress Party is both a tribute to his past attitude and an assurance of success to the new obligations he is to shoulder now. In a sense, there is something to be said for a Maharashtrian being at the helm of affairs in the new bilingual State, particularly in its formative years, if only to initiate and establish a pattern of administration that will be reassuring to minority regions.

In one respect, however, public concern is bound to continue for some time. It may be long before the new Legislature Party, enlarged by the admission of Congress members from various States and regions with no common background of policy or action, starts developing that sense of discipline and oneness which was such a marked characteristic of the old Party in Bombay—at least before the outburst of linguistic fury. To allay the passions and suspicions roused over that issue and to weld the present heterogeneous assemblage into a union of common interests and aspirations is a job which may well be said to call for a strong personality like Shri Morarji Desai, commanding extensive esteem. So far Shri Chavan is concerned, his abilities in this direction are yet to be proved. But meanwhile one may well take solace in the fact that a task that seems to be cut out only for a strong man may well be performed successfully by a meeker and milder one through methods of persuasion that may be as firmly binding as those of awe-inspiring eminence. The history of political parties is replete with such instances.

The State of the Plan

THE Second Plan started functioning six months ago. It would be interesting to enquire as to whether the assumptions in regard to the behaviour of the economy underlying the analysis of the Plan have proved realistic in the light of experience. While the Plan assumed only a moderate rise in the price level over the whole Plan period, the wholesale price index has already risen by more than 10 per cent, and the working class cost of living index by about 7 per cent, since March 1956. This rise has occurred in spite of a seasonal contraction in money supply of about Rs 50 crores between March and August, 1956. It may be presumed, therefore, that the rise in the price level is the result of the increase in money supply that took place during the last year of the First Plan. Obviously under the existing circumstances, large additions to the moneysupply would tend to aggravate the upward trend of the price level. This has obviously important implications for the financial estimates of the Second Plan.

Further, durng this period of six months, it has been realised that the targets of additional production of foodgrains and cloth require a substantial upward revision. In other words, the Second Plan had grossly under-estimated the extent of additional demand for these commodities. It is now estimated that the requirements of food imports would run into 8 million tons during the Second Plan. If we draw upon our sterling balances at the rate at which we have been doing during the last six months, how are we going to find the foreign exchange resources for meeting the additional demand for the import of food, machinery, etc.? The question could well be posed as to whether it would not be advisable to spend considerable investible resources on expansion of agricultural output, and make good the gap through increased production at home, rather than spend substantially larger amounts of foreign exchange in order to import foodgrains.

If the crucial assumptions on which Plan estimates are based tend to go wrong, can the situation be remedied by revising the estimates? Is there not an urgent need for a re-questioning of the assumptions underlying the Plan estimates? After all, is there any reason to hope that the experience of the ensuing months (and years) would tend to be radically different from that during the first half year? This could be so only if agricultural output were to go up by a substantial amount as a result of windfall factors. But the most that can be expected of favourable monsoons is a marginal improvement; it would hardly be prudent to hope for any substantial upward spurt in production. A substantial inflow of foreign aid could, of course, change the picture favourably but if recent experience provides any lesson, it is this: That any one banking on such a possibility is merely basking in moonshine.

Israel's Border Clashes

IT would be wrong to assume that Mr David Ben Gurion is more war-minded than Mr Sharett. Though Mr Ben Gurion is more tolerant to the "activist" group, he is not opposed to a full or limited settlement with Arabs. Mr Sharett is an accomplished diplomat. His policy was to minimise counter-action so as not to antagonise world public opinion. Mr Gurion is not unaware of the need for discouraging provocative local skirmishes. But, when he again became Premier in November last, he said that "if the armistice lines are regarded as being open to the passage of murderers and saboteurs on one side, they can by no means remain closed to the defenders of the other side..... It is my duty to tell the Powers that rule the world—all of them without exception—that the people of Israel will not be led like cattle to the slaughter". These are indications of a change in tactics since resumption of power by Mr Ben Gurion. But the recent major engagements between Israeli and Jordanian forces cannot be explained by the argument that Mr Ben Gurion is in favour of a strong policy to Arabs.

Israel's borders have been drawn in such a haphazard manner as to make border clashes frequent, if not inevitable. Some time ago, Iraq proposed a readjustment of borders based on the 1947 U N resolution. Jordan has also made efforts to the de facto territorial settlement of 1949, on the basis of proposals relating to the Palestine mandate. Israel is not opposed to any readjustment of the present boundaries. But Israel maintains that any such readjustment of borders must be made on a de novo basis. This is not an unreasonable or hostile attitude. The ideal solution would be for Israel and Arab States to start negotiations for an agreed settlement of their dispute without any intervention from the Big Powers. But recognition of Israel by Arab States is a condition for any such negotiated settlement. There are indications that President Nasser's growing influence among Arab States is making the fulfilment of this essential condition more difficult.

Syria and Lebanon have jointly decided to ask for a special meeting of the Security Council to consider "recent aggressions" by Israel. Despite the tension between Israel and Jordan, recent developments are not more ominous than the frequent border skirmishes between Israel and her neighbours in the last few years. Certain developing events may aggravate the tense situation. Jordan has sought, and received, Iraqi assistance under the treaty of 1947. Iraq's aid is welcomed by Britain and France as a stabilising influence. It is argued that Iraq's help may dissuade Israel from any major military action against Jordan in the hope that Cairo's preoccupation with the Suez Canal crisis may prevent any material aid to Jordan by Egypt. But it is unlikely that Israel would start a major offensive against Jordan as it would invoke the Anglo-Jordan treaty of 1948. Mr Ben Gurion may be too optimistic in his assumption that, because of the strained relation between Britain and Jordan as a sequel to the dismissal of Glubb Pasha, Britain may be reluctant to discharge her obligations under this treaty. Meanwhile, it is evident that the Israeli military action against Jordan has strengthened the alliance of Arab States against Israel.

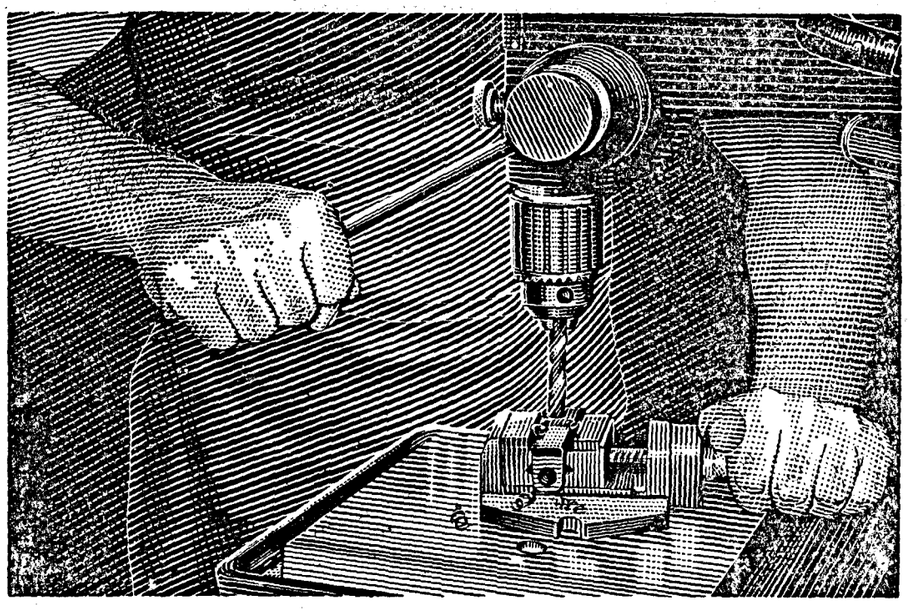
More Aid to Handlooms

UNDER the Second Five Year Plan, the handloom sector has been allotted an additional production of 1,000 million yards of cloth, 700 million yards to be produced from mill yarn and the remaining 300 million from Ambar Charkha yarn. To enable the handloom sector to fulfil its target, the Government has decided to increase the quantum of financial assistance to handloom weavers for their working capital requirements and for the purchase of improved equipment.

Under the new financial measures announced by Government, the limit of loans for working capital for looms in cooperative societies working on cotton, has been raised from Rs 200 to Rs 300 per loom. Government has also abolished the previous distinction between looms already in the cooperative fold and those newly brought into cooperatives for the purpose of eligibility for loans. All looms now qualify for the loan up to Rs 300 each. At the same time, the amount of loans which can be granted to the Central Handloom Cooperative Societies from the Handloom Cess Fund has been doubled.

So far loans were granted up to five times the paid-up share capital of the societies. The limit has now been increased to ten times their paid-up share capital. For the purchase of better equipment for their looms, weavers have so far been given grants for specific items of equipment. Government have now decided to simplify the administration of these grants by sanctioning an outright sum of Rs 218 to each weaver. This represents the value of different items of equipment. The amount can also be utilised for purchasing a new frame-loom, provided with the necessary accessories. The production on frame-looms is, as is well known, appreciably higher than on the old type of looms.

Government has also sanctioned a loan of Rs 14.5 lakhs to the Madras Government for setting up a workshop to manufacture handloom accessories and equipment to meet the increased demand for better type of equipment. This workshop to be set up near Madras city, will be run by the State Government, and its entire cost will be covered by the Central loan. The workshop will turn out take-up motion attachments, hand-operated warping machines, flanged warp bobbins, standard reed, pedal loom, country dobbies and accessories, varnished healds, wire healds for cotton weaving and jacquards. The production of this factory will meet the requirements of weavers in the southern States.



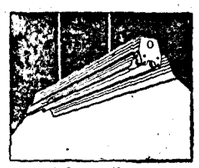
This increased assistance is to be welcomed for the provision it makes for technical improvements in handlooms and for the replacement of pit and throw-shuttle looms by less primeval devices. There is, however, still no official line on the measures proposed to be taken for persuading handloom weavers to produce as many as 300 million yards of cloth from Ambar Charkha yarn.

Status of Jammu and Kashmir

THERE has never been any doubt about the representational character of the Kashmir Constituent Assembly. But the Assembly's delay in deciding the question of the future of the State has caused misgivings in some quarters in this country. These apprehensions have been removed by the presentation of the draft Constitution to the Assembly. One of the provisions of the Constitution seeks to legalise the accession of the State of Jammu and Kashmir to the Indian Union. In the Bill, there is a provision in which "the people of the State of Jammu and Kashmir" solemnly confirm "the accession of the State to India which took place on October 26, 1947". It is further provided that "the State is and shall be an integral part of the Union of India". New Delhi's supremacy is reaffirmed in

the provision that no Bill or amendment can be introduced in the State's Legislature which seeks to alter the future status of the State as an integral part of India. Its implications are obvious. It is a clear reminder to Pakistan that the question of a referendum or a plebiscite to decide the will of the people of Jammu and Kashmir no longer arises. While this implication of the draft Constitution will be relevant in this country, many eyebrows will be raised at one of the provisions of the draft whereby the State will have 'a separate flag".

Not only the Constituent Assembly's sovereign right to decide the future status of the State, but the definition, included in the draft Constitution, of the territorial boundaries of the State is a stern reminder to those who flirt with the idea that the Kashmir dispute can be solved by reorganising the cease-fire line as the final boundary of the State. One of the provisions of the Bill lays down that the State's territory shall be the same as it was on Independence day, August 15, 1947, under the sovereignty or suzerainty of the ruler of the State. This is a clear expression of the will of the people that parts of Kashmir now under the illegal occupation of Pakistan belong to the State, and that Kashmiris are determined to regain the unity of the whole of Jammu and Kashmir under the Indian Union. Twenty-five per cent of the seats in the new Legislative Assembly will be increased for the representatives of the people who are now unable to exercise their franchise because they are in the Pakistan-occupied areas of the State. Karachi can no longer be in doubt about the will of the Kashmiris relating to the territorial integrity and the future status of the State.



give these hands better light—*at less cost!*

A factory cannot afford faults—because faults mean hold-ups, unfulfilled quotas, reduced profits. That's why most modern factories have fluorescent lighting. Production experts have discovered that a good light reduces faults greatly... increases production.

Philips 'TL' Fluorescent Lamps give more than three times more light than filament lamps of the same current consumption! That's real economy! And the light is not harsh—it lights up the working bench evenly. The worker's eyes do not get tired easily if the lighting is well planned! He can do better work. Install Philips 'TL' Fluorescent Lighting and watch output go up... costs come down.

PHILIPS

'TL' FLUORESCENT LAMPS & FITTINGS

—make light work for you!

A Philips Fluorescent lamp gives more than three times more light —lasts on an average 7,500 hours!

Can we advise you? The Philips Lighting Service Bureau will be glad to show you how you can use fluorescent lighting in your factory—free of charge and without obligation. Please write to Philips Electrical Co. (India) Private Ltd.

Bombay and Family Planning

THE refusal of the Bombay Government to offer responsive co-operation in connection with the planning programme of the Central Government raises a number of issues. The Government's action could perhaps be justified on the score of the moral scruples of those in power in the State but it should be emphasised that there is hardly any economist either in India or abroad who does not favour some measure of population control under Indian conditions. Actually, even some Communist countries are thinking in the direction of some measure of family planning. Surveys conducted in different areas in India have revealed that the people are not averse to, though they may be ignorant of, measures for family planning. The only excuse with which the State Government can justify its action is that family planning would tend to lead to a deterioration in moral standards. There is, however, no reason to believe that the moral standards of the people in countries which have adopted family planning are demonstrably lower than of those who have not done so. Can we, for instance, reasonably claim a higher level of personal and social morality than, say, the citizens of the U K? And, further, assuming that State-sponsored family planning on a large scale might create opportunities for moral laxity, are there not enough empirical reasons to believe that the present ubiquitous sale of contraceptives, either openly or disguised as prophylactics in large towns, is already creating wide opportunities for moral laxity on the part of those who would normally be excluded from the benefits of State-sponsored schemes? Moreover, is not the continuance of an appalling level of poverty a more serious cause of moral degradation than State-sponsored family planning could ever be? One wishes that the attitude of the State Government would raise enough enlightened public controversy to clarify the issues involved in this important matter.

Industrial Finance Corporation

SHRI K R K MENON'S speech from the chair at the Eighth Annual General Meeting of the shareholders of the IFCI, which appeared in our last issue, indicates a visible sense of relief at the end of the Sodepore episode. The transfer of the whole net profit of Rs 22.50 lakhs made during the last year to the reserve for bad and doubtful debts, it is anticipated, would clean the slate so far as to enable the Corporation to pay the guaranteed dividend without a call on the Central Exchequer next year. Apart from this legacy of history, Shri Menon gave a fairly satisfactory account of the considerable increase in business recorded during the last year.

The private sector's earlier fears about the working of the Corporation after the resignation of Lala Shri Ram appears to have been fully dissipated by now, for the amounts of loans applied for last year reached a record figure of Rs 27.70 crores, which is one and a half times the total amount applied for in the previous year and more than treble the average of the previous seven years. The loans actually sanctioned during the year under review aggregated to Rs 15.13 crores, an amount more than double that of the previous year and a little less than four times the average of the last seven years. Shri Menon sees no reason why this satisfactory performance should not be maintained, if not improved, in the future. The target set for the Corporation's loans to industry in the Second Plan is, however, only Rs 15 crores, and it is, therefore, proposed to approach the Government to make an upward revision of this target.

While the main emphasis of the Corporation's activities continues to be in four main industries, viz, textiles, engineering, chemicals and sugar, it is heartening to note that during the last year the flow of funds to the industrially backward States has been stepped up considerably. Loans to enterprises in Andhra, Assam, Punjab and Travancore-Cochin, which had amounted to only Rs 2.26 crores till the end of 1955, would record an increase to as much as Rs 6.92 crores by the end of the current calendar year.

Loans to Coop Sugar Factories

ANOTHER noteworthy feature of the Corporation's activities during the last year has been the sanctioning of a total amount of Rs 5.50 crores to co-operative sugar factories. This has been done more or less under the direction of the Central Government and in collaboration with State Governments. Unfortunately, Shri Menon's speech does not provide any indication of the financial problems which Co-operative Sugar Factories are facing, for there are reports that funds collected by these enterprises have not yet reached such a state of sufficiency as to enable them to go full steam ahead. Care would obviously have to be taken to prevent this latest aspect of the Corporation's activities from becoming either another Sodepore to the Corporation or a pre-fab housing to the Central Government.

Shri Menon's comments on the audit system to which the Corporation is subject should be of great interest in this post-Appleby era. It appears that the Corporation enjoys the audit of as many as four different agencies:—(i) internal audit which is claimed to have been put on a satisfactory working basis during the last year; (ii) a firm of Chartered Accountants elected by the shareholders; (iii) another firm of Chartered Accountants appointed by the Central Government in consultation with the Comptroller and Auditor-General.

Both these firms have given a clean bill of health to the Corporation but the fourth agency namely the Directorate of Commercial Audit, under the control of the Comptroller and Auditor-General, seems to have raised some objections, most of which, however, have not survived the replies of the Corporation. No wonder Shri Menon has been constrained to remark that "we have a multiplicity of audit, somewhat in excess of real requirements. One might also be tempted to take the view that if the bulk of the items of original audit objections was withdrawn, there must have been created quite an appreciable quantity of work at all levels, most of which would have been eventually proved to be infructuous". Now that the management of the Corporation has passed into the hands of the civil service ,it would be very interesting to watch this tug of war within the public sector.

Our Delhi Letter

A Policy for Oil

THE return of Shri Keshav Deo Malaviya, Minister for Natural Resources and Scientific Research, to India after a tour of Canada and the United States is likely to give a fillip to the formulation of an integrated oil policy for the country. Shri Malaviya has lost no time. He has been having a series of conferences with his officers to put up concrete proposals before the Government. The formation of a Ministry of Oil and Fuel is still far off but the idea continues to hover on the horizon. Presently, four Ministries —Production, Natural Resources and Scientific Research, Works, Housing and Supply, and Commerce and Industry—are dealing with oil. Progress in this field is inevitably handicapped by the resulting confusion. Besides there is the onerous legacy of neglect. No one has really given thought to the many important aspects of the oil problem for decades. The prices of refined products, for instance, are determined by a Deputy Secretary and a Petroleum Officer, slightly below the rank of an Under-Secretary, in the Ministry of Works, Housing and Supply. An outmoded formula, involving a heavy and avoidable burden on the Indian consumer, is used to determine the prices of refined petroleum products. It has been in force for nearly 8 years.

The emergence of the Cabinet Secretariat as an active agency for framing an oil policy is however a happy development. It is taking the initiative at coordination. The Cabinet Secretary, Shri Y N Sukthanker, has the advantage of expert advice from Shri K K Sahni, Adviser on Oil in the Planning Commission. The appointment of Shri Sahni, who was till recently a senior officer of Burmah Shell, in charge of the Company's aviation service in New Delhi, was suggested by the Prime Minister himself. He has direct access to Shri Nehru who has begun to take personal interest in the oil question. A recent visit to the West European countries and the U S has given Shri Sahni a thorough background of the latest trends in the oil world. Between him, Shri Malaviya and the experts who accompanied the Minister of Natural Resources and Scientific Research on his recent tour, the Government can hope to get enough knowledgeable and up-to-date advice on such policies as it may wish to pursue.

The oil question however is a multi-headed hydra: it has to be tackled simultaneously at several points. Exploration, exploitation, transportation, refining and pricing of oil—each present a complex of technical difficulties. Oil is a highly competitive and organised business; the presence of big international oil cartels is another complicating, if not a perplexing factor. India faces an acute dearth of all types of oil technicians. Besides no attempt has yet been made to study the relative economies of utilising oil and coal and electricity. It has been seriously mooted, for instance, that to pipe crude oil all the way from Assam to Saurashtra would be cheaper than transporting coal from Bihar to that area by sea or surface routes. But who is to find out? Apparently it is necessary to create a technical cell to conduct research on this and allied subjects.

Similarly India's pricing policy should be compared with that of the other countries. In Iraq, petroleum products are reported to be priced at less than one-half of the Indian level. In England, motor spirit sells at 1 shilling seven pence a gallon exclusive of taxes, against the comparable price of nearly two shillings in India. This, at least, is one view of our pricing system. The Ministry of Works, Housing and Supply, dealing with this problem, however, denies the existence of any wide disparity that cannot be accounted for by distance from sources of supply, and freight. It is contended that Iraq being a producing country and England having a large refinery capacity are in a position to sell petroleum products more cheaply than India. But, in fact, the difference between the port prices in India and any other port in the West, after eliminating the freight factor, is no more than one anna. Detailed study of the pricing system is, thus, urgently required to resolve this issue, since a more rational schedule of oil prices could provide immense help to the development of indigenous industry and transport.

An important factor to be considered in relation to prices is the country's production of crude oil. Some of the Western nations are in a position to manipulate petroleum prices and keep them low for their own consumer because they either produce their own crude oil or have a large surplus of refinery capacity or both. India, unfortunately, has neither. Western Europe has developed refinery capacity for processing 135 million gallons of crude oil while its own consumption is about 75 million gallons. More refinery capacty continues to be built. In India, the proved and known oil reserves of Assam can yield only about one-half of the country's requirements of crude oil by the end of the Second Plan. The country is already surplus in motor spirit and furnace oil and would be more so when the Caltax refinery goes into production. Yet there are proposals to start a refinery in the eastern region under the public sector and another privately owned refinery in Saurashtra. Shri Reddy too may ask Russian aid for setting up an oil refinery. These are welcome developments. But the Government should streamline awkward laws, and announce their oil exploration and exploitation policy, particularly since the visit of Shri Malaviya and his team to the United States and Canada has enabled the collection of a large amount of data. The expert view is that we should concentrate our limited resources in the most promising areas of Assam and West Bengal while preliminary surveys continue in the rest of the country. Simultaneously, attempts should be made to train personnel on a large scale; as it is, the chances are that even Rs 11.5 crores provided in the Second Plan for oil exploration may not be spent owing to the paucity of trained staff. Many young Indians studying in the United States are qualified enough to be recalled and put on the job at home. All this points to the need for creating a Ministry for Oil and Fuel to formulate an integrated oil policy and execute a coordinated programme.

From the London End

The British Balance of Payments

THE publication of the White Paper on the Balance of Payments for the first half of 1956 follows closely on the speech of the Chancellor of the Exchequer to the bankers of the City of London this week. The picture presented is by no means as encouraging as a first reading of the White Paper would make. While the Current Account of the sterling area reflects rising earnings on the part of the United Kingdom, thus placing the sterling area as a whole in a more favourable position than it was in the first half of 1955, the Capital Account, by contrast, reflects a steady deterioration in the flow of United Kingdom investments abroad. The export performance of the British economy is however noteworthy and if account is taken of the trade statistics for the third quarter of this year it is likely that United Kingdom exports in 1956 will show a rise of about 10% over that of 1955.

Current Surplus

The surplus of the United Kingdom on its Current Account, which amounts to £ 144 million, for the first half of this year would suggest that a possible annual rate not far short of the £ 380 million target set by the Treasury may be achieved in 1956. The Current Account of the United Kingdom in the first half of this year compares most favourably with the now revised surplus of only £ 18 million in the first half of 1955 and the revised deficit of £ 107 million in the second half of last year (Tab I) The Chancellor of the Exchequer in his speech at Mansion House believed that the improvement in the foreign balance was the result of a combination of three factors: "a substantial expansion of export earnings, a slight fall in import costs and some revival in invisible earnings". Indeed, the White Paper and the more detailed trade statistics now published for the United Kingdom by the Board of Trade show that each of these factors did contribute towards the favourable balance of £ 144 million achieved in the first half of the year. According to the Board of Trade, U K exports in the first nine months of 1956 have been running at a level which is 10% above that of last year. Net earnings from British shipping transactions in all areas have now recovered from last year's decline, and oil receipts continue to grow. The net oil yield is currently almost as high as that of 1953 and 1954. There has been some expansion of American and Canadian military expenditure in the United Kingdom. All these factors have provided the United Kingdom with an invisible surplus of £ 192 million in the first half of this year.

A notable fact on the credit side is that in the first half of 1956 exports to countries outside the sterling area rose by £ 147 million, compared to the same period of last year. This rise of 18% was more than sufficient to outweigh the slight increase in imports. On the same comparative basis, the balance of trade with the sterling area countries in the first half of 1956 remained practically unchanged. It must therefore be clear that the increase of £ 95 million in the sterling area's gold and dollar reserves during the first six months of 1956 was achieved entirely by the United Kingdom itself. The balance of payments of the whole sterling area with the outside world was in surplus by £ 128 million. Of this the United Kingdom contributed £ 125 million.

Sterling Balances

The difference between the rise in the gold and dollar reserves (£ 95 million) and the balance of payments surplus of £ 144 million is largely accounted for by the fall in the sterling balances of non-sterling area countries. In this regard the state of confidence of the non-sterling world in sterling appears to have remained unchanged between 1955 and 1956 in spite of the attractive market rates of interest that rule in London. In 1955 the reserves had fallen to a greater extent than the sterling area deficit; then the sterling area deficit of £ 167 million with the non-sterling world occasioned a fall of £ 229 million in the reserves. Even the rise in the sterling balances of the Colonial territories seems to have now been halted. For the year ending June 1956, the British Colonies added only £ 8 million to their sterling balances in London compared to the rise of £ 110 million for 1954-55. It could very well be that the Colonies are devoting more and more of their export earnings towards internal development expenditure; alternatively, as appears to have been the case actually, the commodity earnings of Colonial produce have been less during the past year compared to previous years.

Tab II—U K Long Term Investments

Change in Reserves	— 29	— 200	+ 95
Change in Sterling Balances	— 38	— 95	— 23
Net Investment (plus) or Borrowing (minus)	+ 9	— 2	+ 26

are, of course, subject to a considerable margin of error but the data given in Table II at least presents certain pertinent orders of magnitude concerning the size of Britain's overseas investments. While, for the whole of 1955, United Kingdom long term investments abroad amounted to £ 225 million, the flow of similar investment funds in the first half of 1956 amounted to not more than £ 75 million or at an annual rate of £ 150 million. The shrinkage of investment in the overseas sterling area appears to have been sharp. The credit squeeze in the United Kingdom has certainly made it difficult and expensive for loans to be raised in London. Indeed there have been occasions in the past six months for a number of sterling area countries to maintain funds in London to earn the higher rate of interest rather than to devote such funds in their own territories. The weakness in the United Kingdom overseas capital account must therefore be conceived as the result of the deliberate policy of "dear money" as has been pursued by the United Kingdom authorities and this, the **Financial Times** claims, has made "the policy work like a charm". It nevertheless makes the flow of investments by the United Kingdom in 1956 reach a post-war low. While it may have brought some relief to the strain on Britain's capital resources, at a period when sterling has certainly been under pressure, it nevertheless tells on the confidence which overseas countries are expected to possess in their expectation of capital flows from London.

Cheaper Money or Status Quo?

The rise in British exports over the past nine months and the stagnating tendency that has come to characterise British industrial production has suggested to a number of commentators that the time has now come for some relaxation in the policy of monetary stringency. Mr Roy Harrod has recently written that the "time to relax is now". The difficulties in the automobile industry and short time working in a number of other industries that are in one way or another allied or associated with motor car production, has given this suggestion some sense of urgency. It has been suggested that the conscious curtailment of the home market for a number of products in the face of stronger competition for similar products in foreign markets has been largely responsible for the stagnation in industrial production. The Governor of the Bank of England, speaking at Mansion House this week, pointed out that the variability of the bank rate was an ever conscious aspect of British policy—it may be changed as and when the British authorities decide.

In contrast to this "relaxation viewpoint" the OEEC report, which has just been issued and which concerns the British economy, recommends a continuing "dear money" policy and, more importantly, a "stabilisation of wage rates". The report claims that if the improvement in external payments is to be maintained, the most "urgent need" is to achieve stability in wages and prices. It states that voluntary price stabilisation on the part of manufacturing industries will only be useful if it "coincides with a period of greater stability of wages". Failing that, there will result a major release of additional real demand which can only damage the balance of payments. The OEEC goes further. It recommends to the British authorities that a "tougher" budget be introduced next year—designed to restrain home demands further and in a manner which goes considerably beyond that which budgetary policy has so far achieved. It views the increasing competition in foreign markets with favour: such competition provides stimulus to economic flexibility and to labour mobility. Both these requirements are sadly lacking in Britain. It is not known how far the political situation would warrant a tougher budgetary policy or for that matter whether the political repercussions of a crisis in the automobile industry would not call for some economic relaxation. If the speech of Mr Macmillan is indicative of British economic policy, then, however, it is more likely than not that "Britain will not relax".

Light on Small-scale Industries

Sports Goods, Sewing Machines & Parts, Bicycles & Parts (Northern Region.) Small Scale Industry, Analysis and Planning, Report Nos 1, 2 and 3. Development Commissioner, Small Scale Industries, Ministry of Commerce & Industry, New Delhi. Pp 37, 37 and 53. Prices not mentioned.

Reviewed by **R K Hazari**

THESE are the first three of a series of reports prepared by teams of economists and engineers in the Office of the Development Commissioner for Small Scale Industries, which are being brought out by the Ministry of Commerce and Industry. The reports have been prepared under the direction of Dr Eugene Staley, Consultant on Industrial Economics, and Shri S Nanjundan, Deputy Development Officer.

A central team of economists and engineers was set up in July 1955, to work under Dr Staley. The team surveyed four industries in the Northern Region in the first instance viz (1) Sports Goods (2) Sewing Machines and Parts (3) Bicycles and Parts and (4) Leather Footwear. The reports have been prepared with a view to assist Government in determining what types of small scale industry should be promoted and what should be the main lines of their growth.

Based on rapid field studies at important centres of the industry in the North, the surveys are non-statistical; "speed, consistent with reaching reasonably valid conclusions on which to base practical action," to quote the authors, being more important at this stage than scientific thoroughness. It is indeed commendable that the first two reports were submitted to Government as early as October 1955, i e, within three months of the teams being put on the job.

Perhaps the most important feature of the reports is the attempt made to evaluate the prospects and the suitability of particular industries for development on a small scale though not in a de-centralised manner. For this purpose a rating system has been adopted, based on evaluation of demand outlook, employment outlook and competitive outlook. Rating A has excellent prospects and it is proposed that industries with this rating should be given all help. Industries rated as B have moderately good prospects, or good prospects with special circumstances e g a large number of household producers whom it may be difficult to bring into technical improvement schemes; in their case while all help should be given, caution would have to be exercised to prevent lopsided development. Last of all comes rating C indicating poor prospects, in which case the Small Industries Service Institute may assist firms in the industry to shift to other activities. All the industries covered by the reports under review have been rated A. It is expected that output in the sports goods industry would expand at an annual rate of 20 per cent, that domestic consumption of sewing machines and parts made by the small scale industry will double during the next five years, and that the bicycle parts industry would increase at an even more rapid rate of development of 25 per cent per annum which would mean a tripling of production over the next five years.

The reports contain factual analyses of the general status of each industry with reference to output, employment, personnel, capital output and capital employment ratios, and its comparative position vis-a-vis large scale industries. Some of these data are collated in Tables I, II and III.

A notable fact about the analyses and recommendations in these reports is that they take up a thoroughly positive and practical approach. The industries selected are those for which internal demand is expected to rise considerably during the immediate future and for which there is scope for markets abroad. Further, the growth of these industries would not lead to displacement of labour in any other sector. They possess sufficient innate strength on account of their low overheads and labour costs, skill, initiative and effective supervision by management, to stand competition from the large scale sector of the industry in question. This, of course, holds for industries other than sports goods in which there is practically no large scale enterprise. The reports do not favour

1954	80,198	30,000	13,976	7,240	116,934

any restrictions on production in the large scale sector and the aids they recommend to the small scale industry are explicitly stated to be an attempt merely to remove the handicaps which the latter suffers from.

In refreshing contrast to the quixotic programme for schemes like the Ambar Charkha, the proposals for these industries give considerable evidence of horsesense. Their location in the North is based not on the nearness of raw materials or of important markets, but on the availability of skilled workmen, entrepreneurial initiative and external economies due to the existence of established light engineering industries in the various centres. It is on these favourable—and one should say fundamental—factors that the recommendations in the reports are based. The fair success of the community development and extension service approach has suggested a similar policy in the field of small industries as well. It is proposed that Industrial Extension Officers should be appointed to act as links between the Small Industries Service Institute and the industrial units. Their function would be mainly educative. They would be expected to work in close collaboration with the co-operatives for buying and selling and trade associations (to be set up) which would voluntarily enforce quality standards and trade marks. Since the investigating teams found that the non-availability of adequate and proper premises was one of the major handicaps of these industries, it is recommended that they should be allotted sites and premises in industrial areas and newly set up industrial estates. A system of hire purchase of machinery from the Government has also been suggested and this is followed by the inevitable —as well as fashionable—recommendation that the Government should give preference to these units in the purchase of its stores.

It has been recognised that, except for sports goods, these industries cannot be de-centralised away from urban areas where skilled labour external economies and proposed Government aid are or can be made available. The need to create quality standards, for which three grades are proposed to be established in the initial stages to smoothen the process of standardisation, makes it all the more essential that these industries should have a modicum of centralisation. One wishes that those dedicated to the ideology of cottage industries would also pay some heed to this important consideration.

There is one point in the recommendations on which opinion may differ for certain fundamental reasons. It has been suggested that State Governments should enforce the provisions of the Factory Act rather leniently in respect of these industries since the investigation teams received widespread complaints from various units about the inconvenience caused to their management by them. While one cannot but be in sympathy with the management for the burdens of Government interference which they have to bear, it is also to be remembered that the law and its enforcement in their very nature do not permit of deliberate discrimination. If these burdens on the management of small units are considered excessive, the proper way to lighten them is to make appropriate changes in the law rather than dilute its enforcement.

The Tsangpo in Tibet and Brahmaputra in Assam

Kumud Bhushan Ray

TIBET is the highest plateau in the world, lying 12,000 feet above sea level. It lies to the north of the Himalayas, which act as a barrier, to the monsoon air currents from the Indian Ocean. Central and Western Tibet receive little rainfall, and the region is barren. Moist currents of air from the Pacific Ocean, however, have access to Eastern Tibet, which is well watered and fertile. No water escapes to the sea from Central and Western Tibet. The troughs contain a series of lakes, into which the rivers empty their water. The Tsangpo is the only river which has access to the sea through the Dihong and Brahmaputra.

Heinrich Harrer, a Tibetan explorer, in 'Seven Years in Tibet', states that "in former times rainfall in Tibet must have been heavier. There used to be great forests, which made for rainier and cooler weather". Burrard and Hayden, in 'A Geography and Geology of the Himalaya Mountains and Tibet', have given a similar opinion on the rainfall in Tibet. South of the Himalayas lie the river basins of the Indus, Ganga and Brahmaputra. The reclamation of the ancient sea, between the Himalayas and the Vindhyas, by the deposit of silt transported by river water from the crumbling of the hills, has created the alluvial plains of India. Monsoon currents of moist air from the Indian Ocean have access to these plains. The combination of the rich alluvial soil and rainfall have made the river basins highly fertile.

The Great River

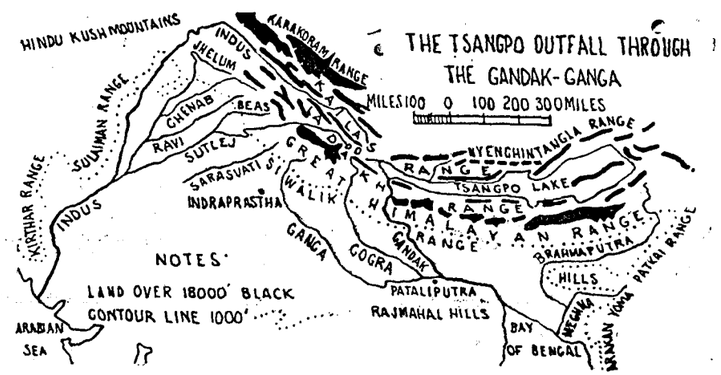
Tsangpo in Tibetan means "any river, but usually a large one; especially the 'great river' of Tibet from west to east".

The Tsangpo rises in Tibet, a few miles east of the Gurla Mandhata peak, between the Ladakh and Kailas Ranges, at an altitude of 16,000 feet. At its eastern end, a few miles east of Gyala Sengdong, the Tsangpo turns south and crosses the Himalayas into India.

Some of the tributaries of the Tsangpo—the Kyi Chu, Shang Chu, Shap Chu, Nyang Chu, etc,—flow in a direction opposite to that of the main river. Burrard and Hayden state that this remarkable feature has given rise to a belief that the Tsangpo "must at no distant date have flowed from east to west in Tibet". The authors write:

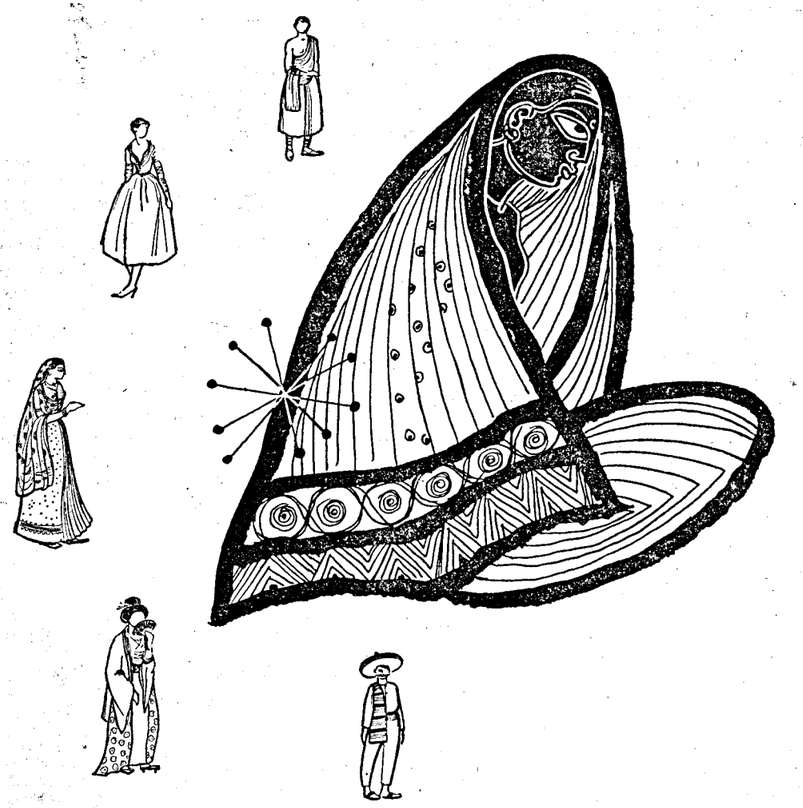
"It is not possible to express an opinion at present as to where it (the Tsangpo) escaped through the Himalayas; it may have flowed through the Photu Pass through the defile of the Kali Gandak; it may have passed through the basin of the Karnali, and it may have flowed through the present Himalayan course of either the Sutlej or the Indus; arguments can be adduced to show that each of these hypotheses is worthy of future investigation, but with our present knowledge no conclusion can be reached".

From the ancient books of Tibet and India, it appears that a part of Tibet was under a sea-like lake. The Kailas on the north shore line of the lake tallies with the existing Kailas Range. The Gandhamadan on its south shore line is probably the Ladakh Range; the Jarudhi on its west shore line is probably a spur connecting the Kailas and Ladakh Ranges; and the Sambartaka on its east shore line is probably the eastern end of the Nyenchintangla Range. All these ranges have altitudes of over 16,000 feet.



The ancient Tsangpo Lake probably extended on the west to the source of the Indus, and covered the Mansarowar and Rakhas Lakes, and on the east to the extreme end of the Eastern Himalayas. Its northern shore line was the Kailas and the Nyenchintangla Ranges, and its south shore line the Ladakh Range.

Tsangpo Flows from East to West



Near Bunji, north of the Nanga Parbat peak, the Indus flows between precipices of 20,000 feet height, through a gorge 17,000 ft deep. Such a deep gorge could not have been cut, if only the water from the catchment of the Indus in the Himalayas had drained through it. Similarly the great Sutlej canyon across the Himalayas could not have been created by "the small stream that now trickles along the floor of the canyon". On the same reasoning, the gorges of the Karnali or the Kali Gandak could "hardly have been cut by the volume of water from so small a catchment as the river now possesses behind the Great Himalayas".

Burrard and Hayden have not, however, mentioned the Sarasvati as being one of the channels through which the waters of the Tsangpo might have once escaped. This is probably because the Sarasvati at present is an insignificant stream near Kurukshetra, losing itself in the desert lower down. For an escape of Tsangpo water through the Indus, the watershed joining the Ladakh and Kailas Ranges, at an altitude of 16,000 feet, need crossing. The water level in the ancient Tsangpo Lake must thus have been above 16,000 feet, so that the region, where Lhasa now stands at an altitude of 12,000 feet, was under 4000 feet of water. With the addition of Tsangpo water, the discharge during the flood season made the Indus look vast as the sea, which justifies

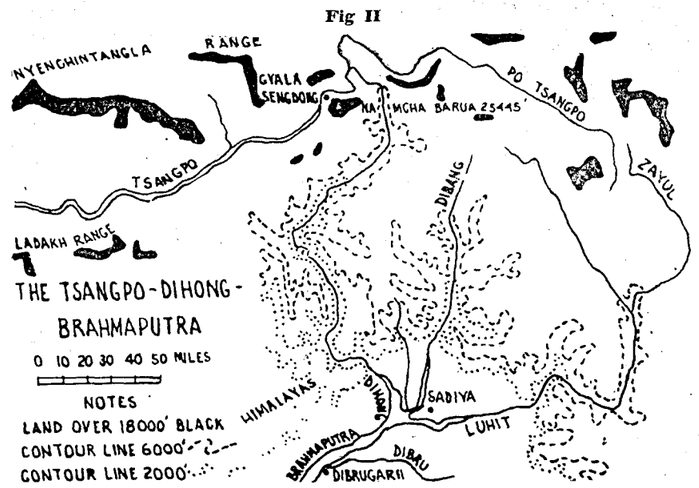
the name Sindhu (sea) given to it in Vedic times.

The Sarasvati, extending its channel by cataract action along the present Sutlej across the Himalayas, reached the Tsangpo Lake. Its water thus flowed through the Himalaya mountains along the Sarasvati to the Arabian Sea. With the flow through the Sarasvati, the level was lowered in the Tsangpo Lake, so that flow of its water through the Indus ceased. Later on, with the extension of the Karnali channel by cataract action across the Himalayas to the Tsangpo Lake, its water flowed through the Karnali-Gogra-Ganga into the Bay of Bengal. The level was further lowered in the Tsangpo Lake, so that flow of its water through the Sarasvati into the Arabian Sea ceased.

Thus the water from the Tsangpo Lake changed its outfall, from the Arabian Sea into the Bay of Bengal. With the cessation of Tsangpo water flow and the subsequent capture of its channel in the Himalayas by the Sutlej, the Sarasvati was deprived of its upland water supply and dwindled down to its present insignificant condition.



The extension of the Kali Gandak channel across the Himalayas by cataract action to the Tsangpo Lake, caused a flow of its water through the Kali Gandak-Gandak-Ganga to the Bay of Bengal (Fig 1). The level in the Tsangpo Lake was further lowered, so that flow of its water through the Gogra-Ganga ceased. Up to this time, the Tsangpo water flowed from east to west.

Tsangpo West to East

The extension of the Dihong channel across the Eastern Himalayas by cataract action to the eastern shore of the Tsangpo Lake, caused a flow of its water through the Dihong-Brahmaputra-Meghna into the Bay of Bengal. The level was lowered in the Tsangpo Lake, so that flow of its water through the Gandak-Ganga ceased. Tsangpo waters now flowed from west to east. Fig. 2).

Drainage through the Dihong lowered the level in the Tsangpo Lake, until land in the Tsangpo valley emerged above water. The deposit of silt from the water of the lake for ages made the soil fertile, while moist currents of air from the Pacific Ocean provided sufficient rainfall. Large forests grew up in

Fig II

the sparsely populated country. With a prosperous cultivation and abundant crop production, civilisation and culture grew up and appear to have flourished in Tibet from the 7th century A D.

On the other hand, although Kamarupa under King Bhaskara Varman had diplomatic relations with China and "attained considerable power and a fair degree of civilisation," the fact remains that "so few materials of their time have come down to us." The reason, given by Gait in his History of Assam, is "that nature vied with man in destroying them." The decline in power and civilisation in Kamarupa, started after the death of Bhaskara Varman in 650 A D.

The building of the Potala Palace in the capital city of Lhasa, and the growth of civilisation and classical literature in Tibet, started from the 7th century A D. The decline in power and civilisation of Kamarupa also started from the 7th century A D. It may, therefore, be inferred that the drainage of the Tsangpo Lake through the Dihong, which caused the emergence of considerable areas of land in the Tsangpo Valley and destructive floods in the Brahmaputra Valley in Assam, started about the 7th century A D.

Conditions in Modern Tibet

The cataract action in the Dihong channel across the Himalayas is continuing. It has been mentioned that the hills on the eastern shore of the Tsangpo Lake had an altitude of over 16,000 feet. Along the channel of the Dihong, there has been a lowering of these hills to 8,000 feet at Gyala Sengdong. About 40 miles lower down, the Dihong channel bed has an altitude of 6,000 feet (Fig 2).

In the vicinity of Lhasa, the Tsangpo has still a wide and shallow channel with a sluggish flow. It is one of the rare instances of a navigable river at such a high altitude. On May 28, 1882, Sarat Chandra Das* came to a chain bridge across the Tsangpo, where its channel was about 400 yards. As it was the dry season, there were sand banks for several hundred feet beyond the ends of the bridge. His party and ponies were taken across the river in a roughly made boat. On August 26, during the flood season, he found that the waters had submerged the wide sand banks. On October 28, during the dry season, the water had gone down, so that he had to walk over nearly 2 miles on soft sand before he reached the ferry boat. The Tsangpo here has thus all the characteristics of an alluvial river.

With the extension of cataract action, from the Dihong to the Tsangpo, its alluvial characteristics are changing. The wide and shallow channel, having a sluggish flow, and which formerly extended nearly up to Gyala Sengdong, is now gradually becoming narrower and deeper, while the current is becoming swifter. Between Sadiya at an altitude of 442 feet and Gyala Sengdong at 8,000 feet, the distance along the river being about 210 miles, the fall in the Dihong is about 36 feet per mile. In its natural tendency to flatten this steep slope, the deepening of the channel bed is gradually ex-

* 'Bhota Prakash' by Vidhu Sekhara Bhattacharya.

tending upstream in the Tsangpo. In this process in the course of a few centuries, the Tsangpo will flow through a deep gorge, similar to the 4,000 feet deep gorge of the Indus.

The draining of the water through the Dihong had at first reclaimed from the bed of the ancient Tsangpo Lake extensive areas of land in the Tsangpo Valley. Heavy silt deposit made the soil very fertile, while moist currents of air from the Pacific Ocean provided sufficient rainfall. Forests grew and there was ample production of food crops. But with the deepening of the Tsangpo channel, and its gradual conversion from an alluvial to a torrential river flowing through a deep gorge, river-side lands are becoming desiccated, by seepage of sub-soil water through the sides of the deep gorge. Thus inspite of the rainfall in this region, with the gradual desiccation of the land in the Tsangpo Valley, Eastern Tibet will become more and more barren, similar to the lands in Central and Western Tibet.

Conditions in Assam

The colossal amounts of debris, formed in the process of lowering of the Dihong and Tsangpo channel beds, and from the landslides in the sides of the river gorges, are adding to the silt load transported by the Dihong waters. But when the wide and shallow Brahmaputra is reached, owing to its lower velocity a considerable part of the silt load is deposited on the channel bed. As the river bed rises, flood waters overflow and deposit silt on the river banks. South of Sibsagar, the palace of the ancient Ahom Kings are buried in silt up to the first-floor level.

The rise in river bed and banks has created other problems. The high dry-season water level in the river prevents drainage from river side tea gardens, villages and towns. It may be mentioned here, that it has become necessary to construct a channel 14 miles long to a point downstream of Dibrugarh, to ensure an outflow for the town's drainage into the river, at a cost of Rs 14 lakhs. Owing to the high water level in the flood-season, the submergence of paddy and tea garden lands, and villages and towns, has become an annual occurrence.

Conclusion

The deepening of the channel bed of the Tsangpo in Tibet, and the deposit of colossal amounts of silt on the bed and banks of the Brahmaputra in Assam, are the primary causes of the rapidly deteriorating conditions in Tibet and Assam. It is not known if the Government of Tibet is taking action to prevent, or minimise, the desiccation of the soil in the Tsangpo Valley. In Assam marginal embankments are being constructed along rivers, to prevent the submergence of river-side lands; but, as is now well-known, such embankments are very temporary palliatives.

Before the Sara Railway Bridge (now in East Pakistan) was constructed, the width of the Padma from bank to bank at high water level was 16,500 feet, or over 3 miles. Although 15 x 359 feet spans are provided in the bridge, in its natural tendency to concentrate in a narrow and deep channel not more than 7 x 359 feet spans or less than one-half mile of waterway passes the whole of the flood season discharge. With the narrowing, the depth of the channel has increased to a maximum of 130 feet, and the velocity to 13 feet per second.

At Pandu, the Brahmaputra has a width of 2,560 feet, the velocity in the flood season in this reach being up to 12 feet per second. But in the other reaches, the width varies from 1 to 9 miles. It needs narrowing, deepening, canalising and stabilising of its channel to a width of less than one-half mile, so that a high velocity is developed, which can transport the whole of its silt load to parts of its wide bed to form new parallel river banks, having in between a narrow and deep channel with a stabilised alignment.

Labour Cost ... of Commonsense

Amartya Kumar Sen

MY note on Labour Cost and Economic Growth has drawn forth some comments from Dr Brahmanand and Mr Srinivasan in The Economic Weekly of Oct 13, 1956. The points raised in the former's rejoinder may be dealt with first.

Consumption Multiplier

1. Dr Brahmanand's suggestion that my example can be fitted into their "generalised formula of the Consumption Multiplier" by reducing the value of the marginal propensity to consume below unity, does not appear to me to be very satisfactory, to say the least. The marginal propensity to consume in my example was unity and the recovery of previous consumption was done by taxation. To put it as if the recovery comes about through a low marginal propensity to consume involves the suggestion that the recovery is due to the savings of the rural population, which is not the case. If Dr Brahmanand is keen on having a general formula, I should suggest the following:

$$\frac{1}{g+(d\times q\times mpc)} \text{ instead of } \frac{1}{g+(d\times mpc)}$$

where q is the proportion of the previous consumption not taxed away. Thus in my example we would find that mpc = 1 and q = ½ and not that mpc = ½, as Dr Brahmanand suggests, since the rural population were consuming all they could.

2. I find nothing in Dr Brahmanand's arguments to believe that the rural population would have a significant part of their income as some members of the family move out. The common characteristic of nearly all low-income groups in the world is a mpc "very near one".

Techniques and Reinvestment

3 and 4. Coming to the choice of techniques, Dr Brahmanand succeeds in making his examples so complicated, that with only a little help from the press, they are almost absolutely incomprehensible. It appears, however, that what he is driving at is the following. He starts with two techniques with the following particulars:

	(In Rupees)	
	Technique I	Technique II
Capital ..	100	100
Wage-bill ..	5	1-2|5
Net output ..	10	6-2|5

He points out that for the same amount of investment, Technique II has less recurring wage-costs (due to less employment) indicated by "even a glance at the above illustration". This saving of wage-costs "will be available for employment in the investment sector". Hence, argues Dr Brahmanand, "aggregate amount of employment would be the same, whatever the technique adopted". Also, according to him, this makes Technique II preferable, as we have greater investment, leading to fresh migration and fresh release of wage goods, further investment and further release and so on.

This would have been so, had the output been the same with both the techniques. But another "glance at the illustration" will show that the case is different. The rate of reinvestment is given by the difference between the net output and the wage-bill, so that just a saving of wage-costs does not mean a higher rate of reinvestment. Again even if we assume that there is a considerable lag between the application of labour and the delivery of the output, the advantage of less labour cost will be only of short term nature, since the output must eventually appear in the market. Also, if a long input-output lag is assumed, it is difficult to see why one should think that to make the additional investment by the saving of wage-costs, to get the labourers from the rural areas, to recover their past consumption, to re-invest to that extent, to get new labourers, to recover their past consumption, and so on and so forth, would involve no time. Dr Brahmanand seems to be making rather a lot of very dubious assumptions.

Finally, Dr Brahmanand concludes his note by pointing out that if the labour-intensive technique gives a lower rate of accumulation, one can choose it only if we discount the future heavily. I was, however, arguing for labour-intensive production when it gave a higher rate of accumulation. Thus Dr Brahmanand's point is interesting, possibly valid, but not relevant.

"GOOD-BYE TO SENSE"

IT would not have mattered very much had Mr Srinivasan merely misunderstood what I had said in my note. But since he has taken the trouble of writing a paper on it, he deserves to be taken seriously. So let us examine his points one by one. (I shall confine myself only to his criticisms of my note, though it can easily be shown that his critique of Prof Das Gupta's note is not any more sound.)

(1) Mr Srinivasan says, "The main core of his (i e, my) argument, as I understand it, is that the additional cost of labour in terms of his consumption consequent upon his transfer from the pool of disguised unemployed to the new investment being smaller, there is a pronounced bias in favour of labour-intensive techniques of production". This piece of enlightenment is very interesting, as the particular thesis mentioned, far from being the main core of my argument, is not even something I said. (Again the sentence does not make very much sense either. To say that the additional cost of labour is "smaller", without mentioning smaller than what, is not a statement that is terribly meaningful. It is like saying, Ram is taller.)

Had Mr Srinivasan read my note carefully, he would have found that my point was precisely the reverse of providing a general argument for labour-intensive techniques on the ground of small labour-cost. I quoted Prof W A Lewis and referred to Prof A E Kahn, supporting labour-intensive techniques on the ground of zero labour-cost in an economy with unemployment, and suggested that the relevant labour-cost from the point of view of the rate of growth, was the increase in consumption as a result of additional employment. Even in an economy with unemployment this would not be zero and hence it would not be wise to choose, as Prof Lewis and Prof A E Kahn seemed to suggest, the most labour-intensive technique available.

(2) Mr Srinivasan suggests that the "main core" of my argument is "based on" the idea that "to the society, the cost of labour is equal to the difference between the wage rate in new investment and his average consumption prior to his transfer". This is very confusing, since what I actually said was that the relevant cost of labour "is not approximated by the difference between the industrial wage and the rural average consumption, but by

the full industrial wage (unless the State intervenes with taxation or with other income-leakage-mechanisms)". Mr Srinivasan seems to have missed the word "not" (printed in emphatic type),—rather an important word to miss when one comes to think of it.

(3) Mr Srinivasan thinks that I have misstated the theory of opportunity costs. The reason for this charge is not quite obvious from what he says. But it appears that he holds that by opportunity cost one should refer to the alternative factor-income and not to the alternative marginal productivity. I agree that both the definitions are possible, and in orthodox economics they actually come to the same thing as factor-income is equated to marginal productivity. In the case of disguised unemployment, however, there would be a difference between the two, as due to the family-based social structure, someone might be superfluous for production and yet share the family income. Here the two definitions diverge, and what we call the "opportunity cost" depends upon whether we are looking at it from the point of view of individual income or that of social production. Prof A E Kahn, for example, in putting forward his Social Marginal Productivity criterion for choosing between techniques, employs the definition of opportunity cost in terms of alternative marginal productivity, (Quarterly Journal of Economics, Feb 1951).

In any case, however, my point is not dependant upon the theory I criticise being called the theory of opportunity costs. It is a real enough theory put forward by big enough economists to warrant a discussion on it on its own merits, whatever its name.

(4) Mr Srinivasan maintains that my criticism of Prof Vakil and Dr Brahmanand's 'Consumption Multiplier' arises from my misunderstanding of the concept. And what is this misunderstanding? I am supposed to have forgotten that in the absence of the release of the consumer goods which Prof Vakil and Brahmanand assume, "the multiplier would not simply function". Well, that I thought was precisely my point. In the absence of special taxation to do the job of recovering the old consumption of the new labourers, there would not be the discussed release of the consumer goods, so that a tax linked with the exodus from the rural area seems to be a pre-requisite of the functioning of the consumption multiplier. In putting forward their concept, Prof Vakil and Dr Brahmanand did not make this clear, even if we assume that they were conscious of this difficulty.

Mr Srinivasan seems to accept the logic of the situation regarding taxation, but then wonders, "how can it make the foundation of the consumption goods multiplier dubious?" The Keynesian Multiplier, Mr Srinivasan is quick to point out, remains operationally useful inspite of the possibility of the marginal propensity to consume being zero. The comparison would have been legitimate, if in the absence of government intervention the marginal propensity to consume had nearly always been zero. This, fortunately for the Keynesian Multiplier, is not the case, and it does not need the help of the government to function.

In any case, however, the important point is that the assumptions on which the functioning of the so-called Consumption Multiplier is based, were not clearly stated, as the originators of the concept seemed to conceive it as a more or less automatic process.

(5) Mr Srinivasan's last criticism of my note is that my point on the effect of recovery of old consumption on the choice of techniques is arrived at only through my arithmetical example*. This is just not true. Mr Srinivasan's confusion arises due to his assumption that I am out "to prove the profitability of the labour-intensive methods of production". It would be pointless to try to build up a universal case for choosing labour-intensive techniques on the basis of some algebra and a little arithmetic. It escaped Mr Srinivasan that I used the algebra and the arithmetic to study the direction of the effect of recovery (if possible) of old consumption, on the choice of techniques. And I found that if alternative techniques exist, this would tend to make us choose "less" capital-intensive methods of production, as recovery in its effect was similar to lower wages. And this does not depend on my arithmetical example, as an equal addition to the numerator (surplus per unit of labour) must increase the value of that expression relatively more which has the lower denominator (capital cost per unit of labour). Thus the taxation policy of the government should influence our choice of techniques, if there are alternative techniques. Mr Srinivasan's claim that "one may just as well arrive at the conclusions opposite to that of Mr Sen, with different but equally plausible sets of figures" does not, therefore, seem to be well-founded. And of course since he assumes that I am trying to prove something which I am not, Mr Srinivasan's point does not appear to be very richly endowed even with the virtue of relevance.

Finally, while going through Mr Srinivasan's economics, I was wondering whether it was really fair to describe economics as "commonsense made difficult". An eminently more suitable definition, in this particular case, seems to be—"good-bye to sense—common, uncommon and half-common".

* Mr Srinivasan's claim that I did "not take into account the duration of the capital equipment" is grand, as he must have thought that I had used the word "ent" in the expression "net product per unit of labour" for sheer fun.

THE CENTRAL BANK OF INDIA LIMITED

(Established December, 1911)

Head Office : Mahatma Gandhi Road, Fort, Bombay 1.

Authorised Capital	6,30,00,000
Issued Capital	5,77,50,000
Subscribed Capital	5,76,66,125
Paid-up Capital	3,14,54,250
Reserve Fund and other Reserves	4,01,00,837
Deposits as at 31-12-54	1,24,21,26,680

Directors:

A Pilot Scheme for Workers' Education

S D Punekar and S Nilakantan

THERE is no uniform course of workers' education and the content of the education differs from country to country depending upon its political, economic and social development. In U S A workers' education is mainly carried on under trade union auspices and largely for the service of men and women in the trade union movement. In Great Britain and Scandinavia on the other hand, workers' education includes non-vocational education designed principally for the working class to provide 'objective' education to improve the students' understanding and increase their mastery of the world they live in, as well as to improve their personal culture. In France, workers' education is considered as one aspect of a wider movement of "Popular Education."

In India the literacy percentage is very low and the trade union movement is yet to be developed. Unfortunately workers have not fully understood their basic civic and political responsibilities and privileges. On the other hand, although the Indian worker is illiterate he is not ignorant of the things that happen around him. If given proper scientific training and guidance, he would not merely prove fit enough to shoulder any responsibility but could be an asset to the nation by rightly leading others in their endeavours. This aspect was amply demonstrated during the last general elections when a large percentage of workers exercised their franchise, understanding fully the significance of the whole business. So it is necessary that the workers' education, if it is to be organised on a sound footing, must be arranged to deal with the worker firstly, as an individual who is to develop his faculties fully, secondly as a partner in industry who must be able to do his job well and lastly, as a member of the community who has a responsibility as a citizen.

In view of this three-pronged approach to the worker as an individual, as a member of the working class and as a citizen (member of the community), the range of studies will be as follows: (a) primary education to satisfy the elementary literacy needs of an individual; (b) professional education comprising of vocational training and labour education, and (c) community education imparting knowledge in civics and citizenship. A fourth approach of looking at the worker as a member of the human race brings in the international aspects of workers' education, which however, is not of relevence in a pilot scheme.

Workers in India are not all equally advanced in their mental pursuits. It is therefore necessary to group them viz: completely illiterates for whom education must be started from the primary stage; those who have undergone some fundamental education; and those who have passed the secondary stage of education. This naturally brings in some changes in the objective of education for these three different groups. While preliminary education opens the horizon, secondary education brings with it further avenues of development and advanced education is designed to make them leaders of the community and the industry.

A chart giving details regarding objectives, duration of courses, conditions for admission, curricula, etc. is given at the end of this article. The chart is of an illustrative type and may serve as a basis of discussion. It divides the whole programme into three stages (a) preliminary, (b) middle, and (c) advanced and lays down the various standards accordingly.

The duration and the scope of the courses cannot be modelled on the school or college type—either as comprehensive or as prolonged. It must be understood that students here are primarily workers who have to support themselves as well as their families. It is expected that a three months' course will enable the worker to sufficiently understand his role. This time is enough to awaken 'the hidden genius'. If some workers show a special interest and ability they could very well undergo the advanced courses and later may be granted some assistance to go through college education. However, no link of the workers' education scheme with the University is contemplated at this stage. It is necessary to prescribe some minimum qualification for admission to secondary and advanced courses for without it, uniformity of courses cannot be achieved.

Workers beyond a certain age come to accept things as they are. They do not exhibit any enthusiasm to learn new things and they consider their lives as 'spent ones'. The only education that could be imparted to them is through the medium of audio-visual aids. To lead a better life they are only to see things by themselves rather than being taught. Hence, it is necessary to fix a maximum age. As for raising the minimum in the case of students of secondary and advanced courses, it is hoped that the worker will attain some amount of maturity to look at things 'objectively' and have a more 'balanced' outlook.

The method of selection of students may be done through the active co-operation of the trade unions and employers in the field, after giving adequate publicity in factories and among trade unions. If there is too much rush for the preliminary course, two sessions might be started on alternate days. As the courses advance, it is necessary that the number of students are to be limited as there must be a direct contact between the teacher and the taught. The teacher could only then take a personal interest in the students, and make out of them leaders and teachers.

It need not be emphasized that the co-operation of the employers for the success of the scheme is of an utmost necessity. The employer need not grant any concession to those undergoing the primary education. The advanced course students, however, might be given permission to attend late or leave early by an hour. In a mill or factory employing hundreds of workers, such concession to a dozen or so will not hinder production. Only in the case of full time students, the employers might make a sizable concession by firstly treating the whole period of absence as on leave and granting pay for 6 weeks from his pocket. But he will be rewarded and the industry shall profit by having the educated workers who will not only understand their own problems but also the problems and difficulties of the employers. This is a good compensation for the monetary sacrifice, of the employers.

No doubt, the worker sacrifices his three weeks' leave to educate himself but to give the worker a status

An Illustrative Chart Showing the Pilot Scheme of Workers' Education

(Continued from the previous page)

Particulars	Primary Education	Middle Standard (Secondary Education)	Advanced Courses (Special Education)	Remarks
Scope of Curriculum	1. The teaching of the three R's. 2. Basic civic, political and economical rights and duties. 3. The local art, music and other cultural activities. 4. Some knowledge of Indian History.	1. Regional language, culture, and music. 2. Civics. 3. History-Indian with special emphasis on regional History. 4. Economics. 5. Labour Problems 6. Principles of Politics and Law. 7. Science-Human physiology. 8. Geography. 9. Vocational Guidance.	1. General applied economics and sociology. 2. Trade Union Studies. 3. Labour Laws. 4. Industrial Relations. 5. National & International Politics. 6. Current Indian & World History.	1. Utility in practical life is the key note of education. 2. Theorizing to be kept to a minimum.
Medium of Instruction	Regional Language.	Regional Language and Hindi or Elementary Hindi.	Regional Language and English.	
Methods of Education	1. Audio-Visual Education 2. Academic Teaching 3. Cultural Activities	1. Academic Education 2. Group discussions and seminars. 3. Cultural and recreational activities. 4. Visits to various centres of interests.	1. Academic Education. 2. Organisation of camps, lectures and seminars.	As the courses advance the academic education is emphasized.
Agencies	1. Adult Education Centres 2. Primary Schools	1. Schools. 2. Workers' Education Centres of the Trade Unions.	1. Labour College of Workers' Education Association. 2. Labour Research Bureau.	In all these cases, the Workers Education Centre remains the pivot of the whole Education Scheme.
Teachers	1. Adult Education School Teachers.	1. Trained Teachers specially selected for this purpose. 2. Teachers already trained by the Asian Trade Union College.	1. Trained persons specially suited to their jobs. 2. Trained teachers from Asian Trade Union College. 3. Experts from other countries. 4. New recruits specially trained for this purpose.	Special care is taken to recruit those with an interest in such work.

Around Calcutta Markets

Market Factors

Wednesday Evening

LYONS RANGE remains closed for the Puja holidays. But kerb dealings indicate an easier trend. This is partly a sympathetic reflection of the weakness in Dalal Street. But there are deeper influences behind the recent downward trend in equities. If these influences persist, the expected upward movement after the Puja holidays may not materialise. It is now clear that neither Lyons Range nor Dalal Street has recovered from the recent shocks. Current indications are that the post-holiday recovery in equities may not be prolonged, even if equities do move up slightly as Lyons Range reopens after the Puja holidays.

Immediately, the extensive flood damage in northern and eastern India is causing anxiety to stock markets. There has been considerable flood damage to life, crops and property in these parts of the country. There were hopes that, as the prices of foodgrains and of industrial raw materials fall, industrial production costs may go down gradually. These hopes may not now materialise because of the flood damage to crops. So, one of the reasons behind the expectation of a rise in equities may no longer be valid or in operation.

Dividend Policy

Gradually, though slowly, the implications of the Government's attitude to dividend payments are dawning upon stock markets. There may be a case for ploughing back profits. There is a case against frittering away of resources through higher dividend payments. Genuine investors are aware of the importance of the growing financial strength of companies. But they are not unconcerned about current yields. More than that, New Delhi's insistence on its right to lay down the dividend policy is causing worry to the private sector.

This is not the only source of anxiety to stock markets. Soon the busy season will start. In recent years, the slack season has not only been of short duration, but average money rates have remained relatively higher. In the busy season, money rates have been comparatively higher. Besides, there has been a scramble for funds. Fears, therefore, prevail that, as the busy season gets going, the money market may not have enough surplus resources to feed stock markets. This is a factor which may affect speculative activity.

New Issues

This raises the problem of the forthcoming capital issues. It is likely that the Indian Iron Company will offer the right issue by the end of the next month. This issue will involve considerable investment of funds. There are other companies in the queue. Hindustan Lever and Guest Keen Williams will soon enter the market. These two companies will be converted into public limited companies through offers of part of their capital to the Indian public. There are many other companies waiting to float bonus or right issues.

It has been apparent for some weeks now that Lyons Range is diffident about these forthcoming capital issues in the private sector. Some of the recent new issues have not been popular. There is not enough surplus cash available with investors. New issues by sound companies may be easily subscribed. But second-rate companies may experience difficulties. Besides, these new issues may cause further tightness in the money market. Stock markets are, therefore, worried that they may be starved of funds.

Jute Shares

While Lyons Range remains closed for the Puja holidays, quotations for only National Jute, a clearing share, are available. Movements in National Jute indicate that Jute shares may remain steady to firm in the coming weeks. Until a few days ago, hessian was going down while sackings were steady. Data about mill stocks of jute goods at the end of September, recently released by IJMA, explain the contradictory behaviour of hessian and sackings.

Sackings have started to move up again. There are reports of considerable buying of heavy goods by the Government. Data of burlap consumption in America are encouraging. There are hopes that burlap consumption may move up further this month. Improvement in gunnies should help the expected spurt in jute shares. True, raw jute prices remain firm. But the spinner's margin is no longer as unfavourable as "bears" of jute shares would seem to think.

Coal Strike

With the end of the coal strike in Raniganj, Coal shares may steady up. Continued weakness in Coal shares has had a psychologically adverse effect on Tea, Paper and Jute shares. Moreover, the end of the coal strike will enable industry in and around Calcutta to function again at top gear. For about a month, the coal strike has affected industrial production in this port town. Lower industrial production has had adverse effects on industrial shares.

Not only coal shares, but Engineering shares will also steady-up as the coal strike ends. If the expected spurt in Engineering and Miscellaneous shares materialises, it may have a sustaining influence on the whole market. Investors in Tea shares will welcome such a conjunctural development, as it would be a contributory factor to the anticipated improvement in these shares.

Gypsum for Sindri

THE entire requirements of gypsum, one of the main raw materials for ammonium sulphate, produced by the Sindri Fertilisers Factory, are being met from the various mines in Rajasthan. The principal mines are at Jamsar in the Bikaner and Kawas in the Jodhpur Divisions.

The factory was planned with the mines at Daudkhel in West Punjab as its main gypsum supplier. After partition, the mines in Rajasthan have taken over that role. Mining in Kawas was started in 1951. Total deposits were then estimated at about half a million tons of gypsum. This estimate has been justified and nearly 500,000 tons have already been mined. But Kawas is not yet exhausted and will probably yield another lakh tons or so of gypsum, before running out completely.

It was planned to work the Kawas deposits first and the deposits at the nearby Uttarlai afterwards. Accordingly mining at Uttarlai has been taken up by the Sindri Fertilisers Factory.

and a direct right to demand education, it is necessary to charge a nominal fee for the secondary and special education. This and a further addition is paid back to him, when the Workers' Education Centre shoulders the responsibility to pay his wages for three weeks.

When designing the curricula of the courses, it must be borne in mind that practical utility in day to day affairs of the workers is the key note of the education; it is therefore, necessary to avoid theorizing and dealing with abstract subjects as much as possible. It is essential that the medium of instruction must be primarily the language of the region, though Hindi and English is of some importance for the secondary and advanced courses. The curricula are drafted, keeping in view the major objectives of education to different groups.

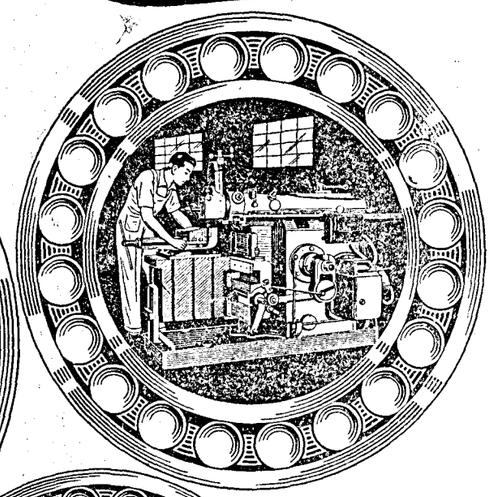
Uniform methods to impart education cannot be adopted for in the case of preliminary education, the audio-visual aids are emphasized, while in other cases academic teaching are relied on. It is easier for an uneducated mind to understand things 'by seeing by oneself' rather than by being told. The former is easily expressed and comprehended and an 'impression' is made. As the workers advance, the academic education and group discussions are stressed and a greater emphasis laid on them. Material aids in the form of books and pamphlets (specially written for the workers), charts, maps and other graphic illustrations, cinema, gramophone, radio, etc will have to be utilised. The methods of education may also take a variety of forms, such as lectures, discussions, exhibitions, observational tours and visits, debates and other methods of self-expression.

As regards management, it is desirable to entrust the work on a State level to a Workers' Educational Board or Association, specially constituted in consultation with the State Education Department, Municipal Schools Committee, Universities and employers and workers' associations. Most of these bodies, along with the general public, may be approached for financing the scheme.

Workers' education is a vast problem, if tackled on a national level. It is, therefore, advisable to start a pilot project in a concentrated industrial area like Bombay or Calcutta. Meticulous details will no doubt have to be worked out, before even the pilot scheme is launched, because the whole future of workers' education will be affected by the success or failure of such a scheme. If the outline given herewith serves even as a draft for discussion for the formulation of a pilot scheme, which may pave the way for the education of the unfortunate millions in this country, we will consider that our labours have been more than worth the trouble.

AN ILLUSTRATIVE CHART SHOWING THE PILOT SCHEME OF WORKERS' EDUCATION

Particulars	Preliminary Course (Primary Education)	Middle Standard (Secondary Education)	Advanced Courses (Special Education)	Remarks
Objectives	1. To make the worker literate. 2. To provide a basic knowledge about the events that occur around him. 3. To follow the elementary principles of Civics, Politics and Sociology.	1. To develop the individuality of the worker fully. 2. To understand and follow his duties & rights as well as rights and privileges as a worker. 3. To make him a useful citizen who can shoulder some responsibility in the community.	1. To train the worker to be a leader in the industry and the Society at large. 2. To make the worker (if he is willing to become) a teacher in the Workers' Education Centre.	It must be understood that if the same worker shows a special interest, he is given promotion to the next immediate course after the completion of the first course.
Duration of Course	Part-time 2 hours a day, 3 days a week for 12 weeks.	Full time 6 hours a day, 6 days a week for 12 weeks.	Part-time 3 hours a day, 6 days a week for 12 weeks.	Only 3 Sessions are conducted in one year.
Minimum Qualification	..	Must have passed at least the eighth standard or preliminary course.	Must be at least a Matriculate or must have passed middle standard of this course.	It is necessary to have a minimum qualification in case 2 & 3, for the worker must have some basic idea of education.
Age Limit.	16—40 years	20—40 years	20—45 years	It is difficult for a worker to begin the primary education beyond the age 40.
Methods of Selection.	Through voluntary calling of names.	1. Trade unions and employers nominate the students. 2. Those who have passed the Preliminary Course.	1. The candidates are selected by a Board specially constituted for this purpose. 2. Those who have passed the Middle Standard.	It must be remembered that the choice of selection is done in collaboration with the Trade Unions. As the course becomes advanced, the No. of students may be limited because only then can the teachers have a direct personal touch with the Students.
Period of Training.	Timings are so arranged to suit the workers. No concession granted by the employers.	The total period of training is treated as on leave. 6 weeks is paid by the employer as on leave with pay. 3 weeks is debitable to the worker's leave and 3 weeks are paid by the workers education centre.	The employer grants a definite concession for those attending the course to attend the mills late or to leave it early as it might be necessary.	The co-operation of the employer is of utmost necessity. His contribution per worker will be roughly Rs 100/-. The worker must also be prepared to sacrifice something. The worker's education centre actively encourages in lessening the burden of the worker by bearing a portion of his loss in earning capacity.
Fees for full course.	..	Rs 10/- from the worker. Rs 5/- from the Trade Union.	Rs 15/- from the worker Rs 5/- from the Trade Union.	The worker must understand that he is paying for his education. That alone gives him a status and a right to demand education.



Saved . . .

5 gallons of lubricating oil every day

— Rs 7950 in a year!

THERE'S a metals plant in a large industrial city saving Rs 7950 every year — just because they asked us at Standard-Vacuum for free advice about their lubricating problems!

One of our engineers visited the plant and noticed that a good deal of oil was being wasted — because of the manner in which important machinery was lubricated. Thanks to his recommendations, the factory now uses 1500 gallons of lubricants *less* each year, and the machinery is working more efficiently than ever before.

Looking after machinery

When our expert comes to visit you, he is backed by the world's greatest lubrication experience — no less than 90 years of it. Not only is he working with the right oils, a full range of MOBIL Industrial Lubricants, but he can give you expert advice on the maintenance of your equipment.

Correct lubrication is a matter for experts. Our advisory service is free — why not ask us to help you?

Around Bombay Markets

Doldrums in Equities

Thursday, Morning

EQUITIES continued to be hesitant during the week under review. Compared to the previous week, however, the undertone was firm, particularly in the Textile section where buying revived following Government's announcement of a rebate of six pies in the cloth excise duty.

This was reflected in the improvement of Bombay Dyeing from Rs 620 to Rs 630-10 over the week; other Textiles also participated in the recovery. Scattered short covering was observed whenever a diffident tone appeared in the market. The Miscellaneous counter displayed sympathetic price movements with a hesitant undertone. ACC lost 3 points and National Rayon slided down to Rs 256. Other leading scrips like Belapur, Premier Constn. and New India also recorded a decline after moving to higher levels. Sentiment in Bombay-Burmah was at first depressed by a sizable bull liquidation but later the announcement of a new scheme to increase the authorised capital caught the fancy of the market and the scrip closed at Rs 743-12 compared to Rs 728-12 last week.

In contrast to the doldrums in the equities, the 4 per cent Bombay Municipal Loans, for which the lists were opened on Monday, were oversubscribed the same day, the total subscription totalling Rs 179 lakhs as against the total issue of Rs. 1.50 crores. It should be noted, however, that the bulk of the support came from the banks and the Life Insurance Corporation.

In Brief

National Electrical Industries Ltd have reported a profit of Rs 4.28 lakhs for the year ending March 1956, compared to Rs 4.06 lakhs in the previous year. The dividend has been maintained at Rs 4-8 per share.

Tractors (India) Ltd have decided to increase their authorised capital from Rs 20 lakhs to Rs 50 lakhs in order to facilitate future issues of capital as and when the need arises. The Company has submitted an application to the Controller of Capital Issues for permission to make a cash issue of one new ordinary share of Rs 10 for each ordinary share held by the existing shareholders. This will raise the paid up capital of the Company to more than Rs 23 lakhs. The shares are currently quoted at around Rs 35.

Cotton

Bearish Trend in Futures

THE cotton futures market presented a distinctly bearish trend during the course of a week of only four days' trading. Weighed down by doubts and fears about possible Government intervention in trade, operators were in no mood to be active and were not inclined to extend their commitments.

A notable feature of the week's trading was the sharp rise of more than ten points in Vijay contract, which rose on the opening day itself from Rs 775 to Rs 785-8, on account of the reported damage to the quality of the crop, especially in the Punjab and other places, following continued and heavy showers. This, however, proved short-lived since the contract closed at the end of the week at Rs 760-8, the lowest level of its short career.

Curiously enough, the excise rebate had little or no effect on the market, though the announcement was welcomed if only for the reason that it presaged further relaxations by the authorities. The impression has gained ground that the Government admits itself to be open to correction and is not dogmatic about imposing its will on the market.

The spot market at Sewri continued to attract mill interest in the purchase of the new cotton crop. About 3,500 bales of Berar Jarilla 25/32" were reported to have been bought on behalf of a leading group of mills in Bombay at around Rs 65 on for January delivery, while reports were current to the effect that a fair quantity of Punjab 320 F had also changed hands at moderately rising prices. Apart from mills, cotton merchants were also in the market for ¾" staple and below, presumably in anticipation of the announcement of an export quota for this staple in the near future. The rumour round the market was that the authorities would shortly announce an export quota release of the order of 150,000 bales of ¾" cotton and 50 to 70,000 bales of Bengal Deshi. It was also expected that the export duty on Bengal Deshi would be raised from Rs 50 to Rs 75 per bale, without disturbing the duties on other varieties, for obvious reasons.

In view of the prospect of an imminent announcement of a quota, the export section was naturally quite active. Prices of Oomra, Kala and Wagad improved by five to six points. Since India has to contend with such strong competitors in the export market as the U S and Pakistan, the Government would be well advised to take immediate steps to boost up our raw cotton exports by granting a quota well in time when the crop has started moving in full swing, and also following it up by a reduction in the export duty on such varieties as are keenly sought after by overseas buyers. Besides guaranteeing an improvement in exports, these measures would also indirectly help the market to recover its lost balance and re-establish a steady trend in prices generally.

Oilseeds

Improved Outlook

INCREASED activity was observed in oils and oilseeds during the week under review. Continued inquiry for Indian castor commercial oil from the U S A and steady purchases by shippers in the local market to cover their sales abroad, coupled with buying by groundnut millers and vanaspati interests, were the highlights of the week's trading.

New York castor oil prices ruled firm during the period under review. Shippers' quotations, consequently, moved up in sympathy. More business with America is anticipated by exporters in the near future.

Exports of castor oil during September were at a satisfactory level, amounting to as much as 3,200 tons. Through September this year's export of oil has amounted to 26,500 tons. If this level of overseas demand continues, exports this year should be much higher than those in the previous year.

Castor May futures appreciated by about five points this week while Groundnut February looked up by nearly three rupees. Linseed futures closed the week steady with fractional gains.

In the ready section, castor and groundnut, together with oils, ruled firm throughout the week.

Up

go coal prices —but cement stays the same

The cheapest (and the best) cement is still supplied by the ACC group of Free Enterprise factories. Meanwhile coal and other prices go up.

And does anyone suffer by this refusal to increase cement prices? Certainly not. Cheap cement means low cost building of everything from homes and roads to dams and factories. Cheap cement means better living for millions.

How does it stay cheap? Simply by improving methods of manufacture—i.e. *by efficiency!* Only thus could the ACC have kept down its price of cement despite the following price-raising factors which have come about in recent years:—

- Higher wages
- Higher royalty charges
- Higher freight charges, & NOW
- Higher coal prices

By this very efficiency and refusal to add to inflationary trends, the ACC is contributing to a new era of history—an era of wealth and prosperity, undreamed of even twenty years ago.

Divali

HOW much of metaphysics do we need? Not much surely, but one cannot do without it altogether. One has normally to assume the incentives which make the world go round. But in the midst of all this festivity, one cannot help pondering what is all this rejoicing about? Divali has come to us as the festival of lights from some long forgotten festival of seasons hailing the advent of autumn, of harvests and of fruitfulness. There is no national festival which is celebrated in all parts of India at the same time, but Divali is the nearest to it, at least for the Hindus. What gives it this wide currency is not the religious part of the celebrations, but the annual stock taking, for which the time is most appropriate.

There is annual stock taking on this occasion, exchange of presents as also conventional annual payments. On this night Lakshmi is worshipped in many parts of the country and Lakshmi is not only the Goddess of Wealth but also the Dispenser of Well-being; besides Lakshmi, Goddess Kali is also worshipped in some parts and so is Krishna, the slayer of Narakasura. But the Bahi Puja on the Divali night which symbolises the ceremonial and ritual opening of the financial new year is naturally of the greatest interest and importance to the trading community. For it is not worship of the books in which our knowledge and wisdom are stored, but only of books of account. We are reminded, that it is in trade that Lakshmi resides and trade is still the key stone of the traditional economic pattern of our society. True, agriculture comes next as a source of wealth but it follows a long way behind and the crafts, in which we take so much pride to-day are not even mentioned among the recipients of the favours of this fickle Goddess!

True, Saraswati has also her day. But this night of nights belongs to her sister. There is also a day for Astra Puja but that is on the Maha Ashtami day, when Taantrik Bengal dedicates the family weapons to the Goddess Durga and Maharashtra reminds itself of its past military glory by decking the horses with flowers and anointment, to mark the launching of military campaigns of the forgotten days, campaigns that started when the rains had gone and the crop had been gathered. Thus had the seasonal underemployment of the Indian peasant once found a solution that later wisdom ruled out and for which it is still trying to work out a solution. What about the craftsmen and their tools? They are not forgotten either. But Viswakarma, the Guardian of the Heavenly Workshop, keeps aloof when the trader balances his accounts and the scholar seeks the blessings of the Goddess of learning. That our craftsmen worship their tools which the Mujik of a generation ago had to be taught to take care of, is something in our past culture and tradition on which we can count and draw upon. But how to combine all these worships into one in one festival which will draw in people from all walks of life and give meaning and content to what they live by and live for?

The multi-purpose projects, Pandit Nehru once said, were the new houses of worship. To-day probably he would yield the pride of place to the community projects instead. For if we are to enlist the vast masses of this country into the effort of building a new India, we could not very well leave out the rural sector. The people of the village have to find some meaning in our efforts. And the meaning gets lost when it is drawn too thin, through tenuous lines, covering too wide an area.

The points of impact even of the multi-purpose projects are too few; the villages to be covered are too many. Also tenuous are the bonds in the integration achieved by the Administration which tends to lose its effectiveness when its resources are spread thin over too wide an area. Popular participation in the great developmental effort therefore awaits. To quote the Planning Commission "the need for creating a well-organised democratic structure of administration within the district is now being widely felt"

If it is being felt, it is not being met. For all that one can see, the district administration continues to revolve around the Collector, a remnant of the old colonial administration, who far from being displaced by elected representatives is being assiduously 'built up' to co-ordinate the various activities at the district level. There is also a new build up of the Congress party which makes a striking departure from the immediate past, when Government was still sought to be of the best available talents in the country rather than that of the Congress party.

At the time of the Divali the reorganisation of the States will be formally implemented. This may not be the end of the process, but it will mean a spectacular change when all the States attain the same status and Part 'B' and 'C' States disappear altogether from the map. The Transfer of Territories Act also comes into force from this day. The changed map of India one may look up and ponder over. The picture of the Indian people, this multiple society with its tribal mosaic fringing the border is not so easy to visualise. Pandit Nehru has lately been to the tribal frontiers in the north east which, he said, much to the disappointment of the tribals themselves, would be integrated in due course with Assam. But he said some thing about the culture and life of these people which applies equally to the whole of India. It is not the policy of the Government, he said, to preserve the tribes as museum pieces; nor was it its policy to integrate them with the rest of the people of India all at once. Talking about NEFA administration, he emphasised that "we cannot leave this big area underdeveloped" But he also added that he wanted "the people to develop on their own lines and not pushed and hurried too much even for development". It is time for him to consider that people would better be left alone than be hurried. But they may also like to hurry themselves.

Railway Delegation for Washington

THE Finance Minister's reply to the President of the World Bank lacked the pyrotechnics that one has come to associate with him. But judging by reactions, it seems to have done the trick. The studied moderation of his reply has been favourably commented upon, and the Journal of Commerce, official organ of the U S Department of Commerce, who shou'd know, has reported good progress and hints at the possibility of a new loan for India early next year. A Railway Mission, New Delhi has announced, will be leaving for Washington this week-end to negotiate with the World Bank. Though no amount has been mentioned, it is known that the railways have a heavy budget and also that the import content of this budget is heavy, too. As India does not expect more than Rs 200 crores from the World Bank in the next five years anyway, it is immaterial whether the World Bank finances this part of the Plan or any other.

The World Bank Mission gave high priority to transport and felt seriously concerned about the inadequacy of transport to cope with the requirements of a large Plan. The Plan allotted Rs 900 crores for railway development in addition to contributions to the railway depreciation fund. Of course, the railways wanted much more—they had planned for a total outlay of Rs 1480 crores but even of the reduced outlay, approximately Rs 425 crores will be required in foreign exchange, for locomotives, other rolling stocks etc. So there is a wide enough range for the World Bank to pick and choose.

Shri P C Bhattacharya, who was until recently the Financial Commissioner, Indian Railways, and who had been instrumental in inviting an American Export Team to study our railways, appropriately leads the delegation. The Team has submitted its preliminary report which is under examination It does not promise spectacular results but it is believed to have pointed out that substantial scope exists in our railways for improving operational efficiency without heavy capital investment. However when everything has been done to improve efficiency, a substantial investment would still be necessary to bring up the carrying capacity to the required level.

A programme of railway-cum-port development with mechanical handling at the terminals to move out ores should not only be self-liquidating, judged by the stiffest criterion of bank credit, but should also earn the necessary foreign exchange, if the World Bank is still as anxious to ensure servicing of loans in terms of the currency in which the loan is contracted as it used to be in the past This is cited only by way of an example, in case the World Bank chooses to apply a criteria of credit worthiness different from that it applied when it gave a loan of $ 250 million to France or $ 100 million to Australia. It appears to have different standards for different countries according to the economic climate of the country concerned.

Indeed in some ways the Bank and the Fund have been carrying on a Punch and Judy show. The Economist was unkind enough to mention the World Bank loan to Yugoslavia when Tito broke off with Moscow but stuck to his brand of communism. The Fund sent a Mission to Yugoslavia at that time which fixed a par value for the Dinar which, it was claimed on the high authority of this expert Mission, would harmonise state trading with free enterprise and communism with capitalism! So in banking on the World Bank Mission Report on India instead of hitching their wagon to the stars, the Forum of Free Enterprise is not banking judicially on a sure winner, for even the great Bank is susceptible to climatic influences The climate of development in underdeveloped countries, unfortunately, favours public enterprise.

Divali Greetings

We wish all our readers and patrons a Happy Divali and a Prosperous New Year.

There will be no issue of The Economic Weekly on November 3 on account of Divali holidays. The next issue will be out on November 10.

A Russian Commonwealth

NATIONALISM is one of the few political discoveries of the nineteenth century which has not lost its appeal in this century. Ever since its birth, there have been attempts to disown or to minimise the logical implications of national sovereignty. Capitalism is no less international in character than Socialism or Communism. In a world dominated by capitalist economy, sovereign, national States have waged wars against each other for reasons of economic or political expansion. After the first World War, the League of Nations was established to ensure amity among nations. It foundered on the rock of nationalism. One of the main reasons why the United Nations have not fulfilled its original expectations is the virile insistence on national sovereignty by member-States. Some of the ominous consequences of national sovereignty are now widely realised. But it is no less evident that nation States are not prepared to shed sovereignty. That is why there is no prospect of a World Government in any foreseeable future. That also explains why the American-sponsored Western European Federation is less popular among Western European nations.

These reflections are prompted by recent developments in Poland and in some of the Communist Eastern European States. Communism was the first, and only, serious challenge to nationalism. Post-war events in Asia proved that the challenge was not very successful. Nationalism has been one of the main antidotes to Communism in Asia. But the developments in Communist Eastern European States are more convincing proofs that nationalism is a stronger political influence than Communism. In the West, Tito and Gomulka have been hailed as influences leading to the disintegration of Communism. This is a wrong interpretation of the triumphant return of Gomulka to power in Poland, or of the recent demonstrations and disturbances in Eastern European States. These events demonstrate the urge of nationalism in these countries. Gomulka or Tito is as much a Communist as Khruschev. Neither Gomulka nor Tito is interested in disowing Communism. These States are insisting that their relations between Russia should be based on their equality and sovereignty.

Sooner or later, events now occurring in Eastern European States would have happened. Denunciation of Stalinism has hastened these developments. Not only in Poland, but in all Eastern European States, excluding the Balkan States, there is now an active campaign against centralism, uniformity, censorship and terror. Khruschev's denunciation of the personality cult has been widely welcomed in Eastern European States. There has been a campaign for liberalisation of regimes in these States. Russia's Eastern European neighbours, with the exceptions of Balkan States, are more sincere and insistent in their desire to disown Stalinism. It would be idle to pretend that Tito or Gomulka is anxious to introduce democracy in Yugoslavia and Poland Not only Poland, but almost all Eastern European States are, and have been, unfamiliar with democracy. In these States, monarchy was replaced not by parliamentary democracy, but by some form of military-cum-feudal centralised administration. When Gomulka demands democratisation of the regime in Poland, he does not mean introduction of a parliamentary system of government. But he insists on the formation of a national Communist regime, and the removal of the Polish born Russian General as the head of the Polish Communist Party.

Unlike Washington, Moscow is aware that Gomulka or Tito is not a threat to Communism in Eastern Europe. But it would be unrealistic to ignore Moscow's dilemma. Not de-Stalinisation, but Moscow's recent recognition of "different social systems and different forms of socialist development" has created and aggravated this dilemma for Russia. If there is a Tito way to Communism, it follows logically that there may be other than Russian or Yugoslav ways to Communism. This is the main significance of the re-emergence of Gomulka. Today, with the denunciation of Stalin, the rigid Comintern cannot be re-introduced. Even the milder device of Cominform, which perpetuated Russia's control and domination of Communist movements and parties outside the Soviet Union, is resented, and has been liquidated. On this major issue, there are discussions within the Kremlin. One school of thought is in favour of reasserting Kremlin's monolithic control over Eastern European States. There is another school of thought which is in favour of gradual liberalisation.

Suggestions have been made that Russia should emulate Britain in adopting the Commonwealth as the basis of relationship between the Soviet Union and other Communist States. Necessary political and economic ties exist between Russia and almost all other Communist States to facilitate the introduction of the Commonwealth concept. But the presence of Russian troops in Eastern European States is a major obstacle to the creation and extension of a Russian Commonwealth. There are no Russian troops in either Communist Yugoslavia or in Communist China. With NATO and with American troops garrisoned in Western Europe, there are strategic reasons for the presence of Russian troops in Eastern European countries. There are, besides, fears of the consequences of Germany's revived military might. It is neither a mere coincidence, nor is it without significance, that, along with the demand for equality and sovereignty by Poland and other Eastern European States, Moscow has requested Bonn to conclude a treaty with Russia and her allies renouncing the use of force. Conditions for the creation of a Russian Commonwealth are not non-existent. But the Kremlin will need vision and statesmanship to form such an association of like-minded States.

ERRATA

THERE were two printing mistakes in the article "Labour Cost . . . . of Commonsense" by Professor Amartya Kumar Sen which appeared in the last issue. On page 1247, first column, paragraph two, third line, the word 'have' should be 'save'. (. . . rural population would save a significant part of their income, not have). In the foot-note on the next page 'ent' is misprint for net.

The author had two separate things in mind, one was a reioinder to "Commonsense Made Difficult" and another a reply to "Labour Cost and Economic Growth." For reasons of space, the two had to be combined; the caption under which his article appeared, however, was not given by the author.

Weekly Notes

Dim Prospects of Sugar Export

THE manufacture of sugar is being developed in a big way. In the Second Plan, the target of production and capacity for sugar have been raised to 2.25 million tons and 2.5 million tons, respectively from 1.5 million tons and 1.13 million tons. Financial provision has also been made by the Planning Commission for this expansion. Indeed sugar factories have come to monopolise the loans from the Industrial Finance Corporation and great encouragement is being given to co-operative production of sugar. In fact of the 17 new sugar mills to be established in Bombay State, 14 are to be on a co-operative basis. Along with the new units which are to be set up, existing factories are also to be expanded. Now with such a programme of expansion on hand, and the acute foreign exchange problem that the country has to face, it is natural to ask, what are the prospects of exporting sugar in the near future? The confident expectation that production of sugar cane will exceed 20 lakh tons in the current season, gives a sharper edge to it.

When the President of the Deccan Sugar Technologists Association says in his address at the Annual Convocation of the Association that given the right fillip, the time is not far when India can be a major exporting country, one naturally feels greatly relieved. But on going through his address, one is left guessing what precisely is necessary for attaining this very desirable consummation. As a technologist, Shri Somaiya argues in favour of larger units of production. Granted that units have to be larger and granted also that this will improve the rate of recovery from sugar cane, would we be in a position to export if this prescription is carried out faithfully? Doubts begin to assail one's mind when one goes through his address, for the answer to this question does not appear to lie in the economic unit of sugar production but the cost of cane, which of course the appropriate size of sugar mills can do nothing to reduce. On the contrary, Shri Somaiya complains that "our cane is becoming very expensive year after year". What chances are there, then, of developing exports?

Cooperatives and Cane Supply

SHRI SOMAIYA would like to have compact and large plots, and mechanised cultivation of cane on plantation scale. The encouragement to co-operative production of sugar and the general trend of land reform both are directly opposed to the consummation of his dreams. Co-operatives come in for special criticism, particularly the policy of encouraging them with no regard to existing interests and the difficulties of the existing factories in obtaining cane. Shri Somaiya complains that over-enthusiasm in pushing co-operative crushing is seriously interfering with the freedom of the cane grower to sell the cane where he likes. What he says is so serious that it should better be given in his own words:

"What is worst is that the cultivator is forced to join a co-operative sugar factory because of the economic sanction against him. If he fails to do so, his acreage is pruned from 25 acres to 6 acres and his guarantee from 12 years to 6 years. To me it is a restriction on a fundamental right of a person as to how he would like to utilise or dispose off the product he grows. Removal of such restriction would go a long way to solve the present impasse

"The cane from the very village in which a factory is situated goes to the new factories about 8-10 miles away. What a waste of national energy, transport and roads!"

If the facts stated are correct, then we must be living in a fool's paradise, hoping that in the near future, India will emerge as a sugar exporting country.

Shri Somaiya has covered many of the important technical aspects of sugar production, gone in detail into the engineering problems of the industry and has also discussed utilisation of bye-products. But he has not touched the practical problem of devising a simple means by which the statutory prices of sugar cane could be linked to the sugar content of cane, so that a direct and powerful incentive could be given for improving the quality of cane and thereby help to bring down the cost of sugar. Until cost is brought down, export prospects will continue to remain dim and obviously hopes lie more in improving the yield of cane by better cultural practices than in expanding the size of sugar mills or in technical improvements relating to the crushing part of the industry, though recovery is also important.

Russia and Japan

TOKYO'S immediate reaction to the Russo-Japanese agreement has been unfavourable. This is not as much a reflection of Russia's intransigent attitude as of Japan's over-optimistic hopes. Negotiations between Russia and Japan have continued for more than sixteen months. The present agreement would not have been possible without a change of government in Japan, or without the political developments in Russia since Stalin's death. Mr Yoshida's critical attitude to the Hatoyama mission to Moscow is understandable. It is evident that Mr Yoshida wants to make political capital out of Mr Hatoyama's failure to secure a more generous and liberal agreement. Ever since its emergence, the Liberal-Democrat coalition in Japan has been an uneasy alliance. Some of the provisions of the Russo-Japanese agreement are resented by Mr Yoshida and his followers and associates. Big Business and some of Mr Yoshida's party members may encourage him to make a bid for power. They will certainly try to exploit Mr Hatoyama's anti-American and pro-Russian sympathies.

A closer examination of the agreement suggests that Mr Hatoyama has not been quite unsuccessful in his Moscow mission. With his predecessor in office, diplomatic relations between Russia and Japan might not have been re-established. For eleven years, Russia and Japan have been technically at war. That anamolous relationship has now been ended. In the joint declaration, Mr Hatoyama and M Bulganin claim that "peace and good neighbourly and friendly relations are re-established". This agreement is to be followed by a peace treaty. Meanwhile, Russia assures that every State, including Japan, has the "inevitable right to individual or collective self-defence". Russia implicitly accepts Japan's sovereign status by her agreement not to interfere in the internal affairs of Japan for any economic, political or ideological reason. Russia promises to "release and repatriate all Japanese citizens still held in the Soviet Union". There are known differences between Tokyo and Moscow about the number of such Japanese prisoners of war. But Moscow has agreed to "clear up" the fate of those Japanese who cannot be traced, or are supposed to have disappeared. Habomai and Shikotan islands are to be returned after the conclusion of a peace treaty. But Mr Hatoyama's political opponents will certainly accuse him of capitulation over Etorofu and Kunashiri islands in the Southern Kuriles. These are strategic islands which Russia has refused to return to Japan.

Mr Hatoyama will stress two points in defence of his claim that he has conceded nothing substantial to Russia, but has, on the contrary, wrested major concessions from Moscow. Russia has agreed to support Japan's membership of the United Nations. It was the Russian veto which debarred Japan's entry into the United Nations. Russia has also renounced all reparation claims on Japan. These are substantial political concessions which have been negotiated by Mr Hatoyama. No less creditable for him are the promises of enlarged trade and commercial relations between Russia and Japan. Since the war, Japan has been deprived of her natural sources of supplies of industrial raw materials. Before the war, Japan secured her supplies of industrial raw materials from her neighbours, China and Russia. Since the war, Japan has been dependent on America for these supplies. This has, naturally, raised Japan's costs of industrial production. Enlarged trade relations between Russia and Japan will be welcomed all the more in Japan because these commercial arrangements will enable Japan to resume indirect trade relations with China, Japan's natural source of supplies of coal and other industrial raw materials. These are the advantages of the Russo-Japanese agreement which will be emphasised by Mr Hatoyama to overcome the opposition of his political opponents.

Division of Functions

IN a recent Press Note, the division of functions of the two ministries relating to industry has been set out in detail. The Ministry of Commerce and Consumer Industries would deal with the following:

1) Plantation Industries.
2) Textiles (i e Cotton, Jute Silk, Art Silk, Coir, etc., but excluding synthetic fibres and yarns).
3) Food, Drink and Tobacco Industries.
4) Domestic ware and household requisites including
   a) Electricals (other than refrigerators and air-conditioning equipment),
   b) Hardware,
   c) Crockery, Glass and Sanitary ware.
5) Cosmetics and toilet requisites.
6) Stationery and office equipment.
7) Sports-goods.
8) Leather, Rubber, Plastic and Celluloid goods.
9) Drawing, Mathematical, Scientific and Surgical instruments other than precision instruments.
10) Timber Plywood and hardboard.
11) Paints and varnishes.
12) Agricultural implements and tools.
13) Bicycles and sewing machines.
14) Musical instruments.
15) Drums and Containers.

This Ministry would also be concerned with all small scale industries.

The Ministry of Heavy Industries will be concerned with the following (except those units which are carried on a small-scale):

1) Cement and Iron and Steel Industries.
2) Automotive industries including Aircraft, Locomotives, Motor Vehicles of all types, Road Rollers, Tractors, etc., and their accessories including tyres and tubes.
3) Electrical Engineering Industries, i.e., Motors, Transformers, Generators, Switchgears, Cables and Wires, Insulators, etc.
4) Engineering Industries including Ball bearings. Machine Tools and other tools, Castings, forgings and Structurals, Bolts, Nuts and Screws, Drums and containers.
5) Chemical Industries including Power Alcohol Drugs and Pharmaceuticals, Dyestuffs and Coal Tar products, fertilizers, etc.
6) Pulp, Paper, Board and Newsprint.
7) Films, for Cinema, X-Ray and Photography and Photographic Chemicals, Apparatus and Accessories.
8) Refractories, Crucibles, Electrodes, etc.
9) Arms and Ammunition; and
10) All other industries not shown under the Ministry of Commerce and Consumer Industries.

The Ministry of Heavy Industries will also deal with all applications under the Industries (Development and Regulation) Act 1951.

Europe and Back by Leyland Comet

EXAMPLE is always better than precept. If this old maxim were to be translated into the language of the present-day, one would have to add to the excellence of actual demonstration as a method of education, the undoubted publicity value of practice as opposed to precept. The Delegation from India which attended the International Road Transport Congress held at Stockholm last June did exactly that. Being in road transport business themselves, in one way or another, they had the bright idea of actually demonstrating that road transport is as good a means of transport as any other. It can be as cheap, if not cheaper and much more interesting, though it may not yet be as comfortable. This, it should be noted, applies not only to cross country but trans-continental travel, for the team covered 16,500 miles by road across 19 countries of Europe and Asia, and all this on a standard Leyland 'Comet' diesel bus, assembled in India, and not in a very special vehicle which is beyond the reach of the ordinary road traveller. The party went all the way to Sweden and covered a good bit of Europe on their way back and not only Western Europe, but Warsaw, Moscow and Tehran, without a single breakdown.

Incidentally, this demonstration of the attractions of road transport brought out two things, namely, that the best way to know people is to travel by road and that India may be able to get more of foreign tourists than what Government publicity is likely to achieve, if the facilities of travelling cheaply by road are properly organised with official help and encouragement. The leader of the 14 man delegation, Shri Kundan Lal, Secretary of the All-India Motor Union Congress, returned confident from this successful trip abroad that "a motor coach service for tourists could be run profitably between India and various countries of Europe".

Australia— big, bustling, wide-open, land of health and opportunity . . . with her glorious countryside . . . her great concert halls . . . her modern shopping centres. A new world of friendly people, only one stop away from India. So fly with us to Australia, see a new land and the Olympic Games. Spend a few days at Singapore at no extra fare.

A.I.I. is the fastest to Sydney from Bombay, with only 3 stops: at Madras, Singapore and Darwin.

Every First Class seat a 'Slumberette'. Choice of Luxury and Tourist Class. Immediate connections for Djakarta, Manila, Los Angeles, San Francisco.

Our Delhi Letter

N I D C

THE National Industrial Development Corporation is at the cross-roads. It is exactly two years this month since it was incorporated. It has nothing to show on the ground though on paper its achievement is considerable. Where to sacrifice care in planning to speed of execution is an under-developed country's most baffling problem. The N I D C has confronted the dilemma from the start. The nation does not want to repeat the wasteful failure of the New Delhi housing factory. Nor does it want to throw away precious time, as four crucial years were allowed to lapse through sheer indecision before the construction of vital steel plants was seriously taken in hand.

The question really is whether the Corporation has bitten more than it can chew. It is simultaneously processing projects for the establishment of steel foundries, forges, and the capacity for the fabrication of steel structurals. The manufacture of intermediates for drugs and dyestuffs, carbon black, sulphur from pyrites, printing machinery, air compressors, fractional horse power motors, refractories, and aluminium are within its scope. It is considering the production of synthetic rubber, phosphorus, raw film, newsprint and phosphatic fertilisers. Rolls and rolling mill equipment, mining and heavy earth moving machinery are within its purview. It will scrutinise applications for loans to rehabilitate jute and textile mills.

The fact that so much is within the sphere of the Corporation is having mutually incongruous consequences. The Corporation is finding it difficult to get all the funds that it needs and it cannot spend even a recognisable fraction of the funds it can get.

The shortage of resources that generally inhibits the Second Five Year Plan affects the Corporation most vitally because of the Plan's avowed emphasis on heavy industry. The Planning Commission allotted, very apologetically, Rs. 55 crores to the Corporation. Between Rs. 20 crores to Rs. 25 crores were earmarked, from this sum of money, for the replacement of the worn-out machinery of cotton and jute mills. The Plan stated that "the extent of the gap between the resources actually required and the provision of funds now proposed will ultimately depend on the pattern of financing adopted and the size of the Government's holding in the overall investments in various projects". The articles of association of the Corporation provided that it could execute a project on its own, through a subsidiary company entirely owned by itself, or in varying degrees of collaboration with private enterprise. At one time, protagonists of the public sector in the Cabinet seriously mooted the proposal that bodies like the Industrial Credit and Investment Corporation and the National Industrial Development Corporation should give no credits to privately-owned concerns at all and that their aid to such enterprises should take the form of equity participation. It was soon realised, however, that few entrepreneurs would share control in management in return for financial accommodation, and in most cases Government would have to fall back entirely on its own resources, if it insists on any such condition.

The Plan however did envisage a degree of pressure on the limited funds of the Corporation that might force it to draw up priorities in regard to projects for implementation. It laid down that "the highest priority will have to be given to schemes for the manufacture of heavy machinery or directly related thereto". Occasion to make this choice has not arisen because the NIDC schemes have still to emerge from the stage of "processing".

As far as is known, the foundries, forges and structural shops will need Rs. 15 crores, a raw film plant Rs. 7 crores and a newsprint plant Rs 5½ crores. Another Rs 8 to 10 crores will be necessary for one or two aluminium smelters. It is obvious that the available money will not suffice for more than half of the projects that the NIDC is contemplating.

Nevertheless serious doubts have arisen as to whether the Corporation will be able to spend the money that has been allotted to it. The projects for the manufacture of raw film and newsprint are in an advanced stage. An agreement may be signed with the East German firm of Agfas for the former and a decision on the latter will be taken as soon as the detailed project report of an Italian firm is forthcoming; the Government has already received one project report on newsprint manufacture from a West German firm. In regard to the other projects, contracts have yet to be signed with selected or still-to-be-selected foreign firms for obtaining detailed technical reports.

NIDC's dilemma is explained partly by the shortage of technical personnel and partly by the slow-moving, unenterprising character of Indian business. It is obvious that large number of technicians have to process the ventures of which Indian personnel at the disposal of the Government have little or no knowledge. The services of foreign experts have to be obtained with care and application, because able technicians are needed in their own countries. Though the recruitment of technical personnel was among its avowed objectives, the NIDC has so far appointed only two advisers: one for forges, foundries and structural shops and the other for intermediates for drugs and dyestuffs. The machinery of the Development Wing is proving grossly inadequate to deal with the tasks which confront it. An all-out bid to obtain foreign technical personnel therefore seems inescapable if the NIDC is to achieve a fraction of the results that it aims at.

Secondly, the co-operation of private business is essential. NIDC's objective is to fill the gaps in the industrial map of the country; it will supplement private enterprise in the fields in which the latter is too shy to venture. It is essential for entrepreneurs, in the larger national interest, to make up their mind and give the green signal to the Corporation to go ahead, wherever they are unwilling to take any risks. Thus the Corporation, for instance, has decided to establish capacity for the manufacture of intermediates for drugs and dyestuffs but "only after the programmes of various firms already in the field are clearly known and determined". It is for them, rather than the Corporation, now to expedite matters.

Lastly, the Corporation should limit the area of its operations to manageable proportions while continuing to survey a large domain with an eye on the Third Five Year Plan. It must learn to bite only what it can chew.

Letters to the Editor

Appleby and Audit

SHRI R DWARKADAS deserves praise for his fine article "Appleby Again" in the "Economic Weekly" of the 6th instant. It is true, as we have felt, the Appleby Report has not been accepted by many of our Parliamentarians in its true spirit and it has been subject to misinterpretation and misunderstanding. But the bottlenecks in our Government departments could not have been pointed out except by an outsider. This is because no encouragement is ever given for any such freedom within the departments and the atmosphere for the exercise of such freedom is not congenial. The coldness shown to proposals for reform and readjustment of the procedures spells stagnation. This is perpetuated by a dismal lack of incentive for merit which is crippled by many many books of Code, Rules and Regulations and a heavy volume of procedural office orders which show little foresight or comprehension.

We have failed to draw upon the accumulated wisdom of other countries, particularly the U S A, where the willing co-operation of the workers has been sought and won rather than purchased. The shyness of the workers has been overcome by the latest management techniques and workers now freely put forward new ideas and plans and are rewarded for them. Anyway, it is hoped that Appleby's Report will not be respected in the negation.

While one can hardly disagree with most of the points raised, I think a proviso needs to be added regarding the function of audit. As is the practice in this country today, it is the function of audit to see whether the formulated policy of the Government is translated into action, within the limits of the financial powers granted to the Executive. In fact it is not the practice in India, to impede the progress of the Executive. As a friend, philosopher and guide to the Executive, the Comptroller and Auditor-General helps in realising the objective with the minimum of expenditure necessary. Many of the Codes and Rules are made by the highest rung of the Executive only the execution of which the C A G watches. As such, the objections to audit are vastly exaggerated. The blame lies on other shoulders in reality.

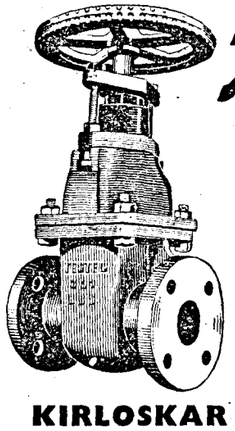
Commonsense on Unemployment



IN his article "Commonsense Made Difficult", in your issue of Oct 13, 1956, Shri M Srinivasan raises an entirely unnecessary point of dispute by his sharp distinction between disguised unemployment and the unemployment caused by growth of population. To draw a distinction between these two is much more like contrasting "black" with "cold" than like contrasting consumption with savings. Disguised unemployment can be distinguished from open unemployment, seasonal unemployment, etc, and the distinction would be useful in discussing the level of wages required to attract different sections of the labour force, or the proportion of their wages which would be met by a reduction in existing consumption.

Again, unemployment caused by the growth of population can be contrasted with that which is the continuation of past unemployment or with that resulting from rationalisation. This distinction would be useful in discussing policies to prevent future unemployment, e g, by preventing population growth. But for the next 15 years (assuming that this is the minimum age of work) the growth in the labour force caused by growth of population must be taken as given. Given an increase in unemployment, it is only a matter of historical interest (except for the considerations discussed in the previous paragraph) how it was brought about. Men, whether they are boys of 16 who have just joined the labour force, or men of 30 who have been unemployed (whether openly or in disguise) for 15 years, must eat, and the increase in consumption caused by employing them can therefore be less than their wages.

The absurdity of Shri Srinivasan's distinction can be seen in the fact that disguised unemployment in any period is itself at least partly the result of population growth. Indeed, all this is so obvious that one is tempted to believe that Shri Srinivasan meant to contrast existing unemployment (whether disguised or otherwise) with the increment which will arise from population growth. But if he did, what is his quarrel with Prof Das Gupta about?

A Kabul Diary-II

More on the Afghan Ally

MY second spell in Kabul turned out to be longer than I had bargained for, thanks to a hiatus between Aeroflot and the Indian Airlines Corporation (both state-owned), and the least I can do in return for the five pages of my passport filled by the Afghanistan Government is to write a second piece on the country. It is not a matter of unmixed satisfaction to me that my second thoughts are more supplementary than contradictory to my first observations. If in the latter there were discreet indications of disquiet, the former will be even less cheerful. I left Kabul, where I saw Babur's tomb and even I, no historian, could not help thinking of what had happened to India through the centuries and why, some of the basic assumptions of India's foreign policy seemed less solid than the rocky hills in and around Kabul. It is necessary to add immediately that in my opinion Pandit Nehru's foreign policy is, for all its idealistic core and coating, based on certain rocks of realism. Where wishing comes in is that there be more such rocks and that we know, even if we do not always parade the knowledge, the nature of every such rock; that we know how long to lean on this rock or that without fear of falling down. The next thing to say is that the Government of India is entirely right in seeking the friendship of the Government of Afghanistan. To have in fact secured it is no mean achievement.

It cannot have been easy. There has not been a census in Afghanistan very recently, as far as one can gather, but the 12-million population is overwhelmingly Moslem; there are no more than three or four thousand Hindus, and a Christian Afghan must be a very lonely man if he exists at all. Now, one need not be a Hindu communalist to believe that the Afghans' natural sympathy would be with Islamic Pakistan than with secular India; there is all history to show that Moslems are made that way, and, given the same kind of origin and development, the Hindus might not have been far different. (What I mean is that I have stated a fact and not expressed an opinion.) To aid these natural inclinations, there is Pakistani propaganda. There are no English newspapers, and all the Persian newspapers are owned or directed by the Government. The foreign visitor thus falls back upon the bulletins daily issued by the Embassies, and here is a typical passage from the Pakistani sheet: "The National Reconstruction Movement... have fervently hoped that King Saud and President Nasser will help the oppressed Muslims of India in their darkest moment and save them from the vengeance of Hindus who are out to wipe out the name of Islam." We deceive ourselves in thinking that this kind of muck has no effect at all on the half-educated English-reading Afghan who, in his turn, tells his totally illiterate countrymen.

* * *

What India is doing in Afghanistan is perfectly justified. If I understand the basic principles of India's foreign policy at all, then the most basic of them surely is that India seeks the friendship of every country, Afghanistan included. Another unstated objective of our foreign policy must be the creation and preservation of as many independent states as possible between ourselves and the two giants flanking India on the east and the west, Russia and China; and one such country is Afghanistan. The defection of Pakistan from the Bandung group, in all but name, and this neighbour's continuing hostility to India, make it the more necessary that we remain friendly with Afghanistan. So far so good. Even at the risk of offending the Government of Afghanistan and possibly the External Affairs Ministry (which has already been praised for its policy) the question must now be asked whether there is between the Government of Afghanistan and its people that minimum identity which it is polite to take for granted. Let me repeat, no change is indicated in India's policy towards Afghanistan. The present is the only sensible policy, to be friendly with the Government in Kabul and not look too closely into the nature of the Government. It is not a foreign government's business anyway.

A journalist may be forgiven if he interprets his duty slightly differently. He is under no diplomatic constraint, and he speaks for himself—not for his Government. Civility for him is a virtue, but not if it has to be practised at the cost of the truth as he sees it. Not a fair parallel in every respect, but Britain knows that the Berlin correspondents who sent home truthful despatches about Hitler were not less patriotic than the editors who withheld their publication because of a mistaken notion of loyalty to the Chamberlain Government. These ethical principles of journalism apart, whilst it is enough for a foreign government to accept a regime for what it is, a journalist owes it to himself to enquire into the character of the regime. It is this kind of enquiry which finds the present Government of Afghanistan wanting in many respects. What follows is probably known to the Government of India. I do not see why the people should not know something of what the Government cannot say.

* * *

There is about as much democracy in Afghanistan as there is gold in an Indian one-anna coin. The people of the country enjoy nearly as much freedom as the Sahara enjoys its rains. There are about as many liberties in Afghanistan as there are snakes in Iceland. The rulers in Kabul are as fond of the principles of liberalism as were the Bourbons in France. Almost every department of life is controlled by the Government, and only in the International Club can one hear some frank criticism of the Government—besides getting a drink. Here gather men from the different Embassies; the whole country being "dry". Afghans not averse to a drink or two manage to come here as guests, and only then do they open up. It should not surprise the Afghanistan Administration to know that there are Afghans who do not think they have the best government in the world. They talk about the man who has just been given that good job and the boy who has got a scholarship for studies abroad; it may be perverse of them, but they seem to think that the latter is the King's fifth cousin's second wife's half-brother and the former is the Minister's third nephew's fifth child by the very first wife. They seem to think that there are better criteria for the distribution of jobs and scholarships. They tell you stories of corruption, some of which sound

true. Not all of them seem to like the Mullahs either who, they think, have less loyalty to Allah than to the Government—the people being a complete irrelevance. You ask in your naivety, why isn't something done about it? The Afghan friend calls for another drink—the host takes out his book of coupons—and you see two Afghan eyes burning. It is possible to meet optimists in the International Club who think the next Amanullah may not be long a-coming and that without history repeating itself. There must be subterranean fires inside those burkhas too.

Of course all the foreign Governments deal with the Daud Government, but not every Embassy can be under the illusion that they are dealing with a regime of unquestionable stability. I am not a dreamer; I think you can fool all people for a heck of a long time; and in any case it is for the Afghan people to get the government they want. Meanwhile one leaves Kabul with the impression that some of the foreign Governments are incurring popular displeasure by being a little too friendly with the unloved regime. About the only foreigners the Afghans like are the Germans. The Russians are building roads, the Americans dams—without either winning the Afghan's heart. I met Afghans who said they would like to go to Germany. I met at least one man who said he would like to see Moscow, another who would not mind going to New York. New Delhi was not mentioned. I was not in Kabul long enough to find out why, but it seems to me a question of some importance.

—Flibbertigibbet

no more the muhannad

FIRDAUSI'S EPIC POEM, *Shah-Namah* tells us that when Alexander invaded Persia in 331 B.C., swords and other weapons of steel were hurriedly sent for from India. Throughout the civilized world India was famous as the home of quality steel. In fact, the old Arabic word for "sword" is "muhannad", meaning "from Hind."

Today, once again, steel is very much to the fore in the nation's thinking, but with a different intent. The country's steel-making capacity is being rapidly enlarged, not for purposes of war, but for peace and development.

TATA STEEL

SERVES THE NATION

TN 999

From the London End

Britain in the Atomic Era

THERE is a certain sense of history in the opening of the first full scale nuclear power station in the world when the Queen pressed the button at Calder Hall the other day. This flow of electricity (generated from nuclear energy) has been described as the inaugurator of the second industrial revolution in Britain. And indeed, this is a truth of considerable significance. It is true that atomic power has already been produced in a number of other countries, principally the United States and Russia. Calder Hall, however, is possibly the first demonstration of the feeding of electricity from a nuclear reactor into the national grid system. From August 27th electricity generated from Calder Hall has been supplied to the neighbouring Windscale atomic factory. And thus a new stage has been opened in the peaceful development of atomic energy.

Ten Year Programme

The supply of electricity from Calder Hall is the beginning and is only a small part of the considerable programme that is now in active execution in the United Kingdom for the large scale generation of power through nuclear energy. Calder Hall is not only an achievement in its own right, but it also stands as the experimental model for the fulfilment of the programme set out in the Government White Paper **Programme for Nuclear Power** of February last year. The White Paper proposed the setting up of twelve power stations in the ten years up to 1965. It was not visualised that these twelve stations would be larger in size than the model of Calder Hall, but with one of the four Calder Hall stations now in operation, the output of electricity has been sufficiently large to make it possible, when the programme is completed, to expand the capacity of the twelve stations considerably beyond the 2,000 megawatts which was then set as a target.

Thus within a decade, the promise of large scale nuclear energy for Britain's industries is more than likely to become a reality. It may equally be a precursor to the revival of Britain's international economic solvency and thus to the achievement of the much publicised ideal of doubling the standard of living of the British people in the next twenty-five years.

The Calder Hall station which has now been opened, is not designed for the primary purpose of generating electricity through the national grid system. This and the other Calder Hall models are merely the prototypes to be built by the electricity authorities under the February 1955 programme; they are not part of this programme. The Calder Hall stations are designed with the primary purpose of producing fissile material—plutonium, and it is only a secondary function for them to act as electricity power stations. While only one of the Calder Hall stations have been opened, the other three are expected to come into full operation at a very early date. The generation of electricity, as a by-product, estimated about a year ago at 100—200 megawatts per station, may now reach as much as 300 megawatts each.

Second Industrial Revolution

The development of nuclear energy for peaceful purposes has been pursued on a three stage programme by the Atomic Energy Authority. The first stage encompassed the Calder Hall project, the first of which has been inaugurated. The second stage is the designing and construction of a gas-cooled type of reactor and it is understood that progress in this direction has been as exciting as in the electricity generating prototypes. Following this second stage, power stations of a different type are being designed and constructed, one of which is being built in the North of Scotland. These stations will have the breeder type of reactor for power generation. Thus beyond the achievement of Calder Hall, there lies not only the ten year programme of nuclear power stations as visualised in the White Paper, but the vast planning and execution of research (under these three stages) which, according to the **Times**, "stretches far into the future".

The provision for nuclear power as the stimulant to the second industrial revolution, was recently surveyed by Sir Edwin Plowden, Chairman of the United Kingdom Atomic Energy Authority. On the assumption that Britain's national income would double in the next twenty five years, he estimated that the fuel consumption in 1975 would have risen to some 370 million tons of coal equivalent. As against this, the plans of the National Coal Board visualise an annual output of no more than 250 million tons by 1975 and that, too, only at a cost of additional investment of perhaps £900 million. Thus if the trend of fuel consumption and of coal output assumed in these estimates prove to be correct, then by 1975 a deficiency of between 110 to 120 million tons of coal equivalent will have to be met by alternative fuels.

In 1955, of the total consumption of 250 million tons of coal equivalent of fuel, oil represented 35 million tons. And had there been no political and strategic complications in the supply of oil, this fuel could very well be regarded as the possible alternative which could in 1975 close the estimated gap of between 110 and 120 million tons. Having regard to the present situation in the Middle East, no Government in the United Kingdom can plan so far ahead on the assumption that oil would be the alternative fuel to coal. Thus the construction and expansion of nuclear power is not only an act of faith, but a principal political aim of the British Government. The fulfilment of the 1955 programme for the construction of 12 nuclear power stations by 1965 would provide the United Kingdom with some 70 million tons of coal equivalent fuel. This will go a long way towards meeting the expected deficiency in 1975, i e a decade hence. It may very well be that by 1975 the full accomplishment of the three stages referred to above may very well increase the amount of electricity generation in this country to the point of not only making up completely the deficiency, but also provide a sufficient margin of surplus of fuel in this country.

Relative Costs

One question which weighed heavily on the British authorities in their planning of nuclear generated fuel was that of relative costs of other sources of fuel. The cost of Calder Hall so far has been in the region of £16½ million. Including the initial supply of nuclear fuel, the cost of the first electricity authority station may be about £150 for each kilowatt of generating capacity.

This is between two to three times the cost of conventional power stations. The Atomic Energy Authority's economist has suggested that the gross cost of producing electricity in a Calder Hall type of power station would be about ¾ pence per unit. The sale of plutonium may reduce the cost to a ½ pence which is only slightly above the costs of coal-fired powered stations.

The capital cost of a nuclear power station at present is £ 120 a kilowatt. To this must be added the cost of the initial investment in uranium fuel which might be about £ 30 million. As against this, coal or oil fired stations of comparable size cost about £ 55 per kilowatt. The engineering progress is designed to bring down the costs of the former to the latter. On the other hand, the running costs of nuclear stations are likely to be only a half of those of conventional stations.

The threat of a fuel shortage has been a continuing one for the British economy. Today Britain is a net importer of coal and its oil imports have been rising with some speed. With the declared belief (as expressed at the International Conference on Peaceful Uses of Atomic Energy at Geneva in 1955) that there is a positive correlation between per capita incomes and per capita energy consumption, all present and future efforts to raise standards of living in Britain must be seen, among other things, against the sources of energy and here only nuclear power provides the prospect. And as the Times describes this prospect "— it is a world to conquer".

From the United States

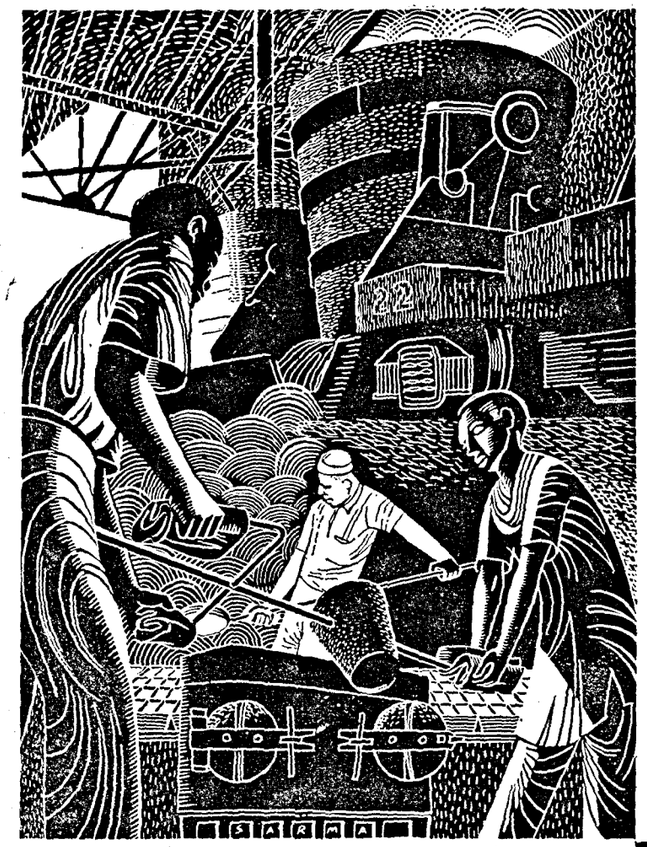
American Elections

THERE seems to be almost no doubt that President Eisenhower will defeat Mr Stevenson in the elections on November 6th. Although the pollsters are understandably nervous about their own predictions, the polls of public opinion so far show fifty to fifty-five per cent of the people favouring Eisenhower, as against around forty per cent favouring Stevenson. The others are undecided at the moment, or so they say, but even if they voted as a body for Stevenson, it would still require a remarkable swing away from Eisenhower on the part of those who now believe they will vote for him. Everyone here, of course, remembers Truman's 'upset' victory, but the polls at that time were wrong by only a very small percentage, and so small a margin of error is important only when the vote is close. The polls could be five per cent off and Eisenhower would still have a majority.

The issues on which the present election is ostensibly being fought are neither very exciting nor very convincing to the voters, and the strong feelings current during the campaigns of Roosevelt, Truman, and 1952 are lacking. The Republicans are running on their "record" and Eisenhower as a man, emphasizing the end of the Korean war, the peace since Eisenhower came into office, the general prosperity of the country, and the virtually stable price level.

The Democrats are having difficulty in finding issues of general appeal in which to fight the present administration. Stevenson wants to make an issue of Dulles' conduct of foreign policy, but it does not seem to catching on as an issue. The President's health cannot be referred to directly, for obvious reasons of taste if not of public morality, but a substitute amounting to much the same thing has been found in keeping the public constantly aware that Vice-President Nixon is the next in line to the President. Otherwise, the Democrats have had to try to make capital of regional issues. Thus a strong campaign is being run in the rural areas where gross farm income has been declining. The Republican administration has substituted flexible price supports and conservation 'soil bank' payments for the rigid ninety percent of parity support prices which had existed. Stevenson has promised to restore the ninety percent parity and there is talk of one hundred per cent of parity support prices. There are areas in the country—Detroit, Michigan, where there has been a depression, the automobile industry is one—where there has been or is a degree of local unemployment. The smaller businesses have also been finding it more difficult to operate within the confines of tighter credit over the past four years, and at the same time mortgages and consequently housebuilding are contracting. The Democrats are using these difficulties in an attempt to build up a picture of the Republicans as friends of big business while the Democrats are the friends of the small man and the worker. There is some evidence that this has been successful, but by no means startlingly so.

The feeling among political reporters and columnists seems to be that these issues are having some effect in mustering support to the Democrats, but that a Democratic victory, if one comes will be more the result of a reversion to the voting patterns of the last twenty-five years than that of the specific campaign efforts of this year.



American elections are not straight party votes and the results require the most careful interpretation. Personalities and local circumstances play a large part, and men are seldom elected or defeated on the major policy problems which are naturally the focus of attention of people outside the States. It may be helpful to analyze the present situation so that the meaning of the results may be clearer when the results of the election come out on Nov 7th.

In an American election the voter chooses men for a rather large number of positions. This autumn he will vote for a president; in two-thirds of the states, he will also vote for a US senator; he will vote for a US representative in his district and perhaps for another representative-at-large from the state as a whole; in a number of states he will be voting for a state governor, a state senator, and a state assembly-man; and again in many places he will be voting this November for local officials of city, town, or county. In each case different sets of circumstances and different sets of motives come into play, and one cannot generalize from trends in one set of elective positions to the outcome for other sets. To illustrate:

In elections for president, senator, governor of a state, or mayor of a city the personalities and personal records of the candidates are very important. This is the clue to Eisenhower's huge popularity with the voters. In elections to the House of Representatives, state legislatures, and city councils party affiliation is much more important, but at any level a particularly strong candidate can run well ahead of the others on his party ticket and win, despite a more general victory for the opposing party in that locality. Conversely, a weak man or unpopular candidate may run behind his ticket. But it is also important to remember that a strong or a weak candidate can by virtue of his own qualities influence the vote for others running with him.

The most outstanding example of the force of personality in determining the outcome of an election is provided by President Eisenhower. By party affiliation alone the Democrats were definitely the strongest party in the States, but in 1952 the Republicans carried both the Senate and the House. Two things are noteworthy about this result. First, Republican control of the legislative branch of the government followed from Eisenhower's victory, not Eisenhower's victory from the vote for the Republican party. Second, despite a natural (and intelligent) tendency to vote to give the president a legislature of his own party, the Republicans barely squeaked into control of the legislature while Eisenhower was carrying the country by an immense majority. In view of the size of his majority, the smallness of the margin of control in the Senate and House could almost be considered a victory for the Democrats. The rest of the story was told in 1954 when, without Eisenhower on the ticket and despite his success in ending the Korean war (or so it is regarded here), the country returned a Democratic Congress.

But the effectiveness of personal reputation is not limited to the pre-

we must

have

STEEL

The expansion of the iron and steel industry has been given first priority in the Second Five Year Plan. Three new plants—each with a capacity of one million ingot tons—will be established in the public sector, while the capacity of existing plants will also be increased. This means that by 1961, India's iron and steel capacity will be well over three times the present figure... from 1.3 million tons to 4.5 million tons. And the value of industrial machinery produced in this country is expected to increase by five or six times. What does this development mean in terms of oil? More fuels and lubricants to move raw materials... more cutting and quenching oils for actual production operations... more greases, lubricating oils and technical service required to look after the many new machines. Oil not only keeps the wheels turning... it helps to make the wheels in the first place. And where oil is needed—there you'll find Burmah-Shell.

BURMAH-SHELL...

IN INDIA'S LIFE AND PART OF IT

1272

sidency. In 1954 in the state of New York the Democrats won all the major state offices but one, and in that one Jacob Javits, a highly respected, competent and liberal Republican was running against Franklin D Roosevelt Jr for the attorney-generalship of the state. The combined effect of Javit's (good) reputation and Roosevelt's (not so good) reputation was to give Javits the attorney-generalship by a sizeable margin—one larger than that with which Harriman entered the governor's mansion. In the same year, with parties reversed, a similar event occurred in Connecticut where Abraham Ribicoff, a Democrat, became governor while the other statewide offices went to Republicans. In American parlance, both these men are known as 'vote-getters'.

The example of Javits in New York continues to be of interest, for he is now running for the US Senate, but in the present case his opponent is also a man of stature. Robert F Wagner Jr. has been a very successful Mayor of New York city and like Javits is a 'vote-getter'. And this is what will present the problem in interpreting the election results next month. Whichever man wins, how can one decide? If Javits wins, will it be because he is a Republican or because he is Javits? Or if Wagner wins, will it be because he is a Democrat or because he is Wagner? The only thing one can be sure of is that any claim that a victory for one or the other represents a true victory for the party will be based on the shakiest of evidence.

The state of Maine holds its elections two months early, to avoid the snow, and this year's results were unusual: Maine has always been a Republican stronghold, but this year the Democrats won the governorship and one of the three seats in the House of Representatives, while a second seat is still in doubt pending the outcome of a recount (the Republicans were first reported to have won the seat by the merest twenty-nine votes) Quite naturally the Democrats have been pointing to this result as indicative of the trend of the country, but a closer look shows how precarious are such inferences. In 1954 the present Democratic governor of Maine won the position from a Republican whose record was so poor that Republicans in large number voted for all the Republicans on the ticket except for the governor. Since that time the state administration has ben so good that no one particularly wanted to turn the incumbent out of office. Therefore one cannot call the gubernatorial race a party victory for the Democrats. The election to the House of Representatives is a different matter. So far as this writer has yet been able to ascertain, there were no local scandals, personality difficulties, or such like to swing Maine towards the Democrats, and elections to the House always being more of a party matter, there seems to be a clear implication that other things being equal, the voters of Maine, and perhaps elsewhere are realigning themselves with the Democrats.

This leads us to the question of who is going to win the Congressional elections. Opinion generally holds that the Democrats will keep control of the House despite the anticipated victory of Eisenhower, and holds that more likely than not the Democrats will also keep control of the Senate. If one were considering only the tenor of people's preferences for Democrats or Republicans in the houses of Congress, one would feel more confidence in predicting a Democratic Senate, but the elections for the thirty-five vacating seats in the Senate are subject to the evaluations of the men in each particular case, and here is where one must be most careful.

Another peculiarity of senatorial elections is that they are staggered over a six year period. At each biennial election one third of the seats become vacant. There being two senators from each state, at each election one senatorial seat in each of thirty-two states is up for election (the extra above thirty-two is due to the death of an incumbent). To add to the difficulties of prediction due to the man (for instance, Republican John Sherman Cooper always runs strongly in normally Democratic Kentucky) there is the difficulty arising from the fact that the seats becoming vacant at any given biennial election may not be subject to the same swings and changes as the country as a whole. Thus in this year 1956 the particular seats at issue are slightly more likely to go Democratic than Republican, but there are only thirteen seats where the issue is really in doubt, so one hesitates to predict. This effect is of course nullified over the whole six year senatorial cycle, but the principle of staggering the senatorial elections was just this: to even out the swings of public opinion so that there would be greater stability in attitude and policy in the government than might occur if all the personnel were subject to change every two years.

Perhaps a further word should be said on the matter of the American tendency to vote for the man rather for the issue for principle. If in calling it a vote for the personality I have given the impression that an election is a contest in smiles and friendliness, I have misled my readers. It is much more a case of voting for the "man for the job". If Americans were split on essential issues of social organisation—for and against nationalisation, for and against collective security through the United Nations—then there would be a lot more reason for voting for the party of one's principles. But they are not. Basically we are agreed on a system of free capitalist enterprise in which the government can interfere whenever we wish it to; on government responsibility for full-employment policies; on widening social security; on peace and collective security; on more and better free education for all; on progressive income tax; on conservation of national resources. Differences between the parties on these subjects are narrow, and are usually confined to arguments over the specific institutions which will carry out the policies or over the rate of expenditure on a policy. This means that the voter has little reason to pick one party rather than the other and consequently he is much more apt to vote for the man who seems most likely to carry out policies in the way the voter would like, or for the man who, the voter believes, will put most emphasis on furthering those policies which the voter thinks most important.

The president is elected for four years, a senator for six. Unlike a Prime Minister, a president cannot "fall" until his term expires. The voter cannot foretell what problems the country will face in three or five year's time. Neither can a presidential or senatorial candidate. How, then, is the voter to assure himself that the president three years hence or the senator five years hence will do what he, the voter wants done? Obviously he cannot, but his next best choice is to pick the man whose personality and record indicate that he is more likely than his opponent to react and think in a manner closer to that of the voetr. In

America party affiliation is a poor guide to this sort of choice. The spread of personalities, of personal preferences or attitudes, is far greater within each party than it is between the parties. There is some tendency for Republicans to be more conservative, but Mr Javits of New York is probably a "left" than the majority of Democratic senators, and Mr Mc Carran of Nevada, a Democrat, was probably America's most conservative senator. So when the American votes, he feels it is much more important to have the right man than the right party, at least in positions of power such as the presidency, a senatorial seat, or a governorship.

It must also be understood that where there are really basic differences in issues of policy, and racial integration in the schools is the only one which comes to mind,* the split is within each party and not between them. Both the strongest proponents and the strongest opponents of integration are in the Democratic party. Since Republican strength is mostly in the North and the West, and since these areas are historically pro-integration, the Republicans tend to be pro-integration, but in areas where there is a split on the issue, the split will run through Republican ranks as much as through Democratic ranks. In America there is very little correlation between "conservative" and "reformist" principles and the two parties. This is illustrated by the voting record of southern Democrats during the Roosevelt administration. The southern Democrats in the Senate and House were the backbone of New Deal social and labour legislation, but the main opposition to Roosevelt's efforts to end racial discrimination. The nineteen forties' senator Bilbo of Mississippi was the archtype of the anti-Negro southerner, yet he could boast the most consistent New Deal voting record in the Senate---better than that of Senator Wagner of New York, whose name is almost synonymous with New Deal labour legislation and who consistently favoured all forms of racial equality. As a final illustration of the inadvisability of using party as a guide to a congressman's voting behaviour, I cite the fact that administration programmes are put through Congress with support from both parties, and with opposition from both parties. Unlike the parliamentary system, there is no stable majority in either House of Congress. Eisenhower's foreign programmes are supported by more Democrats than Republicans. Truman's foreign programmes were guided through the Senate by Senator Vandenberg who was the Leader of the Opposition. A New Yorker can thus with complete consistency of principle vote for Stevenson and for Javits, someone in Oregon with equal consistency for Eisenhower and Morse (a Democratic senator).

As a result of these considerations, or complexities, or at least differences from parliamentary practices, one cannot interpret the outcome of the American election by looking at the total of the votes for president, or even the party composition of Congress. One must go more deeply into the particular question of what kind of men were elected, against what kind of opposition, and in what particular set of local circumstances.

* Even on this issue the opponents of integration say "not this century" and do not say "never", or more accurately, only a small wing of southerners say "never".

The Administrative System
Of a Socialist Society in the Making

Gyan Chand

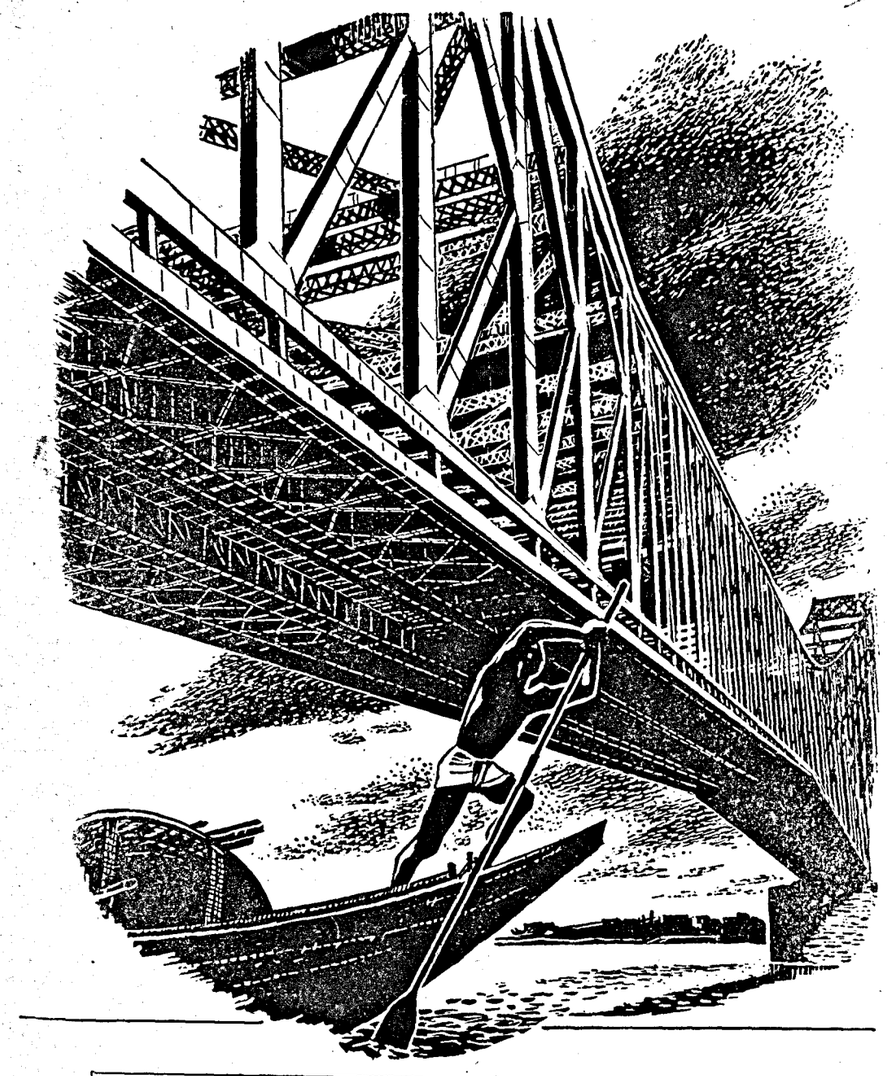
THE Indian administrative system of India had been criticized severely by the men now in power before they came to power and by their critics; and it has been freely admitted that its limitations are one of the most important bottlenecks which cannot but impede the development and transformation of our national economy. And yet hardly anything has been or is being done to create or develop an administrative system adequate to the new needs or objectives of the economy and the problem is not being examined in its proper context.

It is all the more important because social revolution is the avowed object of the changes now in progress, and its adequacy or otherwise, the need for changing it and its nature and urgency are to be examined with reference to this supreme objective. Our higher services have been well spoken of by a number of distinguished visitors; and in certain respects they are entitled to appreciation and admiration; but it is also well known, much more by our people than by the outstanding men on a short visit to this country, that they have been found seriously wanting in the discharge of some of the most important public functions, their power has in fact greatly increased and, broadly speaking, not been used in the best interests of the community.

If They Are Not to Fail

Apart however from the assessment of their role in the past, the more important consideration, to which earnest attention has to be given, is whether our administrative apparatus is suited to and can answer the needs of an economy which is intended and has to be radically changed in the interest of the masses and whether there is any prospect of the apparatus being altered or adjusted to the requirements of a socialist economy in the making. The next ten or even five years are going to be of momentous importance in our history and that of the world; and if the development and transformation of our economy are retarded or distorted by the inflexibility or the shortcomings of the administrative system, the repercussions are going to be serious and will make a very considerable difference to our future.

Our administrative services are, as is well known, important not only for the execution of policies but also for shaping and formulating them. That is unavoidable; and with increase in the importance, number and scope of Government functions we have to assume that these services will acquire even more crucial importance in the working and growth of our economy and their members will occupy key positions, in rapidly increasingly numbers, in our entire social set-up. It is necessary, as stated above, to examine the question of their future with reference to the social objective, to which the country is committed and which, by the force of events and the passage of time, will become more and more imperative in its impact and bearing. The standards of honesty, devotion to duty and application of the administrative services which, as is generally admitted, need to be greatly improved if they are not to fail the country in the very critical years ahead of us; and the attempts made so far to realize these objects are known to have more or less failed to produce the desired results. Much more, however, is needed in India than the qualities which the administrative services must possess everywhere and at all times for the stability and efficient working of a polity, if we are to face the tasks ahead with confidence and understanding of our paramount needs.



Agents of Social Revolution

As by choice and necessity our social revolution has to be brought about without resort to violence or any insurrectionary tactics, our administrative services have to participate actively and intelligently in the working and enfoldment of the revolutionary processes; otherwise not only will their intent not be realized but they will cause serious revulsion. The view that the services have to carry out loyally policies laid down by the Parliament and the Cabinet and cannot have any will of their own in regard to them is valid within limits in static times; but in practice it breaks down for the right execution of a policy in the spirit, and not merely the letter of the decisions, is essential for its success under all conditions. At a time of profound changes, however, this view is not valid even in theory. For executants of a revolutionary policy are as important as its makers, and unless they fully believe in it and are prepared to carry out not only in good faith but with earnestness and full mental exertion, the policy in implementation cannot but fall short of its object.

For the development of a socialist society, it is essential that the men with socialist convictions and a clear understanding of its primary needs should be in key positions in administration and be able and eager to put socialist policies into effect with determination, to remove, as far as possible, obstacles in the way of their execution and create an atmosphere in which they can be implemented with enthusiasm and devotion. Even the most ardent admirers of our administrative services will admit that this essential condition is not fulfilled at present; and unless the position is radically changed for the better, this condition is not likely to be fulfilled in the immediate future. Our services are credited with many qualities; but owing to the conception of their formation, their training, experience, traditions and well-established patterns of behaviour and re-action, it is known that they cannot be expected to be in agreement, much less active sympathy, with revolutionary ends and carry them out with competence and understanding. They are not lacking in ability to perform ordinary administrative duties efficiently and well. In general intelligence, they compare not unfavourably with similar services in any country; but what is in question is not their ability to perform ordinary administrative duties and general intelligence, but their capacity to function as one of the most important agents of social revolution. They cannot, of course, be only or the most important agent of revolutionary social transformation.

Basic Concern for Precedence

The whole nation has to be awakened to its necessity and logic; vehicles for carrying it out have to be provided at the basic level; and public leaders at all levels have to be thrown up who can live and live for social revolution. All these conditions are also non-existent and have to be created, but that increas-

es, not decreases, the necessity and importance of having administrative services capable of serving and fulfilling revolutionary ends. Without revolutionary fervour of the masses, the means of channelizing it and genuine revolutionary leadership, social revolution cannot become an emergent reality; and an administrative system suited to the needs of a social revolution has to be planned and made a working proposition when a social revolution gains momentum and gets well under way. The need of such an administrative system has to be clearly understood and appreciated and appropriate measures have to be taken to build it up on the assumption and in the hope that revolutionary forces in the country would gather strength and give substance to the bold intention embodied in the theory of our Second Five Year Plan.

"It seems strange" in the words of Mr Paul H Appleby, "that basic concern for precedent has not been challenged by the present Government. The primary purpose of political leadership—and notably of leadership in a revolutionary stage is to incite a departure from precedent—for the sake of the achiveement of new valuee." This 'basic concern for precedence', departure from which has to be incited by political leadership, has been paralyzing action and initiative in our administration and is, of course, completely out of accord with the needs of a social revolution. The latter must necessarily call for all-round departures from beaten tracks, spirit of social adventure in action and willingness to face new conditions, new issues and new combinations of forces to achieve new values' with courage and resourcefulness. This spirit our services are known to be completely lacking in at present, and it has to be generated, fostered and developed in order to make them partners in initiating and carrying out revolutionary purposes.

A New Social Technique

As basic social changes are carried out, the problems of administration will acquire new meaning and importance and have a fascinating interest of their own. The rule of thumb and hum-drum methods would necessarily have to be discarded, and social ingenuity developed at all levels to deal with concrete problems and situations. Revolution would primarily mean replacement of old by new social relations, shifting of the centres of social gravity and dedication to new social values, but when that has happened or rather is happening, a new social technique as a continuing process will have to be developed and made operative in a changing and developing administrative system. The qualities necessary for this purpose have to be acquired and cultivated and their development made the object of conscious social research and endeavour.

Poise, dignity, capacity for inspiring confidence, breadth of outlook and flair for practical ends are qualities which are needed for good administration at all times and in all countries; but good administration, when social revolution is an urgent and inescapable necessity and has to be carried out without serious social convulsions and upheavals, needs creative achievement of a much higher order and can be attained when administration becomes social engineering and craftsmanship and expresses and fulfills a coherent revolutionary social purpose. That action on a different and higher level is called for has still to be even appreciated in our country and therefore the measures and methods needed for realizing this all-important object have not been given an earnest thought. Pedestrian administration and social revolution cannot go together; and their mutual repulsion has to be taken as an axiomatic fact to which we have to adjust our minds and policies.

Career-Minded Administrators

New values can be achieved in administration only when new values are achieved in the lives of the administrative personnel. Our administration is still authoritarian, largely incapable of touching human chords, transmitting any stimulus or pointing to new horizons because most of the administrators are almost entirely career-minded and the vistas now opening before the people mean nothing—even less than nothing—to them. The offices which they hold are coveted, besides of course for their monetary rewards, for the power which they bestow rather than the opportunities which they offer. The result is, as the people know, that the animating spirit of administration has hardly changed since Independence, and even the new services, which have been formed for promoting and realising the peoples' well-being, are as 'bureaucratic' as the services directly concerned with civil administration. Besides, corruption and worse evils are still common, there is no indication that the need for new approach in administration is even understood and its relation to basic social changes appreciated.

Needs of a Socialist Society

Our public servants do not express the new social ends in their personal life, and no effort is being made to stimulate earnest thought or endeavour among public officials. Not only are the higher services being paid salaries beyond our means as a nation, but their whole tenor of life, mode of behaviour and response to the changing situation in the country are lacking in those qualities without which social revolution would remain merely a utopian dream. These qualities cannot be acquired without our public officials embodying and expressing the ends of social revolution in their personal life and conduct and establishing a living contact with every day life of the people. This sounds commonplace but is, nevertheless, of fundamental importance. A revolutionary social order needs revolutionary administrators—men and women, like the public leaders referred to above, who live and live for social revolution. Esprit-de-corps, team work, standards of public conduct, which are all essential for good administration, acquire a new meaning and importance when they are set in a revolutionary context and related to the vital needs of a socialist society in the making.

Public Enterprises

Administration of public enterprises, which would necessarily acquire everincreasing importance as social revolution proceeds apace, requires, of course, new type of organization, mode of transacting business and much greater flexibility in policy-making and its execution than in public administration in general. The economic administrator even more than public administrator, has to be a carrier and accelerator of a new social purpose, his technical competence has to be of a high order, he has to be an innovator in pursuit of social ends and their realization, and develop capacity for co-ordination with other public undertakings, the economy in general and the tempo of social change. All this is needed and experience of private economic enterprises cannot be taken as a basis for the acquisition of these essential qualities.

The economic administrator has, however, to be primarily an architect of the new order, understand the implications and obligations of pro-

duction for use, rather than production for profit and learn to cultivate and develop deep concern for human and social needs of labour. Technicians have to be first-rate in their profession, but as technicians of a socialist society in the making, their technical competence can fulfil itself only if it has a broad and deep social content and is exercised in co-operation with others, with solicitude to learn from all including the workers and carry on the administration of enterprises entrusted to them with clear understanding of the need for removing all barriers to what the economists call horizontal mobility i e professional advancement of workers, however lowly placed, according to their work, worth and ability to acquire higher technical qualifications.

Bad Precedent

Public economic enterprises have to attain and maintain a high standard of business efficiency, orderly conduct of production and financial transactions and their accounts have to be in good order; but in this respect, again, they cannot merely reproduce or emulate the methods and standards of even the best managed private economic enterprises. Their problems and needs are essentially different; and though they have to adapt the best in the administration of private enterprises for their ends, they have to realize that economic administration of public enterprises raises new issues and calls for the exercise of qualities which in private enterprises come in the way of personal advancement and even success of the undertakings. Accounting and audit acquire greater importance in economic administration, but even when their technique is the same, their purpose, criteria and tests of efficacy have to be changed radically and given a new social significance. We have to constitute new economic services and the practice of placing the members of the present administrative services in position of direction and authority in the newly started public enterprises is creating a bad precedent and hindering the process of internal growth. The assumption that the technical personnel are not capable of dealing with the wider problems of policy and administration is an extremely biased assumption and a legacy of the past. It has to be discarded in the interest of orderly revolutionary growth of our economy. A radical change in the underlying assumption of public administration is urgently needed for promoting and realising new social objectives.

Symptoms, Not the Disease

"Review by too many persons in too many organs of the Government in too detailed, too repetitive and negative terms" on which Mr Paul H Appleby lays so much stress in his report and for the mitigation of which he urges delegation of authority and elevation of responsibility to a higher level is a symptom of the disease and not the disease itself. Similarly 'concern for the literal', small thinking which 'can completely thwart the public purpose and the public good', 'a system built upon extra-ordinary evasion of individual responsibility and a system whereby everybody is responsible for everything before anything is done' and other defects of the same kind, to which he refers so vividly and with such repeated emphasis, are all expressions of the fundamental weakness of the present administrative system.

A change in procedure, heirarchical relations, methods of financial approval and budgetting and even the position and function of the Auditor General is required, but has to be made an integral part of much more fundamental changes in our administrative system—in its organization, conception and order of its function and more than that, in its motives, spirit and conditioned reflexes. A much wider approach to this problem than is indicated by Mr Appleby's report is needed and has to be made operative with a full understanding of the magnitude, nature and urgency of the problem. That a Committee of Secretaries, even with a whole time competent Secretary, has been appointed to examine the problem is a measure of the poverty of our thinking on this subject and its range.

Not for Secretaries to Solve

The whole question needs to be examined on a much higher level and with a much wider purpose than can be achieved by a report of a foreign administration expert, howsoever eminent, or a committee of secretaries with a whole-time secretary. The services matter and they have to be fairly treated with due regard for their interests and expectations, but the prospect of social revolution and the future of our people matter much more. In the words of Mr Appleby again,

> "Emergency dictates the establishment of procedure that have a maximum potential of acceleration consistent with the maintenance of democratic values."

The maximum potential of acceleration is needed not for establishment of procedures, but acquisition and implementation of, it is worth while repeating, revolutionary social purposes, new operative principles and a **modus operandi** of administration which would greatly further and not obstruct the ends of the urgently needed social revolution in the country. The task is exceedingly difficult but has to be accomplished with the utmost speed and full and undivided allegiance to social revolution and its exacting logic.

Indian Agriculture in Brief

A useful and pocket-size book-let has been recently brought out by the Economic and Statistical Adviser, Ministry of Food and Agriculture, Government of India, with a view to meeting primarily the need of those who wish to have a snap shot picture of Indian Agricultural Economy as revealed by the current Agricultural Statistics, certain essential data in allied spheres; e.g., population, national income etc. needed for an understanding of the Agricultural Economy in its broader perspective have also been included in this booklet.

End of Casteism

P G Shah

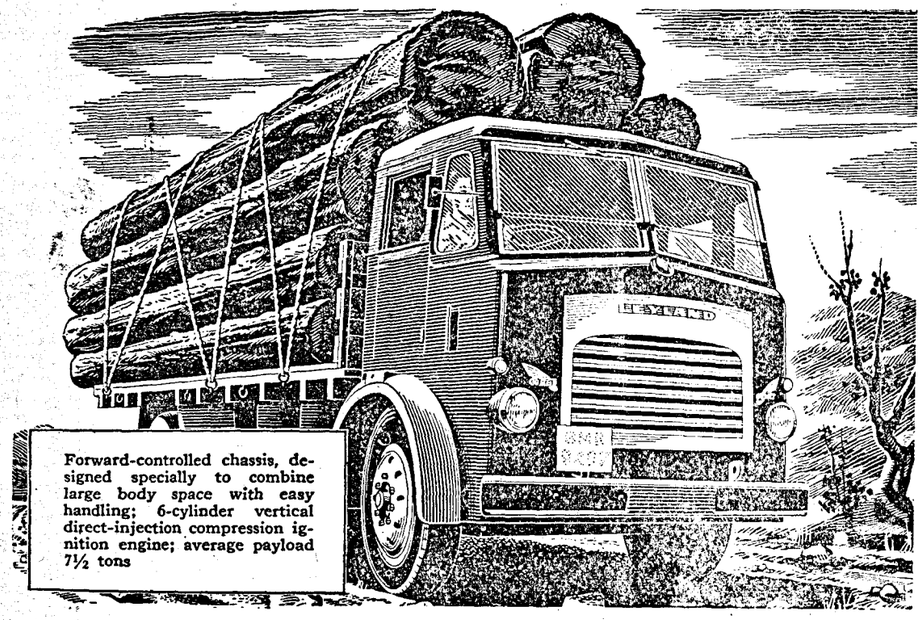
A DEEP sense of frustration is traceable below the theatrical manner in which the announcement was made of the mass conversion of 75 000 members and office bearers of the Scheduled Castes Federation under the leadership of a great Indian, Dr Ambedkar. Whether this was an election stunt in connection with the formation of a new political party (the National Republic Party) or a genuine attempt at securing "liberty, equality and fraternity"—history alone will tell. But to a social scientist, the event appears to be one of importance and provides an occasion for serious thinking as to whether the country is proceeding on correct lines for securing a casteless society free from exploitation. Dr Ambedkar has also announced that though he and his followers have left Hinduism and "would not take cognisance of the caste system"—they would claim and retain all the privileges enjoined in the Constitution for the Scheduled Castes and will continue to fight for our first rights. "They would not lose their rights and privileges with the change of faith."

"Untouchability" was officially abolished in 1948. Its practice in any form is forbidden. Several State acts and a Central Harijan Disability Removal Act have implemented the Constitutional provision. Yet the Harijans complain about their social status. As Dr Ambedkar has stated on this occasion, "mere scholarships and the provision of a few jobs would no longer satisfy the Harijans, they want equality and self-respect." The important point here is whether a group or a community or a caste can at all advance by being isolated for being given special privileges and preferences. The Constitutional position guaranteeing safeguards for specific groups, castes or tribes provide a double edged weapon which may destroy when it should protect. Separate housing colonies, separate wells, and even separate burning grounds for special groups are at present tolerated in a Welfare State pledged to evolve a casteless society.

It is one of the most retrograde provisions in the Constitution that distribution of social relief in the matter of education, housing or social or economic uplift has to be conducted on the caste basis. Government of India recognises 304 scheduled tribes, 818 scheduled castes, and 1426 other backward classes for the purpose of granting scholarships and other concessions. The meaning of this special provision is that members of these 2548 caste-groups have to be certified by local Government officers to belong to the particular caste group by such local enquiries as are feasible. One result is that these caste groups will exist, prosper and continue in this country as long as the special groups are tolerated officially, even though caste may be formally abolished in the census and other official records. The position is complicated by other political considerations e g reservation of posts under Government and of seats in Parliament and the State assemblies. It would cause a huge furore in political circles if, in the scheme of establishment of a casteless society, all reservations by caste groups are abolished. But a social scientist, not concerned with previous political or constitutional commitments would strongly insist on the abolition of all privileges based on caste in some form or another.

It is one of the strongest paradoxes in India that untouchability persists inspite of change of religion. The present policy of selecting persons for social relief on the basis of socially low occupations has encouraged religious communities like Christian, Mohammedan and even Sikh who all believe in equality of social status for all their followers to claim relief on caste considerations. Brahmin Christians would not interdine or intermarry with Harijan Christians and the latter are denied a decent burial ground after death. Members of scheduled castes converted to Christianity or Islam or Sikhism, even though these religions believe in equality of status, are given the privileges open to other backward classes in some States. Dr Ambedkar, even after conversion to Buddhism and after vowing not to take cognisance of caste, insists on the continuance of all the old concessions. The result is that the number of the scheduled castes and other backward classes will never decrease but will always swell.

The only remedy for the State is to abolish concessions based on caste, if there is going to be a genuine effort to abolish casteism. But in a country like India whose education at the primary, secondary and higher levels is neither universal nor free, preference has to be shown to the backward and underdeveloped groups in some form or other till social and economic inequalities are removed. To continue the existing procedure on caste basis will never secure the aim of a classless and casteless society preached so forcibly by the Father of our Nation.



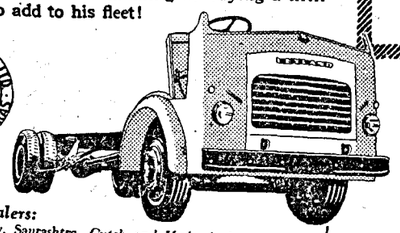
For securing a society in which caste will cease to be a means of either profit or exploitation the only correct remedy is

(1) to cease to distribute social relief scholarships, and other amenities like housing or economic help on caste basis; and
(2) to distribute the same quantity of total relief to the really poor and homeless, irrespective of caste.

The various groups of backward classes so classified at present should be assured that the money set apart for their relief will not be reduced and will be distributed without reference to caste affiliations but on the basis of economic conditions of the families needing the help.

Measures of general welfare e g schools, hostels, colleges, dispensaries and hospitals, will be available to all communities but will be specially provided for areas or villages where they are needed most. A Welfare State, committed to the schemes and policies for the uplift of the backward groups, cannot and will not neglect them. But the masses, the social workers and the State should combine to evolve measures of social uplift based on general considerations irrespective of caste affinities. It will be only through inner evolution of the sincere feelings of equality and brotherhood among the masses that the caste differences will really disappear and a casteless society can be evolved. But an essential preliminary step is for the State to cease distributing social relief on caste basis and to refuse to recognise the two thousand and over caste groups which at present disfigure the fair name of the modern Indian nation, bent on a casteless society.

More than 2,00,000 miles
– and this LEYLAND 'COMET'
runs smoothly as ever!



Forward-controlled chassis, designed specially to combine large body space with easy handling; 6-cylinder vertical direct-injection compression ignition engine; average payload 7½ tons

It's the only 7½-ton payload chassis made in India!

Mr. Jagadeeshwariah, well-known Secunderabad operator, bought his first Leyland 'Comet' five years ago. "This chassis has now covered over 2 lakh miles and it has proved to be extremely reliable and economical. I unhesitatingly recommend that there is no finer vehicle obtainable today," he says. Mr. Jagadeeshwariah now has four 'Comets', and is thinking of buying a *fifth* 'Comet' to add to his fleet!

The Leyland 'Comet' passenger chassis offers *extra* reliability and safety. Special springs for more comfortable riding. Choice of two models. Widely used by State Governments, Municipalities and leading firms and organisations.

New Government Policy

(From Our Singapore Correspondent)

ON September 20th the newly reconstituted Labour Front Government under Lim Yew Hock, the Chief Minister suddenly ordered the arrest of five men and two women as "a threat to the security of Singapore by reason of their Communist activities" and the dissolution of two organisations, the Singapore Women's Federation and the Chinese Brass Gong Musical Society. At the same time the Singapore Chinese Middle School Students' Union registration was cancelled and its Chairman arrested, who, incidentally, was also a member of the Executive of the Peoples' Action Party, the principal opponent of the Labour Front in the Assembly. Every person arrested was a Chinese and every person arrested had been educated in the Chinese schools' system other than Mr Lim himself.

As a result of these arrests, which were made totally without warning and at a time when Singapore had been more peaceful than for many months past, students of two of the principal Chinese schools, the Chinese High School and the Chung Cheng High School, struck and shut themselves up within the school. The Government in reply deregistered the schools and immediately offered to set up new schools at which all the old pupils were required to re-register themselves.

Just as there is a marked difference of attitude between the richer English educated Chinese and the poorer Chinese educated Chinese towards the Government policy, so is there a distinct cleavage between the English and Chinese press. The English press, represented by the "Singapore Standard" and the "Straits Times" expressed their solid support for the Government and praised the courage of Lim Yew Hock. The Chinese newspapers, especially the powerful "Dah Kung Baw", and also the right wing "Shin Chou Rih Baw" omitted any comment, thus expressing their violent opposition to the Government.

The principal overseas correspondent of the "Straits Times", Vernon Bartlett, whose despatches are widely quoted in overseas newspapers, has been praising the firm attitude of the Chief Minister in suppressing the "revolt". Yet regular readers of the "Economic Weekly" will remember that as far back as December 11th, 1954, your correspondent forecasted that difficulties of this sort were increasingly likely to occur, unless a unified policy were immediately instituted to remove the control of the Chinese managers from the schools except in an advisory capacity and a consistent unified policy of Singapore education were carried out in which communal interests were unrepresented. The immense enthusiasm which has greeted the state supported unified Chinese-English schools, is still there. The aim of these schools (of which there are only two) is that at the end of the course, scholars should be literate in both languages. Only in the final year is the medium of instruction English.

The periodical "revolts" which Vernon Bartlett so energetically condemns, are only a symptom of the economic difficulties of Singapore. The unemployment, both open and concealed, the political insecurity of the lowly Chinese-born labourer who is denied civic rights and the insecurity even within the family, where marriages need not be registered by the State and can, practically speaking, be dissolved by desertion, prevent the rise of a real civic consciousness. Since the ability to speak Chinese is almost the only remaining social characteristic all Chinese speaking Chinese have in common, Lim Yew Hock's "firm" attitude may succeed in uniting the Chinese together purely on a basis of Chinese nationalism. The correct attitude should be to encourage the creation of small territorial communities, common schools, common State registered marriages, protection of Chinese children as Singapore "citizens" rather than as "Chinese school students", an inferior category not equal to the easily employable English school graduates.

Singapore wants a strong Chief Minister and not a playboy. Lim Yew Hock is showing his strength. He probably has the strength of character to succeed. But for him to gain his strength from one community at the expense of another is the way to disaster. Even now it may not be too late for him to try to co-operate with the other section of Singapore. After the War, Dato's Sir Cheng Lok Tan succeeded in learning from both sections of the Malayan Chinese community, although he had been brought up a Straits Chinese. Has Lim Yew Hock the foresight to follow the same path?

Disguised Unemployment and Economic Development

A Rejoinder

A K Dasgupta

ONE or two comments of mine on Vakil-Brahmananda "consumption-goods multiplier" seem to have upset the Bombay School of Economics. First came a protest from Mr B C Desai (E W September 1, 1956) on the ground that my criticisms were unwarranted. Then a frontal attack from Mr M Srinivasan on my own handling of the implications of disguised unemployment. More may follow. While I appreciate very much the sense of unity in the school and the vigour with which the disciples are out to vindicate their master, I am afraid their energies are somewhat misdirected.

Let me take the Protest first. Mr Desai is surprised at my calling attention to a certain error in the definition of an "employable unit" used by Vakil and Brahmananda, namely, the expression "labour plus wage-goods". He says, "The use of the word 'plus' is probably wrong, but that in no way justifies Prof Dasgupta's criticism that it is not understandable". Why "probably"? Is he not sure that it is wrong? If he is not, he may perhaps consult Prof Vakil himself. The fact is that I never said in the foot-note where my criticism occurs that the concept is not understandable; I did understand it, as Mr Desai himself concedes in the opening sentence of his note. I actually called it a lapse, and surely it was a lapse which deserved being pointed out. Ironically Mr Desai himself falls into a similar error when, defending the consumption-goods multiplier against my criticism, he maintains that, in the limiting case where the transfer of the disguised unemployed to the investment sector is not accompanied at all by a transfer of wage-goods which they used to consume, the consumption-goods multiplier is "zero". When I read it I could see that what Mr Desai meant by zero was "unity". But would he want me to gloss over the error? Surely, in the face of the fact that there are unwary readers about, as some of us have the misfortune of experiencing while correcting examination scripts, it is dangerous to allow such errors to go unnoticed, particularly when they occur in a book with which Prof C N Vakil's name is associated.

Mr Desai has apparently disliked my reference to Nurkse's concept of 'saving potential'. This is understandable; the authors whom he is out to support do not even once mention Nurkse in the body of their text. I do not see much difference basically between Nurkse's saving potential and the concept of the consumption-goods multiplier except that Nurkse starts from a more sensible end. In any case, since I myself drew a lot from Nurkse's hypothesis in my own analysis of disguised unemployment, I thought honesty demanded that I should make a mention of it.

If Mr Desai cares to re-read the relevant section of my article, he will, I hope, notice that in the context in which I described the consumption-goods multiplier as a "myth", my purpose clearly was to indicate that the emphasis it conveyed was at the wrong end.

While Mr Desai's attitude is defensive, Mr Srinivasan has chosen to take an offensive role. His target is not only myself but also Prof A K Sen who, in the course of an important article on "Labour Cost and Economic Growth" (E W September 20, 1956) happened just incidentally to express a certain scepticism about the usefulness of the concept of consumption-goods multiplier. Here I shall confine myself to that part of Mr Srinivasan's critique which bears on my analysis of disguised unemployment.

Mr Srinivasan sees a "bundle of contradictions" in my foot-note remark, suggesting, in spite of Vakil and Brahmananda, that there is no inconsistency between their "wage-goods approach" and the Planning Commission's "logic" stressing the need for fixed capital. I have discussed this matter so exhaustively in my article on disguised unemployment that I am reluctant to repeat the story here. I would rather ask my critic to read the whole of my article and not just that bit about which he is specially concerned.

Frankly, I do not see what exactly Mr Srinivasan tries to make out. He maintains quite correctly that "what is important in the initial stages of economic development is the wage-goods gap or a marketable surplus in the consumer goods section" and that this sets a limit to the rise in the capital stock. And yet, in spite of his emphasis on initial stages', he sees no point in my distinction between short run and long run in the discussion. It is not such an important discovery that, with constant real wage rate, supply of additional wage-goods is necessary to feed additional employment in the investment goods sector, and I refuse to take credit for realizing that. It is absurd to think that the Planning Commission

Department of Economics, University of Bombay, BOMBAY 1.

aware of this simple truth which has been handed down to us since the days of the classical economists through their wage-fund theory. Why otherwise should the Commission be so desperately in search for "savings"? Even apart from savings out of a given flow, the production of wage-goods itself, as I have argued in my article, is not as inelastic as it is often made out to be. The Planning Commission is therefore logically quite consistent in making fixed capital their target in the Plan and then devising means to adjust the supply of wage-goods to the planned volume of investment. Now, investments done during a given planning period realise themselves in fixed capital in successive planning periods. Over time, therefore, the supply of consumption goods (hence wage-goods) tends to increase, current labour at each successive stages of development being aided by an increasing stock of fixed capital. This is what I meant by the longer run aspect of planning. I am yet to know where the contradiction arises.

I would ask Mr Srinivasan to re-read carefully the section of my article where I discuss the justification or, otherwise of making too sharp a distinction between disguised unemployment and new labour force generated in the process of population growth. For, as I see, he has made a mess of the whole thing. It is true that I believe that the two are not separate entities for the new labour force, in so far as it emerges within the subsistence sector, only adds to the volume of disguised unemployment. It is true also that later on I followed the common practice of dissociating the saving potential from the newly created labour force. How easy it has been for Mr Srinivasan to put these two together and to corner me with a charge of contradiction. What he misses (deliberately, I hope!) is the intervening passage where I plead that the distinction, even though loose, has analytical significance. Mr Srinivasan's critique reminds me of the story of a girl who, when chastised by her mother for not going to school, complained, "Mummy, what my teacher says in class is full of contradiction. One day she says four and four make eight, another day five and three makes eight. I am not going to school until she makes up her mind". Well, if this is contradiction, then Mr Srinivasan will have good plea for not reading my article again.

In a "Who's Who" of industry and commerce, if such existed, you would find many differing activities—and you would also find on every page the names of users of Hollerith. The reason is clear. Diverse though business is, it is united in its demand for higher and higher standards of efficiency . . . and in Hollerith electronic punched card accounting and the use of Hec Computers, it has a large part of the answer.

Jet Airliner Tu-104

(From a Delhi Correspondent)

THE Russian jet airliner Tu-104, named after its designer Andrei N Tupolev, passed through Delhi on its way to Rangoon. It was on a proving flight in preparation for the forthcoming Olympic Games in Melbourne, where it will be carrying the Soviet teams.

The Tu-104 created quite a stir in the Western world when it carried the Russian Security Chief, Gen Ivan Serov, to London, prior to the visit of Messrs Bulganin and Kruschev early this year. At that time, no details about the plane were let out and the secrecy maintained gave rise to a lot of speculation. Since then, the aircraft has been offered for sale, and therefore more information is available, but not all of it. In Delhi, large crowds turned up to have a look at it. The rush was great and the arrangements to handle the crowd were so inadequate that there were even a couple of ambulance cases.

The plane is very pretty to look at, with its sleek and clean lines and very good polish. Looking at it from the outside, the side view of the fuselage reminds one of the so-to-speak curved sweep of the graceful Super-Constellation, but there is no similarity really. There are two enormous yet engines immediately on each side of the fuselage, estimated to be 40 ft long and 5 ft at maximum diameter, with the exhaust end angled away from the fuselage to protect it from the jet blast. The total length of the aircraft is approximately 120 ft (Super-Constellation 113 ft 7 in), and the wing span about 118 ft. The wings are quite thick and swept back more than 30 degrees. The tail fin is about 33 ft high. The undercarriage is of the four-wheel double truck type; the two-wheel nose gear is steerable from the cockpit and the two rear wheels of the main landing gear swivel, so parking manoeuvres can be made in limited space. The tremendous number of rivets catches one's eye, and if one strolls past the undercarriage, one is reminded of the better finish seen elsewhere. The mechanically minded find their attention attracted by the large number of aerials visible all over, and wonder what electronic equipment is carried aboard.

The Tu-104 has a first class and a tourist version, and the one we saw from inside is the former type. On entering, on the right are three toilets and washrooms, with different types of fittings, for the passengers. On the left is the main passenger cabin with 28 seats. There are four seats in each row with a corridor in the middle. The seats are covered with a bluish woollen fabric and white anti-maccassars, and are very roomy and comfortable. Moving forward, we come to a row of four special cabins. The first is a lounge with four double seats and two dining tables; the next, a cafe-bar with two double seats, a dining table, buffet and galley. This compartment is directly over the wings and is slightly higher than the rest. The third is a lounge with two double seats and a dining table on one side and two swivelling chairs and a dining table on the other. The last is a lounge with four double seats and two dining tables. Lace is used to decorate the lounges and there are glass show cases containing porcelain figurines separating the lounges (the figurines are screwed down on to the plate glass and there is no cause for anxiety!). The windows are framed with what appears to be wood but is actually plastic painted to look like wood. The dining tables in the lounges are also finished with this type of plastic.

Leaving the lounges behind, you now step through an airtight door which keeps the lounges and the main passenger cabin pressurised, even if the cockpit is depressurised. Through this door, then, one steps into a forward vestibule for the crew, past a toilet for them, into the flight deck. One first passes the flight engineer and the radio operator who sit in backward facing seats, and then the two pilots seats, with complete duplication of instruments for each. One then climbs down into the navigator's seat in the nose which is fully transparent. There is radar for both weather and navigation.

There are two capacious holds under the cabin floors fore and aft of the wings which can carry upto 5500 lbs of baggage. The whole fuselage is pressurised to correspond to an altitude of 7900 ft to 9850 ft, for cruising between 33,000 ft to 40,000 ft (as against 20,000 ft for Super-Constellation). In addition, oxygen masks are fitted to every seat. A brake parachute is carried in the rear of the fuselage, behind the retractable tail skid.

The greatest amount of speculation is about the power of the engines, the thrust of which is rated by various experts as being anything between 12,000 lbs and 20,000 lbs. The fuel capacity is estimated at about 8,000 Imperial gallons.

Some Other Data

First class: 50 seats and payload 11,400 to 13,200 lbs.

Tourist: 70 seats and payload 15,400 to 16,500 lbs.

Maximum speed 620 mph; Cruising speed 500 to 560 mph.

Maximum range 2800 to 3100 miles.

Cruising altitude 33.000 ft to 0,000 ft.

Take-off run 4,600 ft to 5,260 ft; anding run 3,620 ft to 2,050 ft.

"He who is firmly seated in authority soon learns to think security."

Around Calcutta Markets

Shadows Over Markets

Wednesday Evening

EQUITIES continue to be weak. There were hopes that equities might start moving up with the reopening of the stock market after the Puja holidays. In this week, equities have lost further ground. There was a slight technical recovery at the time of the settlement. But the trend remains irregular. Sellers are not aggressive. There is lack of buying support. This is the main reason why equities remain irregular at the lower level. On current indications, investors are not likely to enter the market in the near future.

There are some local factors impeding activity on Lyons Range. Soon, the Stock Exchange Act will come into force. Before that, the unofficial share markets in and around Lyons Range will be closed. At the moment, futures trading in jute goods is unofficial. Soon, the East India Jute Association will restart futures trading in jute goods. And then, the present unofficial jute goods market will cease to exist. Many traders will become unemployed. Immediately, business in Lyons Range will suffer. In the long run, however, the elimination of unofficial markets will swell the volume of business in Lyons Range.

World Bank Loans

For some days, Lyons Range has been under the shadow of letters exchanged between the President of the World Bank and the Union Finance Minister. Stock markets interpret Mr Black to be critical of the ambitious Second Plan. Mr Black's observations about the transport problems of the Second Plan are fresh reminders that the transport bottleneck can hamper the progress of the Second Plan. Stock markets are also impressed with Mr Black's warnings about the inflationary dangers of the Second Plan's target for deficit financing.

These warnings and apprehensions have been expressed before. Current weakness in equities cannot be explained away by Mr Black's comments on the Second Plan. But the implications of Mr Black's letter to TTK have not been missed by stock markets. Implementation of the Second Plan depends, to a great extent, on foreign aid and loans. New Delhi has been banking heavily on World Bank loans. Stock markets are worried because of the World Bank's reluctance to offer adequate and timely aid.

Wrong Equation

Mr Black has been unwise in his irrelevant emphasis on the importance of the private sector. This has been rightly criticised by responsible opinion in Britain and elsewhere as an attempt by the World Bank to dictate political or economic policies to New Delhi. Pandit Nehru has been apposite in his reply that it is wrong to equate democracy with private enterprise. New Delhi is committed to a policy of mixed economy. Private enterprise has welcomed the new Industrial Policy Resolution. There is not much of conflict between the two sectors.

But Mr Black is not irrelevant in his implied comment that the Second Plan is too ambitious. Execution of such an ambitious Plan may endanger financial stability. As the lender, the World Bank cannot be unconcerned about this aspect of the Second Plan. Mr Black's letter is liable to the interpretation that the World Bank will be more strict and cautious in its loan operations in India. This is what is worrying stock markets. This has been one of the background factors responsible for the quiet trend in equities in the last fortnight.

More Taxes?

There are two reasons why stock markets are worried about the developing events. India expects substantial help from the World Bank. In the absence of the expected aid from the World Bank, India may be forced to cut the Plan down. In the last eight months, India has been consistently losing foreign exchange resources. Any cut in the magnitude of the Plan would mean so much less economic improvement. Industrial expansion must be relatively smaller. It is not surprising that these fears are hampering stock market activity.

Stock markets are, at the same time, apprehensive of a possible alternative method for financing the Second Plan. New Delhi is not likely to be impressed by the World Bank's warnings about the size of the Plan. Despite threats of withdrawal of foreign aid or loans, the Second Plan may not be reduced in size. It will, then, involve measures aimed at further mobilisation of internal resources. This can only mean a substantial increase in taxation. Such tax fears are not entirely groundless. Nor is it unreasonable for equities to remain depressed under the threat of more taxation.

New Issues

Immediately, the quiet trend in stock markets is a reflection of conditions in money and new issue markets. Though the busy season has not yet started in full swing, the money market remains tight. Bank deposits are growing. But the demand for funds is exceeding available supplies. This is a healthy feature. It means that banks are financing industry's short-term requirements. But it also means that there is less surplus cash available for employment in stock markets. This is one of the reasons why speculative activity remains poor. Even investors have to depend on bank loans to finance their purchases of equities. Not only speculative, but investment activity also remains stagnant.

Some promising new issues are in the offing. Guest, Keen, Williams and the re-organised Lever concerns in India will soon be entering the new issue market. In the near future, Indian Iron Company will offer the right issue. There may not have been liquidation of cash scrips by prospective subscribers of these new issues. But many investors are not taking any interest in stock markets at the moment so as to have the necessary funds for subscribing to these new issues.

Quiet Trend

Though the coal strike is almost over, expectations about the end of the coal strike have not materialised. It was hoped that the end of the coal strike will enable industry in and around Calcutta to function again at top gear, and that this would have a "bullish" effect on Lyons Range. Neither Miscellaneous nor Engineering shares are responding favourably to the near-end of the coal strike. These shares, along with equities in general, remain stagnant at lower levels because of the deeper influences in operation.

Around Bombay Markets

Why No Statistics of Unsold Stock?

Thursday, Morning

THE behaviour of equities, to say the least, has been utterly disappointing. Even when prices were declining at an even pace in almost all sections of the market, no attempt was made to halt the downward trend. In fact, confirmed bears were anxious to see the market sink still lower. At times of technical correction, they did not hasten to cover. The small technical rallies, therefore, could hardly appear before the market again succumbed to liquidation.

The reasons for the all round depressed sentiment are not far to seek. In the first place, the market has yet to recover from the shocks administered by the Government's textile policy. Despite the concessions since given by way of rebate in excise duty and the extension of the benefit of this concession to March 1957, the situation has not improved. In fact, an intriguing development appears to have followed these concessions, namely, the accumulation of cloth stocks. Now that some concessions have been given, mills and merchants have come to believe that they can get some more and are naturally eager to take advantage of the situation. For this reason, they are naturally reluctant to part with their stocks.

Assuming that there is an accumulation of stocks of cloth, it is pertinent to ask why such a development should be allowed, not to speak of being encouraged, at a time when the Divali demand for piecegoods is at its peak? Are not, the authorities indirectly encouraging accumulation of stocks, just when stocks should move fastest? A direct consequence of cloth accumulation is the decline in demand for cotton, with resultant fall in prices. Trade circles contend, of course, that there can be no lasting solution to the textile problem unless the increase in excise duty is removed altogether. Is the Government also moving toward this point of view?

Meanwhile, it is high time some one asked whether there has actually been an accumulation of cloth stocks and if so, why the interests, whether they are associations of millowners or merchants, who are extra prompt in confounding the public with voluminous data on how mills or merchants are being mulcted, do not disclose the actual stock position? In fact, it is surprising in the extreme and also suspicious that at a time when the publication of these very figures would be in their own interest, they should continue to keep every body guessing about the exact stock position.

This depressing sentiment in the stock market is hard to reconcile with the much advertised inflationary potential of our development programme. Normally an inflationary price trend is just what the stock market needs as a stimulant. Does the present phase of pronounced depression indicate that there is no need to be apprehensive about inflation? This might be a bearish point for the market but would be welcomed by others.

The sentiment appears to have been deepened during the week by fears of a rise in the Bank Rate. Money, which is already tight on the eve of the busy season, is bound to be much tighter in the weeks to come, and the steady decline of the speculative conversion Loan in the gilt-edged market only confirms these apprehensions. There was an all round decline in equities towards the close of the week, and new bottoms were touched by several scrips. This is proof if it were needed, that confidence is at a very low ebb.

Premier Auto Shares

In the Steel Section, after touching a high of Rs. 194 Tata Steels closed on a weak note at Rs. 191. About Indian Iron also, there was uncertainty. Whilst kerb quotations were moving up, actually there was selling pressure and the shares tended to rule around lower levels. Tata Locomotives, however, continued to be steady in anticipation of a maiden dividend of Rs. 6. These shares have long term attraction and should do well. Premier Automobiles also moved up to Rs. 110 in the course of the week on the expectation of a dividend of Rs 6. These shares will be quoted in the forward section of the Bombay Stock Exchange from next week. Meanwhile, there are reports that the Company is contemplating issue of Rs 2 Crores 6% taxable 10-year debentures.

Cotton

Expected Divali Gift

Cotton futures suffered a veritable landslide in prices during the week under review. Although at the start it looked as if a recovery movement was in the offing, sentiment soon changed and before the close of the week, both the ruling contracts suffered a severe setback of nearly 15 points.

The concessions given to the mills appear to have made the market wish for (if not ask for, like Oliver Twist) more. Sentiment in the event has been considerably affected in view of the hesitancy on the part of mills and traders to go in for more cotton just now. Reports are current in the market that export quota will be announced soon and the export duty will also be revised downwards. It is believed that this will come as a Divali gift for the market, if not come earlier.

Ominous Rumour

Some interesting details are now available about the import of U. S. cotton. Although it is nearly two months since the agreement was signed for the import of U. S. surplus farm products, the procedure for import has not yet been made available. Latest feelers from New Delhi suggest that these details may not be available for some more time to come as there has been some hitch in Washington over this issue. It is reliably understood that the authorities here insist on shippers in India buying a certain proportion of American cotton for the benefit of importing a given quantity of East African cotton. The ratio, it is reported would be 1:1. It is wellknown that the lion's share of East African cotton production is consumed by India. Now if the reported linking of East African with U. S. surplus cotton imports is true, it would naturally prevent India from going in for East African cotton to the same extent as she has been doing hitherto. This is a snag which shippers here may not quite welcome.

* Loans are made (a) to the member or (b) to a political subdivision or a public or a private enterprise in the territories of the member with the member's guarantee.

Printed by A. Fernandes at New Jack Printing Works Private Ltd., Globe Mills Passage, off Delisle Road, Bombay 13 and published by him for Asian New Age Publishers Private Limited. from 15, Tamarind Lane, Fort, Bombay 1 Editor: Sachin Chaudhuri.

Egyptian soil. *Immediately, the proposed* international force will be engaged in the task of implementing the terms and conditions of ceasefire. *As neither* Israel nor Britain nor France is technically at war with Egypt, the proposed international force can, and should, *immediately after the implementation* of ceasefire terms, proceed to tackle the problem of evacuation of foreign troops from the *Egyptian soil.* Both the immediate and subsequent tasks of the international force will be facilitated by its complexion and composition, as formulated by the U N Secretary-General. Mr. Dag Hammarskjoeld is right in emphasising that the proposed international force should not be composed as it was in Korea, or as an Anglo-French "police" force, as suggested by *Britain and France.* It will be a force of the United Nations. It will be under the command and authority of the United Nations *so that* it can act independently of the policies of any one nation.

It would be idle to pretend that, with cease-fire, all the problems *will be easily solved.* Main tasks of the United Nations will be to evolve correct solutions for the political problems which now plague *West* Asia. Loss of moral prestige of Britain, France and Israel is far less significant than the crucial question of *the future of the United Nations.* In the urgent tasks that lie ahead, the United Nations can now depend on the combined moral authority of Russia *and the United States.* Moscow has already expressed its willingness to co-operate with America and other member-States to ensure peace in West Asia as well as to facilitate a negotiated settlement of issues in dispute. With President *Eisenhower's* victory in the elections, Washington is now in a position to make its influence and authority felt in the interest of peace. Small *member-States* have shown admirable unity in their efforts to attain and to maintain peace. With the support of two of the major world powers, with the *united co-*operation of small powers, the United Nations will not be without *authority* to ensure peace and justice. This should be an encouragement to the United Nations to be firm in its determination and efforts to *ensure world peace.*

Two major problems will confront the United Nations in West Asia after the fulfilment of the immediate tasks. One is an agreed solution of the Suez Canal problem. Egypt's sovereign rights and interests over the Canal are beyond dispute. Until the blockade and closure *of the Canal through* Anglo-French military action, Egypt had been successful in keeping the Canal free for traffic. There can, therefore, *be no doubt* about Egypt's ability to operate and maintain the Canal. Egypt was within her rights in nationalising the Suez Canal *Company.* But the only wrong that Egypt has done is to refuse freedom of navigation *of* the Canal to Israel. This wrong *will have* to be righted. Britain's claim for permanent western authority and control over the Canal cannot be accepted. But Egypt must *concede that the* users of the Canal have rights and interests. These rights and interests can be protected by Egypt's agreement *to co-operate with* a wider and representative Canal Users' Association to be established under the auspices of the United *Nations.*

With Egypt's acceptance of the principle that the Canal must be independent of the policies of any nation, it should not be difficult for the United Nations to evolve an *agreed solution* of the Canal issue. No less urgent is the solution of the Arab-Israeli dispute. Israel is not without blame. But it is abundantly evident that Arab States *must accept* Israel *as* a sovereign entity. Good may yet come out of evil. If the hostilities in Egypt facilitate an amicable agreement between Israel and Arab States, the United Nations will succeed in attaining permanent peace *in* West Asia. Rehabilitation of Arab refugees is a condition of any agreement between Israel and Arab States. This is a task which Israel cannot *undertake* without massive international aid but Israel cannot escape responsibility for the Arab refugees either. Egypt and her Arab neighbours have a grave responsibility. By recognising Israel, Arab States can not only live in peace, but can free West Asia from western domination. This is a desirable goal which can be achieved through *amity* with Israel. In hoping that Egypt and Arab States will have the statesmanship to accept the realities of the situation, informed world *opinion* will expect that the United Nations will have the authority and the determination to ensure justice to Egypt and Arab States as well as to assure West Asia freedom *from western political and economic* domination.

The Hungarian Imbroglio

IF Tito and Gomulka prove that the Kremlin is no longer the *Vatican* of the Communist world, developments in Hungary indicate that Moscow is not reconciled to losing its temporal authority over *Eastern Europe.* This is clear. But to accuse Russia of aggression in Hungary, or to draw parallels between the use of Russian troops in *Hungary* and the Anglo-French military operations in Egypt, is to be guilty of confusion of thought. Moscow has been clumsy in its dealings with Budapest. Russia's clumsy behaviour reveals Moscow's lack of touch with events in Eastern European countries. It was wrong tactics of Moscow not to lend massive military support to Imre Nagy when he first appealed to the Red Army for help. That tactical error lends weight to the accusation that Moscow has been arrogant in its later decision to use force in Hungary. Cynics will wonder why Moscow has been undiplomatic in its reaction to events in Hungary. It would not have been *difficult for* Moscow to use the forces of some Communist Eastern European States, or to use the Warsaw *Army,* to crush the rebellion in Hungary. America has adopted such devices in Latin American countries to oust regimes hostile to *her. Russia* has connived at the Czechoslovak arms deal with Egypt.

What prevented Russia from exploiting such devices in Hungary? *One possible* assumption is that Moscow has taken a firm decision that it is imperative to indicate Russia's policy to Eastern European *States clearly* and without any shadow of doubt. It is abundantly evident that the Kremlin has reached the decision that Russia's neighbouring Eastern European States cannot be allowed to disown their allegiance to Communism. This is the conclusion that is being drawn *in the west.* It is not a hasty conclusion, but it is not the whole of the story. No doubt, the military experts of the Kremlin have convinced *Moscow* of the dangerous implications of the re-establishment of non-Communist regimes in Russia's neighbouring countries. Moscow had two choices. It could allow Hungary to go non-Communist. Alternatively, it could use force to crush the counter-revolution. It has decided on the latter course of action because of the grave risks involved in the policy of withdrawal from Eastern Europe. These risks are not only grave, but real.

Before the establishment of Communist regimes in Eastern European States, these countries were dominated by Catholics and feudal-cum-military regimes. Both these socio-political elements are not only bitterly anti-Communist, but also opposed to Socialism. Most of these States were, before the establishment of Communist regimes, dominated by small peasant proprietors. Russian withdrawal from Eastern European States will inevitably lead to the re-emergence of these conservative, anti-Communist, anti-Socialist, anti-Russian elements. These pose grave problems of security for Communist Russia. Such a socio-political make-up in Eastern Europe will tilt the balance of world power decisively against Communist Russia. Only biased observers will deny that these were the reactionary elements which were emerging in Hungary. Imre Nagy not only lost control of the situation, but reactionary catholic and small-holders' parties were prompt in exploiting Nagy's Communist associations to serve their ulterior designs. With NATO, with the constant threat of the revived military might of Germany, Russia could not be expected to tolerate the emergence of such hostile States as her neighbours. There is not the least shadow of any doubt that Russia's later decision to use force in Hungary has been influenced by its determination to crush the counter-revolution in Hungary. On this interpretation, it was a major tactical error for Moscow not to use the maximum force first when Nagy sought the help of the Russian troops stationed in Hungary under the Warsaw Pact.

Russia is prepared to tolerate Tito and Gomulka, but not any reactionary, bourgeois regime in *any* of the Eastern European States. Such a regime will constitute a military threat to Russia. But it is arguable that even a bourgeois regime in Hungary could not be a threat to Russian security had such a Hungary been neutralised like Austria. This raises the problem of extensive subversive propaganda by America in Eastern European States. It is apparent that massive American budgetary appropriations for such anti-Russian propaganda have had some intended effects in Eastern European countries. Even so, would it not have been wiser for Moscow to let Eastern European States choose their forms of government? It will no longer be possible to answer the question whether it would have been in the ultimate interest of Russia and of Communism to show such tolerance so that even such reactionary countries could have been won back to Communism in the long run. This is not an unimportant issue. But it is an issue on which judgment must remain suspended. Those who prefer faith in democracy and Socialism will be more interested in immediate developments in Hungary. That Russia had to use force to prevent the emergence of a reactionary regime in Hungary will be deplored. Though the government that has been formed by Russia is suspect, it has not started badly. It has reiterated Hungary's demand for an equal status with Russia. In aligning itself with those who have been critical of the past Communist regime it has shown its readiness to democratise the administration. Aims and objectives of the regime put up by Russia are not dissimilar to those formulated by Gomulka. If it is allowed by Russia to implement its objectives, the world may yet have an opportunity for a proper re-appraisal of the Russian policy to her neighbouring Eastern European States.

You're safe with a

Standard

Because the STANDARD Battery is so good, its makers do not hesitate to give a genuine twelve-month guarantee with every car battery that's sold

A battery is only as good as its components; we therefore make every component in our own factory. To ensure uniform high quality, we conduct a number of tests every step of the way—from raw material to finished product—in what is the largest national battery manufacturing plant in India.

'Standard' pioneered the use of long-lasting hard rubber containers for batteries. And the use of synthetic separators gives maximum life to *your* STANDARD Battery.

Weekly Notes

Asian Socialists

ASIAN SOCIALIST CONFERENCE in Bombay, the UNESCO Conference in Delhi, American elections and the A I C C session in Calcutta, not to speak of the Suez or Hungary, what a crowded week it has been. The Socialist Conference has been fairly well attended. And most countries have sent delegates but Suez interfered with the passage of some of them e g the Egyptian delegation, which put the convenors in somewhat awkward position as Israel had sent a strong contingent. That the Prime Minister of Burma could find time to attend this conference and that the Prime Minister of Ceylon is joining it, though at a later stage, shows another source of weakness of the Socialists, viz their very uneven strength in the different countries of south-east Asia. But it also shows, the proceedings particularly, the very useful sub-committee meetings and interchange of information, how keen is the desire of the Socialists of these countries to know one another and to learn from one another. They are learning from experience but it is a costly and time consuming process. But the education has begun, the first lesson being a shift in emphasis from distribution to production

Nationalist aspirations and dream of industrialisation, both for winning self-respect, position and strength and for solving urgent economic problems are a common feature of the Socialists of all these countries. But while the desire to know one another is keen and there is no lack of goodwill, the stage has not come yet for working out a common programme or even to attempt any kind of co-ordination in the planning of their respective economies even in the countries in which the Socialists are running the Government. So the Bandung spirit has yet to take shape; it will take long to achieve anything tangible.

The dilemma of the Praja Socialists came out acutely as the Conference, as was natural, was more excited over Anglo-French aggression in Egypt than any other issue. Pandit Nehru, as usual, stole the thunder by calling for measures for checking aggression which would be swifter than aggression itself. This was naturally also the key-note of the Burmese Prime Minister's address to the plenary session.

The American people have improved upon their performance in the last election. They voted a Republican President with a much bigger majority than ever before and at the same time gave a stronger and clearer majority to the Democrats in the Congress returning 229 Democrats to the House of Representatives with 7 seats still to be decided when only 208 were needed to give them control; even in the Senate, Democrats have won one more seat than the Republicans. This hardly makes sense to those who habitually think of Parliamentary Government in terms of British practice, but there it is and as explained by our U S Correspondent in the last issue, triumph of personality in American politics cuts across party alignments.

Foreign Exchange Cut

Our Delhi Correspondent Writes:

THE Suez crisis and the foreign exchange shortage are worrying the economic experts of the Government. The two difficulties, however cancel out, upto a point. On the other hand, their cumulative effect on development plans may be disastrous. The paradox is easy to explain. The drain on India's sterling balances has been of the order of Rs 155 crores during the last 7 months. Government would now like to keep a total reserve of Rs 500 crores or thereabouts in the Banking and Issue Departments of the Reserve Bank. That leaves no more than four months' supply at the current rate of withdrawal. The position is as serious as that. The Suez crisis has tended to raise costs. Freight charges have gone up by 15 per cent. Diversion of shipping via the Cape will increase freights much further. Insurance rates are higher. All told, if conditions created over the past week persist for a year, India may have to pay £30 million more for her anticipated imports by way of ancillary charges during the next one year. This is, of course, subject to revision and the Finance Ministry is keeping a close watch.

The general increase in costs of imported machinery and capital goods owing to the international tensions would undoubtedly increase the strain on India's foreign exchange resources. At the same time, the total volume of imported supplies might diminish precipitately, owing to the inability of manufacturing countries to meet or honour orders. Therefore, the net result may well be a reduction of the foreign exchange expenditure. The effect of such reduction on the development plans would of course be to slow down their tempo. The execution of public projects is just gaining momentum. A reallocation of priorities will not be easy as essential projects alone were included in the Second Five Year Plan on account of the shortage of resources.

Apart from applications for loan from the World Bank, the Government of India may try to enter into an immediate stand-by agreement with the International Monetary Fund for drawing more than 100 million dollars this year. India can draw upto 400 million dollars from the Fund under its constitution but not more than 100 million dollars can be drawn in any one year. It is, however, possible that the Fund may relax this condition as a special case. It must be stated in this context that the distinction between non-dollar and dollar areas has ceased to be of significance in India's trade economy. The country's adverse balance of payments with the sterling area has been much greater than with the dollar area.

The Ministry of Finance has therefore suggested a series of drastic measures to meet the foreign exchange crisis. There is also talk of imposition of controls to meet possible shortages of steel, cement and petroleum products. Decisions were taken last week on some of these proposals at a meeting of the economic secretaries. No licenses will be issued for the import of machinery of the value of more than Rs 10 lakhs unless the applicant has made arrangements for deferred payments. Preference will be given to importers whose orders are likely to mature after six months. Heavy imports of machinery has been the principal reason for the drain on foreign exchange reserves. A quota system may be introduced for the import of iron and steel, importers being allowed less than 10 per cent of what they imported during the preceding year. The foreign exchange allowance for tourists may be cut. Imports of paper, rayons and luxury goods, like big passenger cars, may be eliminated altogether.

Higher Targets and Co-op Farming

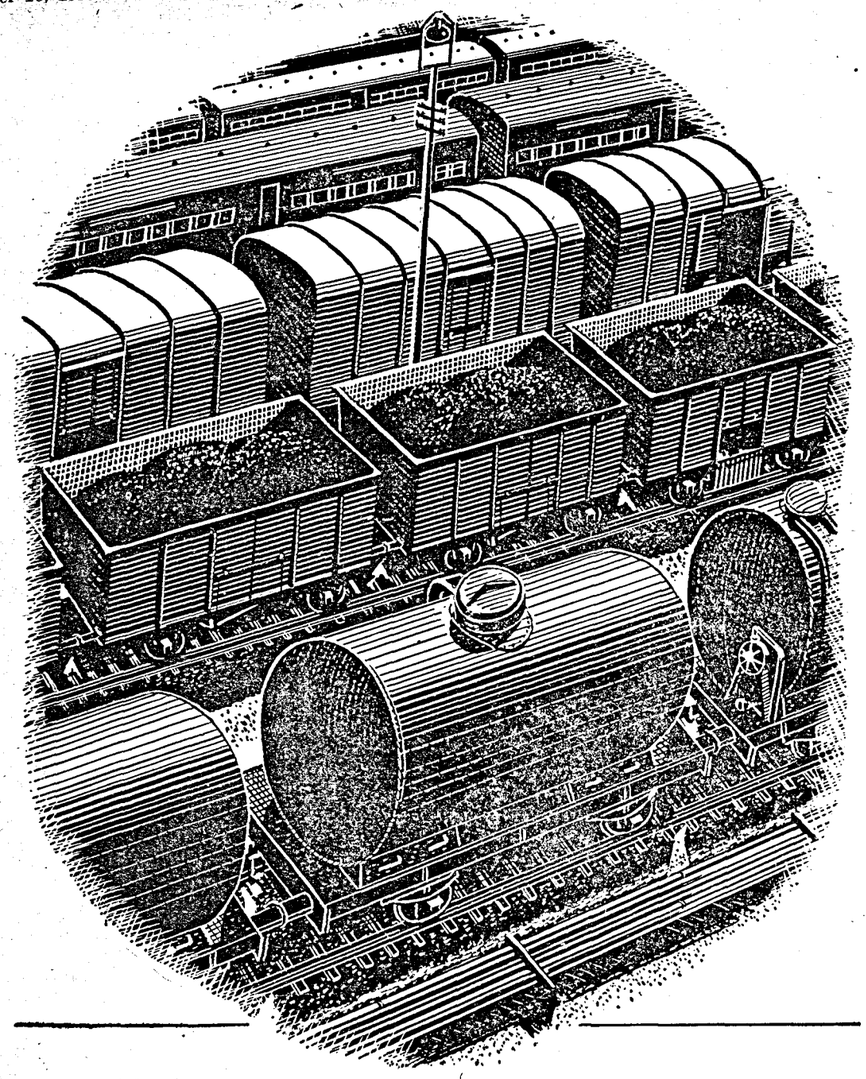
A CONFUSING controversy has been raging off and on ever since the National Development Council, at the instance of the Prime Minister, wanted the target for agricultural production to be raised without any further or substantial increase in the investment for the purpose. At the Conference of the State Agricultural Ministers which met at Mussoorie to discuss the subject, the Union Minister of Food and Agriculture appears to have achieved this miracle literally by a stroke of the pen at the last minute. The printed copy of Shri Ajit Prasad Jain's speech read: "We have come to the broad conclusion that the production of foodgrains can be increased by 13.5 million tons in 1960-61 over 1955-56 as against the figure of 10 million tons proposed in the Second Five Year Plan". This was corrected in ink and 16.5 million tons substituted for 13.5 million tons in the above passage.

Further, the proposed increase of 3.5 million tons over the Second Plan target of 10 million tons, proposed in the printed version, was to have been obtained as follows:

	(million tons)
Seed multiplication	1.9
Minor irrigation	0.7
Fertilizers and better use of manure	0.9
	3.5

Since these figures total up to only 3.5 mn tons, to Shri Jain's printed speech, the following words had been added in ink "and the balance may be obtained by the general improvement in agricultural practices". To this our Delhi Correspondent commented "How this 'general improvement' is to yield as much as 3 million tons when schemes for which firm resources totalling Rs 115 crores are being allocated will, in all, account for only 3.5 million tons passes comprehension" and accused Shri Ajit Prasad, not unfairly, of juggling with figures "without regard to their relevance to facts".

In a Press note issued by the Planning Commission this week, the revised target for foodgrains production has been put at 80.4 million tons, as against 75 million tons in the Second Plan and the target for agricultural production as a whole raised from the 17 per cent increase proposed in the Second Plan to 27.8 per cent. The Note is otherwise exhaustive but does not say much about the increased outlay that might be necessary for achieving the higher target, nor does it give a breakdown, by sources, e g use of better seeds, fertilizers or irrigation etc, from which this increase is expected to come. Another omission is the absence of any reference to co-operative farming. This is particularly significant since later in the week, inaugurating the National Co-operative and Warehousing Board, Pandit Nehru categorically held that without it—he called it 'agrarian co-operatives'—India's No 1 problem, which is food production, cannot be solved. Barring these not unimportant omissions, the Note is illuminating in that it presents a clear cut picture of the expected development in the field of agriculture, community projects and national extension.



Based on Production Potential

TO begin with, the need for raising the target is based on the increased demand for agricultural production that is bound to arise from the "the programme of industrialisation under the Second Five Year Plan with its special emphasis on heavy industries" and the corollary following from it viz "if internal production was not adequate, price levels would rise" and that "it was vital that in the course of the next two or three years, agricultural production should be raised to a level at which it could make up the present shortage, meet the demands of the growing population and those generated by large development expenditures and also provide a small surplus for export".

When acreage under different crops is left to fluctuating prices and seasons and no more than a general effort at improvement is intended, it is misleading to fix targets too precisely. Even so, it is curious that the Planning Commission has assigned no reason why it rejected the estimate of demand for food grains made both by the Ministry concerned and the author of the Draft Plan-frame, independently of each other, it appears, at the same figure of around 10 million tons.

Perhaps wisely the Planning Commission refrains from attempting any statistical estimate of the increased demand that is likely to arise, except in the case of some cash crops like cotton for which the target, we are told, has been proposed by the Indian Central Cotton Committee in consultation with the State Representatives in view of the requirements of the textile industry. For food production, however, despite what Professor Anjaria used to call in the old days a ritual reference to general equilibrium, the Planning Commission concerns itself only with what it considers to be possible. As is well known, the statistical basis for the estimate is still non sequitur. (See Larger Yield in the Community Development Areas?'—A Review of Rabi Crop Estimate Survey 1954-55 carried out by NSS, in the issue of October 6, 1956). "When the planning for consumption goods is production potential-oriented," the reviewer had concluded, the coincidence between the target fixed at Mussoorie and the results claimed for this survey—both being a 25 per cent increase in the food production—do not appear to be merely accidental. At least the revised target for foodgrains does not depart from this basis. The revised targets of additional agricultural production in the Second Plan are as given below.

Commodity	Unit	Estimated production 1955-56 (as given in the Plan)	Targets in the Plan	Revised target	% increase: In the Plan	% increase: As revised
Foodgrains	million tons	65.0	75.0	80.4	16	24.6
Oilseeds	million tons	5.5	7.0	7.6	27	37.0
Sugarcane (gur)	million tons	5.8	7.1	7.8	22	33.9
Cotton	million bales	4.2	5.5	6.5	31	55.6
Jute	million bales	4.0	5.0	5.5	43	58.1
Other crops	..	..	..	..	9	22.4

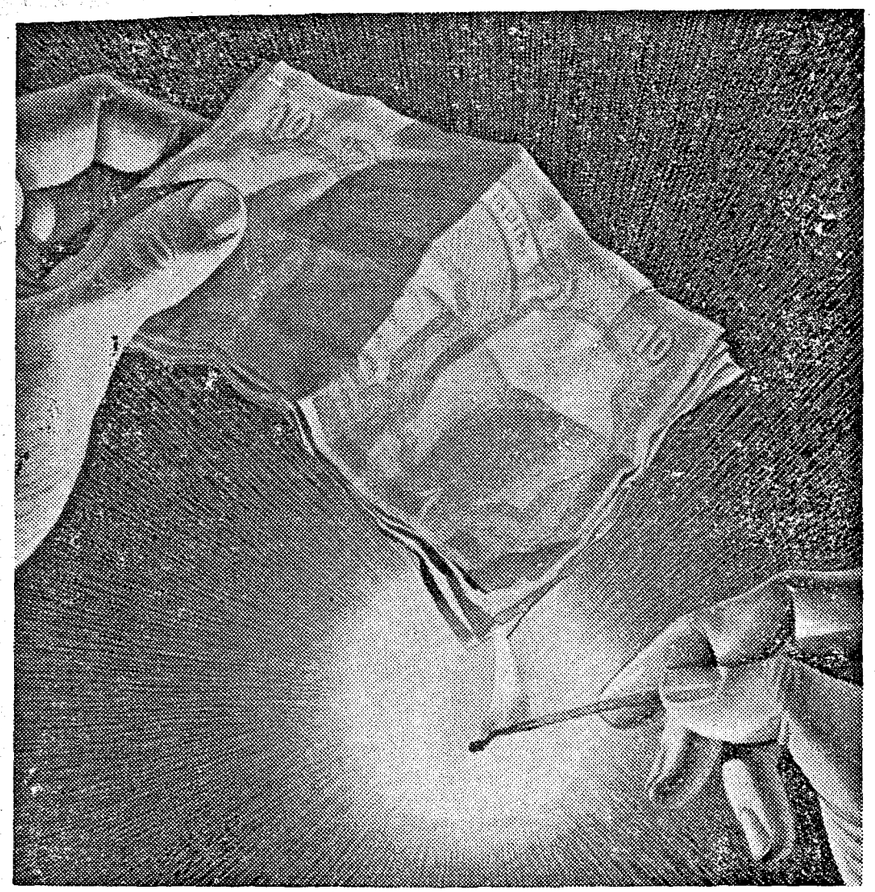
Equality in Capital

International Bank for Reconstruction and Development. Eleventh Annual Report 1955-56. Pp 56. Appendices A to M. Pp 59-75.

THE World Bank has completed ten years of operation. It has so far lent $ 2,720 million to 42 countries and territories through 150 loans. (See Current Statistics in the last issue of this paper.) The most notable thing about the ten year record of the Bank is the larger proportion of funds that have been made available to Europe, the share of which is more than the combined total received by Asia and Africa. A partial explanation for this lies in the fact that post-war reconstruction called for a large amount of funds from Europe during the earlier years of the Bank's operations. Countries like Burma, Indonesia and the Philippines which suffered damage from war in Asia could also of course have qualified for the Bank's attention, but for the fact that they were dependencies.

Another consideration in this respect was the undoubtedly greater credit worthiness of European countries—a point which is not to be belittled, since the Bank is after all not a relief organisation. In view of past complaints that the underdeveloped countries have not been receiving a fair share in the funds loaned by the Bank, it is interesting and one should say satisfying to note that of the $ 396 mn loaned in 1955-56 Asia has received 166 mn, Africa $ 115 mn and the Western Hemisphere (Latin America) $ 75 mn. While Europe has received only $ 40 mn, six of the recipient countries Algeria, Burma, Guatemala, Haiti, Honduras and Lebanon are new borrowers to whom the Bank had not lent previously; together they have received $ 81 mn during the last year. Taken in conjunction with Mr Black's speech at the last annual meeting of the Bank, the trend of operations established during the final year of the first decade of its operations suggests that the underdeveloped countries would be receiving increasingly greater attention from the Bank compared to past years.



Net of refundings and cancellations, of the $ 2,667 mn loaned during the decade as much as $ 2,170 mn was advanced for development as against $ 497 mn for reconstruction which went entirely to Europe. Under the head Developmental Loans, power generation and distribution and transport together account for $1,445 mn. This is in keeping with the Bank's policy of widening bottlenecks and creating social overheads in the economies of recipient countries. Of the $ 656 mn advanced for transport, railway development claimed $ 348 mn or more than 50 per cent and road transport came second with $ 163 mn. The largest share of transport loans, amounting to $ 247 mn went to Latin America, Asia and Africa being next in order with $ 128 mn and $ 125 mn respectively. Latin America took the largest share at $ 312 mn of the loans for electricity, Africa being second at $ 178 mn and Asia coming third at $ 136 mn. The large share of the loans given to Latin America is accounted for by the rather severe shortage of transport and electric power in those South American countries which witnessed a rather hectic period of industrial growth from 1950 to 1952.

Among loans made available for industry, the most conspicuous is that of $ 75 mn to the Tatas in India for increasing their steel capacity. This is, according to the Report "the largest yet made for industry and also the largest for any purpose in Asia". Surprisingly enough at first sight, loans for agriculture and forestry constitute the smallest items in the portfolio of the Bank; their total share amounts to only $ 228 mn or about 10 per cent of the aggregate. Of this, Asia got only 18 per cent, Australia 40 per cent, Europe 22 per cent, Latin America 20 per cent and Africa nil.

While it is true that purely from the view point of needs, Asia and Africa should have received greater assistance it is also to be remembered that a large portion of the agricultural output in these two continents is for subsistence only and it would take a long time and a lot of effort to convert their subsistence agriculture into a credit worthy proposition. In this respect, Latin America is much better placed, since a considerable part of her agricultural output is raised for commercial purposes.

That the credit worthiness of the guranator or the receiving country is the decisive factor in advancing developmental loans is apparent from the fact that of the funds loaned to each continent during 1955-56, a rather dis-proportionate share has gone to a few countries only. Of the $ 115 mn made available to Africa in 1955-56, 105 mn went to South Africa, Rhodesia and Nyasaland. In Asia of the $ 166 mn advanced during the same year, as much as $ 75 mn went to India. The story is repeated in Latin America, where Colombia, Mexico and Brazil have received more than 3/5ths of the loans advanced to the entire Western Hemisphere during the last ten years. As in the field of banking within a country where it is extremely difficult to suggest prescriptions for changing the pattern of bank loans, it would be expecting a little too much of the Bank to relax what it considers to be its criteria for advancing loans. But it can certainly be suggested that just as, for instance, the Reserve Bank of India has recently initiated a programme of vitalising the co-operative movement, similarly the International Bank should also initiate comparable steps to salvage at least those countries which are either just on the margin or just below the margin of the ranks of the creditworthy.

This brings us to another important aspect of the Bank's activities. As an international institution it is not part of the Bank's functions to transform a country from a state of non-creditworthiness to one of credit-worthiness. It has, however, helped a number of countries which could be said to be on the margin to prepare programmes of economic development. In most cases it has sent out technical-cum-economic missions; in the case of others like Colombia, Ecuador, Guatemala, Honduras, Nicaragua and Panama, as of them in Latin America, it has posted resident representatives to assist the countries in dealing with development problems. It does not seem that borrowers outside Latin America are too eager to have them, which is just as well.

Penny-wise, Pound-foolish!

PERSONS WHO ARE 'penny wise—pound foolish' inevitably come to grief. They stint and save in the wrong way. In consequence they pay a heavy price for their follies. In health matters, at the first sign of trouble, do not try to save by buying quack remedies, "cheap and nasty". You cannot afford to ignore the consequences of such a step.

ACW.PR.56.6.

Commonsense of Labour Cost

Rejoinder by **M Srinivasan**

FOR all his promptitude and pomposity, Mr Sen, in his reply in the issue of October 20 ('Labour Cost .... of Common Sense'), succeeds only in revealing his weaknesses in still bolder relief and his clarification of the points to counter my objections has exposed the chinks in his armour. It is clear from his reply that he has given in on major issues either by making distinctions without difference or by denying what he had maintained in his first article. The pity of it all is that he did it unconsciously as I would try to show below.

I had thought till Mr Sen came out with his new definition of opportunity cost that he had only misstated that principle. But now I must correct my earlier impression. Mr Sen has not only misstated the opportunity cost theory but also misunderstood it completely; otherwise he would not have tried to reconcile the irreconcilable as he has done by maintaining that by opportunity cost one may also refer to alternative marginal productivity. This is something which is terribly confusing. Opportunity cost, in its simple form, means that the value of labour input is determined by what it would earn in its alternative use. How does the marginal productivity come in? When the firm employs a labourer it is primarily concerned with what it has to pay to him and the productivity of the labourer comes only afterwards. That the factor—income is equated to marginal productivity is a special case where the firm tries to maximise its profits. To take out this special case and to fit in it the generalised version of opportunity cost principle because it suits Mr Sen's thesis is anything but sound economics. The only interpretation that is based on commonsense is that the opportunity cost refers to alternative factor-earnings and nothing else, and this would have been clear even to Mr Sen, had he not bidden good-bye to commonsense before reading my reply. I don't therefore accept Mr Sen's contention that both the definitions are possible, although I can understand his anxiety to compromise on this issue.

When Prof Lewis and Nurkse state that the cost of labour in new investment is zero, what they in fact mean is that the additional cost of labour consequent on the shift of disguised unemployed to new investment is nil. This is because they assume that alternative earnings of labourer have to be equal to his present consumption. In Mr Sen's case the additional cost of labour is positive. But the point which escaped Mr Sen completely is that the relevant labour cost in both the cases is given by the opportunity cost and as such, his method of valuation of labour does not differ from the principle of opportunity cost. In fact, both mean one and the same thing. Had Mr Sen carefully read Prof Lewis's writings, he would have himself realised that his plea for valuing labour differently was quite unnecessary, to say the least.

Mr Sen further argues in the same context that "his point is not dependent upon the theory I criticise being called the theory of opportunity costs". This is simply marvellous! Any reader who has cared to read Mr Sen's first article will agree with me that the edifice of his argument is based on how labour is valued. But for those who have not read his original article I reproduce the relevant para.

"(1) The relevant industrial cost of labour from the point of view of development and growth is given by the increase in consumption due to the transfer from disguised unemployment to gainfull occupation where the disguised unemployment is the main source of labour supply. The opportunity cost of labour is a valid guide only when we are interested in the immediate rate of income and not in the rate of growth of income". I have tried to show in my previous article that because the disguised unemployed has his reserve price, he would not move to new investment unless he is assured additional consumption which Mr Sen calls "a relevant industrial cost". But then it is nothing but the opportunity cost which the labourer desires to get. Thus it will be seen that if the "opportunity cost" of labour is not a "valid guide" from the point of view of the rate of growth of income, then surely the relevant industrial cost of labour in terms of additional consumption also will be an equally invalid guide. How can Mr Sen then persist in maintaining that his so called point is not dependent on the theory of opportunity cost? Had it been really so, there would not have been any occasion for him to write an article at all. All this confusion in the mind of Mr Sen would have been avoided if only he had gracefully accepted the correct interpretation of opportunity cost which I gave in my first article.

Apart from this, that Mr Sen made his point dependent on opportunity cost was the main target of my criticism. His foray into the realm of opportunity cost, marginal productivity etc, besides being not valid, was irrelavant and his reference to to the writings of the big economists could achieve nothing beyond testifying to his reading.

Mr Sen hastens to add that the main core of his thesis, as I had stated it, "far from being the main core" of his argument is not "even something" he said. He also denied having maintained that the cost of labour is equal to the difference between the wage rate in new investment and his average consumption prior to his transfer. It is true that Mr Sen has not said all this while referring to valuation of labour in a developing economy; but when he brings in choice of technique and recovery, he clearly suggests that the cost of labour to society would be reduced to the difference between the new wage rate and his previous consumption under the conditions of full recovery which is nothing but the release of wage goods from the subsistence sector and as such in those conditions less capital intensive techniques would be socially profitable.

I therefore took that argument of his as it has a bearing on choice of techniques. To substantiate this I reproduce what he has said in this connection.

"But if he (the labourer) still does move, the relevant cost of labour would be less. This would have some interesting results. The more complete this is, the stronger would be the case for substituting less capital intensive techniques for more as the effective cost of labour to society would be less". Even his reply states the following. "I was however arguing for labour intensive production when it gave a higher rate of accumulation". It would thus

be seen that I did not distort in any way the core of Mr Sen's argument. To avoid all confusion, I had briefly restated Mr Sen's case in as simple words as possible so that it should be easily understood by the readers. But I must now confess that I had no idea then that a simplified version of his thesis was necessary even for Mr Sen's own understanding. Mr Sen also seems to be puzzled because of my expression "the additional cost of labour being smaller". When I first wrote it, I felt, out of my respect for the readers that I should not adopt the school teacher's approach in leaving nothing to the intelligence of the readers. The manner in which Mr Sen has tangled himself in that sentence makes me rather guilty of ignoring the fact that there is difference between readers and readers. I must therefore clarify what that 'smaller' really means. It will be evident from the relevant passage that I was referring to the additional cost of labour under the conditions where release of wage goods as a result of switch-over of labour to new investment has been fully realized. Obviously, therefore, additional labour cost would be smaller than in a situation where there is either partial release or absence of release of wage goods altogether.

Mr Sen also gives up his previous position as regards the Consumption Goods Multiplier of Prof Vakil and Brahmananda. Now he begins to feel when I drew him out, the multiplier would not operate because there would not be automatic release of wage good which can be mopped up only through taxation. That means Mr Sen seems to suggest that the so-called Consumption Goods Multiplier would be valid only if fiscal operations are coordinated with the transfer of labour from disguised unemployed. How can he then argue that the foundations of the Multiplier are dubious and that it is useless? Marginal propensity of self-consumption can remain low either as a result of the autonomous decisions of the labourer who stays behind or else it is kept at a low level by government; in either case, the value of the marginal propensity of self-consumption (mpc) should be small, if the multiplier is to operate and it is quite immaterial whether this is brought about by taxation or otherwise. This will spotlight that the distinction which Mr Sen wants to create is merely formal and his approach to the consumption goods multiplier differs from that of Prof Vakil and Brahmanada as much as *tweedledum does from tweedledee*. That is why I had pointed out that it would be wrong to condemn the consumption goods multiplier on the ground that it would not be operative in absence of non-release of wage-goods.

Mr Sen thinks that I criticised his arithmetical example which excluded any reference to the factor of "time" as I must have omitted to notice the 'net' in the expression "Net Product". Let me remind him that there was nothing at all in his example to show that he had considered discounted value of the output and discounted value of the wages to arrive at his net surplus per unit of output. Unless he states this assumption explicitly how can he expect me to go behind the inner recesses of his mind to find it out?

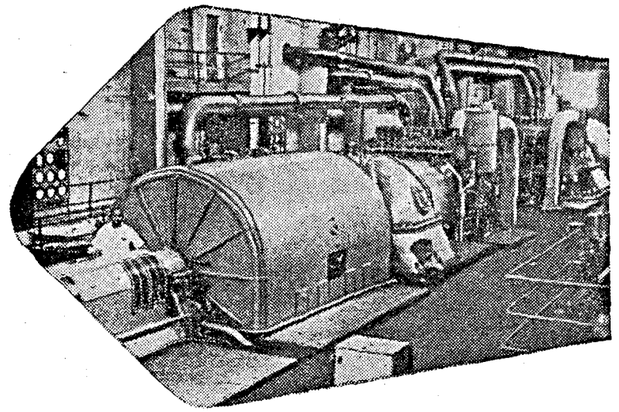
Having successfully pleaded his own case out of court, I was a little amused to find Mr Sen holding brief for Prof Das Gupta by pointing out that my criticism of the latter's note was not sound. In fact the points in which I had criticised Prof Das Gupta were different from those made by Mr Sen and so I would have liked him to dish out reasons for his belief. That would have at least enabled me to meet his criticism. However I feel sorry for Prof Das Gupta for having been talked into a court by a lawyer who himself has lost his own case.

Reply by Amartya Kumar Sen

ALL I want to say regarding Mr Srinivasan's preamble is that I am so glad to find Mr Srinivasan has lately been reading Prof D H Robertson.

(2) I am sorry to learn that Mr Srinivasan finds the definition of opportunity cost as the alternative marginal product of the factor "terribly confusing". As I pointed out last time, if we look at the problem from the point of view of social output (and not that of individual transfer-price), this is the correct definition of opportunity cost, as this gives us the amount of product society is sacrificing by having the factor employed here rather than somewhere else. Mr Srinivasan insists that the "only interpretation" must be the other one. All one can say is that it is a pity that Mr Srinivasan thinks so for others do not. (See for example Lerner, 'Economics of Control'; A E Kahn, Quarterly Journal of Economics, 1951).

(3) That my point is not dependent on "the theory I criticise being called the theory of opportunity costs" can easily be realized from the fact that it can be stated without bringing in "opportunity costs", at all into the picture. It has been claimed (among others by Prof Lewis and Prof Kahn) that in an economy with unemployment, labour should be treated as costless and hence the most labour-intensive technique should be chosen. My point is that even in an economy with unemployment ,the cost of labour is positive, given by the increase in consumption due to new employment.



(4) Mr Srinivasan quotes two bits from what I have said to prove that his account of the main core of my argument (summarised as "labour-intensive techniques would be more advantageous from the point of view of economic growth,, E W, October 13, '56), is not a distortion. The first quotation deals with the effect of rural taxation, when we do have such taxation, on the labour-cost and thus on the choice of techniques. The second quotes me saying that I have argued for labour-intensive techniques only when it gave a higher rate of accumulation. And from these, it is supposed to follow that Mr Srinivasan is right in assuming that I am arguing for labour intensive techniques in general. No comments.

(5) I do not see why Mr Srinivasan thinks I have "given up" my previous position regarding the "consumption multiplier". In my original note I pointed out that one can not expect the release of previous consumption of new workers, "unless the State intervenes with taxation, or with other incomeleakage mechanisms", (E W, September 29, '56). Thus Mr Srinivasan's triumphant remark, "Now he (i e, I) begins to feel when I drew him out, the multiplier would not operate because there would not be automatic release of wage goods which can be mopped up only through taxation", is difficult to explain.

(6) It pains me to learn that Mr Srinivasan did not get what I meant by "net product". The standard definition of net product includes being net also of depreciation.

As regards the validity of the so-called consumption multiplier, I refer Mr Srinivasan to my reply to Dr Brahmanand's note.

The Consumption Multiplier

Rejoinder by **P R Brahmananda**

IT is heartening to find the increasing extent of common ground between the viewpoints of Mr Sen and myself (E W October 20). Mr Sen holds that the working of the consumption multiplier would not tend to be automatic unless adequate fiscal measures are introduced to increase the extent of recovery of wage-goods along with the transfer of the disguised unemployed. In other words, the effective working of the multiplier depends upon the efficacy of governmental intervention with a view to reducing the value of mpc. It will, therefore, be seen that the foundation of the thesis of consumption multiplier is solid enough and there is nothing 'dubious' about it. Mr Sen's objection is to my treating the mpc in his illustration as being equal to ½. According to him, the mpc is 1, and it is because of fiscal measures that half of the above is recovered. Hence, he suggests that the generalised formula should be $\frac{1}{g+(dxqxmpc)}$, where q is the proportion of the previous consumption of the disguised unemployed not taxed away, instead of $\frac{1}{g+(dxmpc)}$.

Mr Sen further argues that in the formulation of the thesis of consumption multiplier, the need of adequate fiscal measures for increasing the extent of recovery had not been emphasised. As Mr Sen assumes that mpc is always equal to unity in the context of underdeveloped countries, his formula should read as $\frac{1}{g+(dxq)}$. Now q is nothing else than the proportion d available for consumption of the farmers. Is this not the same thing as the increment of consumption (self-) as a result of the increment of income? Thus, q is no different from mpc. In other words, to maintain that the smaller the q, the higher the value of the consumption multiplier is the same thing as to maintain that the lower the mpc, the higher the multiplier. It may be easily noted that there is no substantial point of difference between the approach of Mr Sen and that contained in 'Planning for an Expanding Economy', for, obviously, in the latter, the value of mpc would be as determined by the impact of monetary, fiscal and other measures. The emphasis is then upon a downward shift of the consumption (self-) function of the farmers;* assuming adequate fiscal measures, the value of mpc would have been reduced from 1 to ½. Thus understood, there is no need for prefixing *mpc* with a q, and on the celebrated principle of Occam's razor, this prefix of Mr Sen can easily be dispensed with. There is, however, an important advantage in the above procedure.

In a reference to the consumption multiplier—although in another connection—Mr Sen argues that the difference between the above and the Keynesian multiplier is that in the case of the latter, the process, according to him, would tend to be automatic. In other words, the smooth functioning of the consumption multiplier depends upon governmental intervention. Assuming, however, the framework of fiscal and other measures, the process would normally tend to be automatic even in the *case of the consumption multiplier*. Mr Sen, however, complains that there is nothing in my arguments to believe "that the rural population would save a significant part of their income as some members of the family move out". Mr Sen has missed the significance of the functional relationship between the effects upon mpc of the variations in the magnitude of the surplus of wage goods available with the farmers. The larger the surplus that is available with the farmers, whether through output expansion or through transfer of the disguised unemployed, the lower would tend to be the value of mpc. In fact, periodic climatic variations indicate that the variations in the marketable surplus are out of all proportion to the variations in the level of output. The main reason is that other conditions being given, there are limits to which it is possible to set up or to reduce the extent of self-consumption of foodgrains. The clue to the puzzle of the steep fall in farm prices a couple of years ago and the rising trend in these prices for a year and a half lies in the nature of the above relationship. If appropriate adjustments in the investment pattern can be made and adequate organisational measures are adopted, there is no reason why a substantial expansion in the output of farm products cannot be brought about so as to lead to a situation in which the value of mpc can be substantially reduced. To create the necessary conditions under which the working of the consumption multiplier can tend to be frictionless should be among the central objectives of economic policy if at all we are serious about obtaining a high rate of economic growth.

Techniques and Investment

Mr Sen apparently, has not followed the significance of liquid capital in the determination of the most appropriate techniques. The essential aspects of the illustration are reproduced below:—

	(in rupees)	
	Technique I	Technique II
Capital	100	100 (300)
Net Output	10	6-2/3 (20)
Wage-Bill	5	1-2/3 (5)
Rate of profit to the firm	5%	5% (5%)

(Figures in brackets indicate the values in Mr Sen's original illustration.)

Let us assume that the economy has Rs 100 which is available for purchase of fixed equipment and Rs 5 worth of liquid capital available for providing employment. If we purchase equipment suited to Technique I, then we shall be utilising Rs 5 worth of liquid capital. If, however, we choose to purchase equipment suited to Technique II, we shall be saving Rs 3-1/3 worth of liquid capital. The problem of the choice of techniques has to be considered in the context of the given situation in regard to the availability of real liquid capital. By choosing Technique II, the economy is in a position to utilise Rs 3-2/3 worth of wage-goods for adding to the rate of capital formation of the economy. If the consumption multiplier is introduced into the analysis, it is seen that the overall rate of investment in the economy in the case of Technique I would be 8-1/3%; and in the case of Technique II, it would be 11-2/3%.

* "If adequate mobilisation measures are undertaken and the farming sector is prevented from increasing its consumption, then automatically it will be induced or forced to sell in the market the wage-goods released as a result of the transfer". Pp 316 'Planning for an Expanding Economy'

Mr Sen has now dumped another animal into the pond. It appears that our conception of the working of the multiplier is based on certain types of assumptions in regard to lags. Mr Sen's point about lags is certainly not relevant to the main text of the argument. There is no reason why he should have any objection to the process if it implies lags. It is possible to work out the multiplier in terms of the process or the equilibrium analysis. This makes hardly any difference to the substance of the thesis. The important analytical point is that in an economy beset with limited quantities of surplus of wage-goods, the choice of techniques does affect the overall rate of capital formation in the economy. It has no effect upon the volume of short-period employment. (In fact, in a recent discussion in the **Economic Weekly** in connection with the choice of techniques, the problem of optimal utilisation of the given surplus available in the wage-goods sector was not brought to the forefront.)

Mr Sen has also mixed up the terms 'investment' and 'reinvestment'. What I do not understand is how Mr Sen could be averse to assumptions. In fact he assumed that we had neglected the need and impact of fiscal measures. Now he assumes that I complicated his simple illustration; that I maintained the rate of reinvestment would be higher in case of Technique II; and that I had not glanced at the figures of net output. As if all this was not enough, he assumes that somehow my refutation of his position depended upon my aversion to lags. May I point out that all these assumptions (not dubious, of course) have no justification whatsoever? In the first place, we never denied the importance of fiscal measures. In the second place, my illustration is a simplified version of Mr Sen's. In the third place, what was in question was the rate of investment in the economy and not the rate of reinvestment. In the fourth place, glances galore are not necessary when once the position is understood. In the fifth place, I have no aversion to lags and the latter has no relevance to the topic under discussion. Mr Sen's original argument was that if adequate fiscal measures for recovery were undertaken, there would tend to be a case for labour-intensive methods of production. His contention is, however, not valid, except under the assumptions pointed out in my note (E W October 13). Mr Sen concludes his note by pointing out that he argued for labour-intensive methods when they gave a higher rate of accumulation. This statement is interesting, valid in some other connection, but surely not relevant in the context of his articles, and the illustration contained therein and the assumptions underlying all the above.

Reply by Amartya Kumar Sen

DR BRAHMANANDA seems to forget that to say that a conclusion A is valid given an assumption B, is not the same as maintaining that any thesis, whatever its assumptions, is valid which arrives at the conclusion A. Thus inspite of my reference to the investment-creating effect of taxation linked with the exodus from the rural area, when such taxation is possible, my argument that the thesis of the "consumption multiplier" as presented is "dubious", remains unchanged. The "increasing extent of common ground" between his viewpoint and mine, which Dr Brahmananda refers to is, I am sorry to say, illusory.

(2) Dr Brahmananda criticises the idea of changing their "general formula" by introducing a term representing the proportion of previous consumption not taxed away (q) to supplement the marginal propensity to consume (mpc) as he claims that "q is no different from mpc". To make the propensity to consume include the propensity of the government to tax, appears to me to be very queer. While the former is a behaviour-variable, the latter is determined by public policy. Lumping them together is no application of "the celebrated principle of Occam's Razor", which incidentally is associated with reducing the number of assumptions and not the number of separate terms in an expression.*

(3) Dr Brahmananda tends to give the impression that all they have argued for in the book is that the mpc would be less than unity. Actually, much more than this was claimed. As any reader of the book can find out, they have been thinking most of the time in terms of full release of past consumption, i.e., of a zero mpc. Even immediately after the discussion of the general formula where mpc is a variable, they point out, "the larger the output expansion, the lower is the average (mpc). Hence, when there is a substantial increase of output, the multiplier can be assumed to be equal to the value obtained by the inverse of the gap g", (p 263), i e, the relevant mpc can be assumed to be negligible. My point was that for the rural population a much better assumption would be that the marginal propensity to save was negligible. This, in fact, is widely recognised to be the basic problem of an underdeveloped economy, and unless some conclusive data are produced proving the contrary, one does not see much reason to depart from this practice.

Incidentally, as Prof A K Das Gupta has pointed out in his rejoinder (E W, October 27, 1956), when the marginal propensity to save is nil, the "consumption multiplier" is not zero as Mr B C Desai thought (E W, September 1, 1956), but unity. The originator of the mistake, however, is not Mr Desai, as it occurs in the book of Prof Vakil and Dr Brahmananda (p. 263).

(4) Dr Brahmananda sees "no reason why he (i.e., I) should object" to a process "if it implies lags". Coming to think of it, I do not see any reason either. Only, that is not what I objected to. My criticism was not about the existence of lags, but about Dr Brahmananda's assumption that the whole process of the "consumption multiplier" works out fully with all its transfers of population and surplus with no lag, while there is a considerable lag between the application of labour and the production of output in the consumer goods industries. I objected also to his neglect of the fact that just as the saving of liquid capital may be used for new investment, so can be the surplus of final output produced. In his example, technique I produces every year Rs 3-1/3 more final output than does technique II, which can be used in the same way in which Dr Brahmananda proposes to use the Rs 3-1/3 saving of liquid capital. Thus even

*Also, the idea of a falling mpc with increasing income, which Prof Vakil and Dr Brahmananda emphasise so much, makes it clear that they are thinking of mpc in the ordinary sense of the term and not as something which is determined also by the rate of taxation.

if the lags are the way Dr Brahmanand assumes them to be, the extra advantages of technique II (surplus rate of 11-2|3 per cent as opposed to 8-1|3 per cent for technique I) would be for the first period only, before anything can be done with the extra output available. This would have been clear to Dr Brahmanand had he cared to calculate the rates of investment for periods subsequent to the first.

(5) My use of the term "rate of reinvestment" seems to have led to some confusion, as Dr Brahmananda argues that he was interested in the "rate of investment" and not in the "rate of reinvestment". Now, the rate of reinvestment gives us the amount of new investment-opportunity which the present investment creates via the creation of investible surplus. So, given the investment-opportunity today, the "rate of reinvestment" of today's investment gives us the "rate of investment" in future. Thus Dr Brahmananda's charge that I looked at reinvestment instead of investment, is pointless. Both he and I have been looking at the rate of surplus, which gives us the rate of reinvestment ,when the whole of the surplus is reinvested.

(6) Finally, Dr Brahmananda argues that it is "not valid" to claim that the recovery of previous consumption of new labourers, when possible, makes the case for labour-intensive techniques relatively better. Since he must admit that the recovery in its effect is similar to a reduction in the effective cost of employing labour, he is actually challenging the rather well-proved proposition that a higher level of real wages is an argument for higher capital-intensity. Had Dr Brahmananda recognized what the question really boiled down to, he would possibly have disagreed less with what I was suggesting.

Without Comment

Is Nehru a Muslim ?

A FRIEND of mine who had been to Mecca this year for the performance of HAJ has just returned after visiting a number of holy places such as Damascus in Syria, Baghdad in Iran, Amman in Jordan and Karbala Mau'lla in Najaf Ashraf. The story which he has disclosed about the publicity of Pakistan in these places is very disappointing.

It is really disconcerting to know that the majority of people in Saudi Arabia, Syria, Iraq, Jordan and Najaf Ashraf are quite ignorant of the fact that Pakistan is an Islamic State whose ideal is to uphold the cause of the Muslim world. Added to this, the currency notes of Pakistan have no economic value there while the Bharati currency notes are in great demand and accepted very gladly and readily. Besides, the value of Bharati rupee as against the Pakistani Rupee is 93% higher in these Muslim countries.

Furthermore, Pandit Jawaharlal Nehru of Bharat is known there as a "Muslim brother" among the Arab Muslims. When these Arab Muslims are told that Mr Nehru is not a Muslim but belongs to a people who believe in hundreds of gods, who worship idols, snakes, cows and so on and so forth, they are wonder-struck.

These Arab Muslims categorically attribute this sordid state of affairs in the Arab world to the powerful and vile propaganda launched by Bharat in misleading and misguiding the Arab Muslims who are quite ignorant, illiterate and credulous. My friend said the Arabs complained that they knew nothing about Pakistan owing to the absence of effective Pakistan publicity there and on account of vigorous propaganda by Bharat against Pakistan.

It is obvious from the above that, Pakistan's foreign mission are doing nothing to counter the pernicious and venomous propaganda of Bharat against Pakistan.

Karachi **Azimuddin**

—From a Pakistan Journal

Productivity Investments in European Steel

(From Our London Correspondent)

THIS note is prompted by three events: the decision of the British Federation of Shipbuilding and Engineering Unions to submit a claim for an increase of 10 per cent in wage rates: the issue of some pertinent statistics on productivity and output by the British Iron and Steel Federation and, lastly the publication of the Fourth **General Report** of the European Coal and Steel Community. The first of these has already produced a plain rebuff by the employers and thus there exists the strongest of possibilities for a serious deterioration in labour relations in the next two months. On this occasion, however, the employers have been more scientific in their rebuff than at any time before. They have for once argued their case in terms of productivity, profits and prices. And it is here that both the statistics of the British Iron and Steel Federation and of the Schumann Plan report take a new significance.

Since 1941 industrial production in the United Kingdom has increased at an annual rate of about 4 per cent. It is now shown that this increase has been due to a 1½ per cent increase in man power and a 3 per cent increase in productivity or the output per person employed. The British Iron and Steel Federation project these contributions to the rise in industrial production into the next ten years. The supply of manpower in this country is said to be unlikely to increase by more than ½ per cent per annum in the future. It is therefore suggested that to achieve the same rate of increase in industrial production, productivity will need to rise about 1 per cent per annum faster than it has in fact been realised over the last seven years. Taking 1950 = 100, manufacturing output per employee in 1955 amounted to 112 in the United Kingdom, 118 in the United States and 140 in Western Germany. In the last two years, output per employee in these three countries increased by 9 per cent, 11 per cent and 15 per cent respectively. Apart from the fact that there has been a tendency for productivity in the United Kingdom to increase somewhat in the last two years compared to the position in 1950, far larger increases have nevertheless taken place in the two other most important manufacturing countries. The employers in the iron and steel industry, therefore, claim that the pre-requisite for maintaining Britain's relative position in the world is a rise in productivity considerably above that which is expected to take place in the United States and in Western Germany. It is claimed that an unchanged working population need not necessarily impair Britain's industrial expansion. The objective now must be to ensure that each head and pair of hands produce more. In view of this, the employers express considerable reluctance in meeting any increase in wage rates at the present time.

Capital Invested per Worker

This argument, if it is to possess any degree of validity, must be matched by the extent to which investment per head of the working population in the iron and steel industry is taking place. It has now been calculated that for the five most important United Kingdom steel groups in this country (Colvilles, Dorman Long, The Steel Company of Wales, Stewart & Lloyds and the United Steel Corporation) the capital employed per ingot ton produced in 1950 amounted to £ 21½. The comparable capital employed by the United States Steel Corporation (which produces some four times the output of the 5 United Kingdom groups) was £ 26. The comparative figures for 1955 are £ 32½ and £ 32 respectively. In other words, it is claimed that between 1950 and 1955 there has been a 52% increase in the amount of capital employed in the British steel industry compared to an increase of only 23% by the United States Steel Corporation. The correctness of these figures cannot be doubted. It must be assumed that the five United Kingdom steel groups, who produce possibly half of the total ingot output in the United Kingdom, were maintaining a level of investment which by American standards was high.

The British Iron and Steel Federation believes that the ability of so important a sector of the British industry to maintain a high level of investment arose from the fact that a substantial proportion of the profits earned each year were retained in the industry for investment purposes. While in 1955 of the total profits of about 147 shillings per ingot ton produced, 76 shillings or over 50 per cent was retained in the industry. In contrast, the United States Steel Corporation retained under 48 per cent of its profits per ingot ton. The dividends declared by the five United Kingdom steel group from profits amounted to no more than 6 per cent compared to 14.2 per cent in America. In these circumstances, it is maintained that the British iron and steel industry has been pursuing a **high-investment** policy and that profit levels have been largely used for this purpose: the aim being to increase the amount of capital per head of employed persons in the industry and so to contribute to rising productivity.

Small Expansion of Labour Force

A striking feature of Britain's steel industry since the end of the war has been the large increase in output with a comparatively small expansion of the labour force. This feature, no doubt, arises from what appears to have been the policy of the industry to maintain high investment expenditure and to direct these investments into labour-saving equipment. Thus, between 1946 and 1956 productivity in the British steel industry had increased by 46 per cent. Today the wage bill of the iron and steel industry is probably among the smallest in proportion to the other cost elements when compared to such industries as coal mining, building, textiles, etc. The average cost breakdown for all types of finished steel output reveals that only 19 per cent of the total cost is in respect of wages and salaries. By far the most important cost—about a third—is in respect of metallic raw materials.

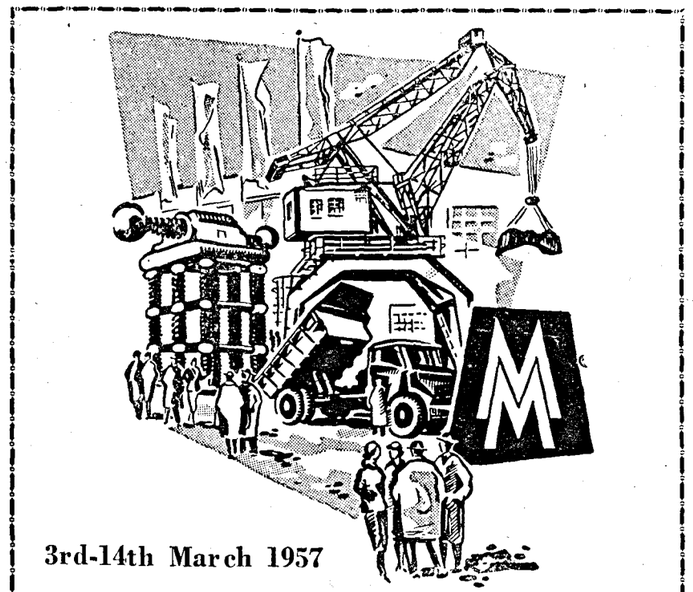
The labour-saving investments that have been introduced in the iron and steel industries appear to be principally of four types. There has been in the first place, a large scale installation of high capacity unloaders for ore handling at the docks. According to a recent bulletin of the Iron and Steel Federation, the normal unloading time for 6,000 tons of ore has fallen from 1,100 man hours to 670 man hours and this within a period of two years. The second type of labour-saving investment undertaken is in the output of basic and hemetite iron from blast furnaces which has risen from 93,000 tons in 1946 to over 150,000 tons in 1955. The larger

furnaces now require fewer men than the smaller ones. A third improvement in labour productivity on open hearth furnaces has been brought about in a similar manner. Lastly, in steel rolling, the change over from reversing mills to continuous mills has had a striking effect on output and the size of the required manpower. Considerable publicity was recently given to the Ebb Vale continuous white strip mills, which had started production in 1938, and which with two other mills account for over 75% of the output of sheet and tin plate in the country. Here it appears that labour productivity is some 12 times higher than in the hand mills.

European Steel Community

Mention has been made of the amount of capital employed per ton of ingot in the United Kingdom. It has been estimated that in the steel industry capital investment per worker employed is as much as £ 15,000. If account is taken of the current rate of capital investment in the steel industry which would be about £ 80 million in 1956, then it is likely that this rate of expenditure would add some £ 250 to £ 300 a year for every person employed in the industry.

The contrast to this position is provided by the investment intention and the level of investment already undertaken in the six West European countries which make up the European Coal and Steel Community. According to the **Fourth General Report** of the E C S C the total volume of investment which companies in the community had made in the period 1953-1955 was equivalent to £ 1,137.5 m. The aggregate for the three years is large by any standard. It is certain that the size of this investment expenditure is mainly the result of the bunching of West German capital investments in 1954 and 1955, in view of the restrictions that were placed in that country on new investments in the period prior to 1953. Comparative data on the distribution of investments in the Community and in the United Kingdom are given in the following table:



Distribution of Investment

	E C S C	U K
Investment in Coal 1953-55 (£m)	533.5	241
Hard Coal Production 1955 (mn tons)	242.5	221.5
Investment in Steel 1953-55 (£m)	604	157
Crude Steel Production 1955 (mn tons)	51.8	19.8

Source: Steel Review—October 1956

Insofar as investments in steel are concerned, the countries in the E C S C were investing in 1955 about £ 11.7 per ton compared to £ 7.9 in the United Kingdom. If, however, the whole period of 1945 to 1955 is taken, investment per ton of the 1955 output was virtually the same in the United Kingdom and in the community (£ 21 each). It would therefore appear that the United Kingdom is matching (on a long-term basis) the expansion plans that have been undertaken on the European Continent. Indeed, a recent report of the British Iron and Steel Federation declared that for the whole of the post-war period, "the position shows that Britain is in the lead" in investment expenditure when compared with continental Europe.

Wages policy in the United Kingdom is increasingly being placed in its international perspective and this cannot but be correct. With increasing attention being paid to the possibilities of establishing a free trade area in Western Europe (including the United Kingdom) and consequential possibilities for the levelling of wage rates and incomes among all West European workers, a more realistic and analytical approach to wage movements in the United Kingdom becomes necessary. It would appear that for the first time the employers in the iron and steel industries are taking this broader view. Any attempt to push forward the level of investment expenditure in British steel will not only contribute to a rise in productivity but will determine whether Britain in a possible free trade area can have any valid economic grounds for possessing a steel industry at all.

3rd-14th March 1957

LEIPZIG TRADE FAIR

Technical Fair and Sample Fair.

"On a total area of 800,000 Sq. metres you find the offer of 10,000 exhibitors from 40 countries."

For Details, please contact:

LEIPZIG FAIR AGENCY IN INDIA,

P. O. BOX 1993, BOMBAY - 1.

Worm's Eye View

Rural Industries

Evelyn Wood

This title is deliberately chosen to suggest a fresh look at a current problem. The writer was originally qualified as an engineer (mechanical and hydraulic), and has been working at rural development, through what are now known as Extension methods, since 1943. His speciality lies in the processes of communication with village people.

Hence the angle from which the new look is suggested has a bias away from the views of the scholarly economists who have debated these issues for almost two years in the columns of the "Economic Weekly", and the even more distinguished politicians whose debates have been in the legislatures and their committees. In fact, the new look seems to the writer to be required from the worm's eye view.

THERE is one unanswerable case for developing industries in the villages of India, provided industries be regarded not merely as organised manufacturing activities. In every industrialised country, the service industries have been found increasingly essential to the development of all forms of production. This aspect seems to have escaped attention in India—except by the village people, who are pretty clear about it. One of the first questions a farmer asks when offered a modern mouldboard plough of steel, to replace his wooden digger plough is "How will I keep this new plough sharp?" This question is in essence the same as the mechanized Canadian farmer's demand that field-services be available from the distributors of a new reaper and binder.

What the Villagers Want

Experience of villages where the National Extension Service or other agencies of development are at work shows that village people are mentally ready for industry. Wide experience of any villages in India shows that a majority of people are insufficiently employed at some periods of the year. The Agricultural Labour Enquiry estimates the All-India average of working days on the land at 218. There is no estimate for unemployment among the "non-agricultural classes" who make up 18½ per cent of the rural population, according to the 1951 Census. Many factors, of which the principal one is probably the enormously increased channels of communication between villages and towns in India, have created a situation in which village people seem to have got it into their heads that industry is what makes townsfolk keep on top of them. This is a dangerous situation in a democracy, especially when the farming majority in the villages are becoming aware that the townsfolk depend on them for food.

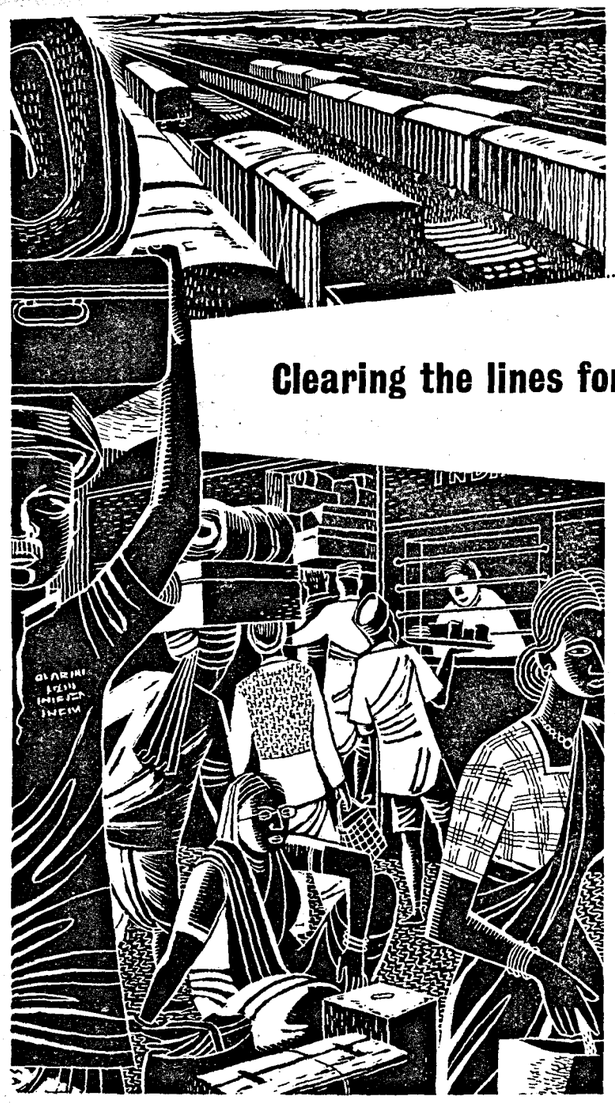
The debate on rural industrialisation has raged largely on economic grounds. But whether or not the economics of the process of industrialising village life are sound is matter beyond the framework of village people's thinking. Their concern for improvement in their lives and work does not fall into our convenient categories, derived from Western analytical science. We may assign the demand from 300-odd millions of people to any scientific category we choose. The facts remain that village people do not want only more consumables or more money; nor do we know, in a scientific sense, that this is their dominant need, without satisfying which no other need can create a clear aim for development. We assume this, because all our education has been shot through with Marxism.

Conversation with village people whom one has come to know intimately shows that their demand for improvement is driven by many motives. Their view of a better organised and self-developing life is certainly not clear, but two elements of that life form a very definite demand. Village people want to feel that they are good at their work, and that their homes and families also conform to a good, approved pattern. For these qualities, among others, they want more respect from non-villagers, and this desire is perhaps even stronger than their need for a sounder economy.

The Demand for Education

Before the present drive for improvement by Extension began, village people's desire that their children should have the means of escaping from the village was very strong, and was probably the principal motive behind the demand for education. Today this demand is equally strong, but it seems to be more driven by villagers' determination that their children shall be on terms of equal respect with townsfolk. Both motives act to produce a ready response from all village people to the suggestion that they should build schools.

There is an equally warm verbal response whenever it is suggested to introduce any form of industry into a village; but here the people feel that there is practically nothing they can do about such a desirable innovation. Co-operatives are always disliked where they have been tried and failed; this is nearly always because the village members were not taught the principles of co-operation, nor how to run a society.



If planning for India's development is really to be done with village people (among the rest of the electorate), as it is claimed to be, then the demands of these people for industry have to be assessed. There is no evidence, for example, that the experimental introduction of 10,000 Ambar Charkas, through 200 Centres, has been planned after ascertaining a definite demand from village people.

By contrast, the pilot-development procedure of the National Small Industries Corporation seems to be much more realistic. Here, with more complex types of industrialisation in view, experiment with village people is sought, so that they are not the guinea-pigs in the laboratory, but the laboratory assistants.

Must India Repeat Other Countries' Mistakes?

It would appear that unemployment in rural India must increase, as a result of any conceivable development policy. The Bhoodan movement has an immense value in recreating an attitude towards land and perhaps other social property in India in which such possessions are regarded as a common trust. But the practical aspects of Bhoodan seem to this writer to offer only a wider sharing of poverty. This is not what village people want, spiritually, socially or economically, although they mercifully do not form these categories as we do.

Consolidation of land-holdings, which is today revitalising farming

Clearing the lines for Progress

More wheels may turn and more machines may manufacture... but this extra activity is meaningless without more transport to move passengers, raw materials and finished products. That's why of every rupee set aside for the Second Five Year Plan—an *industrial* plan, above all—no less than 3 annas will be spent on developing India's railways.

The Plan's allotment of Rs. 900 crores, will be used for rehabilitation of railway track and equipment, as well as to build 842 miles of new track, to buy 2,258 locomotives, 11,364 passenger coaches and 107,247 wagons, and to improve passenger amenities and working conditions for railway staff.

Burmah-Shell supply a lot of oil to Indian railways. And the railways move a lot of oil for Burmah-Shell. In fact, in one year, they carry not far short of *650 million* gallons of oil to cities, towns and villages in every corner of the country. Railways and the oil industry do a vital job for each other—and they're doing it round the clock, year in, year out.

BURMAH-SHELL... IN INDIA'S LIFE AND PART OF IT

in the Punjab, is a more practical solution towards a shared prosperity of farmers; but any better organisation of land-use, like all improved practices in agriculture, must result in reducing the numbers of persons needed to work on the land. As farm-produce and skills increase, the volume of labour decreases, even without powered cultivation. This experience of every other country where agriculture has been made more productive must be repeated in India; it cannot be avoided. But there is no need to repeat all the other experiences of countries which have industrialised themselves. In particular, there seems no need to reduce the rural populations.

There is every good reason to maintain the predominance of agriculture in India. These reasons do not only spring from economic considerations; politics, and more emotional values connected with the fundamentals of culture-patterns in India, all contribute to the logic of such planning. Village people feel the supreme importance of agriculture more strongly than anyone; and they are over 80 per cent of the electorate—in other words, of those who are theoretically the planners. When analysed, this village feeling (by no means confined to farmers) rests not only on the knowledge that farming is the source of their economic living. Here, again, the conviction that their skill in land-use is the true foundation of their human dignity comes up strongly with village people. If this supposed heritage of knowledge and skill be assailed, what has the villager left on which to base his claim to be treated with equal respect?

Yet the agricultural Extension field-worker of the NES must undermine the farmer's necessary pride. In order to get better crop-yields, the farmer has to be shown that he is an ignorant and clumsy fellow in his present misuse of the land. Even on this vital issue, he has to face the fact that the townsman knows better than he does. It is too much to expect every one of over 12,000 gram sevaks to be a diplomat. Consequently the basic and necessary pride of every villager in Extension areas now depends on the progressive farmers; they must show that, with the improved practices, they are far more skilful than any townsman could be at raising more and better quality produce. The progressive farmers will succeed; but there are many stupid and conservative farmers who will not.

Non-Economic Factors

Here is another network of non-economic factors which suggests that better organised industry is a necessity in rural India. There seems to be no good reason why India should not work out a pattern of development which is not completely based on economics. If this be done, we shall have a matrix for growth which is radically different from industrialisation as experienced in Western countries, in Russia, and even in Japan.

The drift from villages to cities does not seem to have been at all decisive in India as it has been elsewhere. Large concentrations of industrial labour have nowhere brought their members more satisfaction in their work; indeed they have destroyed the personal pleasures of craftsmanship. Perhaps automation may restore personal satisfaction in a comparable skill, based on mental acuity, instead of manual dexterity; but this is generations away from us in India. Nowhere else in the world, though, has the pattern of migrant labour in urban industry been so persistent as in India. No other country seems to have experienced this unwillingness of the worker from the country to settle in the factory surroundings. Much of the reason for this lies in complete past failure to promote a tolerable social life for industrial labour in India. Yet the unbalanced political force which this small section of the population can now exert, may now cause more permanent settlement around factories by people from the villages, as has happened in every other country.

A well-balanced plan would establish better social and home conditions equally for farmers and all other village people, while improving conditions for the industrial labour already settled in the cities. This, of course, is the effort already being made; but probably it would be politically safer to meet the demand for industrialization in the villages, and thus to capitalize a certain bias away from city-life which probably still exists in India.

Promotion of Rural Industries

In the last two years, since the Ford Foundation Committee's Report, the administrative jungle of official agencies concerned with the development of rural industries has become a little less tangled. First comes the All-India Khadi and Village Industries Board, now part of the Union Ministry of Production. Of the other All India Boards, Handicrafts is linked logically, but confusingly, with the Indian Co-operative Union, which is not quite an official body; Handlooms is part of the Union Ministry of Commerce and Industry, which also sponsors the National Small Industries Corporation. The National Extension Service also takes a hand both in the Union Ministry of Community Development and through the State's organisations under Development Commissioners. The Central Social Welfare Board has a particular interest in developing industries for village ladies. Each State probably has its appropriate Department to cultivate rural industry, for example the Planning Research and Action Institute of Uttar Pradesh. It would serve no purpose to list all of these.

In the past, private enterprise has done a good deal of this promotion. The Tata Iron and Steel Company's town of Jamshedpur is an example of one form of development. The Ogale Glassworks near Karad in Bombay State represents a different form, where the labour is lodged in its surrounding villages. Religious bodies, particularly the Christian missions in rural India have done much to develop handicraft types of industry, mostly on a part-time basis.

From this brief review of the agencies of promotion, it will be seen that the Karve Committee's report on Village and Small Scale Industries had sound reason to suggest a separate Union Ministry to handle the whole situation. But, as can be seen from the rest of this article, this Committee left untouched whole sectors of the development of rural industry which presumably would have to be covered by any such Union Ministry.

First Principles of Rural Industrialization

It is suggested that some administrative overlap and a great deal of effort by fieldworkers in this development might be economized by a fresh look at the objectives and the means of achieving them which are available or cultivable in a reasonably near future.

A number of assumptions are made by the writer in constructing this outline of the points at which development is required in the rural

areas. Basic to all of these is his personal impression that village people are ready for industrial development, in all its senses: that they have the necessary intelligence and manual dexterity which can quickly absorb and retain the new knowledge and skills required, without waiting for literacy, and that they desire to improve their lives by working to do so. The other assumptions are as follows:

(i) that village people would, on the whole, prefer to remain in their villages, with their families, rather than shift to a town, provided the same opportunities of better work and the rewards of better living, including equal respect, were equally available in the villages.

(ii) that there is an increasing number of village people who need either part-time or full-time work in addition to farming, and its ancillary (or service) industries.

(iii) that there is already much crude plant and equipment in villages, some of which could easily be adapted for more efficient industrial processes, through applied research in collaboration with the villagers who now use such tools, by Extension personnel having some engineering training.

(iv) that there will be a continuing effort made by the NES to educate village people thoroughly in the methods of forming and running multi-purpose co-operative societies. It is this form of group private enterprise which is referred to in the rest of this article. But co-operatives may take a generation or so to establish, in their true, viable form, in which all the members control the operations. Consequently it may be necessary, in order to assure the growth and continuity of private enterprise, for the NES to build up contractors from within the villages. Contractors would ultimately be absorbed by co-operatives. The importance of private enterprise in groups arises from the need to cut the umbilical cord of patronage, which ties most village people to officials or other non-villagers with financial power.

(v) that work for money-payment, sometimes on individual contract, will steadily replace the socially static jajmani system in the villages.

With these assumptions, it is possible to look at the needs of village people for industry, as they might be seen by an informed villager. The range of points to be covered will therefore deal first with those (mainly service) industries which will be increasingly essential as farming improves. It will work upwards in the scale of industrial complexity towards those industries which may with equal economic advantage to all concerned be placed either in a rural or an urban area.

Industries Ancillary to Farming

No Indian farming at all can go on without Blacksmiths, Carpenters, Wheelwrights and Cart-builders. No improved farming is possible without improved home life, which will also require improved Masons and Potters resident in the villages. In all these crafts more skills and a better range of tools are needed, so that the craftsman can give more complex service and take less time over it. If this development will not increase his income sufficiently, the artisan must then form a co-operative with others of the same trade, sometimes in different villages. Together, the co-operative members can then more easily learn some manufacturing skills and thus sell either their services or their products over a wider, but still rural area.

Mechanics for cycles, motor-transport, diesel or electric pumping sets and perhaps other farm machinery are the next industrial servicemen to be trained as essential to improved farming. The mason will have to learn to work with concrete and perhaps steel reinforcement. The contractor for public works of civil engineering must be replaced by the co-operative of artisans. Perhaps the need for the local tailor and cobbler will vanish, as money and factory-made articles become available in village-shops (which should be consumer co-operatives); but in the meantime, the existing tools and skills are capable of better and more satisfactory production and marketing, through professional co-operatives.

Animal Husbandry might well become more widely specialised, like Dairy Farming. Every farmer needs servicemen to castrate bulls; breeding and veterinary treatment can also be treated as new rural industries. Similarly, in other countries rural people have specialised in collecting and storing improved seed, in preparing mixtures of fodder for all livestock, and of fertilisers. All these are essentially local, if not exactly village-by-village industries, and could well be developed as co-operatives with whole-time workers.

Supplementary Farming Industries

To fill the average 147 days when there is no work on the land, farming families must find some part-time gainful occupation. Surplus land-workers, as farming improves, will need other whole-time work for pay. Among the trades indicated above, there will not be room for many of either group, even if caste permits. There is therefore reason to locate in the villages some industries which do not contribute to farming. Because it tends to be based on land-produce, the All India Khadi and Village Industries' Board's list (Planning for Full Employment—1954) makes a useful corrective to the 1951 Census analysis. Considerations of availability of raw materials seem to be fundamental, as also the distances between markets and producers, especially for bulky, fragile or heavy raw materials or products.

Villagers as consumers seem to have no preference for goods produced in the villages. On the contrary, where distribution is adequate, and the retail price is down to the same level for a factory product which looks superficially as good as the hand-produced article from the village, the choice is always for the factory article. Village self-sufficiency is not the creed of village-people today, if indeed it ever was. Retail shopkeeping is however at the lowest level to-day that the writer has seen in 32 years of experience, beginning with cloth and yarn distribution. It would be a real service to village people to assist them in building consumer co-operatives, to replace the retail shops; it would seem logical to villagers to make the present shopkeepers key-figures in such co-operatives.

No further development of village industries is acceptable on the basis that if the product is not very good, but is cheap, it will be good enough for villagers to consume. This is a wholly unjustified extension of the dogma of village self-sufficiency, and can only hamper the legitimate and growing pride of village people in self-development.

The New Look – I

Andhra Pradesh

New State with Large Potentialities

(By Observer)

THE inauguration of the Andhra Pradesh State on November 1, marked the consummation of the four-and-a-half decades ceaseless efforts of Andhras for a State which would embrace all the Telugu-speaking people. Andhra Pradesh, with an area of 110, 250 square miles and 32.5 million population now ranks among the four biggest States in the Indian Union. It is potentially, one of the most prosperous States, with its vast untapped minerals, its growing industrial and power potential and its effectively harnessed water resources.

And yet the new State is not the Visala Andhra, which many Andhras dreamt of, because certain small areas inhabited by Telugu-speaking people are not included in its territory. What they have now is an enlarged Andhra State, constituted out of the merger of 8 Telugu speaking districts in the former Hyderabad State with the existing Andhra State.

No Visala Andhra

This need not be taken to reflect linguistic fanaticism nor is it made in reservation of any future claim to these "excluded" areas. It may be taken more or less as granted that Andhras, by and large, have reconciled themselves to the exclusion of these areas from Andhra Pradesh for good and for ever, even as they reconciled themselves to the abandonment of their claim to Madras city in 1951. It is hoped that safeguards for linguistic minorities incorporated in the States Reorganisation legislation would afford adequate protection to Telugu-speaking people in the States contiguous to Andhra Pradesh like Madras, Mysore and Orissa.

Time was when the Andhra agitation for a separate State was stigmatised as an encouragement to anti-national forces and as tending to undermine national unity. Experience has, however, proved, that at least as far as Andhras are concerned, these apprehensions and prognostications were without foundation and justification. The establishment of the Andhra State has not proved detrimental to national unity or strength. On the other hand, it was the reluctance of the forces-that-be to learn from experience, e.g. that of Andhra and to twiddle with the issues involved in States Reorganisation that resulted in many of the deplorable and unfortunate manifestations of linguistic extremism and exhibitions or mass violence in a number of places that marred efforts to re-draw the territorial map of India.

Past Mishandling of Claim

The point needs elaboration in order to make the implications clear. It has been the conviction of the present writer, who is a close observer of the Andhra scene for a number of years, that it was the hesitation and delay in setting up the State earlier which induced the Andhra electorate to send the Congress into the wilderness in the 1952 general election. It was also indirectly the cause for the martyrdom of Potti Sriramulu and the subsequent disturbances in Vijayawada and elsewhere which brought forth the announcement regarding the formation of the State. Were a favourable decision taken earlier, say, before the last general elections, neither of these regrettable developments would have occurred and there would have been no occasion for the accusation that it was the creation of the Andhra State in the circumstances in which it was done that led to the violent demonstrations in Bombay, Calcutta, Cuttack, Patna, in the Punjab and more recently in Ahmedabad, in the wake of proposals for States' reorganisation.

The Andhras retracted from their earlier attitude born of frustration by sending the Communists into the wilderness in the interim general election held for the Andhra Assembly in 1954, subsequent to separation. They demonstrated thereby the correctness of the conclusion referred to above that in seeking the establishment of a separate Andhra State they were not actuated by parochial feelings, linguistic fanaticism or anti-national bias.

Wise Decision

In the context of past history, it must be unhesitatingly conceded that the decision of the Congress High Command and the Government of India to set up an Andhra Pradesh State immediately, without waiting for five years, as the States' Reorganisation Commission had recommended, by merging the Telangana districts with the existing Andhra State, was a wise one, dictated by and disclosing statesmanship of a high order. It ranks among one of the more prudent of the decisions they were called upon to take in connection with the reorganisation of States' boundaries.

The decision was arrived at in an atmosphere free from acerbity and controversy, despite the initial dissidence of a few individuals and the opposition of a small section of the Telengana public. It was facilitated in a large measure by the reasonable and accommodating spirit in which representatives of the two areas concerned approached the issues involved, and their realisation that whatever compromises and accommodations they had to acquiesce in would be only for the brief transition period. Safeguards for Telengana, which in some respects were not entirely favourable to the areas comprised in and population of the existing Andhra State, were agreed to by the latter in their desire mainly to ensure that no impediments should stand in the way of the realisation of the larger Andhra State for which they had been aspiring all along. Even those who entertained apprehensions that the Andhra-Telangana Pact would involve sacrificing to some extent the interests of the people of the existing Andhra State in the matter of developmental schemes, representation in the services etc under the enlarged set-up did not oppose the Pact, realising that such compromises were necessary in the interests of the balanced and even progress of the new State-to-be.

Regional Committee, No Separation

The Regional Committee for Telangana was also accepted in the same spirit of accommodation, mainly to allay latent fears of the people of Telangana that the Government and the legislature of the composite Andhra State might not devote adequate attention to the needs of the comparatively undeveloped Telangana districts. The constitution of the Committee was a concession to Telangana sentiment which, it hop-

ed, would not perpetuate the feeling of separateness, viz. that its interests and progress are something different from those of the rest of the State. On the other hand it is quite likely that as integration of the services, schemes and programmes of development, educational needs and facilities etc., between the two areas proceeds, the Committee might agree to dissolve itself. In practice, it may be expected that the process of adjustment and integration would be quite expeditious as in the case of Rayalaseema and the Circars districts, where it was completed much more expeditiously and smoothly after the formation of Andhra than many had expected.

One significant and vital factor in the rapid progress of this adjustment would be the retention of Hyderabad as the capital of the State. In fact, it was one of the fundamental factors in their consideration when Andhras readily acquiesced in some of the compromises which the creation of the new State entailed. It involved the fulfilment and realisation of a long-cherished aspiration of Telegu-speaking people, because Hyderabad is in the heart of the ancient Kakatiya and Swetavahana Empires, the memory of which Andhras everywhere cherish with pride. It also meant fulfilment of the ambition which they had at the time of the formation of the present Andhra State and which induced them to accept Kurnool as its "temporary" capital.

Economic Potential

What will be immediately gained through the administrative integration of the Andhra and Telangana areas can be converted into a permanent gain and advantage of the two areas only by integration of the hearts and outlooks of the people. From it alone will the maximum benefits of a composite Andhra State emerge. As it is, all the conditions postulated for the peaceful and rapid progress of the Andhra Pradesh State are there. It will have a number of industries such as sugar, cement, paper and tobacco, and prospects for the development of other industries like mica, minerals etc., exist in abundance.

When the Rs 79 crores Nagarjuna Sagar project on the Krishna river is completed, the State will have ample irrigation and power facilities for the extension of agriculture and the establishment of a number of small-scale and village industries, and when these facilities are combined with those that would be available from the Tungabhadra project particularly after its High level Canal, which would benefit Rayalsema, is completed, the State would have one of the best and most extensive irrigation systems in the country.

In the educational field, the State will have three Universities—Andhra, Venkateswara and Osmania—which would cater to the needs of higher general and technical education. Besides, Andhra Pradesh possesses potentialities for the development of a number of industries, as and when its so far untapped natural resources are tapped for public and national benefit.

Far Sighted Leadership Wanted

All these natural advantages which the State possesses can be fully utilized only if the State has a wise and farsighted leadership—governmental and administrative—and if such leadership can overcome the limitations of communal, sectional and caste predilections which seem to dominate its politics, and which necessarily clash with the larger and more comprehensive interests of the people as a whole.

Such leadership will have to be provided immediately by the Congress, if the initiative is not to be captured by other parties. In a sense, Congress leadership in Telangana and Congress leadership in the present Andhra State have, in the first instance, to adjust themselves to each other before they can present a united front against other parties who would be contending with them. They will have simultaneously to secure the confidence of the people in both areas, which hitherto had remained separate by competently steering the ship of the new State in the next few years, in fact, in the next few months, as interim election for Andhra Pradesh Assembly from the Telangana area would be held simultaneously with the next general elections.

The New Look—II

Punjab—PEPSU Merger

Ved Prakash

THE reorganised State of Punjab has a natural unity in geographical, economic and social aspects. Formerly there were numerous patches of Punjab and PEPSU which were inextricably mixed up and had become sanctuaries for the tax dodgers, bootleggers and other anti-social elements. These have been obliterated by integration and Punjab has become a big, prosperous and well-knit unit.

To know Punjab, one has to meet its friendly, cheerful and hardworking people, see its numerous historic ruins and its natural beauty, unspoilt by commercialisation. In the past, the eight States which formed PEPSU were regarded as dreamy and romantic retreats where the old Rajas ruled in their full regalia and time stood still. Yet in the few short years of independence and formation of the States Union, the people of these sheltered retreats proved themselves fully capable of tackling all the problems which face a modern state.

The States of Punjab and PEPSU with their assets pooled together are in a far better position to meet any eventuality and work for the benefit of their people than before. Of the eighteen districts, spread over an area of 46,616 square miles which make up the new Punjab, thirteen (with 54 tehsils) belong to the historic Punjab, the 'Sword Arm of India' and 5 (with 19 tehsils) to PEPSU. There will be three Divisions in the reorganised State, viz Jullunder, Ambala and PEPSU, with 27 sub-divisions (21 of Punjab and 6 of PEPSU). The total population will be 1,61,00,000 of whom 1,26,00,000 are of the Punjab and 35,00,000 of PEPSU.

The new Legislative Assembly will have 186 members—126 from Punjab and 60 from PEPSU, while the Legislative Council will have a total membership of 46, of which 40 are from Punjab and six from PEPSU. Members of Legislative Council from PEPSU have now been elected by the elected members of PEPSU Legislative Assembly in persuance of the States Reorganisation (Elections to Provisional State Legislature) Rules, 1956. There was no Upper House in PEPSU and the Punjab Legislative Council had only 40 members. After the ensuing General Elections, the strength of the State Vidhan Sabha and Vidhan Parishad will be 40 and 154 respectively.

A new feature of reorganised Punjab, not provided for in the SRC Report, is the implementation of the Regional Formula. Broadly speaking, the Formula claims to maintain unity of the Punjab by integrating the present Punjab and the PEPSU territories, though the new State will be demarcated into two regions based on the language spoken in them. These two regions would have, for administrative and development purposes, Regional Committees consisting of respective members of the Assembly and would include the Ministers of the region but not the Chief Minister of the State. While the Regional Committees would be free to advise on all matters entrusted to them (specified in the Formula) and by Convention, their advice would generally be accepted, their position is not statutory, nor is their advice mandatory. The final decision in each matter would rest with the State Cabinet, which would of course include Ministers from both the regions. The Governor of the State would be given powers to take final decision in case there are differences in the views of the two Regional Committees on matters entrusted to them.

The Regional Committees will deal with the following matters:

1. Development and economic planning, within the framework of the general development plans and policies formulated by the State Legislatures.

2. Local self-government, that is to say the Constitutional powers of Municipal Corporations, Improvement Trusts, District Board and other local authorities for the purpose of self-government or village administration.

3. Public Health and sanitation, local hospitals and dispensaries.

4. Primary and Secondary education.

5. Agriculture.

6. Cottage and Small-Scale Industries.

7. Preservation, protection and improvement of live stock and prevention of animal diseases; veterinary training and practice.

8. Prevention of cattle trespass.

9. Protection of wild animals and birds.

10. Fisheries.

11. Inns and inn keepers.

12. Markets and fairs.

13. Cooperatives.

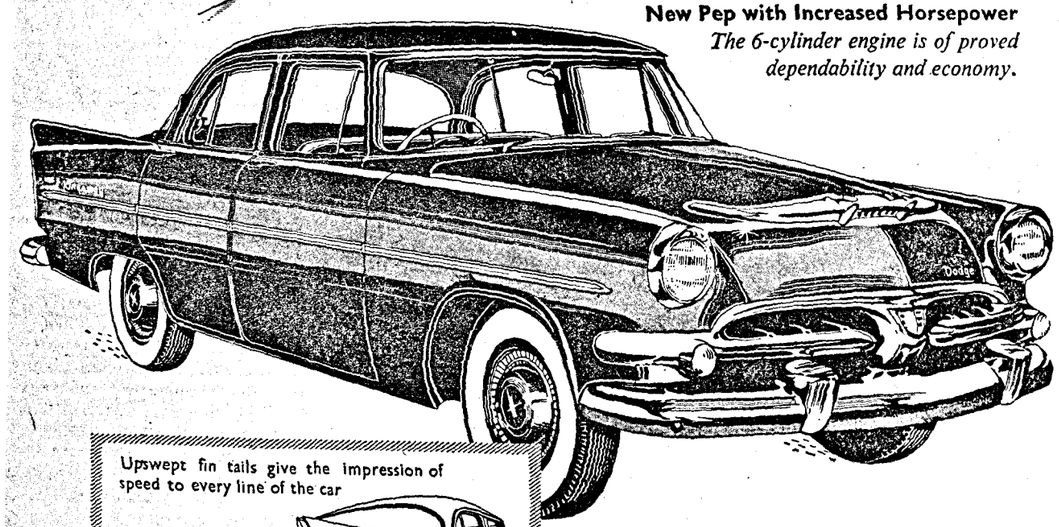
14. Charities and charitable institutions, religious endowments and religious institutions.

The official language of each region will, at the district level and below, be the respective regional languages. The State will be bilingual, recognising both Punjabi (in Gurmukhi script) and Hindi (in Devnagari Script) as the official languages.

Economically, integrated Punjab will be a prosperous State and there cannot be any two opinions about it. The industrialists will have a larger market for their goods as the market was partially limited hitherto by political boundaries of the States and the different structures of taxes in vogue. There was some reduplication of undertakings by private institutions and Government which would be avoided in future and make for greater industrial efficiency. As the area of each of the States, heretofore, was too small for the establishment of any heavy industry, the Central Government did not take any interest in establishing heavy industries in Punjab. Greater Punjab can easily justify its claim for the establishment of industries like Wagon Building, Structural and Foundry Shop, Textile and Heavy Chemicals, and these claims will be greatly strengthened after the completion of the Bhakra-Nangal Project which will simultaneously augment cotton production and power supply.

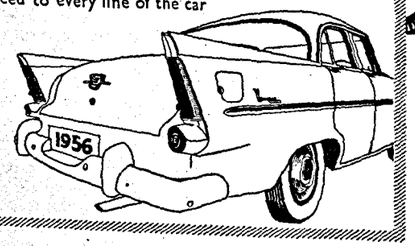
The integration will be a political success, if the Regional Committees work smoothly, without communal or linguistic bias and in a statesmanlike spirit, for the lasting good of the people. The possibility has to be guarded against that the Regional Committees do not degenerate into bodies for fomenting separatism instead of fostering harmony.

1956 DODGE



with Jet-fin styling

The 1956 Dodge with its new FORWARD LOOK and incorporating new features takes you to new standards of performance. Look at these features:



- ★ New 12-volt electrical system gives quicker, easier starting, longer spark plug life, plenty of current
- ★ Maximum vision with new horizon windshield wrapped around top and bottom
- ★ New safety door latch for passenger protection
- ★ Redesigned sealed beam headlights extend zone of lighting on left side by 80 feet
- ★ Independent hand brake provides real emergency brake function
- ★ Safety-rim wheels, tubeless tyres and many other features

New Pep with Increased Horsepower

The 6-cylinder engine is of proved dependability and economy.

Upswept fin tails give the impression of speed to every line of the car

The New Look—III

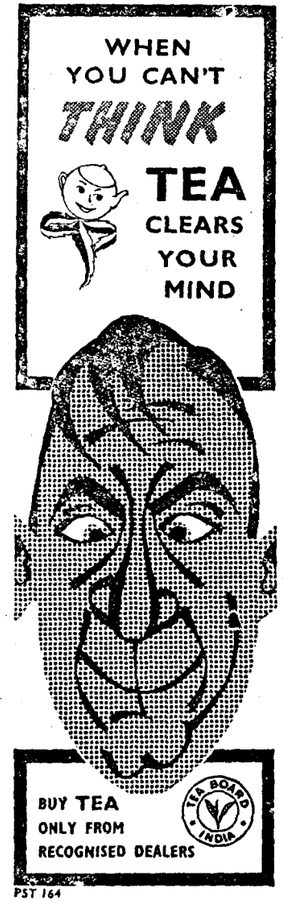
Karnataka is Reborn

(By a Kannadiga)

WITH the formation of Karnataka or the bigger Mysore State, as Mysoreans would have it, a new force, long talked about, but never easily identified, has emerged in the Indian Union. It was a force that had once meant much in history, alike in political, cultural, economic and philosophical fields; and it was a force that was slowly bridging the gulf between the north and the south, the east and the west, ideally situated as it was for this happy mission.

The New State

But then with the advent first of Muslim power and later of British authority, the process of disintegration started. Scattered among various contending powers and then among various administrative units, the spirit of Karnataka could manifest itself freely only in Mysore and to some extent in the Kannada-speaking districts of Bombay while elsewhere it had to accommodate itself to altered circumstances. But not for very long, however. The birth of nationalism and the agitation over the Bengal partition soon revived in the Kannada-speaking people the desire for re-unification; and the resulting agitation, flaring up and cooling down by turns, can be said to have ended only with the inauguration of Karnataka or the bigger Mysore State on November 1 last.



On that day, districts and talukas divided among five different administrative units, Bombay, Madras, Mysore, Hyderabad and Coorg, came together to constitute a single State with an area of about 72,730 square miles and a population of nearly two crores. Superlatives like the 'largest', the most 'populous' and the 'richest' that have been freely showered on some of the newly-created States in the country cannot apply to Karnataka; and if there is anything superlative about this State, it is to be found in the rich variety of terrain, resources, man-power, talent and enterprise in this region and also in the happy combination of all factors, tangible and intangible, for a tremendous spurt of progress.

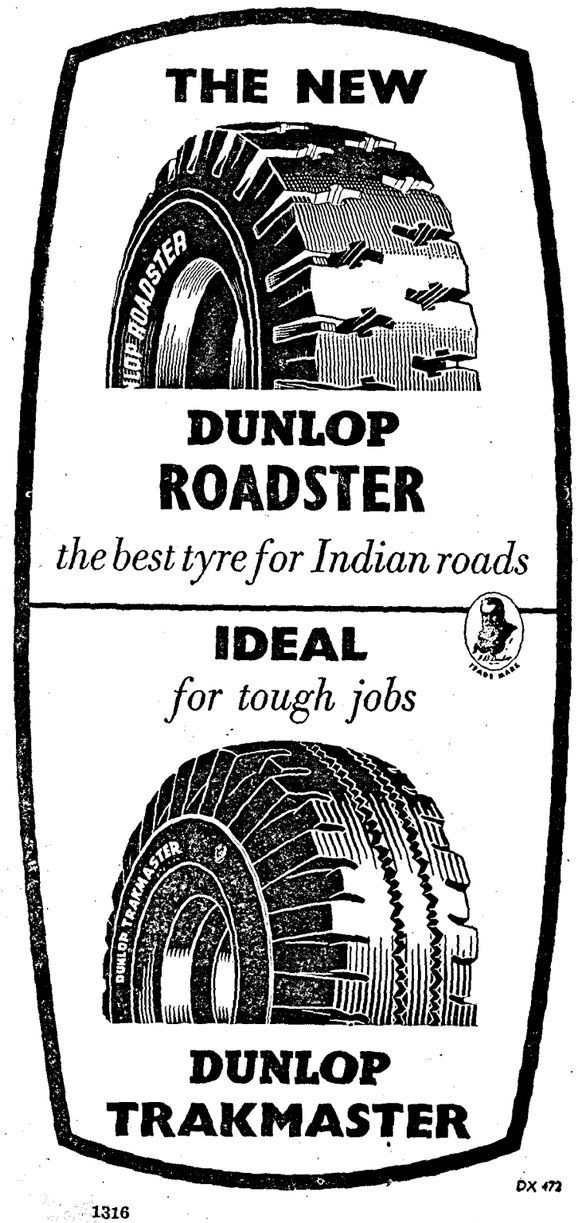
Karnataka has a 200-mile long coastline, studded with good natural harbours and abounding in facilities for large-scale fishing; it has a chain of mountains, bursting with forest resources and providing some of the grandest spectacles of scenic beauty imaginable; it has both plateau and plain, the former dry and the latter extremely wet, growing food and money crops of considerable value; it is rich in minerals and power sources, a few exploited and the rest yet to be taken up for exploitation; it has innumerable rivers, particularly in the coastal region, good both for navigation and irrigation; it has industries, both large-scale and small-scale, especially in Mysore, which hold promise of expansion to other regions; it has famed handicrafts which could flourish again with a little encouragement; it revels in historical relics and monuments, masterpieces of sculpture, places of pilgrimage and scenic grandeur and all that the better instincts of man can ask for; it has a largely congenial climate, reaching the peak of excellence at places like Bangalore; and, more than all, it has a hard-working, intelligent and enterprising population which is responsive to new ideas and methods and which, at the same time, is steeped in folk culture.

The pressure on land is not very heavy yet, except perhaps in the coastal region; and there is plenty of waste land that can be brought under the plough with a proper exploitation of the rivers and tanks in the region. Several irrigation projects have been undertaken already; and more are surely indicated in the arid regions of the east and north-east. There is plenty of scope for the cheap supply of power for industrial enterprise, what with the hydro-electric schemes already implemented and the ones that are likely to be taken up now. The depressed Malnad region, shunned for long, is only crying to be developed; and the unused wealth it contains is not inconsiderable. Again, the vast coastline and the natural harbours on it await proper utilisation. Educationally, South Kanara and certain urban areas of the old Mysore State and Bombay Karnataka are very advanced; and the trend towards technical training, so important to material progress, has already made considerable headway.

Harmonising Regional Interests

In short, all the conditions necessary for the rapid expansion of agriculture, trade and industry are there; and also adequate man-power. But is the right type of leadership available? That is a question that awaits answer. Politically, the State appears to be stable at present, despite the coming together of various groups from various regions with natural differences in tradition and outlook. But this stability is more to be attributed to the sudden impact of a great dream realised than to any evidence of cooperation and cohesion. A tussle for power between the Mysore group and the Bombay Karnataka group is inevitable, with representatives of other areas siding with the one or the other and tilting the balance this

PST 164



way or that. Indeed, this tussle can be said to have begun even at the time of the election of the new leader for the Legislature Congress Party, though wiser counsels resulted ultimately in a unanimous choice. But that can hardly be the end of the tug-of-war.

It is not only regional considerations, but also sectional prejudices and ambitions that are behind this cleavage; and it is time alone that can provide a remedy to this. Meanwhile, much will depend on the leadership of the new State. Shri Nijalingappa, the new leader of the Congress Party and Chief Minister, is no doubt an able and enlightened man, and he has had the advantage, at least for the time being, of being acceptable to all the groups. But whether and, if so, how long he would be able to retain the support of the other leaders, all with followers and ambitions of their own, remain to be seen. Shri Hanumanthaiya and Shri Manjappa, both former Chief Ministers of the State of Mysore, may have retired from the arena of contest for the time being; but whether they will be content to remain in retirement for ever is more than can be predicted. The challenge of the opportunities that face Karnataka is truly great; and it may yet induce that harmony of spirit in the leadership which is so essential to the rapid progress of the new State. It is a hope that Karnatakis ardently cherish as they contemplate the prospects before the new State.

Bridging the Gulf

Apart from the lack or inadequacy of understanding and cohesion in the leadership, there are also certain minor factors which may come in the way of the smooth progress of the new State. One of them is the recurring stress on the importance of the former Mysore State in the new set-up. It may be that certain parts of the new State are relatively backward, particularly in what was Bombay Karnataka and Hyderabad Karnataka once; but the blame for this does not rest on them, and they certainly would not like to be taken advantage of on that score. Even otherwise, the airs that certain Mysoreans are apt to put on as more advanced specimens of Karnataki culture and enterprise cannot but jar on the others. Again, there are certain areas like the Kanaras that have come into the new State with bitter experience of neglect in their old administrative orbits. And Coorg has felt that it was quite happy under the old dispensation, and it may well be waiting to see whether it will be equally happy in the new order. These areas will need particular attention.

All these call for a band of leaders who are not bothered by petty considerations of region, community or caste and who can bring to bear a broad, liberal outlook on the tasks of emotional harmonisation, administrative integration and overall development awaiting the new State. With such leadership, Karnataka could not only grow into a strong and progressive State in itself and a source of stability and power to the Republic, but also resume its interrupted function of providing a link of understanding and cultural synthesis among the various States of the new Union, bridging as it does the north and the south, the east and the west.

New Political Map of India

After States' Reorganisation

AFTER the reorganisation effected on the first of this month, the Indian Union is composed of 14 States and six centrally administered territories; 98 per cent of the total population are covered by the States and about two per cent by the territories. Jammu ad Kashmir is one of the 14 States.

Of the former Part A States, Assam, Orissa and Uttar Pradesh remain unaffected.

Of the seven Part B States, Hyderabad has disappeared from the map; Telengana has gone to Andhra, the Marathi and Canarese speaking districts of the State have gone to Bombay and Mysore respectively. So has Madhya Bharat which has been integrated with Madhya Pradesh, Saurashtra which has gone to Bombay and PEPSU which is now one with Punjab. The remaining Part B States, Mysore, Rajasthan and Kerala (former Travancore-Cochin) are now full fledged States —equal in status with the other States.

Of the Part C States, four viz Delhi, Himachal Pradesh, Manipur and Tripura are now centrally administered territories, along with Andaman-Nicobar and Laccadive-Amindivi group of Islands. Bhopal and Vindhya Pradesh have been joined with Madhya Pradesh. Kutch has been merged with Bombay, Coorg with Mysore and Ajmer with Rajasthan.

The area and population (according to the 1951 Census) of the reorganised States are as follows:

(1) Andhra

Language: Telugu, which has the largest number of speakers in India after Hindi. Population: Increased from 25.5 mn to 31.3 mn. Area has increased by 42,355 sq miles from 63,608 sq miles to 105,963 sq miles. It is the fifth largest State in area and ranks fourth in respect of population. The entire increase in area is due to the addition of the Telengana districts (42,355 sq miles) of Hyderabad.

(2) Assam

Predominant language: Assamese, though the percentage of population speaking the dominant language is lowest in Assam compared to any other State. Assam has not been affected by reorganisation. Population: 9 mn. Area: 85,012 sq miles; Ranks seventh in area and 13th in population.

(3) Bihar

Language: Hindi. With the transfer to West Bengal of 3,030 sq miles of Purnea district and Purulia subdivision, the State's population and area have declined from 40.2 mn to 38.82 mn and 70,330 sq miles to 67,300 sq miles respectively. In area it ranks ninth while in population it comes third.

(4) Bombay

The major bilingual State in the Indian Union (Punjab is another), the two main language groups being Marathi (26 mn speakers) and Gujarati (16 mn speakers). The population of the State has doubled, from 24.8 mn to 48 mn. Simultaneously its area has increased by 79,480 sq miles from 111,434 sq miles to 190,919 sq miles. Before reorganisation, the State had 32 districts of which Bombay Deccan (Southern) comprising of three districts with an area of 15,978 sq miles and another district (Kanara: area 4,000 sq miles) were transferred to Mysore. The gain in size is accounted for by the incorporation of Vidarbha (area: 36,678 sq miles) of Madhya Pradesh and of the Marathawada districts (area: 25,511 sq miles) of the Hyderabad State and the States of Saurashtra and Kutch (area: 21,451 and 16,724 sq miles respectively).

In area, Bombay is the largest State in the Indian Union and in population it is second only to Uttar Pradesh.

(5) Kerala

Language: Malayalam. The population of this State (former Travancore-Cochin) has almost doubled from 7.8 mn before reorganisation to 13.55 mn. There has also been a corresponding increase in its area which is now 15,035 sq miles as against 8,846 sq miles before November 1. Despite the increase in its area by 6,189 sq miles Kerala is the smallest of the fourteen reconstituted States. It ranks twelfth in population.

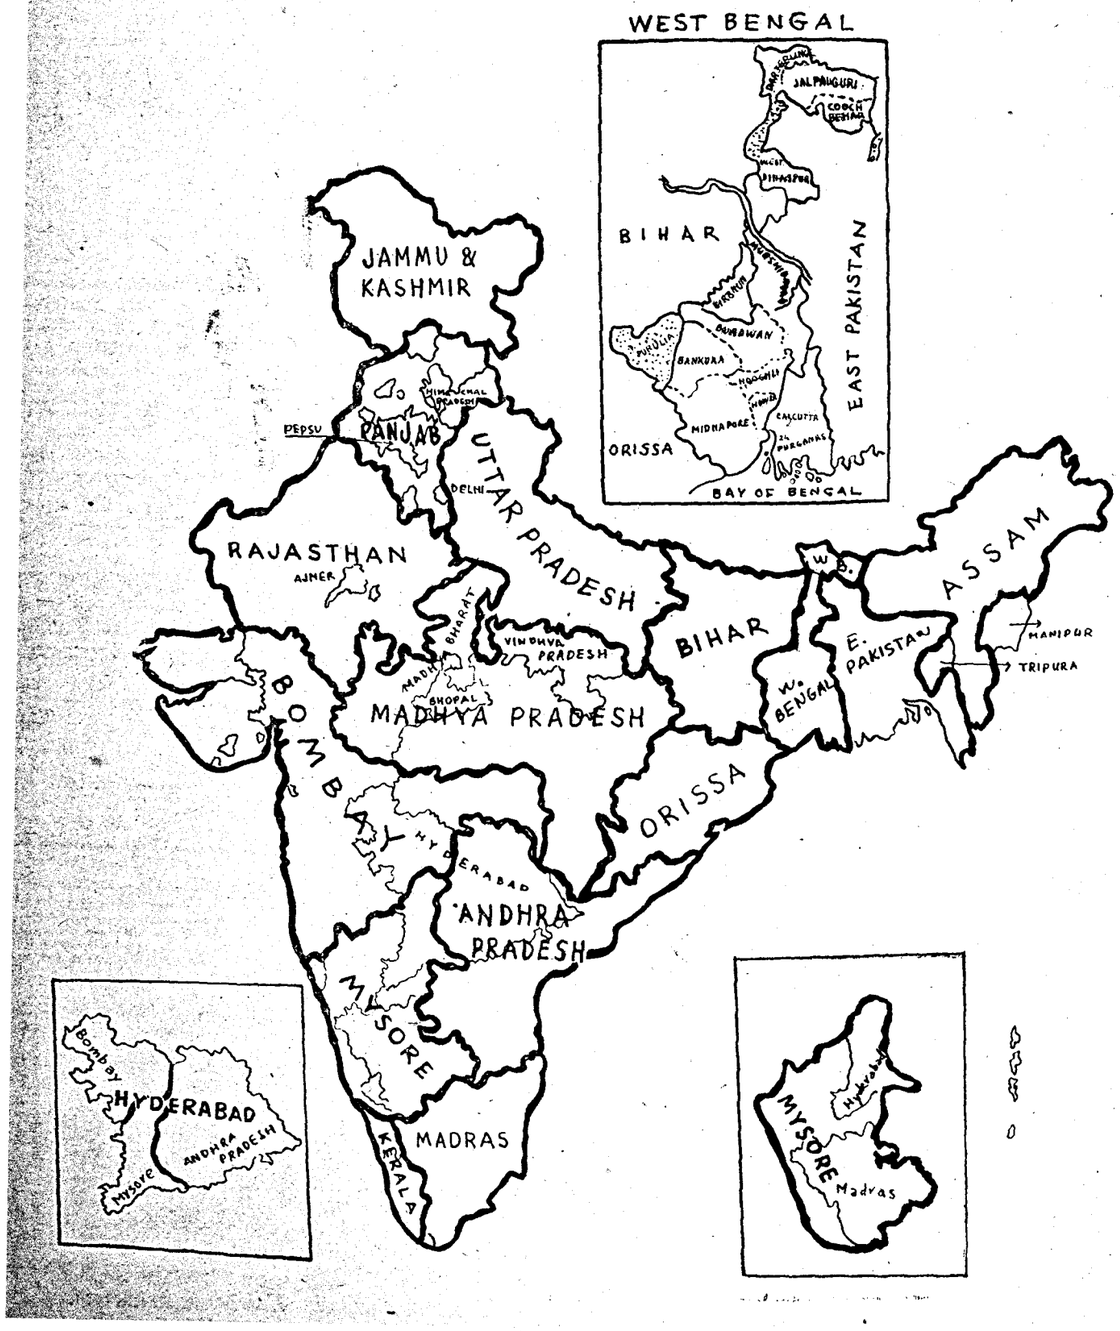
The State is composed of the former State of Travancore-Cochin (minus four taluks of Trivandrum districts and a part of the Shencottah Taluk in the Quilon District), Malabar district (without Laccadive-Minicoy Islands which are now a centrally administered territory) and the Kesargod Taluk of South Kanara district.

(6) Madhya Pradesh

Like Bihar and Uttar Pradesh, Madhya Pradesh is also a Hindi speaking State. After reorganisation, the State has a population of 26.1 mn (of which nearly 4 mn are tribals) as compared with 18.4 mn in the past. Its area has increased by 41,021 sq miles to 170,902 sq miles. With its present area, it is second only to Bombay while in population, it ranks seventh. It has lost 36,708 sq miles of Vidarbha to Bombay State but has gained in area by the integration of Bhopal (area: 6878 sq miles), Madhya Bharat (area: 46,478 sq miles) and Vindhya Pradesh (area: 23,603 sq miles).

(7) Madras

Language: Tamil. Population has declined from 35.7 mn to 30.0 mn and area has declined by 10,252 sq miles from 60,362 sq miles to 50,110 sq miles. Kollegal Taluk has gone to Mysore, Kesargod taluk to Kerala while five taluks from Travancore-Cochin have been added to it after reorganisation. Rank: fifth according to population and eleventh in area.



(8) Mysore

Language: Kannada. Both the population and area of Mysore have more than doubled, from 9.8 mn and 33,309 sq miles to 19.4 mn and 74,093 sq miles respectively. Though the old name is retained, Mysore is virtually a new State, Karnataka of the Kannada speaking people. It has gained in area by 40,784 sq miles by the incorporation of Belgaum (minus Chandgad Taluk) Bijapur, and Dharwar districts (area roughly 17,430 sq miles) and Kanara district (area 3,971 sq miles) of Bombay; Gulbarga, Raichur and Bidar districts (area: roughly 18,000 sq miles) of Hyderabad. It ranks eighth both in area and in population.

(9) Orissa

Language: Oriya. Orissa has not been affected by States re-organisation. Population 14.6 mn. Area: 60,136 sq miles. Rank: tenth in area and eleventh in population.

Indian Union After The States' Reorganisation

(10) Punjab

Language: Punjabi and Hindi. Population has increased from 12.6 mn to 16.0 mn. It has gained 10,078 sq miles in area from 37,378 sq miles to 47,456 sq miles at present wholly from the merger of PEPSU. Ranks twelfth in area and ninth in population.

(11) Rajasthan

Language: Rajasthani. Population has increased to 16 mn from 15.3 mn while area has increased by 1,871 sq miles from 130,207 sq miles to 132,078 sq miles. Rajasthan has lost Sironj subdivision of Kotah district to Madhya Pradesh but gained Ajmer (area: 2417 sq miles) and Abu Road taluk of Banaskantha district of Bombay and Sunel Tappa of Bhanpura tehsil of Mandsaur district of Madhya Bharat.

Ranks third in area, tenth in population.

(12) Uttar Pradesh

Language: Hindi. Unaffected by re-organisation. Population: 63 mn. Area: 113,409 sq miles. Ranks fourth in area and first in population.

(13) West Bengal

Language: Bengali. Population has increased from 25 mn to 26.2 mn and area by 3,030 sq miles from 30,775 sq miles to 33,805 sq miles by the addition of the Purulia subdivision of Manbhum district (minus Chas thana, Chandil thana and Patamda Police station of Barabhum thana) and of the Kishanganj subdivision of Purnea district which lies to the east of Mahananda river. The portion of Gopalpur thana of Purnea district which lies to the north of the National highway in the said thana, including the highway has also been transferred to West Bengal from the State of Bihar. Ranks 13th in area and sixth in population.

(14) Jammu and Kashmir

Language: Urdu. Unaffected by States reorganisation. Population: 4.4 mn, rank: fourteenth. Area: 92,780 sq miles. Rank: sixth.

Centrally Administered Territories

1) Delhi. Area: 578 sq miles. Population: 1.7 mn.
2) Himachal Pradesh. Area: 10,909 sq miles. Population: 1.1 mn.
3) Manipur. Area: 8,662 sq miles. Population: 6 lakhs.
4) Tripura. Area: 4,032 sq miles. Population: 6 lakhs.
5) Andamans and Nicobar Area: 3,215 sq miles. Population: 31,000.
6) Laccadive, Minicoy & Amindivi Islands. Area: 384 sq miles, Population 21,000.

Carrying passengers and freight, Indian Airlines Corporation has an average load of about 4,500 lb. on every flight

SOMETIMES, freight claims aboard an aircraft come first. Would-be passengers are disappointed — especially if they hear afterwards of vacant seats. But, remember, the weight of a passenger may be taken up by a consignment of life-saving drugs, a shipment of vital foodgrains, or a bag of important mail!

The payload of an aircraft is made up by passengers *and* freight — it cannot be reckoned in terms of the number of seats provided. Please remember this, if *you* fail to get a seat on a certain flight. Remember, too, that Indian Airlines Corporation belongs to the people of India . . . and its wings fly in the service of all!

Indian Iron's New Issue

Wednesday Evening

IN the past fortnight, movements in equities have been mainly influenced by war-like developments in Egypt and the disturbing events in Eastern Europe. At the time of this writing, Lyons Range is no longer under the grip of war fears. Equities are where they were a fortnight ago. With the news about cease-fire in Egypt, buyers withdrew. In consequence, equities have rather lost ground during the last fortnight. This is partly due to liquidation by war buyers. In part, however, it is also due to doubts about the smooth implementation of the Second Plan.

In the retrospect of the last fortnight, it would seem that Lyons Range was never apprehensive that developments in Egypt would lead to a third world war. Despite Russian warnings to Britain and France about the possibility of an extension of the war in Egypt, Lyons Range did not lose its poise. Though Moscow's warnings and overtures to Washington had a steadying effect on equities, it proved short-lived as equities slid back again on the news of cease-fire in Egypt.

As was to be expected, bullion and gunny markets responded more promptly to developments in Egypt. Bullion and gunny prices spurted up. Improvement in gunny prices had a sustaining influence on Jute shares. But these shares did not move up confidently because of the simultaneous rise in raw jute prices. There are reports of heavy American orders for hessian. Those who are "bullish" about the outlook for Jute shares emphasise this aspect. But it should not be ignored that raw jute prices continue to be steady.

Nor was it surprising that warlike developments in Egypt would have a sustaining effect on Coal shares and on Miscellaneous and Engineering shares. Even so, it was significant that, despite the spurt in speculative scrips, neither Miscellaneous nor Engineering shares were very active. Indeed, the absence of any material rise in cash scrips reflected the stock markets' view that a third world war was not likely.

Fluctuations in Indian Iron will be influenced mainly by the Chairman's letter to shareholders along with the annual report of the Company. Though working results for the year to March last were satisfactory, Indian Iron were affected by some of the details included in the Chairman's letter to shareholders. In that letter, shareholders were officially informed that the Company will issue 5,183,708 ordinary shares of (Rs 10 each for cash at a premium of Rs 3-8 per share.

There was nothing new in this information. But some operators were inclined to interpret "bearishly" the other disclosure that these new right shares will not participate in any dividend in respect of any period ending on or before March 31, 1957. This merely means that the new shares will not be eligible for dividend during the current year. This is only natural. Right shares have not yet been issued, while there are only five months to go before the accounting year will close. In the circumstances, no one could reasonably expect that these new shares will be eligible for dividend in the current year.

In 1953, the Indian Iron and Steel Co undertook an expansion programme. This is still being implemented and will be completed by the end of 1958. But, in furtherance of the Government's Second Plan, the Company has decided to undertake a further expansion programme. Under this second expansion plan, the Company's steel making and finishing mills' capacity will be increased by a further 100,000 tons, giving a total output capacity of 800,000 tons of saleable steel and 280,000 tons of foundry pig iron per annum.

New expansion schemes are estimated to cost Rs 14.80 crores. Negotiations with the World Bank are in progress for a loan covering the amount which will have to be spent abroad in connection with the second expansion plan. To facilitate such a loan from the World Bank, the Company has given notice of its intention to redeem the First Mortgage Debentures. This will involve a little over Rs 94 lakhs. New Delhi and the State Bank of India have agreed to the creation of the proposed further first charge in favour of the World Bank.

Expenditure to be incurred by the Company in Indian currency in connection with the second expansion plan, as also the amount required to repay the Company's First Mortgage Debentures, is to be raised by the issue of new ordinary shares. Excluding the amount needed for redeeming the First Mortgage Debentures and the loan finally sanctioned by the World Bank, it is assumed that the Company will have to secure a little over Rs 5-1/3 crores out of its own resources. To secure this latter amount, the right issue is being offered.

At present, the Company's authorised capital is Rs 8½ crores. To cover the new issue, the Company's authorised capital will be increased to Rs 14 crores. This will involve a doubling of the ordinary share capital. Will the Company be able to maintain the dividend on the increased capital? Details of the second expansion plan indicate that output, sales, earnings and profits of the Company may expand sufficiently to enable it to maintain the dividend on the increased capital. Investors are anxiously awaiting the Chairman's observations on this major aspect of the right issue in his annual address a few weeks hence.

Chloride Batteries

For Atomic Reactors

THE safety and security of the two nuclear reactors installed at the Calder Hall Atomic Power Station are ensured with the assistance of two large batteries supplied by Chloride Batteries Limited of Clifton Junction, Swinton, Manchester.

The pumps, fans, instrumentation and emergency lighting for each reactor are normally supplied by the rectifiers, but should their output fail, the batteries automatically take over the important load. Absolute reliability of the batteries is essential, as a complete failure of these services could cause severe damage to the reactors. Following an emergency discharge, the rectifier is capable of quickly charging its battery and supplying the reactors auxiliary services at the same time.

Similar large Chloride Stationary Batteries are being progressively manufactured at the Exide Factory near Calcutta and are working in automatic Telephone Exchanges, in new Project Power Stations and Sub-Stations in many Parts of India.

Around Bombay Markets

Dull Moorat

Thursday, Morning

IN sharp contrast to the brisk activity and firm prices witnessed during moorat trading last year, hesitancy and uncertainty marked the moorat session this year. This was due partly to the tension prevailing in the Middle East and the possibility of India withdrawing from the Commonwealth. The general inclination was to await further developments. The volume of trading was therefore extremely limited although the usual enthusiasm associated with moorat trading was not absent completely. The price range continued to be narrow and uneventful.

In the Mulji Jetha Market, moorat was a lifeless affair and the total transactions put through were perhaps the smallest during recent years. In the cotton market, the moorat was no livelier an affair. The authorities decided to keep the market open for a short session on the following day in order to induce some trading at the beginning of the new year. The session, however, turned out to be a flop.

Divali is associated with stock-taking, particularly for the trading and business community. It is natural, therefore, to assess the prospects on this occasion. To be able to do that, it is necessary to review the share market trend at least in broad outlines, during the year that has just passed. In view of conflicting reports of changes in economic policy, especially in regard to the role of the private sector, investors lacked confidence for the greater part of the year.

Against such a background, it is no wonder that even inflationary possibilities, evident in the early months of the year, did not bring about any impressive rise in equity values. Almost until August, the pattern of trading in the stock market was two-sided. In August-September, new peak levels were reached and industrials in general were buoyant. But this bullish phase was like a flash in the pan and all the industrials were once again back to their bottom in the subsequent months when the Government initiated a series of measures to curb the rising trend in prices.

Towards the close of July, the nationalisation of the Suez Canal produced a flutter and as the situation deteriorated, nervousness and uncertainty became more pronounced. Contrary to normal market reaction to war scare, the continued tension over Suez failed to bring about a rise in prices as operators were acutely conscious that a prolonged stalemate in Suez would severely impair the progress of Second Five-Year Plan. . It is this fear of a possible set-back to national development which dictated caution. Indeed, this was more than evident in the reaction of the market to the brink-of-war developments in West Asia. Until peace is restored and the Suez canal is reopened for traffic, the stock market cannot be expected to give a better showing.

Cotton

Bearish Trend

COTTON futures, it will be recalled, had a complete 'black-out' until mid-June. When trading was eventually resumed, it was on the basis of two contracts instead of one, a departure from past practice. Trading since June has been distinctly cautious, as operators were wide awake to the possibility of further intervention on the part of the Government or the Forward Markets Commission.

If the market had been on the leash, as it were, for the greater part of the year, what about the prospects in the New Year? The statistical position of cotton clearly shows that there is everything to be gained and nothing to lose. Production has been on the increase; so also consumption and exports. In fact, India became a net exporter of cotton during the 1955-56 cotton season, a striking proof of the progress that the country has been making in the development of raw cotton. Production of raw cotton is currently estimated at around 53 lakh bales, and mill consumption at around 46 lakh bales. Consumption will naturally increase if and when the ceiling on mill-production of cloth is removed, as indeed Government is likely to do sooner or later.

The performance in the piece-goods market during Divali was poor in the extreme as compared to phenomenal volume of sales registered in the previous years. Poor offtake of cloth means accumulation of stocks with mills which is hardly conducive to better sentiment in the raw cotton market. All these factors have contributed towards maintaining a more or less bearish trend in cotton futures market. Suez crisis has prolonged it. The blocking of the Suez route, shipping difficulties and consequent rise in freight charges will not help exports, however cheap our raw cotton may be. And exports have been one of the bright spots during the year.

Oilseeds

Firm Divali to Divali

THE oilseeds market ruled firm early in October-November last year and the same trend is noticed this year also. In fact, relatively better sentiment has prevailed since July on reports of damage to crops from heavy rains in the groundnut producing areas, and better export outlook for castor oil in the USA and the UK, not to mention expectation of a reduction in the export duty on linseed oil since materialised (on Sept 21, 1956) and the higher prices obtained for oils and oilseeds in the overseas markets. From February to July, the market remained somewhat weak as buyers held off and quotations from overseas markets were also lower. Sentiment was also affected by the ban on exports of mustard and rapeseed oils effective from May 16, 1956. Fear of burdens in the forms of increase in excise duty, cess or export duty on vegetable oils in the Central Budget had inhibited activity earlier.

Towards the close of the year, linseeds came into prominence as a result of abolition of export duty and the subsequent improvement in the internal demand and improved export prospects.

Sentiment in regard to groundnut and castor has also been influenced lately by crop prospects. In groundnuts, downward revision of the crop estimates in Gujerat, Saurashtra, etc led to a generally firmer trend. In castor, however, the downward revision of crop estimates in Brazil spelt better prospects for the offtake of Indian castorseed and oils by the USA. In the event, both groundnut and castor were moving around the higher levels.

The Indian Iron and Steel Company Limited

Notice

NOTICE is hereby given that the Annual General Meeting (being the Thirtyninth Ordinary General Meeting) of the Company will be held at the Registered Office, 12 Mission Row, Calcutta at 11 a.m. on Friday the 30th November, 1956 for the following purposes:

1. To receive and adopt the Audited Accounts for the year ended 31st March 1956, and the Directors' and Auditors' Reports thereon.

2. To declare a dividend on the Ordinary share capital. The dividend, if declared, will be paid on or after the 17th December, 1956 to those Shareholders whose names appear in the Company's Register on the 30th November, 1956 or to their mandatees.

3. To appoint Directors in place of those retiring.

4. To appoint Auditors and fix their remuneration.

5. As special business to consider and if thought fit to pass with or without modification the following resolutions which will be proposed as special resolutions.

(1) That sub-clause 3(16) of the Memorandum of Association of the Company be deleted and substituted by the following two sub-clauses:—

"16(a) To subscribe contribute or guarantee money for any national, charitable, benevolent, political, public, general or useful object or fund or for any exhibition".

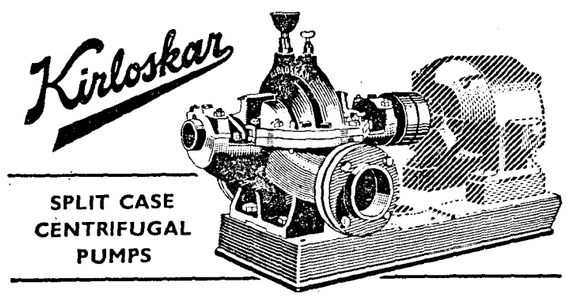
"16(b) To establish and support, or aid in the establishment and support of associations, institutions, funds, trusts and conveniences calculated to benefit persons who are or have been employed by or who are serving or have served the Company or its predecessors in business or the dependents or connections of such persons and to grant pensions and allowances and to make payments towards insurance".

(2) That Article 150(18) of the Company's Articles of Association be deleted and substituted by the two following sub-clauses:—

"(18a) Subject to the provisions of Section 293 (1)(e) of the Companies Act 1956 to establish maintain support and contribute or subscribe to any national, charitable, benevolent, political, public, general or useful object or fund and any institutions, society or club, which may be for the benefit of the Company or may be connected with any town or place where the Company carries on business".

"(18b) To give pensions, gratuities, allowances, bonuses, profit sharing bonuses or benefits or other charitable aids payments or monies to or for the benefit of persons who are or have been employed by or who are serving or have served the Company or its predecessors in business or the wives, children, dependents or connections of such person or persons as may appear to the Directors just and proper whether any such person his widow children or dependents or connections have or have not a legal claim upon the Company".

6. As special business to consider and if thought fit to pass the following resolution, namely:—



"That the Books, Registers and other documents required to be maintained by the Company and kept open for inspection under the provisions of the Companies Act, 1956, and particularly under Sections 49, 118, 144, 163, 196, 301, 302, 304, 307, 362 and 372 of the said Act, shall be available for inspection at the Registered Office of the Company by the persons entitled thereto to the extent and in the manner and on payment of the requisite fees, if any, specified in the aforesaid provisions, between the hours of 10 a.m. and 12 noon on each business day. Provided, however, that the register required to be maintained under Section 307 of the Act shall be open for inspection of the members or holders of debentures of the Company between the times above mentioned only during the period prescribed by sub-section 5(a) of Section 307".

The Share Registers and the Transfer Books of the Company will be closed from the 20th November 1956 to the 30th November 1956 both days inclusive.

A member entitled to attend and vote at the Meeting is entitled to appoint a proxy to attend and vote on a poll instead of himself and a proxy need not be a member.

The Bank of India Ltd. Head Office Building in Bombay

A half century of Banking

'IT is believed not only that there is ample scope for a Bank of this kind but that there is a very pressing need in the trading community for a larger measure of the financial facilities which such a Bank would afford, and that there is every prospect that, if worked on sound principles and under prudent and careful management, such a Bank, while supplying a need to and conferring a boon on the people of India, would, at the same time, itself become a prosperous and lucrative concern.'

These words are from the first prospectus of the Bank of India Ltd., which started on 7th September 1906 with an issue of Rs 50,00,000. Small beginnings indeed, but even then its founders predicted a great future.

Today, with 36 Offices throughout India, the Bank has amply proved itself. It is represented overseas by 11 Branches, it has 92 Foreign Correspondent Banks abroad and Agents in most foreign centres. Its staff, in India alone, totals over 2000. The Bank has a Paid-up Capital of Rs 2,50,00,000, a Reserve Fund of Rs 3,52,00,000 and a Working Capital of nearly Rs 100 crores.

Not chance, but prudence, caution and wise stewardship have been the cornerstones of the Bank's success. Thus, for the past 50 years it has withstood the trials of two world wars, banking crises, market fluctuations and political changes; and continues to play a vital, ever-increasing role in Indian commerce and industry.

All types of Banking business transacted :

Current Accounts — Savings Bank Accounts — Fixed Deposits — Loans and Overdrafts — Cash Credit Accounts — Discount of Bills and Hundis — Safe Custody — Foreign Exchange and Letters of Credit — Demand Drafts & Telegraphic Transfers — Executor and Trusteeship — Safe Deposit Vaults — Guarantees etc.

Figures on 30-6-1956

Capital Authorised	Rs 5,00,00,000
Capital Subscribed	Rs 5,00,00,000
Capital Paid-up	Rs 2,50,00,000
Reserve Fund	Rs 3,52,00,000
Deposits	Rs 75,58,47,500
Working Funds	Rs 97,35,67,500

Bandung Way to Peace

IT would be idle to pretend that the approach of four of the five Colombo Powers to the situation in Hungary and in Egypt is not different. But this is not the central theme of the joint statement issued by the Prime Ministers of India, Indonesia, Burma and Ceylon. Their main emphasis is on the imperative need "to support and strengthen the UN in its task of preserving peace". Thinking persons throughout the world will echo their concern over the aggressive designs of Big Powers. "Recent events have demonstrated with startling clarity that", they warn the world, "strong nations can still commit aggression on weaker countries and attempt to impose their will upon them, resulting in bitter conflict and human suffering". It was too hastily assumed that nuclear weapons had succeeded, where the United Nations had failed, in preventing a third world war. Events in Egypt may still be cited by some in support of the old theory of world balance of power. But many will deplore the development in Egypt as a sequel to regional military alliances and the consequent undermining of the authority of the United Nations.

Two problems arise out of the recent alarming developments in Egypt and Hungary. Can the United Nations tolerate, or allow, ugly demonstrations by Big Powers, that might is right? This theory of international relationship has been discarded long ago. Colonialism has been equally denounced. But, recent world events are poignant reminders that neither colonialism nor the suppression of the weak by the strong powers is a thing of the past. To maintain peace, the United Nations were formed. One of the main functions of the United Nations is to eliminate the sources of world conflict. To preserve world peace, the United Nations must have both moral and military authority. It has been one of the flaws of the United Nations that more time and energy have been wasted in espousing the principle of collective security. Since the "cold war", regional military alliances and pacts have undermined the basis of collective security. In the present state of the world, the principle of collective security cannot be abandoned. But its implementation in Korea has disclosed that the principle can be exploited by some Big Powers. For the first time, the United Nations have created an international force for operation in Egypt, which is truly international. There are many who are convinced that without the authority of decisive military sanction, the United Nations must remain ineffective.

This is a counsel of despair. Four of the five Colombo Powers have reiterated their conviction that "the only way to peace is through the practice of the Bandung principles". There is no conflict between Bandung and the United Nations. But some of the stronger member-States have been accused of aggressive designs. Many Asian and African countries have emerged recently as independent nations. In others, the struggle for freedom continues. All Asian and African countries are militarily weak. These small nations are, therefore, all the more alarmed at the revival of colonialism and of the attempts by the strong nations to commit aggression on weaker countries. Amity among Bandung countries and the failure of the United Nations to stop aggression by the Big Powers lend weight to four Colombo Powers' insistence that world peace

can only be maintained on the basis of freedom and disarmament. These are the two principles which the United Nations must strive urgently to implement. Then alone can the United Nations function effectively, and world peace be ensured. These basic issues are not unrelated to the recent tragic developments in Egypt and Hungary. Egypt and Hungary are likely to be repeated unless the United Nations make determined efforts to create the fundamental conditions of world peace.

Even those who deplore the inability of the United Nations to solve these basic issues will appreciate the prompt response of the UN to developments in Egypt and Hungary. There is now cease-fire in Egypt. But the aggressors have agreed to cease fire on certain conditions. Israel, Britain and France have not yet withdrawn their armed forces from Egypt. In refusing to withdraw their troops, except under certain conditions, these aggressors are violating the directions of the General Assembly. Under the resolutions passed by the Assembly, member-States are commited to support the United Nations in restoring **status quo ante**. Prime Ministers of Colombo Powers have underlined the directions of the General Assembly by demanding immediate and unconditional withdrawal of foreign forces from Egyptian territory. They endorse President Nasser's opposition to the Anglo-French attempt to resume control over the Suez Canal by their emphatic opposition to intervention in the affairs of another State, meant to protect special interests, but which "is sometimes justified on the plea of international cooperation". This is the essence of the Suez Canal problem.

Four of the five Colombo Powers, who had discussions on recent world events in New Delhi this week, are as much distressed by "the tragic events in Hungary" as by the aggression in Egypt. They are as emphatic about the withdrawal of Soviet troops from Hungary as about the withdrawal of foreign troops from the territory of Egypt. They are as much concerned about the relief of distress in Hungary as of the need for relief in Egypt. But it is evident from the statement issued by the four Prime Ministers that their approach to the issue in Hungary is different from that in Egypt. Their accusation of Israel, Britain and France is without any qualification, but Russia is not accused of committing aggression in Hungary. They are diplomatic in their treatment of the Hungarian problem. Unlike the AICC, they do not talk of the "civil conflict" in Hungary. But they deplore that large-scale violence "used on all sides" has resulted "in the killing of thousands of people, and has brought misery and destruction to that country (Hungary)". Confusion widely prevails on the Hungarian issue. Russia has been severely condemned for her military action in Hungary. There will be no quarrel with the four Prime Ministers' espousal of "the inalienable right of every country to shape for itself its own destiny". But the realistic appraisal of the developing situation in Hungary, contained in our last week's issue, is confirmed by Mr Walter Lippmann. The Hungarian drama is doubly tragic. It is tragic to see so brave a people crushed. It is also tragic, Mr Lippmann rightly concludes, in the sense that the outcome has been "fatally ordained" since the Nagy Government "lost control of the rebellion".

Eastern Europe's future is far more important than the issue of Russia's recent action in Hungary. Because of the deeper issues involved, it is deeply to be deplored that Russian troops had to re-enter Hungary after their evacuation from that country. There would have been unqualified support of the Hungarian resistance to Russia had it been sponsored and supported by the Hungarian people and workers. The Hungarian people and workers are much more determined than the reactionary rebels that Hungary should be treated on an equal basis by Russia. Like Poland's, this legitimate aspiration of Hungary would have been conceded by Moscow. But the reactionary counter-revolution has introduced additional complications. Fears have been expressed that the Hungarian rebellion compel the Kremlin to abandon the recent efforts towards the establishment of a "commonwealth of Socialist States". Time alone can reveal whether such apprehensions have any basis. In Hungary, the regime sponsored by Moscow has announced its intention to broaden the basis of the administration. Hungarian experience has not provoked Moscow to reverse its policy to Poland. Neither in Poland nor in Hungary, the process of liberalisation of the administration will be jettisoned. There is yet no indication of a revival of Stalinism in Russia. Whether the Warsaw Pact can be abolished without NATO's liquidation, is a relevant question. But far more significant is the question whether the Hungarian experience will provoke Russia to reverse her plans for creating a "commonwealth of Socialist States". That would be a tragedy for Russia as well as for her neighbouring Eastern European States. There will, meanwhile, be hope that the Kremlin will have the imagination and the statesmanship to proceed with the plan for a "commonwealth of Socialist States", undeterred by developments in Hungary.

Monetary Stringency

MONEY market stringency in what would still be the slack season or at best, the threshold of the busy season by an earlier reckoning, has reached a point that the Finance Minister had to come down to Bombay and Calcutta to confer with bankers. If money market conditions are abnormal judged by past criteria, the method of seeking a solution is no less unusual, going by past conventions. Stricklers for correct form may have their misgivings about leaving the bank rate or monetary policy to be determined by such democratic methods. But one should not perhaps cavil at the means employed provided the ends are adequately served.

At the conference convened by the Reserve Bank, the Finance Minister discussed with the chief executives of the scheduled banks "recent monetary and banking trends and the measures necessary to meet the credit requirements of the coming busy season". At the end of the conference in Bombay, the following press communique was issued:

"Among the matters discussed were the rising trend of bank advances, the relationship between deposit rates and advance rates, the impact of large import surpluses during recent months on the domestic money supply, delays in the payment of supply bills by Government, and the small increase in bank deposits as compared with the increase in note circulation. The talks were of an exploratory character and no decisions were taken".

That stringency is acute, there is no question. The absolute volume of bank advances, the percentage of advances to total assets of the banks and non-availability of credit at current money rates—all show how

severe it is. The question is, what is the reason for this severe stringency? It is not possible to relate the stringency directly to the loan floatations in July or September. If Government borrowing had denuded the market of funds, Government balances with the Reserve Bank would not have come down as they did over the past three months. Nor can the stringency be accounted for by the slow or tardy return of currency to the banking system which is the normal experience of slack seasons. There has been a drop of Rs 96 crores in note circulation from the peak reached in the busy season (second week of May) to the low of the slack season (third week of October). In fact, the volume of return of currency from circulation this year has been the largest in the last five years. For a comparable figure, we have to go back to the slack season of 1953, when contraction of note circulation reached Rs 91 crores. But there is a significant difference. While the contraction of currency was highest this year, there has been no comparable or even significant drop in advances; in fact bank advances at the end of October were only Rs 11 crores lower than what they were at the peak of the busy season. This again is the lowest slack season decline in the past five years.

The most outstanding development in the last few months, however, was the heavy deficit in foreign payments, which led to a decline in the foreign assets of the Reserve Bank of Rs 126 crores, compared to the nominal decline of only Rs 1 crore last year. This was many times larger than the decline in any year during the past five years. The loss of sterling assets has been an important contributory factor, if not the principal factor, responsible for the stringency. This is because the loss has not been off-set by budgetary deficits to any considerable extent. This must be deliberate and the question naturally arises, what was the intention of the authorities in allowing balance of payment deficits to produce such a markedly contractionist effect on the money supply?

The only explanation for following such a course of action can be that the authorities were alarmed by rising prices and therefore did not feel it necessary to off-set the loss of foreign assets by timely and adequate remedial action. It is also possible that the structure of bank assets have been so distorted by the strains to which they have been subjected that they may have found the scope for open market operation too limited, and relied on borrowing from the Reserve Bank to provide the needed measure of elasticity.

Judging from the outside, and viewing the situation in retrospect, the authorities appear to have shrunk from facing the issue of adequacy of credit supply squarely and relied on qualitative control, through directives to scheduled banks, to keep the situation in hand. The latter, however, though certainly a move in the right direction offers no escape from the question of deciding the adequacy of credit supply in a given situation and of devising some tests for judging it. How to determine the right volume of credit supply in a mixed economy where a measure of expansion is also considered desirable in the unplanned sector and allowance has necessarily to be made for financing the larger volume of trade which must go hand in hand with the progress of planned development? Commercial banks cannot very well neglect what is their primary function nor can they decline to shoulder additional responsibilities for financing some needs of industry which would be left elsewhere to specialised institutions and a more active capital market.

Whatever the tests that the authorities may have in mind, surely money supply should not be allowed to follow mechanically fluctuations in foreign balances? The money market had been insulated, as a matter of fact, in the past against external influences more by accident than by design; this had enabled it to maintain its interest rate structure unaffected by the rapid rise in most money markets abroad. Since international equilibrium is not sought to be maintained, anyway, by operating on domestic money supply, it is difficult to see the rationale for allowing the effects of fluctuations in foreign balances to be passed on to the internal economy.

Once it is conceded that money supply should not be allowed to fluctuate with every fluctuation in the balance of payments, there remain only two sources of augmenting or reducing money supply viz budgetary deficit or surplus, and open market operations. Budget deficits result from various causes. They may arise because they cannot be helped or the budget may be deliberately unbalanced in order to achieve certain desirable results. But neither the circumstances which determine the size of the budgetary deficit nor the operations of the Reserve Bank suggest that the volume of this deficit can be regulated or has been regulated in order to meet the legitimate demands of the money market in the present phase of expansion of the economy. Far from being guided by the latter, the Reserve Bank has been unduly inhibited in its monetary policy by what it vaguely suspected to be symptoms of inflationary pressure. While it must put down speculative demand, how can it deny the legitimate demand for credit which the economy needs if it is to perform its tasks?

The banking system, under the strain to which it has been subjected by the lack of a sensible monetary policy, has developed some undesirable features which have drawn wide attention. The unseemly competition for deposits among scheduled banks and lack of any relation between borrowing and lending rates are some of these. Both the problem of inter-bank competition for deposits and rates to be charged on advances however, are for the bankers to solve in their own way. What stops them from charging more for advances, if that is what they want to do, feel they should do, is the fear of losing deposits to others. Here the position is complicated by the differences in status of the State Bank, which does not have to fear withdrawal of deposits as much as the others, and of the exchange banks, which operate on such a comfortable margins that they have a clear advantage in competing for deposits, as compared to the Indian joint stock banks.

It would be unfortunate if the fractional increase in lending rates announced by the Reserve Bank under the Bill Market Scheme leads to a general rise in advance rates. In so far as the concession hitherto given for popularising this particular form of lending is no longer necessary, the change is justified in that it rationalises the lending operations of the Reserve Bank. It is to be hoped that this slight adjustment will clear the decks for smoother and more vigorous open market operations. But it is also to be hoped that the intention is not to force money rates up for which it would be difficult to find justification since the Reserve Bank cannot seriously be thinking of curbing inflationary pressures through monetary discipline.

Weekly Notes

Adverse Terms of Trade

ECONOMICS is as open to changes of fashion as frocks. For some time past our pre-occupation with other, and perhaps more vital, issues has thrown into relative disuse the rather vital concept of the terms of international trade. With a very meagre domestic savings potential, and a not-too-bulging fund of foreign borrowings, even slight movements in these terms are capable of having quite considerable effects. Of course as the country's imports consist increasingly of machinery etc. under medium and long term contracts—not infrequently entered into in a hurry—the import price index will lose some of its characteristics, both of flexibility and variety. As a longer term effect, it may be pointed out that the servicing of these debts now being incurred will again bring into prominence the question of the terms of trade. But that can wait for the moment.

The latest statistics of movements in the terms of trade show some rather disquieting features. The terms of trade (average value of index of imports divided by the average value index of exports) with base 1952-53 = 100 stood at 99 in 1953-54. In the following year it came down to 91, showing a gain to the country. But since then there has been a dangerous rise—in 1955-56 it was 97, and in the first quarter of 1956-57, it stood at 100. How far the removal and, in other cases, the lowering, of export duties have affected the terms need to be examined. While we must export to live, we cannot subsidise our exports.

1953-53=100	Exp	Imp	Terms of Trade
1953-54	94	93	99
1954-55	98	89	91
1955-56	90	87	97
1956-57 I	89	89	100

Net Investment in U K

A RECENT White Paper had shown that in the U K, prices had risen since the war mainly because home costs had risen faster than the national output. The latest National Income Blue Book has given some further details of this process, as also making available for the first time official figures which divide the total fixed investment between capital consumption and net investment in the U K, for 1938 and 1948-55.

In 1955, wages and salaries comprised two-thirds of total home costs. Gross profits i e profits of corporate enterprises before taxation, depreciation or allowance to reserves—these reserves are the main sources of funds for new industrial investment—make up one-fifth of the total home costs. Other incomes make up the rest of home costs.

Between 1954 and 1955, total home costs per unit of output rose faster in 1955 than in 1954. While in 1954 wages and salaries per unit of output and profits per unit of output rose by about the same amount viz 2 per cent, in 1955 wages and salaries per unit of output rose by as much as 5 per cent as against a 1 per cent rise in profits per unit of output. The rise in wages and salaries is common to all industrial sub-groups—manufacturing, mining and quarrying, building and contracting, and electricity, gas and water.

This position compares unfavourably with the recent report by officials on German competition which suggests that between 1950 and 1955 labour costs per unit of output in manufacturing industry rose by more than a quarter in the U K and only about 2 per cent in Germany. From 1954 to 1955 they do not appear to have risen in West Germany.

Every year since the war there has been an increase in the volume of resources put into fixed investment (i e excluding stocks. Part of this is to offset capital consumption (the using up of assets by wear and tear and obsolescence). The rest, net investment, is the real addition to capital assets. By excluding housing from the data relating to capital consumption and net investment, it is possible to get an approximate idea of what may be termed "production" investment. The main conclusions are:

(i) By 1950, total net investment had recovered to 93 per cent of 1938. By 1955 it was 37 per cent above 1938.

(ii) By 1955, net investment in plant and machinery was 152 per cent higher than 1938.

(iii) In 1955 net investment in housing was only 88 per cent of 1938.

(iv) As an inevitable concomitant of a growth in the stock of capital assets, capital consumption in 1955 was 40 per cent higher than in 1938.

(v) As a proportion of national income, net fixed investment was 6 per cent in 1938 as well as in 1946-52, but 8½ per cent in 1955.

Heavy Machinery Plant for Durgapur

TO build a heavy engineering works in the vicinity of Durgapur, West Bengal, a new company is being formed with British and Indian interests. The Associated Cement Co. Ltd., of Bombay, and Vickers Ltd., and Babcock & Wilcox Ltd., of London, have concluded arrangements for the formation of this company which is to be known as ACC-Vickers-Babcock Private Ltd. (AVB).

The new company plans to build a heavy-engineering works to manufacture cement-making machinery, mining machinery, large pumps, heavy gears, steam generating plant of all types, pressure vessels, cranes, and mechanical-handling equipment. Construction of the AVB works will begin as soon as the Government of India's approval—now being sought—has been obtained.

Tata's Contribution to Training of Engineering Personnel

HOW far has Tata Steel Works been able to carry out Jamshedji Tata's injunction "Let the Indian learn to do things for himself"? A sympathetic American observer who has been studying conditions of industrial labour in this country but would not care to be dubbed as a labour economist was puzzled somewhat that after being the pioneers in the manufacture of steel and nearly half a century of experience, the company should have to depend on foreign technical assistance so heavily in carrying out expansions to their plants, however large the expansion might be. This is not a studied observation but a first thought. Perhaps the answer is that the type of technical assistance that is needed for the expansion of plant capacity that has now been undertaken cannot be developed except by a country which has made much greater progress in steel making, at least quantitatively, than we have done.

Development of steel technology labours under certain handicaps which are not often realised. For a variety of reasons it has to be a slow process. For one thing, new techniques are costly; they cannot be developed in a laboratory. Even pilot plants are not enough for only a plant of minimum capacity may be expected to remove the errors of radiation losses etc, cases where rules of similarity can be applied are very rare. That is, where, say, a 1/10th scale model can be used for quantitative examination of changes which occur on the industrial scale are not many. So, much of the research has to be carried out either in the plant or on a scale which is not too different. This raises expenses and resources available to managements, even in the most prosperous units, are not adequate for their needs. From the stand point of technique, the result is conservatism. The tendency is to favour construction of conventional plant rather than run the risks inherent in developing new processes. Indeed conventional processes have been gradually perfected—empirically—over several decades to such a state that isolated changes can hardly fail to be harmful. Even under these handicaps, advances in steel technology are so remarkable that the Economic Commission for Europe has found it worthwhile to publish annual reports on the subject!

To what extent these impediments to experimentation and new developments in technology have stood in the way of turning out steel men of the required calibre who can undertake independently large scale projects of construction is a question that can be answered only at the highest technical level. If we have not come up to that level, it does not follow that the founder's injunction has not been carried out by Tata Steel Works. In fact the Jamshedpur Technical Institute, which celebrated its 35th anniversary this week has been a perennial source of supply, and a very fruitful source, of trained personnel of high calibre, not only to the Tata's and other engineering firms all over India but also to Government departments. By turning out a large number of qualified Indian personnel to take over key jobs, the Institute has certainly helped to fulfil Jamshedji Tata's injunction. When the Institute started, the Tata Steel Works employed some 250 foreign technicians. Today, this number has dwindled to a mere half a dozen, largely due to its effort. This is no mean contribution by itself, but it by no means gives an adequate idea of the total contribution..

Junior Supervisory Staff

IN its pioneer work in the early days, the Jamshedpur Technical Institute had a humbler mate, whose services should also not be forgotten. It was the technical wing of the National University set up in the early days of the Swadeshi movement, the wing that survived the frowns of the Government of the day. It has now developed into a full fledged University and is contributing its share to the training of technical personnel. An essential and an important part of the programme of expansion of manufacture of steel is the training of technicians on a scale hitherto unimagined but which may soon prove totally inadequate, if the target of steel production has to be stepped up at the rate contemplated in the Third Five Year Plan. In the programme of training now being undertaken on the recommendations of the Engineering Personnel Committee, 8 out of the 18 new degree colleges and 29 out of 62 polytechnics are to be set up in the Eastern Zone—West Bengal, Bihar, Orissa and Assam. The Ministry of Education of the Government of India has accepted these recommendations which are now being implemented.

It is easier, however, to open new engineering schools and colleges than to provide facilities for practical training for the trainees, whether they are diploma holders or graduate engineers. Engineering establishments have little spare capacity for the purpose and attempts are being made by the Ministry of Iron and Steel to utilise what spare capacity there is, by farming out trainees among them. The problem of training up for junior supervisory positions is the hardest, if only because the number to be trained up is so large. The magnitude of the problem may well be inferred from the numbers who are being sent abroad by the Ministry of Iron and Steel to Soviet Russia, U S, U K and Germany.

Whatever your risk—

We will safeguard you against it!

NEW INDIA ASSURANCE ... pioneers in Indian insurance, respected and trusted throughout the East. We cover you against all kinds of risk from marine and fire to accident and burglary ... offer you prompt settlement of claims ... guidance and assistance in all matters ... security and service born of years of experience.

For *all* your General Insurance ... rely on New India!

Mahatma Gandhi Road, Bombay

Forward Trading in Jute and Jute Goods to be Resumed

A CRYPTIC press note from New Delhi has announced that Government has accepted the recommendation of the Forward Markets Commission that forward contracts, of the specific delivery type as well as others, in raw jute and jute goods may be permitted within the city of Calcutta and nowhere else in India. It was four years ago that Government suspended forward trading in Calcutta after there was detected a very large volume of speculative transactions of a nature detrimental to the industry. All sections of the raw jute and jute goods trade suffered to varying degrees as a result of this continued ban on forward trading in the last four years. Perhaps the worst sufferers were the raw jute interests. The Forward Markets Commission visited Calcutta more than once, and held discussions with the Indian Jute Mills Association and raw jute interests. The end is now almost in sight, and before long, the regular exchange should be functioning and when a properly organised exchange starts, working, it is fervently hoped that the disreputable Katni market will wither away. But these four years have given the Katni market both experience and strength. It is only if the numerous big interests in the raw jute and jute good sections turn deliberately away from it that the Katni market will weaken, and eventually come to an end.

The press note adds that while the East India Jute and Hessian Exchange Ltd, the largest and best organised of the jute exchanges of Calcutta, has been recognised, the final sanction before transactions can commence is conditional upon this exchange previously adopting such Articles of Association as would satisfy the Commission. During the last couple of years, there have been a series of meetings on this very question, and one wonders how the Commission could recommend, and the Government accept the recommendation, that forward trading in jute and jute goods be allowed and that East India be recognised, without previously approving the Articles of Agreement of East India, specifically the provisions relating to the representations of the various interests on the Exchange and the terms and conditions of business, including the safeguards and emergency provisions? This is like putting the cart before the horse.

INVEST WISELY AND WELL

You may be prudent enough to save a portion of your income, but perhaps you are hesitant to decide on a safe investment.

Let this not disturb you. Your Bank is in touch with the leading brokers and will make their expert advice available to you quickly and without charge.

Your Bank will also keep your investments in safe custody and collect and credit to your account interest and dividends as and when they fall due.

It does not matter where you reside—the State Bank of India has a net-work of offices through which it offers to place these and other services at your disposal.

Why not talk things over with your nearest Bank Agent or write for information?

The State Bank's local head office at Bombay, one of more than five hundred offices waiting to serve you throughout India.

Baghdad Pact Lingers On

PANDIT NEHRU may be hasty in his inference that SEATO and the Baghdad Pact are to be regarded as casualties of the aggression against Egypt by Israel, Britain and France. There is no doubt that Muslim members of the Baghdad Pact are embarassed over the aggression in Egypt. At the recent Teheran Conference, they have condemned Israel, Britain and France as aggressors and have demanded the withdrawal of foreign troops. But Turkey, Iraq, Iran and Pakistan do not seem opposed to the continued existence of the Baghdad Pact. They have not explicity disowned Britain, though they have been strong in their condemnation of the Anglo-French aggression against Egypt. Britain has lost prestige in the Muslim world, while America has gained ground in Arab States.

Turkey was the ostensible sponsor of the Baghdad Pact as an alliance of west Asian States against Russia. Britain entered the Pact to maintain its defence commitments to Iraq as well as to strengthen a military alliance aimed against Russia. Iran was cajoled into the Baghdad Pact because of her strategic position. So was Pakistan. America welcomed the formation of this northern tier of defence in west Asia against Communist Russia, but did not become a full member of the Baghdad Pact. This Pact was resented alike by India and non-participating Arab States on similar grounds. India and these Arab States are opposed to military alliances for two reasons. One is that these alliances do not ensure, but disturb peace in the regions concerned. No less significant is their other objection that such regional military alliances are exploited by outside Powers to maintain their spheres of influence in the regions concerned.

Both Britain and Turkey have tried to exploit the Baghdad Pact for perpetuating their influences in Arab States. These attempts have had the opposite effect. Arab States of west Asia are suspicious of the designs of both Turkey and Britain. With the possible exception of Iraq, Britain has now no friend in the Arab world. To Turkey, even Iraq is not friendly. Cairo has not only succeeded in resisting Ankara's efforts to dominate Arab States. President Nasser has won Arab States to his policy of freeing west Asia from British and Western domination. Simultaneously, Britain's policy to Cyprus has antagonised Turkey. Not only has the Baghdad Pact offered Russia the opportunity to enter the West Asian scene, it has consolidated Arab States in their opposition to Turkey. The Pact may linger on. But it is not likely to remain in active existence.

"Ike" Again

AMERICANS like "Ike". Mr Eisenhower's victory in the Presidential elections was expected. But disturbing developments in Egypt and Hungary immediately before the elections may explain his landslide victory. No other President, with the exception of Franklin D Roosevelt, has been as popular or as respected in America in this century as Eisenhower. Despite his recent ailments and the political complexion of his running mate, the American people have voted Mr Eisenhower back to power in the belief that he is better fitted to preserve world peace and to maintain American traditions and culture. Mr Eisenhower's attitude to developments in Egypt and Hungary has enhanced his prestige with the American people.

Mr Eisenhower is a soldier-statesman. Not only the American people, but the world outside has had more than one occasion to appreciate his restraining influence on his Secretary of State and on Pentagon. Even as he is widely respected as a man of peace with honour, the American people have voted him back to power because they have confidence that, in the event of a global war, Eisenhower is the best President that the country can have. There are few statesmen in America or in any other country who can, like Mr Eisenhower, be regarded as the best choice for peace or for war. Mr Adlai Stevenson has many qualities. It has been his misfortune that twice he has had to contest the elections against Mr Eisenhower. Tradition is against his nomination for the Presidency for the third time, even as it is against a third term for the same President. This is all the more unfortunate for Mr Stevenson.

Mr Eisenhower has been the people's choice for the second term. But they have not voted the Republican Party back to power. Both the Houses of the Congress are now controlled and dominated by the Democrats. This is an unmistakable evidence of the American voters' political maturity. They like "Ike", but they have no faith in the Republican Party. This verdict of the American people will be endorsed by the outside world. In the last two years, Mr Eisenhower has shown that his foreign policy is not influenced by the Right-wing of his Party. In the next four years, he will have to depend on the Democrats for carrying on his administration. There will have to be an unofficial coalition Administration in America for the next four years. This may create certain conflicts in President Eisenhower's domestic policy. But the consequences of such an unofficial coalition on Washington's foreign policy for the next four years will not be unwelcomed by those people or countries who adhere to the principle of solution of world disputes through negotiation.

"He who is firmly seated in authority soon learns to think security."

J. R. Lowell.

Letter to the Editor

Time and the Choice of Technique

THE article in your issue of September 15 by Mr Chakraborty on 'Time and the Choice of Technique' raises a point of great importance, but his conclusion appears to be standing on its head.

If two types of plant promise the same annual surplus of value of output over current costs (gross-return) per unit of initial cost, while one is more durable than the other, clearly the more durable is to be preferred. The advantage of the more durable plant shows itself in lower ratio of amortisation to gross output, and so a higher rate of net return on the investment. About this there is no disagreement. But in such a case there is no question of a choice of technique. In getting a more durable plant at the same cost as a less durable one we are getting something for nothing. The question of choice arises when there is a cost of durability, that is when the less durable plant has a lower initial cost, so that, it promises a higher annual gross return per unit of initial cost over its life.

Suppose that, of two plants each costing 100 to instal one promises 15 of gross return per annum for 10 years, and the other 25 for 5 years. Then each can be amortised over its life (the first at the rate of 10 per annum and the second at the rate of 20 per annum) while yielding a net return of 5% on its initial cost. If we neglect interest the two plants offer equally eligible investments. But interest cannot be neglected. Looking at the matter from the point of view of a private capitalist, interest on the amortisation fund has to be considered. Looking forward to the end of the fifth year if an investor has chosen the short-lived plant, he will have a capital of 100 in liquid form available to be reinvested in equipment representing a new incarnation of his capital, and he will have enjoyed 5% per annum on 100. plus interest on the amortisation fund, which will have gradually risen to 100 over the five years. If he has chosen the long-lived plant he will have a capital of 100, half in the form of the unexpired life of his plant and half in the amortisation fund. The amortisation fund will have risen only to 50 over the five years, and will have brought in so much the less interest. Thus the shorter-lived plant is the more promising investment, and its advantage is greater the higher the rate of interest.

When we look at the matter from the point of view of the national economy, we have to consider the annual contribution to amortisation funds as part of the national savings, representing resources available for investment. The return on investment is the increase in national product which additional capital makes possible. That part of the gross return on new capital which is not yet needed to replace it is invested in further new capital which yields a real return. When the time comes to replace the first incarnation of the capital there is a draft upon the real investible resources of the nation, which have meanwhile been swollen by the product of the investments that have been made out of the amortisation fund. Thus in the national calculation the real return on the investment of the amortisation fund plays the same role as the interest received on it in the private calculation.

The national return on investment is not a very precise concept, but in a developing country suffering from acute shortage of investible resources it must be very high. The higher this rate is considered to be, the greater the importance that must be attached to a high ratio of gross to net yield on the investment being planned today. This surely, is only common sense?

Looking at the question in terms of the capital-to-output ratio, the only way to compare capital ratios for techniques which require investments of different lengths of life is to reduce them each to terms of a perpetual investment (the initial capital of each kind being replaced, out of its own gross earnings, in a succession of new incarnations at the end of each period of working life). The true capital-to-output ratio in each case is the ratio, not of initial cost, but of the capital committed, to the rate of output. The capital committed, if we neglect interest, is simply half the initial cost, whatever the length of life of each incarnation may be. But when interest is taken into account, the ratio of capital committed to initial cost is greater the longer is the expected length of life of each incarnation of the investment. Longer-lived plant (compared to shorter-lived) represents a heavier investment, and can be justified only if it promises a correspondingly higher net return.

In any concrete case, of course, to work out the true social cost and the true social net return on any particular investment project is extremely complicated and must involve a great deal of rather rickety guesswork, but the above argument at least points to the sort of considerations that have to be taken into account.

Joan Robinson

November 5, 1956

In every country and in all ages, men
have associated light with knowledge
and power, prosperity and progress.

In India today, progress is reflected
in lights that shine in more and more homes
in villages and cities, as the power
of fast-flowing rivers is harnessed
in an increasing measure, and the energy
which lies buried in the earth, in coal
pits and oil pools, is unlocked.

A constant supply of our petroleum products
to major projects is a powerful factor
in speeding up the nation's progress.

From the London End

Eden's Forest Fire

THE public and parliamentary revulsion to all that has been done in the name of Britain has now been transformd in a unique manner into one of the most devastating attacks on the Prime Minister—an attack even more bitter and widespread than that which led to the downfall of Mr Neville Chamberlain in 1940. The cry is being made that "Britain's name is suspect, because Eden is suspect". The largest demonstration ever seen in Trafalgar Square since the days of the hunger marches in 1932 was organised at a moment's notice on the slogan "Eden must go and go now!" The forest fire which Eden claimed would develop in the Middle East is now sweeping British public opinion against him (and most remarkable of all not against his Government). Few British Prime Ministers have inflamed the public more than Eden.

It is gradually being revealed that each and every concession he has made to the United Nations was not the result of deliberate policy but of pressure from his own party and the British people. Never has the Government of the United Kingdom shown a greater bankruptcy in policy and action than now. And even then, whatever cohesion and unity was being maintained in the Cabinet, it was the result of Eden's threat (to his colleagues and his party) to request the Queen for a dissolution of Parliament and to call a general election—a prospect which every Tory knew could spell the end of Conservative rule for years to come. And so by concessions and threats he has managed to hold the reins of power. For how long? The **Economist** states that while "judgment on the Prime Minister is held suspended for the moment" the question of alternatives is being put "in the political corridors." It is certain that before the year is out Britain will find itself with a new Prime Minister. In Tory circles the name of Mr R A Butler is held high—he led the Cabinet revolt which resulted in the cease-fire in Egypt and it was he who recognized the threats contained in Bulganin's note. But even this choice is not certain. The powerful Lord Salisbury may have other choices in mind, particularly that of Mr H McMillan—a man who has supported Eden's adventures fully. The conflicts between the leading Tory personalities may thus make a general election inevitable.

Britain's Oil Supplies Now

The recklessness of Eden has resulted in those very jeopardies which the Anglo-French action was allegedly designed to avoid. The Suez Canal is now unlikely to be navigable for six months. More important, the supplies of oil to the United Kingdom and Western Europe have been seriously jeopardised. The seriousness of this latter prospect is indicated by the decision of the British Government to impose a ten per cent cut in oil consumption and rationing. United Kingdom's dependence on Middle Eastern oil cannot be exaggerated. Of the total Middle Eastern output of 162.5m tons in 1955, just under 50 million tons were produced on British accounts. Britain's net imports amount to over 33m tons a year and by far the greater proportion of these imports arrive from Kuwait, i e through the Suez Canal. Iraqi oil, which is supplied through pipe lines to Syrian ports, has been seriously damaged and Saudi Arabia has refused to supply oil to British tankers. The magnitude of the disruption in oil supplies that can result from the Middle Eastern war can be gauged from the fact that of the 146m tons exported from the Middle East in 1955, nearly 72 per cent came through the Mediterranean—65m tons in tankers through the Suez Canal and 40m tons through pipe lines to ports in Lebanon and Syria.

The quantity of oil that is stored in the United Kingdom has not been revealed for security reasons. It has, however, been estimated that United Kingdom's stocks amount to no more than 6 to 8 weeks' supply. With the Canal blocked, the pipe lines in danger and the American attitude far from clear, a quick and acceptable solution to the problems of the Middle East would appear to be the only feasible line of action, for any British Government at the present time. Asking for a quick solution from a Government led by so adventurous and stubborn a Prime Minister must depend in the final analysis, on the extent to which the Government itself can be extricated from the whims and fancies of such a leader.

This is by no means the only problem. The British dependence on the Middle East can also be gauged by the distribution of British's control over the various international sources of oil and petroleum. The British Petroleum Company's aggregate control on oil sources is concentrated wholly in the Middle East. None of the other major American and Dutch companies have all their eggs in the Middle Eastern basket. In the following table the stakes of the various oil companies in the Middle East are given in relation to each of their stakes in the total world supply of oil. It will be seen that the American companies—Gulf oil, Standard oil, Texas and Socony Mobiloil, each possess less than half of their total control in Middle Eastern region.

Stakes in the Middle East

British capital investments in Middle Eastern oil amount to about £ 200M and the easiest way in which this sizeable volume of British assets can be reduced to dust is to lose the confidence and support of the Arab peoples. This is precisely what the Anglo-French action has led to. In all, the irresponsible action of the British Prime Minister has been a spectacle which finds no parallel in the history of British Government.

Two Valuable Judgements

Community Developments in India. Report of a Survey by M L Wilson. C P A, July 1956 Pp 30.
A Critical Analysis of India's Community Development Programme. By Carl C Taylor. C P A, September 1956. Pp. 62.

Reviewed by **Evelyn Wood**

BOTH these Reports are written by distinguished, professional men of long experience who were invited to make their comments by what is now the Ministry of Community Development. Both men did so as Ford Foundation Consultants on *Community Development.* Their approaches to the Community Development Programme promoted by the *National Extension Service* are very different. Mr Wilson has been associated with the United States Extension Service for over fifty years; he thus looks at the situation in India primarily as one interested in Extension as education for economic improvement. Dr Taylor, on the other hand, has the more analytical view of a rural sociologist, and tends to see the programme as the controlled building of a more orderly kind of society.

Mr Wilson's observations were made during field-trips in March and April 1956, in which he visited 9 States, 17 Extension Training Centres, 19 Development Blocks either of NES or Community Development type, 35 villages and talked with about 40 gram sevaks. He has been in India before. In the winter of 1952-53, when he visited 6 States and 7 Extension Training Centres. Thus his observations were to some extent grounded to form an estimate of growth during the three intervening years.

Dr Taylor's study took much more time. In a full year from July 1955, he visited 14 States, 40 Development Blocks and 150 villages; and he talked with 10 "District Officers", who were probably the Planning Officers for Development, the States' Development Commissioners, and in the field with Block Development Officers, Extension Specialists and gram sevaks, besides village people themselves. Dr Taylor, too, had previously spent six weeks here in early 1953, and seven months from April to October 1954. His examination must therefore be more cumulative.

In their earlier pages, both men adopt the diplomatic manner of lavishing compliments on the magnitude, intensity and effectiveness of India's programme of Community Development through Extension processes. It is this characteristic of Mr Wilson's reports which was picked out for Press comment, while Dr Taylor's equally laudatory document has been publicized more for its critical content. In fact both men are actually critical of the whole structure of the Extension Service in India as a tool for rural development, which they see in different forms. Both men are repeatedly insistent that the gram sevak must be primarily an educator, and they see that there is a strong tendency to burden him with so many other duties that he does not get time to fulfil his educational function.

Both men are particularly critical of the Social Education Organisation, which bears more directly on Community Development, as such. Both men notice the need for some basic knowledge of the social sciences to be part of the training of all Extension workers. Dr Taylor, on page 50, is rather less specific about this, but his feeling that such knowledge is not in fact being acquired or built up seems to be the more intense. But Mr Wilson's page 14 is quite specific on this point.

A third, perhaps equally distinguished (but not so venerable) American social scientist, who has spent much time in India, has questioned the soundness of this rather fulsome manner of reporting on development to the Government of India. He suggests that when the appetite for foreign flattery has been satiated, there may remain no digestive capacity for the criticism. Further pursuit of this analogy would trespass on medical science.

Forms of Development

Mr Wilson on pages 22-23 puts his finger firmly on the only means of developing these useful forms of private enterprise in villages. Dr Taylor's comments on pages 60-61 are equally illuminating. Both men call for much more sharply defined working concepts of what co-operatives are, but of course Dr Taylor throws the net wider, as is natural to a sociologist. One very useful suggestion, for what he calls a "farm plan" appears on Mr Wilson's page 24-25; in several places besides this, he is particularly lucid about organized credit. From page 26 onwards, Mr Wilson draws parallels between the American and the Indian use of Extension as a means of community development which may be overdrawn; only time and the more careful studies of social anthropologists will be able to tell.

At the very end of his Report, Mr Wilson makes welcoming references to the Programme Evaluation Organization and to the National Centre or Institute for higher studies and training in the field of Community Development. He interprets both these as signs of great health and flexibility in the Indian programme of development. By this Institute he possibly means the National Institute for Fundamental Education, recently established by the Union Ministry of Education. Oddly enough he does not refer to the ten Institutes for Higher Rural Education which have also been recently promoted by the same Ministry. These Institutes seem to have been referred to by Dr Taylor on page 33, but he does not anywhere mention the Fundamental Education Institute.

Of course the subject is so vast that no person, however expert, can cover every aspect of India's programme of rural development. In fact the "uniqueness" of the Indian programme to which both men frequently refer, is characterized by the fact that the NES is supposedly ready to tackle any aspect of village life and work in which it appears that village people are ready for improvement. In other countries, Extension is a more limited process of education; in the United States, for example, confined to Agriculture and Home Science. But here, in India Health has at least equal importance in Extension teachings. Political mechanisms, children's education, physical communications and such industries as will fit into the rural pattern are all part of Extension's load in India, which is not the case in other countries. Without doubt, the range of subject matter as well as the numbers of population involved make India's the greatest social experiment in all history. (Taylor pages 58-59).

Dr Taylor's Strongest Points

Provided the massive evidence produced in Dr Taylor's paper is absorbed and not allowed to pass undigested, it can give an enormous lift to the whole process of rural development through Extension. This is the most important study of the process yet produced. It is not easy reading, but anyone interested in the subject should give it close attention. There is too much to compress in a brief notice. This reviewer can do no more than list the major points, which are constructively raised in great detail.

Working with Groups

It is found that systematic group-teaching is little practised; progressive individuals are chosen to experiment with, when introducing improved practices (pages 11ff.). Techniques of group-working seem to be unknown. Therefore progress is slow and the new groundwork is insecure (pages 19, 29, 30). There is a tendency to work with any villager who is offered as a "leader", without considering his actual position of influence; the natural uprising of leaders from groups with which Extension works is not considered (pages 17ff.). In these respects there is no improvement in the NES since 1953 (page 18).

Dr Taylor says that the group-working and leader-discovery techniques are more successfully practised in other countries where rural development is pursued. He repeatedly refers to a body of experienced knowledge from which India should draw, but he discreetly avoids naming actual sources (pages 5-55 and 62, final paragraph). In fact, at the foot of page 6, he rather ostentatiously ignores the example of Pharaonic Egypt—and modern Russia! Perhaps this is wise.

He draws useful distinctions between propaganda and the more controlled, two-way channels of communication (pages 7 and 11). The paragraphs bridging pages 11 and 12 are worthy of being written in letters of fire over every Development Block Headquarters. Oddly enough Dr Taylor misses what seems to this reviewer to be the most vital of all motives which drive today's village people in India. This is the weariness of their position of inferiority, so long accepted, which they now express. The positive side of this is the new hunger of villages to be treated with more respect by townsfolk. Village people want to be valued for their good points of skill and knowledge at work, and their ethics of the home. They do not ask for respect towards their social organisation; in this they know themselves to be bad. Dr Taylor does not seem to see the burning need both for good repute, and personal satisfaction in work and home-keeping which are perhaps the strongest driving forces acting on village people today.

Selection and Training of Extension Workers

On the training of all cadres in the NES, Dr Taylor has many practical recommendations, chiefly based on importing current field experience into the Training Centres (page 20 ff.). But, strangely enough, he does not mention the alternative of carrying on the training in the village-field, with villagers helping as trainers. Yet this has worked well, in the reviewer's own experience.

At the District Headquarters level, Dr Taylor finds the weakest link in the programme (page 25, and considers that more technical officers are essential. At the Block level, the selection and training of BDO's is poor (pages 23 and 30); and the Social Education Organisers are vague and unplanned (pages 30-32). It is likely that he leans towards the upgrading of selected gramsevaks for most Block Level and District Extension jobs (page 33). This reviewer would agree completely; but is surprised that the factor of vocation for working with villagers is never mentioned.

Continuous Evaluation of Programme

Dr Taylor's comments on the Programme Evaluation Organization (pages 48-49) are pregnant with creative possibilities. This page cannot be quoted, but must be read in the original. His wider plea for more employment of social scientists in the Programme (page 50 ff.) is almost equally exciting. But will the plea be admitted by implementation?

Last, but not least, Dr Taylor is the only foreign observer whose comments have been read by this reviewer (a voracious reader) who admits that scientists have much to learn from village people in India. (page 58). Perhaps this justifies all the flattery of his Report.

Book Review

University Extension and Workers' Education

Labour and Learning—Albert Mansbridge, Oxford and N.E.A. by M. P. Smith. Basil Blackwell, Oxford, 1956. Pp 92, Price 7s. 6d.

Reviewed by **S D Punekar**

THE scope of this little book is very limited. It restricts itself strictly to the role of the Oxford University in the movement for workers' education. This limitation has its merits and defects. The part played by Oxford teachers like Jowett, Gore, Zimmern, Ball, Marriott, Turner, Acland, Green, Toynbee, Brown, Collier, Smith and many others is traced in hazy details. Same can be said about Albert Mansbridge, the founder of Workers' Educational Association, and of the two Americans (Vrooman and Beard) who established the Ruskin College. The author has collected no doubt a lot of information, but his insistence on centering it on the Oxford University only has made the picture somewhat lop-sided. A history of workers' education in Great Britain or a biography of Albert Mansbridge would have been more readable.

There is considerable avoidable repetition and the author seems to be fond of quoting extensively from speeches and reports. Unfortunately some of the quotations do not exactly fit in the context. If the book is written for a lay reader, it appears that much has been taken for granted. Names and events without previous references are paraded before him. The confusion is heightened by the lack of chronological narration. The book opens with the Oxford Report of 1908, goes back to the establishment in 1903 of the WEA, comes to the Central Library for students (1916), returns to the establishment of the Ruskin College (1899), and then jumps back to the middle of the last century when the working Men's College (1854) and Toynbee Hall were founded.

Workers' education, and particularly the work of the British universities in that field, provides considerable material for a fascinating tale. The first school for workers was started at Glasgow in 1800, and was followed twenty-three years later by another school in London. An important step was taken by F D Maurice when he founded in London in 1854 the Working Men's College. The credit of starting the University Extension Lectures goes to the Cambridge University, which began its extra-mural work in 1873. Oxford followed in 1878 and ten years later, instituted resident summer meetings. The modern phase of workers' education in and by universities began from 1899, when two American students founded the Ruskin College, as a residential institution affiliated to the Oxford University. Then came on the scene Albert Mansbridge, a missionary in the cause of workers' education, who founded the WEA and sought support of the universities. Another important step was taken by the Oxford University in 1908 when it organised the first tutorial class. In the next year, a number of socialist students of Ruskin College organised in the Plebs League revolted against neutrality in teaching and aided by a majority of alumni, founded the Central Labour College, with marked Marxist leanings. The College and the League had to shift to London for further progress.

Most of these events have taken place outside Oxford and hence have been left out in the book under review. The University of Oxford has no doubt played an important part in workers' education and due credit should go to it. However, London and Cambridge should not have been overlooked even in a book dealing with Oxford.

Two facts stand out in this book —first is the mission of Albert Mansbridge and second is the clash between labour and learning. Mansbridge, the great little man, the son of a carpenter, made workers' education his life's mission. He started his life without any apparent advantages, left school to be an office junior and led the life of a middle class intellectual. He scrupulously shunned politics, glory and wealth but was active in the field of co-operation, religion and education. In 1903, he organised the National Association for Promoting the Higher Education of Workingmen which later became the Workers' Educational Association. The Association drew its support from adult education schools, trade unions, working men's clubs, co-operative societies, universities and public spirited individuals. Its original aim was to bring together workers' organisations and to equip the workers, whatever their occupation for life would be, for the work of citizenship. The education was to be of university standard and hence Mansbridge sought the aid of the universities and of public authorities. The technique and organisation of adult education required the assistance of university trained teachers and hence the universities were requested to assist in the maintenance of the standard of education, though the choice of subjects and of tutors was left with the students. Mansbridge succeeded in enlisting the support of the university authorities mainly because of his missionary spirit and his genial, non-partisan and religious nature. It was not uncommon to see bitter political enemies willingly co-operating with Mansbridge in the WEA. The following passage (p 68) reveals this interesting aspect:

"Perhaps the most interesting gathering of all was that which met at Mr Mansbridge's lodgings in Wellington Square on the evening of the conference. The bishop and a number of workmen were staying in the house and they were joined by one friend after another who dropped in for a talk. Most branches of education were represented: Whitehall (which sat on the window-sill), Cambridge in the person of a Fellow of Trinity, the Oxford professoriate, and the elementary teacher; there was capital in the shape of a London banker, and there was labour galore (in both sexes) . . . Wellington Square is not perhaps the place a romance-writer would select for his vision of Utopia; but that night at least it seemed a 'centre of the intellectual aspirations of the whole community'."

Mansbridge gathered around him a band of sincere workers wholly devoted to the cause of workers' education. There was, for example, Phillip Brown, (p 40) who put in exceedingly hard work in the WEA for an extremely small salary. He had many offers of easier work, more ambitious openings and much higher

salaries. He refused them all, because he wished to devote himself to the work that he considered most important, the work of a tutor to classes of working men. Similar was the spirit of Gerard Collier, son of a railway magnate and a peer. To such men, WEA work was not a profession but a cause.

Mansbridge's great achievement lies in smoothening the inevitable clash between labour and learning between the workers and the university, between the masses and the classes. Oxford as the conservative abode of learning for the British aristocracy could not easily welcome the higher aspirations of the lower classes. Fear was expressed that "before long the children of artisans will be in the seats of the mighty, and the sons of peers earning the minimum wage" (p 41). Threats were held out that if working men were admitted to Oxford, parents would send their sons to Cambridge! The new social order, however, was accepted and the credit goes to Mansbridge.

In India, universities have kept themselves aloof from the labour class localities and problems. The Royal Commission on Indian Labour recommended the university authorities to consider the possibility of conducting inquiries and investigations into labour conditions an obligatory part of courses in Economics. This recommendation has been given effect to only by a few universities during the last 25 years. Fortunately, however, some of the universities are now thinking of starting extension lectures for workers, though their scope is limited. The University of Bombay, for example, will soon have its first extension series for workers and the course will consist of lectures on labour problems by University teachers and labour leaders. The lectures will be in Hindi and Marathi and will be given in working class localities. Each lecture will be for 45 minutes, and will be followed by discussion. The course appears to have been modelled on the Oxford tutorial class, which was first organised in 1908.

The Oxford class admitted 20 to 30 persons, who met once a week in the winter over a period of three years. Even weekly period comprised of an hour's lecture, followed by an hour's discussion, the students undertaking from the start to attend for the full period of three years and to do prescribed written work. The classes were under the control of a joint committee consisting of equal number of representatives of the University and working class organisations. The quality of work done in these classes was often of a good university standard. Financial support was obtained from the Board of Education and from local education authorities. The experiment was successful and was followed by all other British universities. A small defect, however, crept in and that was the middle class character of education. The curriculum, mainly aiming at popularising the regular university courses, went no further than what was demanded by the middle class supporters of university extension.

It is hoped that the Bombay experiment will be successful as the first step of workers' education in an Indian University. It is based on the extension principle that if it is not possible (mainly because of financial reasons) for the workers to come to the university, the university should go to the workers to offer its benefits. It would have been desirable at this stage to form an organisation like the WEA, which would have contributed to the success of the experiment. General apathy of workers, partisan interest of trade unions, academic leanings of teachers, middle class character of education; indifference of State and of local education authorities and lack of clear objectives are some of the possible obstacles to be faced.

Rural Industries

(Continued from previous issue and concluded)

Evelyn Wood

SOME hand-processes produce a better article, usually in the sense that it is either more durable, or has a distinctive, individual appearance. These are the hand-processes worth further development, both because of the service which they render to the village-craftsman's pride, and because there is a large group of snob-consumers outside the villages who will pay fancy prices for such products. On the margin earned by such marketing—which should be the specific function of the official development agencies, outside the villages, and abroad—extra money to compensate the hand-producers can provide for their economic advancement, as well. The commercial principle of crediting high profits to a special development fund should be followed.

With all the qualifications previously expressed in this paper, then, here is an outline of the specific areas for development in the supplementary village industries:

1. Textiles

From the villagers viewpoint, the production of cotton, wool and silk cloth (and mixtures) must be considered as a number of separate industries. These range from the first preparation of the raw fibres to the finishing of the cloth after it has left the loom. Compatible with the principle of supporting the artisans' pride, there is little room for part-time work by hand anywhere along this range. Some individual hand-spinners may be dexterous enough to produce first-class yarn seasonally; their product will go into cloth for the snob-consumers' market. The same market can be supplied by weavers of individual designs.

Many of these latter definitely prefer using mill yarn to achieve their effects. As a conservative wearer of expensive khadi for 25 years, the writer has a strong personal bias in favour of this material. But even the finest khadi must disappear sooner or later; and the coarse varieties which sentimentally compete with plain mill-cloth should be replaced as soon as possible. The Ambar Charka may do the job of producing yarn which will compete with power-spun yarn, in cotton only; it remains to be objectively seen how the weavers accept it. To the writer, this whole experiment seems to be a process of forcing choices on village people, which will not serve their self-development at all.

Apart from those hand-producers who can improve their output to serve the snob-market, the remainder of village textile industry can become competitive in quality, and thus advance further, by taking to power-production. In this context, provided the taxpayer bears the financial risk, Mr T T Krishnamachari's theory that village operators can compete in price also, on straight economic terms, with mill-products should be tested by experiment. This should only be done where there is a village-producer's co-operative which will select one or two members to make the power-experiment. In this way alone there can be a common interest and education for the remainder of the members, who carry on with hand processes while the experiment is in progress. These remaining members must be closely associated with the control of the experiment.

Such an experiment would have the great advantage of introducing into village life a class of mechanic who is capable of servicing the power-machines; and such persons can also affect the farmers' attitudes to other machinery.

2. Other Fibre Manufactures

Exactly the same plan of development seems to be applicable to the end-products of coir, sisal, sann-hemp and perhaps jute. Village people should either be helped to make first class string, ropes and mats with machinery; or, if they make them more slowly by hand, they should cater for the snob-consumer and not for the utility buyer who shops on prices.

3. Foodstuff Processing

The preparation of foodgrains, either for the kitchen, or for direct consumption, when puffed or perched, and by reduction to flour, are all essential village tasks in India, though they have long ago entirely passed over to factories in Western countries. But a preference e g for hand-pounded rice should not be permitted to condemn village ladies to this mechanical task; this instance is a case where engineering research applied in the villages may find a way of producing the same results of more nutritive rice by a more efficient process.

Many other foodstuffs which are produced raw in the villages, need to be made fit for long storage and marketing. Such village industries would seem to be particularly suitable for part time work by the ladies. Some nuts, roots, fruits and vegetables can be preserved by drying, others need cooking. All need packing, sometimes in airtight containers. Fish and meat where produced need more knowledge of preparatory hygienic processes. Eggs can be preserved, but even if marketed fresh will yield much better returns with proper packing. All these possibilities for rural industry depend not only on co-operative organization, but also on a new understanding of hygiene and cleanly appearance by the village people who undertake them. A mere acceptance of routinized processes will not serve the aim of the self-development of village people. Given such understanding of hygiene, a far greater production of milk and milk products is immediately possible, by cancelling the wastage involved today in plain dirt.

This whole situation seems to call for co-operatives which can be slowly mechanized, as understanding of market-needs grows. The processing of sugarcane, for example, does not have to start with a full scale factory for which the taxpayer has to advance the capital. There is no reason why the indigenous processes of making gur and khandsari should not be much improved, through applied research. This may mean adding units of machinery, not at first power-driven. When a small sugar-factory is finally assembled, there is no reason why it should not manufacture gur to any taste-requiring degree of impurity, though without waste. The prized pale colour is easily secured by simple processes. This depends on the genuine consumer-demand for this traditional article. The same argument applies to

the production of honey; let the real demand be registered through normal, commercial marketing procedures, adding the modern refinements of consumer-research.

Oil-extraction presents a similar case for gradual mechanization; but in the meantime there is plenty to be done to improve the primitive oil-press, so as to reduce wastage and introduce some elementary cleanliness. At the same time experimental soap-making might be worth trying; or the manufacture of paints for that matter. But both such industries mean importing chemicals into the villages.

In this kind of industry, it cannot be sufficiently stressed that institutional research has proved valueless. Only when the technician is prepared to live and share discovery with village people is there any prospect of further development in the villages. The working skill is there, in village-homes; a village artisan in an institution always gives a false picture of his capacity in the village.

4. Leather Manufacture

As with Food, so with Leather; the raw material is available in rural areas, and should be processed there, if only to avoid waste. The question is how far beyond the improved flaying and salting of hides should the villager go. This can only be answered by starting the improvements with the above first processes, and slowly improving existing equipment, simultaneously with techniques. When quite different equipment has to be introduced, it is time to consider shifting such an industry out of the village, for social as well as economic reasons. There is no other reason why elaborate handsewn footwear and travel goods should not be produced for the snob-consumer market, as in textiles, provided aptitudes are there to develop all the intermediate processes in the village as well. Factories in the countryside seem to be the answer.

5. Plantation Crops' Processing

For some reason, probably puritanism, the essential processing of several important crops is omitted from the Khadi Board's lists (while a triviality like Bee-keeping is included). Tobacco, for example can be carried to the stage of making bidis or huqa-cut with the present implements and skill in villages; it can be a part-time job. Coffee, pepper, cardamom and coconut can be processed to a stable condition for marketing by village people. Tea and Rubber are more difficult; but where factory-machines are necessary, there seems nothing to stop the gradual acquisition of plant in a rural area by a sound co-operative.

6. Working with Wood and Leaves

Cane, Bamboo and the more solid woods, some leaves, reeds and grasses which make decorative articles, furnish excellent handicraft materials, again for the consumer to whom price is no object. An essential to the flourishing of such hand-industries is a strong co-operative system, with skilful marketing. Utility products from these raw materials may well be allowed to pass over to mechanized industry in the towns, unless there be capital to build factories for the co-operatives in rural areas. In this case, such industries become full-time and need not be in the village unless it be to save transport costs on the materials.

There is of course a possibility that demand on such craftsmen may rise from village people as soon as economic conditions improve, and comfort becomes a desired value. This is not so today; yet there is some demand for furniture as prestige, which must be met, in consistency to the need to serve village people's legitimate pride.

Workers in Cane, Bamboo and Leaves or Reeds must appear as members of the essential Industries which are ancillary to farming in areas where the preferred type of village house is made of these materials.

7. Glass & Ceramics

There is little reason to keep this group of hand-industries in the villages. The cost of transporting the finished goods to market is always greater than the cost of transporting the raw materials to the potter; the glass-worker is not quite so heavily handicapped. These are cases for the improvement of techniques and gradual mechanization, in co-operatives, which will almost certainly have to require resettlement of village-potters so as to form larger groups. It is not uneconomical to produce glazed pottery in very small units. The occupation is seasonal, and its high-priced market is proportionately small. Without glazing, the wastage is very heavy. Glass Bangles are a highly skilled product, which would probably benefit from just the same treatment of grouping. Again, factories in rural areas are probably the answer.

8. Brick & Tile-making. Thatching

It looks as if all three of these industries, which are quite separate, must meet with more demand as villages improve. Bricks can apparently be made almost anywhere; but they seem to call for applied research, so that the work may be made in every way more rewarding to the labourers. In some regions, even now, brick-making must be considered as much an ancillary to improved farming as is improved masonary work of all kinds.

Tiles seem to be a product specialized to regions which have the right clay. Research might find more such regions, associated with brick-making. But often rammed earth houses are very suitable, with a good roof, which may be of tiles. Both these industries seem to call for co-operatives, and as rapid advance as is financially practicable towards installation of better plant. The superior clay needed for tiles may also help to produce low-cost methods of improved storage for grains.

Where thatch is considered to be a good roof, it may pay to develop specialized services in the best techniques possible, instead of leaving it to neighbours to help each other. The selection and preparation of the reeds of grasses for thatching certainly seems to be worth further development through both research and horizontal dispersion of village-experience.

9. Paper Products

The market for handmade paper is on exactly the same footing as that for textiles: much greater skill and better implements are required, which can be paid for by selective marketing to snob-consumers.

10. Matches, Metal Work Etc

The industries considered in this group are those for which the raw material has to be imported into the village. There seems to be no reason why this should continue; such industries have to be mechanized in time, and might as well be pursued in urban areas. But it will always be better, from all points of view that the writer can see, to plant industrial colonies in rural areas adjacent both to the sources of raw materials, and to good transport facilities for marketing. These industries are not successful as part-time occupations; in particular match-making becomes an unbearable drudgery, and is done with

shame by villagers, for the sake of the little money it brings.

All ten groups of supplementary industries have some equipment and skills already developed in the villages. From the artisan's viewpoint, they must furnish (a) a better level of personal satisfaction in his work; (b) a better economic return for it; and (c) a more secure feeling that his product is considered to be good by non-villagers. To attain these ends, much technical development is required, and in this the village artisan must collaborate. It is very questionable how far most of such industries can offer part-time work to persons who spend most of their labour-days in the year at farming. Without this condition, the industries fall properly into the next category.

Industries Which are Wholly Alternative to Agriculture

This is the group which does not have roots in any present equipment in villages; nor are village people immediately available with the skills required.

There is no choice about some of these industries; from the character of their raw materials and processes, they have to be in rural areas. Such are Sugar and Cement Factories. Large Paper and Steel plants are probably best placed in rural areas whence their raw materials come. Transport facilities are important for factories producing heavy articles; such plants will be confined to a railway line. Whenever such a large factory is set down in the countryside, whether or not it has to be there for raw materials or other economic reasons, the owners have a two-sided social duty. They must contribute to the development of the lives of the surrounding village people whom they have disturbed; and they must provide for the spare-time occupation of the factory employees so that the village people are not offended by distinction of wealth and better opportunity.

This two-directional social duty applies with even greater force to the managements of mining enterprise—which is always in rural areas. Of their nature, the heavily capitalized mines and factories in rural areas can never belong to village people. The only exceptions to this rule are possible co-operative factories; and in this case the managements and technicians at first employed will be townsfolk, until a city-educated younger generation of villagers is ready to take over. At all times, however, the large factory owned by villagers as co-operators must observe the same social duties as the older forms of private enterprise, and also the newer forms of public ownership.

Some industries are clearly out of the immediate range of village people to staff and promote. Co-operative Sugar factories have been very successful. The Milk Products Factory of the Kaira Farmers Union at Anand, in Gujerat, is probably the outstanding example of the most complex undertaking yet attempted by Union of village co-operatives. Technical (and some financial) aid from UNICEF made this possible.

The system of "Industrial Parks" started by the Union Ministry of Commerce and Industry may prove fruitful, though it has not as yet advanced far into rural areas. It should lead to the promotion of true rural industries by skilled men, rather on the following lines. The most difficult kind of industrial venture to start in a rural area is the small factory which is run by highly skilled artisans, who have managed to collect some capital, not necessarily as a co-operative society. So far, such industries seem to have been mainly confined to the suburbs of large industrial cities. That they can move out into the villages is proved by "freak" areas where exceptional skills, materials or some other factor has enabled local development. Examples are the many small factories for agricultural implements around Batala, in East Punjab, Cutlery-production near Calicut in Malabar; and many units, mostly textile, in the Coimbatore District of Madras State. Mysore State also has many small factories between Mysore and Bangalore Cities.

Maintenance of finance, quality-standards and marketing are the principal problems of such industries. Frequently their promoters do not realise their technical deficiencies, though they are usually clear that they have inadequate skill in commercial handling of the products. It is hoped that systems of sub-contracting by the larger industrial units may support such rural factories; but a great deal of technical and business development will be required before sub-contracting will work well.

Technical Personnel for Extension of Industry to Villages

This is the problem that seems not yet to have been faced by the promoting agencies acting in concert. Engineers and other technicians are in short supply now, whatever may be the planned prospects. Starting from the essential service-industries, such as those of the Blacksmiths, which are ancillary to improved farming; and ranging upwards to the largest alternative industries of all forms of management and ownership which may be placed in rural areas, every such development will require technicians who have also the vocation and training for Extension work with village people. This is the reason why the non-economic and non-technical needs of village people have been underscored in this article.

Even when a large factory is placed for strategic or economic reasons in a rural area, some personnel have to work on cultivating village people's interests, and as far as possible in combining them with the spare-time interests of the non-villager factory workers. This is not quite a technical job; although, if villagers are to be recruited to

work in the factory, engineering or other production-techniques will enter the scope of the work. However, this is social adjustment rather than Extension work; it can be most readily done by the same type of person.

But in all other aspects of rural industrialization, specifically Extension, technicians are required in large numbers. Part of the work of such personnel will be research into improvements of existing tools and skills, which wil have to be pursued along with the skilled villagers. Part of the Extension work will be the two-way communication job of teaching village artisans about new tools and processes, and new skills. This will frequently require communication over the barriers of illiteracy. If anything new is to be made, for example, it must be possible for the designer to make it clear by drawing and dimensioning, however simplified, so that the artisan of village origins can work to a paper specification. This skill of communication has yet to be developed in a country which has not yet accepted audio-visual teaching methods as necessary forms of communications at any educational level.

There is no doubt that the job can be done. It has been done locally by many pioneers of industry in rural areas. And no country has historically shown such skill in teaching millions through visual aids as India of the myriad sculptures. But there are signs that economic debate must end, and the administrative jungle of promotion must get down to agreement on principles. Whatever be the sector of industrial development for which each promoting agency is responsible, its personnel must all see the scope of development required by village people as a whole. Only then can the limited numbers of Extension technicians be used to the best advantage of village people. If the most efficient development agency, or that which has been longest established, gets a start on the others, industrial development in India can only be lopsided, one way or the other.

It must always be remembered that village people are not concerned with which development agency they are to work, any more than they are concerned with scientific categories of analysis. They are just as likely to take a specialist on textile machinery and tax him with questions about how to build a school as they are to look for the right PWD overseer to help them. Consequently every technician must know what is the structure of the whole of the aid in industrialization that can be offered to village folk, whether it be within his particular All-India Board or Corporation, or in some other.

A broader knowledge of the whole plan for development and the official means of executng it have to be possessed by every field-worker in contact with village people. This suggests that the administrative jungle must somehow turn itself into a civilized park, with clear signboards so that even painstaking dunderheads like this writer can find the way among the mysteries of official, and semi-official executive administration.

There now, probably that last bit of secretariatese jargon is all wrong!

Golden Jubilee

Glorious Record of the Canara Bank
1906—1956

IT is Indian banking institutions like the Canara Bank which have enlarged their service and opened out branches, without order or directive and without any subsidy or artificial support. Again, it is Indian banks which are shareholder-owned public institutions, as distinct from State ventures, which have been rendering this useful service to the country quietly and without any drum-beating or fanfare. It is, therefore, heart-rending to find that there is no recognition of all the good work that has been done or is being done by these institutions, so vital for our economy."

—Shri C H Bhabha, President, Indian Banks' Association, speech at the Golden Jubilee of the Canara Bank, held at Bangalore.

A Child of the Swadeshi Movement

The history of the Canara Bank is a record of steady and systematic progress of an institution from a modest beginning into the high position it has gained as one of the leading scheduled banks. The national consciousness that was awakened at the beginning of this century after the partition of Bengal, and the Swadeshi movement which followed, stirred a band of patriots headed by Shri A Subba Rao Pai to undertake many nation-building activities for the benefit of the people in their area, similar to those undertaken by patriots in the Punjab, Maharashtra, Bengal and other parts of India. The Canara High School and the Canara Girls' Elementary School founded at Mangalore were the first of a series of institutions started by them.

The Canara Hindu Permanent Fund Limited

At the same time, the need to improve the economic condition of the people was also agitating their minds. This could be done, they rightly felt, by starting an institution to foster the habit of thrift and promote saving and would extend financial assistance to businessmen to run and improve their business. This became a burning desire and led them to study carefully the working of "Nidhis" of Madura and other towns of the South and to start on this model "The Canara Hindu Permanent Fund Limited." The Fund was instituted on the first of July in 1906 at Mangalore, in a rented building, with a capital of 2,000 shares of Rs 50 each. Shri A Subba Rao Pai was so enthusiastic about this Fund that he went all around, in hackney coach and bullock cart, explained the benefits of the Fund to the common people and collected shares from people of all walks of life. In fact, this was one of the first joint-stock enterprises in South Kanara.

The First Board of Directors

The first Board of Directors consisted of 24 Directors chosen not only from the different parts of South Kanara but also from the Shimoga District of Mysore. The combination of people from such distant parts of the country at a time when communications were undeveloped showed the fervour and devotion as well as the pioneering spirit of the founders.

Credit facilities in those days at Mangalore, a port of considerable importance to Coorg and Mysore, were meagre; merchants had to borrow at very high rates of interest from individuals, and no indigenous bank existed to give facilities to the common people for saving or for financing their businesses. The Fund, however, worked more for the service of the people than for gaining profits. It was so solicitous of the welfare of its clientele that it had incorporated in its articles of association a provision that a rate not exceeding 10% was to be charged for advances when higher rates were quite common. On account of its enlightened policy and because the persons at the helm were educated, patriotic and devoted to service, the Fund quickly won the hearts of the people, and gained the fullest confidence of its constituents. The proceedings of the Directors of those days show how vigilant and cautious they were, how minutely they looked into the affairs of the Fund to avoid any possibility of losses and how they strengthened the institution rupee by rupee.

Hastening Slowly

They initiated a policy of consolidation before progress. This has all along been followed and strictly adhered to by the management in succeeding years. Indeed, this has been the most remarkable feature of the history of the Bank.

There has been nothing more spectacular in the history of the Bank than the resourceful manner in which in the course of its natural growth to maturity it has adapted itself to the changing times, and played its full part in the building up of the economic strength of the people in an ever-widening area. Even the composition of the Board of Directors had been a mirror of the life around. It consisted of leading lawyers, eminent retired Government servants and talented businessmen. This harmonious blending of the different view points proved to be a great asset to the Bank and ensured its stability and steady progress.

The premature demise of Shri A Subba Rao Pai within three years of the starting of the Fund was a great blow; however the men at the helm realized that the strengthening and developing of all the institutions in the founding of which he had played such an important part was the best way of showing their regard towards his great personality; and they devoted their best attention to the "Fund" with the result that the "Fund" grew strong and, with its help business developed steadily in Mangalore.

The Canara Bank

In 1910, the Board of Directors, at the suggestion of Shri K Subramaniam, who had played an important part in the spreading of commercial education in Bombay, reconstituted the "Fund" into a regular Bank and appropriately named it as the "Canara Bank Limited."

With the renaming of the institution, regular banking business came to be conducted to the great advantage of the people. The resources of the Bank steadily increased. As per Articles of Association, the Bank had set apart as high a part of its profits as 25% towards reserves even from its inception. The Bank gained in prestige year by year, and its fame as a beneficent institution spread far and wide. Even from its inception it had been charging interest on loans at rates which were moderate in relation to prevailing interest rates and was giving every facility to merchants to develop their business. The Bank has followed the principle—In the prosperity of its constituents lies the prosperity

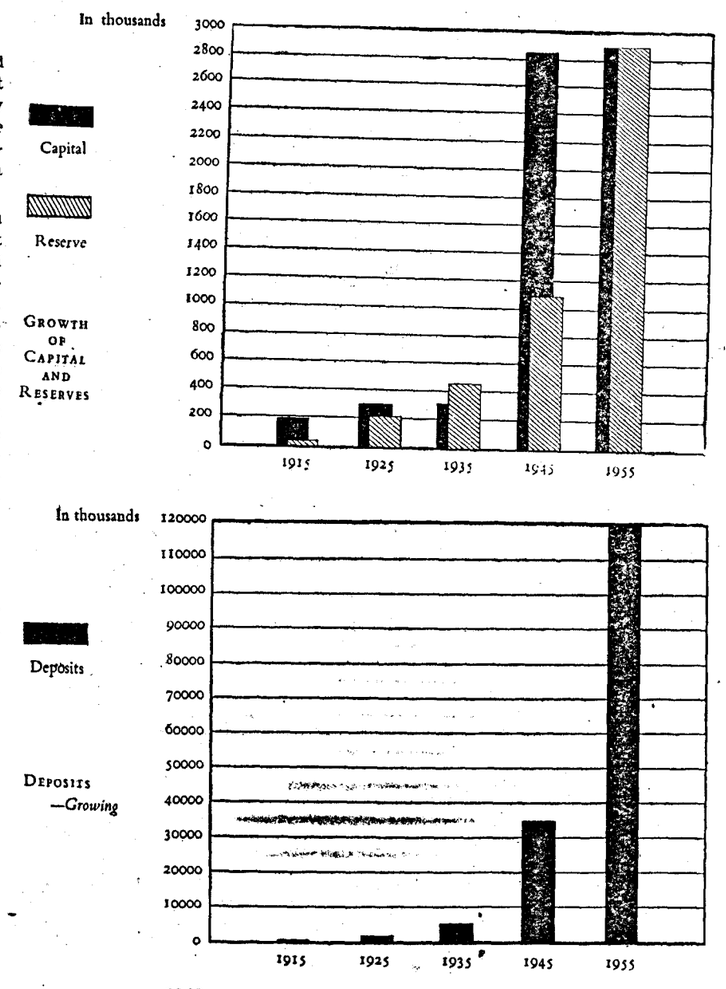
of the Bank. By exercising moderation and caution in advancing money, it had checked many a businessman from undertaking perilous speculation and had thus acted as a steadying force.

Economy

It is interesting to note how the Bank exercised strictest economy in its expenditure. At first the Bank was located in a small rented building paying only Rs. 120 as rent per year. Even the safe was lent by a member of the Board of Directors! Other items of expenditure were reduced to the minimum. It was only in June 1916 that the original premises were purchased by the Bank. Incidentally it may be mentioned that the General Body meetings of the shareholders of the Bank were till 1917 held in the Canara High School, Mangalore!

Facing the Crises

At the beginning of the second decade of the life of the Bank, it had to face the commotion caused by the failure of many banks in the years 1913-1914 and later the excitement caused by the outbreak of a World War in 1914.



But the clientele reposed such confidence in the management that the Canara Bank not only remained unaffected by these crises but emerged stronger than it had been before. By careful scrutiny and by the best-owal of full attention to the affairs of the Bank, the Directors were able to conserve its profits and build up considerable reserves. In the report of the Directors in 1915, they have recorded "In spite of the disorganization in the financial and commercial world consequent on the continuance of European War, the business was satisfactory and progressive."

Another crisis came over the Banking World in 1922-1923 when several small banks collapsed all over India. But the cautious policy adopted and the goodwill earned kept the Canara Bank out of the whirlpool. In fact it had been so fortified by the goodwill of the people and the steel frame of the administrative machinery that the period of depression of 1928 and thereafter and the panic caused by the crash of the Travancore National Bank in 1938 passed over its head doing it no harm. When the then Chief Minister of Madras, Shri C Rajagopalachari proposed in 1938 that the banks do voluntarily request the Reserve Bank of India to look into the internal affairs of the Bank to allay the apprehensions of the people, the Canara Bank immediately and unhesitatingly accepted the advice, an act which enhanced its prestige. During the Second World War too, the Bank remained watchful and alert, and through its General Manager's Office at Bombay studied the National and International trends in finance and steered itself clear of all pitfalls and depths. The strength of the Bank can be appreciated not only because of this passive achievement but of the continued strength and popularity it has gained through the years. In fact it has become "Our Bank" to all those who had connection with it.

Expansion

From the year 1918, Shri A Srinivasa Pai, a leading lawyer of Mangalore and one who was associated with the Bank from its very inception became its President and guided the affairs of the Bank for the next twentyfive years with ability, tact, patience and forethought. His experience, wisdom and knowledge of affairs helped the Bank to build up its strong organization and perstige.

From the year 1926, began the remarkable development of the Bank in all directions. The management felt that the Bank had grown sufficiently strong during the precious twenty years and steps could then be taken for removing its local mantle and transform it into a Bank, strong enough to carry on the ever-increasing activities of modern banking in any part of the country.

This could only be possible if the share capital and the resources of the Bank were increased, if the branches could be spread over places inter-linked with each other by trade and business, if modern banking facilities of all types were extended to the general public. At the same time it was equally essential to build up a strong and impersonal administrative machinery with a well trained staff able to give courteous and efficient service to its clientele.

Increase in Capital and Resources

A casual glance at the annual balance sheets of the Bank reveals how carefully and how in conformity with the growth of the business, the share capital of the Bank has been raised from time to time. The fact that the ordinary shares and the preference shares issued from time to time were quickly purchased even in times of financial uncertainty shows the confidence reposed by the public in the Bank. The Balance sheets also show what a large part of the profits has been transferred to the Reserve Funds of various types. The resources of the Bank on account of its increasing business activities has grown through the years. The graph of the rise of the resources can be noted to be steep.

Spread of Branches

As the resources of the Bank increased and the circle of its clientele widened, the need to increase banking facilities by opening branches at places inter-linked for trade and money transactions with Mangalore and other inter-dependent towns was realized and slowly and after much mature consideration, branches were opened at various places. Today, they are spread all over South India, at almost all the important trade centres and ports. The first branch was opened at Karkala in 1926; later another was opened at Cochin. Branches were opened at select centres in South Kanara, Malabar, Mysore State and Bombay Presidency. The Bombay branch was opened as early as in 1928. The year 1945 saw the opening of 9 new branches, some of them being in the Tamil districts. After that year, branches were opened in the Hyderabd State, one at Nagpur (1946) and another at Karachi (1946) Today, the Bank has 51 branches pursuing a uniform policy of financing business in the very best interest of all concerned.

Increase in Work

The history of the Bank has also shown how gradually its scope of business has been extended along careful, well-defined lines. In the early days the loans that were granted were either loans on the security of gold or were unsecured loans to well-known parties. But gradually, as scientific knowledge of the banking principles developed and spread, the Bank was quick to offer varied services, which a modern bank could give, services both to the investors and to the borrowers. Today, an increasing number of people are becoming clients of one type or another of the Canara Bank.

The Foreign Department

A great step forward was taken by the Canara Bank when it opened its foreign department in 1953 and undertook the complicated task of handling the foreign business of its customers who conduct international trade or travel abroad. In this task, it secured the services of Mr D Freeman, who was for thirty years an officer in that department of the Lloyds Bank, London. He not only organized the foreign department of the Canara Bank but also trained several members of the staff of the branches in the technique of handling foreign business. For this purpose, regular classes were held at Bangalore to train members of the staff. Later several other members of the staff also received instructions from him at branches. This careful training has enabled the branches to handle this new business intelligently and efficiently. Today, this foreign department has become a natural and an integral part of the Bank's activity.

'Foreign Trade Digest'

While on this subject of Foreign Trade, a few words may be said about some special services the Bank is giving to its customers in this field. It publishes a regular bulletin entitled 'Foreign Trade Digest' giving information on foreign trade and distributes it, free of cost, among its customers and friends doing foreign business. Through the medium of this magazine, and through other measures, a special effort is further made to stimulate participation by its customers and others in international trade fairs, specially those sponsored by the Government of India. The Bank also sends its own posters for display in such international fairs and exhibitions.

Structure of Administration

The efforts of the Bank to increase the efficiency of its organization can be noted through the years. When the Bank was venturing on its career of expansion, it invited in 1931 Shri Vidyasagar Pandya, M L A, an eminent leader in the field of banking at Madras to make suggestions regarding alterations of the Memorandum and the Articles of Association and for the improvement of the organization of the administration. His valuable suggestions were adopted with great profit to the Bank. Careful attention was paid towards efficient control and supervision of branches. In 1943, the General Manager's Office was shifted to Bombay. This was in pursuance of the policy of raising the tone of the administrative structure. The financial trends could easily be watched from such a big financial centre as Bombay and the Bank could get the full benefit therefrom. Again with the opening of several branches spread over a large area the administrative office was shifted in 1954 from Mangalore to Bangalore a more central place from where guidance to the branches could be given in the quickest possible time and better coordination could be effected. The special attention bestowed by the management on the constitution of the steel frame of administration has not only increased its all-round efficiency but has also made it quite impersonal bereft of redtapism. The advice given by the Reserve Bank from time to time and after its periodical inspections has also been incorporated in the conduct of business. An eminent Banker who observed the organization of the Bank from close quarters remarked "If all the Directors of your Bank and its principal officers are replaced in a moment by their wives, the administration would still remain unaffected." This humourous remark conveys the true nature and the impersonal character of the structure of the administrative machinery of the Canara Bank.

Training of the Staff

The management has bestowed very great attention on the equipment and training of its staff as part of its drive for administrative efficiency. The present General Manager was deputed for training in two leading banks of Bombay and later was sent for about six months to study in the Midland Bank in London before his appointment for the post in 1932. As a result, the administrative and accounts departments were overhauled; the loans policy of the Bank was improved so as to increase liquidity

and minimize losses; the departments of publicity and public relations were brought in line with those existing in advanced institutions.

The management all through has been receptive of new scientific ideas in banking. In 1952, when branches had spread out and the volume of business expanded, the management felt that it would be better to know how such work was conducted in the leading banks of the West. In order to get this benefit the Bank sent during 1952—1954 six of its senior officers for training abroad for six months under an arrangement made with the good offices of the Reserve Bank of India and the India High Commissioner for the United Kingdom. They studied modern efficiency methods, Bank organization, loans procedure; and co-ordinating and development technique. These Officers today occupy key positions in the Bank and are giving the Bank the benefit of their training.

The training of other members of the staff has also been undertaken. Since 1954 the Bank is sending its officers regularly to the courses conducted by the Bankers Training College organized by the Reserve Bank of India.

The Canara Bank has organized two courses of its own, the basic course for beginners and the senior course for future officers, in order to train the members of its staff for its work. It gives them all the essential knowledge in banking, inculcates in them the special traditions of the Canara Bank and gives them initiation in the technique of modern banking. This has provided the Bank with a band of efficient workers pursuing a uniform policy in order that the Canara Bank may maintain an individuality of its own in the service of the Nation and make all those who come in contact with the Bank acquire and retain attachment to the institution.

The Bank was started with only 4 members on its staff. As the volume of its work grew and its branches multiplied, the number on the staff has also been increased. Today it may be interesting to note that over a thousand people are working in its different branches and in its administrative offices together.

The fifty years of the life of an institution like the Canara Bank is a sufficiently long period to take stock of its achievement and its drawbacks. The Bank is ever alert to consolidate the position it has gained and bring about improvements that are necessary with the passage of time. The management spares no pains to make the Bank "Our Bank" to all its constituents in whatever walks of life they be and in the different parts of the country with a view to raising the economic level of the Nation. The Directors are putting all efforts in making the Canara Bank play its due part in the economy of the Nation to the best of its capacity.

Staff Welfare

The directors have before them a scheme of raising a fund called "The Canara Bank Golden Jubilee Staff Welfare Fund". Among the objects of the Fund will be the economic, social, and moral advancement of the members of the staff and to help them to develop habits of thrift, self-help and better living and to give financial aid to members in case of sickness, or distress, and for education of children etc. The membership will be purely voluntary and the benefits of the funds will be confined to members who will manage the funds under a democratic constitution. The funds will be raised by monthly deposits from members at not less than one per cent of their salary and the Bank will contribute a substantial amount to form a nucleus of the Fund. If properly worked, the Fund is calculated to play an important part in promoting the welfare of the members. It is hoped that the majority of the members of the staff would join the Fund and work it out successfully.

The directors have also a scheme for housing loans to employees on hire purchase basis with a sufficiently long period of repayment. The amount of loan would depend upon the salary of the employee and the rate of interest would be as low as 3½% simple. This would enable a number of the Bank's employees to have houses of their own.

Further, the directors are also considering a pension scheme which can be chosen by the staff as an alternative to staff provident fund and also a scheme for employees' participation in Capital through the issue of a special class of shares. The details are being worked out and it is hoped these would be welcomed by the employees.

Scholarship Scheme

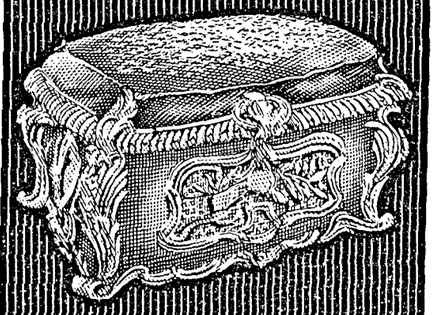
The administration of a scheme of educational loan scholarship, however, calls for certain special qualities. Thus, it is not enough if the authorities are able to spot a candidate who deserves to get it. It is necessary to be able to keep a continuing watch over the recipient, to follow up his career, to know precisely when he becomes capable of returning the loan and, above all, to ensure that the loan is returned. A mere philanthropic sense, though it forms the basis of the scheme, is not the only factor which will make it a success. Clearly, something more is needed. It requires a banker's insight into the creditworthiness of candidates and the banker's organising ability to supervise the return of the loan. A scheme of educational loan scholarship thus implies a healthy combination of educational altruism and financial realism.

It is precisely such a combination that is to be found in a remarkable experiment in loan scholarship that has been initiated by the sponsors of the Canara Bank Jubilee Education Fund. The enterprising authorities have evolved a scheme which seeks to blend the philanthropist's zeal for service in the cause of education with the Bank's organising ability, on the one hand, and to supplement the donor's financial resources with its own, on the other. A look at the scheme will reveal that it is both well conceived and ably devised, so that it ought to commend itself to all lovers of educational charity and, more especially, to those who hold that private banking can and should render genuine public service.

Briefly, the scheme involves the grant of a loan scholarship which will be five times the amount placed by a donor at the disposal of the Fund. Under this novel scheme, the Fund which is created by the donors is pledged as a security with the Bank which, in its turn, has agreed to grant loans up to five times the funds given as security, subject to a maximum of Rs 5 lakhs. The Canara Bank has itself donated Rs 20,000 to the Fund and the collections so far made amount to Rs 1,20,000. There is no doubt that the whole scheme is as economically sound as it is ethically worthy of the highest praise.

Main Features of the Scheme

It seems necessary, at this stage to bring out some of the main features of the scheme. The Fund, which is a registered body, derives its finances mainly from the donations made to it. It will, of course, be augmented by other sources of income such as interest on investments. The Bank, as already stated, will hold the Fund as a security against the loan it sanctions up to five times the security offered. It will charge only 4 per cent simple interest on these loans. Besides the financial help it renders, the Bank will make available to the Fund its organisation for the purpose of ensuring the return of the loans given to scholars. The scheme provides that the first instalment of the loan to a scholar is to be repaid not later than one year after the completion of the course of his studies made possible through the scholarship.



A notable feature of the scheme is that it provides for taking out both a life policy on the recipient of the scholarship and third party security on his behalf. The idea is to grant 10 loan scholarships of Rs 1 000 each year to begin with. The same group of scholars will be granted Rs 1,000 every year till they complete their studies and, at the same time, ten fresh scholars will be selected for aid every year.

There are several considerations which suggest that the scheme will achieve all the success it deserves. In the first place, loan scholars all the world over are deeply conscious of the value of the help they receive at the impressionable period of their life, and, therefore, grateful. In banking parlance, they are a highly creditworthy lot. Indeed, the experience of other funds which the sponsors of the present scheme have studied has been very encouraging. Secondly, the taking out of a life policy and third party security still further reduces the risk of loss.

To the donor, it should have a special appeal, because it enables him to be more generous than his purse can permit. He has the additional satisfaction that his donation will remain intact and be available on a continuing basis to generations of students. He is further relieved of the anxiety to collect the loan, for the Bank will ensure that it is repaid. Nor need he fear that the loan will go to an undeserving person, for the Fund will see to it that it is the deserving scholar that gets the aid. As regards the scholar, he ought necessarily to welcome the scheme which allows him to pursue his studies without financial worries to disturb the even tenor of his academic career.

Private enterprise in India is on trial. And private banking, as the citadel of this enterprise, owes a special responsibility to the society. It is up to it to vindicate itself through actively aligning itself with schemes which serve the public. If all Indian banks could establish "Educational Funds" on the lines of the Canara Bank's scheme, they would be further adding to their stature in the public eye. Their present detractors would then be compelled to recognise that private banking could be harnessed to the task of rendering efficient public service.

Rs. 7920 saved on lubricating oil every year!

A REQUEST to Standard-Vacuum took one of our lubricating engineers to a sugar mill in Northern India. There he found that 40 lb *of the wrong kind* of mill roll oil were being used every eight-hour shift — to keep the bearings running cool.

Our expert recommended the proper MOBIL Lubricant, and today the mill uses just 12 lb every eight-hour shift. The savings over one year come to Rs 7920 — and the bearings run cool as ever!

Choosing the right grade

Our experts are backed by the world's greatest lubrication experience, 90 years of it. Besides, they have the right oils to work with — a full range of MOBIL Industrial Lubricants! No wonder they can give you correct lubrication, with the right grade of oil.

MOBIL Lubricants have been developed through tireless research, and they are constantly being improved. When our expert says: "Use MOBIL Lubricants", he is offering your machinery the finest protection that science can devise, or money can buy.

Correct lubrication is a matter for experts.

Our advisory service is free — why not ask us to help you?

Around Calcutta Markets

Dull Trading

Wednesday Evening

DULL conditions continue to prevail on the stock market here. Trading is mostly professional. Only jobbers seem interested, while investors keep away from the market. Even speculators seem uninterested in equities. And the outside public does not seem to be in. This explains why the volume of business has shrunk considerably. In a thin market, price fluctuations remain narrow. There is neither any selling pressure, nor any buying support. So, equities are marking time. Meanwhile, the outlook remains uncertain.

On second thoughts, Lyons Range realised that the annual report of Indian Iron was not discouraging. Ex-dividend quotations for Indian Iron have tended to be steady. In sympathy, other clearing shares remain steady. At the time of this writing, there is some evidence of selective support for sound equities, but only at slightly lower levels. Even so, the existence of buyers, even though at slightly lower prices, has had a sustaining influence on the whole market.

War And After

To some extent, the current inactivity in stock markets is due to losses incurred by some operators during the west Asian war crisis. Two weeks ago, some speculators bought war equities in anticipation that the war in Egypt would hasten a third world war. As soon as they discovered that their expectations were premature, they started unloading their holdings. This liquidation was absorbed by "shorts". That was why the fall in equities after the Egyptian cease-fire was not heavy. This may be a correct description of Lyons Range a week or ten days ago. But the current week's lack of activity remains to be explained.

Some "shorts" hastened to cover their sales a few days ago as it seemed that, despite cease-fire, the situation in Egypt continued to be tense. That is why, there is no replacement buying by "shorts" at the moment. By the beginning of the current week war fears had receded. But neither speculators nor investors have entered the market as buyers because the outlook remains uncertain. There is nothing in the economic policy, formulated by AICC at the recent Calcutta session, to disturb markets. But investors are waiting for the release of the Congress election manifesto to have a clearer idea of the Congress economic policy in the near future.

Congress Policy

Not only is the Congress economic policy disturbing, there is much in it which should enthuse the private sector. There is, of course, emphasis on the socialistic pattern of society. But there seems to be more emphasis on the ideal of a "co-operative commonwealth". Co-operative farming seems to be the Congress middle-way between landlordism and collectivisation. In the industrial sphere, there is a reference to co-operation between labour and industry. Labour's right to share in the management of industry is mentioned. Apart from this aspect of the economic policy, there is nothing in it to disturb the private sector. There is no over-emphasis on the public sector. And it is throughout assumed that there is no inherent conflict between the two sectors.

If Congress is interested in pursuing an escapist policy, it should suit the private sector. From what the economic policy leaves unsaid, the organised private sector should take comfort. There is not a single reference in the economic policy to the Government's plans of encouraging village and small-scale industries. Indeed, the Congress President's Note to AICC is liable to the interpretation that the Congress is now reconciled to mechanisation of mechanisable small-scale industries. This is a possible reorientation of the economic policy of Congress which should be welcomed by the organised private sector.

Foreign Exchange

It is not the economic policy of the Congress, but the Note by TTK on the resources budget for the Second Plan which is causing anxiety to stock markets. TTK is not pessimistic about foreign aid. There is some left-over amount from the first Plan. American food and raw material supplies on a loan basis will enable the Government to exploit rupee counterpart funds. Prospects of loans by the World Bank are encouraging. Above all, India's foreign aid requirements for the second Plan are not so heavy as to extend the loanable resources of rich western countries.

Tax Fears

Despite encouraging prospects of foreign aid, there will be need for further mobilisation of internal resources. Under the Second Plan, the target for more taxation is placed at Rs 450 crores. Only Rs 50 crores more are likely to come out of the increases in taxation in the last budget and in the current financial year. Tax resources will, therefore, have to be increased by an additional Rs 400 crores. TTK stresses the need for broadening the tax base. This may be differently interpreted. It may mean that more people will have to be brought into the tax net. It may also mean that the main aspects of the Kaldor tax plan will have to be introduced. Neither interpretation is "bearish" for industry or for stock markets.

Quietly Steady

This is the wider background against which the current phase of stock markets has to be viewed. In the last three weeks, tea auction prices have moved up. But Tea shares remain inactive. Similarly, Jute goods have improved. But Jute shares remain idle. Data relating to mill stocks of jute goods at the end of last month are rather confusing and misleading. But output declined during last October. Exports and despatches are likely to pick up. Mill stocks are, therefore, likely to decline. Raw jute prices, of course, rule steady. But jute goods are equally firm. Immediate prospects for Jute shares do not seem unpromising.

It is only natural that Miscellaneous and Engineering shares should follow fluctuations in speculative scrips like Indian Iron and Texmaco. Even so, sound Miscellaneous and Engineering shares have been relatively steady in recent days. There is always buying support for these shares at set-backs. This is an encouraging feature of recent trading in Lyons Range. According to reports, the Guest Keen Williams issue has been successful, though not as successful as some of the recent new issues like National Carbon. This belies pessimism about the forthcoming new issues.

Madras Plantation Award Upsets

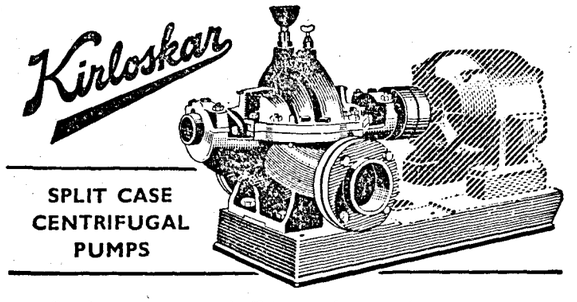
Thursday, Morning

MUCH of the international tension has been removed by the ceasefire and the setting up of an international police force. To that extent, therefore, uncertainties in the market have also disappeared. The steadier undertone which followed the dull Moorat trading, however, could not be maintained. The Labour Tribunal Award for Madras Plantations threw the market into confusion once again. It was not only that Madras Plantations shares declined by 30 to 35 per cent; the repercussion of this debacle was quite serious in the Bombay market also. This was because of the INTUC Chief's warning that textile industry would follow suit by pressing for higher wages.

These apart, there has been persistent stringency in the money market with inter-bank call rate at more than 3¾ per cent. This is only the threshold of the busy season. How the demand for money is going to be met this season is any body's guess at the moment. Bankers are borrowing at higher and higher rates, but how long can they go on paying more for money without charging more for their advances? It is reported that leading banks have already intimated their clients that they will raise their lending rates to as much as 5½ per cent from 3½ to 4 per cent as at present.

As though these were not enough, the extension of the public sector emphasised in the speeches at the Calcutta session of the AICC was yet another damper. The Finance Minister's emphasis on the necessity of raising internal and external resources and increased taxation was also bearishly interpreted by market circles, and naturally too. In view of prolonged tight money conditions and prospects of heavier taxation in the next budget, there is hardly any likelihood for capital appreciation in the equity market in the near future.

After the landslide in Madras Plantation stocks, with all sellers and practicily no buyers, in order to avoid panic, the authorities of the Madras Stock Exchange were forced to fix the minimum prices with immediate effect for all ordinary shares of planting companies quoted on the Exchange as on November 8, and these prices are to remain in force until further notice. The Award, if implemented will mean that the plantation industry will have to pay about Rs 15 crores by way of increased wages with retrospective effect from March 1952. The industry will also have to incur annually about Rs 5 crores for increased wages and other amenities. The United Planters Association of South India have taken the matter to the Supreme Court and applied for an interim stay order against the Award.



Dalal Street's reaction to the Plantations Award was noticeable in the sharp decline in the shares of the Bombay Burmah Trading Corporation. This company would be affected by the Award to the tune of about Rs 50 lakhs for the period of 1952 to 1956 and Rs 12½ lakhs each year thereafter. Burmah shares lost more than Rs 45 and other counters in the miscellaneous section closed on a distinctly bearish undertone.

Cotton

Bright Patches in Dull Market

THE cotton futures market had a predominantly bearish week. However, there were bright patches here and there, mainly on reports of damage to the crop in some cotton growing districts from heavy rains. There were of course the usual quota of reports and rumours that the export duty on cotton would be abolished or reduced and that there would be a reduction in the excise duty on cloth. Whenever such reports were rife, rates tended to steady up and in their absence, the reverse trend manifested itself.

On the international cotton front, a notable event was the successful implementation by the United States Department of Agriculture of its cotton sales drive, exceeding as it did the targetted 5 million bales. There have been reports both in America and other cotton growing countries that America may launch on yet another export sales drive, for disposing its surplus cotton. Up to the time of writing, no official plan of this nature has been announced. But the U S Department of Agriculture is reported to have pointed out to cotton interests that there would be no change in its export sales programme. This may mean either that the first extended export sales programme initiated at the beginning of the 1955-56 season would now be stopped as the target has been reached or that the same competitive sales would be continued for another year, with no change in the method of export sales.

Sturdy construction and efficient performance for many years have made KIRLOSKAR Centrifugal Pumps extremely popular with agriculturists and industrial concerns all over the country. Available in sizes up to 5,000 gallons per minute.

Burn and Company Limited

Notice

NOTICE is hereby given that the Annual General Meeting (being the Sixtysecond Ordinary General Meeting) of the Company will be held on Friday the 7th December, 1956 at 11 A M at the Registered Office, 12, Mission Row, Calcutta to transact the following business.

1. To receive and adopt the Audited Accounts for the year ended 30th April, 1956 and the Directors' and Auditors' Reports thereon.
2. To declare a dividend. The Dividend if declared will be paid to the Shareholders on or after the 12th December 1956 whose names are on the Company's Register on the 7th December, 1956 or to their mandatees.
3. To appoint Directors in place of those retiring. In this connection notice is hereby given that a Special Notice as defined in Section 190 of the Companies Act 1956 has been received by the Company under Section 261 and 281 of that Act to move the following resolution as a Special Resolution at the Meeting:—

   "That Mr P N Banerjee who is an associate of the Managing Agents of the Company and has attained the age of 73 years be and is hereby appointed a Director of the Company and that it is hereby declared that the age limit prescribed by Section 280, of the Companies Act, 1956, shall not apply to him."
4. To appoint auditors and fix their remuneration.
5. As special business to consider and if thought fit to pass the following resolution, namely

   "That the Books, Registers and other documents required to be maintained by the Company and kept open for inspection under the provisions of the Companies Act, 1956, and particularly under Sections 49, 118, 144, 163, 196, 301, 302, 304, 307, 362 and 372 of the said Act, shall be available for inspection at the Registered Office of the Company by the persons entitled thereto to the extent and in the manner and on payment of the requisite fees, if any, specified in the aforesaid provisions, between the hours of 10 A M and 12 noon on each business day. Provided however, that the register required to be maintained under Section 307 of the Act shall be open for inspection of the members or holders of debentures of the Company between the times above mentioned only during the period prescribed by sub-section 5(a) of Section 307".
6. As special business to consider and if thought fit to pass with or without modification the following resolutions which will be proposed as special resolutions.

   (1) That the Memorandum of Association of the Company be altered by adding thereto after clause 3(u) thereof the following two sub-clauses

   "3(uu) To establish and support, or aid in the establishment and support of associations institutions, funds, trusts and conveniences calculated to benefit persons who are or have been employed by or who are serving or have served the Company or its predecessors in business or the dependents or connections of such persons and to grant pensions and allowances and to make payments towards insurances".

   "3(uuu) To subscribe contribute or guarantee money for any national, charitable, benevolent, political, public, general or useful object or fund or for any exhibition".

   2. That Article 151(17) of the Company's Articles of Association be deleted and substituted by the two following sub-clauses "(17a) To give pensions, gratuities, allowances, bonuses, profit sharing bonuses or benefits or other charitable aids payments or monies to or for the benefit of persons who are or have been employed by or who are serving or have served the Company or its predecessors in business or the wives, children, dependents or connections of such person or persons as may appear to the Directors just and proper whether any such person his widow children or dependents or connections have or have not a legal claim upon the Company". "(17b) Subject to the provisions of Section 293(1) (e) of the Companies Act 1956 to establish maintain support and contribute or subscribe to any national, charitable, benevolent, political, public, general or useful object or fund and any institution, society or club, which may be for the benefit of the Company or may be connected with any town or place where the Company carries on business".

The Ordinary Share Register of the Company will be closed from the 28th November, 1956 to 7th December, 1956 both days inclusive.

A member entitled to attend and vote at the Meeting is entitled to appoint a proxy to attend and vote on a poll instead of himself and a proxy need not be a member.

Threats to Peace

ATTEMPTS to equate tragic happenings in Egypt and Hungary, or partisan propaganda efforts to emphasise one of those two distressing events so as to minimise the other, are not as relevant as the deeper significance of Egypt and Hungary. To stress that both are menacing manifestations of the "domination of naked force", is not necessarily to view these two tragedies from the same angle. When the immediate responses and reactions to these disturbing events recede into the background, the deeper issues involved will emerge more clearly. They are certainly far more significant. In the last fortnight, Pandit Nehru has had frequent occasions to analyse the distressing developments in Egypt and Hungary. His assessment may not be endorsed by all. Neither India's nor the four Colombo Powers' hostile reaction to aggression by Britain, France and Israel in Egypt has evoked any uncharitable comment. But New Delhi's response to the Hungarian tragedy has provoked strong condemnation by Socialists. Pandit Nehru's oblique hint to them not to fall unwilling victims to propaganda is not quite out of place. But more relevant is the suspicion that the Prime Minister does not seem to be fully aware, as his recent statements indicate, of the developing world situation since the Geneva "summit" Conference.

Any such suspicion may be without basis. For Pandit Nehru can claim to be the first world statesman to have warned the United Nations many years ago that Asia and Africa can no longer be ignored by the West, and that world problems cannot be solved in the context of Europe alone. He might not, then, have visualised the current phase of the international situation. But the unexpected, and somewhat distorted, consequences of the Geneva "summit" Conference deserve emphasis. From the moment the Big Four reached an understanding not to wage on atomic war, Europe faded into the background. NATO and the Warsaw Pact lost their basic significance. America ceased to have any real interest in the German issue. Russia's intelligent anticipation that, after the "summit" Conference, time would be on her side in regard to the German problem was not wrong. This does not mean that NATO and the Warsaw Pact do not exist, or that the German problem is no longer alive, or that both sides will not exploit "cold war" devices when occasions arise.

But, since the "summit" Conference, the world emphasis has shifted to Asia and Africa. Simultaneously, and along with this shifting world emphasis on Asia and Africa, the realisation has grown that Russia and America are the two Big Powers which are competing with each other for world domination. Britain and France cannot escape the realities of the situation. But both seem unreconciled to the changing balance of world power. In Europe, the emergence of America and Russia as competing world Powers does not directly or materially affect the interests or prestige of Britain and France. Not so in Asia or Africa. This is the basic historical interpretation of revived bellicosity of Britain and France in Asia and Africa. This explains the Anglo-French aggression in Egypt as a smoke-screen for regaining control of the Suez Canal. This fits in with M Mollet's harsh, militant policy to Algeria. And the joint Anglo-French aggression in Egypt would seem

to be a combined demonstration to both America and Russia that the former will not accept the superior status of either of the latter.

It would be hasty to accept the cynical assumption that, since the "summit" Conference, both America and Russia have reached a tacit understanding to exploit Asia and Africa jointly at the expense of Britain and France. Perhaps, both Egypt and Hungary are, though in a different sense, symbolic of Europe's instinctive resistance to fade out of the world focus. But neither Egypt nor Hungary is likely to reverse, though both or either may delay, the process of disentanglement from Europe by both America and Russia. So far as America is concerned, the process has already begun. In regard to Russia, the process, already in evidence, may be reversed either by any hasty action by Russia herself, or by a revived expansionist policy by a re-armed, united Germany, either singly or in combination with Britain and France. As both America and Russia retire gradually from Europe, their policies to Asia and Africa assume greater significance to the latter as well as to the wider world.

More than once, Russia has sought to wean America away from the latter's Western alliance, though ostensibly for attaining or maintaining peace. Many times before the Geneva "summit" agreement, Russia had approached America for direct, bilateral talks on world peace. On the Egyptian issue, Russia issued an appeal to America for joint "police" action to stop the aggression. America rejected this appeal, even as she, on second thoughts, abandoned the reported move to order the US Sixth Fleet in the Mediterranean to intercept British and French warships on their way to Egypt. It could be argued that America, though violently opposed to Anglo-French military action against Egypt, was neutral in regard to Israel, Britain and France, and threatened to intervene only if Russia sent her forces or "volunteers" to Egypt. But Washington will retort that America's support to the United Nations debarred America from any unilateral or bilateral counter-action in Egypt.

This raises the main issue that Pandit Nehru will have to discuss with President Eisenhower during the Prime Minister's forthcoming visit to America. Weak nations of Asia and Africa are alarmed at the revived manifestation of force by strong Powers. Afro-Asian nations want peace so that they can prosper. America must convince Britain and France that Western domination of Asia and Africa must cease. It will not be denied that, since the "summit" Conference, Russia has gained friends in Asia and Africa. This should cause no anxiety to America or Britain or France, as long as relations between Russia and Afro-Asian nations remain on an economic basis. Here, the principle of competitive, but peaceful, co-existence can prevent any disturbance of peace in these regions. But possibilities of persistent Anglo-French attempts to perpetuate or to regain political or economic domination of Asia and Africa, and of similar Russian efforts cannot be ruled out of consideration. This is where India can hope to function as a bridge between Russia and the West, and particularly America. No doubt, Pandit Nehru will try to persuade President Eisenhower to change America's policy to China. Admission of Red China to the United Nations is an essential preliminary step to solving the problems in far east Asia. One of the main purposes of Pandit Nehru's visit to America will have been achieved if he can help in bringing about greater understanding and amicable relations between Russia and America. In the main, Pandit Nehru's aim should be to cooperate with America to achieve the common objective of strengthening the United Nations so that threats to world peace and acts of aggression can be prevented. America's recent moral support to the United Nations encourages the hope that Pandit Nehru's mission to America will be fruitful.

Assam Oil Negotiations

OIL prices, as indeed everything else connected with the subject of oil, are shrouded in the popular mind with a great deal of mystery. Whether this mystery can be dispelled by a careful study of facts or not —it is high time that we got into grips with the economics of oil pricing, even though it be as abstruse as it has been made out to be. The Government of India has not yet done that, though the Minister in charge of Natural Resources who is also responsible for oil explorations has had a shot at it and subsequently even Pandit Nehru has, on more than one occasion, thought aloud on the subject.

The principle of basing oil prices on 'Gulf rates' has puzzled many others besides Pandit Nehru. The subject is complicated and much discussed. The Report on Price of Oil in Western Europe prepared by the Secretariat, Economic Commission for Europe, and released last year gave rise to furious controversy the result of which, it was confidently anticipated would be the substitution of Gulf rates for some other formula. It is quite some time that Western Europe and we here stopped getting our oil and oil products from the Atlantic sea board of the United States. How is it that this link has persisted so long?

Problems generally do not wait to present themselves in proper sequence or in a logical order. In the case of oil, it has been no different. Accident of circumstances called upon the Government to tackle the question of refining first. This it did when it entered into an agreement with the oil companies for starting the three refineries. It was accepted then without question, it appears in retrospect, that products of the refineries would continue to be sold, as before, on the basis of world prices. Again, seized with the urgency of the problem of exploring our natural resources, which must after all be the foundation of economic development, the Government had to formulate a policy for oil explorations, both through the oil companies and on its own. Exploration, however, is different from exploitation and until oil is found by actual drilling and reserves are proved to be adequate to justify production on a commercial scale, the need for formulating a policy for oil production and deciding the question of fixing a proper price for oil did not arise. The question of a fair price for crude oil, however, has arisen after extended explorations in the new Assam oil fields yielded such promising results.

The pricing of refined products has complexities of its own because there is a great deal of product differentiation in the refining industry. But it is not a matter of great urgency, as in any case it will not come up for serious consideration until the duty (and price?) protection granted to the oil refinery companies for a period of 10 years come up for revision.

The text of the agreement with the refinery companies was not published. The duty protection which has been mentioned implies, however, that internal prices of refined products would be based on imported costs plus duty, and not the actual cost of refining in India. One of the refining companies, Burmah Shell, has already found, presumably from its experience of the cost of refining in India, that it does not need such protection and has voluntarily foregone it from the first of October. While gratefully accepting this gesture of goodwill, the Government of India expressed the hope—it did so in a press note—that other refinery companies would follow suit. So far, however, the others have not responded. The pricing of the refined products, it may be assumed, will continue to follow international prices even if all oil companies forego the duty protection as Burmah Shell has done. These prices result in such apparent anomalies that motor spirit can sell cheaper in Britain and Western Europe than in India, though the raw material from which it is refined has to be transported over longer distances to Europe, which so puzzled the Prime Minister.

The reason why costing of refined products may not be so important as that of fixing a fair price for crude is two-fold. First, given the price of crude and the pattern of production of the different refined products, the determination of margins should not be so difficult, particularly since the Government would be the major shareholder in the refinery to be set up for processing Assam oil. Secondly, as already mentioned, the price to be charged by the refinery companies according to their existing agreements would not come up for examination for some time.

The immediate problem, therefore, is that of determining a fair price for the crude oil to be produced from the new oil fields of Assam. There is a curious coincidence, observed over the years, between the price of crude oil quoted in the Middle East, which has been the primary source of supply both for Western Europe and India in recent years, and the price at which crude oil is marketed in the Gulf ports on the Atlantic Sea Board. This is the truth behind the so called 'Gulf rates'. This correspondence cannot be explained in terms of free competition, nor in terms of costs which are believed to be so much lower in the Middle East than in the United States. True, comparison of costs is difficult, being subject to various qualifications but the belief is supported by published data on oil royalties paid by American companies in the Middle East from which profits per unit of crude can be deduced fairly accurately. A similar correspondence can also be detected, despite some 'shading of prices', in the prices of refined products in Middle East, Gulf ports, and Western Europe.

The Government of India cannot be expected to pay for oil produced in Assam what it costs the marginal well to produce oil in Texas. The Minister for Natural Resources was not probably fully briefed when he put it as a matter of digging only 2000 ft in Middle East against the cost of extracting oil from wells in the States which go down 10,000 ft or more. The average depth of the oil wells in the new oil fields in Assam will be nearer to those in U S that the Minister had in mind rather than in the Middle East. So if he is prepared to accept depth of wells from which oil is extracted as the primary determinant of cost, he should not baulk at Gulf rates!

Where something is produced under widely varying natural conditions, costs are bound to vary widely too, and in the case of oil, where continuous explorations and prospecting are essential in order to ensure future supplies, the cost of such development has largely to be found from the price charged for oil. This is the case of the oil companies who do not accept that the price of oil is fixed according to any convention. They claim, on the contrary, that it is left to the market forces of free competition and that in any case, the earnings of the oil companies are not excessive judged by comparable returns in other industries. When profits are considered in terms of capital actually employed and note is taken of the fact that a large part of such profits have to be ploughed back into exploration, prospecting and development.

It is really not necessary for the Government of India to enter into these complexities of international pricing, though price dispute for crude, among other things, appears nevertheless to have proved a stumbling block in the negotiations. So far the Government has insisted on majority shareholding only in the refinery company that is to be set up for processing oil. The problems of oil exploitation and development are so closely inter-related, however, that it is difficult to see how a satisfactory working arrangement can be possible, if Government retains control only over refining, which is the end product, but does not have similar control over transport of crude oil through pipelines, for which a separate company has been proposed, or over the drilling company which is to produce the crude. Purely technical considerations, if nothing else, would seem to rule out such a three-fold, water tight, compartmental division of control and responsibilities. An independent company operating a pipeline for the transport of crude would naturally demand the right to export the surplus which may not be required by the refining company. Its interest would be to see that a maximum quantity is recovered quicker and profits can be maximised. A manner of operation for such a company is conceivable in which the oil fields would be depleted within a short time in an effort to reap the best advantage from transporting it. Similar arguments would apply to the company which is to produce the crude. After all oil reserves are national assets that have to be exploited with an eye to optimal advantage, rather than profits.

It is to be hoped that the newly formed Commission for Oil and Natural Gas will enlighten the public before long on the progress of negotiations which appears to have been in abeyance for quite some time. Nothing definite has been known about these developments after Maulana Azad's statement early this year that the Government, in pursuance of its Industrial Policy Statement, will retain majority shareholdings in the proposed refinery company which is to process Assam oil. Surely drilling of oil or its transport are no less important?

Weekly Notes

No Urgency!

THERE was surprising moderation in the demand for curtailment of imports or promotion of exports in the speech of the Commerce Minister at the last meeting of the Import and Export Advisory Councils. This was deliberate, for as soon as the difficulty of the foreign exchange situation was mentioned, the President of the Federated Chambers of Commerce and Industry came out with a list of suggested cuts—fish and canned foods figured prominently in the list, to which pat came the reply from the official side that there was no need to worry.

The Government appears to be at some pains to dispel the impression that there is serious shortage of foreign exchange. This is, of course, for the benefit of trade, lest it runs away with the idea that imports may be difficult to obtain, hold up stocks, raise prices and rush to utilise import licences which have already been issued. But can trade be persuaded so easily? After all the weekly returns of the Reserve Bank are still being published and the decline, week by week, of foreign exchange holdings is no secret.

Granted the wisdom of not creating a scare, the unhurried pace with which the Minister plodded through his account of the export situation and export promotion activities hardly suggested any sense of urgency or serious necessity of increasing foreign exchange earnings. There was the usual routine recital of the new Export Promotion Councils that had been set up, appeal to exporters to pool their experience and study foreign markets, repetition of the arrangements that had been made for grant of 'draw back' of duty and the same naive wonderment why these were not being taken advantage of! The Minister did not even say what he thought of the very sensible suggestion which spokesmen of the engineering industry had put forward for grant of draw back on an ad hoc basis.

The only new idea came from Shri Morarji Desai. He called upon importers to exercise voluntary restraint, rather than force the Government to say 'no'. The only development of interest mentioned in Shri Karmarkar's speech was the triangular deal for supply of cloth to Burma from American surplus cotton and the possibility of a similar deal with Indonesia. But this was hardly news. This is the major achievement of cloth export promotion. Despite the kudos to the Cotton Textile Export Promotion Committee, there was little to indicate how the target set for cloth exports was ever going to be reached!

Feasibility of Sugar Exports

THE sugar season which ended on October 31 has been a record one in many ways. It saw an all time high sugar production of 18,60,545 tons, compared to 15,90,000 tons in the previous year and 10,01,000 tons in 1953-54. The new sugar year begins with a comfortable stock of 5,42,400 tons compared to 4,32,000 tons in the previous year and a little above 1,00,000 tons in the year before that. These are the figures of 'indigenous sugar'. To get the net position, some minor adjustments may have to be made on account of the imports which may have come during the year in fulfilment of earlier commitments.

Making due allowance for all that, but for rising consumption trends the statistical position suggests that a case could be made out for encouraging some exports this year, if conditions of production and prices remain favourable. As the Government of India has staked its claim for token exports before the International Sugar Council, and sought to raise the permissible limit of such exports subsequently, there is already some speculation about the possibility of exporting sugar.

This is not to suggest that present market prices are anywhere near the export level or that production expected this year is so heavy that internal prices may come down on their own accord to the level at which exports may be profitable. The rising trend of consumption evident in recent years and the general trend of agricultural prices would seem to rule out such a possibility altogether. But price differences are not such that exports cannot be promoted as a matter of deliberate policy, if some adjustments are allowed in duties and other impositions which sugar has to bear.

The crisis in the Suez has improved the chances of export to Persian Gulf ports, provided the Government is prepared to allow some adjustments in duty cess. Some notional figures may be considered. The landed cost of sugar at the Persian Gulf ports approximates £52 per ton or Rs. 675. If from the present domestic price of Rs. 800 per ton, the following deductions are allowed:

	Rs	As
Excise	112	8
Cess	50	0
Commission to co-operatives	25	0

the net export prices work out to something like Rs. 612-8. To this has to be added freight and insurance at Rs 50 per ton. The c i f price for Persian Gulf then works out at Rs 612-8, which may be compared with the price current there of Rs. 675.

For most agricultural produce, particularly for food articles, export surpluses just do not happen. They have to be created at the cost of some restriction of consumption. This is, as explained by Shri Karmarkar at the last meeting of the Export Advisory Council, a matter of tightening the belt. Though the Minister was referring to groundnut oil, the argument applies equally to all food articles. In the case of sugar, so far there has not been any conscious attempt to stabilise or maintain consumption at any particular level, the energies of the Government having been taken up wholly by attempts to hold down sugar prices. Crystal sugar has certainly become a conventional necessity but considering the possibility of substitution by gur, production appears to have reached a level where exports in moderation should not impinge too much on domestic consumption. A beginning could certainly be made with token exports.

The danger is of initiating a speculative rise and of inviting traders to help themselves. It happened once in the past when sugar interests complained of excess production and sought an export outlet for what later turned out to be an imaginary surplus. It may happen again. The possibility cannot be denied. But both Government and trade must have learned something from past experience and to that extent, the risk can be guarded against. The situation to-day is sufficiently under control to justify the experiment.

E I Jute & Hessian Exchange

OVER three-fifths of the 51-page cyclostyled report of the Forward Markets Commission is devoted to the issue of selecting a reputable Association to which Government could accord recognition, and permit transactions in forward contracts in raw jute and jute goods. After considering five associations which had applied for such recognition, the choice of the Commission has fallen on the East India Jute and Hessian Exchange—as was of course widely known for a considerable time. In its present form the Exchange was registered in 1945 under the Indian Companies Act, 1913, after amalgamation of two associations, viz., the East India Jute Association—established in 1927 for forward trading in raw jute, and the Calcutta Hessian Exchange, established in 1919 for forward trading in jute goods. Apart from its age, the Exchange has a sound financial position, a long tradition and experience in futures trading, and a large membership, covering many of the members of other associations. Its bye-laws and articles of association have the general approval of most, though to safeguard all interests these will require considerable changes.

The Exchange has submitted to the Commission a scheme of reconstitution, worked out in conjunction with the Indian Jute Mills Association. According to the scheme worked out by the Ad Hoc Sub-Committee, the members of the Exchange—persons, firms and companies having a place of business in Calcutta—would be classified into five panels viz (1) manufacturers', (2) jute goods shippers', (3) jute goods dealers', (4) raw jute dealers' and (5) brokers'. Only members enrolled in the last would have entry into the ring of the Exchange.

The Ad Hoc Sub-Committee's scheme for futures contracts excludes the existing system of trading in jute goods on the basis of the IJMA forward contracts and the transferable Pucca Delivery Orders (PDOs) issued by mills. While the hedge contract provides for a basis and specifies the varieties tenderable against it, the IJMA forward contracts are for almost all types manufactured by mills and thus have a narrower market than the contracts which are more suitable for hedging and speculation; secondly, hedge contracts have defined maturity periods unlike the IJMA forward contracts which provide for delivery many months ahead; thirdly, while in the futures market the parties pay or receive periodically through the clearing house the differences between the market and contract rates, this is absent in the IJMA contracts.

Will Jute Growers Benefit?

THE Commission, however, feels that the Ad Hoc Sub-Committee's scheme would require to be modified to cover the IJMA contracts and PDOs to continue to be operative under the regulation of the Exchange. For this it has recommended that the Exchange should conduct trading in transferable specific delivery contracts in jute goods in addition to hedge contracts, so that the existing pattern of trade is not dislocated. But these contracts would be entered into only with, or by, or through a member of the Exchange, on a form prescribed by it, which would be based on the existing IJMA form, with such changes as are necessary, including a more precise definition of the rights and obligations of the buyer and seller. The Commission has laid down that members entering into such contracts should report them to the Exchange periodically in a specified form, and the clearing house would be used by both parties to meet obligations, transmit shipping instructions, etc. It has also listed the principal modifications necessary in the conditions governing the issue of PDOs including two vital matters—no mill may buy back its own PDO, and PDOs should be issued only against actual stocks.

The stage seems to be well-set now for a "well-regulated" market—that very over-worked phrase in Calcutta market circles—to begin operations. Although the report of the Commission does not say so, one hopes that the almost endless meetings to evolve an acceptable set of rules for trading, form of contract and PDO etc are soon to end. Otherwise there will be delays.

A futures market is necessary to provide adequate hedging facility to the buyers and sellers, as well as a reasonable play of speculative forces. But most such markets become the preserve of speculators who seek to manipulate them in a manner which may do much harm to the primary producers—in this case the producers of raw jute. The forward market in jute, it had frequently been complained in the past, had been run in the interest of the baler, shipper or the mill; it had not helped the growers. It does not appear very clear from the Commission's report, if jute growers are going to fare any better. It is no doubt premature to make any forecasts, but as long as their interests are only remotely represented in the Exchange, they may go by default. Of course, even the assurance of a fair price at terminal markets is no guarantee that the benefits would be passed on to growers. For that, the solution lies in organising co-operative marketing. That such an experiment in the early 'twenties failed is no reason that it would fail again. But only by building up a strong body of primary sellers could Government hope to end the old complaint that the mills exploit the farmer.

Focus on Cyprus

UPTIL now, three countries and governments were directly interested in Cyprus. Since the Anglo-French aggression in Egypt, another country has now become interested in the Cyprus problem. Not only these four countries, but the world has now become concerned about the Cyprus issue. Cyprus was the base from which the Anglo-French air forces committed acts of aggression in Egypt. Recently, the Egyptian representative in the United Nations had occasion to remind the world that Cyprus had, therefore, assumed "increasing international importance". This view will be widely endorsed. Indeed, the steering Committee of the United Nations has now decided to place the Cyprus issue on the agenda of the General Assembly. Britain has not opposed this move. But, on previous occasions, she has maintained that the United Nations have no right to interfere in the "internal" affairs of Cyprus. If this is the argument by which the United Nations are to be debarred from interference in Cyprus or Algeria, there can, surely, be no case for the U N intervention in Hungary.

Cyprus has been a source of irritation between Britain and her old ally and friend, Greece. Cyprus has also strained the relations between Britain and her new friend and ally, Turkey. Cyprus will now be a constant threat to Egypt as long as the Anglo-French air bases are maintained in the former country. Cypriots are fighting for inde-

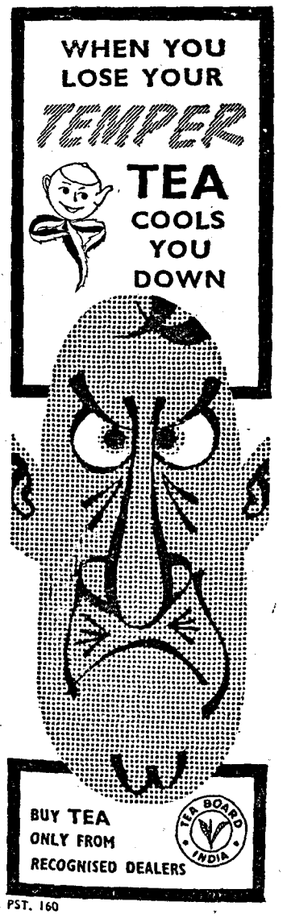
pendence. Britain is suppressing the nationalist movement in Cyprus on the pretext that it is a terrorist movement. Conflicting claims of Britain, Greece and Turkey are not as important or vital as the Cypriot demand for freedom. Fortification of the British base at Cyprus introduces fresh urgency to a just solution of the Cyprus problem. A constitution will be framed soon by Britain, but it is not likely to be accepted by the people of Cyprus. There may still be time for Britain to come to an arrangement with the Cypriot leaders. In the absence of any such gesture, the movement for enosis is likely to gather momentum.

Letters to the Editor

Hungary

YOUR editorial on Hungary in the last issue of "Economic Weekly" was surprising and disappointing. Surprising because you have adopted two different standards in commenting on the Egyptian and Hungarian crises in the same issue. Disappointing because though a staunch supporter of Pancha Shila you have sought to justify Russian intervention in the internal affairs of Hungary. I submit that Russian action in Hungary is a flagrant violation of the tenets of Pancha Shila and is all the more deplorable because it is by a power who has avowedly supported them.

If you do not approve of Eden's action in Egypt on the ground that Suez is Britain's life line, how can you justify Russian intervention in Hungary on the ground that a non-communist Government there would be a 'real risk' to Russian Security? If overthrow of Nagy and installation of a puppet Kadar regime can make Russian action legitimate, surely Eden has been a big fool to stop short of overthrowing Nasser in Egypt! There cannot be one interpretation of Pancha Shila for 'imperialist', 'capitalist' West and another for 'communist' East.



A C Chhatrapati

Hindustan Vanaspati
Manufacturers' Association,
Bombay.
November 15, 1956.

[Shri Chhatrapati is surprised that the "Economic Weekly" has adopted two different standards in commenting on the Egyptian and Hungarian crises in the same issue. Twelve days after this editorial was written, Pandit Nehru reiterated in the Lok Sabha that the two cases were not parallel, in fact were different.

Shri Chhatrapati is disappointed that the "Economic Weekly" has sought to justify Russian intervention in the internal affairs of Hungary. This is a wrong interpretation of the editorial under reference. The editorial was written before the detailed developments, as a sequel to the re-introduction of Russian armed forces in Hungary, were available. Even so, Shri Chhatrapati's attention may be drawn to the very first sentence and the last paragraph of the editorial under reference.—Ed.]

YOU will forgive a regular reader if he expresses his opinion that your politics is weak and unconvincing even in its partisanship. The editorial in your issue of November 17 makes out a poor case for the Soviet Union's role in the present world crises. You obviously approve of the Colombo powers and the AICC not directly accusing Russia of aggression. You then refer to your "realistic appraisal" of Hungarian developments in the previous week's issue. How realistic is that appraisal? Your choice of words and phrases is revealing. You speak of Moscow being "clumsy in its dealings with Budapest" and of its "wrong tactics". You side with the Soviet Union in its actions, even though you "deplore" them, because of the "grave risks involved in the policy of withdrawal from Eastern Europe". You are convinced that "these risks are not only grave but real". You are afraid that "reactionary" elements might again obtain control of East European countries and that "these pose grave problems of security for Communist Russia."

This concern for the security of Communist Russia is really touching. To ensure absolute security Russia should extend her control still further to the Atlantic ocean. Even then her empire would be threatened from North Africa. Therefore in the interests of security it had better be annexed. How far will you go in supporting the Soviet Union? You say that "only biassed observers will deny that these were the reactionary elements which were emerging in Hungary". Are not all elements revolting against tyranny "reactionary"? Have you so completely accepted communist standards that you deny the possibility of a revolt by the Hungarians against the intolerable restrictions on every aspect of life which it is in the nature of communism to impose?

You do not stop short of apologising for Soviet tyranny. You actually advise it on tactics. On your interpretation, you say, "it was a major tactical error for Moscow not to use the maximum force first when Budapest sought the help of the Russian troops stationed in Hungary under the Warsaw Pact." What is your definition of "maximum force"?

I do not expect you to take this attack lying down, but I am even willing to be hurt when you hit back if you take the trouble to make out a stronger documented case for your views. I shall at least know on what evidence you are basing your views.

Nissim Ezekiel

67, Breach Candy,
Bombay—26.
November 19, 1956

[Mr Ezekiel accuses the "Economic Weekly" of partisanship. He is entitled to his views, but he has not substantiated the accusation.

Neither in the editorial in the issue of November 17 nor in that of the previous week does the "Economic Weekly" offer any apology for Soviet tyranny. Developments in Hungary and in Egypt are interpreted differently. But this difference does not mean or involve endorsement of all Russian actions in Hungary.

Not only is the Russian use of force in Hungary deplored, Hungary is cited as evidence that Russia is reluctant to lose her temporal authority over Eastern Europe. Mr Walter Lippmann's comments on the Hungarian issue are quoted approvingly. Insistence by the four Colombo Power Premiers on "the inalienable right of every country to shape for itself its own destiny" is endorsed firmly.

In these two editorials, the "Economic Weekly" is not as much concerned about the security of Communist Russia as about the effects of global, particularly European, strategy. With NATO and the alliance between Western Germany and Western Europe, the Russian withdrawal from Eastern Europe must necessarily pose problems for her security. To ignore this is to disclose lamentable unfamiliarity with the "cold war" political and strategic situation in Europe.

It will be news to many that "all elements" revolting against tyranny are "reactionary". That may be Mr Ezekiel's view. But the "Economic Weekly" has repeatedly stressed Hungary's right to sovereignty and to an equal status with Russia.

Mr Ezekiel informs us that he is a regular reader of the "Economic Weekly". We presume he is being polite to us. But we may be excused in hoping that he will, in future, read the "Economic Weekly" more carefully.—Ed]

Consumption Multiplier Again

SINCE Prof Das Gupta wrote his article (Economic Weekly August, 25) on the book written by Prof Vakil and Dr Brahmananda, I had necessarily to refer to that book in my comments made with a view to clarify certain analytical issues involved in his article (issue of September, 1). However, in his rejoinder, Prof Das Gupta attributes motives to me for giving my comments (issue of October 27). Is Prof Das Gupta a better psychiatrist than an economist?

I used the word 'probably' advisedly. Even for pulling together two non-additive things, sometimes 'plus' is used as a sort of a short-hand, though strictly, from a purist point of view, it would be wrong to do so.

Yes, what I meant was that the value of the consumption goods multiplier would be unity. I am glad that he has pointed out this 'unpardonable' lapse.

When a man like Prof Das Gupta says that he is honest, one cannot but believe him. However, one cannot accuse a person of dishonesty simply because he did not boast about his honesty. Does Prof Das Gupta really believe that two persons cannot discover the same thing independently of each other? The concept of consumption goods multiplier is another way of expressing Nurske's savings potential and I said so in my comments. Of course, I also said that Prof Vakil and Dr Brahmananda went a step further than Nurske in discarding Nurkse's assumption of the equality between the wage and the consumption units. I find that in analysing problems of **capital formation**, the concept of consumption goods multiplier is very helpful in finding out the effects of whatever 'savings potential' is available in the economy. Is not starting from the investment end more logical? Any way, in such matters, the approach one adopts depends to a large extent on one's taste and I have therefore no quarrel with Prof Das Gupta if he prefers Nurske's approach to that of the consumption goods multiplier. But, why this self-righteousness?

From the London End

De-Stalinisation of East Europe

IT is certain that the Hungarian uprising will be quelled. It is equally certain that the Hungarian Communists will continue to remain the dominant force in that country's Government. What is not so certain is whether the cohesive factors making for a highly monolithic Soviet bloc in Europe will continue in operation. This uncertainty clearly suggests a possible shift in the European political balance. In retrospect, the Russian intervention in Hungary appears to have been more concerned with meeting this eventuality than (what was first thought to be the aim) of securing continued internal power for the Hungarian Communists.

The course of events in Hungary has been the principal focus of European political attention over the past weeks. This "diversion" may very well have proved to be welcome in British and French official circles and this explains the private encouragement that has been given to public demonstrations, to attacks on Communists and Communist Party offices and meetings. In Paris and in London, public attention is being riveted on Hungary and on the various aid schemes and funds that have been set up to assist Hungarian refugees. All this public activity is being mobilised on the single charge that the Soviet armed intervention in Hungary was immoral and designed to suppress the local upsurge to ensure the continued hegemony of the Communists in that country. The course of the uprisings and the extent of the Hungarian peoples' loss of confidence in the government has been variously described in the British press. By and large, the descriptions have been highly inconsistent—some have declared (as did the **Daily Express**) that the piloting of the uprising was fully in the hands of emigres who had now returned to Hungary while others (like the **Manchester Guardian** and the **Daily Herald**) state that the Russian claim of "counter-revolutionaries are aiming to restore fascism in Hungary" is nothing more than a piece of "lying deceit."

The crucial fact of the Hungarian situation is that the Hungarian working people, the intellectuals and

the peasantry, have lost every vestige of confidence in the Communist leadership as was provided by the Rakosi-Gero faction. The Communist coup in 1948 was part of the Stalin drive to establish the Soviet Union's preponderant position in Eastern Europe. For a short time, the Hungarian Communists pursued the previous policy of land reform, nationalisation of heavy industry and of improving the country's living standards. This policy was quickly subverted by the expulsion of Yugoslavia from the Cominform and by the need to "find evidence of Titoist influence" in all the East European countries and the pursuit of a wholly unpopular civil policy. The Communists in Hungary who espoused or believed in independence were liquidated. The careerists, who applauded the new policy, were able to secure for themselves highly paid positions in the State hierarchy and so a regime of terror was installed. In the economic field an armaments programme coupled with costly investment expenditure in heavy industry was put into operation with little regard as to whether such a policy will lead to a deterioration in living standards. The contract between the State and the people began to disappear. What has since happened in Hungary was thus inevitable.

The "de-Stalinization of the Soviet regime" which was to follow the 20th Congress of the CPSU and the efforts at reconciling Yugoslavia, let loose the hitherto latent opposition of the East European peoples against their respective Communist hierarchies. That Poland was able to effect a change with little violence was all the more remarkable, considering her past. Those Communists in Eastern Europe who believed that the Marxist creed was un-meaning unless it guaranteed freedom, liberty, self-determination and independence, i e such of them as had not been liquidated in the Stalin era, now came into element. It was possible for Poland to bring about a largely peaceful change only because Gomulka was still alive and was prepared to lead the change-over. In Hungary every one in the Communist Party—even those who were released from prison after the thaw—had a tainted past. This was not the only cause of the violent forms which the Hungarian change-over took. Such Communists as Gero had not understood the fundamental opposition in the country—their first reaction to popular demonstrations was to take the Stalin line of armed intervention. This, as President Tito now says, was the "fatal error" of the Hungarian Government.

In your correspondent's view, this appears to be the background to the present Hungarian situation. The utter failure of the regime to command any support from the population let loose the popular agitators and subsequently the violence and bloodshed. The resort to arms in the earlier stages contributed to a hardening of popular feeling and it is certain that it was at this subsequent stage that the drift of emigres and other elements into Hungary from abroad provided the organisational basis for an insurrection. It is certain that had not the Soviet intervention taken place, all Hungary would now be aflame—aflame on a scale as would make that country lay prostrate and helpless for many years.

The Soviet intervention may, however, stem from another possible cause. The Western press has referred to what is alleged to have been the contents of the Russian letter of explanation to the Indian Prime Minister. It refers to Marshall Bulganin's view that the Anglo-French action against Egypt had brought nearer the prospects of a world war and that the Soviet Union's security (in this situation) required a policy in Eastern Europe which would necessarily call for "vigilance" and the strengthening of the European status quo. There can now be little doubt that this consideration weighed heavily in Russia's calculations before the intervention in Hungary was decided upon.

The movements in Poland and Hungary have taken on an essentially nationalist character. The Communist argument that Socialism ultimately submerges all nationalistic notions may very well be true. In the concrete circumstances in which the East European countries have found themselves it was, however, inevitable that nationalism should prove of more profound significance than even the many reforms which the Communist leaderships were prepared to or did introduce. The whole history of Eastern Europe is a history of external domination. Up to 1914, the Austro-Hungarian Empire was in control. Between the wars, shifting power relations between Germany and Italy had placed most of the East European countries under fascist or quasi-fascist regimes owing allegiance to one or other of the central and south European powers. In the post-war years, the Soviet Union rose to a position of dominance in the area. And so, the urge for national independence as well as the cry for land and bread was ever strong and remains today stronger than ever before. The satisfaction of Poland's demands for sovereignty and equality must, in turn, lead to a Soviet acceptance of similar treatment for the other hitherto East European satellite governments. The policy of de-Stalinization, if carried to its conclusion, with the sincerity which, we are made to understand M Kruschev and M Bulganin espouse, then the change-over in Eastern Europe will be a peaceful one. The revelation by President Tito that there are still a number of Stalinists in the Kremlin does not suggest that the loosening-up process will be quick or, for that matter, peaceful. It is, however, clear that the dimensions of the Hungarian uprising cannot but expedite similar movements throughout Eastern Europe, and no matter what the Kremlin may wish to think, the drive for independence and self-determination will continue unabated until it stretches from Poland to Albania.

The culmination of East European nationalism to the point at which the Nationalists can be satisfied must portend certain changes in the distribution of power in Europe. There can be no doubt that the Warsaw Pact has been immeasurably weakened—certainly more than the NATO alliance has been weakened by the precipitate Anglo-French action against Egypt. There may very well arise in Europe a whole series of states believing more fully and more fundamentally in the need for peace—in a policy of neutralism coupled with friendship with all adjoining states. Some may argue that this trend can introduce a power vacuum and thus of instability leading to a possible revival of German imperialism in Europe. Such was certainly the trend in the interwar years when the 1919 Peace settlement created so many of the East European states. The present situation is, however, different. What happens in Europe is no longer determined solely by European factors. The emergence of the United States and by contrast the Soviet Union, and equally significant of the prestige of Asia, is tending to submerge European factors as determinants of contemporary international political developments.

Our Delhi Letter

Delving into Oil Economics

INDIA is likely to take the initiative and inject an economic fact of crucial importance into international politics. Hitherto it has kept out of the dangerous sphere of oil diplomacy. West Asia has more than three-fourths of the world's oil reserves and yet it produces less than a third of the oil output in the Americas. The cost of bringing the black gold to surface in the Persian Gulf area is a tenth of the comparable cost in the United States. Still much more money is being spent on oil exploration in the United States than on the exploitation of the known petroleum deposits of West Asia. The "fantastic" fact is that the cost of petroleum products the world over are based on the cost of oil production in the Gulf of Mexico rather than in the Persian Gulf.

All this is well known to experts and others. But the consumer in the less-developed countries has not been aware so far of the iniquitous stranglehold of big producers. Merely because the nations of West Asia gave away oil exploration rights to Anglo-American interests, steps have been deliberately taken to retard oil production in those regions.

India is vitally interested in fostering oil development in the East so that it may become a more important source of oil than the West as it potentially is. This is not only a political necessity, though the assertion of freedom by the nations of West Asia is intimately tied up with their oil economy. India has also to decide its own oil exploration policy, and the Government would like to ensure that the comparative paucity of means and technical know-how should not impel her to pave the way for the establishment of another oil imperialism in this country.

India as one of the small producers of oil is intimately concerned with the intricacies of oil economics. Its output, at present, is 4 lakh tons a year. India imports about 3.2 million tons of crude oil, in addition, from the Arabian countries, at a cost of Rs. 30 crores. This expenditure can be reduced considerably and directly if the import prices are related to the production costs in the areas from which oil comes. The "artificial" inflation of oil prices not only enables the producing companies to cover their costs of exploration and exploitation in America but also to swell their margin of profits. Nearly 87 percent of the oil consumed in Europe, excluding Russia, Rumania, Hungary and Yugoslavia, is supplied from West Asia by four companies with almost equal British and American ownership.

World production of crude oil outside the Soviet countries is reported to be 415 million metric tons in the first six months of this year. This is 10 percent more than the oil output in the previous half-year. The estimated annual production may be thus 830 million metric tons in 1956 compared to 770 million metric tons in 1955. Production of U S S R and the countries under its influence in 1955 is estimated at 75 million tons. These countries are however progressing rapidly towards the attainment of their target of 140 million tons by 1960.

In the next five years, Rumania proposes to treble it oil production from the present annual level of 10 million tons while Russia's oil output is expected to be doubled during this period. Hungary, if political conditions in that country stablise soon, will increase its oil production from 1.5 million to 2 million tons.

The Chinese produce about 1 million tons of oil in their country but they hope to double this figure next year with the completion of the railway line linking the old established Yumen oilfields with Eastern China.

These trends indicate that America's share of world oil production has declined from 51 percent in 1953 to 45 percent in 1956. The trend is likely to continue. After all more oil is found at depths 2½ to 3 times nearer the earth's surface in the Arab-Ural area than in the Americas.

Ports measure the nation's pulse...

Watch the cranes at any one of our six major ports—loading India's produce into ships and unloading the raw materials she must have. It is in these ports that the economic pulse can best be measured. And as the economy expands, the pulse beats faster.

During the next five years Rs. 71 crores will be spent on developing major ports and harbours, and five crores for some 150 minor ports along India's coastline. Also four crores will be used to build new lighthouses and modernize existing ones.

In most of India's big ports, ships are fuelled by the Bunkering Service operated by Burmah-Shell. We supply many special lubricants for vessels of all kinds; diesel oil and petrol for port equipment; bitumen for surfacing dock roads and roofs; and grease for slipways...in fact we are rather proud of our part in India's nautical life.

AND PART OF IT

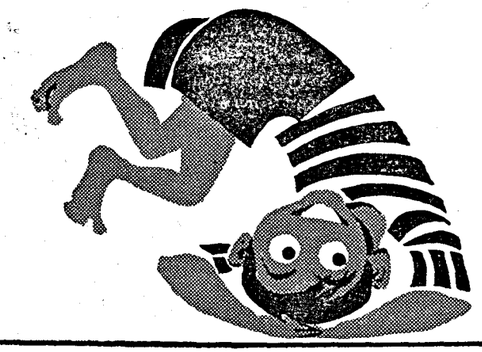
The Commonsense of Opportunity Cost

Dhiresh Bhattacharyya

THE discussion between Messrs Sen and Srinivasan in the columns of the Economic Weekly (September 29 & October 13) provides an occasion for some re-thinking on the doctrine of opportunity cost. Two definitions of opportunity cost have emerged from that discussion. The first refers to the marginal product of a factor in an alternative occupation; by almost unanimous consent this is taken to be nil or negligible for newly employed industrial workers in overpopulated agricultural countries. The second definition is concerned with the compensation which must be received by a factor if it is to continue to offer its service to a firm; it is the minimum supply price that must be offered to a factory to keep it in its existing occupation. The former has figured prominently in discussions of the social costs of wiping out so-called disguised unemployment in underdeveloped countries, while the latter seems more relevant for the practical question as to whether new firms will at all grow up to take care of the unemployed workers of the country.

In a fully employed economy, where all incomes are based on considerations of productivity the two definitions tend to coincide. Any lack of coincidence has to be explained, in such situations, either by reference to economic friction or in terms of the special attachment which particular occupations may have for specific groups of factors. The minimum supply price of factor X to occupation 1 may be higher than what it might earn by alternative use in occupation 2. In such a case, the doctrine of opportunity cost, taken literally, fails to satisfy. The cost of the factor X to occupation 1 is something more than what it might earn or produce in an alternative use, for example, in occupation 2. The doctrine is salvaged by broadening the definition of cost so as to include the "net advantages" of different kinds of occupations. The cost of a factor to an industry is the value of what it might produce elsewhere minus (or plus) the net advantages (to disadvanges) of this particular occupation as compared with its rivals.

In a society where incomes are not based on a strict valuation of the marginal product, or where doles constitute a source of livelihood for some people, the relation between the two definitions is virtually snapped. The minimum supply price of labour to a new firm may be equal to the full industrial wage. This is higher than what labour is currently 'earning' in agriculture (his barest subsistence needs). That in turn is higher than what he contributes to production in his existing occupation. The difference between the labour cost to industry and the current earnings of labour in the rural areas has to be explained, I presume, by reference to the same non-economic factors as were referred to in the previous paragraph. (There may be other explanations in terms of institutional obstacles to the mobility of labour, the existence of heterogeneous groups among rural workers, etc). On the other hand, the difference between labour earnings in agriculture and the marginal product of the labourer has to be explained in terms of the institutional peculiarities of pre-capitalist agriculture.



How does the doctrine of opportunity cost emerge out of this ordeal? The cost of labour to an industry is now equal to the value of its alternative product (nil or negligible by all admission) supplemented up to the cost of subsistence (according to rural standards) plus the differential advantage of rural living as it appears to the labourers themselves. The relation between the two definitions with which we started is no longer as self-evident as it was in our example of a fully employed capitalist society. But given the institutional structure of rural society and the peoples' attitude to industrial work, the two definitions are not entirely unrelated. Once again the doctrine has to be salvaged, if at all, by broadening the definition so as to include in the displaced alternative the cost of the industrial workers.

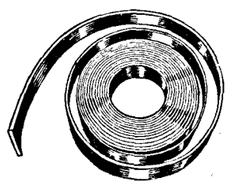
One naturally loses faith in a doctrine which changes its character so frequently. Doubts have been expressed regarding the applicability and relevance of the doctrine in the theory of economic growth. If one sticks to the first definition of opportunity cost as the value of the alternative product, tha cost is nil, and the case for using up as much of the labour as possible in highly labour-intensive occupations seems to be irresistible. But the cost of labour, or to put it more laboriously, the cost of providing employment to the unemployed is equal to the full industrial wage which, as we have seen, is equal to the cost of subsistence plus the differential considered necessary by the labourers. Shall we adopt the second definition and say that the cost of employing labour is nothing but the opportunity cost as so defined? The former seems to be barren of all practical significance, while the latter looks suspiciously like circular reasoning.

To get out of this dilemma one can do no better than go back to first principles. The doctrine of opportunity cost, in the hands of its originators, was a device for showing forth the relation between private and social costs. Where a factor is capable of being used in two ways, its social cost in the first use is measured by the value of its alternative product in the second. In this case the supply price of the factor to the first industry reflects the value of the 'displaced alternative'. In terms of our two definitions, we can say that the second definition is a construct based on the first which represents the essence of the social cost of producing the particular product. Where no such alternative use is possible, the social cost is no longer the cost of a displaced alternative; the supply price of the factor ceases to deserve the name 'opportunity cost', since no other opportunity of production exists. What does the supply price stand for? Does it reflect any social cost? I believe it does.

The minimum supply price of the disguised unemployed comprises, as we have seen, the cost of rural subsistence and a differential. The former is a fixed social obligation and is discharged by the family, the State, or some other agency. The latter is embedded in the existing system of valuation of the community. An employer who provides useful employment to the unemployed takes over the former obligation and has to pay an additional penalty for investing in an industrial rather than an agricultural process. His private cost is a reflection of two separate social costs—the cost of maintaining the unemployed and the cost of introducing an industrial process in a predominantly rural society. Neither of these is an opportunity cost, in

the correct sense of the term. Both of these are, however, real social costs involved in an industrial investment process. The ancients would have called them the costs of accumulation, of building up the wages fund, and such costs would, in a Smithian economy, be accompanied by an additional item, viz. a rise in 'profit'. A rise in profit, if effective, would have transferred to the hands of the would-be employer a sufficient command over wage-goods to enable him to give useful employment to labour. In so far as the previous consumption of the disguised unemployed can be thus channelled into the wage fund, the cost of providing employment is not wholly a net cost. But a certain additional social cost must almost always be involved in creating fresh employment for the disguised unemployed. Even in the limiting case where labourers agree to work in industry for the rural subsistence and the whole of the previous consumption can be recovered, additional social cost is involved in organising the fiscal and other necessary arrangements (e g transport). Against this additional cost we have to set the additional product from the new employment.

TURNING A NEW ROLL



We have turned a new roll; and it has cost us three and a half crores of rupees.

To what purpose, pray ?
At the end of the rolling, we get coils of flat, steel strip—skelp, as the steel man calls it. The skelp is passed on to the Indian Tube Company, which welds it into tubes.

So what ?
Merely that steel tubes pipe up water from deep inside the earth to parched fields, helping to grow a rich harvest. In the cities, countless homes receive a protected supply of water through these pipes.

Soon, a new plant will turn out the kind of steel tubes that go into the making of bicycles. Remember also that the locomotive speeding along the track is kept going by steel tubes which hold the steam.

Tata Steel's new Skelp Mill, the first of its kind in India, has a capacity of 200,000 tons. When there is enough steel, this mill will roll all the skelp and strip the country needs.

TATA STEEL
SERVES THE NATION

Subcontracting in Engineering Industries

George Rosen

This is an interim report on a study of 'subcontracting' among 15-20 Bombay firms carried on in July-August of this year. The full report will be written in the United States, but it was felt both by the author and editor that this interim report migh be of value in India's planning now.

IT was considered desirable to study the engineering industry as part of the M I T examination of industrial growth in India. However the character of the industry made it unfeasible to use capital: output ratios as a method of examining that growth. The very great complexity of the industry in terms of products produced, the great ranges of size in the industry, the relative newness of many sectors, and the absence of satisfactory statistical data since many of the firms are not in the public limited corporate sector, all make the computation of capital: output ratios both of great difficulty and of very questionable meaning.

Instead of this computation it was felt that a qualitative, non-statistical study of smaller firms in the industry, directed at determining the present extent, methods and future possibilities of sub-contracting in India would be of value for several reasons. This would give some understanding of the place of small industry in the Indian economy, and its potentialities for growth; and would also explore the important problem of the relationship between larger enterprises and smaller ones. Sub-contracting for the purposes of this paper may be defined as the practice of one firm contracting with a second firm, for the second firm to manufacture some part of either a larger product, or a larger order, being produced by the first firm. This is practiced very widely in Japan and the United States, and has the effect of both encouraging a wider dispersion of industry and permitting greater specialization.

In India this has apparently not advanced widely. Apart from certain areas in North India, and Bombay and Calcutta, there are not many "small industrial" areas: at the same time many of the larger firms, either as a result of experience or convenience, prefer to concentrate as much of the manufacture of a product as possible under their own direct control. In Bombay city with many small industrial establishments it seemed that a study of the degree of subcontracting, the difficulties faced by the smaller firms doing the subcontracting, the problems faced by the larger firms giving the orders, and the question this raised for the extension of subcontracting would be worth studying. These results, related to the results of other studies of small industry made by, among others, James T Mc Crory, P N Dhar, and the Development Commissioner, Small Scale Industries of the Ministry of Commerce and Industry, Government of India, would contribute to a better understanding of the present position and the future of small scale industry in India.*

Field and Method of Study

The author was able to get introduction to a group of about 15 small and medium size firms in Bombay city, that were doing work on a contract basis for one of the larger firms. He was also able to visit several of the larger firms which subcontract work to the smaller firms. (There is some overlapping here. Many of the medium size firms especially were both performing work on subcontract for other firms or the Government, at the same time that they were themselves letting out work on subcontract to other firms for their own use). The firms visited, and business men interviewed, were largely either in the electrical machinery field, or the metal stampings field. The author spent on the average at least two hours at each of the plants visited. The questionnaire (see Appendix below) shows the major points of interest and questions asked.

As can be seen the author sought to gain information concerning the physical characteristics of the plant, the capacity for expansion, and the problems arising both in the operation of the business and in relation to plans for expansion. These questions led to other questions and to voluntary offers of information in areas not covered by the questionnaire, including questions of finance and volume of business done. In the latter area the author was extremely careful to dispel any suspicion that he might be connected with Government (a general initial suspicion). The information gained in the financial field is very general; since the firms did not publish financial accounts. (In no case were the smaller companies public limited companies). Where financial information was made available there was no way of checking on its accuracy, and it is probably of dubious accuracy at best.

Small Sample

What follows is a very brief summary of the characteristics of the firms visited, and certain tentative conclusions. It should be stressed that this summary and the conclusions based thereon, is derived from a very small sample in the Bombay region. Characteristics in other areas may be significantly different, and the conclusions would also be different. It should also be stated that the firms interviewed are successful firms, in many cases over 10 years old, and with a record of proved stability. As such they cannot be considered typical of the many small firms that start, fail, and restart, and that are perhaps more typical of small scale industry than these.

Character of Firms

Of the 15 small or medium firms visited, the employment per firm ranged from a minimum of 10 to a maximum of 700. The model employment however was in the 50-100 worker class, with a few firms with less than 50 and a few with more than 100.

All of the firms produced a substantial part of their output to specific orders, i e. on contract to other manufacturing firms, or to middlemen, or to the government. All carried on a substantial amount of subcontracting, either as producers of parts of larger equipment units, or as repair work. Several of the larger firms in the group also produce items such as fans, stainless steel ware etc on a production line basis, but even for these firms work on

* Mc Crory, J T "Factors affecting Growth in Small Industry"; Development Commissioner, Small Scale Industry—Small Scale Industry Analysis and Planning Reports, esp 2 and 3 on Sewing Machines and Parts; and Bicycles and Parts (for Northern India); P N Dhar "Some Aspects of Technical Progress in Small Scale Industries", Indian Economic Review, Vol III, No 1 (Feb 1956).

contract represents the larger proportion of the output.

The amount of machinery varies from one or two small lathes and drilling machines, to numerous such machines, as well as cutting, turning, and welding machines. However in all cases much of the machinery is either second-hand or frequently produced within the shop by its own workers to its own specifications for its own particular purposes. The machinery would, I believe, in many cases probably be considered past its useful life in the United States. The number of workers in each shop appears great, with much of the filing, finishing and joining of parts done by hand to the required tolerances. Compared again to United States machine shops, facilities are often primitive—dirt floors, belt driven machinery, excess crowding to utilize all the space in a small corrugated tin shed. Very few have their own casting facilities since the cost of firing a cupola for a small volume of castings would be prohibitive, so that most of these in turn subcontract their casting requirement to a foundry.

In spite of this limitation in machinery and space the quality of the output is frequently high. For work in which tolerance requirements are not unduly high, where a relatively small output is required on an individual basis, the shops are able to turn out a quality of output comparable to that in the West.

The workers are in many cases uneducated, recently moved from the village. Nevertheless many of these workers, trained on the job with an older skilled mechanic, are able to construct pieces of equipment and elaborate machinery either on the basis of a sample model of a part or a machine, or on the basis of designs and patterns given to them. Apparently there is no feeling that the lack of skilled labour would prevent the firms from taking on additional work.

Finance and Organization

The firms themselves in some cases go back to the first World War, though many were started following the Second war. In all cases they were started by a single man, usually with a very few workers and one or two machines. The owner or founder himself was usually a skilled mechanic, frequently uneducated in the regular school system, but well-trained in a larger machine shop and with a knack for handling machinery. At some point his reputation as a skilled worker became such that he received after work-hour orders to build one or two small machines, or to repair a motor or switchboard. As these setting up his own shop and he would face the question of whether the possibility of making more money was greater on his regular job, or by setting up his own shop-and he would make the latter decision. Initially the financing would come either, in a few cases, from his own savings but more likely from the family, or others in the same community who would become silent partners. Then would come a long period of austerity, plowing back of profits and savings, and, since these are successful firms, a period of some growth or expansion. This latter period would usually be a war period. In no case was the early financing from banks or the government. There is a general fear of bank financing or outside assistance -a fear that this would eventually mean either loss of control if a crisis arose, or that it would involve burdensome fixed charges. More recently there is a fear that it would mean undergoing long and tedious investigation and burdensome red tape. (There is general knowledge of various government programmes to aid small industry, but the fear of the government apparently outweighs the advantages of its aid. Only one of the firms interviewed has applied to the Bombay State government for aid in expansion).

Not Public Limited Cos

None of the firms are public limited companies; a few are private limited companies and the remainder are sole proprietorship or partnerships. The red-tape involved in the company act legislation apparently discourages any extension of public limited organization, and even the firms interested in raising capital are unwilling to become public companies to do so. Sole proprietorships are preferred because several firms have had unfortunate experiences with either partners claimed to be of doubtful integrity, or upon the death of the original partners.

At present almost all the firms are operating at or close to capacity. Several are reorganizing their space to squeeze in additional machinery; others, the larger ones, are considering an extra shift. Almost all are at least considering moving to larger quarters. Nearly all use rented space and have expanded in the pact by renting another nearby shed. Now, with the great limitations of space in the crowded areas of the city where they are located—Kumbharwada, Fort, Ballard Estate, Byculla, Parel, Girgaum—they are considering moving to the proposed industrial area on the outskirts of Bombay where they might be able to build a plant and combine enlarged operations under one roof, rather than in a series of makeshift sheds.

Shortage of Material and Equipment

What are the technical problems faced by these firms? A general problem is the availability of the raw materials where steel or cast-iron is the basic material. Because of the shortage of steel almost all firms are forced to resort to the black market to get steel beyond a limited official quota based usually on their past requirements. However, while they can get steel on the black market, this is at the cost of both a price higher than the official price (this higher cost may not be allowed in computing taxes since there are frequently no records), and at wider quality variations, which may adversely affect the quality of the manufactured product. The same may hold for the pig-iron used for castings, and the quality variations of these are a frequent complaint.

Other problems, though less serious for existing operation, are delays in getting machinery for expansion. Apparently there are lags of as much as a year in the delivery of smaller machines and precision tools from domestic sources. Getting permission to import such machines requires passing through the elaborate procedure of Import Control, which is often beyond the capacity of the small man as well as long delay between order and delivery.

For those firms producing for more than a local market railroad transportation, with the present shortage of wagons, also causes delay, with consequent tying up of working capital in stocks of raw materials and inventory of finished product.

Limiting Factors

Apart from certain of these shortages, government legislation apparently operates as a limiting factor to these firms, and acts to discourage expansion. Firms are known to have remained at below 20 employees to avoid entering under the requirements of the Factories Act; and to below 50 men to avoid the requirements of the Bombay Provident Fund legislation. The limitations on discharge of permanent workers has also acted to either encourage use of temporary workers or to discourage a rapid expansion that might only prove temporary—and it may discourage two-shift operation for many of these firms.

Unlike the firms studied by Mc Crory, a lack of working capital is not a major limiting factor on growth for most of the firms. (There is one major exception). These are firms which have achieved relative stability having survived through busy periods and periods of slack, and by now, they have established contacts and methods of payment which assure them of their short term capital needs, and enable them to tide over periods of either undue delays in sale, or slow sale. As such they may not be typical of most of the smaller firms.

Methods of Payment

Methods of payment for the job vary. In only a few cases, and these primarily where the order requires an unduly long production period or is unusually large, is there advance payment—i.e. payment at the start of production and some proportionate payment during the period of production. (One exception is a relatively large firm in terms of employees and fixed capital which suffers from a serious shortage of working capital and which asks for, and gets a large advance payment). For most firms there is simply payment after delivery and acceptance of the product by the buyer. The time of payment also varies for new customers, it frequently accompanies delivery and is immediate. For older customers, or those with an excellent reputation, payment may be made from several weeks to one or two months after delivery and after it proceeds through the customer's normal accounting procedures.

The government is to some degree an exception. The complaint is made that payment by government firms is often delayed for as much as six months, especially if there is any question of variation of the product supplied from government standards. As a result several of the smaller firms refuse to take government orders directly, since the possibility of delayed payment is serious. (They may handle government orders indirectly, either through a middleman or on a sub-subcontract with a larger firm. In such a case they get payment quickly from the middlemen).

The government policy of requiring deposits from firms before letting contracts to them has also created criticism, not so much of the requirement but of its implementation. Apparently there is little consistency between government departments with respect to size of deposit, nor is there a centralized deposit requirement—if a firm wishes to bid on orders for several departments it may have to provide separate deposits. For a small firm this may mean that a large proportion of its liquid capital is tied up in deposits, and this discourages its willingness to accept government orders.

Customer-Producer Relationship

The relationship between the customer firm and the firm producing on a contract basis varies. In some cases it is direct, based on the buying firm's knowledge of the smaller firm—frequently through contacts made when the owner of the smaller firm worked for the larger firm. Bids are asked for a job, and are let directly. In other cases it is indirect with intermediaries. The intermediaries may be another manufacturing firm which has accepted an order but finds for some reason that its capacity is limited, and it therefore sub-contracts part of the order. In today's boom market with numerous rush orders this happens quite frequently, and the original firm will give part of the order, or part of another order to free capacity, to a smaller firm—frequently operated by a relative or a close friend.

The other type of middlemen are regular traders who do not have technical capacity, but who act as go-between between large firms and small firms—and who may supply capital to the smaller firms. There is some feeling among the smaller firms that these middlemen are making a profit out of them purely as traders, and that it would be desirable that they be eliminated. Certain of the larger, well established quality-conscious companies often prefer to deal with the small producer directly since they have a more direct check upon the quality of output.

The company placing the order only rarely supplies its sub-contractor with raw materials. This is ordinarily only done in the case of such items as special steels which the customer requires for the output. In all cases the customer will supply designs and specifications of the product to be manufactured. He also provides some inspection in the shop. Usually when an order is first given inspection is quite regular, but then if the item produced is a standard item it may be stopped. If it is a special item with unusual characteristics, inspection may be continuous; and if there are difficulties in production the purchaser may provide technical advice, or make changes to enable the difficulties to be overcome. In all cases there is inspection before acceptance by both the producing firm in its shop, and by the purchasing firm. Payment depends upon acceptance, and producing firms will usually make changes without charge if there are rejections due to failure to come up to specifications.

Experience of Larger Firms

How has sub-contracting worked for the larger firms which have practiced it? Opinion varies—several firms are apparently satisfied with the results and are planning to expand the area of sub-contracting. Other firms are very dissatisfied with sub-contracting and have stated that they will not be satisfied until they can concentrate all production under their own roof. These attitudes are based on varying experiences and after calculation of the costs of sub-contracting. For the consuming firms the costs of sub-contracting are not only the direct costs of production but costs of transportation, any cost modification of the product delivered by the sub-contractor, costs of inspection, and any costs arising from delays in delivery either because of poor planing by the sub-contractor, or because of factors out of his control such as absenteeism or strikes.

Several of the larger firms in the Bombay area have found that up till now the costs of sub-contracting in practice exceed the costs that would be incurred if they produced the items themselves. The types of items produced in these latter cases are usually items requiring a high degree of precision and a large volume of output. In several cases the final product supplied has come up neither to specification nor to samples, as sub-contractors skimp on quality either to meet costs, or

Carrying passengers and freight, Indian Airlines Corporation has an average load of about 4,500 lb. on every flight

SOMETIMES, freight claims aboard an aircraft come first. Would-be passengers are disappointed — especially if they hear afterwards of vacant seats. But, remember, the weight of a passenger may be taken up by a consignment of life-saving drugs, a shipment of vital foodgrains, or a bag of important mail!

The payload of an aircraft is made up by passengers *and* freight — it cannot be reckoned in terms of the number of seats provided. Please remember this, if *you* fail to get a seat on a certain flight. Remember, too, that Indian Airlines Corporation belongs to the people of India . . . and its wings fly in the service of all!

INDIAN AIRLINES CORPORATION

Mahatma Gandhi Road, Bombay 1. Telephone: 251540, 251544 (6 lines)

to increase speed of delivery. Where the item is part of a larger final product whose output is on a time schedule, rejection is difficult. The purchasing firm then has to make its own repairs and modifications to achieve the desired quality, and the final cost to the buyer becomes unduly high.

A frequent complaint also heard is that the price offered is too high. This may reflect the smaller firm's inability to handle a large order, and in some cases inadequate knowledge of its own costs, because of primitive accounting methods.

The firms that are satisfied with sub-contracting are those requiring work of relatively lower precision—such as tanks for transformers—or where they have had a long relationship with a few reliable sub-contracting firms that know their customers' requirements and are willing to make adjustments for them.

The Small Scale Industries Service institute is attempting to provide central workshops with new machinery where small firms can bring large volume orders, or where work of great precision is required. It is also making machinery available under very favourable terms of payment, which will enable small firms to modernize plant and turn out higher quality work. These are necessary steps if sub-contracting is to expand.

Conclusions

It should again be repeated and stressed, first, that these conclusions are based on a small number of firms—15 to 20—surveyed in Bombay city and suburbs; and second, that these are interim conclusions subject to later revisions. What holds true for these firms may not be true of others either in Bombay or elsewhere.

1. A major conclusion is that entrepreneurial and technical ability exists, not only in the larger organized sector of Indian business, but in the small firms and shops of Bombay. This conclusion agrees with that reached in the other studies. It might be added that these business men were not refugees, as found in McCrorey's Study, but were people who had lived and worked in or near Bombay all their lives, and included representatives from many of the communities in Bombay.

2. The Five Year Plans, by their great encouragement to the engineering industries, have also provided a major stimulus to sub-contracting. Existing firms, able to take advantage of that stimulus, have expanded some by making additions to space and machinery, and by the production of additional lines. At the same tme the larger firms which can give orders on a sub-contract basis to the smaller ones have also been expanding and are looking for smaller firms to give additional orders to, if the smaller firms can deliver. (In some cases these firms would formerly sub-contract with other large firms which had excess capacity—but as these latter firms today approach major lines they can no longer take capacity operation in their own sub-contract orders, and new sub-contractors must be found). There are thus large potentialities for further sub-contracting on the demand side, and these may be expected to increase if the opportunities are taken advantage of.

3. While the broad government expansionary policy is of definite aid to the small firms, and this has been reenforced by the small industries programme which is going into operation, other specific polices apparently run counter to these expansionary influences. First is the general distrust of government and suspicion of government activities, whether warranted or not. This arises primarily because most of the people have met the government previously in the role of a tax collector, or as a policeman. Apart from this past history certain specific departmental policies, with respect both to payment on contracts and deposits required, act to inhibit small industry's interests in government contracts. Some reduction in the red tape involved in dealing with small business—especially with respect to imports, raw material and transportation—would also be of value in making it easier for the smaller firms to expand. Finally some question may be raised as to whether the size limits of the applicability of welfare and control legislation may not be too low in their application to small and medium size industry.

4. Private banking facilities for small and medium size firms are either almost non-existent or unused. A system of making medium term credit for fixed plant available from private banking sources within a relatively short period of time after application would be worth exploring. Expansion of the rediscount facilities of the Reserve Bank against such paper might have encouraging consequences.

5. It is important that a wider extension of sub-contracting take place simultaneously with the expansion of large scale industry, or it may be too late. If large scale firms find themselves forced to enter the production of the numerous small items which they would prefer to sub-contract but are unable to at present, it may be too late to encourage sub-contracting to smaller firms at a later stage. Once a firm has made the investment in plant and machinery to produce its own requirements of an item, it will be unlikely to sub-contract; in fact it may itself enter into production of hose items for other customers to operate at full capacity. This will both make for increased centralization of industry at the same time and it will probably reduce the employment effects of industrialization since the larger firms are likely to use more capital intensive methods than the smaller firms.

6. The smaller firms which have succeeded with sub-contracting have been able to turn out goods which meet the quality standards of their customers at a reasonable price and in sufficient quantity. For smaller firms to succeed it is most important for them to stress both high quality of output, and close control of costs. Customers by providing inspection, can assist in quality control; the government small industry progamme will encourage improved quality also; possibly either by publications or brief inexpensive courses in accounting more widespread use of accurate costing methods would be encouraged among smaller firms. This finally requires a desire as well as ability on the part of the small firm and middlemen to deliver goods of the highest quality at reasonable prices over a continued period of time.

APPENDIX

Questionnaire used in the enquiry

1. What machines do you have and how many of each type?
2. What type of engineering work does your firm do?

   Does it produce finished products or is your work largely repair?
3. How many workers do you have? How many are skilled mechanics and metal workers?
4. How many hours per day and week are you working? How many shifts?

Do you have machines or skilled workers who are not working now? Could you handle more work with your present machines and workers?

What other types of work could you do other than you are doing now?

If you needed them to expand could you get more machines and workers? Would you have the capital to expand production? How soon could you expand output if orders came?

7. Where do you get your orders from now? How are they handled? Do your customers supply you with raw materials and specifications? Do they inspect your work as it proceeds? What proportion of rejects do you have? Could you reduce this—how and by how much?

8. How long does it take between order and production? If not on order, how long does it take between production and sale? Do you get advances from your buyers—or how else do you get your working capital?

Changing Character of Bank Advances

Special Measures Needed

Sukumar Chakrabarty

AMONG the points brought out in recent discussions on monetary stringency, the one which deserves special attention on its own merits is that of changing character of bank advances. It must have been raised by the bankers in their discussions with the Finance Minister, for among the proposals put forward, extension of the period of loans under the Bill Market Scheme from 3 to 5 months appears to have figured prominently.

That the character of bank advances has been changing and that bank advances are becoming less liquid than before, has been the general experience of all practical bankers. As a result, flexibility of operations in the matter of adjusting bank assets to changing monetary conditions has also been impaired to some extent. This is not something which happened only in the last few months. The change, moreover, cannot be gauged from the analysis of bank advances published by the Reserve Bank periodically, though in the recent literature on the subject, a slight increase in the proportion of advances to industry has been noted. In the last report on the Trend and Progress of Banking for 1955 the position has been summed up as follows:

> "Taking the five-year period from December 1950 to December 1955, the proportion of industrial to total advances showed a rise of 2.3 per cent to 34.3 per cent whereas the proportion of commercial advances declined from 51.8 per cent to 50.1 per cent".

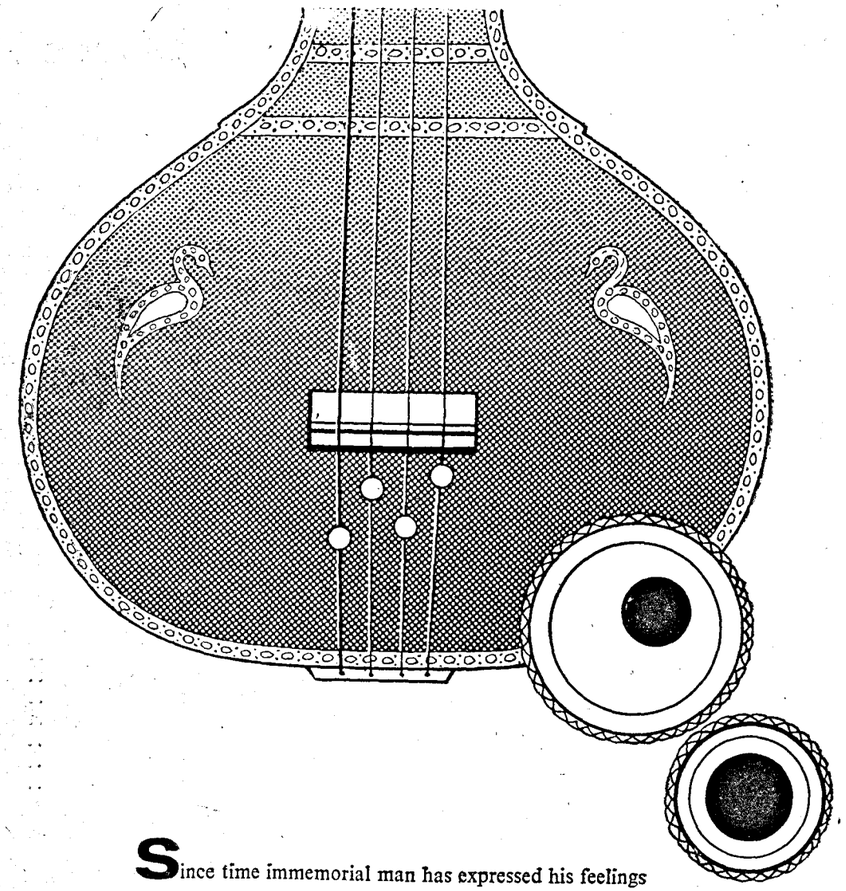
The recorded increase in the proportion of advances to industry of a mere 2 to 3 per cent in five years is not, of course, much of a change, nor do the published figures convey an idea of the underlying processes which they are supposed to reflect.

That there has been a material change, nevertheless, in the character of bank advances is suggested, among other things, by the remarkable increase in recent years in the imports of capital goods in which bank finance has an important part to play, in one way or another. It is commonly complained—and this is borne out also by such data as are currently available—that the inflow of foreign capital and of the volume of fresh foreign investment in the country has not been substantial. Therefore, the responsibility of financing imports of such a large volume of capital goods has fallen heavily on Indian industry which has necessarily to depend very largely on the banking system for providing necessary finance, in the absence of an active new issues market or easy access to the capital market. It would be worth investigating to what extent imports of capital goods have been and are being financed by bank advances. If such an investigation were carried out, there is reason to believe that not only the share of the banks would be found to be large, but it would also be found that this share was increasing.

Such advances, needless to say, are by their very nature of longer duration than commercial advances. The increasing predominance of capital goods among our imports not only increases the volume of advances and lengthens the period of such advances, it has other repercussions on the banking system which are perhaps even more important but are much more difficult to trace.

When a manufacturing concern borrows from banks to finance the import of some capital goods, such borrowings will figure in the returns of banks as industrial advances. But when importing houses finance imports of heavy machineries with bank advances, such advances are treated as commercial advances, though they may not be liquidated as quickly as those against import of consumer goods. The manufacturing concerns, on the other hand, may pay the importer for the machinery they import, over a period of time, covering the erection of the plant. This results in a gradual decline of commercial advances, and increase in industrial advances. Thus the advances made to importing houses, though classified as commercial advances, are actually of industrial nature, judged by their purpose as well as by their duration.

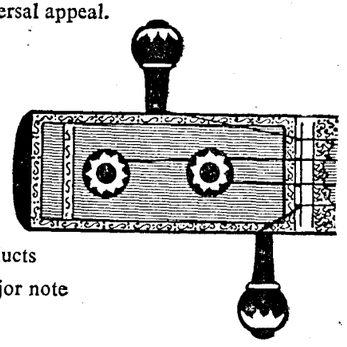
A study of seasonal variation in bank advances over the last five years reveals that the slight decline in the last slack season was not a mere aberration but in conformity with a definite trend. The table below, showing the seasonal decline as percentage of bank advances (including bills purchased and discounted) at the peak of the busy season, establishes that the seasonal character of bank advances is wearing off. Industrial expansion under the First Five Year Plan, which developed momentum in 1953, has been quite rapid since then. In the absence of capital market activities, as pointed out before, the burden of financing this expansion has devoloved largely on banks and hence the shrinkage in the customary seasonal decline.



Seasonal decline in bank advances as % of peak of the busy season

1950	..	16
1951	..	17
1952	..	17
1953	..	15
1954	..	10
1955	..	.05
1956	..	.01

Bank advances to importers of iron and steel, on Government account are similar in nature to industrial advances as their liquidation takes a much longer time than that of ordinary commercial advances. At the present rate of steel import, it is estimated that on an average bank advances to the tune of Rs 50 to 60 crores have been outstanding at a time during the past months on account of this item alone. Delay in Government's procedure of payment has caused additional strain on banks' resources.



So long the character of advances are based on the character of borrowers, the analysis of advances carried out by the Reserve Bank periodically will not reveal the actual transformation that has taken place in the bank advances and the present absence of seasonal decline will be treated as an aberration.

Larger advances to industry is undoubtedly a welcome feature of recent banking practice. The old practice of restricting bank advances to commercial purposes only have been a major handicap to the proper execution of the Second Plan

Since time immemorial man has expressed his feelings through music. From the primitive drum beat to the highly developed symphony, music is the cherished heritage of all peoples. Music binds us together through its universal appeal.

Like music, shared aims and effort form a close bond. This is evident in India today where technicians from abroad are working with their counterparts here to develop industries, erect giant projects, increase trade and commerce.

A constant supply of our petroleum products essential to such joint enterprises is a major note in this new symphony of progress.

in the private sector. But the problem of finding resources for meeting the developing demand for such advances remains to be solved.

Whether the Reserve Bank increases the duration of usance promissory notes under Bill Market Scheme from 3 to 5 months or not is immaterial for this particular problem. So long as the limits fixed for banks under the Scheme remain the same, lengthening of the usance of bills will not add to the resources of the banks though it will certainly simplify the procedure and reduce the clerical work involved. The Bill Market Scheme has been a great stabilising factor and has enabled banks to withstand the strain caused by the rise in Bank Rate in England. On the other hand, it has failed in its original purpose of creating a proper bill market and the manner in which the Scheme has been operated has reduced the prospect of a bill market ever coming up. This has been done by introducing the element of 'advance' in Reserve Bank lending, with bills as collateral, and withholding the element of 'discount', which is the very essence of a bill market. This has no doubt been very helpful to the banks on account of the flexible character of 'advance' as against the more rigid character of 'discount'. If now the usance of bills is increased when the general tendency is reduction of usance abroad, even the semblance of a bill market in the scheme will disappear altogether.

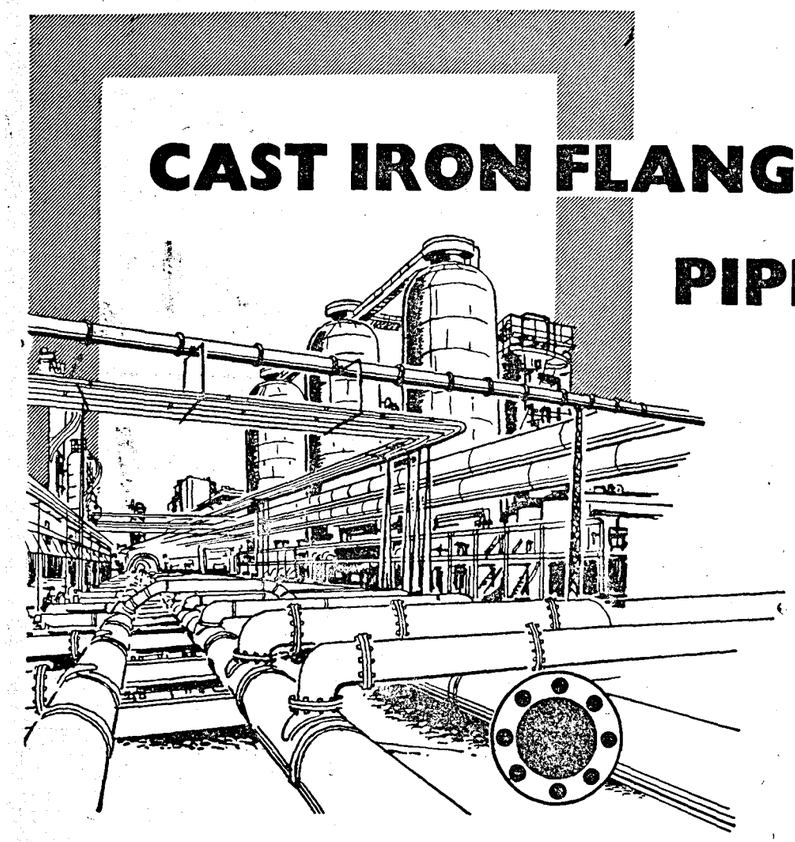
The suggestion, however, merits support in an amended form. If bills of longer usance are discounted or advanced against by a specialised institution (and not by the Reserve Bank as under the present scheme) it will increase the resources of the banks and make their industrial advances more liquid. Industrial Finance Corporation has yet to play its full part in the industrial development of the country. The preamble to the Act said that the Corporation would particularly help the medium scale industrial firms which have no access to the capital market. The lack of such access has been the main cause of pressure on bank advances. True, the I F C is expected to provide only fixed capital, but there is nothing to prevent it from extending shorter term loans, i e shorter by its own standard but inconveniently long, according to commercial banks. Since the consortium recommended by the Shroff Committee did not come off, it may be suggested that the extra burden on banks due to increasing demand for longer term industrial advances should be reduced by transferring such advances to the IFC. The suggestion which has already been made that the IFC's resources should be increased by handing over to it the counter-part funds of the recent Indo-American Wheat Agreement on the same line on which such transfer was effected in the case of ICFC, should be strongly endorsed.

This fund may form the nucleus of a scheme for promoting the development of a market for industrial bills to supplement the Reserve Bank's Bill Market Scheme. The justification for this necessary reorientation of the suggestion put forward by the bankers lies in this that the distinction between commercial and industrial advances must be maintained in the interest of the development of commercial banking on sound lines. In the absence of specialised institutions in adequate number and strength to cater for long term financial requirement of industry, banks can only distribute such assistance with resources other than those on which they rely for their normal commercial banking needs. Combination of diverse types of financial assistance under one 'scheme' may lead to lopsided development.

WOODWORK NEEDS PROTECTION

Whatever the wood and the condition of its surface, there is a specific **Shalimar Paint Product** which will make it wear better, last longer and look more attractive.

... That's because, **only Shalimar Paint Products** are backed by over 55 years of manufacturing experience in India. The extensive paint research, constant progress, and development carried out is a guarantee that **Shalimar Paint Products** will stand up to the difficult and extreme climatic conditions in India.



Whatever the need, specify the purpose when you order

SHALIMAR PAINT PRODUCTS

Write for the **Shalimar Ready Reference** leaflet which will introduce you to the complete range of our products.

Around Calcutta Markets

Dull but Steady

Wednesday, Evening

STOCK markets remain inactive. In the last few days, the downward trend has been halted. At lower levels, there was some evidence of revived buying support. But the market situation at the time of this writing indicates that investors are not confident about the outlook. A slightly easier trend in clearing shares may be due to the settlement. In to-day's kerb dealings, Indian Iron tended to steady-up. But recent price fluctuations strongly indicate that neither speculators nor investors are eager to add to their commitments.

Jute shares continue to belie hopes of optimists. Despite the continued firm trend in weekly auction prices, Tea shares remain quitely steady. There are, however, indications that investors are rather inclined to lend support to both Tea and Jute shares at all set-backs. Paper shares seem to have gone out of favour. But Coal shares are attracting the attention of investors at the current low levels. There is occasional support for Miscellaneous and Engineering shares. But it is not consistent.

Tight Money

Recent inactivity in equities is not mainly due to apprehensions about the dividend outlook or about the future of industry. Stagnant conditions in stock markets is a basic reflection of dearer money. About six months ago, the Reserve Bank introduced the policy of qualitative control over credits. In the changed circumstances of to-day, some aspects of this policy have been reoriented. For instance, restrictions on bank advances against rice and paddy have been withdrawn. But the other aspects of the policy of selective credit control remain in operation.

At about the time that restrictions were enforced on bank credits for paddy and rice, the Reserve Bank let it be known that it frowned on speculative advances by Banks. Immediately afterwards, the Reserve Bank called for detailed information about bank lendings. These directives by the Reserve Bank have had some of their desired effects. For some months now, not only speculators, but investors have been complaining that banks are reluctant to lend against the collateral of stocks and shares.

Higher Costs

Speculators have occasionally to take resort to banks to tide over certain temporary difficulties. Such accommodation is now not so easily available, and can be had only at higher rates of interest. Even genuine investors find it difficult to lend support to sound shares, as bank advances for such purposes are now more difficult to obtain. Lyons Range is primarily a cash market. It is, therefore, not difficult to appreciate that the stricter attitude of banks is hampering even genuine investment activity.

Last week, the Reserve Bank raised its rate of advances to banks under the Bill Market Scheme. This will not necessarily lead to a further stringency in the money market. But this move by the Reserve Bank must have a hardening effect on market rates of interest. Many banks have already raised both their borrowing and lending rates. Higher rates for bank advance will raise industrial costs. Dislocation of traffic through the Suez Canal will raise import costs, and will delay imports of plant and machinery. As industrial expansion becomes costlier and is delayed, industry and, hence, equities are likely to suffer.

Coal Shares

Lack of investment support has to be analysed in the light of the hardening tendency in money rates. On top of this, some of the sound new issues are competing with the existing equities to attract the attention of investors. This explains the lack of sustained buying support for equities. Even so, in the last few days, some investment support has been in evidence for sound scrips in more than one group of equities. If this trend persists, the stock market may continue to be steady.

Among clearing shares, Burrakur Coal have been consistently firm in the last few weeks. Improvement in this scrip is mainly due to the recent activities of the Company concerned in acquiring interest in allied companies and industries. But, in the last few days, there has been a welcome revival of buying support for small-priced coal shares. This revival of interest is not wholly due to dividend considerations. There are revived hopes in the future of the coal industry during the Second Plan period.

Since the start of the Suez Canal crisis, there have been hopes of a revival of interest in Jute shares. These hopes have not materialised. But both Jute goods and raw jute have firmed-up considerably since the start of the war in Egypt. Improvement in jute goods is not without basis. For one thing, statistics indicate a considerable inrease in burlap consumption in America.

There were, recently, reports of New Delhi orders for heavy goods. These figures and reports have encouraged considerable speculative activity.

But there is another reason why jute goods are moving up. There are boom-like conditions in raw jute markets in Pakistan. This is one of the main reasons for the spurt in raw jute in Calcutta markets. Firmness in raw jute has necessarily been reflected in higher prices for jute goods. But investors are, naturally, reluctant to lend support to Jute shares because of fears that the spinner's margin will continue to remain unfavourable. These fears are not entirely baseless. But comparative statistics indicate a relative spurt in jute goods. Current comparative price fluctuations in raw jute and jute goods should encourage moderate optimism about the immediate outlook for Jute shares.

Around Bombay Markets

Not Out of the Woods Yet

Thursday, Morning

IN distinct contrast to the bearish trend witnessed during the previous week, the stock market has steadied up, although there has been no particular factor which may be said to have imparted strength to the market. So long as apprehensions about heavier taxation and larger demands from labour all round continue to plague the investment climate, the market cannot be said to be completely out of the woods.

Meanwhile, a notable development was the release of a substantial number of shares of Voltas Ltd issued as right shares at a premium of Rs 11 per share of Rs 100 each. These were immediately taken up and are now being quoted at a premium of Rs 4 to Rs 5. The progress of the Company during 1955-56 has been quite impressive with sales at Rs 15 crores recording a rise of 60 per cent. As this should naturally be reflected in higher profits, there is a general belief that the Company would be able to raise its dividend from the 5½ per cent of the previous year.

In the steel section, speculative support helped to harden the price trend. Towards the close of the week, Tata Steel Ordinary were ruling steady at around Rs 193-8 while Indian quoted Rs 34-8.

Textiles, however, continue to be in the doldrums. It is true that reports from the piecegoods market have been encouraging for the first time since Diwali. The uncertainty in regard to Government's textile policy, however, still continues. Despite talks of boosting up exports and limiting imports of certain items at the Export and Import Advisory Council Meetings last week-end, neither the new Commerce and Consumer Industries Minister nor the Minister for Commerce tried to meet the demand of the industry in regard to official ceiling on production. While there have been repeated assurances from the ministers concerned that the textile industry would be freed of this limitation, to this day there has been no categorical announcement from the Government that mills could have their own production schedules dictated by the supply and demand position. This has caused some disappointment although Shri Morarji Desai's realistic approach to some of the problems of export and import was noted with satisfaction.

In the miscellaneous section, a slight decline has been registered by National Carbons although they are still potentially good investment. The final dividend of Indian Aluminium is expected to be 5 per cent making the total 10 per cent. Plantations which played such an important part during the previous week gradually moved up in sympathy with the generally firming tendency. Panic has been allayed to some extent also by the Supreme Court's stay order of the Tribunal's Award.

The Dunlop Rubber Company, it is reported, will shortly issue Rs 1 crore preference capital and Rs 1 crore ordinary capital to meet the expenditure of expansion plans. It is expected that preference capital will be issued to the public and ordinary capital will be issued to existing shareholders in the proportion of one for every one share held at a premium of Rs 10. The Company will be able to keep the ratio at 1:1, as the parent Company in London has agreed to forego its rights in order to offer a larger participation to Indian shareholders.

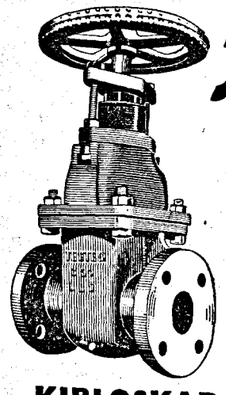
Cotton

Capital Export to Burma?

COTTON features presente,d on balante, a slightly improved appearance at the close of the week compared to the previous week but the appearance may prove deceptive because export quota, by which traders set such great store, have not yet been announced, though Shri Morarji Desai told the Export Advisory Council earlier in the week that a decision would be taken "in a day or two". The latest from Delhi, at this writing is that the quota may not be announced in the near future, as cotton prices are regarded as too high.

If this turns out to be Delhi's considered opinion, the market will have to do some re-thinking. Knowledgeable quarters have so long felt that a mere quota would not suffice to bring about recovery; it has to be reasonably big, if cotton features are to resume their upward trend.

The Government of Burma, it is believed, is likely to approach the Government of India for Indian capital and personnel to set up textile mills in Burma, to help Burma to become self-sufficient in cloth and yarn. Burma annually imports cotton piecegoods valued at Rs 20 crores.



The Prime Minister of Burma, who was in the city for the Asian Socialist Conference, is believed to have approached some textile interests to get their reaction to his Government's offer. The Burmese Government, it is further reported, will not only welcome both Indian capital, part or full, and Indian technical personnel; it is prepared to extend all facilities to Indian industrialists, including protection against nationalisation. The offer of fresh fields of development should be particularly opportune at this moment, when textile interests are not being allowed to expand at home.

Oilseeds

Modest Setback

THE bull phase in oilseeds continues, despite a modest setback towards the close of the week. The main feature of trading during the week has been the sharp rise in the price of castor in which business to the tune of 2000 tons of oil have been reported on U K account at higher rates. As the week progressed, however, there were weak advics from Rajkot which induced some bull liquidation bringing in its wake a sympathetic decline in groundnut and linseeds. The observations of Shri Morarji Desai and Shri Karmarkar at the Export Advisory Council in respect of export of groundnut oil have damped enthusiasm as no quota can be expected for some time to come.

Referring to exports of oils and oil cakes, Shri Karmarkar said at the Export Advisory Council Meeting that these two constituted a very hopeful source for increasing foreign exchange earnings. And yet, the Government was chary of releasing a sizeable export quota for them. Government admits that the demand for these products in the world markets is on the increase. As there has been a parallel increase in home demand, "we have been unable to spare as big a proportion of our production as the world is in a position to absorb". To overcome the difficulties, the only solution is "to step up the production of oilseeds in the long run, and to tighten the belt in the short run". So,perhaps, exports in the future are not entirely ruled out. The market will be left guessing how much we can tighten the belt, and whether we can do it at all or not.

Bank Credit for Development

THE Finance Ministry has not yet indicated how it would like the banks to cope with the demand for credit during the current busy season. It is possible that when the congestion created by heavy steel imports is cleared and hold up on account of payments due from Government is straightend out, the situation could be met by the normal recourse to direct borrowing from the Reserve Bank under the Bill Market Scheme. As the requirements must have been sized up by now, it is also to be presumed that borrowing limits would be suitably raised in order to enable the necessary expansion. The dislocation to shipping caused by the blocking of the Suez Canal may itself bring some-relief, as imports will have necessarily to be phased over a longer period. From present indications it appears, however, that stringency will continue to be a normal feature of the money market henceforth and that assistance from the Reserve Bank through the Bill Market Scheme will just enable the market to cope with the situation as best as it can. This would be unfortunate, for the present situation has brought out some aspects of development which deserve to be treated more seriously in order that the expansion now contemplated may be successfully put through.

Experience has amply demonstrated that whatever view one may take about the wisdom of deficit financing or whatever limit for it may be considered safe, budget deficit is not by itself a price-stabilizer. This was shown clearly during the busy season last year when food prices went on falling to the point of creating considerable concern, despite the sizeable deficits incurred in the budget for two years in succession. The experience during the slack season which has just passed has brought out another aspect of deficit financing equally clearly viz that it does not automatically increase banking resources and that expansion of money supply is no solution, by itself, of the problem of adequate bank credits. The expansion of money supply has gone hand in hand with expansion of economic activity and development. If the latter called for currency and bank credit in the same unvarying proportion, no stringency would have overtaken the banking sector and yet acute credit stringency has been experienced, despite a steady upward trend in demand deposits which has been maintained, with minor interruptions, since early 1954. But though bank deposits have increased, they have not kept pace with the expanding demand for bank advances.

It was, therefore, particularly disconcerting to find while examining the special factors which have intensified the stringency in the past few months that the Reserve Bank had contracted currency quite considerably as a set off against loss of its foreign assets which have been exceptionally heavy in recent months. As in any case the decline in foreign assets had been 'planned', it was taken for granted that it should not have been allowed to affect money supply. Lest this should be considered suspect, as savouring of inflationist psychology of the market, it may be mentioned here that even the Bernstein Report said so.

The hypothesis put forward in these columns a fortnight ago that legitimate demand for credit should be met, if development is not to be retarded, has been challenged on the ground that it took no note of the inflationary pressures, suggested by the increase, year by year, of the volume of bank credit. The seriousness of the stringency in the short

term money market is not to be denied; it is serious, because it is accompanied by rising prices. In the circumstances, it has been argued, liberalising the Bill Market Scheme, for which the case has been made out, is open to the same objection that it will only feed inflation. The fact is that the demand for credit has assumed the present staggering magnitude only because the past expansion of credit and money supply had been so excessive. The argument can be easily expanded it was presented with full documentation by Professor S N Sen in a paper which appeared in the last Annual Number. Professor Sen's contention was that bank credit had been expanded year by year and that the presumption was strong that such excessive demand had been fostered by speculative holding of commodities and therefore, it should be sternly checked. That the character of bank advances has been changing and that relative'y small contraction in the slack season cou'd be ascribed to "the beginning of the growing diversification of the Indian economy", leading to general rise in credit demands (as generally argued in the Annual Report on the Trend and Progress in Banking in 1955), he had dismissed as altogether untenable. With th's view, however even the Reserve Bank will not presumably agree. The Bank has been keeping a c'ose check on advances, with an eye to restricting speculative holding of stocks. The directives issued by it and the frequent returns it calls for may be taken as a sufficient guarantee that a speculative build up, over the years, has not been primarily responsible for the present situation.

Another interpretation, a more sophisticated one, is that investment has already been pushed beyond the level that can be supported by the Indian economy, that the increase in savings on which the Planning Commission had banked has not been taking place and that the time has come for curtailing the Plan. This explanation has been translated in terms of monetary and banking deve'opments. That the increase in banking resources has not been keeping pace with the increase in currency circulation, it is contended according to this view, shows clearly that the class of people whose money incomes are rising is not the class which saves and that the section from which the Planning Commission expected planned savings to come, mainly profit earners, are not having a proportionate increase in incomes.

The distribution of increments to money supply between the banking and non-banking sector depends on a number of factors, of which the following would appear, on a priori grounds, to be the most important. (1) The level of activity and production in the non-banking sector i e largely in the field of agriculture, and the demand for agricultural produce and the level of agricultural prices. (2) The demand of the non-banking sector for products primarily financed through bank credit. Absorption and return of currency have been associated in the past with the movements of exports and imports. Currency used to flow out from the banking system in order to help move the crops, and used to flow back into the banking system in payment of imported consumer goods. This is unfortunately no longer a valid working hypothesis for studying money flows. Terms of trade between agriculture and industry and the magnitude of inter-change may have a valid claim to take its place, but it has to be studied, the concepts have to be refined and rough statistical measures found, before the hypothesis can be usefully applied for purposes of analysis.

All this takes us away from the patent fact that present resources of the money market are wholly inadequate for the tasks that have been imposed on it. This was fully recognised when provision of industrial finance was accepted as a State responsibility, but setting up of Industrial Finance Corporations has not fully met the credit needs of industry. In fact, to the extent these new institutions have been active, they have made fresh demands on the banks for medium term and other credit.

How are the banks to increase their resources by their own efforts? They should expand their activities and try to bring back into their coffers the currency that is flowing out. Mobilization of these potential savings, however, calls for an organisational effect which had been halted many years ago by the Reserve Bank when it stopped opening of fresh branches. Banks feel handicapped also by the bank award, which has raised costs so much that opening of new branches and tapping of areas not hitherto brought with'n their fold is seriously handicapped. Even if expansion in these directions takes place, it will be on'y a long term solution. But efforts should certainly be directed towards mobilising untapped resources. The present competition for deposits does little good to anybody except feeding a class of rentiers. Deposits in the aggregate have not proved to be interest-elastic. This indicates a stationery state of banking which is wholly inconsistent with the expansionist drive that is under way.

Report on China

ACCELERATED industrialisation envisaged by our development plans cannot coexist with an outmoded agricultural system. This emphasizes the need to concentrate the utmost energy on raising the productivity of the Indian peasant. This is all the more necessary if inflation is to be held at bay while investment is stepped up in industry. The problem, however, is not merely a short-time one. The structure of the countryside must be so altered that the foundations are laid for a progressive economy and an egalatarian social system. That is the long-term problem.

In the search for a solution, the eye naturally turns to China. India and China have many similarities, despite many points of dis-similarity. It was natural, therefore, for the Government of India to send a high-power expert Delegation to China to see if their methods and experiences could be of help to us. It was a mission of great importance, though it was completed in an eighteen-day tour, and limited in its scope, because of the decision to send a separate Delegation at about the same time to study the development and role of co-operatives in China. The decision appears some what strange when every one knew that after the initial step of distributing land to millions of landless peasants, almost the entire subsequent development has been in and through the co-operative system.

The redistribution of land had been effected in China by a surgical operation, but largely in an ad hoc manner. Simultaneously with the expropriation of the landlords, the land was parcelled out among millions of peasants, many of whom perhaps never had owned a square yard of Mother Earth. Their land-hunger had been appeased. But an

expanding economy demands full and unstinted use of all its resources —most of all of land, which yields food and many raw-materials of industry. Productivity could, of course, be increased by mechanisation. But that involves large capital investment. It means also that many farmers become almost immediately unemployed before other parts of the economy are ready to absorb them. So that was not the path to take. Cooperative farms offered an excellent alternative.

All the farmers did not join the co-operatives at once. But within a couple of years, all but a twentieth of them have come in the fold-whatever might have led them there. And, as stated above, in and through these units, the State has executed its agricultural policy, following this lead:

"Co-operative farming makes it possible to have a single management for the farm, to cultivate crops best suited to the various types of soil, to put more labour power into improving the land, to improve methods of cultivation by deep ploughing and careful weeding, better techniques of sowing and planting; to improve the organization of field work and increase yields per mou."

—Draft Programme for Agricultural Development.

But then there were two other forces too. One has already beenindicated—the clearing of the field, literally and figuratively, by abolishing all intermediary rentier interests, including trading interests. This, and the move towards economic equality, were supplemented by the second factor, viz., the very intimate connections between the ranks of the Government and the Communist Party. The Delegation has reported that, there is considerable and continuous interchange of experience, information, and personnel between the Party and the Government at all levels. For a proper appraisal of the Chinese efforts and successes, it is very necessary that the full significance of this vital State-Party link is appreciated. It will be doing the Delegation injustice to say that this has escaped its study of the Chinese scene. But one fails to find enough evidence in their report that the members have appreciated how far and how deeply this permeates the entire Chinese economy.

What is the criteria for assessing the work of the Delegation? Nowhere in the report has its basic approach been clearly defined. What was it after? The terms of reference do not indicate it. The report is heavily overlaid with details of the administrative structure and the set-up of the statistical service. And in line with these, an appreciable part of the Report deals with these issues. It is understandable that since the Delegation was formed of administrators, administrative matters would receive more than their due share. Except for a brief reference, the Report makes it clear that it is not entering into a discussion of the principles and methods of land reform. This was one serious omission. For the second—another Delegation to study cooperation in China—this delegation was not responsible, though one may still ask why it did not insist on a more rational arrangement. Together these two rob the attempt of considerable value.

In the Chinese experiment, price policy, technical assistance, the provision of consumers goods as well as producers goods like fertilizers—and in some cases the contracts for purchase of produce at predetermined prices—all these various means are used for making the Chinese farmer follow the planned pattern of development. Not only is the discussion of this scheme inadequate but, and it perhaps springs from this that the delegation do not seem to be quite impressed by the scheme as can be seen from the opening paragraph of the chapter on 'Measures for implementation—Agrarian Reorganization." In China the purchase and sale of foodgrains is a near-complete monopoly of the State. Despite a higher cost of living than in India, salaries are very much lower at the upper rungs of the administrative ladder, even after allowance is made for the free provision of medical facilities, education, subsidized housing etc. Chinese planning gives special and immediate attention to production; as far as amenities are concerned, these are often left to local efforts, if not relegated to the future. An extraordinarily large, efficient and inexpensive leadership has been built up over the year.

All these have developed a potential for production and fuller and more efficient use of the country's resources. At some places in its Report* the Delegation has interjected some significant sentences—"The system of Communism in China does not of course provide for freedoms such as those of information, expression and association in the manner familiar to us" and the last sentence of the Report—"we must emphasize, however, that any measures that we may adopt for economic development or technical progress should be fully in accord with our democratic traditions." But what are these traditions? How far have we already encroached on them and how much further can we go? China and Soviet Russia have done it in their own ways—ways which we may not like. Then there must be a different way and a better way to achieve the same goals? When administrators talk of 'democratic traditions' they often use the latter as a talisman to protect themselves from some evil, whether it be social change or unwise talk.

* Report of the Indian Delegation to China on Agricultural Planning and Techniques. Government of India, Ministry of Food and Agriculture, July-August, 1956. Pages 199. Price not mentioned.

Indian Agriculture in Brief

A useful and pocket-size book-let has been recently brought out by the Economic and Statistical Adviser, Ministry of Food and Agriculture, Government of India, with a view to meeting primarily the need of those who wish to have a snap shot picture of Indian Agricultural Economy as revealed by the current Agricultural Statistics, certain essential data in allied spheres; e.g., population, national income etc. needed for an understanding of the Agricultural Economy in its broader perspective have also been included in this booklet.

Price per copy As 8.

Copies available from:—
The Manager of Publication, Civil Lines, Delhi.

Weekly Notes

Scandalous Neglect

WHAT ails the coffee trade and the coffee producer does not appear to have been the primary concern of the Plantation Commission in their study of coffee. True enough, they have looked into every aspect of the industry and recommended changes all along the line from growing of coffee to its curing and processing as well as marketing and propaganda for popularising this 'drink of democracy'. But judging from the press summary of the Report, the full text of which, as usual has to be awaited yet a while, what worried the Commission most was the complete neglect of replanting. Outside the circle of coffee planters and the trade, the problems of coffee are hardly ever understood. How could they be, when coffee drinking habit has developed so fast that plantations have never any problem of selling and controlled distribution through the Coffee Board guarantees them at least a fair return? The approach all these years has been distinctly Western and materialistic, of whetting the appetite and stimulating the desire for drinking more coffee. But the solution has been sought on traditional oriental lines of feeble effort towards increasing the cultivation of coffee, largely through expansion of acreage. In the process replanting has been neglected and neglected grievously.

The Commission found that in Mysore 66.90 per cent of the trees (planted before 1920) are due for replanting, in Madras 52.92 per cent and 35.14 per cent in Coorg. The press summary does not fully explain why the planters are so averse to replanting and why instead of keeping the acreage already under coffee in fair trim, effort has been concentrated all these years in expanding the acreage? It hardly makes sense, unless there are convincing reasons for pursuing what would appear to be predatory methods of cultivation, of exploiting existing plantations ruthlessly to the point of exhaustion. One reason could be that planters having invested their capital in an enterprise in which they see no prospects, want to recover their investment as quickly as they can and an active process of dis-investment has been going on in the form of paying out large dividends instead of putting back what would normally be adequate depreciation to cover the cost of replanting. True, coffee plantations may also have the usual problem faced by all old established industrial concerns these days, viz, inadequacy of past depreciation reserves for replacing at current very much enhanced cost. But this could be met, as it has been met in other industries. The problem, however, does not seem to have been presented in this light before.

The above, however, is an over simplified version. The facts are that only a part of the crop is grown on a plantation scale and proprietory estates as well as plantation companies are almost equally responsible for neglecting replanting. The worst recorded, however, is that of the sterling coffee plantations, 75 per cent of the acreage under their control being due for replanting as against 29 per cent and 30 per cent respectively in plantations under Indian proprietors and companies. Plantations under European control seem to be switching over from growing of coffee to curing and processing which being more capital intensive probably offer better returns.

Despite inducements, coffee production and cultivation have not been expanding fast enough. There was a time when India could emerge as a sizable exporter of coffee but barring an exceptional year or two, domestic production has left little surplus to be exported and the concern of the Coffee Board has been how to meet the internal demand without letting prices rise too high. Exports no longer command the same high premium, and long term prospects of substantial exports do not yet appear to be a factor of any importance in the framing of our coffee policy.

Disarmament Talks

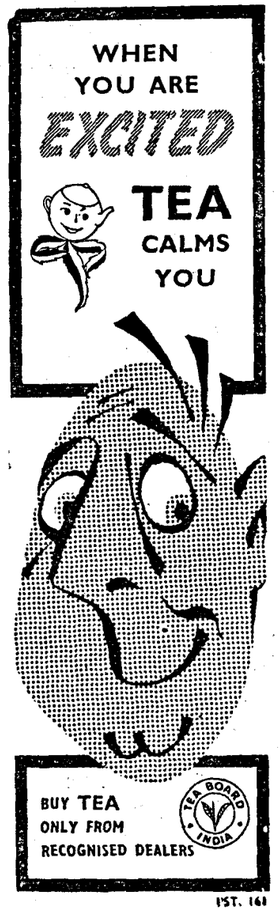
WASHINGTON has not responded to Berne's call for another Summit Conference at Geneva. Nor is America likely to react favourably to Moscow's endorsement of the appeal from Berne. To Moscow's suggestion for a Summit Conference on disarmament, Washington can legitimately reply that this issue can be more usefully discussed under the auspices of the United Nations. Britain and France, with their preoccupation in Egypt, are in no mood to discuss wider issues at the moment. London and Paris will, therefore, welcome Washington's cold reception to gestures by Berne and Moscow.

Moscow's gestures for peace and disarmament have always been suspect in the West as mere propaganda moves. At the moment, Russia is doubly suspect. Her armed intervention in Hungary will be cited as evidence that Russia is not sincere in her proposal for disarmament talks to ensure world peace. Alternatively, the suspicious West will allege that Russia's renewed suggestion for disarmament talks stem from her realisation that she cannot, as Hungarian events prove, rely on force to maintain her control over Eastern Europe.

Moscow's offer has been questioned because of its timing. The Anglo-French aggression against Egypt and the Russian use of force in Hungary have revived the "atmosphere of war hysteria". One of the conditions of disarmament is an improvement in the international situation. Can disarmament talks succeed, it is arguable, under the prevailing tense circumstances? Such arguments do not seem convincing. It is far more arguable that the existing international tension lends urgency to disarmament talks. This is the main assumption behind Russia's renewed call for a Summit Conference on disarmament.

There is nothing new in Russia's offer of a non-aggression pact between NATO and Warsaw Treaty powers. But the Kremlin's qualified acceptance of President Eisenhower's "open skies" plan is both new and encouraging. Russia's proposal for aerial inspection up to 500 miles on either side of the "Iron Curtain" is not a minor concession. It will, admittedly, provide Russia the opportunity to acquire precise details about NATO forces and bases. But the proposal will also enable the West not only to inspect, but to have detailed information about the deployment of Russian forces in Eastern Europe and in the adjoining areas in Russia. This proposal would seem to confirm the impression that, despite the ugly Hungarian experience, Russia is prepared to quit Eastern Europe. It is possible that the Russian proposal is based on the assumption, discussed in an editorial in the previous week's issue of this journal, that America will go ahead with de-Trumanisation of Europe. There is something in the argument that de-militarisation of a 1,000-mile belt of territory will not ensure peace in Europe, or that partial disarmament in Europe will not alone assure world peace. But, then, phased or limited disarmament is surely better than no agreement on disarmament.

Railway Minister Bows Out



THAT published speeches and statements of our Ministers often betray a lamentable lack of any sense of collective responsibility has often been remarked by Consitutional Pandits as well as others. Differences among Cabinet Ministers are, of course, not uncommon and the right of these Ministers to convert others to their view point may also be conceded, but only so long as they present a united front in enunciating and defending Government policy. It is a difference of degree rather than of kind, Indian Ministers may plead in extenuation when they are criticised for ventilating their differences too much in public. Without going into the constitutional niceties, one could say that cabinet differences are certainly made much more public in India than in the U K. The Ministers in Britain can vary their lines only in unimportant matters, otherwise they keep quiet or resign.

For fixing individual responsibility on the Minister concerned, however, there has been no occasion in the past. Ministers have been criticised and Government policy in certain lines proved to be wrong—failures on the food front had been a pretty frequent occasion for censure, Indo-Pakistan relations and rehabilitation of refugees had been a source of much resentment and nation-wide as well as vocal criticism. Shri Lal Bahadur Shastri, however, sets the example for the first time of holding Ministers personally responsible for what happens in the sphere under their charge. The example he has set has been widely acclaimed, and the gesture has been deeply appreciated. In fact by voluntarily giving up, he has got back more than he ever had before. The finest tribute that the people and Parliament paid him was by clamouring to get him back to the post he had relinquished. In not yielding to this demand, Shri Shastri has been wise.

Gesture and Re-appraisal

THE precedent he sets up should be an extremely valuable one. Cynics may demur that it was a calculated risk that the ex-Railway Minister took and that by his clever move, he not only reinstated himself in public estimation but helped not inconsiderably in winnng popular support for his Party. And coming just before the elections, it has been a shrewd and well-calculated political step that will bring ample returns.

The railway disaster which brought out Shri Lal Bahadur Shastri in such shining light is a tragedy of quite unprecedented magnitude. The bridge over a swollen river which collapsed while the Tuticorin bound Madras express was not, unfortunately, an isolated disaster. A bridge had collapsed only a few months ago in Hyderabad and taken a heavy toll of life. There had been other accidents to show up the railway administration in a very unfavourable light. The railways have been incessantly criticised in the past for not doing enough to improve their operational efficiency; they had themselves by their own publicity, almost admitted as much since it is only after severe criticism both at home and by experts from abroad that they started highlighting their modest achievements in improving their operational efficiency. But the general standard of administration and level of efficiency is one thing and responsibility for accidents, hurled thoughtlessly in the highly charged atmosphere following a series of accidents, is quite another matter. At the moment the subject must be treated as sub-judice, pending the findings of the judicial enquiry which has been instituted. But when tempers have cooled and the atmosphere has cleared a little, if the railways were to retort that perhaps the public and the Government have not in the past taken them as seriously as they deserved when they complained of arrears of replacement and re-equipment, perhaps the boot may turn out to be on the other foot. When the judicial enquiry is over the sad experience of the recent past should lead to a sober reappraisal of the railways, both of resources and performance from the single point of safety, which must, in the last analysis take precedence both over economy and output.

Jute Labour Threatens Strike

ONE cannot but feel unhappy for West Bengal. Jute mills, which provide the largest single source of industrial employment in the State, have been progressively reducing their labour force in the last two decades. Employment in the mills has gone down by about a sixth, if not a little more, between 1938-39 and today, and it now stands at 2.3 to 2.4 lakhs. But one must remember that over this same period, the production of jute mills has gone down too—by over 11 per cent—from 1.22 mn tons in 1938-39 to 1.09 mn tons in 1955-56. On these very broad comparisons, the industry is today employing more men for every unit of output than before. And this, despite the modernization and rationalisation programmes of the mills.

There was an occasion to look into these figures because jute mill labour has threatened an industry-wide strike "if the IJMA refuses to abandon or modify its rationalisation policy". The mills are reported to be compelling weavers and spinners to operate two looms and two frames each, instead of the established system of one machine for one worker, which is said to

have been in force ever since the inception of the industry. It is claimed further that this doubling of the conventional work load would render surplus 50 per cent of the present strength of spinners and weavers, leading to large scale retrenchment. The workers demand that Government of India should appoint a high power tripartite Commission to enquire into the whole question of rationalisation, pending which the IJMA should suspend its schemes.

Unless IJMA Drops Rationalisation

THE jute industry is India's top dollar earner. The National Industrial Development Corporation has committed itself to finance the mills to instal up-to-date machinery so that the industry may be able to face competition from continental and other producers of jute goods in world markets. Government has also recently approved that three large engineering establishments in the country should take up manufacture of jute mill machinery in India viz Britannia Engineering, Lagan Jute Machinery Company and Texmaco. When these decisions were taken, it is to be presumed that the employment aspect of the question was not ignored. And in any case, the mills have to see, out of necessity and not of altruism, that retrenchment is reduced to a minimum. This is sometimes achieved by installing new spinning machinery only half of the capacity of the old machines and running them two shifts The IJMA Working Time Agreement does not ban two shift working of the spinning section, although the weaving section must not be operated more than the specified number of hours in a week It is not that mills cannot evade some of the responsibilities which the Industrial Disputes Act places on them when labour is retrenched. Their main means of reducing labour force, however, is natural wastage. Even to wastage, it is not always possible to give full play. The man machine ratio is not flexible in all operations.

Government, both of West Bengal and at Delhi will find themselves in an awkward position if the issue has to be faced squarely just before the elections. To what extent labour displaced from the mills can be diverted to the new steel works or various constructional activities must have been examined thread bare. The very acute unemployment situation in and around Calcutta that was revealed in the recent survey does not appear to have changed. If anything, employment has gone down in West Bengal. Curiously enough, some of the provisions of the Industrial Disputes Act make it very difficult for employers to take on extra hands even to meet a seasonal or temporary demand, since their subsequent retrenchment costs a lot of money. It is a general issue but New Delhi might consider to what extent that Act can suitably be amended, with full protection of the interests of labour.

Hindustan Lever

IN recent months, stock market inactivity has coincided with selective activity in the new issue market. Only recently, the new issue of Guest, Keen, Williams was oversubscribed. Market expectations are that the new issue of Hindustan Lever will also be heavily over-subscribed.

Messrs. Unilever Ltd, London, are offering 5,57,000 ordinary shares in Hindustan Lever. Shares are of the denomination of Rs. 10, and are being offered for sale to the public at a premium of Rs. 6½ each. As stressed by the Chairman, the offer represents a major landmark in the history of Unilever enterprises in India. It is a symbol of international co-operation in the economic growth of this country. Hindustan Lever's authorised capital is Rs. 5.57 crores, divided into 55,70,000 ordinary shares. Ten per cent of the capital is now being issued for sale. Of this issue, ten per cent will be reserved for the employees of Hindustan Lever.

In the offer for sale, it is explained that the consumption of products in the manufacture of which the Company is interested is likely to expand along with the improvement in the standard of living of the people. Hindustan Lever hope to be a beneficiary of the expected prosperity of the industries concerned. For the current year, the consolidated net profit of the Company and its subsidiaries is estimated by the directors at Rs. 96 lakhs. This is after deducting taxation, including that to be paid by the Company for capitalising a portion of its profits in October last.

An interim dividend of eight annas was paid. For the current year, the directors hope to declare a final dividend of six annas, to be paid before the end of May next. In future, the director's promise to be more liberal in dividend payments. For the coming year, they hope to pay Rs. 1-6 per share, free of tax, if the estimated profit for the current year is maintained and if there is no material change in the tax burden or in trading conditions.

Errata

Sugar Exports

In the Weekly Note "Feasibility of Sugar Exports" which appeared in the last issue, the c i f price for Persian Gulf (last sentence, paragraph 4) should read Rs 662-8, instead of Rs 612-8 as wrongly printed.

Commonsense of Labour Cost

The first paragraph in Prof Sen's reply to 'Commonsense of Labour Cost' by M Srinivasan in the issue of November 10 refers to a quotation from Alice in Wonderland that originally occurred in Mr Srinivasan's Rejoinder which for reasons of space, was deleted at the time of printing.

The perplexity caused to some readers by the deletion is deeply regretted.—Ed.

He who is firmly seated in authority soon learns to think security."

Letter to the Editor

Upsurge in Eastern Europe

EVENTS in Hungary have served only to dramatise the growing nationalist upsurge in Eastern Europe against Soviet imperialism.

This is not clearly realised in certain circles because of the lingering illusion that a "proletarian" State is incapable of imperialism. But ever since Lenin spoke of the "bourgeoisification" of the British proletariat, it has been clear to thinking people that it is "objectively" possible for the proletariat of one country to enrich itself at the expense of the proletariat of other countries.

Whether a "proletarian" State takes advantage of this possibility, turns this possibility into a reality, depends on "subjective" factors. A socialist State sufficiently inspired by the spirit of internationalism will disdain to stoop to imperialism. After the October Revolution, Lenin allowed a part of Poland to be lost to Russia, because to him the principle of national self-determination was a living principle, which he placed above Russian national interest. One of the crucial developments in the Stalinist era has been the nationalist degeneration of the Soviet State.

The point is easily illustrated. After World War II, Russia extracted huge reparations, dismantling whole industries in East Germany, and transferring machinery and plants to Soviet territory. Such acts amount to penalising a whole people, and not war-criminals; and Lenin would have hated to adopt such a course. But from a nationalist point of view, there is nothing against it.

It is not surprising that Russian nationalism has developed into imperialist domination over Eastern European countries, exhibiting such features as the imposition of adverse terms of trade on the "colonies", though the peculiar circumstances under which this development has taken place affect the form and language of this new imperialism.

It is equally understandable that this imperialism has produced its "anti-thesis",—an anti-Soviet nationalist movement.

To characterise the Hungarian revolt as either democratic or "fascist" is to obscure the central fact that it is essentially nationalist. Like all nationalist movements, it includes democratic as well as reactionary elements. But if in Hungary the Red Army is hated today, while it was greeted as an army of liberation in 1944, when it came in the wake of fleeing Nazi forces, this is because the movement which it is engaged in suppressing today is essentially popular rather than "fascist". Nothing has demonstrated the popular character of this movement more convincingly than the "passive resistance" of the last few weeks.

A nationalist movement tends to take a "fascist" character, particularly if it is cruelly suppressed. Had Moscow decided to discredit socialism in Eastern Europe, it could not have done it better than by imposing a "socialist" government against the will of the overwhelming majority of the people. As in Asia so also in Eastern Europe, the chances of healthy democratic development are enhanced by allowing people freely to shape their destiny.

Relations between Russia and Hungary would have improved as a result of a generous gesture of withdrawal. But once a country has established its domination over another country, it is always difficult, on "strategic" grounds, to withdraw. Such withdrawal leaves a "vacuum", and reluctance to part with power, exaggerates the possibilities, more or less real of dangerous ways in which such a vaccum may be filled up. There was a time when Britain argued against withdrawal from India on the ground that Russia might take over.

Thanks to the hydrogen bomb which both Russia and America possess in sufficient quantity to destroy the whole world if they so choose, a war between Great Powers is extremely unlikely to-day. Even if Russia loses Eastern Europe, there is little danger of an attack on the Soviet Union. The most disturbing problem today, as Egypt and Hungary so clearly illustrate, is that the near-impossibility of a global conflict may encourage a Great Power to use brutal violence against a smaller nation. Where such violence is committed, it is of the utmost importance that we do not speak haltingly or in terms that tend to extenuate aggression.

Analysis of Election Results

(From Our American Correspondent)

November, 15

THE most striking thing about the elections has been the lack of change in the composition of the federal government. An overwhelming Eisenhower victory was expected, but it was, if anything, a little more overwhelming than expected. The polls predicted that Eisenhower would receive fifty five or six per cent of the popular vote; in fact he received fifty-eight per cent. But despite such a huge majority (and unlike Franklin Roosevelt's victory in 1936, it cannot be said that the losers were terribly disappointed or upset), the Republican presidential candidate failed to carry a Republican majority into either house, and in fact the Democrats added one, and what will probably be four or five seats when the counting is over, to their majority in the House of Representatives.

The situation as it has developed is this: probably the most popular president since George Washington, but at that time the electorate saw fit to give his party only the barest of majorities in Congress. Two years later at the interim elections, the electorate took away this majority. A swing away from the majority party is common at these off-year elections, but it is most uncommon for such a swing to be confirmed at the following election without unseating the President as well. A measure of the unusualness of the election result is that one must go back to 1848 to find a year in which a president was elected from one party while the opposition party won control of both houses of Congress.

The Man for the Job

An explanation is obviously called for, and the explanation is equally obvious. Eisenhower has the confidence and the admiration of the American people. They believe him to be eminently suited to the job, and eminently trustworthy, and events under his administration have done nothing to destroy this faith. There has been peace during his administration, and until the last few days before the election a definite feeling that international tensions were lessening. On the domestic scene there has been prosperity and as stable a price level as is likely to be seen in this world. The events in Hungary and Suez did not lessen Eisenhower's appeal. If four years of peace was to his credit, so equally he was regarded as the man best fitted to deal with crises arising abroad. It must be understood that the errors of his Secretary of State, being errors of technique, are not really appreciated at home. Dulles' mis-steps have been monumental at times, amounting to total disregard of the rules of the diplomatic game, but if one sticks to acts and ignores words, the Aswan Dam Affair is about the only concrete act-of-commission blunder which can be laid at his door, and so it is not easily apparent to the electorate that perhaps much of the blame for the deterioration in Anglo-U.S.-European and U.S.-Arab-Asian relations belongs with the U.S.

The faith reposed in Eisenhower the man and Eisenhower the president does not extend to his party. The American electorate did not accept the view that Eisenhower needed a Republican Congress. Quite the contrary. They took the view that what he really needed was a Democratic Congress, and they gave him one. All across the country tickets were split as never before. Large numbers of Americans voted for Eisenhower, Democratic governors, Republican senators and Democratic representatives, or split their votes in other ways. In Michigan Eisenhower's presidential majority was matched on the Democratic side by William's majority in his candidacy for the governorship. If the results were disappointing to loyal members of one party or the other, there can be no doubt that the voters did have a clear idea of whom they wanted and gave a first class demonstration of the vigor of democracy. It now seems clear that other things being equal the American voter prefers the Democrats to the Republicans, but that in this case Eisenhower was not other things being equal.

The New Congress

In comparing the new Congress with the old one is struck with the similarity in political complexion between them. The House of Representatives remains virtually as it has been for the past two years, and there were no significant changes in the personnel.

In the senate the Democrats retain their 49 to 47 hold but eight senatorial seats changed hands. This is almost a quarter of the 35 seats up for election, but the net result was nil as four democrats took Republican seats and four Republicans took Democratic seats. A closer look at these changes may serve to illustrate, first, how senatorial races can be independent of presidential and party races, and second, how the political complexion of the Senate can change or remain the same within the same party totals, and despite marked changes in personnel.

Opposite Cases of Personal Standing

First, we have two, and opposite, cases of personal standing. In Ohio Frank Lausche (Dem.) unseated Senator Bender (Rep.). Lausche has been almost a perpetual Democratic governor in an almost perpetually Republican State. As a governor he has been extremely successful. As a Democrat he has been so independent as barely to qualify as a Democrat. He has even hinted that in the voting on the organization of the Senate (Committee chairmanships, etc.) he may not vote with the Democrats. Thus Lausche the man and the governor defeated Bender the Republican. In Idaho, another strongly Republican State, Senator Walker (Rep.) has made such a poor reputation for himself—extremely reactionary and generally useless to Idaho constituents—that Frank Church (Dem.) could beat him easily with disgruntled Republican votes. The Idaho results show that if a senator is poor enough, no party loyalty can save him.

Special mention should be made of the results in Kentucky where John Sherman Cooper, recalled from India for the purpose, won the senate seat vacated by the death of Senator (formerly Vice-President) Barkley. There should be no need to explain to Indians why Cooper, although a Republican, could win handsomely in a normally Democratic State.

The second point to be made is that the senate is now neither more

conservative nor more liberal than it was before the election although liberals have lost seats, for so have conservatives. On the extreme right Herman Welker of Idaho has been eleminated, but at the same time former Republican Senator Chapman Revercombe, once in and then out and a very, very conservative man indeed, has now been re-elected in West Virginia. Moving in from the extreme right wing of the Republicans we find Senator Bender, definitely of the "old guard" of the Republican party, defeated, but by a very conservative Democrat. The substitution of Democrat Lausche for Republican Bender is far from a radical change. East coast Republicans would regard Lausche as a conservative.

Moving to into the middle of the road we find Clarke (Dem.) replacing Duff (Rep.), but here Duff was of the liberal, Eisenhower wing of the Republican party, while Clarke does not appear to be on the left of the Democrats. Except on a few specifically "party" issues (where a vote does not definitely reflect internationalist or isolationist, strongly pro- or strongly anti-labour, views for instance) Clarke's voting record in the Congresses to come will probably not differ greatly from the record which Duff would have made had he been elected. In part if not in whole the Clarke victory reflects changes in internal Pennsylvania politics. By industrial and occupational standards one would expect Pennsylvania to be generally Democratic, but for years an extremely efficient—and in Philadelphia certainly corrupt—Republican political organization kept the State's administration in Republican hands. Clarke broke the power of this political "machine" to become Mayor of Philadelphia, and this year's shift to the Democratic camp (except for voting for Eisenhower) largely represents the final demise of long-standing Republican control and the election of an honest and worthy man whose work for good government within the State has earned him further recognition.

In analyzing two other Republican victories we must move to the left of centre in American politics. In New York, the Democrats put up Wagner to succeed retiring Senator Lehman. Wagner, who would have continued Lehman's leftish New Deal, Fair Deal record, was defeated by Ives. Until he became Attorney-General of New York in 1954, Ives was a Republican representative in the House, and while there, his voting record would have done credit to a Truman Democrat. New York Republicans are as a rule "liberal" —they were the nucleus of the liberal, Eisenhower wing of the Republican party —but many of them regard Ives as far too liberal if not downright leftist. Thus the change of party in New York will not significantly change voting patterns in the Senate.

Cooper's victory in Kentucky is even more upsetting to the common view outside America that Republicans are conservative and Democrats liberal or left. Cooper has served twice in the Senate, from 1947 to 1949, and from 1951 to 1953, each time filling out the last two years of some one elses unexpired term, as he is again to do from 1957 to 1959. His record in his previous terms indicates that he is as much to the left as Senator Barkley whom he succeeds, and very likely more so. Much less is known about Morton (Rep) who defeated Senator Clements (Dem) for the other, full six year term from Kentucky, but Morton is an Eisenhower Republican and hence it is expected that he will not increase right wing Republican strength. While Cooper won by a large vote, Morton barely made it, and his victory therefore seems attributable to the Eisenhower landslide in Kentucky rather than to his own vote-getting power.

The last change of party occurred in Colorado, traditionally Republican, where John Carroll, formerly a Democratic representative, now becomes Senator. As the Democrats also won the governorship in Colorado, this change is most probably the result of the increase in urban industrialization (large cities tend to be Democratic) and some shift in a farm vote irritated at lower farm prices. This election result will mean a slightly leftward shift, but if we sum up the leftward changes of Church, Clarke, Cooper, Carroll and Lausche against the rightward changes of Bevercombe, Morton, and Javits, the net movement has been very small indeed.

Other election results, while leaving the men unchanged, point to more permanent changes in the future. In the northwest, Democrats Magnuson of Washington (the State) and Morse of Oregon retained their senate seats in campaigns against former Republican governors Langlie and Mckay, and increased the Democratic margin over previous years. More was a Republican until 1952, became an independent in that year, and in 1955 became a Democrat, but throughout his career, he has been on the far left of the Senate. Washington and Oregon have been Republican States but of recent years have sent Democrats to the Senate by close votes when the issue was between a Democrat favouring Federal Government development of hydro-electric power. This year's results indicate that these two States will be sending more Democrats to Washington (D C) than they have in the past.

In Michigan, G Mennen Williams (Dem) has won his fifth two year term as governor, this year defeating the popular Mayor of Detroit by a larger margin than he has defeated lesser opponents in the past. In consequence it looks as if Williams may develop into the Democratic Presidential candidate in 1960. It should be noted that Williams is a centre to left-of-centre Democrat in a normally Republican State.

What then can we anticipate to be the probable effects of this election upon the course of American policy? First, with President, Senate, and House remaining as before, there is no reason to expect any large changes, certainly in basic attitudes. But two, joint results of the election may lead to an American foreign policy more sensitive and sympathetic to the problems of both our allies and the neutral nations. One result, the great vote of confidence in Eisenhower, was underlined by the other result, the vote of lack of confidence in traditional, isolationistically inclined Republicans. These two together should give Eisenhower more scope to follow out his evident desire to work more through the United Nations and to accomplish more by understanding negotiation and to reduce the number of occasions on which American policy is reduced to belligerent statements. As against this stand the fact that as a President approaches the end of his term in office (and Eisenhower cannot run again), his influence in Congress declines. Lastly, there remains the great question mark of what will happen if Eisenhower does not fill out his term and Vice-President Nixon succeeds to the Presidency.

Whatever may happen, this election has shown clearly that there is but a dim and dismal future for politicians who try to make a career out of bomb-waving and threats.

Official Papers

Training for Social Research

S D Punekar

IT may be necessary to define the limits of social sciences, before the necessity of research tools is considered. Most of the social sciences are young and their limits have yet to be demarcated. Considerable overlapping, though it leads to confusion, is inevitable. With the rapid advancement of knowledge during the last century, the boundaries of some of these sciences have been considerably pushed afar and certain branches thereof have evolved as independent sciences. This can be illustrated by the growth of economics as a separate discipline. Economics, known then as political economy, was till recently a subordinate part of a training in law on the Continent and a junior partner of mental and moral philosophy in the English-speaking countries.

Scope of Social Sciences

In spite of the changes that social and allied sciences are undergoing, we can still limit our scope to certain definite fields, which belong to the realm of social structure and institutions and also to processes or mechanisms of social action. The sciences of economics, sociology and politics (including international relations, which is often treated as a separate science) are without doubt members of the family of social sciences. Then there are a number of other sciences, some parts of which relate to the analysis of social systems. In this category we have a large body of the legal science (comparative law) and the social aspects of anthropology and psychology (social anthropology and social psychology), as well as what can be termed as human geography. Ethics and philosophy (even social philosophy) fall outside the group of social sciences. A third category, which does not form a part of social sciences, but whose knowledge is desirable to understand these sciences, consists of history, mathematics, criminology and demography. Lastly we have what we may call the "method sciences" such as logic, statistics and scientific method. These cannot be included among social sciences, but they provide valuable tools, without which these sciences cannot progress. This article* aims to study the tools provided by statistics and scientific method.

Training for Research in Other Countries

Research forms the main method in getting the doctorate (Ph. D. or its equivalent degree), though in a few cases it is a compulsory or voluntary requirement for getting an intermediate or post-graduate degree (MA or MCom). The usual practice for the doctorate is that the degree is awarded on a dissertation followed sometimes by an oral examination in which the candidate is called upon to defend his dissertation and to show knowledge of the general field of study within which it lies. In a few countries (e g USA), a qualifying post-graduate examination is compulsory, before the candidate is admitted for the doctorate degree. In such cases, the programme falls into two fairly distinct periods: The first period is devoted to advanced courses and other studies through which the candidate acquires knowledge of facts, familiarity with tools and methods of research, and with the general problems of his subject. The second period is utilised in application of his knowledge to the topic of investigation chosen by him for his dissertation. The programme for the Economics doctoral degree at the Columbia University may serve as an illustration. At the end of, or sometimes after, his required period of residence, and after his dissertation project is approved, but before work on it has begun, a student may take his final examinations in subjects. He must be examined in six subjects, of which three (economic theory, economic history and statistics) are compulsory. In two of these subjects, he may take "certification" examinations, in the sense of being examined privately, either orally or in writing, by the appropriate professors. After being "certified" in these two subjects, he is examined orally for two hours by a committee of at least four professors (an examiner in each subject) in the remaining four subjects, of which economic theory must be one. Members of other social science departments also attend these examinations, either as observers or as examiners. After passing these examinations, the student devotes himself as consistently as possible, and for whatever time is necessary, to preparing his dissertation. The doctoral course is thus a continuation of the earlier (MA) course involving intensive lecturing, seminar and tutorial work and academic discipline, the research project having a secondary place in the programme of studies. At the same time, the student is *well-equipped not only* with the background material of his research project but with the methodology of research.

Training in Methodology

In research studies, India has followed the British universities, and the University teachers, who are research guides, are expected to supervise the thesis work and guide the research student not only in the subject of research but in its methodology. Like the British universities, however, the student is too often left largely to his own devices, subject to such assistance as he could get from his officially appointed supervisors. As Dr. V K R V Rao graphically describes:

"The work is mainly that of the student, guidance is largely nominal, there is very little of seminar or lecturing or tutorial work, there is no academic discipline and the research student reigns or suffers in splendid isolation, only occasionally finding for himself a meaningful place in the corporate activity of the student body to which he is supposed to belong. (Round Table Conference p 93).

* For this article, I have freely drawn material from the following UNESCO publications:

(i) **Round Table Conference on the Teaching of the Social Sciences in South Asia (1954),**

(ii) **The University Teaching of Social Sciences: Economics (1954),**

(iii) **The Teaching of the Social Sciences in the United States (1954),** and

(iv) **The Teaching of the Social Sciences in India (1956).**

It is, therefore, no wonder that even after conducting research for years and taking his doctorate, the learned doctor remains ignorant of the elementary statistical methods for the collection, analysis and interpretation of social facts, of the formulation of research hypotheses, of the various methods of collecting analysing and tabulating data and of preparation of the research report. An elementary course in methods of social research and statistics would not only have given him some knowledge of methodology but it would have also made his research work easy and scientific. Even without these aids, a good many research students have no doubt completed their work and got their degrees; however, most of them have to pass through a labyrinth, have often to grope in the dark, stumble against obstacles, and only accidently find some light and somehow reach the destination.

Arguments Against

In spite of this urgent necessity of the research students for some knowledge of methodology, it is somewhat surprising that there should be objections against having an elementary course in methodology. It is argued for example that the research methods used in social sciences are exceptionally varied, ranging from the study of documents (historical or contemporary) through field studies and sample surveys to the use of higher mathematics and laboratory experiments; students are not expected to become proficient in all these; nor can the courses in research training conform to a single pattern. Another line of argument is that a specialized course is not necessary in cases of carefully supervised individual research during which the guide criticizes the techniques used as well as the materials utilised by the research students under his charge. A third objection is that quantitative techniques are not required in all disciplines and hence a basic course will not serve the purpose of all social sciences.

Normally, training in research is not objected to, if it is individually given. The utility of having a special course for all social science research students is considered by a few to be of not much useful purpose. However, with the development of research in social sciences and with the demarcation of boundaries of the science of methodology, the objections raised are dying out and the value of training in methods of social research is being increasingly realised.

A Proposed Scheme of Social Research Methodology

(i) **Nature and duration of the course**—The course should consist of about 15 lectures, each lecture being for about an hour. Lectures may be held twice a week in the evening, so that the course can be completed within two months, preferably in the months of June and July, at the beginning of the academic year.

(ii) **Admission of Students**—The completion of the course should be made compulsory, before a student is admitted for the doctorate degree in any of the social sciences. This condition may not be necessary in the earlier post-graduate research degrees (MA or MCom), though these students may also be allowed to attend the course. Normally, each class should not have more than 30 students and a small fee for the whole course may be charged from each student.

(iii) **Teachers**—University teachers and statisticians may be requested to give lectures, if necessary, on a small honorarium.

(iv) **Methods of Teaching**—Lectures will form the main method. They should be supplemented by seminars, library periods, group studies and field work. Actual participation in social suveys may prove useful.

(v) **Syllabus**—A detailed course will include a variety of subjects like the nature and significance of this particular "science", its relation to different social sciences, a study of the various social sciences and their underlying unity, pure and applied sciences, application of scientific method in the study of social phenomena, problems of observation and measurement, policy considerations, designs research, historical method and use of documents, case and life histories, exploratory and formulative studies, social surveys (descriptive and diagnostic studies), experimental tudies, questionnaires and interview schedules, interview methods, field operations, content analysis, panel technique, mailed questionnaires, ecological techniques and graphic presentation, sociometry, scaling and measurement techniques, constructive typology, research writing, use of the library ,editing, coding and evaluation of data and elementary statistics.

The science is fast growing and covers a wide field. It is not possible to cover all the above subjects within a short course of 15 lectures. The object of the course is limited, viz to acquaint the student with the techniques of social research and hence many details, some of which are of importance, are to be left out. The following course of lectures is suggested from this view point.

1. **The Sciences** (one lecture—introductory)—Physical and social sciences; the scientific method and reflective thinking.
2. **Aims, objects and principles of research** (one lecture)—A review of research in social sciences.
3. **Formulation of the research problem** (one lecture)—Selection of problem; purpose and scope; working hypothesis.
4. **Data Collection** (five lectures)—What to collect; where to collect and from whom to collect; role of the library; direct and indirect methods of data collection; observation; questionnaire and schedule; interview; other techniques.
5. **Basic elementary statistics** (three lectures)—Statistical units; sources of data; sampling; accuracy and approximation; averages, geometric mean, median, mode; correlation, scatter diagram; tabulation and graphic representation.
6. **Organisation of data** (two lectures)—Scrutiny, tabulation, analysis and interpretation.
7. **Presentation of results** (two lectures)—Research writing; bibliography.

(vi) **Books on the subject**—Literature in this field is fast growing and it is not possible within the short space of an article to give a list of books. The works of Chapin, Doby, Elmer, Festinger and Katz, Furfey, Goode and Hatt, Hyman, Jahoda Deutsch and Cook, Lerner and Laswell, Lindzey, Lazarsfeld and Rosenberg, Lundberg, Merton, Parten, Rose and Young may prove useful. One difficulty is that the illustrations given in these books are foreign and many of them unimportant from the Indian view-point. It is, therefore, desirable that a standard text book by an Indian author taking into consideration Indian conditions should be written.

Non-Monetised Economy and Development

Hannan Ezekiel

IN a recent paper published in The Economic Weekly (June 23, 1956) Sukhamoy Chakravarty has suggested that in making national income estimates for underdeveloped countries, the non-monetised sector in these countries should be entirely excluded if these estimates are to prove useful from the point of view of economic growth. This suggestion deserves careful consideration, particularly at the present time when all underdeveloped countries are making attempts to initiate a process of economic growth.

A preliminary question in this connection concerns the exact meaning to be attached to the term, non-monetised economy. Chakravarty has suggested a definition of this term from the point of view of economic growth. He says:

> "the crux of the monetary system lies in the fact that wages are paid out in terms of money. A non-monetary economy, on the other hand, is one where in the Marxian terminology, the question of the exchange of labour-power against money never arises."

This definition I find unsatisfactory for two reasons.

Wage Relationships

First, one of the earliest consequences of placing a non-monetised economy in relation to a money economy is the emergence of wage-relationships. This fact is of considerable significance since we are speaking of underdeveloped countries where presumably monetised and non-monetised sectors exist side by side. That the first fruit of the impact of monetised on non-monetised economies is the emergence of wage-relationships has been commented upon frequently in connection with African territories, where for instance the levy of taxes payable in money on members of African tribes stimulates a flow of labour to mines and urban industries.

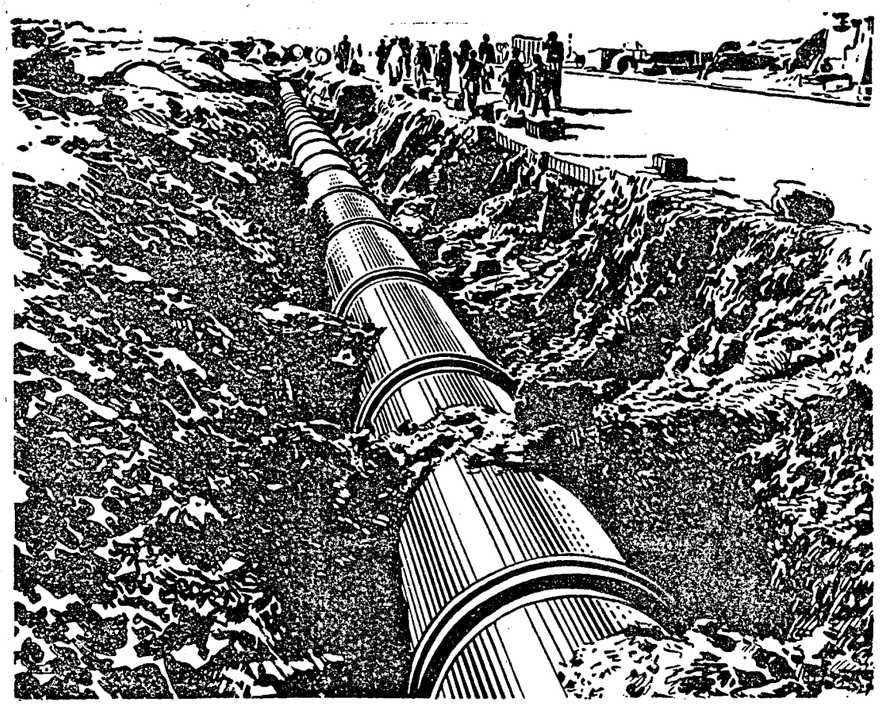
In our own country, it is well-known that subsistence farmers sell a part of their output to enable themselves to buy a few necessaries and to carry out other minimum money payments. They also sell their labour, however, with the same purpose in mind. Even those who belong to the aboriginal tribes and could for all practical purposes be described as living in non-monetised economies, frequently enter into wage-relationships with the monetised sector beside which they carry on their existence. (cf **Indigenous Peoples**, I L O Geneva 1953) Instead of the definition advocated by Chakravarty having a restrictive effect on the size of the monetised economy as he evidently wants it to have, therefore, we find that it extends the content of the term to include vast sections of the community commonly held to be outside it.

Sale and Purchase of Labour

It is true that the wage relationships referred to above are entered into not within the sector concerned but rather between it and the more developed monetised sector outside. Perhaps, in formulating his definition, Chakravarty had in mind development of such relationships within the sector itself. This is, however, not evident from his paper. On the contrary, he says, "so long as money cannot purchase labour because labour power has not become a saleable commodity, the role of money is bound to be of a limited character" (emphasis mine). Wage relationships may not, however, develop within such an economy even though labour has become a saleable commodity as evidenced by its sale to the monetised sector outside. In other words, the practice of purchase of labour for money may not develop within such an economy though its sale does take place. The explanation for this, however, would be that, though the sale of labour for money is well understood by the members of that economy, they do not possess adequate money incomes or money capital for the purpose of purchasing it for productive purposes. This in turn is probably the result of the subsistence character of their principal productive activities and the relatively low wage payments that they receive when they sell their labour to the external monetised economies.

It is clear from this discussion that though labour power has become a saleable commodity, the development of wage labour relationships within the sector itself may be prevented by the existence of certain obstacles. One of the objectives of economic planning might in fact be to overcome these obstacles in order to initiate a process of economic development within that sector. In any case, however, such an economy clearly exhibits wage-labour relationships at any rate externally.

Sometimes, sales of labour for wages within the economy itself might also develop. This by itself would not, however, justify the inclusion of such economies within the monetary sector. Probably Chakravarty himself would agree that they should be excluded. But his definition leads to their inclusion as shown above. In this sense, therefore, it can be considered too wide.



Too Narrow Definition

At the same time, however, Chakravarty's definition of a monetary economy is too narrow because it leads to the exclusion of obviously monetary sectors. Visualise a society in which division of labour has proceeded to the stage at which extensive exchange of commodities takes place through the medium of money, while wage relationships have not developed on a large scale as yet. Such an economy, would, by Chakravarty's definition, be a non-monetised economy. He specifically points out that the mere use of money for other purposes, i e purchase and sale of goods, does not make the economy a monetary one and that "money understood in the sense of a circulating medium only and having little or no connection with production relationships has been prevalent since very ancient days".

Following Chakravarty, therefore, these economies of ancient times, in which money functioned as a circulating medium, would have to be excluded from the purview of monetised economies. There is an interesting shift in the terms used by him in this connection which should be noted. Whereas he has been speaking so far of wage relationships, he now uses the term, production relationships. Are not the commercial relationships which are operated through money as a circulating medium, then to be treated as production relationships?

To clarify the picture, let us examine the case of an economy in which labour is employed for wages but only in commerce not in manufacture. Would Chakravarty con-

sider such an economy to be monetised? Apparently not, for in a footnote Chakravarty identifies a non-monetised economy with one in which pre-capitalist relationships prevail. In other words Chakravarty really defines a monetised economy as an economy in which wage relationships exist in production, the latter being defined in a special, Marxian, sense, i e as an economy in which capitalist relations in Marxian terms, exist. It would have facilitated discussion if he had said so clearly. In any case, however, I cannot see the justification for giving one term a connotation already comprised by another, when the first has already a well-accepted and very useful connotation of its own.

The Importance of Concepts

Chakravarty is, of course, entitled to define his own terms in his own way and to argue further on that basis. This discussion of Chakravarty's definitions of monetised and non-monetised economies is, however, justified by the need to clarify the implications of these definitions and to show that there is a certain measure of confusion about his discussion of the term itself. Such a discussion is always useful because it is likely to help in bringing out the limitations of the conclusions reached by an author on the basis of defined concepts and expose any weaknesses that may exist in the process of reasoning by which those conclusions have been reached. It may help, therefore, in questioning the validity of the conclusions themselves.

That this general justification is directly relevant to the present discussion becomes apparent immediately, one examines an important characteristic ascribed to a non-monetised economy by Chakravarty. According to him, accumulation does not take place in a non-monetised economy. He argues:

> "Market as an economic institution has.... only a very limited scope. If market for commodities hardly exists, it would surely be out of the question to postulate a market for assets. Accumulation, under the circumstances is not possible for to store things having no universally recognised common denominator and having no opport- changing negotiable re be any) against a meaningful econo-

Two Fallacies

There are two fallacies in this process of reasoning. First, the author's own definition of a non-monetised economy does not preclude the existence of markets in that economy, both for consumption goods and assets. Chakravarty has himself conceded that a money economy in the sense of a market economy utilising money as a circulating medium has existed since ancient days. In such a market economy, negotiable assets understood in the sense of securities or documentary evidences of credit, may not indeed exist. But there is no fundamental reason why they should not do so. The economic history of Western European countries shows that societies in which capitalist wage relationships had not developed as yet, did have fairly well developed credit systems and probably even well organised markets for negotiable assets.

Yet, such societies would be non-monetised by Chakravarty's definition. Therefore, his argument that accumulation could not take place in a non-monetised economy because of the absence of markets for goods and assets is clearly incorrect in relation to his own definition of a non-monetised economy. Having defined a non-monetised economy in a special and limited sense at the commencement of his paper, Chakravarty seems to have conveniently forgotten it in the rest of his discussion, having returned to the normally understood meaning of the term as a non-market economy.

The second fallacy in the argument is the assertion that the non-existence of markets necessarily implies the absence of accumulation. The argument is fallacious in other words even if one tries to apply it to a non-monetised economy in the usual sense of the term. Why should the storing of things having no universally recognised common denominator be "not a meaningful economic activity"? If the act of storing goods helps the person storing them to improve his productive capacity or his ability to consume in the future, that should be sufficient reason for him to do so without someone describing it as not constituting meaningful economic activity. One may well ask "Meaningful to whom?"

An Economic Surplus

Enlarging on his theme, Chakravarty says that in such economies, "the surplus of production above consumption, if there be any, is a physical surplus and not an economic surplus." There is no justification for this statement at all. On the contrary, studies of various non-monetised economies made by economists and sociologists show that the distinction between consumption and investment is quite clear even in the minds of primitive peoples. It has been shown for instance that among the Bantu people in Africa the economic application of resources is very clearly understood. (cf Goodfellow, D M **Principles of Economic Sociology**) The character of a commodity, say, grain or cattle, differs according to the use to which it is put, being treated as either a consumption or a capital good. Even when a physical difference does not exist, therefore, a qualitative differentiation is made which proves that the surplus is not just a physical surplus. It is rather a surplus whose character is explicitly and clearly recognised by the people. In fact, it becomes a surplus only by virtue of the decision made by them to postpone consumption in exactly the same way as we understand it for a monetised economy.

Accumulation and Technical Change

That the analysis proceeds from an inadequate understanding of the character of the process of accumulation is suggested by a further statement in this connection contained in the paper. Chakravarty says, "a non-monetary economy .... implies little or no capacity for accumulation and consequently little or no possibility of changing the technique of production."

Does the causal relation established in this statement actually operate in that way? True, societies in which little accumulation takes place are usually societies in which there is little technical change. The inability to change the technique of production in such societies arises, however, not from an absence of accumulation but independently from a lack of knowledge. These societies have become stagnant so that categories of technical change do not exist for them. That is why though accumulation does take place in such societies, it does not assume that character which it does in an advanced society.

Impossibility of change in technique is not caused, therefore, by the inability to accumulate, as Chakra-

varty suggests. Rather, it is the inability to accumulate rapidly which is caused by the impossibility of changing the technique of production. Accumulation, then, does proceed in a society in which technical change does not take place. The fact that even such societies are able to sustain an increasing population at static levels of living at any rate upto a point or that even where levels of living fall they do so more slowly than would otherwise be the case provides independent logical support for this contention.

This is not to deny, however, that a measure of accumulation may be necessary for the implementation of technical changes once these have been devised in or become known to that society. Inadequate accumulation in a society may hamper the introduction of technical changes or may slow down the rate of technical change. While this is also true of a monetised or even a highly advanced economy, this fact explains particularly why a non-monetised economy existing side by side with a more developed monetised economy and having wage-labour relationships with it may fail to utilise the technical knowledge possessed by the latter.

Money—A Circulating Medium

Sukhamoy Chakravarty's definitions of monetised and non-monetised economies cannot, therefore, be accepted, nor can his statement of the characteristics of such a non-monetised economy. Clearly, a non-monetised economy is one in which a single circulating medium of exchange, which is used on a significantly large scale and provides a common measure of value does not exist. A non-monetised economy is thus, as indicated by the term itself, one in which money is not commonly used. It may be identified with a non-market economy, since it is difficult to visualise a market economy not based on money.

A non-monetised economy is not, however, merely a non-exchange economy, since exchange may take place in an economy through barter without making an economy monetised. Yet subsistence production is undoubtedly the most important characteristic of such an economy, since where exchange takes place only through barter its volume can hardly be large. This of course takes us to the concept of self-sufficiency, which is merely another way of expressing the idea implicit in the concept of subsistence production.

Surprisingly enough in the light of the discussion above, Chakravarty claims in a footnote that "the notion of self-sufficiency in the meaningful sense is subsumed in our definition of non-monetisation". One can hardly admit this when Chakravarty himself concedes that there can be economies which though using money as a circulating medium i e in commerce, would fall within the scope of non-monetised economies as defined by him. Such economies can hardly be described as self-sufficient economies since by definition they are based on well-developed exchange relationships taking place on a large scale through the medium of money.

Exclusion of Non-Monetised Sector

We may now turn to an examination of the main question which is whether the exclusion of the non-monetised sector is justified in calculating a growth-oriented national income total. Chakravarty's principal argument for excluding this sector is that it does not employ reproducible capital or augment the total stock of reproducible capital in the process of accumulation. It is his contention, in other words, that a growth-oriented income total must be an accumulation oriented one and that since the non-monetised sector is not accumulation-oriented, it should be excluded from that total.

Now, as has been shown above, this latter contention cannot be accepted. It is certainly not true for the non-monetised economy as it is defined by Chakravarty. Even for the non-monetised sector as it is generally understood and as I have defined it above, the weight of evidence is against the view advanced by him. The suggestion that the non-monetised sector should be excluded from the national income total must therefore, be rejected.

Another argument in this connection is that if this sector is not excluded as suggested, "it makes models of economic growth based on postulated relationships between income, investment and savings extremely precarious." Since demand must also be accomodated and, therefore, attention cannot be concentrated purely on the investment-income relationships, savings must be explicitly introduced into the picture. Where there is a wide non-monetised sector, the savings-income ratio is unlikely to be stable since the process of economic development itself implies an increasing monetisation of the non-monetised sector. This is his argument.

Separation of Non-Monetised Sector

Let us assume for the sake of argument that the only way to ensure stability in the savings-income ratio is to have figures covering only the monetised sector for use in this ratio. Why not then split up both total savings and total income for the country into two components: monetised and non-monetised? That would permit at any rate the drawing up of a significant and useful savings-income ratio for the monetised sector for comparison with the investment-income ratio.

Chakravarty asks a somewhat similar question but rejects this way out of the difficulty on the ground that the non-monetised sector is not accumulation-oriented and need not, therefore, be considered. This is hardly relevant at this point. If one can show, as I have done, that accumulation does take place even in the non-monetised sector, then the problem of the stability of the savings-income ratio can be considered on its merits. In that case, the splitting up of national income totals into separate totals for monetised and non-monetised sectors offers a perfectly valid solution for this problem.

One may, of course, deny that a savings-income ratio which was restricted to the monetised sector alone, would by virtue of that fact become necessarily stable. Apart from other factors, the portion of the increase in the income of the monetary sector which results from a transformation of the non-monetised sector might not show the same characteristics as the rest of the monetised economy and this is bound to affect the ratio itself, and not merely its income component.

Again, the capital: output ratio which would also be an essential element of model building for economic development, would prove unpredictable if the non-monetised sector was entirely excluded. One should expect this to happen because growth in the income of a community might then result not merely from the investment on which attention had been concentrated, but also from a transformation of a non-monetised into a monetised economy. Thus the difficulties of model-building would not be necessarily reduced by restricting the scope of the national income total to monetised sectors only.

In any case, the fact that difficulties arise in building models of economic development because of the existence of a non-monetised sector is no justification for bringing about a drastic change in the concept of national income itself, particularly because national income totals serve so many different purposes.

Some Difficulties

Changing the national income concept as suggested by Chakravarty will give rise to a number of difficulties. Take the concept of per capita national income. If national income were denned so as to exclude the non-monetised sector, the resulting total divided by the entire population of the country would give a misleadingly low figure for per capita income. If the non-monetised sector were sufficiently large, it might very well happen that the per capita income figure might be so low as to be entirely meaningless.

The application of the new concept would tend to produce a distorted picture of consumption and of investment. Since the volume of subsistence output produced in the non-monetised sector would not be taken into consideration at all, the resulting figures of national income and its breakdowns would be less rather than more significant for the purposes of economic planning.

Again, since one of the consequences of economic development is the progressive transformation of non-monetised into monetised economies, Chakravarty's national income totals will exaggerate the rate of growth of national income. There is already a tendency towards such exaggeration arising from the fact that many productive activities not normally included in the national income get included when they are effected through the market. Thus the national total tends to rise when there has been no real increase in production. Kuznets has stressed this fact frequently. By redefining national income on the lines suggested by Chakravarty, therefore, one would only make the position in this respect worse than before.

It is no doubt desirable to know to what extent subsistence or non-monetised economies are being monetised in the process of economic development. It is not necessary for this purpose, however, to restrict the scope of national income to the monetised sector only. On the contrary, if this is done, it would probably be impossible to distinguish between the increase in income resulting from a genuine increase in production and the increase that occurred due to the transformation of the non-monetised economy. A measure of this transformation could be obtained more clearly if separate estimates for the two sectors as components of the national income total were obtained. Though some difficulties at the margin would still remain, one would be able to see what part of the increase in the income of the monetised sector had been produced at the expense of the non-monetised sector, because to that extent the national income total would not be affected.

The Objective

Finally, one may point out that though a progress of economic growth implies the accumulation of capital, this is not an end in itself. The objective of economic activity is the satisfaction of human wants. Capital goods are included in the national income for the period during which they have been produced on the grounds that since they increase the capacity to produce goods and services in the future, they constitute an addition to the present welfare of the country's residents. A growth-oriented national income need not, therefore, be an accumulation-oriented one at all. It is the economic activity of the country aiming at rapid growth, which must be accumulation-oriented, but the results achieved in that direction must still be measured in the normal way, giving due importance to all sectors and activities in the economy.

Prospectus

A copy of this Offer for Sale, having attached to it the documents required by Section 60 of the Companies Act, 1956, and specified below, has been delivered for registration to the Registrar of Companies, Bombay.

Consent of the Government of India has been obtained to this Offer by an Order, of which a complete copy is open to inspection at the Registered Office of the Company. It must be distinctly understood that in giving this consent the Government of India do not take responsibility for the financial soundness of any schemes or for the correctness of any of the statements made or opinions expressed with regard to them.

The Application List for the ordinary shares now offered for sale (including the shares preferentially offered to the employees of Hindustan Lever Limited as mentioned below) will open at 10-30 a.m. on the 3rd day of December, 1956, and will close at 3 p.m. on the 5th day of December, 1956, or later, at the discretion of the Offeror.

Hindustan Lever Limited

(FORMERLY LEVER BROTHERS (INDIA) PRIVATE LIMITED)

(Incorporated on 17th October, 1933, under The Indian Companies Act, 1913)

SHARE CAPITAL

Authorised :		Issued and fully Paid:
Rs. 5,57,00,000 in 55,70,000 Ordinary Shares of Rs. 10 each	..	Rs. 5,57,00,000

Unilever Limited, London (sometimes referred to in this Offer for Sale also as "the Offeror") is the beneficial owner of the whole of the issued capital of the Company which, with the exception of seven shares, is registered in their name.

LOAN CAPITAL

The Company has created no mortgage or debentures and has no other loan capital.

The Company has bank overdraft facilities secured by guarantee by Unilever Limited or by hypothecation of stock in trade, but on 31st October, 1956, no amount was outstanding. The Company has a current account with Unilever Limited and from time to time is indebted for goods and services supplied in the normal course of the Company's business. On 31st October, 1956, this account showed an amount due by the Company to Unilever Limited of Rs. 21,19,922.

OFFER FOR SALE OF

5,57,000 ORDINARY SHARES OF Rs. 10 each fully paid at Rs. 16-8-0 per share (including a premium of Rs. 6-8-0) payable in full on application.

Unilever Limited invite applications for the purchase from them of the above shares.

In addition to paying the purchase price to Unilever Limited the purchaser (or transferee) will have to bear the stamp duty on the transfer of the shares from Unilever Limited.

Applications must be made on the official form and in the case of applications from the public must be forwarded to the brokers to the Offer named below or to any of the branches of the National Bank of India Limited at the addresses stated on the application form.

It is intended to reserve a maximum of 55,700 (i.e 10%) of the above 5,57,000 shares for offer in the first instance to the employees of Hindustan Lever Limited at the above price of Rs. 16-8-0 per share (including a premium of Rs. 6-8-0) payable in full on application. Applications from employees for these shares must be made on BLUE application forms and must be for 25 or 50 shares only.

Applications for the shares offered for sale to the public must be made on WHITE application forms and must be for 50 shares or a multiple thereof.

Any of the shares reserved for the employees of Hindustan Lever Limited which are not purchased by them will be available to meet applications from the public.

The shares offered for sale will rank for any dividends which may hereafter be declared.

HISTORY

The Company was incorporated in India as a private company on 17th October, 1933, under The Indian Companies Act, 1913, with the name Lever Brothers (India) Limited. Shortly after incorporation the Company took over the Lever soap business established in India in the nineteenth century by Lever Brothers of Port Sunlight, Cheshire, since when the Company has carried on business continuously.

On 8th October, 1956, but with effect from the close of business on 31st December, 1955, by virtue of Orders of the Bombay High Court the Company was amalgamated under Sections 391 and 394 of the Companies Act, 1956, with the undernoted Companies whose assets thereby vested in the Company subject to their liabilities, duties and covenants:—

(1) THE HINDUSTAN VANASPATI MANUFACTURING COMPANY PRIVATE LIMITED (Sometimes referred to in this Offer for Sale also as "HVM")

(2) WILLIAM GOSSAGE & SONS (INDIA) PRIVATE LIMITED

(3) JOSEPH CROSFIELD & SONS (INDIA) PRIVATE LIMITED.

These companies (hereinafter collectively referred to as "the merged companies") have now ceased to exist. Previously they were closely associated with the Company all being wholly owned subsidiaries of Unilever Limited. Since the amalgamation the Company has been carrying on the combined business comprising the manufacture and sale of soaps, detergents, toilet preparations and glycerine, together with vanaspati, margarine, edible oils and oil cake, formerly products of HVM which since 1932 has been the largest producer of its kind in India.

Following the amalgamation, the Company was converted to a public company on 27th October, 1956 and changed its name to Hindustan Lever Limited on 1st November, 1956.

BUSINESS

The Company's main aim has always been to sell good quality products at fair prices. Its products now include SUNLIGHT and LIFEBUOY soaps, LUX toilet soap, LUX soap flakes, RINSO soap powder, VIM scouring powder, DALDA and LOTUS brands of vanaspati, BLUE BAND and other margarines, and MARVO cooking medium. The rights in India to all the trade marks applied to these products are the property of the Company. The Company has arrangements with companies of the Unilever Group outside India by which it manufactures and sells their products in India for its own account; these products include PEARS transparent soap and talcum powder, REXONA toilet soap, BREEZE toilet soap, ERASMIC shaving stick, and shaving cup soap, HIMALAYA BOUQUET toilet and talcum powder, PEPSODENT and GIBBS, S.R. toothpaste and GIBBS dentifrice, CALIFORNIAN POPPY hair oil and ERASMIC cocoanut hair oil. The Company also produces industrial and B.P. quality glycerine which it sells under its trade marks PYRAMID and WHEEL. The Company also sells the soapless detergent powder SURF; supplies of this product are at present imported from the United Kingdom, but local manufacture is planned.

The Company's products are distributed throughout India. The Company's sales offices in Bombay, Calcutta, Delhi and Madras and its depots at Gauhati, Cochin and Bangalore deal directly with over 13,000 wholesalers and stockists in over 3,000 towns. The Company's 375 salesmen are in touch with about 2,00,000 shops that deal in the Company's products.

As a member of the Unilever Group, the Company has access to Unilever's international knowledge and experience of the manufacture and marketing of detergents, edible fats and toilet preparations. To a great extent because of its membership of the Group, the Company has made a valuable contribution to the development of the soap and vanaspati industries in India and continues to do so.

The basic raw material of the Company's soap and vanaspati manufacturing businesses is vegetable oil. The quantities (to the nearest thousand tons) of such oil processed by the Company and by HVM whose business is now amalgamated with the Company, during each of the five years ended 31st December, 1955, are given below; a predominant part—about 88% in 1955—is purchased within India.

1951: 81,000 tons; 1952: 91,000 tons; 1953: 89,000 tons; 1954: 97,000 tons; 1955: 1,04,000 tons.

PERSONNEL

For many years the training of Indian employees for higher posts, whether technical or commercial, has been an important part of the Company's policy and selected personnel are sent overseas for special courses of instruction and for observation of advanced practices. More than 85% of the managerial staff are Indians.

In recent years during which relations between employees and workers in all industries have been subjected to many strains and stresses the Company has been loyally served by its workers and has on its part endeavoured to think and act progressively in all matters pertaining to wages, conditions of work, retirement provisions and welfare. The wages and salaries paid by the Company have been acknowledged on several occasions by Labour Tribunals as the highest in the Industry.

The number of people employed by the Company exceeds 6,000.

SUBSIDIARIES

The Company has four wholly owned subsidiaries. They are:—

United Traders Private Limited and Van den Berghs (India) Private Limited, neither of which are trading at present, and

Levers Associated Trust Private Limited and Levindra Trust Private Limited, both of which are trust companies managing the Provident Fund of the Company's employees.

FACTORIES

Situation and Address	Approximate Area Acres	Nature of Tenure	Main Products
Haji Bunder, Sewri, Bombay.	24.0	Leasehold To 1983 with option for renewal to 2032	Soap, toilet preparations, glycerine, vanaspati, margarine and oil cake.
Garden Reach, Calcutta.	3.4 9.0	Leasehold To 2008 Freehold	Soap, toilet preparations and glycerine
Athpur, Shamnagar, W. Bengal.	15.2	Freehold	Vanaspati
Grand Trunk Road, Ghaziabad, U.P.	19.7	Freehold	Vanaspati
Edamalaipatti, Pudur, Tiruchirapalli, S. India.	39.5	Freehold	Vanaspati

The Factories are well situated for the purposes of securing regular supplies of raw materials and ensuring efficient distribution of manufactured products to all parts of the country. They are equipped with modern plant and machinery, adequately provided with railway sidings, water and power and are maintained in good working condition.

Negotiations have been completed for acquiring a lease from the Government of Bombay of a site of about 0.9 of an acre in the area known as Back Bay Reclamation on which the Company proposes to erect a Head Office building to house members of its staff at present dispersed over five buildings in Bombay City.

AUDITORS' REPORT

The following is a copy of the Report received from the Company's Auditors, Messrs. A. F. Ferguson & Company:—

Bombay, 12th November 1956.

The Directors,
Unilever Limited,
Blackfriars,
London, E.C. 4, England.

Gentlemen,

We have examined the audited accounts for the five years to 31st December, 1955, of Hindustan Lever Limited (formerly Lever Brothers (India) Private Limited) and those of its subsidiary companies at that date, all of which were wholly owned, namely:—

United Traders Private Limited

Levers Associated Trust Private Limited

Levindra Trust Private Limited

and those of the following companies (hereinafter collectively referred to as "the merged companies"), whose assets and liabilities were on 8th October 1956 transferred to Hindustan Lever Limited, namely:—

The Hindustan Vanaspati Manufacturing Company Private Limited (hereinafter referred to as "HVM")

Joseph Crossfield & Sons (India) Private Limited

William Gossage & Sons (India) Private Limited.

We have also examined the audited accounts of Van den Berghs (India) Private Limited which was a wholly owned subsidiary of HVM but which, on 8th October, 1956, on the abovementioned transfer of assets and liabilities, became a wholly owned subsidiary of Hindustan Lever Limited.

We have also examined the audited accounts of the following companies (hereinafter referred to as "the liquidated companies"), for the four years to 31st December 1954 and the period to 27th July 1955, namely:—

The North West Soap Company Private Limited

The Premier Soap Company of India Private Limited

which, as wholly owned subsidiaries of Hindustan Lever Limited, went into voluntary liquidation on 28th July 1955, and held their final meetings in the liquidations on 23rd October 1956.

Throughout the years under review we have acted as auditors of all the above companies.

No audited accounts of any of the above companies have been made up since 31st December 1955.

1. PROFITS

We report that the combined profits of Hindustan Lever Limited, its subsidiary companies as at 31st December 1955 and the liquidated companies, and the profits of each of the merged companies, (in the case of HVM, combined with those of its former subsidiary company) all arrived at on the basis set out below, were as follows:—

Year ended 31st December	Hindustan Lever Limited and its subsidiary companies	HVM and its subsidiary company	Joseph Crosfield & Sons (India) Private Limited	William Gossage & Sons (India) Private Ltd.	AGGREGATE

1953	1,64,71,799	82,80,750	35,753	39,170	2,48,27,472	1,07,84,433	1,40,43,039
1954	1,71,65,259	53,31,230 Loss	35,758	38,052	1,19,07,839	51,72,468	67,35,371
1955	1,90,86,815	57,34,820	36,569	39509	2,48,97,713	1,08,14,944	1,40,82,769

(i) The profits shown in columns 2 to 6 inclusive have been arrived at after charging all expenses of working and management, interest, and depreciation and after making such adjustments as are in our opinion necessary. Depreciation has been charged throughout the five years on a consistent basis and, in aggregate, exceeds the total income-tax allowances exclusive of initial allowances and development rebates.

(ii) The taxation shown in column 7 has been calculated on the profits shown in column 6 at the rate of 6.95 as. in the rupee. This is the combined rate of income-tax and super-tax applicable to the profits of the companies for each of the years under review before taking into account the effect of dividend distributions out of such profits. In respect of 1955, the Finance Act, 1956, imposed on companies taxation additional to the basic rate of 6.95 as. to the extent that dividends declared during 1955 exceeded 6% of issued capital. On the basis of the Finance Act, 1956, and the present issued capital, the additional taxation payable by Hindustan Lever Limited in future years will be as follows:—

On the first Rs. 33,42,000 of dividends—Nil

On the next Rs. 22,28,000 of dividends—2 as. in the rupee

On the balance of dividends over Rs. 55,70,000 —3 as. in the rupee.

The aggregate actual taxation paid or calculated as payable by Hindustan Lever Limited, its subsidiaries and the merged companies is as follows:—

Year ended 31st December	Rs.
1951	60,74,497
1952	75,94,460
1953	90,12,026
1954	80,44,480
1955	1,38,42,031

2. DIVIDENDS

The following rates of dividend were paid in respect of the five years to 31st December 1955 by Hindustan Lever Limited and the merged companies:—

The capital of each company consisted wholly of fully paid ordinary shares of Rs. 10 each								
Year ended 31st December	Hindustan Lever Limited		HVM		Joseph Crosfield & Sons (India) Private Limited		William Gossage & Sons (India) Private Limited	
	Paid up Cap. Rs. Lakhs	Rate %	Paid up Cap. Rs. Lakhs	Rate %	Paid up Cap. Rs. Lakhs	Rate %	Paid up Cap. Rs. Lakhs	Rate %
1951	138	Nil	133	Nil	0.8	Nil	3.2	Nil
1952	200	Nil	133	Nil	0.8	Nil	3.2	Nil
1953	200	25	133	Nil	0.8	200	3.2	50
1954	200	55	133	30.075	0.8	Nil	3.2	Nil
1955	200	37.5	133	50	0.8	56.25	3.2	18.75

3. NET ASSETS

The net assets, based on the audited balance sheets as at 31st December, 1955, of Hindustan Lever Limited, its subsidiary companies at that date, each of the merged companies, and Van den Berghs (India) Private Limited at that date a subsidiary company of HVM, after making such adjustments as we consider necessary, were as follows:—

	Hindustan Lever Limited	The subsidiary companies of Hindustan Lever Limited	HVM	Van den Berghs (India) Private Limited, a subsidiary company of HVM	Joseph Crosfield & Sons (India) Private Limited	William Gossage & Sons (India) Private Limited	AGGREGATE

*This represents a net dividend declared on 22nd February 1956 in respect of 1955.

We are, gentlemen,

Yours faithfully,

A. F. FERGUSON & CO.
Chartered Accountants

PROSPECTS

The consumption of products of the types manufactured by the Company is likely to increase as the standard of living is raised. The Company expects to win a fair share of any increased prosperity that may accrue to the industries concerned.

Assuming a continuance of present rates of taxation the Directors estimate that the consolidated net profit of the Company and its subsidiaries for the year ending 31st December 1956 (after taking into account taxation of Rs. 108 lakhs of which Rs. 19½ lakhs is in respect of the capitalisation of Rs. 157 lakhs of profits on 11th October 1956) will not be less than Rs. 90,00,000. On the 1st November 1956 the Company paid an interim dividend of 8 annas per share absorbing Rs. 27,85,000.

If the estimated net profit is realised and there is no substantial change in trading conditions the Directors would expect to recommend that a final dividend for the year 1956 of 6 annas per share, free of income tax, be paid before the end of May 1957.

For the future it is the intention of the Directors (in the absence of unforeseen circumstances) to recommend the distribution of a large part of the Company's profits by way of dividend. For example, if the estimated level of profit for 1956 is maintained and there is no substantial change in rates of taxation or trading conditions, the Directors would expect to recommend for the year ending 31st December 1957 a total dividend of not less than Rs. 1-6-0 per share free of income tax. On the sale of the shares now offered the Company will become a Company to which Section 23A of The Income Tax Act, 1922 applies.

As will be seen from the Auditors' Report one of the merged companies (HVM), the business of which is now carried on by the Company and is primarily concerned with the manufacture and sale of vanaspati, incurred a loss in 1954. In that year the price of Indian groundnut oil fell heavily. The profits of this particular business—as indeed of the Vanaspati Industry as a whole—are governed to a great extent by price fluctuations in the Indian groundnut oil market. These fluctuations in recent years have been very wide.

STATUTORY AND OTHER INFORMATION

The Offeror was the promoter of the Company but no sum was paid to the Offeror for its services as promoter.

During the two years preceding the date hereof the Company issued 20,00,000 Ordinary Shares of Rs. 10 each credited as fully paid to Unilever Limited in consideration of the vesting in the Company of the assets of the merged companies and it also issued during this period 15,70,000 Ordinary Shares of Rs 10 each credited as fully paid to Unilever Limited by capitalising Rs. 1,57,00,000 of profits standing to the credit of general reserve.

No amount has been paid to the Company by way of premium on any shares within the two years preceding the date hereof.

Apart from the dividends referred to in the report of the auditors, the shares above referred to, the sum of Rs. 5,22,590 being remuneration paid to the directors and secretary of the Company and the sum of Rs. 2,84,43,747 being payments made to or to be made to Unilever Limited for goods and services in the ordinary course of the Company's business, no amount or benefit has been paid or given within the two years preceding the date hereof to the promoter or any officer of the Company. It is not intended that the Company should pay or give to the promoter any amount or benefit other than such amounts as may become payable to the promoter in the ordinary course of the Company's business. It is not intended to pay or give any amount or benefit to any officer of the Company other than normal remuneration.

Except as beneficial owner of the whole of the Company's issued share capital and as a creditor of the Company from time to time in the normal course of the Company's business, the Offeror has no interest in the profits or property of the Company. The other members of the Company have no beneficial interest in the profits or property of the Company.

Since incorporation the Company has capitalised profits standing to the credit of general reserve (including the Rs. 1,57,00,000 referred to above) as follows: 20th March 1937 Rupees Six Lakhs; 29th December 1937 Rupees Eleven Lakhs; 22nd July 1939 Rupees Three Lakhs; 20th August 1940 Rupees Two Lakhs; 17th November 1942 Rupees One Lakh; 6th September 1943 Rs. Six Lakhs; 19th February 1945 Rupees Thirteen Lakhs; 7th September 1945 Rupees Twelve Lakhs; 24th December 1946 Rupees Six Lakhs; 31st December 1951 Rupees Fifty Lakhs; 22nd August 1952 Rupees Sixty-two Lakhs; 11th October 1956 Rupees One Hundred and Fifty Seven Lakhs. The Company applied the amounts capitalised in paying up in full ordinary shares of the Company of Rs. 10 each of a nominal amount equal to the profits capitalised. All the shares were allotted to the Offeror or its nominees, or subsidiaries of the Offeror incorporated in the United Kingdom or their nominees.

The Company has not issued any redeemable preference shares and does not at the present time intend to do so.

The premium receivable on the shares now offered for sale will be retained by the Offeror. No part of the proceeds of this Offer for Sale is receivable by the Company. The Offeror will pay all the expenses in connection with this Offer for Sale except the stamp duty on the transfers from the Offeror to the persons in whose names the shares are registered which will be payable by those persons. The Offeror will also pay brokerage as indicated below. The total expenses, including brokerage, payable by the Offeror are estimated to be Rs. 350,000.

No commission (except brokerage as hereinafter mentioned) was paid during the two years preceding the date hereof or is payable to any person in consideration of his subscribing or agreeing to subscribe or procuring or agreeing to procure subscriptions for shares in the Company.

All the directors are whole-time directors and are not required to hold any qualification shares.

No director had any interest in the promotion of the Company and neither the promoter nor any director has any interest in any property acquired by the Company within the two years preceding the date hereof or proposed to be acquired by it other than the promoter's interest as a member of the Company and beneficial owner of the whole of its share capital.

No sums have been paid or agreed to be paid to any director in cash or shares or otherwise by any person to induce him to become or to qualify him as a director or otherwise or for any other purpose whatsoever for services rendered by him in connection with the promotion of or formation of the Company.

Mr. A. J. C. Hoskyns-Abrahall is the beneficial owner of £200 Unilever Limited 8% Cumulative 'A' Preference Stock.

The Articles of Association of the Company contain provisions to the following effect:—

(a) The profits of the Company which shall from time to time be determined to be divided shall be divisible among the members in proportion to the capital paid up on the shares held by them respectively.

(b) Unless otherwise determined by a general meeting the number of directors shall not be less than three and not more than eleven.

(c) The directors including the Managing Director, if any, shall be paid out of the funds of the Company by way of remuneration for their services such sums as the Company in general meeting may from time to time determine, and such remuneration shall be divided among them in such proportions and manner as the Directors may determine, and, in default of such determination within the year, by the Chairman. If any Director shall be called upon to perform extra services or make special exertions or efforts the Board may arrange with such Director for such special remuneration for such extra services or special exertions or efforts either by a fixed sum or otherwise as may be determined by the Board and such remuneration may be either in addition to or in substitution for his normal remuneration. A Director who is not a resident of Bombay City may be paid such sum as the Board may consider fair compensation for travelling, boarding, lodging and other expenses incurred in attending meetings of the Board in that City. If any Director is called upon to go or reside out of Bombay City on the Company's business, he shall be entitled to be repaid any travelling or other expenses incurred by him in connection with the business of the Company.

(d) Save as required by the Companies Act, 1956, no restrictions are imposed by the Articles of Association on the Directors' powers of management and the control of the Company's affairs is vested by the Articles of Association in the Directors.

(e) Subject to the provisions of the Companies Act, 1956, the Board may appoint from time to time any one of its numbers as Managing Director of the Company for a fixed term not exceeding five years at a time upon such conditions as it thinks fit and may vest in such Managing Director such of its powers as it thinks fit and such powers may be made exercisable for such period or periods, and upon such conditions and subject to such restrictions as it may determine. The remuneration of the Managing Director shall be determined in the same manner as that of a Director.
The Board has not appointed a Managing Director and it is not its present intention to do so.

(f) The Directors may from time to time at their discretion raise or borrow or secure the payment of any sum or sums of money for the purposes of the Company. Provided, however, where the moneys to be borrowed together with the moneys already borrowed (apart from temporary loans obtained from the Company's Bankers in the ordinary course of business) exceed the aggregate of the paid up capital of the Company and its free reserves (not being reserves set apart for any specific purpose) the Board shall not borrow such moneys without the consent of the Company in General Meeting. The provisions of the Articles of Association relating to borrowing are qualified by the relevant provisions of the Companies Act, 1956.

(g) Every Officer or agent of the Company shall be indemnified out of the assets of the Company against any liability incurred by him in defending any proceedings, whether civil or criminal, in which judgment is given in his favour or in which he is acquitted or in connection with any application under Section 633 of the Companies Act, 1956, in which relief is granted to him by the Court.

(h) Save as hereinafter mentioned in regard to joint holders, on a show of hands every member who (being an individual) is present in person or (being a corporation) is present by a representative, shall have one vote. Upon a poll every member who (being an individual) is present in person or by proxy or (being a corporation) is present by a representative or proxy shall be entitled to one vote for each share held by him. No person may vote in person or by proxy if there remains unpaid any call or other sum due on any of his shares.

(i) If there be joint registered holders of any shares, any one of such persons may vote at any meeting either personally or by proxy in respect of such shares, as if he were solely entitled thereto, provided that, if more than one of such joint-holders be present at any meeting either personally or by proxy, that one of the said persons so present whose name stands higher on the Register of Members shall alone be entitled to vote in respect of such shares, but the other or others of the joint-holders shall be entitled to be present at the meeting. Several executors or administrators of a deceased Member in whose name shares stand shall for the purpose of the Articles be deemed joint-holders thereof.

(j) The Articles of Association contain no restriction on the transfer of fully paid up shares. The Directors may decline to register a transfer of any partly paid shares to a person of whom they do not approve and may also decline to register a transfer of partly paid shares on which the Company has a lien.

(k) The special rights attaching to any class of shares may be varied, modified, commuted, affected, abrogated or dealt with by any agreement between the Company and any person purporting to contract on behalf of that class provided that such an agreement is ratified in writing by the holders of at least three-fourths in nominal value of the issued shares of that class or is confirmed by a resolution passed at a separate General Meeting of the holders of shares of the class and supported by the votes of the holders of at least three-fourths of the shares of that class.

MAIN OBJECTS

The main objects of the Company include the manufacture and sale of soap, soap powders, detergents, toilet requisites, vanaspati, margarine, edible oils, cattle food and foods of all kinds.

All the objects of the Company are in law main objects and therefore a copy of the objects clause of the Company's Memorandum of Association is annexed hereto and forms part of this Offer for Sale.

CONTRACTS

The following contracts, not being contracts entered into in the ordinary course of business, which are or may be material have been entered into by the Company during the two years preceding the date hereof:

No.	Date	Particulars
1	2nd May 1955	Assignment of the Trade Mark, "Breeze" registered in India under No. 128300 to Erasmic Company Limited of Unilever House, London.
2	1st February 1956	Assignment of the Trade Mark "Bris" registered in India under No. 163139 to Erasmic Company Limited of Unilever House, London.
3	12th November 1955 to 18th September 1956	Correspondence between the Company and the Government of Bombay by which the latter has accorded sanction to the grant of a lease of a site at Backbay Reclamation, Bombay of approximately 4258 sq. yards for a period of 99 years at a ground rent of Rs. 12 As. 8 per sq. yd. on condition that the Company erects thereon an Office Building of not less than Rs. 12 lakhs in value within the first four years of the said lease.
4	27 September 1956	Agreement between the Company and its workmen employed in its factories at Sewri, Bombay, represented by Lever Brothers Employees' Union, Bombay, fixing generally the terms and conditions of employment for the years 1955 to 1960 both inclusive, and, in particular, fixing pay-scales, dearness allowance, grading of hourly-rated jobs, provident fund, gratuity and incentive payment and bonus.
5	10th October 1956	Resolution passed by the Company in general meeting on 10th October, 1956, voting as the annual remuneration of all the Directors collectively a sum not exceeding Rs. 8 lakhs to be apportioned among them as they may determine.

UNDERWRITING

This Offer is not being underwritten.

APPLICATIONS FROM THE PUBLIC, which must be for 50 shares, or a multiple thereof, must be made on the official WHITE application form and will be declined if not so made. WHITE application forms, together with a remittance for the full amount payable on application, should be sent to any of the branches of the National Bank of India Limited, or to the Brokers to the Offer, at the addresses as given on the application form. A separate remittance must accompany each form.

APPLICATIONS FROM THE STAFF OF HINDUSTAN LEVER LIMITED for the shares reserved in the first instance for them, and which must be for either 25 or 50 shares, must be made on the official BLUE application form and will be declined if not so made. These forms are obtainable only from the offices of Hindustan Lever Limited mentioned in the last paragraph of this Offer for Sale. BLUE application forms, together with a remittance for the full amount payable on application, should be sent to the Secretary of Hindustan Lever Limited at Scindia House, Dougall Road, Ballard Estate, Bombay. A separate remittance must accompany each form.

All remittances should be made by cheque or draft drawn on a bank in any one of the following towns, Bombay, Calcutta, Madras, Bangalore, Amritsar, Cawnpore, Delhi, New Delhi, Tuticorin, Cochin. Application forms sent with cheques or drafts drawn on banks in towns other than those stated above may be refused.

Cheques or drafts should be made payable to "National Bank of India Limited A/c Unilever" and should, for the applicant's protection, be crossed "A/c Payee only".

The Offeror reserves the full and uncontrolled right of accepting or rejecting any application in whole or in part. Where an application is rejected or not accepted in full, the whole or the balance of the applicant's remittance will be returned, in which event bank commission, if any, will be payable by the applicant.

Acceptance will be notified by the despatch of a definitive share certificate in the name of Unilever Limited together with a blank transfer executed by that company or on its behalf as transferor. These documents will be sent by registered post at the risk of the applicant. The Company has agreed to waive the transfer fee for the registration of such transfers from the Offeror.

A brokerage of 4 annas per share will be paid by the Offeror to the Managing Brokers in respect of all acceptances. The Managing Brokers will pay 2 annas per share to Certified Brokers of any recognised stock exchange and to the National Bank of India Limited on the basis of acceptances of applications received and bearing their stamp. In addition to the 2 annas per share, the Managing Brokers will pay to Messrs. Place, Siddons & Gough, Messrs. Kothari & Sons and the National Bank of India Ltd. remuneration for any additional service rendered by any of them to and at the request of the Managing Brokers.

The consent in writing of the above-mentioned Bankers, Solicitors and Brokers to act in their respective capacities has been obtained and none of them has withdrawn their consent to the issue of this Offer for Sale. Messrs. A. F. Ferguson & Co. have also given and have not withdrawn their written consent to the issue of this Offer for Sale with their Report included in the form and context in which it is included.

The foregoing written consents, copies of the contracts numbered one to five above and the written statement of the adjustments made by the Auditors in arriving at the figures shown in their Reports and giving the reasons therefor have been attached to the copy of the Offer for Sale, which has been delivered to the Registrar of Companies, Bombay, for registration.

The documents mentioned below may be inspected at the Registered Office of the Company, Scindia House, Dougall Road, Ballard Estate, Bombay, during usual business hours (excluding Saturdays) until the Application List has been closed.

(1) The Memorandum and Articles of Association of the Company.

(2) Copies of the Contracts numbered one to five above.

(3) Copy of the order of the Central Government giving consent to the Offer for Sale.

(4) Copy of the order dated 8th October, 1956, of the High Court of Judicature at Bombay under

Sections 391 and 394 of the Companies Act, 1956, vesting the assets (subject to the liabilities, duties and covenants) of The Hindustan Vanaspati Manufacturing Company Private Limited, in the Company.

(5) Copy of the order dated 8th October, 1956, of the High Court of Judicature at Bombay under Sections 391 and 394 of the Companies Act, 1956, vesting the assets (subject to the liabilities, duties and covenants) of Joseph Crossfield & Sons (India) Private Limited, in the Company.

(6) Copy of the order dated 8th October, 1956, of the High Court of Judicature at Bombay under Sections 391 and 394 of the Companies Act, 1956, vesting the assets (subject to the liabilities, duties and covenants) of William Gossage & Sons (India) Private Limited, in the Company.

(7) The original Report of Messrs. A. F. Ferguson & Co., as set out herein and a copy of their statement as to the adjustments made by them in arriving at the figures shown in their Report and giving the reasons therefor.

(8) Copies of the balance sheets and profit and loss accounts upon which the Report of Messrs. A. F. Ferguson & Co., Bombay, is based, for the 5 years ended 31st December, 1955.

Copies of the Offer for Sale and WHITE application forms may be obtained by the public from all Indian branches of the National Bank of India Limited and from the Brokers. Copies of the Offer and BLUE application forms may be obtained by the staff from the Registered Office of the Company at Scindia House, Dougall Road, Ballard Estate, Bombay, and from the Company's offices at 4 Lyons Range, Calcutta; 12|1 Delhi-Ajmeri Gate Scheme, Delhi; 11|14 Armenian Street, Madras; Mattancherry Main Road, Cochin; 2 Central Street, Bangalore; Athgaon Road, Gauhati; Grand Trunk Road, Ghaziabad; Edamalaipatti, Pudur, Tiruchirapalli.

Dated at Bombay this seventeenth day of November, 1956.

From the Chair

Killick Industries Limited

Speech of the Chairman Mr E D Sheppard

ADDRESSING the Ninth Ordinary General Meeting of Killick Industries Ltd., held in Bombay on 27th November 1956 Mr E D Sheppard, the Chairman said:—

Gentlemen,

You will recall that during the course of the speech which I made last year at this Meeting, I attempted an analysis of the political and social thinking prevailing in the country in so far as it affects the formulation of economic policy. As a conclusion from this analysis I suggested that there was no alternative to the co-ordinated efforts of both the State and of Free Enterprise, and that in order to achieve as quickly as possible a better life for all in India, the fullest advantage must be taken of the contributions which each system is best capable of making. In effect this implied the application of "Mixed Economy" or as I would prefer to call it of "Joint Endeavour".

Since then the Avadi Session of the Congress Party has decided that the economic development of the country is to be directed towards the achievement of "A Socialistic Pattern of Society". Various policy pronouncements and Acts of Parliament which have followed in the wake of this decision give the impression that it is to be implemented by a process of establishing uniformity and an official discouragement of incentives or individual gain. Indeed the thoughtful mind cannot help but feel the strongest misgivings that, if it is along these lines that the Socialistic Pattern is to be pursued, it will eventually lead to frustration, and the belying of the hopes for a fuller life which so many millions of people have pinned on it.

Dog in a Barnyard

In a recent article entitled "The Dynamic Society", a leading economist has dubbed the philosophy which forms the basis of this type of economic thinking as being "like a dog in a barnyard. It cannot lay eggs itself and it will not let the hens do so". This writer points out that when men are not allowed to strive for their dreams and to enjoy the fruits of their strivings, they consume everything they produce from day to day and so make it necessary for the State to force them to abstain, in order to save and build tools for the future.

The same Economist points out that there are two methods by which the economic donkey can be propelled forward. One is to offer him a carrot and the other is to beat him. In both the cases the result is forward movement. Similarly there are two dynamic economic systems prevailing in the world today. One is that of Free Enterprise, or development through individual incentive, and the other that of the authoritarian State and its methods of compulsion.

We in India have rejected the stick theory and the concept of the authoritarian state as being alien to the traditional Indian way of life. Can we not therefore accept as a nation the logical corollary of introducing the carrot in its stead? We are not prepared to accept interference with our political freedom, or with such matters as the freedom of speech, and of the Press; why then should we take a completely different stand in relation to economic freedom? In this sphere people who would resist to the utmost limitations being imposed on their social and political rights, accept without murmur controls over such matters as production, profits wages and prices, and feel that it is perfectly reasonable for Government to regulate them. In my view this is an inconsistency which could lead to a frustration of the National Economy.

The Private Sector

The terms "Capital" and "Capitalist" have over a period of years been misinterpreted and distorted so much that in the public mind they are now associated with systems which are completely at variance to their real activities. "Capital" is widely identified with an undesirable concentration of power and the accumulation of personal wealth, rather than what it in fact is, namely the savings of people which have been created by hard work and self-denial and which are thus available to start more good things growing. Now a similar process of distortion is in being which seeks to identify the term "Private Sector" with something that is anti-social and anti-national. "Private Sector" is a term which is at variance with the system which it purports to describe. There is nothing "private" about the finances and accounts of the major industrial units existing within the so-called "Private Sector". These units of Free Enterprise are as public as they can be. They are subjected to continuous and close audit, and are available for scrutiny to a wide range of people. The goods which these industries produce and the products which they market are sold only because there is public requirement for them and at a price which this public is prepared to pay. Shareholders of these so-called "Private Sector" units in fact represent a wide cross section of public society. The recent passage of the new Companies Act into law has stripped the last vestige of even legitimate privacy from these Joint Stock companies.

Furthermore, the tendency to associate the "Private Sector" with the relatively few major corporate industries is itself quite wrong. The truth of the matter is that the so-called "Privae Sector" consists of all business activity and commercial endeavour except those few units which are operated and owned by the State. The vast range of these business and commercial interests varies from the largest industrial concerns on the one hand to the small shopkeepers carrying out their day to day trade in the bazaar on the other, and it is all these who are denoted by the misused term "Private Sector".

"People's Sector"

If it is necessary, as it apparently is, to differentiate within the mixed economy between those activities which are State controlled and State regulated on the one hand, and those which operate through the initiative of individuals on the other, then I would suggest that a more accurate description of the two sectors would be to rename what is today called the Private Sector as the "People's Sector" and the Public Sector as

the "State Sector". Such renaming would, I feel, go a long way towards removing the unfortunate and erroneous association of ideas in the minds of the public regarding the structure of Free Enterprise.

A Co-operative Society

We hear also a good deal of talk these days by socialistic planners of the desirability for increasing co-operative societies. I submit that a Joint Stock Company is nothing but a co-operative society in the fullest sense of the term. Its capital is created by co-operative faith in its venture, its direction is provided by those who reflect in their persons co-operative choice, its factories are worked by co-operative endeavour and finally its products are sold only if there is co-operation from the consuming public. The doctrinaire socialist, who suppresses or distorts facts that do not fit in with the theories that he has imbibed during his student days, tends to brush this argument aside with the remark that a handful of shareholders cannot be described as a co-operative society. To meet this contention I think it will interest you to know that in the major industries in India the ratio of shareholders to workers employed is approximately as follows:—

Ratio of Shareholders to Workers			
Steel	..	1	1
Cement	..	1	1
Textiles	..	1	2
Electricity	..	10	1

Surely the logical result of a dispassionate appraisal of all the facts is that the existing policy, namely that of a constantly increasing State Sector, and by implication a proportionately smaller People's Sector should be exactly reversed and the best interests of India would be served by the State doing only those things which the people cannot do by the exercise of their own initiative and judgment in the arena of the world market place. Can any Government truthfully say that it knows this market place better than its people know it?

Classless Society

On the subject of the use of terms which come to have a meaning foreign to their purpose, one must also comment on the "classless Society" so much in current vogue. Inasmuch as this term denotes a society from which has been banished hereditary privilege and unwarranted opportunity, and means the creation of a social organisation to which each one is entitled to contribute on merit alone, its implication can only be welcomed. Unhappily this is not the concept that is meant by those who so constantly refer to it. The type of "Classless Society" which these people appear to have in mind is one in which all men are dragged down to a level of uniform poverty.

Such a society must of necessity be a third class society. Any deliberate attempt to abolish a class by taxation or any other legislative means will never succeed in abolishing "Class". For in the vacuum so created an official bureaucratic aristocracy would emerge at once. What it would achieve would be to abolish variety, character, and those inspirational gifts which alone save a country from colourless uniformity. It is the personal vision and the difference between people that count and help towards the making of a nation. This difference of outlook must inevitably express itself in a search after varying environments. "Class" is not a matter of money and still less is it one of social ambition. It comes from the free exercise of choice in culture, environment, and the differences which life has to offer, it cannot be "ironed out" for the human soul does not lend itself to the process of laundry.

Doctrinaire Socialism

It is interesting to note the revulsion which has appeared in England against the dose of doctrinaire socialism that was injected into the economic system of that country for the five years immediately after the last war. In practice Socialism has meant the creation of huge irresponsive public corporations and the extension of bureaucracy. Nationalisation has not succeeded in changing the lives of the workers but has only added to the steady concentration of power in the hands of official classes. Trade Unions have become the strongholds of restrictive practices, limiting not merely industrial output but, far more important, liberties of individuals and those of minorities. It has become very clear to me that what people want is, as far as possible, to be allowed to choose from a bigger selection of things—material and spiritual. The way to satisfy them is not to cut down to a common size every one else's choice. That is precisely the way to deprive the community of the flexibility, the diversity, and the incentives upon which the policy of plenty and a dynamic society must depend. The right way is to create incentives that lead to an increase in the total national product and thereby level upwards and not downwards.

Middle Class Neglected

I would like, during the course of my talk this afternoon, to deal especially with the plight of the middle class of our country and the constantly increasing bleakness of the future which faces it.

That the middle classes are depressed, that they are being destroyed by taxation and the high cost of living, that some Finance Minister of the Government of India must do something about it—and that none every does; these are the truisms which have been with us ever since 1947.

What is this middle class and whom does it comprise? I would suggest that it embraces all those people who work with their brains and derive their income from salaries and professional fees or from the active management of property, those who do most of the organising and creative and inventive work from which the nation gains its vitality. The spread of this class stretches from the clerk and salesman at one end to business executives, and professional men at the other. The thread which unites them is social rather than financial. The contributions which these people make come from intelligence, character and example. For the most part they do not clock in and clock out for eight hours a day, but are always on duty. They are compelled to keep up a standard of living not merely for the sake of appearances, but in order to play their part in the social life which they guide and nurture.

Working Class Welfare

Universal adult franchise in our country encourages politicians to look solely to the masses and to ignore the middle class as though it were negligible. Since independence the well-being of the industrial working class has been the special care of the Central and State Governments, as also that of the majority of parliamentarians. As has recently been stated by the Labour Minister of the Government of India, there has been a rise in the real wages of this class. Not only can no one object to this, but indeed

if the raising of the standard of life of all people in the country is to be achieved, then we must regard the betterment of the living conditions of this particular class as a matter of great satisfaction and unstinted pleasure. At the same time one hears that the agricultural class, which of course constitutes the great majority of the Indian people, has also taken a few albeit faltering steps forward, on the path to a better life. It is the hope of all people that this trend will be emphasised and speeded as rapidly as possible.

But what of the middle class? When attention is focussed on their betterment there appears to be a curious lack of interest in it. No political champions come forward to safeguard their interests. As has been suggested earlier, the reason for this may well be purely one of numbers—in a population of 360 millions they do not appear to warrant the interest and attention of those standing for parliament and whose political future is decided by the counting of heads. Consequently the middle class is left friendless and unsupported. Unless this process of deterioration in its standard of life, and therefore in the morale of the people constituting this class is arrested, an irreplaceable component of the industrial and commercial structure of the country will be dangerously weakened, and no amount of planning or legislation will be able to replace it or revive it.

But are the numbers of the middle classes really so negligible? The figures I gave you earlier of the relative numbers of workers and shareholders in various industries show that the number of shareholders—about 90% of whom belong to the middle class—is by no means inconsiderable. They represent an integral and vital part of the social structure of all countries and can wield an influence out of all proportion to their numbers. I would liken them to the leaven of the mass and without leaven the mass cannot rise. In India today too much time and attention is devoted to the mass and far too little to the leaven of the mass.

Highest Taxed Nation

It is true to say that over the past years there has been an erosion of incentives in the case of most salaried people, whether serving in public life or in a private capacity. The general standard of living of salaried workers has been considerably reduced. This has been brought about principally by means of taxation. To the plethora of already existing taxes which have hit the middle class hard the last budget added even more. It was a measure of the extent to which tax-payers have been demoralised in the country over the past few years that after the last budget, which in real terms made India—still in a relatively early stage of industrial development—the highest taxed nation in the world, there was a feeling of relief that it had not been even more penal on individual earnings. This matter of taxation has been written and spoken about at such length and in so much detail that there is nothing new which can be said about it. All the arguments of disincentives, of inequality, and of the frustration which will result, have been put forward time and time again. I feel however that the time has now come when the inroads of taxation upon the earnings and on the standard of life of the middle class must be faced up to if there is not to be a collapse in the morale of that class which will be irreparable.

Lower Profits

Turning now to the affairs of your own Company, you will doubtless have observed that the profit is lower than that of the previous year. This is accounted for by the reduced profits of the Kohinoor Mills Co., Ltd., and the Ahmedabad Electricity Co., Ltd. for the period reflected in the accounts, and the reasons for which are well known to most of you. There was also, as anticipated, a loss on the first year's working of John Baker & Sons Steel File Factory, though this was fortunately considerably less than was estimated when this undertaking was planned.

I am glad to say that both the Kohinoor and Ahmedabad companies are now working at a normal rate of profit and that the steel file factory should—barring unforeseen eventualities—return a satisfactory profit for the current year.

Another factor which also contributed to the reduced profits is less easy to remedy. I refer to your Company's share in the Managing Agency commission of the Associated Cement Companies Limited which is received in the form of a dividend from Cement Agencies Limited. This became subject to the tax on dividends over 6% introduced in the 1956 Budget which had the effect of reducing the amount received by Rs 1.25 lakhs. It is difficult to see what can be done about this so long as this inequitable tax remains on the Statute Book.

Expansion and Diversification

The expansion and diversification of your Company's activities continue to receive the closest attention of your Directors. As you will have seen from the Report permission has been received from Government to increase the production of the steel files factory and a licence has been granted for the manufacture of nuts and bolts, dogspikes and coachscrews. In addition several other projects both large and small are in process of detailed examination.

Killick Nixon & Co

Also your Directors have recently come to an agreement with the shareholders of Messrs Killick Nixon & Co., Ltd. to purchase all the shares of that company and the matter is expected to be finalised early in the New Year. Killick Nixon & Co Ltd., will then become a wholly owned subsidiary of this Company. Among their assets is this Building in which we are now meeting. Their Shipping and Trading interests will lend a healthy balance to the predominantly Industrial activities which have hitherto represented the bulk of your Company's business.

Taking everything into consideration therefore I feel we can face the future with confidence and I have little doubt that when we meet here again next year the picture which I shall then be able to lay before you will be a happier one, though it may well be that the figure in the accounts which will show the most significant increase will be that under the heading ''Provision for Taxation".

Note: This does not purport to be a record of the proceedings of the Annual General Meeting which will be sent separately to shareholders.

Not Enough!

THE Finance Minister has done very well. He has not given in to the line of thinking which has been pressing for a rise in the bank rate. By presenting a supplementary budget instead, proposing more taxes he has shown an awareness of the problem facing the country which had not been evident during the discussions on the Plan so far. Indeed, the manner in which the problem of resources has been avoided so far, had confirmed the suspicion that Government might have something up its sleeve but grand strategy demanded that it should hold its cards until the time was more opportune. Resources have to be found for implementing the Plan. More and more of the additional income generated by development has to be channelled back into development. The feed back process has to start some time. All these must have been well-known, but the remedy had been kept a secret.

Many tax proposals must have been studied and other devices for mopping up surplus incomes must also have been carefully examined. State trading was thought of at one time partly as a fiscal device but this part of its activities was promptly dropped and no more was heard about it after agitation was started by the interests which would be affected by the expansion of State trading. The surplus from land which contributes nearly half to the national income cannot be mobilised so long as the present land system continues virtually unchanged. Trading surplus can be touched only partially. Direct taxation on personal incomes has already reached a point beyond which it cannot be pushed. The tax system has got into a rut. It does not bring into the public exchequer even a constant proportion of national income. So it has to be broadened and deepened. It is necessary to increase the coverage of taxation by reaching those classes of incomes which have hitherto been kept out of the purview of taxation.

The Finance Minister, however, has not spread his net wide. In the field of direct taxation, he has introduced the capital gains tax. This closes a gap and is justifiable on social grounds. In the wake of rising prices and inflationary pressures, capital assets tend to appreciate and capital gains following from it aggravate economic inequalities. But its effect will largely be to remove a lacuna in the existing system of direct taxes on incomes rather than to bring an altogether new class of incomes under the purview of taxation. The Government has had the authority to tax capital gains ever since the measure was first introduced in the Liaquat Ali budget; but the power has not been exercised and the tax on capital gains is for all practical purposes a new measure.

The other direct tax, the rates on which are proposed to be stepped up, is the tax on distributed profits of companies. It was introduced for the first time in the last budget on the suggestion of the present Finance Minister who was then in charge of Commerce and Industry. The Cabinet accepted it as a compromise not between excess profits tax and ceiling on dividends, both of which had been suggested and discussed, but as a compromise between offering an inducement to retain profits by a small rebate on the income-tax payable on them and impounding excess profits by more drastic methods. Corporate savings are an important source of fresh industrial capital, both for establishing new industries and for expanding existing ones. That profits are necessary for expansion and

Around Calcutta Markets

Yield Factor

Wednesday, Evening

MORE than one explanation has been offered for stock market inactivity, despite continued industrial progress. There is something to some of the arguments advanced for the quiet trend in equities. Industry may be progressing, but investors are suspicious of the Government's dividend policy. New Delhi's dividend directives to TISCO and IISCO are not only resented by the shareho'ders concerned. These directives have been widely interpreted as the Government's orthodox policy to dividend payments. Investors, it is argued, have lost interest even in sound shares, as they suspect that industry may be persuaded to follow a dividend-freeze policy.

This may be one of the reasons why equities are not moving up. But, if this is the conviction of investors, it justifies a further fall in equities. For, if dividend is to be freezed, equities will have to fall further to fetch reasonable yields. That equity yields should move up, has been argued, implicitly and explicitly, more than once in these columns. There is some circumstantial evidence in support of this theory. This problem is discussed later.

Costs and Taxes

There are other reasons why equities remain quiet. Fears persist that production costs will mount. Import costs have risen. Internal prices remain high. These fears have some basis, but can be exaggerated. With a time lag, rising production costs must be reflected in higher selling prices for manufactured goods. So, on this account alone, profits are not likely to suffer. It is, of course, arguable, that, if dividend payments are not allowed to be raised, it is immaterial whether profits are maintained or higher.

Tax fears are no less responsible for the quiet trend in equities. It is common ground that the tax load will have to increase. But increased indirect taxation is not necessarily a "bear" factor for industry or for equities. Nor is the Kaldor plan a handicap to industry. Implementation of some aspects of the Kaldor plan may, on the contrary, lead to a decreased tax load on industry as well as on individuals.

Dearer Money

In recent months, dearer money has had an adverse effect on equities. There are many aspects to this issue. Securities have fallen considerably. Higher yields from securities have had a psychological effect on equities. There is some relation between yields from stocks and from shares. As the former move up, the latter tend to rise. Something like this has been happening in the last six months.

Dearer money has also affected stock market activity. Bank advances for speculative purposes have been checked. This explains why even speculative shares are inactive. There are reasons to believe that banks have been reluctant to lend freely even to investors. This is one of the reasons why even investment activity in equities is poor. No doubt, these monetary factors have contributed to the prevailing stock market inactivity.

Yield Factor

There is something to all these arguments. But the yield factor is the most important influence behind the quiet trend in equities. Dearer money, suspicions about a dividend-freeze policy and some other factors may have made investors yield-conscious. Whatever be the reason or reasons, the behaviour of stock markets in the last few months underlines the investor's conscious or unconscious belief in higher equity yields.

Once this is appreciated, the seeming paradox between falling equities and the over-subscription of sound new issues is easily solved. Investors are not enthusiastic about the premia for the right issues of IISCO and TISCO because, at current market quotations, these right shares are not quite attractive. They are eager to subscribe to new issues like those of Guest, Keen, Williams or of Hindustan Lever because, despite the premia, investors are optimistic about these latter issues.

The Margin

Behaviour of Jute shares has been a disappointment in recent months. As export duties were abolished along with devaluation of the Pakistani rupee, there were hopes that Jute shares would revive. With the gradual unsealing of looms, there were further hopes that demand would improve. Later, when it was found that demand did not improve, looms were resealed. Jute shares failed to respond to any of these developments. Since the start of the Suez crisis, jute goods started moving up. But Jute shares did not respond.

There are reasons for the lack of response of Jute shares. Jute goods have been going up. Raw jute prices have also been rising. Both the industry and investors of Jute shares are conscious of the spinner's margin. Considering developments in Pakistan, the outlook for raw jute seems "bullish". But some are gaining the impression that this problem of the spinner's margin is being over-emphasised.

Auction Prices

Tea shares alone seem to have benefited out of the war in Egypt. Auction prices had been moving up in the last few weeks. Tea shares have also received support at higher levels. There is some buying of Tea shares for dividend considerations. This is the dividend season for tea companies. But speculative investors may be interested to know that, during the current week's auctions, demand and prices have tended to ease both days as the sale progressed.

There has been some selective support for Coal shares also. But Paper shares remain inactive. So are Miscellaneous and Engineering shares. These latter groups closely follow fluctuations in clearing shares. In recent weeks, clearing shares have been irregularly lower. This may be one of the reasons why Miscellaneous and Engineering shares remain rather quiet.

Ahmedabad Advance Debenture

Thursday, Morning

IN the absence of fresh developments, trading on the stock exchange was indifferent and devoid of any interest. The continued tight money conditions and the indication that stringency is bound to be even greater in the coming months has been inhibiting fresh investment purchases. Some bank finance has been locked up in recent months in taking up new issues, in addition to normal security trading and pressure has begun to be felt. The market, in the circumstances, will have to bide its time before investment support reappears. It may not, until budget proposals are well digested, that is, by about the middle of March next.

Meanwhile, one more issue has come on the market, namely, the Ahmedabad Advance Debentures. In order to modernise their plant, the Managing Agents, Tata Industries, have decided to issue Rs 30 lakhs of debentures carrying interest at 5.½ per cent, repayable in 10 to 15 years. This is an approved investment under the Insurance Act, and a substantial portion of the issue, it is reported, has been taken up by the Life Insurance Corporation and other institutional investors. The company has a paid-up capital of Rs 50 lakhs and has made a net profit of Rs 13,11,721 for the year ended June, 30 1956.

Shri A D Shroff, Chairman of the company, speaking at its annual general meeting during the week, referred to the substantial increase in excise duties from 1st September onwards and said that this "has thrown cloth markets into a state of near panic". "For a considerable time", he added, "stocks were not lifted by the trade and it was difficult to book fresh orders for forward sales even during such high demand periods as the Puja and Diwali festivals. The markets have become so bad that mills have been forced to allow substantial rebates, in many cases up to 100 per cent. of the recent rise in excise duty, to induce merchants to fulfil their commitments".

Dilating on the measures so far taken to rehabilitate the cotton textile industry, Shri Shroff pointed out that while substantial renovation of plant and equipment had been undertaken, much still remained to be done to put the mills on a firm competitive footing, at home and in export markets. In this connection, he emphasised the need for further expansion of processing capacity in the industry in order to enable it to produce a larger variety of processed goods, and warned that if the mill industry was not given its due share in expanding production facilities to meet the large anticipated future demand, a situation worse than what was witnessed today would have to be experienced by millions of consumers in India.

The reorganisation of the stock exchange envisaged under the new Act has been attracting considerable attention of late. When this Act comes into force, Shri M C Shah told Parliament, Bombay would no longer have two stock exchanges and hence the amalgamation of the Indian Stock Exchange with the Bombay Native Stock and Share Brokers' Association has become a matter of some urgency. Difficulties have arisen because of the wide differences in the terms and conditions of membership of these two trading bodies. If the parties do not succeed in reaching an agreement through negotiation, Government will have to intercede.

Cotton

Divergent Trends

THE slight improvement noticed at the close of last week proved in fact to be deceptive, as had been anticipated in these columns. There was little activity and prices continued to record new bottoms every day.

The market had set great store by export quota. The new Minister for Commerce and Consumer Industries had said earlier that an announcement would be made regarding the export of raw cotton "in a day or two". A Press Note issued early this week made it clear that Government was not in favour of releasing an export quota "at this stage when prices are high". To anyone who has been following the trend of cotton futures over the past few months, it would be news that present prices were high! In fact, not only has it been widely accepted for a fact that the price trend has been uniformly bearish for many weeks, it has also been contended that this has been mainly due to the by-laws which govern the current hedge contract and that the terms of the contract should be revised, if forward trading has to fulfil one of its primary functions, viz that of securing a parity between spot and futures prices. In the circumstances, it is asking too much to accept prevailing future rates as high.

Anyway, the trade has one consolation. That is, Government may relent a little and grant the long awaited export quota, if and when prices come down to the Government's idea of 'reasonable price level'. The pattern of trading during the week has demonstrated amply that the market was out to get the export quota! For, prices registered a landslide and the Jarilla contract which was ruling Rs 663 on November 19 succumbed to heavy selling pressure to register the lowest level of the season at Rs 629 on November 26th. The Vijay contract was also ruling distinctly weak in sympathy and recorded its lowest level during the week's trading.

Another interesting feature of the week was the gradual withdrawal of mills from the spot market, where activity has considerably dwindled and bases of spot and delivery contracts reflect the general weakness of the cotton market.

A notable development was the announcement of the policy in regard to the import of U S cotton. For the first time since the conclusion of the Indo U S Trade Agreement in respect of U S surplus farm products, the procedural details in regard to the import of American cotton have been released. The trade was relieved to find that there was no link between the import of U S cotton and that of East African cotton. Details in regard to the import of East African cotton are expected to be announced shortly.

development of industries, the Government has learned the hard way from experience. In the case of steel and cement industries, for example, it has now recognised that development has also to be provided for in the prices fixed for the products. An element has been added to the price where price control has been in force in order to pay for development.

If corporate savings in industries which are not intended to expand could be fully immobilised, one would not have to bother much for they could not then leak into investments which are not wanted and raise prices or aggravate shortages thereby. There is no guarantee, however, that corporate savings would not be used, directly or indirectly, and add to inflationary pressures. Hence the other and perhaps the more important proposal in the supplementary budget, for immobilising corporate savings through compulsorily deposit of a portion of the reserves of companies with the Reserve Bank. There is no mechanism by which such reserves could be kept out of mischief and yet be made readily available for approved uses. No measure devised for this purpose can be simple or frictionless. From a subsequent elucidation of his proposal for compulsory deposits, it does not appear that the Finance Minister fully appreciates the complexities that the proposal is likely to create. For one thing, it does not appear that industries can be divided into two broad groups, in one of which reserves could be left to be freely utilised by the companies concerned while in the other, they could be impounded until such times that the industry concerned is allowed to expand. Moreover, reserves whether earmarked for depreciation or maintained for strengthening the resources of the company in question, are never kept separate; they form in most cases a large part, if not the bulk of the working capital. Even if a part of these resources are to be compulsorily deposited with the Reserve Bank, the banking system, if not the Government, will have to assume the responsibility of finding the working capital of such industries. The Finance Minister is to be congratulated for having sensed the essence of the problem, but he has yet to present a scheme for its detailed operation before the workability of the measure can be judged.

By and large, the above proposals suggest that the Finance Minister is attacking only the soft spots of the economy where control can be readily exercised. Quantitatively, however, it does not amount to much, as will be evident when the yields from the proposed taxes and the volume of deposits expected are compared to the deficit which has to be covered.

Rising prices and rapid decline in foreign assets call for a two pronged attack. The indirect taxes that have been proposed are aimed at checking the latter. The foreign exchange deficit is too large, however, to be affected to any appreciable extent by higher import duties. The Finance Minister has been banking on substantial foreign assistance and it is possible that continuation of 'token' imports and imports of incentive goods—one does not know in which class to place the continued imports of luxury cars, albeit in knocked down condition—may be a necessary condition for getting such assistance. Except on some such assumption, it is not possible to make any sense of the present import policy which continues to allow non-essential imports when we are supposed to be making heroic efforts to build up the country and conserve all available foreign exchange for imports of essential capital goods. To what extent token imports help to improve the quality of domestic manufactures and nylon bush shirts, Tootal ties or Pyramid hand-kerchiefs help to enthuse our youth to greater efforts, need to be examined carefully.

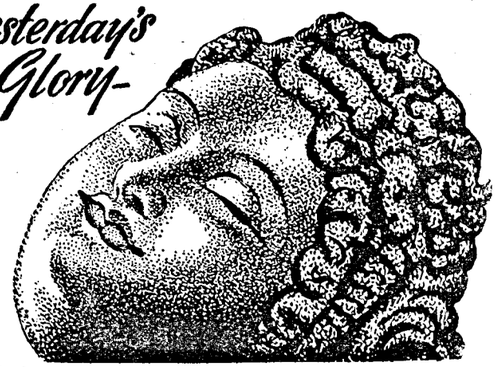
For the feed back process, which is the essence of developmental planning, it is immaterial whether resources flow directly into the desired channels of investment or they are routed to such channels via the exchequer. So it is not enough to mobilise the savings which are already accumulating; it is perhaps far more important to increase the total volume of savings, by restriction on consumption wherever such restriction is possible. If savings of the magnitude required for the successful implementation of the Plan could be realised purely through fiscal measures, the Government could do without vexatious controls and unwanted interference with the lives of the people. The Finance Minister seems to think that fiscal measures by themselves will do the trick and he will not have to expose his Government and his party to the approbrium of imposing obnoxious controls.

Even physical controls cannot be successfully operated without supporting fiscal measures. In view of the patent inadequacy of the latter and the Finance Minister's awareness of the magnitude of the problem, it is likely that the greater reliance is going to be placed on direct control on bank credit and that compulsory deposits are not the whole story. While the intention "to progressively reduce" deficit financing is to be welcomed, it is necessary to emphasise at the same time that restrictive measures, though inevitable and necessary, are not all that we required. The upsurge of money demand following deficit financing has also a positive role to play in inducing the flow of idle resources into production. The process needs to be strengthened by determined and systematic attack on the bottlenecks which develop and prevent the full realisation of the savings potential which lies dormant in an under-developed economy. Above all, it needs organisational effort to move resources to right uses.

This aspect of deficit financing and demand is apt to be forgotten. It can be seen clearly in the relative movement of sectional prices, particularly in the relative stability of the index of manufactured goods during a period of rapid rise of the index of food and raw material prices. Lately, however, prices of manufactures have also been tending to move up. This pinpoints the need to hold down wages, largely through a check on prices of wage goods. To release the savings potential in the economy, a systematic drive to organise production of consumption goods through techniques which do not make heavy demands on scarce resources has to be organised. It has often been talked of but has never been seriously taken on hand. The Finance Minister may have good reason to be allergic to village industry when the case for such industry is presented on narrow uneconomic grounds. In his search of savings, however, he can ill afford to neglect this potential source, particularly when the Government is committed to the decentralisation of the economy. Some day in the distant future we shall all be heroes. But the fight is here and now and the challenge becomes more and more insistent day by day. Why doesn't he grasp the nettle firmly by hand?

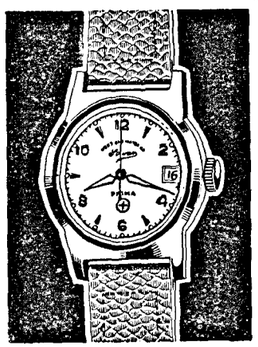
Two Ways to Peace

PAKISTAN'S Prime Minister is entitled to his logic. Mr Suhrawardy does not believe in a neutral foreign policy. In his opinion, a neutral foreign policy does not pay. India believes that this is the most realistic foreign policy for any country. Like Pakistan, India is anxious to win friends. But the Pakistani way of winning friendship is to enter into military alliances. Mr Suhrawardy justifies Pakistan's membership of SEATO and the Baghdad Pact on the ground that even the most powerful nations like America and Russia pursue a policy of military alliances such as NATO and the Warsaw Pact to win friends and to ensure security. There are two ways to peace. Military alliances have not eliminated the "cold war". Such pacts have, on the contrary, provoked local wars. Because military alliances are potential threats to peace, India follows a policy of good neighbourliness.



India cannot be unconcerned about her neighbour's foreign policy as Pakistan's membership of SEATO and Baghdad Pact are threats to peace in Asia. Mr Suhrawardy is not diplomatic in his defence of Pakistan's military alliances. He boasts that Pakistan's military alliances are, or will be, useful in solving disputes relating to Kashmir and Canal Waters. Precisely. This is the main justification behind New Delhi's stand that Pakistan's military alliances have completely changed the context of the Kashmir issue.

Mr Suhrawardy is not only blunt, he blows hot and cold in the same breath as he justifies Pakistan's policy of military alliances. He confesses that no country has aggressive designs against Pakistan. And yet, he argues that Pakistan will seek military alliances as long as there is the remotest danger from India to Pakistan's safety and territorial integrity. Those who are familiar with Pakistan's political and economic make-up will appreciate the Pakistani Premier's ulterior motives in fabricating such threats from India. Informed world opinion will not be impressed with this deliberate attempt to foster fear complex in Pakistan. India has no aggressive designs on Pakistan. But India and the outside world will be intrigued by Mr Suhrawardy's reference to Muslims in India as "my countrymen".



Mr Suhrawardy's undiplomatic outburst was obviously provoked by the acceptance of a Constitution by the Kashmir Constituent Assembly. Pandit Nehru's observations on the Kashmir Constituent Assembly's decision are appropriate. More relevant is the Indian Prime Minister's reaction to reports that Pakistan may again raise the Kashmir issue in the Security Council. It is more than time for New Delhi to inform the United Nations that Pakistan, an aggressor in Kashmir, is still in unlawful occupation of one-third of that State despite the UN Commission's original and fundamental directive that Pakistani troops must first be withdrawn from Kashmir.

Then, and only then, can the latter processes envisaged by the UN Commission be implemented by India. It is equally urgent that India must make it clear to the Security Council that Kashmir and the refugee exodus from Eastern Pakistan are inseparably related issues. In recent months, Pandit Nehru has shown realism in his approach to India's relations with Pakistan. There will be hope that India's representatives to the United Nations will put forward an informed and just defence of India's policy to Pakistan.

Yesterday's Glory-

To-day's Pride!

SOWAR PRIMA CALENDAR 10½"
Rs. 185

Indian tradition of quality going back over the centuries and glorifying the Indian builder can be seen to-day in varied designs and exquisite stone carvings throughout the length and breadth of India. It is this same tradition of quality that has made the name 'West End' famous for over three-quarters of a century for watches that not only look hardy in construction but are truly accurate time-keepers combining good looks with reliability. It is no wonder then that many to-day are proud of their West End Watches.

'T END WATCH CO.
BOMBAY CALCUTTA

its growth. "In the circumstances, the best bet lies in setting up a Government sponsored construction corporation." Among the advantages he claimed for it was the adoption of cost-plus-a-fixed-fee type of contract. Dr Sen did not think that a single corporation would fill the bill and wanted the first to start with private collaboration rather than as a 100 per cent State enterprise. But he did not rule out the latter form. On the contrary, he suggested, if two such types function side by side, it would be possible to compare their respective performances and gain valuable experience for deciding which would be the right organisation for the future.

Shri Kunwar Sain also welcomed the proposal, not because he particularly favoured the cost-plus-a-fixed-fee basis of contract but on the ground that such a corporation would be able to cut through the present dilatory departmental procedure and work more efficiently. He particularly welcomed it because the experience of such a corporation would provide a healthy check on the rates quoted by private engineering firms.

There were no two opinions, however, that such a corporation was necessary in view of the limited number of contractors and the huge volume of work remaining to be taken up. The Seminar, however, left it undecided whether it should be a company or a corporation, obviously meaning by the latter a statutory public corporation, though it insisted that whatever form be chosen, it should be an autonomous body, free from Governmental interference, except in matters of policy. It should function like any other construction firm and compete with contractors, corporate bodies or individuals on equal terms, although naturally as a national undertaking, profitability of its operations would not be the primary consideration governing its development.

"Character Roll" of Students
Maintenance Suggested

Patna, December 3.

Shymnandan Sahay, Vice-Chancellor, Bihar University, has suggested the maintenance of a character roll of every student in colleges to serve as a guide to the Government in making appointments in the services.

He was addressing a meeting of the University Senate here on Friday. He said that indiscipline in the recent past frequently disturbed the even tenor of academic life.

It should be impressed on the students that their conduct and behaviour in the college would have a decisive effect on their career, he added.

Shri Sahay also suggested that the University should refuse permission to a student to appear for examinations if his character was unsatisfactory.

"What the university is supposed to impart is education and not merely literacy or scientific knowledge," he said.

He also called for the intensification of extra-curricular activities in the colleges to direct students' energies to proper channels.

Shri Sahay said that every teacher should be entrusted with a group of about 20 students and he should keep an eye on the day-to-day activities of those placed under him.

—PTI message

Real specialists in this sort of thing may be found among the K M T cadres in Formosa. Why not obtain their services under some sort of technical assistance? Considering the outcome of K M T work on national character control in China generally, perhaps, if some such programme as this is adopted in India, it would be well for people like Shri Sahay to start buying property in the Andamans.

Letters to the Editor

"Britannia 320"

WE were interested to read your article "Farnborough and Indian Airlines" in the September 29th edition of The Economic Weekly and, in particular, the statement that "The Britannia is designed for larger distances than India would require".

May we put before you some facts and figures concerning the Medium Range Britannia 320? This would seem to be an ideal aircraft for operating over the air routes of India by virtue of the capacity, speed and economy it offers over both long and short ranges typical of airline services in your country. It will be available to airline operators in 1958.

The Britannia 320 is economical over sector distances from 200 miles upwards. Capacity payload of 28,000 lb can be carried over stages of up to 2440 statute miles including full reserves and fuel allowances. at an average True Air Speed of 390 mph. This aircraft has accomodation for 79 first-class seats, four abreast, including a rear lounge for six people. Alternative seating arrangements provide for up to 133 passengers in a coach class configuration. In addition there is provision for 790 cubic feet of cargo in the under-floor holds.

An analysis of the operating costs of the Britannia 320 shows it to be profit-making even on very short sectors such as the Allahabad-Gaya route. For example, on first class services over this sector, a passenger load factor of only 63 per cent is required to break even on Total Costs. Over a longer route, such as Calcutta—Bombay, this figure would be reduced to as low as 34 per cent.

Your article states that the aircraft required for trunk services in India must be capable of cruising at 350—450 mph, have an efficient stage distance of 500—1500 miles and must be capable of holding up to 100 passengers in tourist class seating.

We therefore feel that the statement "so far Britain has not produced an aircraft which is in any way suitable" is a little misleading since the Britannia 320 would appear to meet, and in fact better, these requirements.

Consumption Multiplier

I HAVE no comments to make on Mr B C Desai's letter in the issue of November 24 except to remind him with reference to para 4, that, inspite of himself, he agrees with me and not with the authors of 'consumption-goods multiplier' when he says that "starting from the investment end (is) more logical."

Obituary

Bhimrao Ramji Ambedkar

BEFORE he died, Ambedkar fulfilled his vow of leaving, with his followers, the Hindu fold. No one will ever know what impelled him to take the refuge of the Buddha. Was it because Buddha's philosophy fascinated him as it fascinates many a modern intellectual? Was it his doctrine of compassion that attracted him or was it because he found in Buddhism a symbolic and living refutation, more symbolic than living, of the injustice in Hindu religion and society against which he had fought all his life with such intrepid courage, persistence and steadiness? Partly the key to the riddle of Ambedkar's personality, the strange qualities in him that endeared him so much to his own community and aroused such political antagonism in others would be found in the answer to this question.

It was years ago that Ambedkar had publicly declared his firm resolve to forsake Hinduism. For a time after making this announcement, he toyed with the idea of getting himself and his followers converted into the Sikh religion. Khalsa College in Bombay was the product of his flirtations with the Sikh leaders in this period. Then followed dallying with the Congress when Ambedkar joined the Cabinet as the Law Minister and drafted the Constitution. This was work after his heart. Then followed something of no less importance—the Hindu Code Bill. But he could not see through the legislation to reform Hindu society for the Bill which he sponsored had to be dropped, despite the support promised for it by Pandit Nehru. This resulted in his break with the present Government, and much unpleasant mutual recrimination. Frustrated, Ambedkar fell back on his old resolve, which he carried out in the end. But it did not bring him any sense of fulfilment. He had faded out from politics and died prematurely, a frustrated man.

Who had done more for the Harijans, Ambedkar or Gandhiji? The question sums up Ambedkar's achievements and failures.

No public figure in recent times had so many facets to his character as Ambedkar had. A brilliant student of economics, Ambedkar collected more academic honours abroad in his own subject than perhaps any of the academic luminaries of his times. Forsaking economics for law, he acquired an enviable reputation as a jurist which led him later to the first Indian Cabinet after Independence. It was a scholarship by the late Gaikwad Sayaji Rao which enabled Ambedkar to study abroad, in London and Columbia. But his return to Baroda was not the proverbial home-coming of one who had won laurels abroad, and on the very first night of his stay, he was hounded out from his hotel by an angry mob which objected to a Mahar polluting the sanctity of Hindu society. Such incidents in the life of a highly placed, England returned Indian of his status must have been rare even in those days. Social status and occupation cut across caste and untouchability. That has been the tragedy of the untouchables. Those among them who progress in education and move up the economic ladder, usually forsake them. But iron had entered Ambedkar's soul, and though he also succumbed, like others, to the ambivalence of marrying outside his community and living a life appropriate to his status rather than his birth, he made the cause of Harijans his own and served it with unflinching devotion. Ambedkar believed in education as the ultimate solvent of social injustice and conflict. He was a rationalist, scornful of poverty and the outward exhibition of saintliness.

Then why did he turn to formal religion at all? Or oppose conversion of Harijans to Christianity which would have removed the stigma of untouchability, and brought them both economic and political advantages under the British administration. Here perhaps his spirit shone and his sturdy self-respect stood firm as a rock. The fight that Ambedkar took up is long and unending for he had no illusion that economic betterment or political reform could be a final solution to the problem of social discrimination which lies at the root of untouchability. For he was not fighting against superstition alone or outmoded customs but for a basic truth which has to be lived by every individual. A just economic system and right laws can only create the conditions for such a life; they are no substitutes for it.

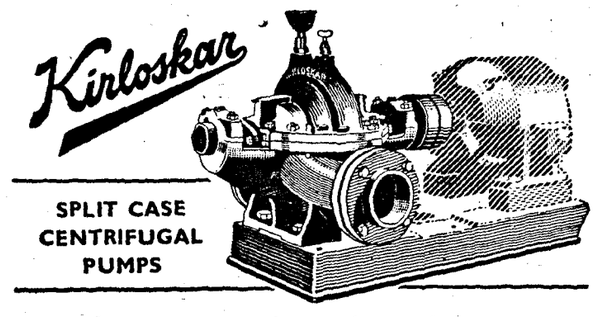
Our Delhi Letter

More Trucks on the Road

INDIA is likely to take a big stride forward in the motorisation of its economy. The full picture would emerge in a month's time when the Government announces its decision on the Tariff Commission's enquiry into the automobile industry. There are, however, pointers that increased production, dieselisation of commercial vehicles and extension of cheap credit to road operators would be the main prongs in the Government's drive to double the annual offtake of motor vehicles. The Second Five-Year Plan envisages that indigenous capacity for production of cars and trucks should increase from around 29,000 in 1955 to 59,000 by 1959-60. The Ministry of Commerce and Industry had suggested a five year target of 65,000. But the indications are that the five-year target would be approached in the second year of the Plan with an output (and assembly) capacity of nearly 60,000 trucks, cars and jeeps by the end of 1957. As a result of the recent measures taken by the Government, output had attained the annual level of nearly 36,000 cars and trucks by the middle of this year and is expected to rise up further by the end of 1956. The Ministry of Heavy Industries has begun to make direct allotments of raw material quotas, including wrought iron, sheets, plates and coal, to the various producing units. This will continue.

In 1953, the Tariff Commission submitted a report on the future development of the automobile industry. The Government decided to implement the recommendations of the Commission. This meant that only six firms with definite manufacturing programmes of production within the country were allowed to continue in operation and the other six firms engaged in assembly had to cease operations within a period of three years.

The approved firms have made considerable progress in the direction of indigenous manufacture. The Hindustan Motors are producing 65 per cent of the total content of their Hindustan Landmaster cars and the Premier Automobiles are producing nearly fifty per cent of the parts that go into the assembly of their Dodge and De Soto trucks. The Standard Motors, however, lag behind with a comparable figure of five per cent and the Tata-Mercedes-Benz with 12 per cent.



The Tariff Commission's report, already submitted to the Government, has made recommendations on the fair ex-factory prices of various types of motor vehicles produced in the country and the method of readjusting these prices as an increasing number of components are manufactured in the country.

It is certain that the Government will not permit an increase in the number of manufacturing units. The automobile industry has crushing overheads and an expansion of the number of manufacturing units would result in the creation of uneconomic establishments. This is the reason why the recent East German offer to manufacture 4-passenger 10 horse power cars at a selling price of Rs 4,000 to the consumers has been turned down. Nor are negotiations with the manufacturers of BMW cars in West Germany, which put forward a similarly attractive proposition, likely to bear fruit.

The Government, however, is keen on dieselisation. Negotiations are therefore proceeding with the Ford and International group of American automobile manufacturers for the setting up of capacity for the manufacture of their diesel trucks in the country. While Ford truck engines may be manufactured in Madras in partnership with the firm of Perkins, the Hindustan Motors in Calcutta may change over to the manufacture of International diesel trucks from Studebaker petrol trucks.

These are still in the stage of negotiation. An important aspect of the negotiations relates to the extension of credits. If Fords agree to give a credit of, say Rs 10 crores to their Indian counterparts, the latter, in turn, could extend hire-purchase terms to actual operators. Thus all-risk and third party insurance on the trucks would be deposited by the borrower with the manufacturer who would be reimbursed for the cost of the vehicles over a period of years in instalments drawn from the profits of operation. This method was used extensively in many European countries for the motorisation of transport and is likely to succeed in raising the offtake of commercial vehicles in India where capital with the small operators is scarce.

Alternatively, the Reserve Bank of India might be approached for a bulk credit to the manufacturers for working the scheme.

Sturdy construction and efficient performance for many years have made KIRLOSKAR Centrifugal Pumps extremely popular with agriculturists and industrial concerns all over the country. Available in sizes up to 5,000 gallons per minute.

From the London End

European Free Trade Area

TO the Government benches, the Commons' debate on the European free trade area was a most welcome relief from the agonies wrought by the Suez adventure. The broad support of Labour for the policy of the Government was, according to the **Financial Times**, "the most interesting feature" of the debate. Other organs of Conservative opinion generally interpreted the broad agreement in this country as a "significant indication" that Suez did not irretrievably "disrupt national unity" as was originally feared. And yet the quickening tempo of British policy to this question appears to be indubitably the result of the Suez crisis. The patent indifference (and virtual contempt) with which the United States had initially treated Anglo-French pleas for oil supplies has forced the British Government "into Europe"—and this decision appears to possess all the features of being irrevocable. The Conservative acceptance of the principle of a European common market must, therefore, be understood to be the result of its growing anti-Americanism. And yet this acceptance contains a crucial (and publicly recognised) contradiction which in the present circumstances can only be resolved by the astutest of compromises. How can Britain, in the words of the Chancellor, "harmonise the interests of Britain, the Commonwealth and Europe"?

The First Stage

In the present discussions, the term "free trade area" appears to imply a somewhat modified form of Customs Union or Common Market. A Common Market in the contemporary understanding of the term includes not only all the features of a Customs Union but also the free and unrestricted movement of capital and labour between the countries participating in the market. A Common Market is, therefore, the first stage towards the ultimate economic (and possibly political) countries. It is presumed in the integration of the participating European scheme that the common market will require the setting up of a supra-national authority concerned with the pursuit of a common financial policy, foreign trade and monetary policy and policies concerned with wage rates, industrial location, social services and so on. A free trade area in contrast presumes an arrangement between countries to establish a greater degree of trade co-operation between themselves by a phased reduction in tariffs and of discriminatory import restrictions and no more. An examinaton of all the statements that have so far been made by representatives of the British Government make it clear that the portended free trade area would not require each country to do away with its tariffs completely. Nor would it require each of the participating countries to pursue a common tariff policy towards countries outside the area. A free trade area can possibly mean that a greater level of trade can take place for any one group of commodities rather than for all commodities as would be visualised in a Customs Union or Common Market.

Common Market Scheme

Such a description of a free trade area naturally takes most of the glitter out of the present discussions. The countries of Western Europe are, however, pursuing a policy which has possibilities of taking the free trade movement considerably beyond the scope to which the U K authorities are prepared to commit themselves. It is therefore, well to examine the background to the Continental European and British schemes.

At the Messina Conference of June 1955, the Ministerial Council of the European Coal and Steel Community decided to establish a committee under the chairmanship of the Belgian Foreign Minister, M Spaak, to formulate proposals for the creation of a European Common Market and an organisation for the administration of atomic energy utilisation. The Spaak committee's final report was made available in May, 1956. It set out the fundamental rationale for the intended Common Market and outlined certain concrete proposals. The report proposed that a maximum period of 15 years would be required for the complete abolition of all internal customs tariffs. It stated that the tariff policy of the member countries would be unified and a common tariff vis-a-vis third countries would be established. In the initial stages all the participating countries would abide by the OEEC for the liberalisation of quantitative trade controls and that subsequently, all such controls would be abolished. With regard to agriculture, certain transitional provisions would be necessary in view of the wide variation of the stages reached in the agricultural development of each of the member countries. The implementation of the proposals, it was recognised, would bring about various dislocations and here, the Spaak committee proposed that a fund should be established for investment and for the re-adaptation of redundant workers. Various institutions would be set up to organise and administer the Common Market.

The Politics of it

The need for urgent examination and acceptance of the proposals was underlined by the Spaak committee by reference to the broader facts of the economic and political situation. It stated that:—

"While on the one hand, the United States in almost every sector is producing one-half of the world's goods and on the other the Communist countries, numbering a third of the world population, are increasing their production annually by 10 or 15 per cent, Europe, which once had a monopoly in the manufacturing industries and could count on its overseas possessions for considerable resources, now finds its external position weakening, its influence declining and its capacity for progress diminished by internal divisions".

The political factor in the Spaak committee proposal must thus be seen as an integral part of the common market scheme. In July last, when the French Assembly agreed (by vote) for the continuation of negotiations for a Common Market treaty, M Mollet, the French Prime Minister, suggested that European integration was the only road for France in view of the fact that "confronted by the American and Russian colossi, no European country, Britain not excepted, can hope to make its weight felt and its voice heard in isolation".

Lest Britain Misses the Bus

Throughout the post-war period Britain had persisted in deluding itself that its status and power was

only matched by those of America and Russia. The United Kingdom therefore, did everything in its power to prevent the full realisation of West European economic and political integration. For a time this obstructionist policy proved somewhat successful. With the now full operation of the ECSC and the determined manner in which Continental Europe is pursuing the Common Market proposals, a change in British policy and approach has become inevitable. Now, when the Spaak committee has been entrusted with the task of drafting a treaty on the Common Market, the UK has come to realise that events in Europe have by-passed its own policies. The Times now states that "it is important for Britain to get into these discussions before the European countries have made their own compromises."

British Counter-proposals

The contradiction referred to earlier has now reached the point where a solution of some sort must be found. The Chancellor of the Exchequer indicated in the Commons debate that the Spaak committee proposals had received the "sympathetic consideration" of the Government and more important, "the Government has reached a point of presenting its own proposals to the Continental European countries as a basis for negotiations". It is recognised that should a Common Market be brought into existence (without British participation) then three critical developments, unfavourable to the UK are likely to take place. First, the Common Market will necessarily discriminate against British exports destined to the countries of Continental Europe. This must be considered to be a matter of sufficient seriousness as British trade with Continental Western Europe amounts to 25 per cent of its total exports and 23 per cent of its total imports. Secondly, the Common Market will, in the course of time, become a major competitor to Britain in non-European markets, and finally, the establishment of a European Common Market without Britain can mean the emergence of new economic power grouping in Europe with Britain's relative status considerably diminished.

The British counter-proposals attempt to meet these points without at the same time, enabling an immediate realisation of the Spaak committee proposals. The scheme for a free trade area as envisaged by Mr Macmillan will be a gradual one and it is doubted "whether 1957 will see the end of the negotiations." The treaty, which the Chancellor of the Exchequer has in mind is one under which "European tariffs will disappear over a period of 10 or more years". It envisages a number of important provisos which may very well take the essence out of European thinking on this matter. For example, the abolition of tariffs and quantitative controls over imports would be subject "to the proviso that they may be restored temporarily at any time by a country faced with balance of payment difficulties." The British free trade area idea further envisages the complete exclusion of all foodstuffs and other agricultural products.

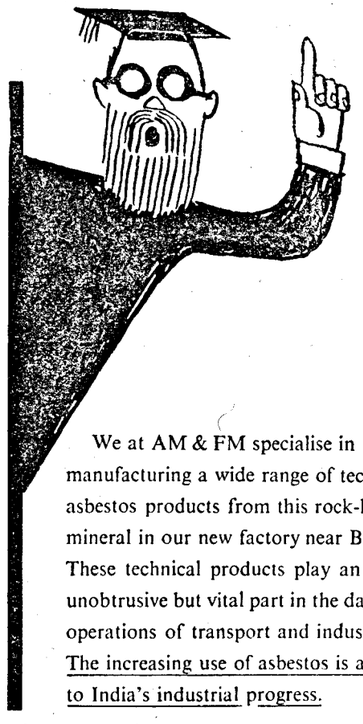
Fear of Isolation

This, it is stated can be a basis on which the harmony of the interests of Commonwealth and Empire to that of the portended free trade area can be ensured. Many people in the UK are however, coming to recognise that the continued defence of imperial preference is no longer the key to the cohesion and unity of the Commonwealth. As the **Economist** recently pointed out, many of the Commonwealth countries who wish to develop their economies, "want to buy machinery in the cheapest market". This often means the "lowering of tariffs on American machinery'. Further, many Commonwealth countries have varied their own trade policies with little reference to either the prerequisites of imperial preference or to the effects of such policies on Britain's foreign trade. There have been occasions in the past when the Australian authorities have subjected their imports from all sources to the most rigid controls in spite of the open knowledge that such controls impinged upon Britain's export programme. On the other side of the picture is the gradual realisation on the part of many Commonwealth and Empire countries that Britain no longer provides a stable market for raw materials.

It is this recognition which now forces the Labour opposition in Britain to suggest that cohesion of Commonwealth and Empire in the present situation can best be served, not by imperial preference but by bulk purchase of raw materials and foodstuffs and by long term contracts with the overseas sterling area. Nevertheless, the absence of similar economic interets between the overseas Commonwealth countries and the UK has made a number of prominent commentators conclude that all talk of imperial preference in the present situation is of little significance. The Banker put the matter in the following way :—

> "The world markets would be divided into the dollar bloc, the Communist countries, the West European Community—and what remains of the Commonwealth group. Pulled between the move of the newer dominions towards republicanism and independence and the inevitable attraction of Canada towards the realities and philosophy of the dollar bloc, the Commonwealth group—or rump—would stand in splendid but dangerous isolation".

The trend of the Parliamentary debate as well as the public discussion indicate the inevitable movement of Britain into Europe. This movement, is however, being hedged by virtue of the obvious differences in reconciling the fundamental interests of many of the overseas sterling area countries with those of Britain. The Suez crisis has however, put the seal to British doubts. The weakening links with the Commonwealth, the reality of the British alliances with the United States, the virtual collapse of Britain in the Middle East and Asia generally and the unpredictable nationalist movement in Britain's African Colonies bring into focus the inexorable path that Britain must hence tread. That path leads to Europe and nowhere else.



Tata Locomotive Dividend

THE Directors of the Tata Locomotive & Engineering Company Limited have decided to recommend to the Annual General Meeting the payment of the following dividends:-

1) Arrears of dividend on the 5% Cumulative Preference Shares
2) A dividend at 5% per annum on Preference Shares for the year ended 31st March, 1956
3) A dividend at 6% per annum on Ordinary Shares for the year ended 31st March, 1956.

Note: The dividend on Preference Shares will be subject to deduction of income-tax.

"Hydrated Magnesium Silicate..."

...a fibrous mineral possessing resistive properties to combustion, corrosive liquids and other chemical and physical phenomena. ...or just asbestos...one of the most useful minerals known to man. It is made up of millions of tough, thin, tightly-compressed fibres, and is acid and fire-resistant.

We at AM & FM specialise in manufacturing a wide range of technical asbestos products from this rock-like mineral in our new factory near Bombay. These technical products play an unobtrusive but vital part in the day-to-day operations of transport and industry. The increasing use of asbestos is an index to India's industrial progress.

Where There's Industry There's Asbestos

Some Economic Aspects of Large-Scale Farming

A N Sharma

THE present study is based on the case histories of 12 large-scale farms varying in size from 60 to 350 acres. Two of them are situated in Agra, four each in Mathura and Aligarh, and one each in Etah and Mainpuri Districts. These farms were selected to present the prevailing situation of large scale farming in the Agra Division of Uttar Pradesh. However, their selection was governed also by the response of farmers and the availability of farm records with them. The enquiry was conducted during 1955-56. The frequency of visits to these farms was, in most cases, three, and in some cases four. Information was collected by personal interviews, during which a schedule of enquiry was filled up.

Table I shows the size and location of the farms.

There are two approaches in the study of a combination of enterprises in farming; the area basis, and the income basis, i e, the percentage of area devoted to different crops or the percentage of income received from different crops, expressing the relative role of the different enterprises. We approach the problem in both the ways.

Table I—Size and Location

Case No.	Location: District	Location: Village	Owner	Size of Farm (acres): For crop cultivation	Size of Farm (acres): Garden area
1	Agra	Achhnera	Shiv Prasad Agarwal	200	10
2	Agra	Kailash	Chhidulal Bhargava	80	16.6
3	Mathura	Chhatikara	Rao Krishna Pal Singh	200	10
4	Mathura	Annoda	Ram Rakhash Pal Singh	70	—
5	Mathura	Jagdishpur	Kr Girvar Singh	60	15

COMBINATION OF ENTERPRISES

Area Approach

In the case of large scale farming the general expectation is that there is, and should be, considerable specialization and commercialization. About specialization, it is said that at least 40 per cent of the area should be under one particular crop, or at least 40 per cent of the income should be from one source before a farm can be called a specialized farm. Judged from this standard we find that on the whole (taking the total of the 12 cases) there is no specialization since the maximum percentage comes to 32.59 per cent under wheat closely followed by sugar-cane in which the area is 15.68 per cent. See Table II.

This paper is a brief adaptation of the thesis submitted by the author to the Agra University for the degree of M Sc (Ag) in May, 1956.

Fodder Crop	13 (3.08)	9 (2.90)	4 (0.43)	26 (1.63)

Table III—Annual Gross Income from Various Sources

(1954-55)

(Income in Rs % in brackets)

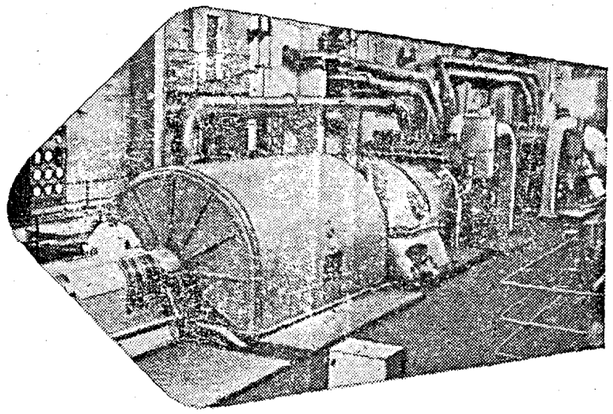
Case Nos.	50—100 acres: 2, 4, 5, 7 8 & 12	100-200 acres: 9 & 11	Over 200 acres: 1, 3, 6 & 10	Total of 12 cases
A—Kharif Crops				
Paddy	—	—	1400 (0.9)	1400 (0.04)
Jowar	2839 (2.42)	1994 (1.32)	1823 (1.20)	6656 (2.1)
Bajra	3584 (3.05)	2555 (3.33)	3510 (2.32)	9649 (3.34)
Maize	2813 (2.39)	3465 (4.00)	2586 (1.71)	8864 (2.56)
Til	256 (0.13)	—	975 (0.64)	1231 (0.38)
Sugarcane	23030 (19.62)	25880 (33.78)	59886 (39.66)	108796 (32.36)
Cotton	736 (0.61)	—	8790 (5.75)	9526 (3.6)
Arhar	777 (0.66)	625 (0.81)	1316 (0.87)	2718 (0.9)
Urd	432 (0.36)	—	340 (0.22)	772 (0.2)
Moong	740 (0.63)	176 (0.23)	751 (0.49)	1667 (0.4)

Taking the farms individually we find that in farms Nos 3 and 8, 42.86 per cent and 41.30 per cent respectively of the total area are devoted to a single crop, wheat. In all the remaining cases the percentage devoted to different crops nowhere approaches the standard mark. Taking all farms together wheat is found to have been given a remarkable preference over other crops (col V, Table II).

It is significant therefore that farming even in such cases remains largely of the traditional type of grain cultivation, and has almost the same degree of diversification. Inspite of most of these farms being suitably located, i e, enjoying good transport facilities and the proximity of cities, these farmers do not take to growing vegetables or market gardening.

The Income Approach

The income method yields the pattern shown in Table III.



The largest single source of gross income (taking the total of the twelve cases (Col V, Table III), is sugarcane —32.36 per cent, closely followed by wheat —29.57 per cent. Other crops form very low proportions. The percentage under vegetable is only 12.74 out of which potato contributes 6.50. The share of gram and barley is only 3.55 per cent and 3.18 per cent respectively. Gardens yield a very small income 2.65 per cent only. The highest percentages of gross income in the Kharif season are received from Cotton, Bajra, Jowar and Maize 3.6, 3.34, 2.1 and 2.56 per cent respectively.

The Choice of Enterprise

A break up of the data according to the size of farms (arranged in three groups, as shown in the Tables II and III) conforms to this general pattern with but minor variations. Besides, so far as market gardening is concerned farms under group I seem to have some area under it and the larger farms are concentrating more on cereal cultivation. The area under sugarcane (39.65 per cent) in the case of group III is influenced by the special circumstances of case No. 6 which supplies cane to Dubra Sugar Mill. However, the degree of diversification in the case of farms between 50 and 100 acres is amazing.

Thus, even in the case of large-scale farming the present study shows that the choice of enterprise has been largely governed by custom and tradition. Diversification

and not specialization is still the dominating character. The most important cause of this was found to be the problem of marketing, which prevents these big farms from combining dairy or market gardening with other farming. The other causes for diversification are: as a check against natural hazards, and for a more balanced land-use. But while diversification guards against natural hazards or risks to some extent, it also increases the market or trade risk because farmers have to deal in small quantities of a large number of commodities and the price fluctuations in the case of all those commodities must affect them.

The Idea of Efficiency

Efficiency is most rigidly defined in the field of mechanics where it is used to describe the ratio of useful work, or effect produced, to energy spent in producing it. With some modifications, the same idea may be carried over to economics and business. Broadly defined it is the relation of output to the input complex of labour, equipment etc. And greater output per unit of input is another way of saying increased efficiency when we refer to increased production by greater economy in the use of productive agents.

It is generally believed that bigger the scale of operation greater the productive efficiency. The same belief is held in agriculture, and it is proposed to examine this here.

Some of the accepted measures of efficiency could not be adopted in this case as the necessary data were not available for these farms. We, however, adopted three methods found to be most convenient under the circumstances, and the details are as shown in Table IV.

Table IV—Costs and Returns in Relation to the Size of Farms

Case Nos	Net cropped area (acres)	Total cropped area (acres)	Operational costs (Rs per acre)		Gross returns (Rs per acre)		Profit or loss per acre on net cropped area	
			On net cropped area	On Total cropped area	On net cropped area	On Total cropped area	Profit (Rs)	Loss (Rs)
1	200	220	233- 5- 1	222- 1-11	216- 3- 9	196- 8- 9	—	19- 1- 4
2	80	100	247- 9- 1	198- 0-11	308- 3- 0	246- 0-10	60- 9-11	—
3	200	216	197- 2- 8	182- 9- 1	179- 3-10	161-15- 0	—	17- 8-10
4	79	79	227- 7- 7	227- 7- 7	179- 9-10	171- 9-10	—	55- 7- 2
5	60	79	210- 0- 5	151- 8-11	218-13- 1	191- 6- 2	38-12- 3	—
6	240	248	226-12- 1	218- 7- 1	214- 9- 4	202-10-11	—	12- 2- 9
7	80	88	213-12- 2	194- 5- 3	281-10- 4	256-14- 0	67-13- 2	—
8	80	84	169- 4- 7	153- 4- 3	245-15- 8	223- 5- 0	75-11- 1	—
9	120	140	168- 9- 9	168- 6- 9	214-12- 3	234- 4- 6	46- 3- 9	—
10	210	220	202- 3- 4	193-13- 3	132- 0- 5	126- 0- 4	—	70- 2-11
11	200	200	179- 9- 7	129- 9- 7	254- 2- 9	254- 2- 0	74- 9- 2	—
12	76.4	92	233-10- 5	193- 9- 0	311-14-11	252- 4- 0	78- 4- 6	—
Average	135.4	144.5	208- 7- 4	193- 9- 8	219- 0- 9	204- 7- 4	10- 9- 3	—

In order to have a clearer idea the twelve cases are grouped below in three size-groups :

Table V—Size Groups

Size Groups (Acres)	No of farms.	Operational cost on net cropped area (Rs per acre)	Gross return on net cropped area (Rs per acre)	Net profit or loss	
				Profit (Rs per acre)	loss (Rs per acre)
50 - 100	6	217- 2- 5	359-10- 9	42- 8- 4	—
100 - 200	4	197- 9- 1	216- 3-11	4- 8- 7	—
200 - 300	2	210-12- 7	175- 1- 1	—	35-11- 6
All farms	12	208- 7- 4	210- 0- 9	10- 9- 3	—

The popular feeling that costs decrease with size is not confirmed by these data. On the whole operational costs per acre on the basis of net cropped area and total cropped area are seen to be Rs 209-10-0 and Rs 194-3-11 respectively. The gross return per acre on the basis of net cropped area is Rs 221-5-11, and of total cropped area Rs 204-6-9. Together these twelve farms made a profit of Rs 11-11-1 per acre during 1954-55. Seven farms made profits and five suffered losses. The maximum profit was Rs 78-4-6 per acre in case No 12 and maximum loss was Rs 70-11-2 per acre in case No 10. The minimum figure for profit and loss were Rs 38-12-7 in case No 5 and Rs 12-2-9 in case No 6 respectively. **There is no co-relation between the magnitude of profit and loss and the size of farms.** From Table V we find that the largest group suffered loss and the other two groups made profits. The maximum profit was, however, made by farms of 50-100 acres. The largest farms suffered loss because part of the area was not fully developed on which the yield was comparatively low.

It may be concluded that the most efficient or the most profitable farms are found to be of the size of 50-100 acres. Larger farms appear to be less efficient. This is mainly due to two factors:—

(i) Supervision becomes less effective as the size increases. For example, in case No 1 which is of 220 acres, considerable produce was stolen away due to lack of supervision.

(ii) Some of the agricultural operations get delayed in larger farms. Agriculture requires timely performances of all its operations, and delay in some of them affects the yield adversely. It was observed that on comparatively larger farms in some cases the operations get delayed.

The average yields per acre for the most important crops, covering about 70 per cent of area, obtained during 1954-55 were as follows:

Table VI—Crop Yields in Relation to Size of Farms.

Size groups	Average Yield (Mds per acre)					
	Wheat	Sugarcane	Gram	Barley	Bajra	Jowar
50 - 100	13.50	380	10.5	9.0	7.6	9.1
100 - 200	10.50	375	7.5	10.0	7.75	8.9
200 - 300	11.50	300	6.0	5.0	8.5	9.0

Table VI reveals that the farms of 50-100 acres gave the best results. For wheat this group averaged 13.50 maunds whereas the other two groups got only 10.50 and 11.50 maunds. In the case of Sugarcane, Gram and Jowar, farms of 50-100 acres got the highest yield. In the case of barley farms of 100-200 acres got the maximum yield and only for Bajra the maximum yield recorded was by farms of 200-300 acres. Case No 11 got an exceptionally good Barley crop and Case No 10 an exceptionally good Bajra crop. These are, however, exceptions and should not be considered. On the whole the farms 50-100 acres are seen to give the best yield.

Crop Intensity and Size of Farms

The procedure adopted in calculating the index of crop intensity is: The net cultivated area has been taken as 100. To this we have added the double cropped area and the area under such crop mixtures which mature and are reaped at different times and yield equally significant incomes as in the case of Jowar and Arhar, Bajra and Arhar, and Wheat and Mustard. The case of such mixtures like Wheat and Barley, or Jowar and Bajra are of different nature and such mixtures should be treated as a single crop for such purposes and no further addition be thus made. The total figure thus arrived at is taken as the total cropped area for which an index on the basis of net cropped area is calculated. The following results have been obtained:

Size groups		Index of Crop intensity
I	50 - 100 (Acres)	110.12
II	100 - 200 ,,	107.10
III	200 - 300 ,,	104.00

Group I (50-100 acres), the smallest of the three, shows the highest index of crop intensity and as the size increases the index declines. This shows that (i) on the larger farms land is not being put to the maximum use, and (ii) for increasing the total farm business activity intensification is a better remedy than larger size.

Income and Expenditure According to Time

Agriculture, like other activities, requires finance. The requirement varies with the intensity of farm operations, and there are certain peak and slack months of demand. Since these farmers do not keep proper accounts, it was not possible to find out the income and expenses in different months. However, detailed discussions with them gave the picture as outlined below.

In July the demand for capital is large for manuring, ploughing, and sowing of kharif crops, whereas the only source of income is from vegetables and the stored rabi crop. In August, the requirements go down with fewer operations when income is only from fodder crops. The requirements rise in September when the fields are prepared for rabi crops. Organic manures are used, but the income is more or less constant.

Expenses go down slightly in October in comparison with the previous month because the harvesting of kharif and sowing of rabi start in the last week, but the income increase as kharif crops are ready for sale. The demand for finance again rises as both these operations are done in November and also because one irrigation is given to the wheat crop. The income also increases in this month. Very little money is required in December and so is the case with income.

The demand again rises in January as the fields are prepared and sugarcane is sown in the latter part. The financial requirements become

more acute as the proportion of farm income becomes less in comparison with the expenditure, and this continues upto April. In these months some money is required from outside. Money is needed in February as Arhar is irrigated and wheat is weeded.

The demand for money again rises in March when harvesting of wheat and Arhar begin. The wage rates are nearly 1½ times more than those in the previous months. In April and May the demand remains comparatively low as winnowing and thrashing start. Income increases in April from the sale of rabi crops, but the maximum income is received in May. Again, on the farms where summer ploughing is given the demand for money is great in June, otherwise it is a bit easy. The above is illustrated in Table VI, where we give data (from another large-scale farm—the B R College, Bichpuri farm of 436 acres) for which detailed figures were available.

Table VI—Income and Expenditure of B R College Farm (Bichpuri) 1954-55

Month	Expenses		Income	
	Rs	%	Rs	%
July	9412-12- 9	13.6	13485-15- 6	18.1
August	3929- 5- 9	5.4	659-15- 3	0.9
September	7443- 1- 6	10.3	4783- 0- 0	6.4
October	6224- 4- 3	8.6	3995- 5- 0	5.4
November	7445- 8- 0	10.3	17857-13- 0	26.2

How banking serves the COIR INDUSTRY

INDIA is the world's chief producer of coir and coir products, her yearly output being around 130,000 tons. More than half this output is exported, earning about ten crores of rupees in foreign exchange. The coir industry, which is exclusively South Indian, is concentrated in Malabar and Travancore-Cochin, and employs over six lakhs of workers.

Banking has greatly helped in the rapid growth of this industry. The facilities and guidance of a good bank, such as the availability of ready funds when needed, and the collection of dues in any part of the country, are an essential part of good organisation in the coir industry.

We at Palai are proud that so many leading coir goods manufacturers of South India employ the complete banking service we offer.

Current Accounts — Demand Drafts — Telegraphic Transfers — Investments — Letters of Credit — Bill Collection — Deposits — Loans & Overdrafts—Confidential Credit Reports, etc.

★ ★ ★ ★

If you have business interests in the South, it will pay you to open an account with us. Our 25 branches are strategically located, 23 in important South Indian business centres and two in Delhi and New Delhi ; and we have correspondents in all important Indian cities. We offer a fully comprehensive banking service at each office

Our clients can make deposits at any of our correspondent banks, situated in all important Indian towns, and have the amounts credited to their accounts at any of our branches.

A LEADING BANK IN SOUTH INDIA

Small Scale and Cottage Industries in Punjab

Ved Prakash

ECONOMIC development requires a continually expanding output of agriculture. The increase in agricultural output cannot come from new land, of which there is very little. Higher output has to be obtained through more intensive and more efficient cultivation. As development is accelerated, there could even be a reduction in the absolute numbers engaged in agriculture.

Industrial output has increased by almost 50 per cent in the last five years, but there has been little increase in industrial employment. Although mining railways, construction and urban trade have absorbed fairly large numbers they have made little impression on the occupational pattern as a whole. While agricultural production has increased by about 20 per cent in the last five years and though this has reacted beneficially on the quantum of work available in the rural sector, it can hardly be expected to reduce visibly the surplus of man-power on land.

Under these conditions, if per capita income in the agricultural sector is to keep pace reasonably with income in the other sectors there must be a steady diversion of people from agriculture to other occupations. The adequacy of our Plans must therefore be judged in terms of the opportunities they open out for employment in non-agricultural activities.

In Punjab whose economy has been unbalanced since partition, miseries of which are too well known to need recapitulation, where pressure of population on land has been mounting, the development of small scale and cottage industries has definitely checked the growing menace of unemployment and ushered in all round prosperity. The number of factories, and workers employed have increased to 2,311 and 54,250 in 2955 from 600 and 37,486 respectively in 1947. These figures are swelling day by day. 2,600 small units have come into being, a good number of them sponsored by enterprising refugees from Pakistan.

The small scale industries which have made a mark, are described below:

Cycle Parts Industry

Cycle parts industry can easily be stated to be the representative of small scale industries of Punjab. It is estimated that there are about 300 manufacturers giving employment to 6,000 workers and producing on an average cycle parts etc worth about 160 lakhs. To provide technical assistance to factories of cycle parts a Finishing and Testing Centre have been set up at Ludhiana. A number of concerns have started manufacturing complete cycles of quality comparable to imported goods. The Atlas Cycle Company, Sonepat, which produces about 250 bicycles per day finds a ready market.

Sports Goods Industry

India at present manufactures about Rs 1 crore worth of sports goods of which Punjab alone accounts for Rs 65 lakhs or 65 per cent.

Sports goods industry is mainly located at Jullundur and partly at Batala. The industry provides employment to 3000 persons. There are 150 units which manufacture a variety of sports goods, viz: cricket bats, hockey sticks, tennis rackets, footballs, shuttle cocks, sports nets and requirements of carrom, chess, golf, billards etc.

In 1955-56 sports goods worth Rs 64 lakhs were produced out of which goods worth Rs 47 lakhs were exported. The badminton rackets found a good market in the foreign countries. The sports goods industry at present, suffers from paucity of raw materials like willow, mulberry, etc. Plans have been launched to provide for growing these trees. The Government of India proposes to establish an industrial extension centre for the development of sports goods industry at Jullundur. Groups of small scale units will be set up. These units will be provided with accommodation for workshop and residence on a hire-purchase basis or on rent and with electric power and water at reasonable rates. Loans will be advanced to the units for their working capital.

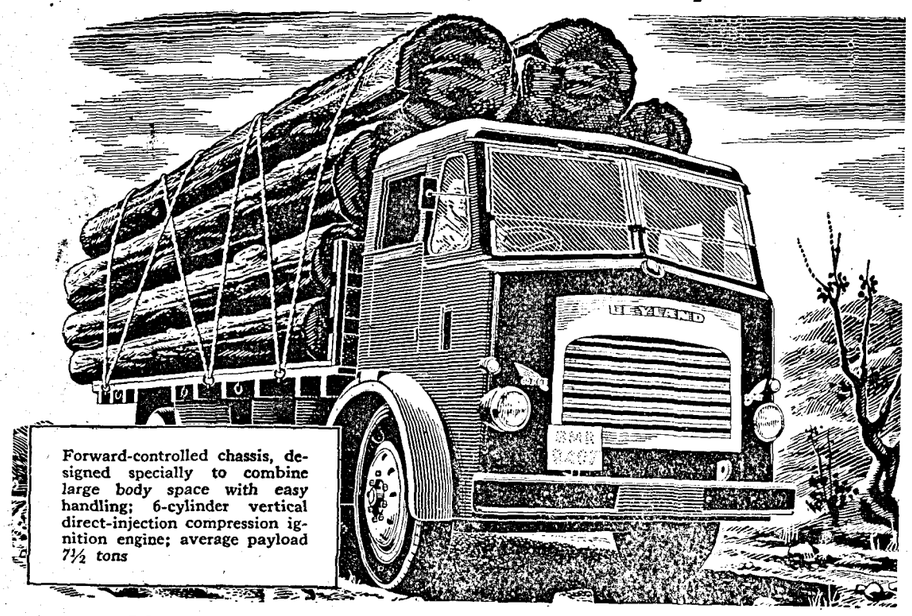
These small scale units will be set up around central workshops which will guide the units through qualified technical persons in the improving both technique of production and quality of products. The workshops will also undertake purchase and distribution of raw materials disseminate marketing information and help the units in the procurement of orders and their execution.

Light Engineering

Light engineering industries include manufacturing of chaff-cutters, crane-crushers, iron presses grinders, ice-freezers, juice extractors, ball bearings and agricultural implements. Chaff-cutters of Batala are known throughout India. About 5,000 crane-crushers are made annually which have a good home market. A number of small concerns at Batala, Goraya, Phillaur, and Ludhiana are engaged in making ball-bearings, weighing machines, hand saws, persian wheels, plough chains, agricultural implements, lathes, drills, cotton crushers etc. There are 250 units of production giving employment to 5,000 workers and the value of goods produced is Rs 1 crore.

Hosiery Industry

The name of Ludhiana is associated with this industry. Out of 873 factories engaged in hosiery goods in India, 803 factories are located in Ludhiana. More than 80 per cent of the total production of woollen hosiery goods in India is accounted for by two centres, Ludhiana and Dhariwal. The hosiery factories are installed with 2,50,000 machines. Punjab also manufactures some of these machines. The state substantially meets the demand of most Indian factories. Raschel looms, hydro-extractors, glove fabrics machines, steam calendars, bobbin winders, Jacquarel sinker body, under wear machines, hose machines and their spare parts, etc are some of the machines which are manufactured.



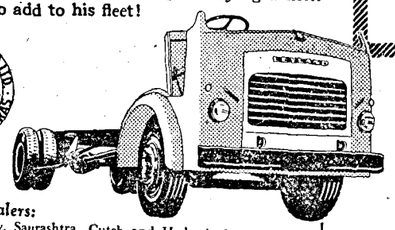
Metal Industry

All types of domestic utensils and articles, requiring high mechanised skill are produced for local, inter-State and export trade. The chief centres of production are Jagadhari, Ludhiana, Jullundur, Amritsar and Rawari. About 1,850 individual units of these industries in the State provide employment to 17,000 workers.

Handloom Industry

Handloom industry is the largest of small scale industries of the Punjab. On its welfare depends the prosperity of Punjabis, as it has greater employment potential for

More than 2,00,000 miles – and this LEYLAND 'COMET' runs smoothly as ever!



Forward-controlled chassis, designed specially to combine large body space with easy handling; 6-cylinder vertical direct-injection compression ignition engine; average payload 7½ tons

It's the only 7½-ton payload chassis made in India!

Mr. Jagadeeshwariah, well-known Secunderabad operator, bought his first Leyland 'Comet' five years ago. "This chassis has now covered over 2 lakh miles and it has proved to be extremely reliable and economical. I unhesitatingly recommend that there is no finer vehicle obtainable today," he says. Mr. Jagadeeshwariah now has four 'Comets', and is thinking of buying a *fifth* 'Comet' to add to his fleet!

The Leyland 'Comet' passenger chassis offers *extra* reliability and safety. Special springs for more comfortable riding. Choice of two models. Widely used by State Governments, Municipalities and leading firms and organisations.

the rural population, at present under-employed. There are 51,889 handlooms in the State which can provide employment to about 65,000 persons.

The handloom industry is chiefly located in Hoshiarpur and Amritsar districts, though fairly distributed all over the Punjab. Hoshiarpur and Amritsar handlooms specialise in cotton fabrics, like curtain cloth, shirtings, coatings, chaddars, dhoties khes, garhas, duries, towels, dusters, lungies, etc and artificial silk products such as shirtings, saries, lungies, boskies, etc. Blankets, lohis, shawls, and carpets are the important woollen goods which are produced in Panipat, in the Karnal ditrict and in Kulu sub-divisions of Kangra District.

Sericulture Industry

Sericulture industry affords a fairly remunerative occupation to the rearer and the reeler. It is a seasonal industry being subsidiary to agriculture. The rearing is done once a year from February to the end of April. About 700 maunds of dry cocoons worth about Rs 21,000 are provided at present in Punjab from its 1,00,000 mulberry trees. The Department of Industries arranges to supply disease-free seeds, provides guidance in the art of reeling and assists planting of the right variety of mulberry trees on large scale. Thirty thousand saplings of Japanese mulberry were imported for the first time through the Central Silk Board from Japan. A demonstrative and experimental farm at Sujanpur in Gurdaspur District has also been started for conducting research. The climate of Punjab is conducive to the rearing of silk worms.

Handicrafts

There are a number of crafts in which the craftsmanship of Punjabi workers have found expression e g ivory carvings, ivory inlay, artistic copper, brass and metal wares, pottery, wood carvings, lacquer goods and several varieties of textile fabrics, shawls, and carpets etc. Many of these handicrafts which suffered a set-back due to partition are fast recovering.

Other industries like leather goods, laundry soaps, radio arial machines, table and ceiling electric fans, sewing machines and cottage match industry are also making rapid strides.

The secret of being the pioneer and spearhead in these industries lies in the encouraging help provided by the Punjab Government to the producers. Government has set aside Rs 3.54 crores and 2.18 crores for the development of small scale and cottage industries respectively. The importance of industrial cooperative societies for small scale and cottage industries was recognised for improving techniques of production, qualitative improvement in designs and creating markets. A Deputy Director of Industries has been given the powers of Deputy-Registrar, Cooperative Societies, for effective coordination of industries and the cooperative department. The societies are organised by the Industries Department for efficient working, but the actual working is left to non-official promotional bodies. Trade associations, have been formed under the guidance of Industries Department to solve jointly their problems like marketing, standardisation of products etc.

State Aid

The State has started industrial areas at Ludhiana, Jullundur, Sonepat, Panipat, Bahadurgarh and Jagadhari for rehabilitating refugees. One such area has been earmarked in Chandigarh. An individual can get plots on hire-purchase or rental basis and Government will make available factory buildings according to requirements of the entrepreneurs on a rent of four per cent of the cost of the factory building. The allottee can purchase the land and factory building during the period of lease: the land at market price and the factory buildings at depreciated value. Loans will be made available for machinery up to fifty per cent of the cost.

These concessions are in addition to the financial assistance already available for small scale industries in the industrial areas where loans, upto Rs 50,000 are advanced to purchasers of plots under a scheme which obviates the necessity of mortgaging immoveable property. Besides all this there are work centres at Jullundur, Ludhiana, Panipat, Sonepat, Rohtak, Hissar employing about 6,000 workers daily. The work centres provide vocational training in short courses of a few weeks.

The Industries Department has a stores purchase organisation at Jullundur which patronises individual industries with a price preference of 10 per cent for the goods required by various Government departments. The price preference scheme should be stopped and the State government should order for the entire purchase of goods produced by local factories only. The State Government has selected, in consultation with the Legislators and Deputy Commissioners of the districts, three villages in each tehsil for intensive development of village and small scale industries. Besides, the Batala Community Centre, comprising about 400 villages, has been selected for intensive development of the cottage and small scale industries. Here, it is proposed to develop the handloom industry by setting up dyeing houses and by advancing working capital, improved looms and accessories, weavers' cooperatives.

Quality Control

To improve sales in the country and exports to foreign markets, the Punjab Government has started the Quality Marking Scheme. The Scheme is already in operation at Ludhiana and Batala for the hosiery and agricultural implements industry. Under the scheme, standard goods are given quality stamps. With the introduction of this scheme, sales have registered a marked increase. The Quality Marking Scheme is proposed to be extended to cover the furnishing fabrics industry at Panipat, the furniture industry of Kartarpur, sports industry of Jullunder, etc.

The Government of India will set up Industrial Extension Centres at Batala, Jadadhari, Ambala and Jullundur. They will operate under the Small Industries Service Institute, which was sanctioned for Ludhiana in April 1956 by the Central Government. It is in the process of being established. The four extension centres will deal with specific problems of sports industry at Jullundur, machine-tools and agricultural implements industry at Batala, metal utensils industry at Jagadhari and scientific instruments industry at Ambala. Technical knowledge will be provided to these industries through these extension centres. Another important facility which will be provided through the extension centres is that of common servicing for respective industries. This will remove the existing handicap of the small units which cannot afford the outlay required for extensive machinery.

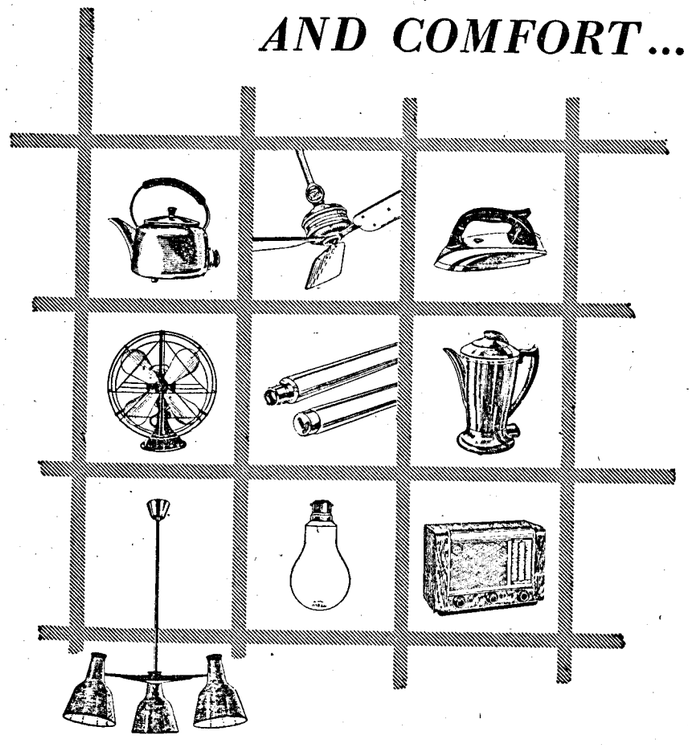
To facilitate owners of small units who do not have the necessary

financial backing to instal additional machinery, the National Small Industries Corporation at the instance of the Union Government has started the Hire Purchase Scheme. The benefits under the scheme will be available to all small scale industrial units using electricity and having a capital investment of less than Rs 5,00,000. Equipment under this scheme will be available on easy terms of payment at an interest of 5 per cent over a period not exceeding 8 years. Initial advance deposit, ranging from 20 per cent to 70 per cent will have to be deposited for procuring the machinery on hire purchase basis.

The State Bank of India is also introducing pilot schemes for provision of credit through banking institutions. Ludhiana has been selected as the Pilot centre. The purpose of the Pilot Project is to examine and recommend how credit to small industries by various agencies—the State Bank, the State Financial Corporation, Cooperative Banks, Commercial Banks and Government sources—can be most effectively provided and coordinated.

The Reserve Bank of India has agreed to make credit facilities available to the handloom industry at two per cent through the medium of State Cooperative Banks. Government has also agreed to guarantee a portion of the losses, if any, and to subsidise handloom weavers at not more than three per cent interest.

With the reorganisation of States on November 1, PEPSU has been integrated with Punjab. Not only have the different tax barriers been eliminated but the market has also been enlarged. All these, together with the encouragement of both the Central and State Governments will go a long way in developing the small scale and cottage industries of Punjab and provide much needed new employment to the people.



Bombay State Financial Corporation

THE Financial Corporations established under the State Financial Corporations Act, 1951, for the former States of Bombay and Saurashtra have been amalgamated. The Central Government has, after consulting the Governments of former Bombay and Saurashtra States, constituted a Board of Directors of the Corporation for the new State of Bombay for such matters as were, necessary to give effect to the amalgamation. The amalgamated Corporation will be known as the Bombay State Financial Corporation and will serve all the areas of the new Bombay State.

There were no Financial Corporations in the territories of the former States of Kutch and Madhya Pradesh, which have now come over to Bombay State. The Financial Corporation for the former Hyderabad State has been transferred to Andhra State.

The head office of the Financial Corporation will be at Bombay and there will be a branch office at Rajkot. The authorised capital of the Financial Corporation will be Rs 4 crores, divided into shares of Rs 100 each. Issued and paid-up capital will be Rs. 2 crores. Shares of the Financial Corporation shall stand guaranteed by the Government of Bombay as to the repayment of the principal and the payment of annual dividend at a minimum rate of 3½ per cent.

From the Chair

The Great Eastern Shipping Company Ltd

Speech of the Chairman, Mr A H Bhiwandiwalla

THE following is the speech delivered by Mr A H Bhiwandiwalla, Chairman of The Great Eastern Shipping Co Ltd at its Eighth Annual General Meeting held on 6th December 1956:—

Gentlemen,

It is my annual pleasure to welcome you at this meeting and speak to you on the shipping industry in general and the working of your Company in particular.

The Directors' Report and Accounts of the Company have been in your hands for sometime now and with your permission I shall take them as read. The results as you know, are satisfactory. The Report and Accounts contain a mass of statistics on the working of the Company, and I do not propose to inflict them on you here again.

The good results derive largely from our tramping activity and the expansion of our agency business. The year under report also saw the epoch-making acquisition by the Company of the first-ever tanker purchased by Indians. Another noteworthy feature of the Company's activities is its contractual commitment to carry 70,000 tons of rice from Burma to India on Government account. After the end of the financial year and in less than six months, the Company's ships have carried almost the entire 70,000 tons of rice.

Tramping Business

Your Company has taken active interest in tramping right from the commencement. The adventurous and enterprising spirit with which shipowners have been imbued from the dawn of history attains its high water mark in tramping. Your Company had to face competition of an international character from well-established foreign shipowners; this is an implicit challenge in tramping business. Owing to ignorance and apathy on the part of Indian shipowners, as well as the Government in this country, about the importance of tramping business and its requirements, we had to face not only lack of co-operation, but actual hostility and obstruction, in the form of numerous restrictions that were placed on our "freedom of the high seas". **The position has improved with the Government's recognition of the role of tramping in the country's economic life.** I am, however, sorry to say that the majority of Indian shipowners interested in the liner trade have not yet, to say the least, appreciated its significance. Liners and tramps are like two wings, each equally indispensable to the life and growth of India's shipping industry.

In view of this prevalent bias against tramp shipping, the Government has been influenced and swayed by the liner interests and prejudices, and conditions for the creation and growth of the tramp fleet in this country have not been established. It is hoped that the Government will consider the matter dispassionately and allow the same freedom of operation to trampowners in this country as is enjoyed by successful tramp-owners in other maritime countries.

Economics of Shipping

There is a lot of confusion and far from clear thinking about the economics of shipping in this country. In normal peace times and in the absence of emergencies, the maximum operational efficiency and the optimum utilisation of tonnage should guide and govern the employment of ships. There is nothing sacrosanct about the carriage of India's exports or imports in Indian ships. What matters is the rapid growth and development of Indian tonnage plying on the high seas. This can only be brought about if the Government does not interfere with the employment of vessels and permits tramp operators to follow considerations of operational efficiency and gainful employment which will assist the rapid expansion of the merchant fleet. If some of the Indian ships do not carry part of India's imports or exports, the country will no doubt have to pay the freight charges in foreign currencies. But the Indian ships, which are more gainfully employed in other trades, will earn more foreign exchange than will be paid to foreign ships for carrying part of India's imports and exports. It is the net difference in foreign exchange that matters. The astonishingly rapid progress made by Norwegian and Greek shipowners in recent years would not have been possible if the Governments of those countries had imposed the restrictions which are fettering the Indian tramp operators at present.

Time-Chartering

The Government restrictions on letting out Indian ships on time-charter to foreigners have acted as a restrictive influence on expansion of Indian tonnage and foreign exchange earnings without doing an iota of good to the country. If an Indian shipping company wants to expand rapidly it must make sure of gainful employment of at least some of her ships for a period of time. Time-chartering out of ships provides this sort of employment for an assured period and makes the shipowner immune from the risks of fluctuations in the freight market. With such a hedge he can afford to take the risks of the freight market by building and or purchasing more ships at the prevailing high level of prices in the place of those chartered out. Moreover **tramp operators have to judge the freight market** and at times to cushion off the risks of a fall in the market by letting out some of their vessels on a time basis. The only difference between letting out a ship on a time basis and fixing her for a voyage is the difference between the wholesale selling of freight and the retailing of freight. Whilst the Government has no objection to the retailing of freight, it has prohibited wholesale selling of freight to the great detriment of the shipping industry. May I earnestly appeal to those in authority to examine this question dispassionately and exempt at least tramp operators from the restriction on letting out of their vessels on a time basis?

Importance of Tramps

We ploughed a lonely furrow and preserved when the sun was not shining so brightly on the tramp trades. We carried wheat in bulk from West Australia to India at 55 Shillings per ton as compared with today's rate of 140 Shillings. Our shipowner friends then said "Tramps are a dying breed". What do we find today? Tramps are flourishing at present more than liners. The post-war development of shipping

proves that countries which stuck to liner services only have increased their tonnage at a slower pace than the countries engaged in tramping. My appeal therefore to all concerned is not to pass a hasty judgment on the comparative usefulness and importance of tramps and liners. Both tramps as well as liners have their respective roles to play in the development of shipping and tramps are far from being either a dying or a useless breed.

M. V. "Jag Laxmi"

I am pleased to inform you that from occasional tramping we have advanced a stage further and have formed a permanent nucleus of ships for our tramp activities. Our present tramp fleet consisting of s s "Jag Vijay", m v "Jag Laadki" and s s "Jag Shanti" will be considerably strengthened by the addition in February 1957 of the largest cargo ship on the Indian registry viz, mv "Jag Laxmi" of 12,080 tons deadweight, which will be completed and delivered to us by a Japanese shipyard. The earnings from tramping have contributed a good deal to the satisfactory results achieved during the year under report.

Let me however utter a word of caution. Tramping is very susceptible to trade cycles. Booms and depressions alternate much more intensively in this line of shipping. It is therefore most important that a tramp operator should consolidate and strengthen his position in good days in order that he comes out unscathed in bad days which inevitably follow in their wake. It is hoped that the Government will create a suitable climate in which tramping as well as liners can flourish side by side and accelerate the development of Indian shipping. May I reiterate that I have nothing against my friends in the liner trades and it is my conviction that both liners and tramps must understand each other and live together.

Agency Business

With the securing of the agency of the Hellenic Lines Ltd of Piraeus and New York, your company's agency business has grown considerably. During the calendar year 1956 we shall have handled more than 100 ships as agents at Indian ports. The vessel of the Hellenic Lines with their sailings from Indian ports to the USA ports, the vessels of the Yamashita Line and a number of other tramp operators have brought considerable revenue to the Company and have added to the earnings for the year under report. The growing tendency on the part of foreign shipowners to entrust their agencies in India to nationals of this country is a welcome development. Your company being a shipowner itself, is ideally placed to look after the interests of foreign shipowners at Indian ports, and render first-class service. This has not only meant better business and full satisfaction to these principles, but has also ensured improved revenue and better returns to you. This agency business has also enabled your company to establish valuable contacts and cement mutually remunerative business relationships, besides providing valuable experience in new trades and lines.

Tanker "Jag Jyoti"

The 12th of April 1956 will rank as a memorable and eventful date in the history of Indian shipping, because it was on this day that the first-ever Indian-owned tanker was acquired by your Company. The Transport Minister's recognition of this pioneering will have heartened and thrilled you. The tanker has been chartered out to the Standard Vacuum Oil Company for carriage of refined products on the coast. The teething troubles have been overcome and your company is gaining very valuable experience in this new line.

In fact your Company wanted to purchase a second tanker. Instead the Government has acquired a tanker for their Shipping Corporation. With the acquisition of these two tankers, I am glad to say, the country has just made a beginning in this vital branch of shipping. With increasing industrialisation and mechanisation of agriculture and the rise in the standards of living, the demand for oil is bound to grow up considerably. The country will therefore need a sizable fleet of tankers for the carriage of crude oil from oil producing countries to India and distribution of refined products on the coast. A good beginning in the carriage of crude oil to India can be made by the building and acquisition of two supertankers of 36,000 tons deadweight each. Although it is announced that the Government proposes to acquire and operate further tankers in the public sector, I for one cannot believe that it is the Government's unalterable intention to exclude private enterprise from the task of nation-building in this important field. I therefore request the Government to dispel the doubts and declare categorically that it will change its policy towards acquisition of tankers or super-tankers by Indian shipping companies. The building up of a tanker fleet will require considerable funds and I hope that the Transport Minister will be successful in his endeavours to secure additional allocation of finance for shipping.

Rice from Burma to India

With the rise in the international freight market, the Burma-India Conference which was catering to this trade and which included some foreign shipping companies, folded up its tent and declared its inability to cover this berth except at fantastic freight rates. It was the same Conference which had prevented in the past young Indian Companies, like ours, from participating in this trade monopolised by their members on the pretext that the berth was adequately covered by their members and therefore they could not allow outsiders to participate in this trade. When the members of the Conference declined to lift this vital movement of rice from Burma to India, your Company approached the Government and assured them of our willingness to co-operate in the essential movement of rice from Burma to India at reasonable freight rates. Subsequently, I am glad to say, Indian shipping companies undertook to lift 3 lakh tons of rice from Burma to India in six months at freight rates which were 20 to 25 per cent lower than those indicated by the members of the Conference. Your Company has almost fulfilled its commitment for the carriage of 70,000 tons of rice ahead of others and has thus established its claim to a 25 per cent share in this trade.

Coastal Trade

It will please you to learn that the fulfilment of your Company's commitment to carry Burma rice did not adversely affect the liftings on the coast. Unlike others, your Company chartered outside tonnage and ensured that the carriage of coastal cargoes in the Company's vessels was not adversely affected. In fact our coastal liftings amount to a quantity which could only have been lifted by the engagement of all our owned vessels in the unremunerative coastal trade. It is a creditable achievement especially because your Company, like other companies, could well have diverted

some of its coastal tonnage to the Burma-India rice trade without bothering to charter additional tonnage at the present high charter rates. In view of the uneconomic freight rates on the coast, any diversion from the coast brings in some sorely needed relief. However, your company resisted this common temptation and has continued to maintain its coastal liftings.

Uneconomic Coastal Freight

The uneconomic coastal freight structure can be evidenced from, among other things, the extremely slow growth in coastal tonnage as compared with overseas tonnage. In fact no one can afford to buy, for coastal operation, ships at today's very high level of prices and high costs of operation and run them at low and uneconomic freight rates. The Government's persistent refusal to permit a commensurate rise in the coastal freight rates has administered a setback to the cause of Indian shipping. If the Government had conceded economic freight rates in time, shipping companies would have acquired additional tonnage for coastal operation at reasonable prices at the most opportune time. It is no use now crying over spilt milk and let us hope that the Rail-Sea Co-ordination Committee which has examined this question thoroughly will recommend to the Government the necessary increase in the coastal freight rates, so as to bring them to an economic level.

Transport Bottleneck

The inadequacy of the coastal tonnage in relation to the cargo offering for coastal movement will be greatly aggravated with the progressive execution of the Second Five-Year Plan and enormous increase in the quantum of cargo that is expected to be moved by coastal vessels. We feel sure that the rising tempo of various schemes and projects under the Second Five-Year Plan will bring about a transport bottleneck in the country. The Railway and road transport will not be able to handle all the increased traffic and the coastal movement by sea may be expected to increase progressively from 3 million tons to about 5 million tons per annum. Meanwhile a number of old coastal vessels may have to be scrapped. The problem of replacement and expansion of coastal tonnage therefore assumes great urgency and importance.

Your Company was among the first to be seized of this problem. The freight rates on the coast, even allowing for any increase that may be recommended by the Rail-Sea Co-ordination Committee and accepted by the Government, cannot bear the extremely high cost of new or secondhand tonnage. This is because in the ultimate analysis the coastal freight structure is bound to be influenced by the railway tariff. The railways carry an overwhelmingly large proportion of the country's internal traffic and the coastal freight rates therefore cannot be far out of step with the railway rates. The shipyards of the world are fully booked and delivery of new ships cannot be expected under 3 or 4 years. Second-hand tonnage is extremely scarce and the very few ships that are offered are quoted at fantastic prices.

Liberty Ships from USA

My colleagues on the Board, Mr Vasant J Sheth toured the UK, the USA, Europe and Japan to see if any way could be found out of the prevailing tonnage crisis. He found that the only country which could assist India is the USA with her mothball fleet and her generous tradition of assistance to under-developed countries. On his return to India, the Company decided to pursue the matter earnestly and deputed the Company's former General Manager Dr Sen to the USA. For four months Dr Sen persisted in his skillful advocacy of India's dire need for ships, which could only be met by the release of liberty ships from the mothball fleet of the USA. The Government of India and the Indian Ambassador in America Mr G L Mehta lent their weighty support and made their good offices available to Dr Sen. After protracted negotiations and conferences with various Executive Departments of the US Government, Dr Sen felt confident of their support of enactment of suitable legislation for the release of liberties from the Mothball fleet to India. However, because of the impending elections in that country, it was too late to introduce the necessary legislation. Now that the Administration has emerged successful in the elections, I have every hope that the necessary legislation will be passed shortly and that at least 12 liberties will be released to our country.

These secondhand liberty ships which, though aging, have been kept in good condition, are urgently required to augment our coastal tonnage in the transitory period and to avert a transport crisis. By releasing them now the US Government would have helped us before these ships run out their useful life and become obsolete in their stables. With the progress of the Second Five-Year Plan there is bound to be a very severe tonnage crisis on the coast. These ships will just help us tide over the crisis in our transport system and thereby assure the success of our Second Five-Year Plan. If the USA Government requires an undertaking that these ships would only be used for our coastal trade and not for competition with the US Liners, this may be given on a Government to Government level. It cannot be regarded as an unreasonable demand in view of the US Government's legitimate concern to safeguard their own interests. What is most important is that we must get going and save ourselves from being engulfed in a transport crisis. It is also clear that these ships could be utilised for the coastal trade only if they are released at the usual prices and not at the international level of prices. The coastal trade with its low freight rate structure will not be able to bear the incidence of the high international price level of ships.

Only U S Can Assist Us

In the conditions as they exist in the world today, we are sure that it is only the US Government which can assist a young country endeavouring to build and consolidate a democracy on foundations of unregimented economic planning and well-being. Other powers are in no position to assist our country in this direction. Our Prime Minister is visiting the United States and perhaps during his visit the release of US Liberties could be arranged. If the Government desire to pursue this vital matter we are prepared to send our representative to the States in order that he may be available on the spot for necessary consultations.

Your Company took the initiative and have put in considerable efforts for the release of liberties from the mothball fleet of the USA. Out of 12 liberties proposed to be released to our country, we can legitimately claim an allotment of six liberties for our coastal fleet. Three or four liberties will serve as timely replacements for the three or four coastal time-charters which will be expiring shortly and the remaining two or three liberties will be a welcome addition to our coastal fleet. Your

Company is prepared to finance up to 50 per cent of the cost of these ships from its own resources.

Port Facilities and Dock Labour

The progressive implementation of the Second Five-Year Plan would not only bring about an increase in the coastal movement by sea but will also increase the foreign imports of capital goods, machinery and raw materials into the country. The present port facilities in the country are woefully inadequate. Congestion at ports and delays to ships which are common even at present are on the increase. It will therefore be an impossible task to handle the enormously increased coastal and overseas traffic at the ports without a speedy and commensurate improvement and expansion of port facilities. Otherwise, I am afraid, we shall not only be unable to handle the increased traffic, but would also pay heavily for the limited traffic in terms of increased transport costs and waste of national tonnage as a result of dislocation and congestion at the ports. The Government would therefore be well advised to accord topmost priority to the improvement and expansion of port facilities.

The introduction of the piece rates in Bombay has had a salutory effect on the output and earnings of dock labour. It is essential that the piece-rate system should be extended to all the ports. It is hoped that increasing co-operation between employers and dock labour will improve the turnround of ships and will enable them to carry more efficiently the increased overseas and coastal traffic.

Fleet Expansion

Your Company started its operation in 1948 with one liberty ship which was acquired for about Rs 22 lakhs. At present the Company owns eight ships worth Rs 3.25 crores at cost and much more at market value. The three new ships which are on order will cost a further sum of Rs 3.75 crores. By the time this young company of yours is 11 years only, we shall have invested as much as seven crores of rupees in the Shipping industry and become owners of 11 vessels — a steady accretion of one vessel each year.

I have taken into account only the committed expansion programme of the Company. The allotment of liberties from the US mothball fleet and part of the expansion programme submitted by us to the Government in pursuance of the Second Five-Year Plan, have not been taken into account. We are still awaiting the Government's decision on our expansion plan submitted to them in February 1956.

Capital Structure

The initial paid-up capital of the Company in 1948 was a modest figure of Rs 20 lakhs. Since then your Company issued bonus shares twice, issued new equity shares of Rs 20 lakhs and preference shares of Rs 25 lakhs. The paid up capital of your Company thus stood on 30th June 1956 at Rs 85 lakhs, out of which Rs 60 lakhs was equity share capital and Rs 25 lakhs preference share capital. With the present issue of Rs 60 lakhs in equity shares, your total subscribed capital will rise to Rs 1.45 crores and subscribed equity capital to Rs 1.20 crores. Your directors took the decision to increase the capital not only because your Company was undercapitalised in relation to the cost of the fleet, but also because they wish to maintain a healthy ratio between the risk-bearing capital and loan liability of the Company to the Government.

Prospects

Our tramps are doing very well. mv "Jag Laxmi" which is expected to be delivered in February 1957 will operate for four months in the current year. The earnings from the operation of the tanker, agency business, Burma-India rice trade and 4 months trading of mv "Jag Laxmi" will also be reflected in the current year's results. Subject to unforeseen circumstances, therefore, I visualise a bright future for your company in the current year.

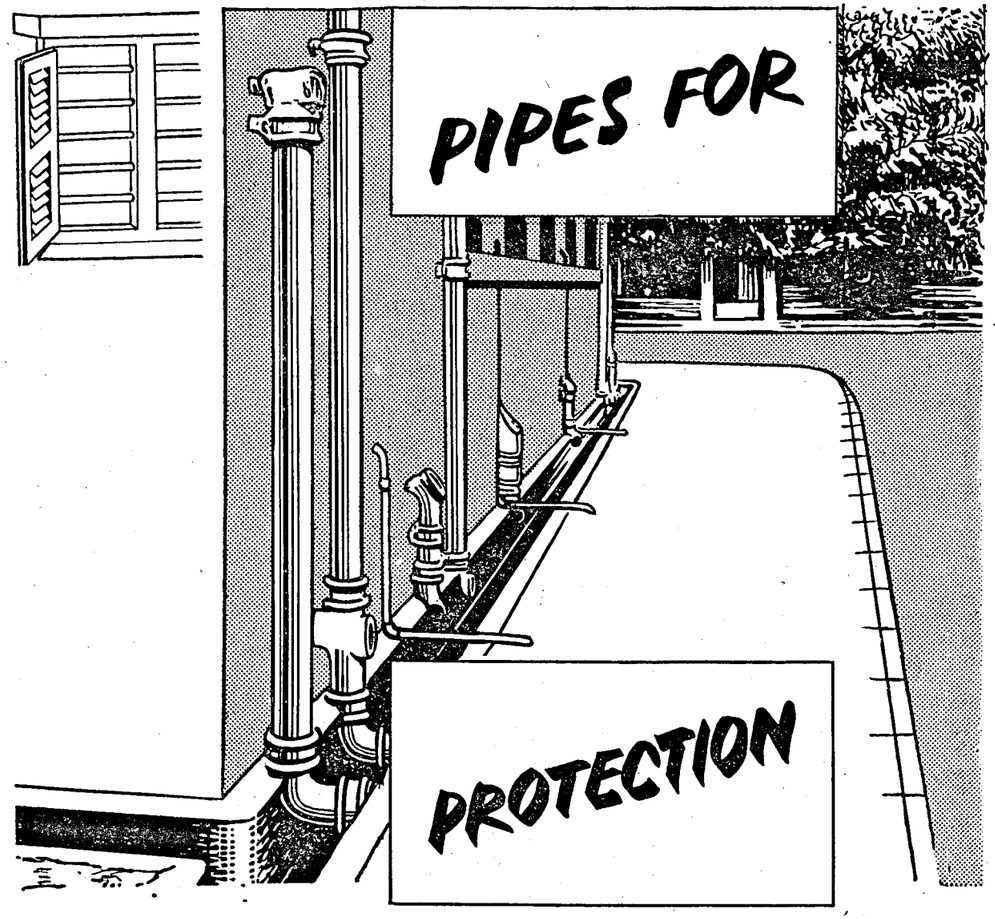
In the five months ending 30th November 1956, the gross freight earnings have been Rs 144 lakhs as compared with Rs 96 lakhs for the corresponding period during the year under report. If the remaining seven months maintain the promise of the first five months of the year, the gross freight earnings should reach the target of Rs 3 crores, as compared with Rs 2.11 crores for the year under report. On this assumption and in the absence of any unexpected setbacks or deterioration in trading conditions, it may be possible to maintain the dividend on the increased capital.

Government Assistance

I have time and again criticised those policies and actions of the Government which in my opinion, are retarding the development of shipping. By and large, however, the Government is endeavouring its level best to develop Indian Shipping by grant of generous loans and many other measures of assistance. The Transport Minister, The Transport Secretary, officials of the Transport Ministry, The Director General of Shipping and his staff have all continued to assist and promote the cause of Indian Shipping. Your company owes a deep debt of gratitude to them all. It is a rare experience that Government departments go out of their way and take the initiative in conveying useful information and providing valuable guidance to companies even on telephone. With such assistance from Government, I am sure, your Company will march forward to new milestones of progress and play its rightful part in what our Prime Minister aptly called "the mighty adventure of building a new India".

The news about the resignation of Shri Lal Bahadur Shastry as Transport Minister has been received with great regret by all and especially those who have first-hand knowledge of his sincerity and devotion to the cause of Indian Shipping. It is hoped that his qualities will be utilised in same responsible capacity for the good of the country.

Government Director



You will, gentlemen, undoubtedly wish me to extend a cordial welcome to Shri P. R. Subramanian, Senior Deputy Director General of Shipping, who has recently joined the Board of your Company as a Government Director. Mr Subramanian is an able officer with a long experience of shipping problems. His association will therefore be of great benefit to your Company.

Gentlemen, I am sure you will join me in expressing our well-deserved appreciation and thanks to the staff, both afloat and ashore, for their devotion to duty and the way in which they have shouldered increasing responsibilities as a result of the rapid expansion in the activities of the Company.

I thank you Gentlemen, for giving me a patient hearing.

May I now move that the Report and the Accounts for the year ended 30th June 1956 be and are hereby adopted?

Note: This does not purport to be a record of the proceedings of the Annual General Meeting.

Capital Gains Tax and the Tax on Bonus Shares

I S Gulati

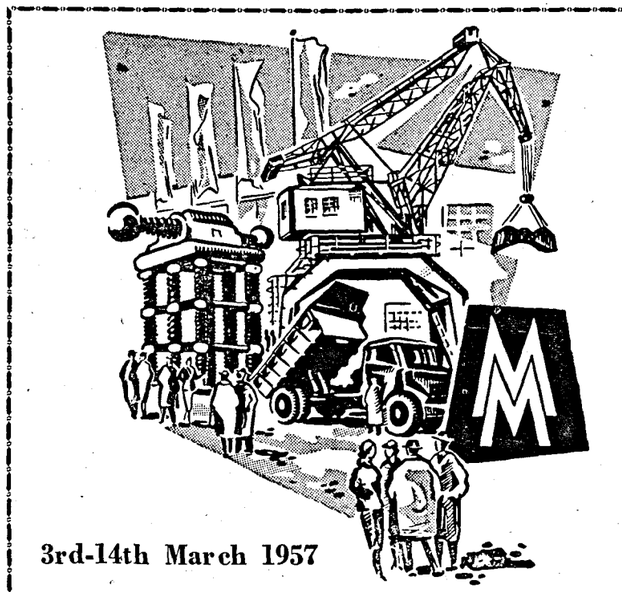
NOW that the capital gains tax has been re-introduced, the question of the taxation of bonus shares assumes some significance. The tax on bonus issues was introduced in April this year in order to prevent the use of bonus issues as a means to scatter the percentage which dividend payments bear to paid up capital (i.e. subscribed capital plus capitalised reserves) and thereby to avoid the new super-tax on dividends. It was clearly a measure taken to prevent tax avoidance, and not one, as was put forth by the then Finance Minister, for which any justification in terms of equity or economic expediency existed.

In fact the measure could be said to have introduced some sort of inequity in that it subjected to tax only those capital gains as were represented in bonus issue (although the extent to which bonus issues do represent capital gains differs for different types) and did not touch other capital gains. Now a general tax on capital gains has been brought in. But it is not clear from what has been reported so far how it is proposed to treat bonus shares, for the purposes of the capital gains tax.

An Anomaly

If the idea is not to treat bonus issues as capital gains, but to continue to tax them separately at the rate of 12½ per cent, this would amount to continuing with the sort of tax-differentiation referred to above. Of course, now the tax differentiation would not necessarily operate against gains accruing in the form of bonus issues. It will operate against bonus issues so long as the tax rate otherwise applying to capital gains in general is lower than 12½ per cent, and in favour of bonus issues when the rate applying to the general capital gains exceeds 12½ per cent. This is an anomalous position indeed, and should not be allowed to continue.

A still more important question relates to the very advisability of continuing with a separate tax on bonus shares. In his Report on Indian Tax Reform, Mr Kaldor argues that



> "the taxable capacity created by a bonus issue depends on the consequential appreciation in the market valuation of the company, and is not measured by the bonus issue itself"

and this appreciation cannot be separated off from other factors affecting the valuation of shares. Therefore, he advocates a general tax on capital gains which automatically mops up gains created by bonus issues, along with all other capital gains.

Differential Benefit

Even though we might dispute the justification for a separate tax on bonus issues on grounds of equity, the administration will perhaps insist on having such a tax so long as there is a super tax on dividends. This latter tax relates, for the fixation of rate, dividend payments to paid-up capital. To do so seems fundamentally wrong, because it assumes that the paid-up capital represents capital effectively employed in business. In actual practice the capital effectively employed may be in most cases much more than the paid-up capital, and therefore to restrict dividends on the basis of paid-up capital is not very fair. As Kaldor has argued, the choice of paid up capital favours those who were clever enough to have capitalised reserves in the past as against those who did not.

A revision of the basis of the super-tax on dividends is called for in order to rectify the adventitious character of the differential benefit now accruing to those who had capitalised their reserves in good time, and also to remove the justification however slender for a separate tax on bonus issues.

Capital Gains Tax

B K Singh

THE Finance Minister, Shri T T Krishnamachari, has announced the imposition of a tax on capital gains made on or after April 1, 1956. Such a tax was levied in 1947 but was abolished after a brief period of two years in April 1949. The Act authorising the tax, however, was not repealed. It still remains on the statute book.

During the last War profits were subject to an Excess Profits Tax which reached 62 per cent. on the excess over the standard profits. At the end of the War, the tax was rather hastily abolished in 1946. With the discontinuance of the E. P. T. a Business Profits Tax was levied on profits earned by businesses as an anti-inflationary measure. At the same time as the B. P. T. was introduced, a Capital Gains Tax was imposed on capital gains escaping income taxation. While presenting the Budget the Finance Member had proposed a graduated tax on realised capital gains exceeding Rs. 5,000 but the exemption limit was raised to Rs. 15,000 on the recommendation of the Select Committee. The rate of tax payable on realised capital gains exceeding this limit was fixed as under:—

1. Where the amount exceeds Rs. 15,000 but does not exceed Rs. 50,000.
   One anna in the rupee.
2. Where the amount exceeds Rs. 50,000 but does not exceed Rs. 2,00,000.
   Two annas in the rupee.
3. Where the amount exceeds Rs 2,00,000 but does not exceed Rs 5,00,000.
   Three annas in the rupee.
4. Where the amount exceeds Rs 5,00,000 but does not exceed Rs. 10,00,000.
   Four annas in the rupee.
5. Where the amount exceeds Rs. 10,00,000.
   Five annas in the rupee.

In the case of the corporations the entire capital gain was to be included in the total income of the company and the usual company rate of tax was to be charged on the entire total income. The tax was assessed on any profits or gains accruing from the sale, exchange, or transfer, effected after 31st March 1936 of property of any kind held by an assessee, whether or not connected with his business, profession or vocation but does not include (i) any stock in trade, consumable stores or raw materials held for the purposes of his business, profession or vocation; (ii) personal effects, that is to say, movable property (including wearing apparel jewellery and furniture) held for personal use by the assessee or any member of his family dependent on him; (iii) any land from which the income derived is agricultural income. The gains were to be measured over the acquisition price, which in the case of capital assets held before 1st January 1939 was to be taken as the fair market value of those assets on this date. It was provided that losses on the sale of capital assets in any particular year could be set off only against the capital gains of that year, or they could be carried forward for the following six years but not beyond, to be set off against any future gains.

The then Finance Member justified the proposal to levy Capital Gains Tax on the ground that large capital gains had been made in recent years which lay outside the scope of the Income Tax Act. Capital gains are usually in the nature of unearned increment and, consequently, they should be taxed at a higher rate than earned income. Unfortunately, however, the imposition of the tax synchronized with a period of falling capital values and the expected revenue from the levy did not materialize. The Finance Member's hope that the tax would discourage investment was more than fulfilled. In fact, the tax measure had come too late.

The new proposal seeks to reduce the exemption limit to Rs. 5,000. Concession is proposed to be given to persons in the lower income groups in that no Capital Gains Tax would be chargeable if the total income including the capital gains does not exceed Rs. 10,000. The rate of tax to be charged on capital gains would be the income-tax rate applicable to the other taxable income of the assessee increased by one-third of the capital gains he makes in the relevant year. In the case of the companies the rate of tax would be the usual income tax rate. The assessee would be allowed the option to have his gains worked out either on the basis of original cost or on the basis of its value on the 1st January, 1954.

In a period of continuously rising prices and capital values, capital gains become an eminently suitable subject for taxation and should be brought within the tax net. In view of the greatly accelerated rate of capital expenditure under the Second Five Year Plan prices and profits are bound to rise and give rise to inflationary tendencies. The capital gains tax is highly effective in an inflationary phase as a deterrent to investment in securities and real property and as a curb on speculation. Excessive business profits arise at a time when large development expenditures are being incurred and hence the exclusion of capital gains from the scope of income taxation would be quite indefensible either on grounds of equity or of administrative efficiency. Capital gains are an important factor in aggravating economic inequalities and there is no justification for regarding capital gains as a species of income not liable to taxation.

Given the order of the development plans, if tax resources should fall seriously short and inflation should result, it may involve large cuts in the consumption standards of the weakest sections of the community. The kind of tax system which would be best adapted to meet the requirements of the Second Plan must have an adequacy of both depth and range. It is necessary to increase the coverage of taxation of wealth and property. The taxation of capital gains would increase the resources available to the public sector, ensure greater equity in the taxation of income, reduce inequalities of wealth, and reduce inflationary pressures in a developing economy with its increasing measure of industrialisation and urbanisation.

The new proposal of taxation of capital gains seeks to withdraw some of the existing exemptions. These are capital gains arising on transfers of property on compulsory acquisition, capital gains arising on distribution of assets on dissolution of partnerships or on liquidation of companies, capital gains

arising on the sale of residential property possessed by the tax-payer for seven years, etc. Thus the present proposal removes the inequitable features of the former measure. The present tax has been so framed that all capital gains should come under the tax net sooner or later. The former exemptions reduced the yield of the tax considerably—one of the reasons given for the abolition of the tax in 1949.

The preferential treatment of capital gains is sometimes defended on the ground that it would retard investment in the private sector, which was essential for rapid industrial development. In the first place, it has not been established that the former tax had important adverse effects on investment, or hindered the free interchange of securities. Secondly, various studies in the U S A have arrived at the conclusion that in the U S A the tax had no significant effect on the volume of stock-exchange transactions. The Capital Gains Tax does not tax investments nor even capital appreciation but only such gains as are realized by the owner. The tax would, of course, offer hardly any inducement to persons who invest purely from speculative motive.

Around Calcutta Markets

Against the Rentier

Wednesday, Evening

NEITHER commodity nor bullion markets seem to have been materially affected by the proposed Capital Gains Tax. But there has been a slump in stock markets as a sequel to the higher supertax on dividends and the Capital Gains Tax. At the time of this writing, there has been a slight technical recovery. But conditions remain unsettled. A firm or consistent recovery in equities is not likely. For the new imposts are heavily biased against the coupon-clipper. Effects of the new taxes are likely to be less on industry, though the Capital Gains Tax may check speculative activity of all types.

Partial recovery in some speculative scrips like Indian Iron is due to the realisation that the super-tax on dividend remains unchanged for those companies which distribute dividends between 6 to 10 per cent. IISCO is one such company. In the meeting held on Saturday last, the details of the new right issue were finally sanctioned. IISCO management gave an undertaking that the dividend would be maintained on the increased capital. This has helped the partial recovery in Indian Iron.

Bonus Shares

There are two other factors which may have aided the slight recovery in equities. Hopes linger that many companies would pay the higher taxes than lower dividend payments. It was on some such ground that Tea shares managed to stage a slight recovery from the bottom levels. There is something in this argument. This is not the place to dilate on the finances of tea companies. Some other industrial companies also may decide to pay higher taxes rather than lower dividends unduly. That the Government's intention is to restrict dividend payments is, however, beyond dispute.

After the immediate slump in equities, there has been some speculative support on the assumption that the higher dividend taxes will encourage the issue of bonus shares. There are some passages in the Finance Minister's speech in the Lok Sabha which may lend weight to some such assumption. It is clear that the Union Finance Minister wants to encourage self-financing by industry. This means and implies a more liberal attitude to bonus issues. Taxes on bonus shares have not been raised. There is some validity in this argument. But it is difficult to appreciate, how it can be an explanation for building up equities. For, the effects of the higher taxes on total dividend payments will remain.

Liquid Capital

Industry cannot be as much worried about the higher dividend taxes as about the provision relating to deposits of its annual profits and past reserves with the Government. There is no doubt that New Delhi is suspicious about the use of these funds by some sections within the private sector. Here, the parallel between industry and life insurance companies enters the picture. In the wider public interest, this may be justified. There are some who wonder why the Government is taking time to introduce similar measures in relation to provident funds of employees.

But this is an issue which is not directly relevant to the stock market. Cynics will argue that this provision will, like nationalisation of life insurance, deprive some speculative industrialists from utilising funds under their control in stock markets. This is another argument why speculative activity may decline. But this has no long-term relation to investment problems. There is, however, something in the argument that the new provision for deposit of industrial funds will create problems of liquid capital for industry.

Compulsory Deposit

True, it is not the intention of the Government to take away the whole of industrial reserves as deposits. Only a percentage of such reserves has to be deposited under the penalty of taxation of depreciation and development rebates. It does not follow, however, that enough liquid resources will be left with industry in all cases for its day-to-day requirements. This is because requirements of working capital and the provision of such capital from internal savings vary so widely from company to company. Moreover, the needs of working capital will not be the same in industries which are intended to expand and others e g cotton textiles which are not to expand during the Second Plan period. Even those companies which are left with adequate liquid resources may complain that the interest rate to be paid by the Government on that part of their resources which is compulsorily deposited may be less than what they can earn by investing their surplus cash.

The Finance Minister makes it clear that the Government is anxious that industry should speed-up capitalisation of reserves to finance its expansion plans. On any such demand by industry, the deposits will be refunded. But industry resents the control that the Government will automatically exercise by acquiring industrial deposits. This provision, along with the Government's ownership and control of investment of life funds, does empower the Government with comprehensive control over industrial finance. This is undeniable. But it is also inevitable if industrial expansion in the private sector also has to be according to Plan.

For the Plan

New Delhi is not opposed to the use of industrial reserves for expansion by industry. The purpose behind the provision about deposits of industrial reserves is to ensure industrial expansion according to the Plan. It will not lead to any permanent diversion of funds away from the private to the public sector. Only those industries which do not fit into the Plan perspective may have cause to complain. But there cannot be many such industries. It is not against the organised section of the private sector, though it is aimed at encouraging organised industry to expand as envisaged in the Second Plan.

Meanwhile, this provision should help the Government in its ways and means position. Along with the rupee counterpart fund, to be formed against sales of American supplies of foodgrains and industrial raw materials, it will ease considerably the Government's ways and means position. This should have a salutary effect on the money market and the various market rates of interest. These incidental benefits should help both industry and stock markets in due time.

Rentier

Only the rentier will be the permanent sufferer. After some time, possible effects of a stock market slump on the new issue market will not be felt. Recent trends are highly interesting. Equities have been falling for some months. But sound new issues have been over-subscribed. This divorce of investment from speculative activity is a welcome development, and augurs well for the future of industry as well as for stock markets. Attempts at indirect limitation of dividends are likely to encourage this new trend in investment activity.

Coupon-clippers must be prepared for lower returns on their investment. But they have a remedy. By not supporting equities at higher levels, they can ensure a reasonable return on their investment. This indicates a level for equities which is well below that prevailing in this country until recently. There is, perhaps, scope for a further downward adjustment in equity values. But, as the capital gains tax and attempts at dividend limitation discourage speculation, the temporary wrong done to rentiers will have been undone. Stock markets, rentiers and industry must abandon their speculative outlook and cultivate genuine investment habits.

Equipment for Rourkela Steel Works

ORDERS have now been placed for practically the entire equipment for the Rourkela Steel Works.

During last summer orders were placed for the coke oven plant on Dr Otto & Comp, the blast furnace plant on G H H and the gas cleaning plant on Lurgi, all German firms. The value, fob, of equipment for these three departments comes to about 104 million Deutsche Marks (about Rs 11.7 crores).

As a result of the negotiations which the Indian Steel Mission had in Germany, orders have been placed for the value of approximately 647 million Deutsche Marks (about Rs 72.7 crores) for the remaining sections of the Plant. The principal items are as follows:

	Million D Marks
i) Steel Melting Shop—Krupp-Voest ..	80
ii) Strip Mill—Demag ..	71
iii) Blooming Mill—Sack ..	19
iv) Heavy Plate Mill—Krupp ..	17
v) Plate Finishing Equipment—Schloemann	42
vi) Electrical Equipment for Rolling Mills—	
A E G 45 m.DM	
Siemens 59 „	
Brown Boverie 15 „	119
vii) Power Plant—Siemens	47
viii) Water and Gas Systems —Mannesmann-Seiffert	36
ix) Steel Structures—German Consortium ..	52
x) By-product Plant—Koppers ..	50

READY REFERENCER ON THE INDIAN COMPANIES ACT, 1956

BY

JOHN AND ROW

Advocates, Madras

Price Rs. 25|-

The following is an extract from Mr Tenneti Viswanatham's letter, which will speak to the merits of the book as well as the authors of the same.

"The Ready Referencer published by John & Row is indeed a very valuable book. It is a clear analysis of the provisions of the new Act. It brings together the changes in their logical sequences so that the Directors and Managing Agents can immediately lay their finger on the required provisions whenever they are in doubt as to what is to be done or what the Law on the subject is. Besides, the Referencer is of even greater value to the Lawyer, as one can expect it to be, coming as it does from John & Row, who have been distinguished specialists on Company Law. Likewise the Bench should find it invaluable."

Supplementary Budget Reactions

Thursday, Morning

THE immediate effect of the supplementary budget proposals was confusion and panic. The market has been treated with the annual budget shock in advance. The caretaker Parliament will not be called upon to approve any fundamentally new proposals. So it is only when the new Parliament assembles that a proper budget will be presented. But even the present proposals have some useful political content which is calculated to help the Congress Party in the forthcoming elections. That these proposals will not hit the common man has been emphasised by the Finance Minister and this will no doubt be taken up by others.

The serious repercussions of higher tax on dividends and tax on capital gains on the capital market can hardly be overemphasised. But it is also being realised, albeit slowly, that once it is accepted in principle that more and more of resources have to be channelled, through taxation and Government borrowing, into planned investment, whether in the public or the private sector, some control over internal savings of the companies and on dividends was inevitable. The wonder is that it has been so late in coming. There may be difference of opinion about the manner of exercising such control; but it is rather late in the day to question the principle of it. Moreover, since the capital market is being deliberately undermined, it also follows as a corollary that the Government will have to assume the responsibility, more and more, of providing the necessary resources for developing those industries in the private sector the expansion of which are part of the Plan objective.

The immediate impact of the supplementary budget was nervous liquidation all round. The announcement took the market completely by surprise, just as the nationalisation of Life Insurance had done earlier in the year. Sluggishness gave way to a bout of selling and no buyers were coming forward to absorb these sales. The consequence was a general fall in price level. Some of the leading scrips suffered heavily in this widespread confusion. It looked as if a payments crisis would arise, if the market did not recover sufficiently early.

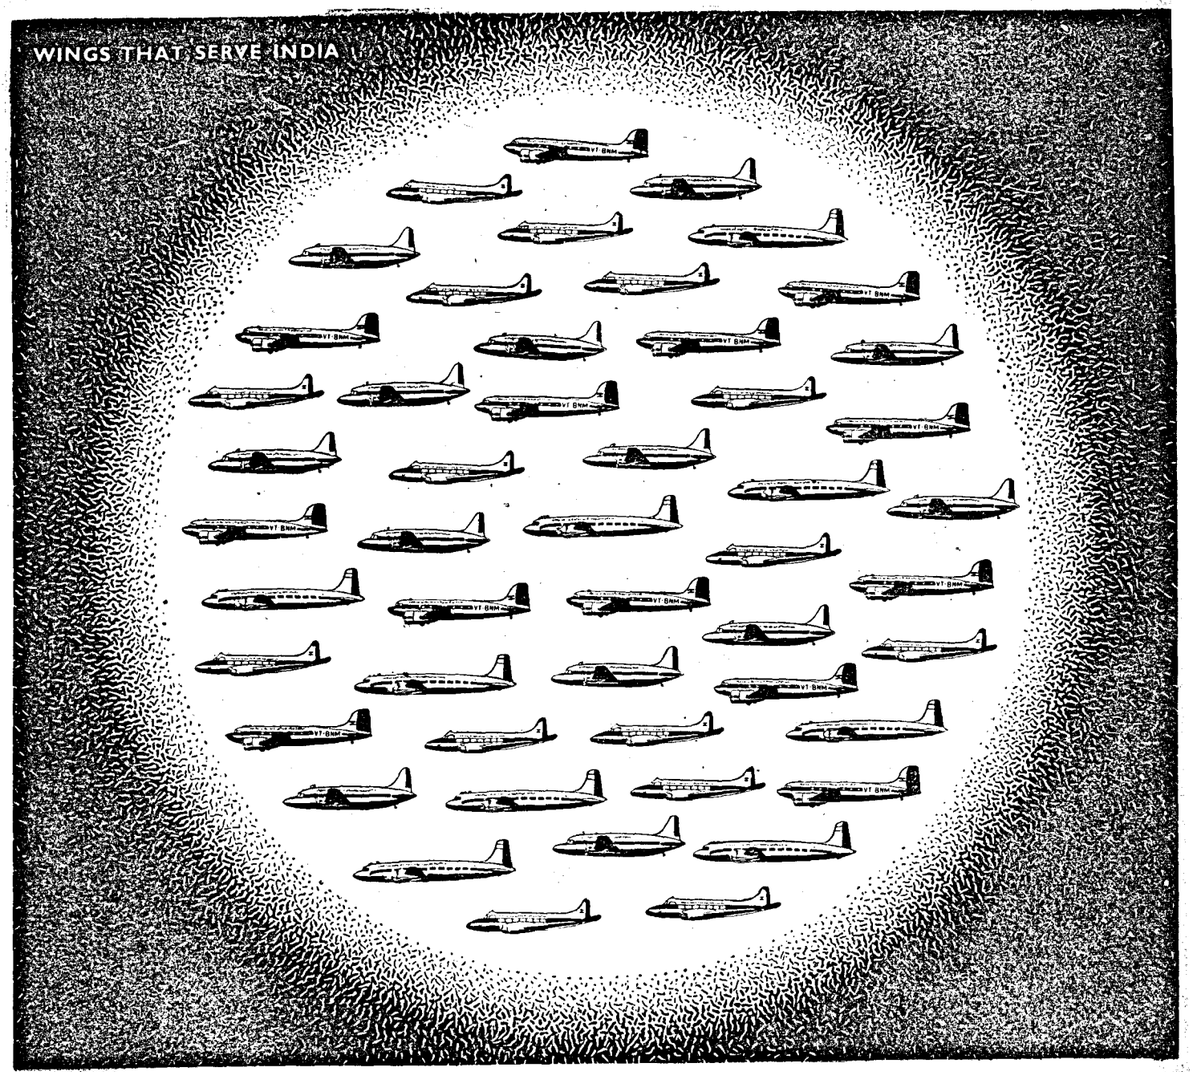
As the week progressed, however, the market tended to recover, by fits and starts, as the implications of the taxation proposals became clearer. What helped the market was the realisation that the proposal for raising the super-tax on dividends would not materially affect companies which do not pay dividends higher than 10 per cent. Scindia, which pays only five per cent, Bombay Dyeing and Indian Iron, paying 10 per cent each, were the first to rally and recover their losses. The second group to rally included Premier Automobiles, National Rayon and Tata Locomotives.

The group likely to be hardest hit include Swadeshi Mill, Shivarajpur, Century, Kohinoor and Bombay Burmah. The price range of this group naturally tended to decline. Towards the close, however, Century shot up on expectations of issue of bonus shares.

While it is easy enough to classify shares according to their dividend payments and judge the possible effect of higher taxes on dividend, speculation centres on quite a different point, namely, whether the companies which pay high dividends would not continue to do so, even after higher taxes, since their profits must also tend to be proportionately higher. For cotton mills generally, the consensus of opinion seems to favour this view.

More will be heard in the next few days about the possibility of channelling reserves into fresh bonus shares, in order to circumvent higher taxes on dividends. This, again, applies specially to the textile industry. The Plan may not favour expansion in their case but there is nothing in the Plan to prevent replacement of depreciated plant and equipment for which a genuine case can be made out for strengthening their capital structure by capitalisation of reserves.

The results of working of two companies, which have been published during the week, deserve notice. Tata Locomotive and Engineering Co. has been able to record a handsome profit of Rs 77.79 lakhs for the year ended March 31, 1956. Gwalior Rayon Silk Manufacturing and Weaving Co. Ltd. show a profit of Rs. 1.01 crore. The Directors report that extension of the staple fibre factory to increase production capacity to 40 tons of staple fibre per day is nearing completion and that the plant is expected to be in commission before the end of this month.



Cotton

Export Quota at Long Last

THE news of the week in cotton was the announcement of the export quota of 50,000 bales of Bengal Deshi and 1,50,000 bales of other exportable varieties of ¾" staple and below.

What had happened in the interval between the earlier announcement to the effect that the time was not yet ripe for the export quota and the present announcement? The question naturally arises when one recalls the market's keen disappointment when it was given out that there would be no export quota for some time. The proceedings of the Export Advisory Council encouraged the market to expect some favourable news. Later, it was stated that as prices were 'high' no export quota would be announced 'at this stage'. Soon after this, comes the announcement of export quota. It is rather unfortunate that the Government should choose a time when prices were around the lower levels to announce the quota. If the quota had been released earlier when there was quite a bullish trend in the market, the authorities could have taken advantage of higher prices and gained a little more by way of foreign exchange!

If the Government's approach to the export quota was strange, it is even stranger to find that the market is practically unable to lift itself up. The continued bearish trend, despite the quota announcement, is attributed to the meagre size of the quota as also to the doubling of the export duty on Bengal Deshi. Besides these, reports are flowing in of accelerated movement of new crop and slow buying by mills which further subdued the trend in both cotton futures and spot markets.

Every day at noon

there are 50 I.A.C. planes flying !

THEY travel the skies of India. They carry businessmen and tourists, families and freight. They provide the quickest, most comfortable means of getting from place to place and, every day they are bringing the people of India closer together.

Indian Airlines Corporation operates 132 flights every day and covers 20 million miles every year. And as each year passes, more and more planes are brought into operation to satisfy India's ever-growing need for swifter, more comprehensive communication.

This story begins in 1888...

The world still awaits the adventure of Wireless . . . it's the age of the horse-drawn carriage. And people who talk of flying aren't airmen as yet; they're poets.

Calcutta is India's capital, and at one of its busy wharves, there's a picturesque mailboat from England, self-conscious in its new power of Steam. Look away for a moment to something else that is new. There! In those crates . . . the first few cakes of a new soap: *Sunlight*. The crates say: 'Made in England by Lever Brothers.'

Bobbing away on porters' heads, the cakes go off to some obscure bazaar of old Calcutta and from there . . . on to journey's end: the homes for which Levers have made the soap.

That's how it was one summer day of 1888. Lever Brothers (then, a three-year old British enterprise) thought the world of *Sunlight*. Soon, thousands of bazaars were stocking 'the tablet that foamed'—and families became converts for good.

Little by little, the motor car arrived (the model with the turkey-croak hooter); then the telephone began to jangle in Indian homes. And in those homes, time wasn't standing still either. People were asking for new and varied products to meet their changing needs. So, Levers—developing in step with them—produced for the home such things as *Lifebuoy* . . . *Vim* . . . and *Lux Toilet Soap*. This is becoming a story of familiar names, isn't it?

In 1922, Levers started making soaps in Calcutta—encouraged as they were by the increasing demand for their products. In 1934, a second factory went up in Bombay.

In 1926 came Dalda Vanaspati from Holland. And, with it, there started a revolution in India's nutrition—the use of a hardened vegetable oil for cooking. To manufacture *Dalda* in India, a new Lever Company was born in 1932: 'HVM'—the Hindustan Vanaspati Manufacturing Company Limited.

And still the Indian home called for newer and 'different' products. And so there came to India *Pears Soap*, *Erasmic* and *Gibbs* products, *Himalaya Bouquet* toiletries, *Rexona Soap*—familiar members of the Lever family. Marketing of these products led to the formation of yet another Lever Company in 1935: 'UTL'—United Traders Limited.

Now, you can't separate the tale of these products from the tale unfolding *within* Levers. The people in their factories and offices were changing for one thing. Foreign experts were joined by the young men of India and today four-fifths of Levers' executives are Indian.

Meanwhile, Levers were buying all the raw materials that India could offer. These purchases grew as manufacture expanded—till, in 1955, about 88 per cent of the oils and fats that Levers traded was supplied by India's fields and coconut groves.

An international partnership—that's what soon grew up in Levers. Foreign technical and marketing experience linked up with the talents and resources of India. Result? The Indian housewife today is supplied with products that are among the world's best.

Today, we are sixty-nine years from the craft of soap that, almost unnoticed, started Levers in India. Today, a new chapter in our story has opened with the association of Indian and foreign capital in Levers. Indian and British Directors work together on the Board, too. Here's a joint venture that serves the nation and advances with it.

Yes, the future arrives with each tick of the clock. And Levers face that future with a new name: 'HINDUSTAN LEVER LIMITED.' So the stories of HVM and UTL end, in a sense—because they've merged with 'Lever Brothers' to form Hindustan Lever.

But the Lever story goes on. For India's story goes on, and Levers have grown with India's needs and progress. As it has done for sixty-nine years, Hindustan Lever will continue to serve the Indian home.

HINDUSTAN LEVER SERVES THE HOME

Mission to Washington

IT was inevitable that, the moment India became independent, she would emerge as the leader in Asia. Much has happened in Asia and in the world since India's independence. Some of the Western countries have been inclined to write India off as an ally for democratic peace. Suspect in both camps of the "cold war", India has pursued a policy of good neighbourliness. Her foreign policy is now better appreciated. India's economic achievements compare favourably with those of Communist China. Bandung has convinced Asia that India has no design to be an arrogant and aggressive leader in Asia. Her moral status is now firmly established. New Delhi's foreign policy is appreciated in Moscow, Belgrade and Peking. Cairo values New Delhi's mature judgment. Despite the Anglo-French aggression in Egypt, India remains a member of the Commonwealth. Since the Anglo-French aggression in Egypt, India and America have drawn closer together.

Since independence, New Delhi has functioned as a bridge between two rival sides in the "cold war". India's first major achievement was the joint enunciation of Panch Shila by New Delhi and Peking. This was the prelude to Bandung. Her second achievement was to convince the Soviet Union that Panch Shila was the only secure basis of relations with nations and neighbours. Deeper international influences would seem to confirm Pandit Nehru's reiterated belief that, in spite of Hungary, the process of liberalisation of regimes in Eastern Europe will continue. In the past, India has adroitly exercised her influence as a Commonwealth member and her friendly relations with Communist countries to ease the tension between the two rival camps. In the changed current phase of the international situation, it is essential that New Delhi must co-operate with Washington to eliminate local tensions as well as to maintain world peace. It is a happy coincidence that Pandit Nehru will have talks with President Eisenhower at an opportune time when India and America are in closer agreement on the immediate world issues.

Developments since the Summit Conference at Geneva have provided the opportunity for closer collaboration between India and America in the interests of world peace. De-Trumanisation, along with de-Stalinisation is a process which is not without significance. But it is neither necessary nor relevant to stress any clandestine understanding between America and Russia to evacuate Europe for joint exploitation of Asia. This is not the main motive behind Washington's hostile reaction to the Anglo-French aggression in Egypt. Here, it is useful to discuss the changed global strategy since the Geneva understanding between East and West not to start an atomic war. Before the Geneva Summit Conference, Washington's policy was to ring the globe with bases and bastions. This strategy has become obsolete since the "hydrogen" stalemate. Pentagon now relies on "Fortress America" for strategic retaliation in the event of war.

Washington's earlier policy of fortifying overseas bases has had some unintended consequences. It has encouraged the revival of Anglo-French colonialism. With American supplies of war equipment, Britain and France had tried to maintain their positions in Indo-China, Algeria and Cyprus. Since the nuclear deadlock, Britain and France have increasingly relied on NATO equipment to perpetuate colonialism. NATO

equipment was, contrary to the agreement between America and NATO allies, used by Britain and France during their aggression against Egypt. With "Fortress America" as the basic defence strategy, the realisation has dawned on Washington that America's earlier world strategy has been exploited by some of her NATO partners to perpetuate colonialism. Washington is now in a mood for a reappraisal of the necessity, as well as of the indirect consequences, of overseas bases and military alliances like SEATO and the Baghdad Pact. Sadder by the Egyptian experience, President Eisenhower may now concede that Pandit Nehru's apprehensions that Pakistan may exploit her membership of SEATO and the Baghdad Pact are not entirely without basis, despite the distinct understanding that Pakistan will not use American supplies of war equipment against India.

India has been consistent in her attitude that military alliances provoke counter-alliances, and create, instead of preventing, tensions. New Delhi has been equally emphatic that SEATO and, in particular, the Baghdad Pact are military alliances which may be exploited to perpetuate colonialism. Developments in Egypt have confirmed these fears. It is the Baghdad Pact which has provoked Russia to make attempts to win friends in West Asia, even as NATO has created, and justified, the Warsaw Pact. Wiser by the Egyptian experience, Washington now accepts the necessity for strengthening the United Nations. To enhance the status of the United Nations, it is necessary to make this organisation truly representative. This is one of the main arguments for encouraging all countries, now under subjection, to choose the form of government they like, so that they, as free nations, can become member-States. Meanwhile, it is necessary to admit all independent countries, including Red China and Japan, into the United Nations. No doubt, Pandit Nehru will inform President Eisenhower about his talks with the Chinese Prime Minister as the former discusses with President Eisenhower the question of Red China's admission into the United Nations. There are now brighter prospects that Russia will not oppose Japan's claim to be a member-State. Egypt and West Asia will be the major issues in the agenda for discussions between Pandit Nehru and President Eisenhower. On these issues, it will not be difficult for the Indian Prime Minister and the American President to reach an agreement. Pandit Nehru's visit to America will have achieved its main purpose if he can secure President Eisenhower's full endorsement to the policy of strengthening the United Nations in order to preserve world peace.

Going Their Several Ways

WHAT the Planning Commission is thinking, what the Government at the Centre is doing and what is happening in the State Governments—it is not often that one has to connect all three even in the limited sphere of Governmental activity, where information is so much more readily available. To get a conspectus of what happens in the lives of the people in the towns and villages is, of course, much more difficult. With the sights fixed principally on 'coastal statistics', on the movements of foreign trade and payments, industrial production and only the broader changes in agriculture, one can hardly expect to get a full view of what is happening in the country. And of late foreign affairs have been so much in the limelight that even that limited view has tended to be dimmer than usual.

But a number of things have come tumbling together in the last few days and their impact has been so powerful that willynilly, one has to sit up and take notice. Developments each of which could be normally left to follow its own course and treated in isolation have come crowding together in such a manner that sorting them out becomes difficult, if not impossible. Yet the opportunity should not be lost; indeed it is essential to try to get a connected picture for there is no reason to suppose that as time goes on, things will sort themselves out of their own accord, so that each problem can be handled as it arises, by itself.

There has been a sizeable problem of foreign exchange before the country for some time. The losses in foreign reserves month by month have been so heavy that it is no longer wise for the government to pretend that there is no reason for any 'scare' and that business can go on as usual. Foreign resources for the Plan, it was known all along, would be harder to secure in the sense that self-help would not avail beyond a point. Not that the problem of raising internal resources presents no difficulties; it is in fact much more formidable for one cannot draw on external assistance to a considerable extent, as is possible in the case of the former, under favourable auspices. But flexibility of operations in the field of foreign resources is definitely more restricted.

The question of internal resources had also to be tackled some day of course. But considerations of strategy made it advisable that the Government should go slow and the economic situation prevailing at the time when the draft Plan was drawn up, did not impart urgency to it. Now there has been a change, forced by rising prices and the Finance Minister has modified his assessment of the situation from one of 'strains, but no inflation' to that of 'incipient inflation.' Partly the present emphasis on resources is also in order to present a clean bill to the prospective foreign lenders, particularly those who go by the accepted commercial criterion of credit worthiness.

To suggest, however, that the Government has been waiting, Micawber like, for some thing to turn up would be wrong and unfair. It has been assiduous in extending foreign contacts and foreign economic collaboration for the completion of the Plan, it is hoped, will fan out and all will be well.

It is perhaps only a question of foreign exchange here and now, to meet the deficits in the next few months, until the World Bank loan becomes available and the credit arrangements which are now being negotiated with so many countries are finalised. But why did we allow ourselves to get into this predicament, when import control has been in operation and every little thing involving foreign payments needed Delhi's approval?

It is easy to be wise after the event and say that somebody must have tripped somewhere. Of course, even so, outsiders who do not have access to all the inside information may go wrong. Was the Finance Minister over-optimistic in banking upon foreign assistance, or rather, the timing of it? Since on Government's own admission much of the present difficulties have arisen from the staggering of steel imports, would it be too naive to ask whether these imports could not be phased? And since in the next few months, large payments will become due on account of the steel plants, would it be equally naive to ask if the steel plants could not be taken up one after another in an orderly function, instead of crowding them up all together? Energy and enthusiasm are precious indeed, particularly in a country where things move so slowly. But since one cannot put into the Plan what is not there, even superior energy has to move through the narrow grooves of resources here and now.

This takes us back to where we started from and the Planning Commission, the Government at the Centre and the State Governments moving and acting along their separate ways. Faced with such blatant, albeit minor, failures in planning—for temporary stress and strain can be overcome and they cannot finally prevent implementation—one cannot help wondering what has the Planning Commission been doing by way of co-ordination and phasing of programmes? The Commission's stature does not go up when such mismanagement of affairs come to public notice.

The National Development Council which met over the weekend had wider problems of co-ordination to discuss. This being the first meeting of this august body after the reorganisation of the States, it was too early perhaps for it to consider the question of resources seriously. But it did some valuable preliminary work in that direction. The direct taxes which the Finance Minister introduced in the supplementary budget, it may be taken for granted, are only a prelude, though perhaps a necessary one, for a much bigger bill of indirect taxes to come. As a matter of fact, Delhi is expected to take powers for it before the Parliament dissolves. What the National Development Council did was to take the first decisive step towards straightening out the present basis of sales-tax which is chaotic in the extreme. The States have all along been extremely jealous of their rights over this source of taxation which is bound to be exploited even more fully in the future. The limited powers that the Centre has taken by the Sales Tax Act passed by the Parliament earlier in the month do not profess to encroach upon the States' right to tax. It is primarily to fill the lacuna created by the Supreme Court decision restraining the power of the State Governments to tax inter-state sales. Even so the move is in the right direction and it is much to be welcomed that the Centre will now levy, collect and distribute taxes on sales of coal and coke, cotton, hides and skins, jute and oil-seeds. The articles listed, it will be noticed, are all raw materials of industry so the objection is met that Parliament intends to interfere with the liberty of the People of the States to tax themselves! They are still free to tax as much as they like the consumer goods consumed by themselves, and not by the people of other States!

What the National Development Council has done is to agree on principle that sales tax on mill made textiles, tobacco and sugar should be replaced by a surcharge on the Central excise on these articles and that the revenue derived from the surcharge will be distributed among the States, as advised by the Finance Commission. The Chief Ministers who met in Delhi were given the assurance that routing of these taxes through the Centre will not affect the shares of their respective States.

What is far more important for the Second Plan than even the question of resources was also touched upon by the NDC, but it hardly attracted much attention. It is the broader question of popular participation in the Government and in the execution of the Plan. The Home Minister put the proposal before the Council for its approval, which was of course duly given, that the district administration should be reorganised and that with the exception of law and order, and collection of revenue, the rest of the functions should be progressively handed over to popular bodies. All this is in the Plan. But the absence of any discussion on it and lukewarm reception to the proposal did not leave the impression that the Chief Ministers are too much worried about such things. On the contrary, their visits to Delhi are primarily to exact the utmost they can get from the Centre—matching of State's contribution against Central assistance come in for the usual criticism—while Delhi takes the opportunity to press, but not too obviously or blatantly, its claims for introducing some measure of uniformity and coherence in the structure of sales tax levied by the States.

Between these two somewhere comes the Finance Minister's performance at the Associated Chamber of Commerce. This was not the first time that he was facing the representatives of foreign capital in India but on this occasion, he went all out to be nice. He was even prepared to yield on the vexed question of taxing perquisites which had so rattled Clive Street. It was perhaps not the occasion to go into the principle of the thing. His predecessor had been firm in refusing to countenance the suspicion of discrimination which concessions like free passages and paid holidays abroad created, at least in the minds of the Indian employees of the foreign firms. Of course, the fine manners which the Finance Minister put on for the special benefit of his distinguished audience had the general foreign exchange situation, and prospects of getting foreign assistance in view. He was naturally eager to make things smooth so that Government's efforts may succeed. But does he also share his predecessor's faith in the inflow of private capital as a factor of importance in meeting the foreign exchange deficits of this or the following Plans?

"One has no protecting power save prudence."

Juvenal.

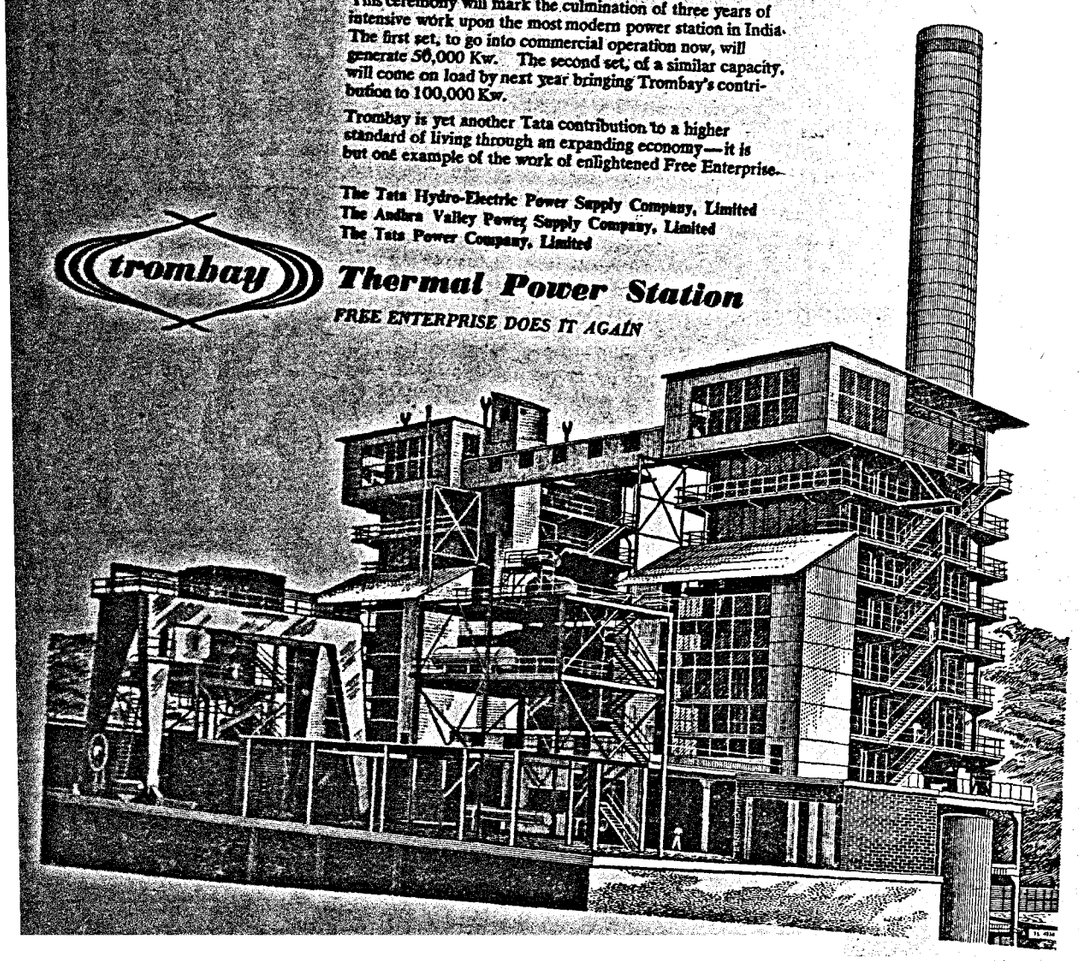
More electric POWER for Bombay

Today the Chief Minister of Bombay will open the Trombay Thermal Power Station.

This ceremony will mark the culmination of three years of intensive work upon the most modern power station in India. The first set, to go into commercial operation now, will generate 50,000 Kw. The second set, of a similar capacity, will come on load by next year bringing Trombay's contribution to 100,000 Kw.



Trombay is yet another Tata contribution to a higher standard of living through an expanding economy—it is but one example of the work of enlightened Free Enterprise.

Weekly Notes

India and China

MR CHOU EN-LAI can be amiable and urbane. His statements and pronouncements during his visit to India have been simple, and yet firm. He showed his religious tolerance by entering the Buddhist temple at Calcutta's Mahabodhi Society barefooted. Equally, he disclosed his catholic outlook by his repeated emphasis that nations must agree to disagree. On many issues, there are differences of opinion between Communist China and non-Communist countries, including India. It has been one of the main themes of his statements in India that such differences are no obstacle to friendly relations among nations. Both implicitly and explicitly, he has stressed that differences of opinion between India and China have not prevented the establishment of amicable and cordial relations between the two countries. But Mr Chou En-lai can also be astute. This he has shown in his references to America. He has expressed full appreciation of America's policy to Egypt. He hopes that relations between China and America will become cordial. Mr Chou En-lai hinted, in his Press conference in Calcutta, that Peking was willing to settle the repatriation problem, but Washington must relent its attitude. Taipeh is the major source of irritation between Peking and Washington. If this is the only reason behind America's unfriendly attitude to Communist China, Mr Chou En-lai's recent offer to Chiang Kai-shek should facilitate amicable relations between the countries. With the recent orientation in America's global strategy, Taipeh ceases to be important to America as a distant outpost. Possibilities of rapprochement between Peking and Taipeh provide Washington the opportunity to establish cordial relations with Communist China. Mr Chou En-lai's hope that Pandit Nehru's talks with President Eisenhower will lead to a greater understanding between America and Communist China will be widely shared.

India and China, the original sponsors of Panch Shila, have much in common. Mr Chou En-lai's claim that the Indo-Chinese formula for world peace has been endorsed not only by Asian and African countries, but also by some European countries, will be conceded. Both India and China are poor countries. In both, the main problem is to eliminate poverty. Different solutions are being tried in the two countries. But that does not preclude, as Mr Chou En-lai rightly stressed, mutual help and co-operation. Both have a common interest in abolishing colonialism, as it perpetuates inequality and poverty. The Anglo-French aggression in Egypt is an attempt to revive colonialism. Mr Chou En-lai was therefore, justified in his comment that, while West accuses Communist countries of subversive activities, some Western countries are not only guilty of aggression, but are also pursuing subversive tactics. To admit this is not to accept Mr Chou En-lai's interpretation of Hungary without mental reservations. Neither the considerable budgetary appropriations in America for propaganda in Eastern Europe nor subversive activities by West in Hungary can, or will, be denied. Mr Chou En-lai was emphatic in his observation that socialist countries will not allow their achievements to be taken away by "subversive activities of colonialists in socialist countries", but this is surely not the whole story in Hungary.

No Change in Coal Target

THE Statement attributed to the Minister for Heavy Industries about the formation of a National Coal Development Corporation, and containing the surprising decision to raise the target of coal production in the Second Plan from 60 million tons to 65 million tons, which was flashed in a PTI message and was commented upon in the last issue, has been flatly contradicted by the Minister concerned. The *New Sketch*, India's Coal Organ, published from Dhanbad, writes in its latest issue:

"This statement bristling with so many incorrect assertions in every blessed detail having reportedly emanated from no less a person than Shri Manubhai Shah, the Union Minister for Heavy Industries, was a bewildering experience which easily created an unprecedented sensation among the coal public. In the first place, the National Coal Development Corporation had already been formed and was known to everybody except the Minister Shri Shah, as it seemed. Only last week we published a lengthy advertisement issued by the Corporation for quite a number of important posts to be filled up. The Minister's ignorance seemed to be colossal. The object of the Corporation was primarily to look after the State collieries, their development and output and it was misleading to state that its sole purpose was to step up coal production from 38 million tons to 65 million tons. It was neither correct to state that the total target of coal production was 65 million tons nor that the additional target of the private sector was 12 million tons and of the public sector 15 million tons, the true position being that the total target was 60 million tons to be achieved at the end of the Second Plan period with 10 million tons for the public sector as additional annual targets. It was confusing to call the Balwantrai Committee as the Coal Development Board and to connect this committee with the private sectors' additional output target wrongly placed at 12 million tons instead of 10 million tons. To say that it was the responsibility of the Corporation to raise the balance of 15 million tons of additional coal was another mis-statement alleged to have emanated from the Minister. It was no surprise that the whole industry was taken aback by these statements because a statement by one Minister was as good as that of another in view of the joint responsibility of the Central Cabinet of Ministers."

But all this was much ado about nothing. The paper, usually well informed about coal, is authoritatively informed that the Minister made no such statement. It goes on to say that "We now find to our relief that Minister Shri Manubhai was entirely misreported. He is reported to have commented as follows when his attention was drawn to the misleading statement:

> "I have been misreported. I did not say that a National Coal Development Corporation will be formed. Indeed, I could not have said so as the corporation was set up last October with the Minister of Production as its chairman. Nor did I refer to any change in the targets of coal production. The Plan aims at producing 60 million tons of coal. The additional 22 million tons is apportioned between the public sector (12 million tons) and the private sector (10 million

tons). There is no question of a change of allocation."

News reporters covering a story on coal from Ahmedabad may trip on a matter of detail but it is not as simple as all that. How could P T I put out a message with just that air of plausibility which makes it so dangerous? It sure would have embarrassed any other Cabinet but targets are now-a-days played up and down so often that the Ministers have only themselves to thank if news men occasionally take such liberties. It would be comforting to note that at least somebody in the Cabinet was upset over this sorry business.

Legal Props to Trade Unionism

THE question whether employers should be forced to recognise duly registered trade unions was raised in the Lok Sabha early this week, when a half-hour discussion was led by a Communist member on the non-enforcement by Government of the Indian Trade Unions (Amendment) Act, 1947. The debate brought up certain interesting questions: Whether the Government can defeat the purpose of the Bill by not enforcing the Act, passed by Parliament? Whether the non-enforcement of the 1947 Act affected our trade union development? Whether legal support even to weak unions will make them strong enough to be an effective agent in collective bargaining? Whether political considerations encourage employers to distinguish between unions while giving them recognition?

The first queston is only of academic interest because if the Congress Government did not want to enforce the Act, it would not have introduced the Bill. In its unbounded enthusiasm after political independence, the Congress Party and the Congress Government immediately embarked on the task of achieving economic and social freedom for the masses through the most natural and simple means of legislation. In 1947-48, the Government of India put on the statute book many progressive labour laws, like the Factories Act, the Employees' State Insurance Act, the Industrial Disputes Act and the Minimum Wages Act, without caring to see whether they could be adequately enforced or not. The amendment to the Indian Trade Unions Act also belongs to this first "flush" of labour legislation. When the question of enforcement and implementation came, practical considerations put a damper. Another factor which influenced such legislation was the predominance of the Labour Minister's policies over those of the Government. The Minister who piloted the labour Bills was fond of enacting Laws. His successor detested legislation and preferred negotiation and collective bargaining to adjudication and State intervention. The 1947 Amendment Act was not enforced, because its provisions were incorporated in the Trade Unions Bill, 1950, which the anti-legislation Minister allowed to lapse.

The non-enforcement of the 1947 Act, however, could hardly have made any difference. The present Labour Minister was not far wrong when he said in Parliament that non-enforcement had strengthened trade unions instead of weakening them. In fact, it should not be forgotten that Indian labour is one of the most protected in the whole world and this has been responsible in no small measure for its weakness. If a trade union develops inherent strength by enlarging its membership and funds, and works within its legitimate field of activities, it can demand recognition from employers. It need not beg for it or rely on the crutches provided by law. The State's responsibility should be restricted to provision of the machinery within which employers and employees can bargain. The simple old Trade Union law of 1926 is enough for this purpose.

Political influences on trade unions have been one of the greatest obstacles to their growth. The all-India workers' organisations owe their allegiance to political parties and naturally the activities of the unions affiliated to them are coloured by politics of these parties. Employers naturally favour the unions affiliated to the organisation which owes allegiance to the ruling party. It is not uncommon to find employers and their organisations giving recognition to unions of a particular party, irrespective of the strength of these unions. This collusion between employers and political unionism is carried on in the fields of recruitment and promotion. It appears from the Labour Minister's reply that an enquiry is being conducted on the question of recognition vis-a-vis membership. For the sake of justice and fair play, the enquiry should be entrusted to an impartial outside agency; it should not be conducted by an interested Government.

Problems of Pump Manufacturers

COMPLAINTS of manufacturers have a monotonous uniformity which can neither be quite accidental nor entirely due to the natural human failing to grumble. It is usually the associations of the smaller manufacturers who ventilate their grievances freely at their annual general meetings. Top rank industrialists also reserve theirs for the annual general meetings of the share holders of the companies which they control, but as they take up the more important issues directly with the authorities and as in these days of increasing Government control and interference, prudence demands a discreet silence on matters of vital concern to the company concerned, the Chairmen are not always as illuminating in their addresses as they could be. The associations, however, can be more forthright because the President speaking on behalf of a number of manufacturers, would not be accused of furthering particular interests. These speeches give an insight into what is actually happening in the industrial field which one cannot get from published reports, or from the official statistics relating to the industry concerned.

The address of Shri C N Pradhan at the annual general meeting of the Indian Pump Manufacturers' Association may be taken as a fair sample of the sort of problems which small manufacturers are facing today. The only snag is that it presents the picture from the view point of the manufacturer himself. It is a pity that it cannot be easily complemented by the consumers' or the Development Wings' version of the story. But here is how the pump manufacturers view the situation.

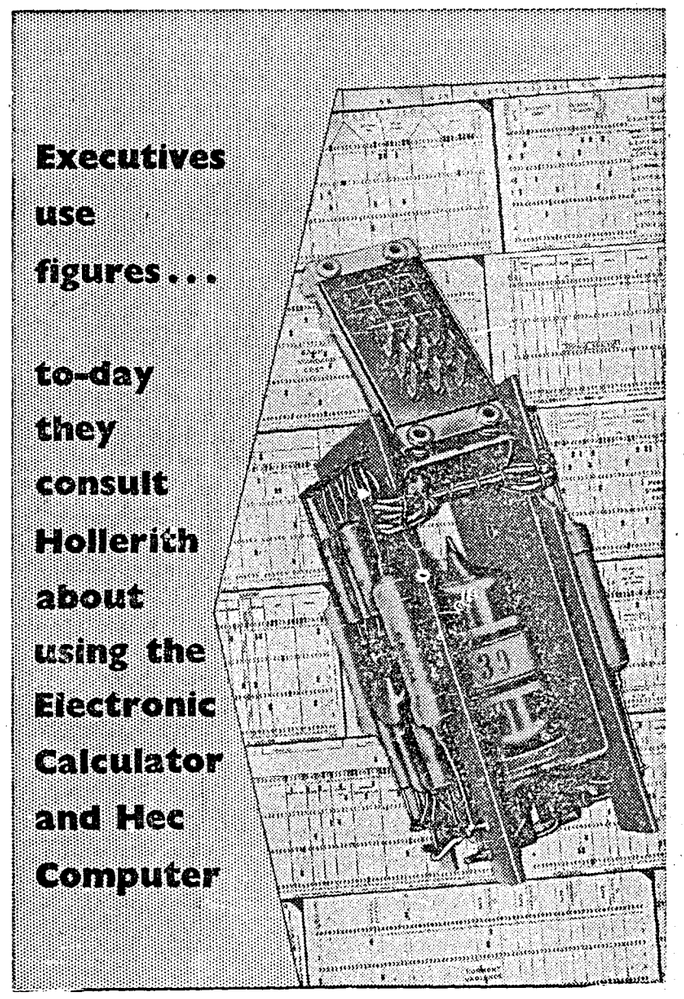
At the end of the First Five Year Plan, the installed capacity for manufacture of power driven centrifugal pumps was expected to reach 80,000 units, while demand was forecasted at around 1,00,000. The gap between demand and supply was to be met by tube well turbine pumps which were also to be manufactured within the country. All this was in the First Five Year Plan.

At the end of the five years, installed capacity nearly reached the target, being rated at 65,000 centrifugal pumps per annum, and capacity had also been installed for the production of 2,000 bore hole turbine pumps. Demand, however, did not come up to expectation. In fact, it did not even come up to half of the estimated figure, being only 40,000 per annum as against 1,00,000 forecasted. In view of this disappointing experience demand estimates have been drastically scaled down and it is now thought that even at the end of the Second Plan period, the demand for pumps would not exceed 86,000. Yet new units are coming up and the President of the Association complains that licences are being issued to fresh entrants while established manufacturers are burdened with unsold stocks.

Advance Planning of Purchases

BUT that is not the only trouble. Despite existence of considerable excess capacity suggested by the above figures, imports of pumps had been allowed at one stage during the First Plan, and even the current import policy does not take adequate note of the manufacturing capacity which has been developed within the country. The reason why imports had to be allowed was that purchases, of which the bulk is by the Government, had not been suitably phased to take full advantage of manufacturing capacity. Towards the end of the First Plan — development had to be rushed in the last two years and disbursements steeply staggered—300 bore hole pumps were needed in a hurry which the manufacturers were not in a position to supply, presumably within the stipulated time. Had purchases been more evenly distributed over time, manufacturing capacity could have been better utilised.

Keeping the existing manufacturing capacity in view, the Chairman suggests that imports of the following categories of pumps should be restricted:



(1) Horizontal Centrifugal Pumps for clear water and also Sewage Pumps upto 14" delivery for the capacity of 2.5 lakh gallons per hour for the total head upto 200ft.

(2) Multi-stage Centrifugal Pumps up to 8" delivery for the capacity of 1 lakh gallons per hour and also pumps suitable for heads upto 300 ft.

(3) Bore Hole Pumps upto the capacity of 1 lakh gallons per hour for heads upto 300 ft and 2 lakh gallons per hour for heads upto 150 ft.

Then follows the usual list of complaints, headed by Government purchase policy. The demand of the Association viz that all Government purchases should be centralised through the Directorate General of Supplies and Disposals and that DGS & D contract terms should be offered to those manufacturers who are on the approved list. Advance planning of purchases with an eye to fuller utilisation of installed capacity is another legitimate demand of the industry.

The second in the list of grievances is the difficulty of getting raw materials and equipment—pig iron, cast iron scrap, hard coke, ball bearing and electric motors, the latter for the firms which manufacture pumps but not the motor with which pumps have to be coupled before they can be sold. In the case of imported materials like pig iron, ball bearings and electric motors, the demand is, in short, for free licensing of imports. This is in such striking contrast to the dem-

and, for which a case is made out so convincingly, for restricting imports of pumps that it calls for particular attention. But this demand for banning imports is so general in every field of manufacture that one cannot help suspecting that however strong a case manufacturers of pumps may have, suppliers of the materials used by them, among others, may also have something to say, unless, of course, the Development Wing has been getting it all wrong in every case.

Unlike many other light engineering industries, however, power driven pumps do not appear to have much of an export market yet. The Association welcomes the steps taken by the Government to promote such exports, by arranging exhibitions for instance. It is also willing enough to co-operate, but makes the modest suggestion that as exhibitions are so frequent, participation by members will mean a large number of pumps being permanently kept on show and this will block up scarce capital. So should not the Government assist the industry and in particular those manufacturers who are keen on participating in exhibitions by buying up the pumps which are to be exhibited?

All in all, this is a revealing cross section of the industry. It is a pity that the Associations have not yet realised the value of publicity and do not widely publicise the full text of their addresses.

Letters to the Editor

Time and the Choice of Technique

I HAVE read with great interest Mrs Robinson's letter on 'Time and the Choice of Technique', which appeared in your issue of November 17. Since the letter begins with a reference to my article published in your issue of September 15. I, think it may be desirable to clarify the position I adopted in my article.

My standpoint was briefly this. Assuming gross investment and its rate of growth to be given, my problem was which technique or set of techniques to choose if we wanted to make the ratio of new investment to gross investment as high as possible. I used new investment rather than net investment because replacement was the more suitable category for my purpose than the so-called depreciation. The main purpose of raising the ratio of new investment to gross investment is precisely to introduce an element of acceleration in the process of growth. This is a factor which I consider to be well-substantiated by the recent experience of USSR. The main way of economising in replacement requirements is to choose more capital-intensive techniques, meaning thereby projects with longer life span. I, therefore, wrote "other things remaining the same, the choice of capital-intensive projects would then lead to an acceleration in the rate of growth of the economy."

Now, in case the gross investment cannot be regarded as a datum, there can be little doubt that the gain involved in increasing the life-span of the capital asset is no longer unambiguous, for we have to take into account the cost of greater durability. Such situations are likely to arise and they may be quite important, but they are surely different from the sort of situation I contemplated. The conclusion that I drew holds good in the first situation, and not in the second. But it was not my purpose to discuss the second situation. This line of reasoning seems to me to be valid. It does not, however, dispute in the least the validity of Mrs Robinson's argument which I find very suggestive and important.

Hungarian Imbroglio

THE editorial on Hungary in your issue of November 10, has proved itself, in the long course of angry (!) burst-outs, as the only sane one among the editorials in the Indian press. It has very ably pointed out the reality in the affairs of Hungary by a fine discernment of the issues involved. But as it seems to me, it has been misunderstood in many quarters and even misread by many intellectuals, who have been guided much more by their hearts than heads in this case.

Basically the aggression in Egypt by Britain and France is different from Russian intervention in Hungary, as you have pointed out. First of all we must understand that the attack on Egypt owed its origin to a flimsy excuse—flimsy because Egypt had the right to nationalise the Suez Canal in spite of the commitments made previously. The question of internationalisation should not have arisen at all because Egypt was always ready to admit ships of every country provided they paid the tolls.

In the affair of Hungary, the intervention of Russia was at the invitation of the Hungarian Government (Kadar's) and wholesale massacre was never intended; for if they really wanted to do it, the Russians could have done it on a much greater scale. There are on record many instances, in which the U S A participated, in the form of direct and indirect help, on the plea of protecting democracy! I do not find any real justification in raising a cry to place Hungary on the same rank as Egypt as a victim of attack.

India was wise in not believing the propaganda of Free Europe and in treating the Hungarian upsurge as the domestic affair of Hungary and in emphasising that U N O is not a champion of any particular ideology.

To Professor Amlan Dutta, I would like to say that his description of the situation consequent upon both USA and USSR having in stock many Hydrogen bombs is not at all complete nor does it convey the whole truth. I think the situation can be described more appropriately as follows: "The near-impossibility of a global conflict may encourage a smaller nation to use provocative methods against a great power (in isolation!) so much so that when the big power shrugs its shoulders, the small power attracts the sympathy of all through propaganda."

From the Chair

The Indian Iron and Steel Company Limited

Speech of the Chairman Mr T LeslieMartin

THE following is the full text of the speech of Mr T Leslie Martin, Chairman of The Indian Iron & Steel Company Limited, delivered at the Thirtyninth Annual General Meeting of the shareholders held on November 30, 1956:—

Gentlemen,

In my address to you last year I stated that it was extremely unlikely that the production and trading results of that year would be repeated and that the large increase in the revenue and consequent profits could only be regarded as a windfall. Happily, my prognostications have proved entirely wrong and very wide off the mark. From the Report and Accounts for the year 1955-1956, which have been in your hands for some days, you will have seen that the results of the previous year have actually been exceeded. Today I do not intend to make any forecast but will confine my remarks, in the main, to facts and will explain to you, briefly, the factors that have contributed to this happy position.

Production

The Company's total production of 7,06,986 tons of iron fell short of the figure of the previous year by less than 9,000 tons. The output, however, of your Burnpur Blast Furnaces which provide the hot iron for steel making fell from 5,17,899 tons to 4,73,172 tons. This was due to the fact that No 2 Furnace was off production for periodical relining. The loss of production on this account, however, proved to be much less than had originally been envisaged as, by improved re-lining technique, the work was completed in a very much shorter period than on any previous occasion.

With the change over of two of the Steel Melting Furnaces from Producer Gas Fuel to tar firing we were able, and are now in a position, to utilise a greater proportion of steel scrap in our furnaces than was formerly the case. As an offset to the inevitable drop in the availability of iron for steel making resulting from the closure and re-lining of No 2 Blast Furnace, an intensive drive for the procurement of steel scrap from local sources was launched and carried out with such success that it was possible to make good the anticipated deficit and even to surpass last year's production tonnage of ingot steel by some three thousand tons. A further benefit was received by reason of the fact that the Rolling Mills were able to produce a larger proportion of the output in the form of finished steel commanding a larger margin of profit than semi-finished steel such as billets, blooms and slabs.

The production of iron from your Kulti Blast Furnace was 233,814 tons as against 197,702 tons in 1954-55, since both Furnaces were in full production throughout the year. In addition to the benefit of the consequent increased availability in the sale of pig iron, full advantage was taken of a larger allotment of iron, sanctioned by Government, for use in the Kulti foundries. This enabled an increase in the production tonnage of Spun Pipes and General Castings of some sixteen thousand tons which, again, had a marked effect on the satisfactory trading for the year under review.

Profit

Taking these factors into account an increase in profits of some Rs 70,00,000|- has been realised for the year. From this amount we are required, in accordance with the terms of the Agreement entered into with Government (to which reference is made in your Director's Report) to set aside Rs 29,47,838|- to a Special Fund to be utilised solely for the purpose of our expansion programme.

As to the future, I can only say, in view of the excellent results for the year 1955-56, that despite the many difficulties encountered your Burnpur Works have worked to full capacity and that until this capacity is augmented by the extensions now in progress, which will gradually come into operation, no appreciable increase in output can justifiably be looked for. Also, it must be remembered that it is not unlikely we may have to contend with increasing difficulties in the operation of the existing plant owing to the disorganisation caused by the expansion works in progress. I would, therefore, ask you to bear this in mind when forecasting possible results over the next year or so.

In this connection I should like to take the opportunity to pay tribute to the very efficient manner in which the task of the Planning and Co-ordination of the extensions works is being carried out by your Consulting Engineers, the International Construction Co, Ltd, and to the spirit of co-operation between them and the Works Management which has enabled all difficulties encountered to be smoothed over with the minimum of inconvenience to either side.

Finance

So far as the financial figures for the year under review are concerned, there can, I think, be few points on which you will require further enlightenment. The Accounts as drawn up in conformity with the provisions of the new Companies Act 1956 give even fuller particulars than the previous very full disclosure it has always been the practice of your Board to make. There is, however, one item on which I might perhaps remark. You will notice that the Accounts show the transfer of a sum of Rs 7,00,000|- to General Development Reserve. You may feel some doubt on the necessity for such transfer, having regard to the very large amounts set aside on the other extensions reserves. I would, therefore, like to explain that the sum in question represents the approximate reduction in the normal taxation liability for the year by reason of the Development Rebate allowed by Government exempting from taxation 25% of the cost of the new plant and machinery installed. The consideration underlying this concession is that the saving in tax should be set aside for development purposes. We count to a large extent on the continuance of this rebate for financing both the 1953 and 1955 extensions and it is very desirable that this position should be recognised by the immediate institution of a General Development Reserve as a separate item of the reserves.

Dividends

In view of the substantial increase in the amount of profits earned, your Directors had natural-

ly wished to mark the position by some increased distribution on the Ordinary share capital. Every endeavour was accordingly made to obtain the approval of Government to the admission of the shareholders to an increased participation in the profits, but as reported in the Board's Circular Letter of the 1st October, 1956, Government have found themselves again unable to agree at this stage to an increase in the rate of dividend. Though the position is disappointing to us all and is one which your Directors greatly regret, as I advised you under similar circumstances last year, the orders of Government cannot be ignored nor their legality challenged without serious detriment to the interest of the Company. It is incumbent on us, therefore, to accept the decision of Government with good grace. To the extent that profits earned are retained in the business the finance of the expansions programme and the ultimate repayment of the loans that are being incurred is facilitated. Also, we may derive such consolation, as we may, for the present restriction of dividend from the assurance that has been given by Government in their letter dated 22nd September, 1956. It has been stated in that letter that the mobilisation of the available resources for the completion of the expansion programme is in the long term in the interests of the shareholders "as ultimately they will have their full share of the increased profits".

1953 Extensions

You will, I trust, have a full appreciation of the progress made with the 1953 extensions programme from the descriptive booklet that has been issued as a supplement to the Report of your Directors and will have noted that the programme is scheduled to be brought to completion by the end of 1958 in two stages.

Further Extensions

Particulars of the further expansion to an annual output capacity of 800,000 tons of saleable steel which at the request of Government, has been agreed to, have been given in the Board's Circular Letter of the 5th November, 1956. In my speech to you last year I explained that no decision as to the undertaking of this further expansion could be arrived at until the revised sales retention prices of steel, to be operative as from the 1st April, 1955, had been notified by Government and we had thereby been enabled to forecast with some reasonable degree of accuracy the future financial position of the Company. The revised retention prices were communicated to the Company in February, 1956, and were fixed at a satisfactory level. The further expansion was, therefore, approved by your Board and the necessary financial negotiations for securing the finance to cover the cost put in hand. As you are aware, this programme provides mainly for an increase in the finishing mills capacity. It is scheduled for completion under normal conditions early in the second half of 1959.

The outline of the general financial arrangements in this connection, which has been shown in the Board's Circular Letter, will be placed before you for formal consideration at the Extraordinary General Meeting to be held tomorrow. I will, therefore, not comment on this occasion other than to express our great appreciation of the full understanding and sympathetic consideration that has been shown by Government in the fixation of the current sales retention prices of steel and at all stages of the subsequent negotiations even though it did not prove possible for them to see eye to eye with your Board on the question of the price at which the proposed rights offer of additional Ordinary share capital should be made.

International Situation

All that I have said on your immediate and future prospects and the completion of both the extension schemes must be judged in the light of the rapid developments which are taking place in the entire international sphere. No one can tell what ultimate direction these may take but it would seem that world-wide impact on almost every national activity may result, which could seriously upset the implementation of all important schemes dependent upon sea transport, foreign exchange, the manufacture and delivery of imported plant and machinery together with the thousand and one other national requirements for industrial or other developments.

In conclusion I should like on your behalf to express our appreciation of the services rendered by your General Manager, Mr J McCracken, and by all the staff and workers whose able and willing combined efforts have made possible the very satisfactory results that have been achieved.

Note: This does not purport to be a report of the proceedings of the Annual General Meeting, which will be sent to shareholders in due course.

The Reckoning and the Crisis

THE day of reckoning has arrived. And in any such reckoning the political consequences unquestionably predominate for, as the 'Banker' put it, "these will in the long run largely determine the economic consequences". Here only the economic costs of the Anglo-French intervention in Egypt will be examined. It must, however, be recorded that contrary to every expression of public passion in Britain, the words of Lord Salisbury, Premier-designate in 1863, ring more true today than at any other time in British history. Referring to the German invasion of Schleswig-Holstein, he is reputed to have commented that "...few will be found to dispute that England occupies a position in the eyes of foreign powers which she has never occupied before during the memory of any man now living...the condition of things has lamentably changed". Today Britain's influence in the Middle East is virtually extinguished, the imperial foundations of her Commonwealth policy stand in ruins and the one condition for survival in Europe—the American alliance—has suffered a set back. The United Kingdom is no longer a free agent to pursue policies which it conceives to be in the interests of its "traditional power"—in a word, the country has awakened to the brutal fact that by itself it is a mite in the company of the Anglo-American colossi.

Crisis in its most Tangible Form

The impact of this awakening on the British people and on informed opinion has been one of shock and of deep resentment. As 'The Times' put it, the "House of Commons is now an unpredictable institution". The arch-bearers of the American alliance — the Conservatives — are divided on the current assessment of American aims and express this division in terms of unparalleled hostility. The Cabinet is not only divided; its members connive at perpetrating one of the most ghastly misrepresentations known since 1945 — of claiming that no collusion existed in the intervention in Egypt! This is not all. The Prime Minister, as is now publicly interpreted, was "sent off" so as to "get the country out of the mess". And in line with this, the name of the next Prime Minister is a matter of public discussion.

The crisis in the economy is more clearly appreciated only because it appears in one of its most tangible forms. In the month of November alone, gold and dollar reserves of the sterling area fell by $279 million—a fall without precedent since monthly statistics of gold and dollar movements have been published. This is by no means the only critical fact. The 'Manchester Guardian' has calculated that at least 6 million tons of oil will now be required every month from dollar sources until the Suez Canal is once again navigable. This will involve a dollar expenditure of $50 million per month. Taking into account the loss in dollar earnings of United Kingdom oil companies, and the rise in tanker freight rates, the monthly cost on oil (in terms of hard currency) may well reach $90 million or about £35 million. The Chancellor's measures to meet the crisis call for an all-round increase of fuel costs and it is estimated that this is likely to send up industrial costs by as much as 2 per cent. Apart from these unpleasant prospects, oil deliveries from dollar sources are unlikely to maintain the tempo of the current level of industrial production. The prospects are therefore grim.

As is to be expected, in the present situation it is right that everything should be done to "defend sterling". The size of the outflow of gold and dollars last month suggests that a major proportion of the outflow represented capital flights which are usually associated with a decline in international confidence. As shown in the table below, something like $252 million represents "other gold movements". This is equivalent to just under £100 million, and it is difficult to believe that movement of funds on so large a scale could take place in a single month, unless those holding sterling balances in London really believed that war was in the offing.

Flight of Capital

At the end of June 1956, residents of countries outside the sterling area held some £649 million as balances in London. About 90 per cent of these was held by residents of the non-dollar, non-sterling countries. It is thus certain that the flight of about £100 million of capital was effected largely through the unofficial markets for transferable sterling. And this is confirmed when account is taken of the depressed rate at which sterling was being sold on these unofficial markets. The demand for dollar securities in London and on the Continent is possibly another index of the state of confidence in sterling. There was a time last month when transactions in dollar securities in London carried a premium of over 12½ per cent. It has, however, been objected that these forms of capital flight cannot by themselves explain the magnitude of the gold and dollar loss. Many ask whether residents of the overseas sterling area were not able to engage in "switching" and "shunting" operations in past months and thus to exacerbate the outflow in gold and dollars?

This situation must demand a major policy appraisal on the part of the U K government with a view to restoring confidence. It was well, therefore, for Mr Macmillan to hint at the size of the hidden reserves of Britain: about £1,000 million in dollar securities and about £30 million in short-term U S Treasury bills. It was equally necessary for the U K to ask for loans from the I M F to which it is entitled. It was a mistake, however, to waive the interest payment on the American loan as it is liable to create the impression that

Sterling Area Gold and Dollar Movements During 1956

($ million)

	Nov.	Monthly Averages Dec	2nd Quarter	3rd Quarter	1st Quarter
American Aid ..	4	7	— 8	3	6
E P U Settlements ..	— 31	—28	—39	+14	—18
Other Gold Movements	—252	—63	+12	+19	+64
Change in Reserves ..	—279	—84	—35	+36	+52
Current Reserves ..	1965	2244	2328	2385	2277

Britain was tantamount to "scraping the barrel" and admitting thereby that the economic situation was desperately serious. The application for waiver of interest has contributed to a new loss in confidence and once again sterling exchange is limping at the lower support point of $2.78¼ = £1.

Impact on Exports Inevitable

The motor vehicle industry is possibly the most sensitive industrial indicator of the trend of economic activity in Britain. Even before the Suez adventure, output of motor vehicles was running at a level of about 10 per cent below that of 1955. Now, it is reported that over 100,000 workers in the industry are to be declared redundant or to be placed on short-time. The blame for it is now mainly put on the petrol and oil restrictions. It is increasingly felt that with consumption levels sufficiently controlled through the credit restrictions, the main weight of a reduction in aggregate output will now fall on exports. The "defence of sterling" requires the concerted effort of the entire sterling area. On the question whether this effort would be forthcoming or not, depends the crucial answer whether the existing exchange parity can be held or not. It is understood that Commonwealth consultations are to take place. In the meantime the switch to gold shares on the London stock exchange and the sharp upward movement of prices on London bullion market suggest that not a few people are thinking in terms of a possible devaluation of sterling. And the very thought of such an eventuality can accelerate the movement towards its realisation!

The Only Path Left Open

In a world of competing economies, Britain is really and truly weak. Britain's dependence on foreign oil is now seen to be vital and this has called forth from the more thinking sections of the British people a new reappraisal. If, as has been proved, Britain cannot "go it alone", what then was the point of a £1,500 million annual drain on the resources of the country through an armaments programme? Further, why the extended political commitments in almost every part of the world? The 'Financial Times' declared in a powerfully outspoken editorial:

> "In recent years we have tried to maintain a great power position in politics, the role of the world's banker and our interests as an industrial and trading power. If recent events have shown nothing else they have proved that we cannot any longer drive these horses in harness".

It was possibly with this in mind that the Chancellor in the House debate saw that the only path left open for Britain in our time was that of integration with Europe. The post-war settlement established the hierachy of economic and political power—Britain refused in its heart to accept that settlement and the changes wrought by it in the world distribution of power. Now the delusion has been brutally shaken. Indeed, "the condition of things has been lamentably changed" for Britain.

Book Review

Sino-Japanese Relations

The Japanese and Sun Yat-sen By Maurius B Jansen. Harvard University Press, Cambridge, Mass.

Reviewed by **W H Newell**

SINO-JAPANESE relations have never received the attention that they deserved in the understanding of the politics of East Asia. This 27th volume in the Harvard Historical Monographs is a major contribution to this understanding. It takes the form of drawing on Japanese sources for an understanding of Sino-Japanese relations between about 1890 and 1920. Many of these sources have not previously been known to any Japanese or Chinese historians. They include the files of the Tokyo Foreign Office relating to refugee revolutionaries which were captured by the Americans after the defeat of Japan. One cannot but be impressed with the Japanese secret police who kept such a minute check of every contact that Sun Yat Sen ever made in Japan. In some cases the secret files were diagrammed with a complete chain of command within the Chinese revolutionary forces derived from conversations Sun Yat Sen had with Chinese and Japanese visitors in his house in Tokyo. Even these conversations were overheard and carefully recorded!

Chinese Material Lack Balance

Mr Jansen is a Japanese scholar and the whole book is written entirely from the Japanese sources. Although he periodically quotes from Chinese sources also, his Chinese material lacks the right balance within the Chinese scene. For example, although he rightly stresses the great importance of the Chinese student movement within Japan, he fails to see that Sun Yat Sen, by his foreign upbringing and training, was culturally only on the fringe of the great cultural changes which were taking place within the Chinese educated Chinese student movement.

No reference is made to Lu Hsuin and his journal **New Life** although the famous leader Chang ping-lin (1868-1936) is mentioned and his **Min Pao**, which began publication in February, 1906. The activities of this group were the subject of an official complaint by the Manchu government to the Japanese government. As far as I know there is no authoritative book yet on this Chinese student movement in Japan, although the importance of such a study cannot be denied.

No Consistent Policy

From the point of view of the Japanese, however, the peculiar ambivalence of the Japanese authorities towards their great Chinese neighbour can easily be seen. Mr Jansen traces this ambivalence, with great skill, through the next twenty years of Japanese political history. His main thesis is that far from Japanese policy towards China being determined by purely imperialistic considerations, it showed marked vacillations. The indecision as to what policy to pursue towards China was the real reason why the Japanese gained far less out of China than might have been expected, if the Foreign Office had followed a consistent policy.

This indecision really arose from a fundamental misunderstanding of the nature of the Chinese revolution. Lacking an understanding of the whole, various Japanese pressure groups were able to force their views on the government in power, irrespective of whether their aims would really be attained by the means that they suggested. Sun Yat Sen was really only a pawn in the hands of the Japanese, at one time being welcomed as a real representative of a foreign power and, after the defeat of the Republican forces by Yuan Shih Kai in 1915, being almost placed under house arrest.

Historian's Puzzle

What has always puzzled the historian of this period of Sino-Japanese relationships is the consistent hope that Sun Yat Sen had for aid from Japan. Towards the end of his stay in Japan, he became more and more anti-western in sentiment, especially anti-British, yet he consistently made proposals to the Japanese which would have more effectively deprived the new Chinese republic of sovereignty than any that the west could propose. This was the case even after Japan's famous 21 demands to China.

One document which has now come to light in the Japanese Foreign Office files, proposed and drafted by Sun Yat Sen, has 11 articles. Some of the more important proposals in this draft treaty were that Japan and China should never make an agreement with a third power without consulting the other that all of China should use only Japanese style arms, that priority would always be given to Japanese advisers in the armed forces, that first preference should always be given to Japanese advisers in civil matters, that all capital for Chinese depelopment be first raised in Japan and that Japan should take an active part in determining what form China's new administration should take.

Fortunately this document was never made public and the opposition government of Ycan shihkai never realised just how far Sun Yat Sen had really compromised himself with the Japanese.

Secret of Sun's Strength

Jansen does not adequately explain why it was that Sun Yat Sen so consistently looked for aid to Japan. Various parts of Sun Yat Sen's writings and sayings have been adopted by Wang Ching Wei, Chiang Kai Shek and Mao Tse Tung as a charter for their action and all are to a certain extent within their rights in doing so. Yet it cannot be doubted that were Sun Yat Sen living to-day, he would not have been able to follow any of them. It is likely that the real strength of Sun Yat Sen over Chinese and Japanese alike lay in his charm of character rather than in his ideas. Accusations were at various times levelled against him, both by Japanese and Chinese, that his foreign style upbringing precluded him from ever leading a revolutionary China. Yet in 1907 one of his principal Japanese fund raisers had this to say of him,

> "A man like Sun will not be seen to-morrow, or in fifty or in a hundred years. Even in dreams you cannot imagine such a man. I had not dreamt of such a person until he appeared. Sun is the world's great revolutionary".

But Sun was not present either at

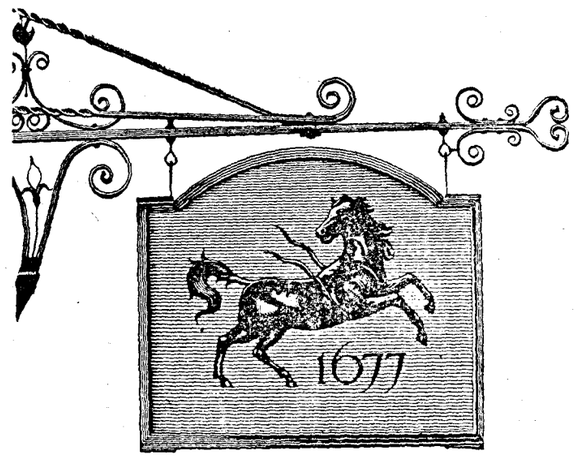
the commencement of the 1911 revolution or at the third revolt in China. In one he was in Japan, in the other touring the United States and Britain for funds.

No Obelisk to Other Asiatics



The real importance of this book to the historical scholar lies in its cold analysis of the relationship between Japan and China. At the time when Japan was suffering, along with China, the incursions of the western powers, the Japanese decided to become the equal of a western nation herself. She was so successful in this that she conceived herself as the natural leader of a Greater Asia, a British Empire with the Japanese in the role of Britain. When I first visited Singapore after the war, I climbed a high mound in the centre of Singapore island on which was an obelisk erected by the Japanese commemorating all those Japanese soldiers who had died in the conquest of Malaya. Beside this obelisk was a smaller one, commemorating all the Europeans who had died in the defence of Singapore, put up by the Japanese at the same time. There was no commemoration tablet of any sort for other dead Asiatics!

That Japan still conceives of herself in this role of an Asiatic nation equal to Europeans but superior to other Asiatics in western techniques is illustrated by some of her postwar films. One of the best of these, **The Refugee**, with Keiko Gishi in the leading star role, criticises Japan mercilessly for not being the true light of Asia and winning the recent war. The explanation why she was defeated, according to this film, lay in the fact that she had not adequately learnt the virtues of American democracy, that she had learnt only the American techniques of war but not the American democratic spirit which would result in victory in war.

Chinese Attitude to Japan

Jansen does not deal with what will probably become the more important issue in the future, viz the attitude of China towards the Japanese. It is not possible to discuss it in a book review. Yet in view of the recent speeches by the Chinese judges releasing the senior Japanese war criminals, one cannot but get the impression that there are major differences in the Chinese attitude towards western and Japanese imperialists.

The attitude of the Chinese in admiring Japanese achievements in the technical sphere conflicts with the traditional Chinese attitude that Japanese culture is merely a poor copy of the Chinese. That a pupil should excel his master and yet not acknowledge his debt is a basic thought at the back of the Chinese mind. Yet the modern Japanese, since the metamorphosis of Japan into an industrial nation, claims his technical ancestry from the west. He despises a master who while claiming superiority fails to succeed in so disciplining himself that success is certain. Chinese success in this direction would be a grave threat to Japanese leadership in Asia. The problems still lie ahead.

The Kaldor Report

Taya Zinkin

MANY have seen in the latest Finance Bill the Kaldor Report casting its ominous shadow before. This is only a half truth. The passion with which Mr Kaldor advocates one part of Shri Krishnamachari's proposals, the capital gains tax, is equalled by the vigour with which he destroys the arguments for another part, the differential taxation on dividends according to the return they represent on a highly arbitrarily defined paid-up capital.

This difference between Mr Kaldor and Shri Krishnamachari is not surprising. Mr Kaldor need consider only equity and economics. Shri Krishnamachari has to consider also inflation, the belief of so many Congressmen that nobody should pay a dividend above 6 per cent, and the desire of the public that the rich should be soaked if the poor are to be taxed.

Nevertheless, it would be helpful if between now and the next Budget —the usual annual one, it is to be hoped Shri Krishnamachari will declare no more interims—the finance Minister would read Mr Kaldor with great care, for Mr Kaldor's Report places an authoritative finger upon the key problem facing the tax structure of a 'socialist pattern of society'. How is equality to be combined with incentive?

More particularly, how can men of property be taxed sufficiently to bring about some measure of equality without destroying their desire to invest and at the same time so overtaxing those whose high incomes come from their own exertions that their desire to work is not seriously reduced? In a society most of which is still to be left to private enterprise, it is very important that private companies and individuals should save and invest sufficiently, and also that their choice of investment should not be distorted by discrimination in the tax system against risk. Moreover, as society becomes more complex, it becomes increasingly dependent on the efforts of a limited number of people whose skills are at present in short supply: scientists, chartered accountants, senior civil servants and so on. If these people have to face very high marginal rates of tax, there is the risk that they may decide to be paid partly in increased leisure, as they already are in, say, France.

Mr Kaldor meets his double problem ingeniously. His key proposal is not any of his extra taxes, but a limitation of an existing tax. He would place the maximum direct taxation on incomes at 45 per cent. This would mean that the marginal rate would never be so high that it would be worth substituting leisure for work; it would also greatly reduce the discrimination against risk-taking enterprise of the present system, where the individual bears the consequences of failure but the State may take nearly all the rewards of success. And it makes it possible for Mr Kaldor to create a tax-system which encourages savings without encouraging inequality, and taxes more heavily the man with property than the man without.

Mr Kaldor encourages saving without making inequality more obvious by his expenditure tax. He recognises, and partially nullifies, the advantages of the man with property over the man who has only his brain and his hands, by his capital gains tax, his gift tax, his death duties and his tax on wealth. These together mean that the property-owner would pay a large premium for the cushion of security his property gives him. Indeed, only the most unremitting and successful entrepreneurs could hope to keep their property intact for any length of time.

It is not necessary here to go into the details of Mr Kaldor's recommendations. He makes a very good case for their practicability but it is for the Central Board of Revenue to say whether the tax machine could in practice carry them out. He gives, and argues for, particular rates, but it is for the politicians to say whether those are the rates Parliament and the public would accept. What can be said here is that Mr Kaldor's scheme is logical and coherent, though in some respects, the treatment of losses and business expenses, for example, is rather weighted against the taxpayer.

Certainly Mr Kaldor's scheme, if it will work, would achieve his objectives. The expenditure tax, by replacing super tax, would greatly increase the incentive to save, and would make it much easier for the growing private business to grow in the traditional way, by ploughing back profits. The capital gains tax, though undoubtedly difficult to administer, would tax what is probably now the main source of conspicuous consumption. The tax on wealth would reduce the inequality which results from treating high incomes from property and high incomes from work in the same way, without being so severe as to drive people from investment into hoarding. The levelling out of all company taxation at the one As. 7 rate would prevent the distortions resulting from the present somewhat arbitrary distinctions. Severe penalties and regular prosecutions for tax defaulters on American lines would result in a sharp decrease in tax evasion, though, if these powers were not to be abused, they would make even more necessary another of Mr Kaldor's recommendations, raising the pay and status of the Income Tax Department.

Mr Kaldor has produced a logical and attractive scheme. The danger is that Government will take all his extra taxes and forget that the key, the very centre-piece, of his whole system, is the 45 per cent maximum for income tax and supertax. Without that, Mr Kaldor's taxes would merely break the economy's back.

Would the top blow off?

It might...if there was an acute shortage of CAF (compressed asbestos fibre) Jointing. Not only would many engineers "hit the ceiling", but there would be "blown" gaskets everywhere, with disastrous results. But thanks to the new AM & FM factory at Ghatkopar, Bombay, the chances of this happening are remote. We make this vital material in sufficient quantities to meet the entire demand of Indian Industry.

CAF Jointing is used wherever a good, strong, efficient seal is needed—sealing flanged joints in pipe-lines, making cylinder head gaskets, boiler joints, etc. This jointing holds fast and remains leak-proof against steam, water and oil at varying temperatures and pressures.

This is just one of the many unobtrusive but important parts that this versatile raw material — asbestos—plays in our daily lives. We at AM & FM make a wide range of technical asbestos products to meet the varying needs of India's industry. The increasing use of asbestos is an index to India's industrial progress.

More on Capital Gains Tax

A Half-way House

(Contributed)

WHY has the Finance Minister introduced the new tax on capital gains? His arguments in its defence fall under three heads. First, the greater needs of development programme make it imperative that new sources should be tapped; second, capital gains aggravate inequalities; and third, there is no case in equity for "regarding capital gains as a species of income not liable to taxation".

The Taxation Enquiry Commission were aware of all the above arguments but were not persuaded to recommend "for the time being the imposition of a special tax on capital gains". The Commission felt that the reasons which were advanced in April, 1949, for the suspension of the capital gains tax still held good, and that "in particular, the need for promoting a better climate for investment is stronger today than before, with the importance that industrial development is expected to assume in the next Five Year Plan". The Commission did, however, add that "if, owing to the accelerated tempo of development or otherwise, we enter an era of continuously rising prices and profits and of capital values; in that event, capital gains may become an eminently suitable subject for taxation and should be brought within the tax net".

Partial Acceptance of Kaldor

No doubt, inflationary pressures have started showing their ugly head over the past few months, but one wonders if it could be said that this marks the beginning of "an era of continuously rising prices". The easing of the international situation and a better crop next season might well create nearly the same conditions of ease as during the year 1954. This is perhaps the reason why the Finance Minister does not invoke the authority of the Taxation Enquiry Commission in defence of his proposal.

What appears to be the case is that the present Finance Minister thinks that the grounds on which the Commission argued against a capital gains tax, for the time being, are not adequate. Here one notices the identity of views between Mr Nicholas Kaldor and the Finance Minister. In his report to the Government, Kaldor argued very forcefully for the resuscitation of the proviso of the Indian Income Tax Act relating to the taxation of capital gains which has been in abeyance for the last seven or eight years. Briefly, Kaldor's argument was that the exclusion of capital gains from taxation was grossly inequitous, and that "the tax ought to be reintroduced as soon as possible, and quite irrespective of the immediate prospects of rising or falling prices, or of the immediate expectation of the yield". As regards the plea that the taxation of capital gains impinged on economic incentives, Kaldor's answer that to exclude capital gains from taxation was a dishonest means of offsetting the highly disincentive effect of the income tax applying at very high marginal rates.

"It is far better", he said, "to forgo the appearance of high progressiveness in the schedule of taxation than to choose a definition of "income" for the tax base which is neither consistent, nor impartial, nor unambiguous in its application to different tax payers".

The Finance Minister has accepted Kaldor's arguments, and as advised by him, has re-activated the relevant proviso in the Indian Income Tax Act. He has not, however, taken any action to bring down the high marginal rates of income-tax!

This is presumably because (a) in the short run at least the decline in receipts from the income-tax is not likely to be set off by the new revenue from the tax on capital gains; and (b) such a step may appear to reduce the progressive character of the tax system. These are good enough reasons for the Finance Minister to move cautiously in the matter. His present action in putting a tax on capital gains may be just one of the many other steps that he has under consideration. That is perhaps the reason why he has not gone wholehog for Kaldor's tax proposals. Even in regard to capital gains, Kaldor had suggested that the present proviso in the Act be so amended that all capital gains should come under the tax net sooner or later, and that the existing ceiling rate of income-tax be raised from 4 annas to 7 annas in the rupee, with capital gains being treated as income for the purpose of income tax. In the Finance Bill before the Parliament, however, there still remains a very important category of capital gains which shall continue to be exempted. The reference here is to those gains in capital value which are not realised through sale but which are transferred untaxed to one's beneficiaries in gifts or in inheritance. Also, the ceiling rate has been retained at the level of 4 annas in the rupee i.e. the maximum rate of tax applying to capital gains will be 25 per cent as compared to the maximum rate of 92.5 per cent for regular income.

Present Finance Bill Inadequate

If the Finance Minister is going to be content with the present Finance Bill, one wonders if it would accomplish anything for him. It will mean hardly any improvement in terms of equity because a very large part (if one goes by the experience in the USA, this may be any thing between 66 and 75 per cent) of the capital gains will remain untaxed. Also, the contribution to the exchequer is not likely to be very large, firstly because of the exemption of such a large portion of the capital gains accruing in the economy, secondly because the rate of tax has been fixed so low, and thirdly because there is a possibility that a number of capital gains which are at the moment being treated as regular income and charged as such may manage to pass off as capital gains and therefore escape high rates of super-tax, thus causing loss to the exchequer under receipts from the taxes on regular income. Moreover, no indication has so far been given about the steps which the authorities propose to take to ensure that even the chargeable gains are correctly declared to the tax officers.

As it is, the new tax on capital gains is a half-way measure. A lot still remains to be done if the intention is to tax capital gains effectively and in the right fashion. And then, it needs to be dovetailed with the other reforms so urgently needed in the Indian system of Direct Taxation.

Road Sense

Our cities and villages are far apart... only 0.2 miles of road exist in every square mile, and the average of roads to each lakh of population is only 68 miles. Some Rs. 271 crores is being spent in the Second Five Year Plan to build a better road system—so that every village is within five miles of a national highway. The objective is to provide black top surfaces on all main arteries.

The Burmah-Shell Refinery is daily producing 600 tons of bitumen, besides special grades of bitumen that can be used cold. These grades permit road construction where heating bitumen is not possible.

Bitumen is distributed by Burmah-Shell in drums, and in Bombay by road vehicles which carry bitumen in bulk direct from the Refinery to the customer.

All this is part of the *road sense* which we have gained by being **in India's life and part of it.**

1470

Perspectives in Wage Policy

WITH the Indian National Trade Union Congress, the leading labour organization in the country, putting forward a demand for 25 per cent increase in wages, the question of wage policy bids fair to be at the forefront of the problems which the country has to face at the outset of the Second Five Year Plan. It is one of the vital questions which, on account of the partisan feelings which it arouses, has hardly been examined in a dispassionate manner so far. Any attempt to study the issues involved clearly and in an objective manner and to indicate the direction in which a solution to the conflicting view points of the workers and the employers could be found should naturally prove of incalculable benefit.

The National Institute of Labour Management has, therefore, rendered a service by bringing out a small booklet on wage policy by Shri R G Gokhale, the Labour Officer of the Bombay Millowners' Association.* The author touches upon the different aspects of the problem of devising a suitable policy for the remuneration of labour and sums up in brief what he considers to be the fundamental principles on which such a policy should be based. Labour economics has largely been a neglected subject in the academic field and very few persons in the country today combine an intimate practical knowledge of the problems of labour in industry with an academic and scholarly bent of mind. Freely drawing upon his rich experience and wide knowledge, Shri Gokhale has compressed in only 40 pages the pros and cons of the different issues which have become associated with the question of the formulation of a proper wage policy for the country during the last few years.

One would readily agree with the author that the wage structure in the country to day, which comprises basic rates and dearness allowance, the latter accounting for a preponderant share, should be constructed de novo. Following the concept of the minimum wage as laid down by the Fair Wages Committee in 1949, if a new wage structure based on the current habits of consumption, the prevailing level of prices and the present size of the average working class family is formulated, it will automatically solve the thorny problem of consolidating dearness allowance with wages. It will also do away with the multiplicity of scales on which dearness allowance is paid to workers in different industries in different regions. While reconstructing the wage structure on a new basis, the demand for a 25 per cent increase in wages could also be examined.

The principles for determining the new wage scales which have been advanced by Shri Gokhale, however, run counter to this bold stand and some of them lack a logical basis. His suggestion that a definite relationship should be maintained between industrial wage level and the level of national income and that the disparity between these two should as far as possible be avoided, presents the problem of wage determination in a wrong perspective. No wonder that on the basis of a national income of Rs 1,120 per family of four he seems to consider the total annual income of Rs 1,760, direct and indirect, of a Bombay cotton textile worker to be far above the mark. Notwithstanding the fact that the Fair Wages Committee has mentioned per capita national income as one of the relevant factors in determining the minimum wage, particularly in a country where a vast proportion of the population is under-employed, it is hardly of any significance. The Fair Wages Committee has not explained how a purely value concept like that of per capita national income, which is only worthy of publication in the statistical abstracts of the different countries, can have a bearing on industrial wages.

Further, it has been contended that the disparity between the wages of agriculture, plantation and industrial labour should be progressively reduced. That the difference between agricultural and industrial wages in other countries is much less than it is in India today has been advanced as an argument in support of this contention. In the case of economically developed countries, as a result of the process of levelling up, disparities between the incomes of various classes of wage earners naturally tend to diminish. In an under-developed country, on the other hand, where industrial development is the spearhead of the attack on under-employment and poverty, industrial wages must of necessity maintain a long lead over agricultural wages. In course of time, as industry develops and absorbs a large number of the agricultural

uc.1/56

population, the impact would be felt on agricultural wages as well. But that stage is still some way off. In any event the disparity should not be removed by keeping down industrial wages. Besides, a comparison between the money wages of agricultural workers and industrial workers has very little meaning. The real value of a rupee is much higher in the rural areas than in the urban industrial centres.

This is not the only disparity which bothers Shri Gokhale; he appears to be obsessed with disparity in wage structures in general —inter-industry and inter-regional. He recommends that wage structure in a particular industry should be in balance with the general wage level in the country and that there should be parity between the wage structures of different industries. It is not quite clear what he has in mind. Does he wish to suggest that the wage structure of a cotton mill in Coimbatore should be the same as that in a cotton mill in Ahmedabad or that in a steel works in Bihar? The Fair Wages Committee allows for variations on account of regional differences and productivity. Capacity of the different industries to pay is another factor making for divergence in wage scales. So long as these factors operate, wage scales are bound to show disparities between industry and industry in the different regions. There is nothing unhealthy about them.

If the fear of disparities—disparity between the average national income per family and the average earnings of an industrial worker, disparity between the earnings of industrial workers and agricultural labourers and disparities in the earnings of workers in different industries in different regions—under which Shri Gokhale seems to labour is left out of account, the principles he lays down for the determination of wages are perfectly valid. Gross inequalities of income between the whole class of manual workers on the one hand and the small community of landlords, businessmen and people in the various professions on the other is one of the major social problems in the country today. Compared to these, inequalities between different categories of labour are insignificant. During the process of economic development some of these disparities are bound to be accentuated but not all of them can be removed even under ideal conditions.

INVEST WISELY AND WELL

You may be prudent enough to save a portion of your income, but perhaps you are hesitant to decide on a safe investment.

Let this not disturb you. Your Bank is in touch with the leading brokers and will make their expert advice available to you quickly and without charge.

Your Bank will also keep your investments in safe custody and collect and credit to your account interest and dividends as and when they fall due.

It does not matter where you reside—the State Bank of India has a net-work of offices through which it offers to place these and other services at your disposal.

Why not talk things over with your nearest Bank Agent or write for information?

The State Bank's local head office at Bombay, one of more than five hundred offices waiting to serve you throughout India.

Some Economic Aspects of Large-Scale Farming

(Continued from previous issue and concluded)

A N Sharma

ALL the farms in the present study employ paid labourers, both permanent and temporary. No farm is worked by only permanent or only temporary labour. No large farm can keep all the required labour permanently or do without some of them; nor can it depend wholly on temporary labour.

Pattern of Labour Employed

Reliable data for permanent labour were available for all the farms, but data for temporary labour could not be obtained as detailed accounts are not kept. However, it has roughly been estimated that of the total labour on these farms about 40 per cent is permanent and the remaining 60 percent temporary.

Table VIII gives the number of the permanent labourers and the man-days for temporary labourers on different farms during 1954-55.

Table VIII—Farm Labour

Case No.	Size of Farm (acres)	No. of permanent labourers.	Labour requirement man days Total (000)
1	200	13	3.5
2	80	8	2.6
3	200	10	3.0
4	79	6	1.0
5	60	7	1.5
6	240	15	5.0
7	80	5	1.8
8	80	5	2.5
9	120	7	3.0
10	210	20	3.5
11	200	15	3.0
12	76.4	12	2.0

*Excluding garden area.

Table IX shows the index of crop intensity, total labour engaged and the utilization of labour (permanent and temporary) in different size-groups of farms.

The number of permanent labourers kept on each farm varies according to the size: 10.8 in Group I, 11.3 in Group II and 17.5 in the Group III. But in proportion to the area there is no difference in the case of different groups and the number per 100 acres of the cultivated area is about 8. A slightly smaller figure in the last two columns in the case of Group II is due to the greater degree of mechanization. The variation in the requirements for temporary labour is also negligible, particularly when measured in terms of man-days required per 100 acres of the total cropped area. This further confirms the previous findings regarding the cropping pattern in the different size-groups.

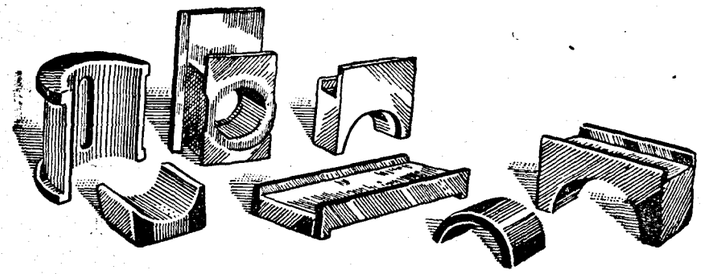
Of the total requirements for temporary labour in a year, nearly 70 percent are employed in the rabi season, and about 30 percent in the kharif season. Only jowar bajra and maize, which do not require much labour, are grown in the kharif season. In the rabi season, nearly 60 percent of the labour are utilized in March and April for harvesting, threshing, etc, and 30 percent in ploughing and sowing in October and November. The remaining 10 percent are utilized in minor operations throughout the cropping season. Of the total requirements for the kharif season about 40 percent are engaged in July in sowing and 40 per cent in October in harvesting.

There are three peak periods of demand for farm labour in July, October/November, and March/April. The maximum demand is, however, during March/April.

The owner-worker relationship is cordial on most of the farms. The only exception is in farm 6 which is a limited concern. The owners never come to see their farm which is controlled by a manager. The labourers do not seem interested in making the farm successful. More cordial relations between owners and labourers were found on farms 2, 3, 9, and 12 where it was difficult to distinguish between labourer and the family members of the owners. They are treated sympathetically and are given their wages in advance, in cash or grains, according to the need of the workers. On the whole, conflicts between employers and employees are rare, and not as lasting as in industries. The tie between the two parties is not purely economic, but also social.

Supervision by Owners

Supervision is of utmost importance in large farms. In farm No 1 the owner had lost about Rs 5000/- in 1954-55 because the labourers stole a large portion of the produce. Similarly in farm Nos 4 and 6, where the owners never went to see their farms, they are running at a loss. Though farm No 8 is making a profit, the owner reported that the actual profit was much more than what he received as a part of the produce is stolen away every year.



Though supervision of farms is the main responsibility of these farmers, and they know that it is very important, even so they are unable to carry it out properly. Of these farmers, Nos 4, 5 and 6 are willing to sell their farms as they are interested little in it. They have invested their money only to maintain possession of the land. But this is not true of all of them. There are some (Nos 1, 2, 3, 7 and 12) who devote all their time to their farms and want to be successful farmers. But on the whole these farms are not being supervised as adequately and as well as the job requires.

Table IX—Crop Intensity and Labour

Size group (acres)	Index of crop intensity*	Total labour engaged: No of permanent labourers kept: All farms	Total labour engaged: No of permanent labourers kept: Per farm	Total temporary labour (man-days) (thousands)	Labour utilization per 100 acres of total cultivated area: Permanent nos	Labour utilization per 100 acres of total cultivated area: Temporary (man-days yearly) (thousands)
50 -100	110.12	65	10.8	2503	8.2	2.2
100-200	107.10	45	11.3	1812	7.0	1.9
200-300	104.00	35	17.5	1875	8.3	2.1

* The method of calculating the index of crop intensity has been explained in the previous article.

non-ferrous castings

for bulk supplies on repetition basis to standard specifications

Availability of Labour

The demand for labour is rather flexible, i e, there are seasons when demand is slack, hence labour supply is plentiful, and at other times labour becomes scarce because demand is very great. In the former case it becomes a problem for labourers to get work while in the latter case it becomes a problem for owners to get labourers to finish the work in time.

Wage Rates—Wage rates are highly elastic. Rates are low in the slack season (August, December, May and June) and high in the peak season (July, January, March and April).

Thefts—Labourers are generally dishonest, particularly the daily labourers, and it becomes a problem for the owners to stop thefts.

Slackers—If labourers are not supervised properly they will not work. This is the habit of all workers and this is the common experience of all farms.

No Wage Differentials—Efficiency is generally not considered in determining wage rates between skilled and unskilled labour. Also most of the work is team work. Hence there is little incentive for hard or better work.

Hours of Work

Hours of work vary from season to season and from crop to crop. All the work has to be done in sunlight, but invariably in the early cool hours of the morning. Even moonlit nights are utilized for ardous work. Such work is not properly done when hired labour has to be depended upon.

FARM EQUIPMENT

In western countries, tractor ploughing has dispensed with the woodden plough and the draught animal. The combined drill performs both the operations of sowing the seeds and putting the fertilizers simultaneously while the combined harvester has simplified the work of reaping and threshing into a joint process and rendered obsolete the use of the sickle, pitchfork and scoops level. A potato harvester digs, gathers, grades, sacks, weighs, and delivers the potato to a waiting truck with an estimated saving of 50 dollars a day or more over the old way of handling the crop. In modern agriculture machines are being increasingly employed in one way or another in almost all farming operations ranging from breaking up the soil to the marketing and sale of farm produce. This is made possible largely by the extension of electricity in the countryside, manufacture of suitable agricultural machinery and the dispersion of knowledge and instruction in technical and rural engineering at agricultural schools.

In India, this system of mechanized and large scale cultivation is not going to be the general pattern of agriculture. This has been indicated in the various policy statements and discussions on the Second Five Year Plan.

Extent of Mechanisation

The agricultural operations which are performed in farming can be classified as follows:

1. Ploughing, 2. Manuring, 3. Sowing, 4. Weeding, 5. Watching, 6. Irrigation, 7. Harvesting, 8. Thrashing, 9. Winnowing, and 10. Transporting. Ploughing is done wholly mechanically on all the mechanized farms (farm Nos 1, 3, 6, 7, 8, 10 and 11). All these farms have tractors and their accessories. It has been beneficial to them because it saves time and money. Manuring is generally done by labourers and animals but in some crops and on some farms (Nos 1 and 3) it is done by machines. Only in one farm (case No 1) sowing is done by mechanical seed drills, otherwise it is usually done by the "Nai" attached behind the plough, and dragged by the bullocks. Only on farm No 1 irrigation sets are used to draw water. These are the only operations done mechanically. The rest are done by human or bullock labour. Thus the extent of mechanisation in the case of these 12 large farms is very limited.

Investment in Machinery

Table X shows the amount of investment in machinery, including all types of machines, implements and tools which have been used on these farms.

We find that the investment per acre of net cultivated area is Rs 123-8-5. The range of variation, however, is very great from Rs 4-7-10 to Rs 425-0-10. It was found to be the highest on farm 1 being Rs 425-0-10. It is a case of an almost fully mechanised farm. In case Nos 7 and 8 it was about Rs 160-0-0. In other cases it was quite low, as they were operated by bullock labour. By arranging the investment on equipment and machinery in relation to different size groups we get the picture as shown in the Table below. The highest investment is found to be in the groupII (100-200 acres). This is because one highly mechanised farm falls in this group. If we exclude that farm then the average comes to Rs 64|- only. In the other two groups it was Rs 88|15|10 in case group I and Rs 100|4|7 in case group III. The two cases in group III (numbers 6 and 10 are of partial mechanisation). On the whole it is difficult to suggest any relation between the size of farms and the degree of investment on equipment

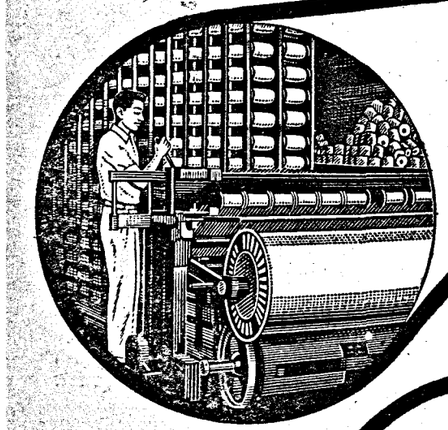

Table X—Investment in Farm Machinery

Case nos	Size of the farms (Size in acres)	Total investment in equipment and machines investment in Rs.	Investment per acre of net cultivated area
1	200	84,710-0-0	425- 0-10
2	80	1,124-0-0	14- 0-10
3	200	18,750-0-0	93-12- 0

SAVED...
Rs. 21,000
a year on
LUBRICATION
COSTS alone!

A PROMINENT
textile mill in Ahmedabad
is saving Rs 21,000 a year —
because its management asked for
our free advice!

After careful study, our lubrication expert found that the mill was over-lubricating its machinery — with the wrong grades of oil. Now, every month, the mill uses three thousand pounds fewer; *thirty-six thousand pounds of industrial lubricants saved every year!*

Choosing
the right grade

Our experts are backed by the world's greatest lubrication experience, 90 years of it. Besides, they have the right oils to work with — a full range of MOBIL Industrial Lubricants! No wonder they can give you correct lubrication, with the right grade of oil.

MOBIL Lubricants have been developed over many years of scientific research, and they are constantly being improved. When our expert says: 'Use MOBIL Lubricants,' he is offering your machinery the finest protection that science can devise, or money can buy.

Correct lubrication is a matter for experts. Our advisory service is free — why not ask us to help you ?

STANDARD-VACUUM OIL COMPANY
(Incorporated in the U.S.A. The Liability of the Members of the Company is Limited)

and machinery on the basis of this study. Relatively higher degree of mechanisation in the case of the second group explains the less amount of labour engaged in this group as shown in the table.

In some individual cases farmers have taken to mechanisation because of the labour problem, non-availability and habit of whiling away time. For the country as a whole these arguments do not stand since they aggravate the unemployment problem. As a remedy for such problems of the farmers it will not be safe to suggest mechanization. Under such circumstances labour supply is to be regulated, and mechanization should be considered in relation to the problems of finance, and organization of the unit of operation in agriculture.

Care in the Use of Machinery

Agricultural machines must be taken care of properly and repaired systematically if they are to work efficiently and last long enough to render service at low cost. Investigations into the life of agricultural machines indicate that there is little relation between the life of agricultural machines and the number of days they are used annually. In a well designed agricultural machine all the parts subject to wear could be either adjusted or replaced, and in majority of cases the wearing parts form a small part of the whole machine. It is recognized, however, that certain agricultural machines have so many wearing parts that when they get badly worn, the replacement would be more costly than the purchase of a new machine. "It was reported on Kr Surendra Singh farm (case No 11) that his tractor remained idle for the last four or five years because the broken part was not available here, and was repaired only when that part was imported by the tractor company (Ferguson)". The disc harrow, in which many parts are subject to wear is an example of such machinery.

The maintenance of agricultural machines involve three functions.

1. Protection from the weather by housing,

2. Protection of parts subject to decay by paint or by a protective coating, and

3. Repairing by adjustment, sharpening and replacement of parts.

Farmers are quite universally criticized for failure to house machinery and thus protect them from rain and sun. Investigations which have been made to determine the influence of housing indicate that losses from exposure are not so great as is often contended. However, the life of a machine is generally prolonged by proper housing. A machine left exposed during the idle season requires more time for starting, particularly if certain parts have been rusted. On most of the farms (except in case Nos 1 and 3) the machines are kept under trees. There are no proper houses for them. As a result they give a bad appearance, do not last long and therefore, prove costly.

Painting of agricultural machines protects them and improves their appearance. Paint protects woodden parts from moisture and decay and metal parts from rusting and corrosion. A good base paint with linseed oil is very satisfactory. Such paint is not so durable although the appearance is generally preferred. Bright colours, red, blue, green and yellow are conventional (this advice is given by Rallis & Co. Sole agent for Massy-Harris Tractors and Machinery). Such practices are not followed on any of the farms studied by us.

In order that agricultural machines may be in first class condition for work it is necessary to protect certain parts from rust. This is particularly true of the parts of tillage tools which are required to scour in the soil. The usual method of protection of such parts between seasons of use is to coat them with grease, ordinary axle grease being commonly used. Some farm owners (case Nos 1 and 3) have found the practice of spraying machinery with oil an effective way of protection.

Experience of Mechanisation

Mechanisation lowers cost of production, increases output per head of worker, and economises on labour.

Tractors plough fields deeply (8" to 12") so they invert the soil more and if sufficient irrigation and manures are not be applied to the land it becomes more susceptible to soil errosion. The yield instead of increasing goes on diminshing. So these types of tractors are not suitable to our conditions.

Machines require either petrol or diesel oil. These are not always available in the villages. Sometimes when the machines use up the fuel the whole work has to stop, and must be postponed to some other day. Such delays sometimes cause heavy losses.

Sometimes it so happens that the machine goes out of order because trained expert operators are not available in villages. Hence either expert mechanics are called from other places or the machines are taken to cities. Both these take time. And time is a very valuable factor in agriculture. It was reported by all farmers using modern machinery that machines going out of order frequently and not being repaired in time led to considerable losses and delay in agricultural operations.

Machines are often not used to the fullest extent. For example, tractors after ploughing often remain more or less idle. On the whole the experience of these farmers with their machines is not very happy. The reasons are the unsuitability of models, non-availability of trained operators, difficulties and delay in repairs, high cost, etc. Most of them are not maintained properly and will not last long, and, therefore, will prove rather costly on the whole. But it should not be concluded from this that machines have no, or should have no, place in our agriculture. However, long research regarding their use has to be done; considerable engineering improvements have to be made; and problems of fuel, repairs and of technical labour have to be solved before they can be serviceable even on a large-scale farm. Apart from these considerations the extent of their use in our agriculture has to be further examined in the light of the general problem of providing employment and the organization and the size of the operative unit in agriculture.

WANTED

As there is a demand from new subscribers for the following back copies of **The Economic Weekly**, it would be much appreciated if readers would kindly mail back these copies to the Business Manager, The Economic Weekly, 15, Tamarind Lane, Bombay-1. The copies will be paid for.

Volume VIII—Nos. 14, 15, 27; 28, 29, 31; 32 and 33.

Federation Meeting

The Federation of Electricity Undertakings of India

Speech of the President Mr K G Milne

THE following is the full text of the speech of Mr K G Milne, President of the Federation of Electricity Undertakings of India at its Twelfth Ordinary General Meeting held on December 12, 1956:—

Gentlemen,

The thought upper-most in all our minds today is the progress which is being made in Parliament at this time with amendments to the Electricity (Supply) Act, 1948. Now at last the fruit which has been growing for the last six years upon the legislative tree appears ready to be picked. We have tended it through all this time with anxious care. Many journeys have been undertaken and many have been the letters and discussions between us and Government representatives as to what should be done for the best. Investors too will be eagerly watching to see whether, in the midst of their sore preoccupation with new and crushing loads of general taxation, they may yet once again find some solace here with us.

Investors' Apprehensions

By and large investors have not much liked the look of us during the last few years and have progressively been diverting their attention in other directions. Investors were worried lest Government might finally decide towards the general nationalisation of the Electric Supply Industry, or that they might re-enact terms of compensation upon acquisition which might be of a confiscatory nature. They have been worried too that the maximum rate of return allowed to our Industry was incommensurate with the risks involved and the opportunities afforded for investment in other counters. There had furthermore been signs of undue interference by State Governments and by Electricity Boards, with the day to day working of Undertakings, and in particular with their rate making policies.

What therefore can I tell you, and investors, about the ripe legislative fruit which is about to be picked? Is it fair and luscious and such that investors may be encouraged to come forward once again to enable our Industry to maintain its rightful place at the base of all advancement of the living standards of the people? Or is it corrupt and maggoty and an object of despair?

The New Formula

From all I am able to gather—and a great deal has actually been happening during the last week—I am glad to be able to tell you that I believe the Electricity (Supply) Amendment Bill, 1956, as it emerges from Parliament in the next few days is likely to meet most of the points which our Federation had desired. It is true that the new Standard Rate of permissible return which is proposed to be granted cannot be regarded as a matter of any great excitement. On the other hand a return, after allowing for taxation, of 5-1|2 per cent upon the Capital Base of an Electric Supply Undertaking is not in my opinion a return which should be lightly regarded, or cast aside as completely unworthy.

While it will be for the various undertakings within our membership to apply the new formula to their own financial structures in each case, I am under the impression that even allowing for the fact that certain previously available advantages under the law are being withdrawn, the final return to investors is likely to be somewhat improved under the new dispensation.

Link With Bank Rate

Besides the return to the Electric Supply Industry will now be linked with the Reserve Bank Rate. True this is not a very scientific basis for calculating the return upon an industrial investment, but at least I for one do not at present foresee any great likelihood of the Reserve Bank Rate being reduced, and even if it were so, the reduction must then affect the value of all other investments equally. Contrariwise, it is not every Industry which will be in a position, should the Bank Rate be raised, to follow it upwards with an enlarged return as will be the case with the Electric Supply Industry in the future. This is an element of the new situation which investors would I think do well to consider carefully.

The Amended Act will, as I understand it, provide also for our Industry to retain the tax savings resulting from the Development Rebate given by the Taxation Authorities as a concession to assist Companies to expand their business. Previously in the case of this Industry these tax savings were misaccruing to consumers. This new provision will not enable Electricity concerns to earn any more upon their investors' money, apart from 1|2 of one per cent as a sort of handling fee on the amount of the resulting Development Reserve, nor will the Development Reserve itself be permitted to add to the ultimate property of the investor. Nevertheless it should help the Industry in some measure in its task of raising the additional Rs 70 or 80 crores which it will require to complete its programme during the Second Five-Year Plan.

Deferred Taxation Reserve

Here I must mention a maggot which I understand has just fallen out of our allegoric fruit, but which unfortunately will take with it a part of the fruit itself. I refer in fact to a permission to create a Deferred Taxation reserve. I am not going into all the details here as to why a Deferred Taxation reserve was necessary in the case of our Industry; I have been into it in almost every speech I have made bearing upon this Industry's affairs for years. The point I am going to make here is that the Government were finally favourably disposed towards allowing the Industry to do something about bringing this Reserve into being, but as the proposed permissive clause emerged from Select Committee it was in a form which could have done tremendous harm to units of our Industry. It was pointed out to Government that in our opinion the clause needed considerable redrafting to attain the precise objects in view. Since however time did not permit a full and proper consideration of the various points involved before the Lok Sabha came to vote on the Bill, it has been proposed to drop the clause. This how-

ever does not mean to say that the Government will not be prepared ever to reopen the question. Indeed I am advised that Government will be only too willing to make sure that justice is ultimately done in this matter.

Harmonius Co-existence

In the context of investors' fears about general nationalisation of this Industry or confiscatory terms of acquisition, it appears evident to me that the Central Government has now no such intentions. The whole scheme of the Electricity (Supply) Act is directed towards harmonious co-existence of Electric Supply Undertakings owned by the State and operated by Electricity Boards on the one hand, and Electric Supply Undertakings owned and operated by constituents of this Federation on the other. Indeed the reports are that the Central Government has been much distressed at the attitude of certain States of the Union who are unwilling to set up Electricity Boards to co-ordinate electrical development in their areas and who have spoken instead of local measures of nationalisation.

It is, I firmly believe, the policy of the Centre to discourage such tendencies and to insist, with the fullest support of all constituents of this Federation, upon the desirability of setting up State Electricity Boards in all the States of the Union so as fully to implement the policy for which the Electricity (Supply) Act was enacted. This policy is declared to be rationalisation, and certainly did not and does not include nationalisation.

The Central Government has made no attempt, nor do I believe it intends to make any attempt, to alter the general terms for acquisition of Electricity Supply Undertakings, which remain as they were set out in the Electricity Act 1910; namely fair market value of assets at the time of expiration of the relevant Licenses.

A matter of particular alarm to investors during the last year was an attempt made by some State Governments to declare that dividends should be limited to 3 per cent in certain circumstances, except with the State's sanction. I am glad to be able to say that the new amendments are taking care of this, and should make it quite clear, in case there was ever any real doubt that State Governments have no powers to interfere with dividends.

Rating Committees

I will only touch on one other amendment, also of major importance. This will ensure that State Governments, or Electricity Boards as the case may be, will in future have no powers to impose Rating Committees on Electricity Undertakings unless there has first been established a breach of the Electricity (Supply) Act regulations in regard to their financial obligations. Furthermore, if there is any dispute about whether or not there has been such a breach it must be referred to arbitration of the Authority before any Rating Committee can function. This amendment will do away with one of the greatest obstructions to financial viability in the case of Electrical Undertakings whose position required increases in rates. Now such Undertakings are to be enabled to increase their rates in accordance with law and without any improper interference. Of course, if it is afterwards shown that they acted incorrectly, restitution will naturally have to be made to consumers, but that is very unlikely to happen.

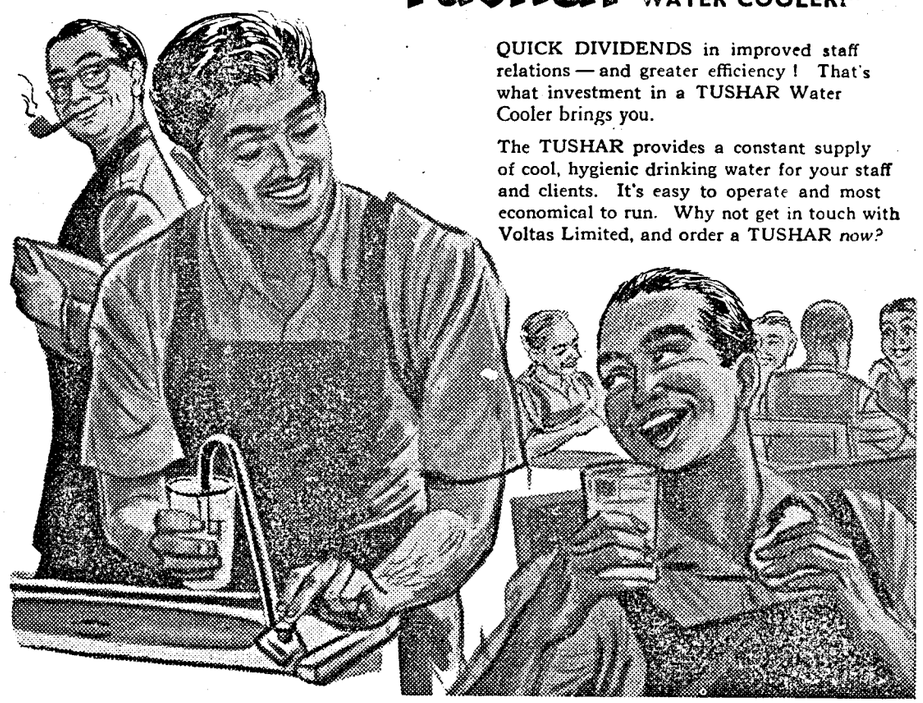
Taken all in all I, therefore, think we may say that we are pleased with the outcome of our six years' effort; hard and worrying as this has been. We will, of course, not relinquish our endeavours to obtain a finally fair settlement in regard to the major outstanding point of Deferred Taxation, but meantime I am hopeful that the principal law governing the well-being of the Electric Supply Industry may be said to have been cleared of its major obstacles.

Of course only the investors themselves can tell us, and the Government of India, whether the return which the amended law is now proposing to give will be sufficient to attract their money. If it is not, then it will inevitably mean that the Government of India must think again; for our Industry can under no circumstances be allowed to stagnate if the country is to continue to go forward.

Demand for Electricity

I fear that a great deal too much emphasis is being placed upon taxation for the sake of financing the Public Sector. Probably few will be prepared to accept what I say. We are accustomed now to being unheard in such matters. I will only suggest with the remote hope that there may be those who are willing to agree, that we would do well to watch with great heed the rate of growth of demand for electricity in the country. This figure of demand for Electricity is the index of progress here as elsewhere.

It costs on the average between Rs 4,000 and Rs 10,000 invested in other plant and productive machinery to make use of 1 Kilowatt (just over 1 Horse Power) of electrical power. If all the people who have been planning to use their money in development are still able to do so then the demand for electricity will continue to grow. But if this money is diverted into the pockets of the State to too great an extent, the rising curve for demand for electricity must begin to fall. I pray that the country's plans may be so laid as to avoid so fateful a reversal of trend, and its dismal implications for the future of the people.



Between God and Mamon

Before I conclude I must refer briefly to a few other matters of individual moment. The Bombay High Court has ruled, in suits before it during the year, that the levy of "additional income tax" on dividends was ultra vires, and the cases have been appealed to the Supreme Court. Meantime there has not been any further progress in determining the legality of denial of dividend gross-up for tax relief purposes where a company has no income tax profit; and thus there continues this satanic reward to those who have done their duty to their countrymen by expanding fastest! To these problems, both stemming from the different depreciation allowances of the Electricity (Supply) Act and of the Income Tax Act, there may now be added another in the latest requirement that the tax allowances be deposited with Government before they can be used for capital purposes. Constituents of the Federation not being allowed by the Act even to earn all the tax allowances they do get as soon as they are earned, are thus in danger of again being caught, as it were between God and Mamon. Which Act one may associate with God and which with Mamon in this context may perhaps best be left to the imagination! The Federation has of course strongly represented the special position of this Industry to the Finance Ministry, and hopes for responsive action.

This Industry is dependent upon a large volume of consumer goodwill; perhaps more than any other industry, and towards this end the Federation has given great attention and will continue to do so. Apart from our Industry's own problems such as regulation and control we must, for the good of the country, make it electricity conscious and so that the benefits of this civilizing influence will enlarge as years go by.

Note: This does not purport to be a record of the proceedings of the Annual General Meeting which will be sent separately to Members.

"...and a bonus of goodwill to the management —for installing the 'Tushar' WATER COOLER!"

QUICK DIVIDENDS in improved staff relations — and greater efficiency! That's what investment in a TUSHAR Water Cooler brings you.

The TUSHAR provides a constant supply of cool, hygienic drinking water for your staff and clients. It's easy to operate and most economical to run. Why not get in touch with Voltas Limited, and order a TUSHAR *now?*

With the TUSHAR you get

- A continuous supply of instantly-cooled water at the touch of a button — no unhygienic refilling or storing.
- A choice of two handsome models.
- Ease of installation.
- Economical to run.

'Tushar'
WATER COOLERS
A modern must for factories, offices, schools, hotels, hospitals and colleges

A Study of Street Beggars

THIS is perhaps the first systematic socio-economic survey* of a neglected stratum of Indian society. The Director of the Survey, Professor Iyengar, says in the introduction that "recently, such surveys were conducted in Madras, Bombay, and Delhi. In spite of repeated requests, literature and data with regard to these surveys could not be had". Considering these initial handicaps, the 'ubiquitous paucity of funds' — notwithstanding the generous donation of H E H The Nizam's Charitable Trust — and the intrinsic difficulties of applying recognised investigational techniques to such intractable material, the present survey must be given due credit as a commendable attempt. It covers such diverse aspects of the beggar problem as the causes and techniques of begging, health conditions, economic status, social life, and immigration. By far the most interesting feature of the survey is the series of case studies of beggars, which give flesh and blood as it were to the bare bones of the statistical sections. These studies, which account for 21 out of the 2419 samples examined in the course of the survey, "go some way in throwing light on certain aspects of street beggar life, which could not possibly be treated adequately in the Report proper".

According to the Report, the number of street beggars in the Hyderabad-Secunderabad City Area is roughly estimated at about 5,000. The survey covered 2,419 street samples out of whom 1,259 were males and 1,160 females. The response of the beggars was generally satisfactory and only 48 refused to answer questions absolutely while 37 refused to undergo medical examination out of fear. The technique of investigation had of course to be adopted to the convenience of street beggars. The socio-economic and health investigations were conducted concurrently and the "beggars were offered some jowar or some cash as a compensation for loss in alms during detention for examination"! The timing of the enquiries was also suitably regulated with a view to maximum response and coverage; for instance, mid-day in market centres and mornings and evenings in durgahs and temples. The enquiry was conducted at 51 centres — an average of 40.1 cases per centre — with no judicial powers or police assistance.

The main findings of the survey are interesting. In regard to the communal distribution of beggars — though communal feelings were conspicuously absent among beggars as well as donors — it was found that Muslims were predominant, accounting for 1,048 out of the 2,419 samples. This is ascribed to the economic dislocation following the Police Action, the abolition of jagirs, the disbandment of the regular and irregular armed forces, and also to the fact that Muslim charities are relatively liberal. Among scheduled castes, hereditary beggars were prominent.

The principal factors in beggary were mental and physical infirmity (644), old age (509), heredity (508), inadequate income of family (350) and unemployment (138). Immigrant beggars (903) mostly came from within the Hyderabad State. Immigration was mostly due to the vexations of village money lenders and the prospects of better alms and medical treatment in the city.

The Report also makes several suggestions towards solving, or at least mitigating, the beggar problem e g through establishment of relief and corrective institutions to be financed partly by a graduated Poor Tax at 2½ — 10 per cent on property and professions by local authorities. The Report poses the question whether street beggars should not be "provided, at the minimum, the standard of life of convicted and sentenced prisoners"?

The Report is written in a lively style and with a shrewd eye on the paradoxes of contemporary social life. There are a number of photographs with arresting captions. Among the memorable case studies are those of "Mahbub Ali" whose opening gambit "I have seen you at Sir Akbar Hydari's house" takes in many a unsuspecting motorist at the petrol pump, and the Arab pensioner who downs his entire monthly pension of Rs 15 in a single day's ganja session!

*Report on a Socio-Economic and Health Survey of Street Beggars in Hyderabad — Secunderabad City Area. Issued by S Kesava Iyengar. The Indian Institute of Economics, Hyderabad (Deccan) Pp 172. Price Rs 6.

Irregularly Lower Trend

Wednesday, Evening

RECOVERY in equities after the slump, as a sequel to the recent tax proposals, was symbolic of the resilience of stock markets. That recovery has not been maintained. This aspect is discussed later. But it is necessary to appreciate the reasons for the earlier recovery to gauge the immediate market trend. There is nothing much in the argument that many companies will pay the increased taxes rather than lower dividend payments. This is not the main reason behind the recovery after the slump, although some speculators may have exploited some such argument.

Technical factors helped the recovery. There has been some covering by "shorts". This raises a question which has yet to be widely realised. Increased super-tax on dividends, tax on capital gains and compulsory deposit of industrial funds are the three main proposals. Industry is mainly concerned with the first and third measures, though the capital gains tax will also affect it. Speculators are mainly concerned with the capital gains tax, while rentiers are worried about the higher dividend taxes.

Marketability

Of all these measures, the capital gains tax has been widely conceded in principle. Speculators are worried, but not unduly, about it. If equities fall further, it will be because investors will not lend support to stock markets except at lower levels. Professional operators are not unaware of this. That equities may settle down at lower levels, does not necessarily mean that stock markets will be stagnant at a fixed, lower level.

Whether or not stock markets have any function, is a question which is not under reference here. But even those who question the utility of stock markets will concede that stock exchanges do facilitate marketability of stocks and shares. Price fluctuations are incidental consequences of this essential attribute of stock markets. This elementary fact is known to speculators. Equities may touch lower levels. But the new taxes do not preclude fluctuations in equities at lower levels.

Futures Markets

Fortunes are made not only in futures markets. During wars, or in periods of planned development in undeveloped countries, values appreciate. Such increment of values is manifested in various forms. Industry, property-owners, traders— all are likely to gain as the economy expands under the impetus of the Plan. But to the layman, the capital gains tax is associated with appreciation in values in futures markets, and taxation of such capital gains. Be that as it may, this does not necessarily involve fixed, lower levels for equities.

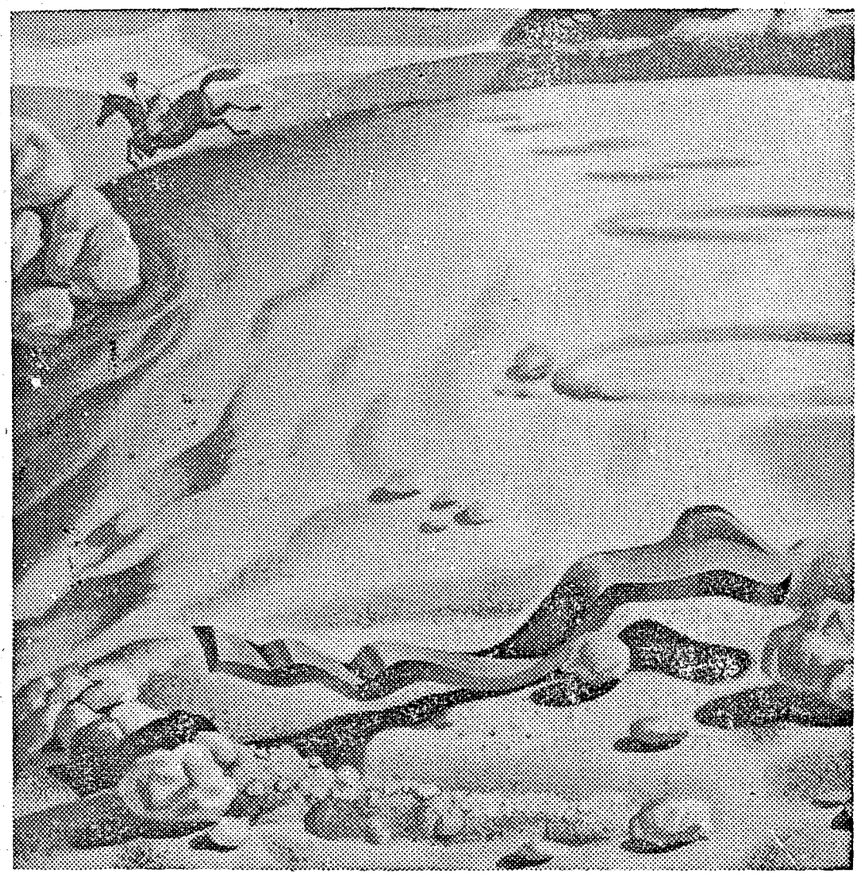
This is where the professional operator enters the picture. He knows that he will have to pay more on his capital gains. This is an impediment, but not an absolute deterrent to appreciation in equity values. It was on some such reasoning that equities made an attempt to move up after the initial slump due to tax-selling. Ups and downs in equities will continue. So will speculative activity. In the process, capital gains will accrue, which will be taxed. That is all that the capital gains tax means so far as futures markets are concerned.

Two Bear Factors

Two factors were responsible for the resumed downward trend in equities. From the Bill introduced in the Lok Sabha, it is evident that the Government is determined to streamline the working of banks. This Bill has been widely interpreted as a prelude to nationalisation of banks. This is a hasty assumption. It is, on the contrary, a move to regularise the working of banks so that circumstances do not arise, as in life insurance, which may necessitate nationalisation.

Those who are familiar with the working of stock markets will not be surprised at Wednesday's behaviour of equities. Stock markets resumed the downward trend as it became known that the Government had appointed a committee to investigate the affairs of a group of companies. That New Delhi is determined to force the private sector to behave, is evident. But there is nothing to suggest that the decision to institute investigation of a group of companies is aimed at the private sector as such.

Income-tax



When stock markets recover from the shocks dealt by the capital gains tax and the higher super-tax on dividends, the shape of things to come will become clearer. Though TTK was discreet in his silence about the main point raised by the President of the Associated Chambers, there are many who are inclined to the view that New Delhi is a convert to the suggestion made by Mr Jenkins. This will follow as a corollary to the Kaldor plan of tax reforms. It involves a scaling-down of the rate for personal income-tax. By May next, when the budget is presented, the standard rate of personal income-tax may be lowered.

After some time, as this realisation grows, the stock market sentiment is likely to improve. A lower rate for personal income-tax, or a reduction in direct taxation of incomes beyond a limit, is likely to have some beneficial effect on equities, as rentiers will have to pay less on dividends even though such incomes will continue to be taxed at the maximum rate. Lower personal income-taxes will have some inducement to save, and should augment individual savings. In the long run, industry will benefit.

Irregular

An irregularly lower trend in speculative scrips, since the introduction of the Bill aimed at greater control of banks, is only to be expected. This Bill has also had indirect effects on the shares of those companies which are known or supposed to rely heavily on bank finance. It has also affected speculative activity in stock markets. There is some reason to believe that the discouraging behaviour of some groups of engineering shares is indirectly due to this Banking Bill.

Improvement in Tea shares has proved short-lived, though weekly auction prices continue to be satisfactory. There was a sudden revival of enquiries for Jute shares on dividend considerations, but the demand petered out as suddenly as it emerged. Activity in stock markets remains poor.

For want of a nail...

THE MEREST TRIFLE—a neglected nail! Yet it led to the loss of a shoe...a horse ...a rider...a battle...a kingdom! Health troubles too are tiny at first, deceptively trivial...coughing, loss of weight, persistent pain in eyes or head, insomnia, listlessness etc.

Don't ignore them. Don't "doctor" yourself, either. See a fully qualified medical man. He alone—with his knowledge, training and experience—can find out the real *cause* of the trouble and treat and advise correctly.

Obey his instructions, and save yourself from suffering, expense and serious complications.

All Eyes on Bonus Issue

Thursday, Morning

IT is true that some relaxations have been made in the supplementary budget. But these are for middle income groups and failed to enthuse Dalal Street. Actually, the market refused to be coaxed into a steady trend and continued to show signs of nervous liquidation all round. However, as the tax on bonus shares has not been raised with the dividend tax, a spate of bonus issues is expected in the coming weeks and Century has led by announcing 1½ shares for every share held. There is a widespread feeling in market circles that all companies will explore the possibilities of capitalising their reserves and issue bonus shares to effect a reduction in the incidence of the dividend tax in the long run.

To the general bearish trend, the demand for higher wages approved at the Labour Conference in Ahmedabad contributed not a little. The Minister for Labour and the Minister for Planning have given their support to INTUC's demand for higher wages in the seven major industries. To this Shri Homi Modi, President of the Employers' Federation of India, has taken strong exception, as the Ministers' reported support to the wage demand is "bound to create a legitimate apprehension in the minds of industrialists that the scales are weighed against them".

An exception to the general trend was Shivrajpur, which maintained a very firm tone following keen influential support towards the end of the week. The inspiration for it was provided by the possibility of a bonus issue by the Company in view of the very high dividend the Company is paying on its paid-up capital.

The new issue of Hindustan Lever received very encouraging response from investors, the issue being over-subscribed on the very first day of the opening. Subscription is said to have exceeded seven times the amount called for. The question of allotment of shares will now be taken on hand in joint consultation with the authorities of the Bombay Stock Exchange since the shares are to be quoted on the exchange. It is understood that the management of the company will favour allotment in lots of twenty five shares. The shares are currently quoting around Rs 19-8.

Cotton

No Imports of US Cotton Yet

THE visit of the Chinese Premier to Bombay has given rise to rumours that the Government of India may grant a further export quota to enable raw cotton exports to China. Like Oliver Twist, the market keeps on asking for more! Sentiment throughout the week was mainly influenced by these reports.

Meanwhile, a mild sensation has been provided by the success of the experiment conducted in South Malabar for the cultivation of "Andrews" cotton, a type of Sea Island cotton, the monopoly of the production of which is held by West Indies. The significance of this successful experiment cannot be overemphasised.

Sea Island cotton is spinnable upto 150s counts and is a well-known specie of extra long staple cotton. It was reported that "Andrews" gave a per-acre yield of 1,614 lbs of 'kapas' at Pattambi in South Malabar and had been adjudged suitable for spinning 70s count in small scale spinning trials. The cultivation of this variety may bring the grower a net profit of about Rs 500 per acre, it is further stated as compared to hardly Rs 100 from other varieties. Needless to say this experiment will surely lead to more intensive investigation and a wider area will be put under this cotton so that in due course India may become self-sufficient in extra long staple cotton. The scheme gains added significance in view of the difficulty of obtaining Egyptian cotton since the blockade of Suez.

Some concern is expressed in importing circles here because no licence has been issued so far for the import of U S cotton, applications for which were submitted over a fortnight ago. It took quite some time for the procedural details to be finalised after the trade agreement had been signed between India and U S A. Even after the publication of these details, it has not been possible for the authorities to issue licences. Importers and mills have protested against this abnormal delay and have drawn the attention of the Government to the freight increase which is to become effective from January 15, 1957. If licences are issued sufficiently early, they mey yet be able to take advantage of the prevailing lower freight rates as also of the relatively lower price level in America.

Oilseeds

Brazil Oil Dampens Prices

WHILE castor futures tended to rule lower from the high level of prices during the last two weeks and more, groundnuts were distinctly firm. Sentiment in castor was adversely affected by liquidation on fairly large scale. Enquiries continued to flow from America and the U K but at lower prices. It was reported that Brazil was offering castor oil to America and hence American quotations tended to be lower.

There was sustained demand for groundnut from millers and crushers on hopes of an early announcement of an export quota for groundnut oil which influenced sentiment in both ready and futures.

Groundnut February which opened at Rs 144-4 gradually improved and shot up towards the end of the week on Calcutta support to a new peak level of Rs 153-8.

Linseed and cottonseed tended to be steady. There was speculative support early in the week in both linseed and cottonseed.

Washington and The Neutrals

IT would be optimistic to expect any basic change in either American or Indian foreign policy as a result of talks between Pandit Nehru and President Eisenhower. But it would be reasonable to hope for a greater understanding between the two countries as a sequel to discussions between the two statesmen. Such an understanding will have to be based on the changing world set-up since the Geneva Summit Conference. Washington's reported invitation to President Tito emphasizes President Eisenhower's awareness of the developing international situation. It is a welcome sign of the times that neutralism is no longer suspect in Washington. This is evident from the Indian Prime Minister's visit to America and the anticipated invitation to President Tito for talks with President Eisenhower on world affairs.

President Tito and Prime Minister Nehru not only embody the essence of neutralism. They are undisputed leaders in two key positions in the world. In the fight for an even world balance of power, Asia and Eastern Europe occupy crucial positions. It is, therefore inevitable that both Washington and Moscow will be anxious to cultivate friendship of these two key statesmen. Both sides of the "cold war" have reached an understanding not to start an atomic war. But the struggle for world domination has not ceased. Hungary and the Anglo-French aggression in Egypt have created additional complications. America's NATO allies are hoping that President Eisenhower will succeed in convincing both the Indian Prime Minister and the Yugoslav President of the need for as critical an approach to Russia as to West. In any such attempt, President Eisenhower will be preaching to converts. Equi-distantialism is implicit in neutralism.

There are other equally urgent world issues which demand greater understanding and collaboration among Washington, Belgrade and New Delhi. Even without recent developments in Hungary and Egypt, such tripartite co-operation could be of help in easing the prevailing world tension. Trouble has been simmering in west Asia for more than a year. Cairo's decision to nationalise the Suez Canal Company and the consequent Anglo-French aggression in Egypt have intensified the tension in west Asia. Far east Asia continues to be a potential threat to world peace. Developments in Hungary have focused the world's attention to Eastern Europe. For a solution of issues in both Europe and Asia, it is necessary to ensure greater understanding between America, India and Yugoslavia. India can function as a bridge between west Asia's aggressive nationalism and West, as well as between Communist China and West. Yugoslavia is in a position to maintain the balance in Eastern Europe. Together, President Tito and Prime Minister Nehru can suitably co-operate with President Eisenhower to ease the tension between East and West.

For a proper appreciation of the need for collaboration among America and neutral nations like India and Yugoslavia, it is necessary to assess certain recent developments. There have been attempts by Britain and France to justify their aggression in Egypt on the ground of progressive Russian encroachment in west Asia. Such explanations have not convinced the world, though some Western Powers, including America, have expressed fears about the extension of the Russian sphere

of influence in the whole of Asia. Pandit Nehru has expressed his opinion that such apprehensions are exaggerated. Both the Indian Prime Minister and President Tito are known to have exercised a restraining influence on President Nasser. Cairo will certainly reject *the 18-nation plan for the future* control of the Suez Canal. But, there are indications that, at the instance of India, Yugoslavia and the Soviet Union, Egypt will accept a reasonable arrangement for co-operation with a representative users' association for the operation of the Canal.

On the Canal issue, there is not likely to be any fundamental *disagreement between India and* America. There is another recent world development which is a matter for concern to both countries. Britain and France resent America's policy to the Canal and to west Asia as an affront to the Atlantic Alliance. Recent shifts in America's foreign policy is being exploited by some of her Western allies for consolidating unity in Western Europe. This raises *the controversial* theory about a tacit agreement between America and the Soviet Union to withdraw from Europe in order to *concentrate* their energies on Asia. As Europe is receding into the background, Afro-Asia is emerging as a major world factor. Western Europe, including Britain, is as much suspicious of the growing influence of Afro-Asia as of the two major world powers, America and the Soviet Union. To counteract both these growing world factors, there is a *move towards closer* political and economic alliance between Britain and the European members of NATO. Such a politically and economically united Western Europe is to be encouraged as a bargaining force against both the giants, as well as to perpetuate its sphere of influence in Asia and Africa. To consolidate Western Europe and the *Atlantic Alliance*, new supra-national political assemblies and institutions have been proposed. For the economic benefit of such a homogeneous western Europe, colonial areas in Africa are to be expoited through a development fund to be created by the powers concerned.

Under the joint Anglo-French leadership, the proposed consolidation of Western Europe will serve two purposes. It will be used as a counter-balancing force against both America and the Soviet Union, as well as a sop to America to lend support to it in her policy of containing Communism. There are many aspects to this proposal for a united Western Europe. But India and other Afro-Asian countries will be intrigued over the plan for joint economic exploitation of the remaining colonial areas by Western European powers. It is to the ultimate interest of Afro-Asia, including India, that Pandit Nehru will discuss with President Eisenhower all the aspects of this new shift in the policy of Western European powers. Even as New Delhi's friendly relations with Cairo and Moscow enable India to function as a bridge between East and West, her link with the Commonwealth and amicable relations with France provide her the opportunity to discuss the new political trends in Western Europe with its two leading powers. Developments since the Geneva Summit Conference underline the simultaneous need for fortifying the United Nations and for greater understanding and co-operation between India and America.

Greetings

We wish all our readers and patrons a Happy Christmas and a Bright and Prosperous New Year.

This is the last Number of the current year. There will be no issue of The Economic Weekly on December 29 on account of Christmas Holidays.

The next issue Volume IX No 1 will be out on January 5, 1957.

Jute—Prince of Pakistan or Quisling?

SINCE Partition the East Pakistan Government has staged a succession of moves either to prevent a leakage of foreign exchange from the export of raw jute or to provide its growers with a better return for their labours than they were getting. Of course, even that Government would admit that solicitude for the grower was but sproadic, not sustained. One of the important forces with which the Government had to contend was to prevent smuggling across the East—West Bengal frontier. This was no easy work, particularly when many of its own nationals co-operated in this black trade, without which, of course, the trade would have withered away. Other measures taken to improve the jute economy and/or to improve the State finances were the institution of minimum export prices and the levy of export duties. Without an adequate trained personnel, to enforce minimum prices proved a tricky task when Government had to contend against interests in the trade with hoary connections with this commodity.

As a technical factor aimed at giving the East Pakistan Government greater control over the raw jute trade, the export of kutcha bales was banned some time ago. These were largely exported to India, and this ban has helped in no small way in enforcing price and quality controls. It is through such measures that the ubiquitous Jute Board has been attempting to gain control over the raw jute trade simultaneously with providing the basis for a quick development of the manufacturing industry. The total ban of all export from India to South Africa provided Pakistan with a *tailor-made market* there for her gunnies; foreign competition in South Africa was non-existent, except for the small quantities of Indian goods which found their way there through a circuitous route, evading the law at numerous points.

In any case, however, the development of the mill industry in East Pakistan is inexorable. The golden fibre is at its door-step, and through export duties and minimum price regulations Government has further widened the gap between the price that the Pakistan mill has to pay for its raw jute and the price that mills elsewhere must pay beyond the usual cost of transport, etc. Despite high initial capital expenditure and the handicaps like shortage of power and trained labour, the competitive position of Pakistan jute goods is very strong. Add to these advantages a fully protected and expanding internal market.

But something must have gone wrong somewhere. East Pakistan has now announced its decision to set up a Jute Marketing Corporation, with an authorised capital of Rs. 8 crores, to carry out controlled marketing operations from the beginning of the next jute season, that is, July, 1957. According to the Chief Minister, this Corporation will bring into existence a Government sponsored trading agency free from the cumbersome Government procedures and in a position to function in a real business-like manner. This, he hopes, would ensure a fair price to the jute growers and bring stability in the jute market. We may mention in passing that in recent times the Pakistan grower has indeed been faring very well. With growing internal and foreign demand, and fluctuations in Indian policy with regard to the operating capacity of our mills, in the interior markets of Pakistan raw jute has averaged Rs. 26 a maund in this season. This is, by all known standards, way above what it costs the grower to put a maund of jute on the market. However, Government may just be providing against a recurrence of the post-Korean slump.

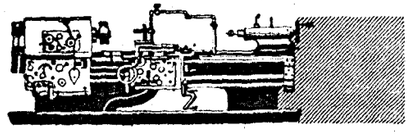
To come back to the Corporation, of its authorised capital of Rs 8 crores, only one-half is proposed to be issued. Government will contribute Rs. 2 crores of this, and the balance of Rs. 2 crores will be raised from the public in shares of Rs 10 each. Perhaps to prevent a concentration of holdings, public subscriptions will be limited to a maximum of Rs. 500 for individuals, and Rs. 1,000 for organisations and firms. Rs. 2 crores is a large sum to be raised in such driblets, particularly when it has been announced that the Corporation will not be a profit-making concern whatever that might mean.

How far it will influence the jute economy is still rather vague. The smallness of the capital in relation to the size of the East Pakistan jute crop—roughly valued at Rs 60 to 70 crores at the village level—may not be a serious limiting factor. The Corporation would not at any one time hold more than a fraction of the crop, and, with Government as a shareholder, the State Bank of Pakistan or commercial banks may supplement its resources. Also it is wise to go slow and feel one's way before enlarging commitments.

The Corporation is to set up 20 large buying centres in the Province to buy jute direct from the growers, and is to have the monopoly of buying within 5 miles of the border of the Province. (Full reports are not available, but a figure of 200 centres is also mentioned in some despatches). The transactions of the Corporation will be on the basis of minimum prices to be determined by Government for the season in relation to the export minimum prices which Karachi will fix in consultation with Dacca. This, of course, is alright. But what happens when such minimum prices need to be reduced? Will this Corporation oust from the field the private agencies to whom the growers today sell their crop, very often against a prior loan which virtually mortgages the crop to such agencies? If Indian experience is any guide, marketing and credit must go hand in hand for either to succeed. As for godowns to store what the Corporation will buy, Government will presumably requisition them, including bailing presses, if need be.

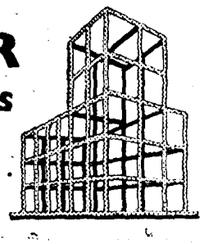
But the big question mark is with regard to exports. In recent years East Pakistan has exported some 5.6 mn. bales annually, one-quarter going to India. Is the Corporation to have a monopoly of such exports? Not that such a step is strictly necessary, but the course of events, and the need to avoid losses due to changes in the minimum prices may drive the Government to it. In that case the major consumers of Pakistan jute may have to think anew their own purchasing policy vis-a-vis a monopoly seller. These are all vital matters, and one can only hope that in the working of the Corporation, jute will not step down from its princely pedestal to become a quisling.

METAL NEEDS PROTECTION



Whatever the nature of the metal surface, it can be protected indefinitely against corrosion by the use of a specific **Shalimar Paint Product.**

That's because only ***Shalimar Paint Products*** *are backed by over 55 years of manufacturing experience in India. The extensive paint research, constant progress, and development carried out is a guarantee that* ***Shalimar Paint Products*** *will stand up to the difficult and extreme climatic conditions in India.*



Whatever the need, specify the purpose when you order

SHALIMAR

Weekly Notes

Russian Aid for Steel

Our Delhi Correspondent Writes :

THE Soviet team of experts on heavy industry which recently toured India is understood to have made a recommendation which, if implemented, would make perhaps the most significant contribution towards the industrialisation of the country during the Third Five Year Plan period and thereafter. It has suggested the establishment of a heavy machine building plant to fabricate units for steel production. To be located in Bokaro, the plant will have the capacity for casting, forging and machining 100,000 tons of steel annually—a capacity just sufficient to give the country every year one steel plant with a million ton potential. The project will cost Rs 168 crores and the Russians appear to be willing to finance it. If steel production is the key to industrialisation, the Soviet experts are eager to help us acquire it.

Opinion on the project is however, divided among the Government's top policy-makers. Shri Govind Vallabh Pant, Shri T T Krishnamachari and Shri Morarjee Desai would like to put in a more modest effort. They are understood to be in favour of a plant half the recommended size. Shortage of finance is one reason. The need to minimise strain on limited transport capacity is another. Presumably the feeling that India should not commit herself too heavily with the Soviet Union also hovers in the minds of the "Big Three" of Nehru Cabinet.

Another view however is that India should accept the project report and immediately initiate negotiations to ensure Soviet aid on the required scale. By the end of the Second Plan, it is argued, India would have 5 steel plants. Another steel plant at Bokaro and a seventh steel plant in the south is being contemplated. The replacement needs of all these plants could total up to the equivalent of half a new plant. Thus the project would produce enough equipment for a new steel plant every two years. Considering that China is already geared for producing 12 million tons of steel, India, by implementing this project, would be merely making a modest move towards self-sufficiency. Transport of nearly 200,000 tons of equipment and raw materials to the site of the project in the heart of the steel belt should not present any problem in the context of 180 million tons of goods traffic that the railways would be expected to carry at the end of the Second Plan. Besides the opportunity to take advantage of the Soviet generosity may not recur. Nor will the eventual expansion of a smaller plant to the size contemplated now would be as technically or economically sound and practicable proposition in these days of mounting costs and rapidly changing techniques. A final decision is likely to await the return of the Prime Minister.

How is the Soviet loan of Rs 60 crores likely to be utilised? Details have yet to be worked out. Preliminary plans indicate that the foreign exchange component of the Rs 23 crore fertilizer plant in Trombay will be financed from the Soviet loan. The plant will have an output of 75,000 tons of nitrogen. A new fertilizer plant in Bhilai is contemplated at a cost of Rs 18 crores. The Sindri fertilizer project has an expansion programme costing Rs 10 crores. Besides some of the equipment for the heavy electrical equipment plant in Bhopal might be financed from the Soviet loan. The Bhopal project is being implemented under an agreement with the Associated Electrical Industries. How the British firm will collaborate with the Soviet Union is likely to present an interesting set of problems.

Developing Our Tourist Industry

TOURISM is big business in Switzerland and France. India has yet to develop it and the Union Ministry of Transport is concerned about this matter. The Second Plan has estimated an average annual income of Rs. 11.20 crores for the five years 1956-60, the targets for individual years being: 1956: Rs 8.75 crores, 1957: Rs 10.06 crores, 1958: Rs 11.57 crores, 1959: 13.3 crores and 1960: Rs 15.31 crores. The number of tourists who visit India has increased from 20,000 in 1951 to 43,600 in 1955. In 1955 tourist expenditure was Rs 10.1 crores, as compared with Rs 7.7 crores in 1951. Since the Second Plan had estimated no more than Rs 8.75 crores in 1956, this target was already exceeded in 1955!

The Second Five Year Plan has allotted Rs 4.23 crores for developing tourism, of which 187 lakhs will be spent by the Centre, 151 lakhs by the States and Rs 85 lakhs from central funds which will be made available for promotion of tourism in Jammu and Kashmir.

The schemes include new rest houses and expansion of existing ones, gardens, canteens, pavillions and cloak rooms at sites, development of spas, game sanctuaries, provision of transport, car parks etc. The expenditure earmarked by the Central Government on these schemes total Rs 90 lakhs. Another Rs 40 lakhs will go in publicity—folders, documentary films etc—and about 10 lakhs for Tourist Bureaus. The States will spend their amounts on similar schemes. But here the slant is on home tourism. Special rest houses and restaurants etc will also be run for low income groups.

The Estimates Committee of the Lok Sabha on Tourism, finds this amount liberal, in view of the limited financial resources available for the Second Plan. Regarding the proposal to set up a Corporation to promote and regulate tourism, the Committee agreed on the desirability of such a Corporation when the industry had fully developed, but as it had not yet reached that stage, it has recommended a Board of Managing Directors be set up instead. This Board will consist of four to five members, including representatives of the Department of Archaelogy, and the Ministries of Information and Broadcasting and Transport. At least one of the members should have experience of financial matters. The Chairman should be directly responsible to the Minister for Transport, and should not be subject to the control of the Secretariat of the Minister.

The Report of the Estimates Committee contains the findings of a sample survey of the pattern of tourism in India, conducted by the Tourist Division. It covered 1067 tourists who were interrogated in Delhi. Here are some of the results of the survey:—

i) 53.5 per cent of these tourists were from the U S. Pakistan and UK, technically second and third, contributed only 7.5 per cent and 4.5 per cent respectively to the total.

ii) The average duration of stay of a tourist in India was 28.52 days. Tourists from the U S and Canada stayed for an average of twenty days only.

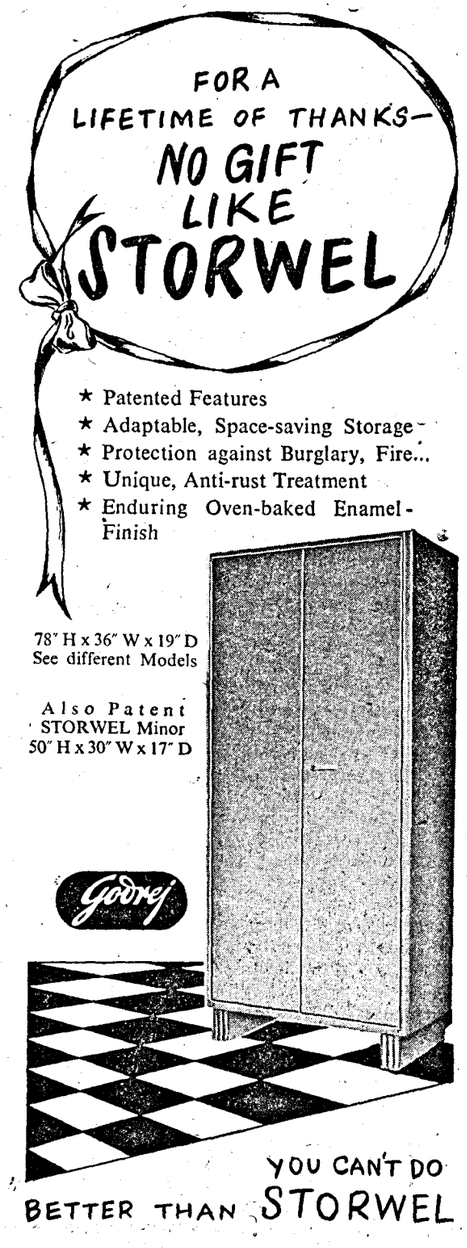
iii) As many as 82.1 per cent of the tourists arrived by air. Of the rest, 8.7 per cent came by sea and 9.2 per cent by land.

iv) Average daily expenditure of a tourist was Rs 62, of which over one-half, Rs 34, were spent on boarding and lodging. (The Committee remarks, rather curiously, that the latter figure is on the high side).

v) The favourite items of souvenirs purchased were curios, textiles, and various handicrafts, eg ivory goods, and gold and silver ware.

According to the survey hotel accommodation was, generally speaking, satisfactory. Complaints relating to bad food and want of cleanliness were mainly directed against certain hotels in Calcutta, Banares, Agra and the circuit house at Jaipur.

Extension Service in Coal



THERE must be few people who could vie with Shri Darab Driver in his intimate grasp of the multifarious problems of the coal industry—in its production, transport, and utilisation aspects. His Presidential Speech at the Annual General Meetings of the Coal Consumers Association of India is always eagerly read. He is constantly throwing out new ideas, and new combinations of old ideas, and what is equally important, urging Government and the industry to adopt the latest technical advances achieved in the laboratory crucible. This voluntary extension service deserves our thanks, as well as sustained application to see how many of these ideas and developments can be applied in the constant economic battle—to make our limited resources which have alternative uses to go the longest way.

Shri Driver enumerates four extraneous circumstances helping the Coal Plan of the country.

(a) 50 miles south of Sui in Pakistan perhaps one of the largest deposits of natural gas in the world has just been discovered. It is not beyond the capacity of the diplomats of the two countries, hopes Shri Driver, to arrive at an agreement by which Pakistan could export this gas to Saurashtra and the industrial belt in and around Ahmedabad to pay for her imports of about a million tons of coal from India annually.

(b) Researches at the Fuel Research Institute at Dhanbad appear to hold out distinct promise that by suitable blending of coal from the Raniganj and Jharia a reasonably satisfactory quality of metallurgical coal can be produced, which will remove an important bottleneck in the way of the expansion of our steel production.

(c) Studies conducted in Europe by our technical men indicate the potentialities of special boilers to use high ash content coal which would become available either directly from the Korba fields, or as a product of coal-washing which is being planned on a large scale for

feeding the steel plants with coal of uniform ash content.

(d) If the Assam Oil Company refinery is located near Calcutta the use of its fuel oil and gases will gradually reduce the consumption in Calcutta of the Dishergarh type of Raniganj coal which would be required for purposes of blending.

Shri Driver has drawn pointed attention to the qualitative content of the extra 22 mn tons of coal proposed to be raised annually in 1961. If the new fields to be developed yield inferior coal, the allocation of the additional production that has now been made as between the different areas may have to be changed. With regard that very serious matter namely transport, Shri Driver feels that the fact that the Railways have been allocated a smaller sum in the Plan than was demanded may not be very significant. Planning Commission has assured the Railways that this allocation would be revised from year to year according to the circumstances. Also Shri Driver is candid, and says "we fear there will be many retarding factors affecting the Plan."

Electrification the Remedy

HE places considerable emphasis on electrification of certain routes, and goes as far as to say that "speedier electrification on many important railway lines is the only ultimate solution of the inability of rail transport to meet the rising demands". The electric locomotive scores over the steam engine in many respects—its efficiency is 13 to 20 per cent as against 4 to 6 per cent of the steam engine; coal required to produce net electric power to move the same amount of traffic is only one-quarter of the coal required in steam traction; electric engine can work 20 to 22 hours a day against 10 to 15 hours by a steam locomotive, and can do an average mileage of 1 lakh against 29,000 miles of a goods steam engine; electric locomotive costs twice as much as a steam engine but gives 2½ times the work of the latter; it requires less maintenance personnel; it has better acceleration and gives better speed and therefore better turn round of wagons which means less equipment of rolling stock for a given volume of traffic than with steam traction. He gives two revealing figures, which put the coping stone to these arguments—in 1954-55 the railways paid Rs 16.5 crores and Rs 20.55 crores for coal used by them and freight on such coal respectively.

Addressing the coal consumers in particular, Shri Driver was more than candid when he said "the Second Plan will be a purgatory of suffering for the consumers and they should be prepared beforehand". They are today paying for qualities of coal which they often do not get. Railways are perhaps the worst sufferer. With the increase in the proportion of open cast coal in the total risings of the country, unless very definite measures are taken the dust content of coal will tend to rise. The recent Award of the Coal Tribunal which increased the prices of coal by Rs 3 per ton is only the first of a series, and the Award indicated that the Tribunal thought that higher coal prices would tend to make consumers economy and efficiency minded. More than half the State collieries are working at a loss, and when the new collieries in Korba, Karanpura and other places, are opened up the loss in the public sector will probably increase and the normal reaction would be to raise coal prices to enable collieries in the public sector to balance their losses.

Japan's Seeming Political Balance

SINCE Mr Ichiro Hatoyama's return from his mission to Moscow, it has been evident that some groups in his coalition Cabinet are dissatisfied with his leadership. But the appointment of Mr Tanzan Ishibashi as his successor indicates that the retiring Prime Minister's political opponents have not succeeded in gaining control of the coalition Cabinet. It is not without significance that the nominee of Mr Kono, the "strong man" in the Hatoyama Cabinet, has not been chosen as the Premier. There have been reports that the political elements who are hostile to the Russo-Japanese agreement, recently negotiated by Mr Hatoyama, have been trying to consolidate their position under the leadership of Mr Yoshida. He is also reported to have the support of Big Business. Even so, it has not been possible yet for Mr Yoshida to reemerge as the leader. Nor has Mr Shigetmitsu, the Foreign Minister and the leader of the Progressives in the Liberal-Democrat coalition, succeeded in his bid for power.

Mr Ishibashi's appointment as Prime Minister of the coalition Cabinet would seem to indicate that Japan would continue the present foreign policy for yet a while. Japan's admission to the United Nations was a foregone conclusion since the Russo-Japanese agreement. But there are many issues still in dispute between Japan and Russia. There is dissatisfaction in Japan about Russia's attitude on the strategic islands in the southern Kuriles. On the other hand some political elements have strong reservations about American bases in Japan and Okinawa. There are economic issues which may aggravate political troubles. Japan's export drive to southeast Asia remains an explosive issue. Under the Russo-Japanese agreement, Russia has promised increased trade relations between the two countries. This is one possible way for Japan to bypass the prevailing restrictions on trade with the Chinese mainland. Each and all of these political or economic issues may disturb Japan's seeming political balance.

Letters to the Editor

Capital Gains Tax

SHRI B K SINGH's article on the subject in your issue of December 8, though informative, suffers from one important defect. It is practically silent about the defects of the proposals regarding capital gains tax made by the Finance Minister on 30-11-56. In these proposals the Finance Minister has followed Prof Kaldor's principle of taxing capital gains at the ordinary income tax rate. But his recommendation to lower the marginal (seven annas in the rupee) rate has not been accepted. This is a grave defect of the Krishnamachari proposals. For this will have a very adverse repercussion on the private sector. Prof Kaldor himself in his Report has pointed out that, "if capital gains are treated in the same way as other forms of income, which means taxing them at the rate of 90 per cent, the economic effects will undoubtedly be serious". In fact, the disincentive effects of taxation depends on marginal rates of taxation and if these are kept down to reasonable levels, there will be no inducement to resort to tax evasion and dishonesty.

Kaldor's proposals are still under consideration of the Government and hence perhaps the Finance Minister does not like to lower the marginal rates of taxation of income without giving effect to his other proposals. For this may lead to a fall in revenue. These are the likely justifications of Shri Krishnamachari.

Now pending implementation of Kaldor's integrated scheme (or other fresh schemes), some sort of solution has to be devised. We may now follow the American model. In America, the rate of long term capital gains tax never exceeded 25 per cent whereas the highest tax rate on ordinary income is 82 per cent. This provides an inducement to persons in the highest income brackets to obtain income as long term capital gains. Thus in U S A wealthier persons can obtain their income in this form only if they make investments which appreciate substantially in value. Normally I would not support this sort of policy on fiscal grounds, but in the present case this seems to me a correct remedy. The difference between the income tax rate and capital gains tax rate, however, should not be more than 15 per cent (say 90 per cent and 75 per cent). In the long period, it is possible to evade tax by converting ordinary incomes to capital gains. But in a temporary arrangement (like the one suggested here) it will be very difficult to do so.

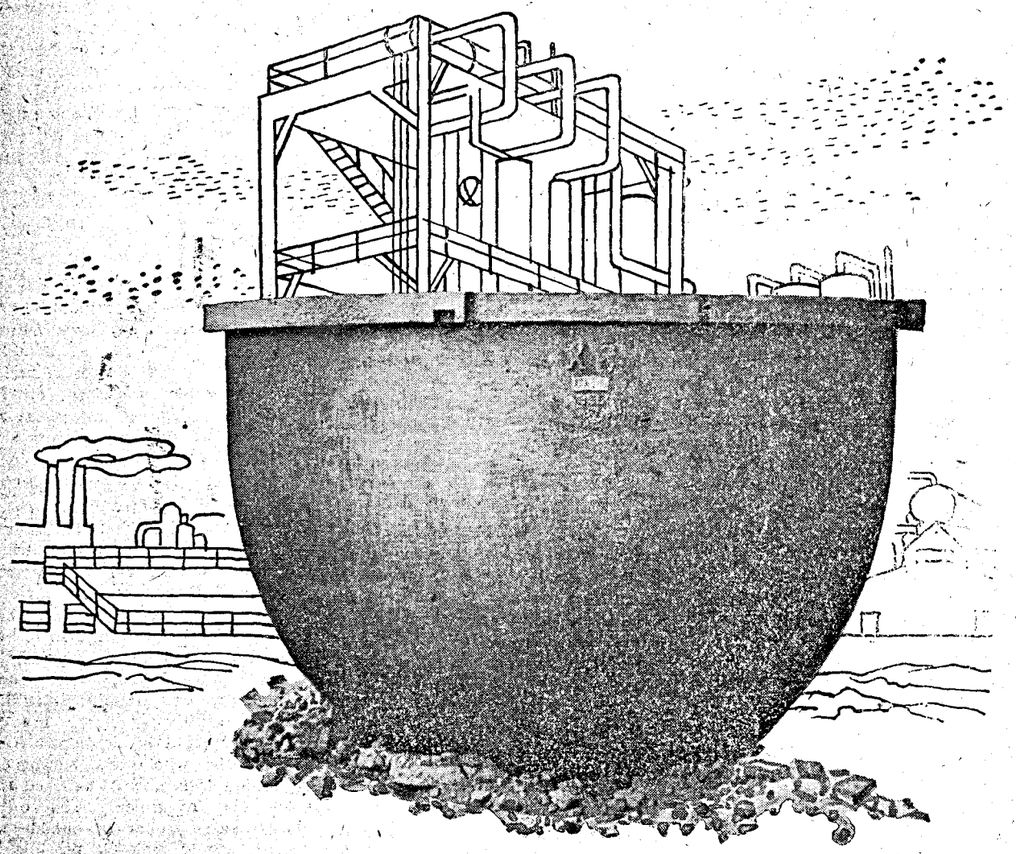
Consumption Goods Multiplier

PROFESSOR VAKIL and Dr Brahmananda assert that they are the originators of the concept of the consumption goods multiplier. Prof Dasgupta who claims to be a careful reader of Nurkse as well as the authors of the consumption goods multiplier, asserts that the 'authors' approach the problem from a wrong end as compared to the more sensible approach of Nurkse. The following passages from Nurkse, which I quote without comments, will show how unfounded both these assertions are.



"In these circumstances the formation of capital through the use of surplus labour is self-financing only if the mobilization of the concealed saving potential is 100 per cent successful. If it is less than completely successful, the scheme seems to break down; the amount of saving or in real terms the subsistence fund available to support the workers engaged on real capital accumulation, proves insufficient. Let us suppose the leakage arises from the peasants who remain on the land consuming more of their own food crops. If their dependents, the investment workers, do not get enough to eat on their new jobs, they will run back to the farms to resume their previous existence and to absorb on the spot the food produced there. It seems to be a question of all or nothing. Either the whole of the food surplus that becomes available on the land through the withdrawal of the surplus labourers is mopped up to feed them in their new occupations, or nothing can be done at all.

"On reflection, however, it will be seen that the surplus labour can still be employed for capital formation if some complementary saving can be secured from outside the system, to close the deficiency of saving that may arise within it. Some complementary saving might become available from domestic sources, and there is the possibility of capital imports. So it may not have to be all or nothing. Even if there is a leakage in the subsistence fund, provided only that it can be covered by means of resources obtained from outside the system, it will be possible to mobilize the whole or a part of the disguised unemployment for the purpose of capital formation. The degree of mobilization possible will depend on the amount of complementary saving available and on the relative size of the leakage.

"Suppose, for example, that 20 million dollars is the annual value of the subsistence fund that should theoretically become available when the surplus workers leave the farms. Suppose further that the unavoidable leakages, due to somewhat higher consumption and also to the cost of transporting food from the farms to the capital projects add up to 10 million dollars. In this case, if 10 million dollars of investible funds could be obtained from outside, the whole food surplus of 20 million dollars could be freed and used for investment. In other words, every dollar of outside resources would make it possible to realize two dollars' worth of the saving potential associated with disguised unemployment. **In this way the funds from the outside can exercise a magnifying effect on the total rate of capital formation. Evidently a multiplier concept of a certain kind becomes applicable here, though we should hesitate to multiply the multipliers that have appeared in economic literature.** (Emphasis mine) We should only remember that the outside funds just mentioned can be, but do not have to be, of foreign origin; they can come, as already explained, from domestic saving, voluntary or involuntary. They are resources that originate outside the subsistence fund concealed in the state of disguised unemployment."

—Ragnar Nurkse, Problem of Capital Formation in Underdeveloped Countries (pp 39-40) Oxford, 1953.

Implications of the Compulsory Company Reserves Deposits Scheme

A C Chhatrapati

THE most surprising part of the 'surprise' supplementary budget proposals of Shri T T Krishnamachari is the proposal requiring Companies to deposit prescribed percentages of their past accumulated reserves and current retained profits and depreciation reserves with the Reserve Bank of India. There is no precedent to this measure which will have far reaching repercussions on company finances as well as on the liquidity of the banking system which is the depository of the liquid funds of companies.

The Second Five Year Plan is admittedly ambitious. Its fulfilment will demand fullest possible mobilisation and effective direction of the use of the country's resources. This task is particularly difficult in India with a democratic form of Government and a mixed economy. The Government of India have started in earnest to mobilise the domestic resources of the country. Within limits imposed by the political and economic conditions taxation and deficit financing have been resorted to. Campaigns for sale of National Savings Certificates and loans, compulsory introduction of provident funds, nationalisation of life insurance and the largest commercial bank, The Imperial Bank of India, have been steps to encourage private savings and control their use largely for the public sector. The State budgetary controls are expected to ensure that these resources are used for the fulfilment of the Plan.

Company Reserves Deposit Scheme

So far as the private sector is concerned, administrative measures have been used to prevent the use of resources in directions not conducive to the fulfilment of the Plan. The Industries (Development & Regulation) Act and the Control on Capital Issues provide the tools for this purpose. Government has also been in a position to influence the directions in which commercial bank deposits can be used through the Reserve Bank of India. The only remaining form of organised savings is the ploughing back of profits by Joint Stock Companies. So far Government could only prevent their use for expansion of the of the industries controlled under the Industries (Development & Regulation) Act if so desired for purposes of the Plan. There was no way to ensure that these reserves would be definitely used for the purposes of the Plan. The object of the company reserves deposit scheme introduced in the new Finance Bill is to obtain a control on these reserves and direct their use for purposes of the Plan.

The new Finance Bill seeks to restrict large distributions of dividends through penal rates of supertax on larger dividends. The corporate savings are, therefore, expected to increase and thus larger resources would be available for the Plan.

The new Finance Bill will deprive the companies of the benefit of deduction from income of depreciation, development rebate and of losses on sold or discarded property for income-tax purposes unless they deposit with the Reserve Bank of India by 30th June each year an amount made up of the following:

(1) 25% of the accumulated profits and reserves to the extent they are not represented by fixed assets in business; and

(2) 75% of the amount by which retained profits, i e, profits less taxes and dividends plus depreciation and development rebate exceeds Rs 1 lakh.

The Finance Minister has announced that initially only 50% of the annual retained profits and depreciation will be required to be deposited in the Reserve Bank. He has also assured that the Rules will provide for refunds of the deposits to companies for ways and means, repayment of loans, rationalisation and expansion of their activities and investment in new approved projects. Further, banks will not be required to put any deposit.

Company Finance

Before analysing the implications of the compulsory deposit scheme, it may be useful to consider the general ways in which company finances are raised and managed. A company starting an industry will raise capital by ordinary shares, preference shares, debentures and long term loans from Industrial Finance Institutions, in any one or more ways, to finance the initial cost of fixed assets and the estimated minimum initial working capital.

The amount of working capital to be raised by equity or other form of long term loans will depend on the nature of the Industry, expected rate of output initially and the availability of short term finance from banks and raw materials on credit from suppliers. No company provides its full requirements of working capital in the form of equity or long term loans because it will be wasteful and expensive. It would also adversely affect the financial status of the company by showing a poor ratio of return on employed capital. Once the company is a going concern, it is the task of management to find ways and means for maintaining and expanding its activities. Additions to and replacements of equipment and building, changes in the inventory of raw materials and finished goods, extension of credit to clients, repayment of loans require funds or affect receipts and disbursements. Since profits are only part of receipts, they are very often absorbed in business by these day-to-day decisions of management.

The accountant keeps a record of these changes and at the end of a financial period prepares a profit and loss account and balance-sheet. The board of directors meet to decide the disposal of the surplus revealed by the profit and loss account. Their decisions regarding provision of depreciation and reserves are independent of the ways and means position of the company because the surplus earned on the liability side of the balance sheet is already accounted for by changes in fixed assets, stores, accounts receivable, investments and cash on the assets side. The fact that reserves do not necessarily represent accrual of liquid resources can also be effectively brought out by the changes in a balance sheet effected by the decisions of the directors to revalue fixed assets or bring goodwill on the books as an asset. Such decisions will increase

reserves on the liability side without bringing additional resources to the disposal of the company.

Radically Different Concepts

The deposit scheme is tied up with the income-tax liability of the companies. A deposit liability will therefore be determined on the basis of accumulated reserves and retained profits and depreciation allowances reflected in the company finances assessed for income-tax purposes. Now the commercial accounting concepts and income-tax concepts differ radically. Under the Income-tax Act both income and expenses are determined according to the law. They are therefore statutory fictions. To illustrate, a company purchasing machinery with a useful life of 20 years will provide depreciation at 5 to 10% depending upon its profits. Under the Income-tax Act the company will be allowed a deduction every year of normal depreciation at 10% of the written down value of the machinery, additional depreciation equal to normal depreciation in the first five years, extra depreciation at 50% of the normal depreciation for each of the second and third shifts worked and finally a development rebate of 25% of the original cost of the machinery. No company provides such depreciation allowances in its published accounts. Therefore depreciation reserves and accumulated profits from the accounting standpoint and the income-tax standpoint will differ widely especially in the early periods of installation of new machinery. For this reason the balance-sheets of companies which have installed new plant and machinery are not a good guide for determinig their deposit liability. For long established industries, however, the company balances can be used for estimating their deposit liability.

As stated above, the accumulated reserves of a company have already been put to a constructive use in providing some fixed assets and working capital. At a time when industries are working at full or near full capacity, transport difficulties and market fluctuations make larger working capital necessary; when the commercial banks provide working capital only to approved industries and when bank credit is fully extended; the reserves deposit scheme requiring withdrawal of liquid funds from companies must adversely affect production. The Finance Minister has assured that these deposits will be refunded to meet working capital requirements. However, the rigid legal requirement of first depositing and then seeking a refund would disrupt the working of many companies which have insufficient liquid resources.

Effects of the Deposit Scheme

The effect of the deposit scheme will vary according to the nature of the activity of the company. Trading companies use their reserves only as working capital. Their investment in fixed assets is relatively small. Therefore, instead of being deprived of a large part of the working capital, they would prefer to pay income-tax on their depreciation allowances. Similarly managing agency companies which have invested their reserves in shares of the companies they manage will have to forgo deduction of depreciation from income rather than liquidate their investments and lose control over managed companies. The processing industries like sugar and vanaspati whose requirements of working capital are far larger than the investment in fixed capital might also be forced to pay income-tax on their depreciation allowances rather than be deprived of their working capital accumulated through reserves. This would be particularly so where the fixed bloc has been largely written off in the past.

The decisions whether to part with their requisite funds or forgo deduction of depreciation allowances will largely depend upon the manner in which the rules regarding refund of deposits are managed. In order to assess the effect of the deposit scheme on company finances and the liquidity of the banking system, we may assume that all companies will agree to deposit with the Reserve Bank the prescribed percentages of their past and current reserves. For this purpose I have analysed the consolidated financial position of the 771 public companies as reported in the Reserve Bank Bulletin of August, September and November 1956. The relevant figures for the financial years ending in 1953-54 and 1954-55 (July-June) are reproduced alongside.

It will be observed that if the deposit scheme were made applicable to the above companies on the basis of their financial position in 1954-55, they would have been required to deposit a maximum sum of Rs 72,13 lakhs on past reserves and Rs 23,65 lakhs in respect of depreciation and retained profits of 1954-55. These companies had only Rs 70,17 lakhs in cash and Rs 71,32 lakhs in investments including Government securities. The deposit requirement would have obviously wiped out the liquid resources of these companies. The above estimates must be taken as maximum because the incidence of deposit liability depends on gross fixed assets, paid-up capital and reserves of individual companies and the aggregate of these figures of various companies does not necessarily represent the actual position of their deposit liability. This may be illustrated by a small example of two companies their financial positions being as shown in Table II, below.

Since the major industries in India have been long established and their reserves used for development, the actual deposit liability position will not differ significantly from the figures based on the consolidated financial position of these companies. This is brought out by the following Table of the deposit liability of 148 pubic companies estimated on the basis of their latest individual balance-sheets. (See Table III, p 1500)

Magnitude of Deposit Liability

It will be observed that the estimated deposit liability on past reserves of these 148 public companies with a total paid-up capital of Rs 14,124 lakhs comes to about Rs 3,010 lakhs. Their deposit liability on the basis of consolidated figures comes to Rs 3,073 lakhs.

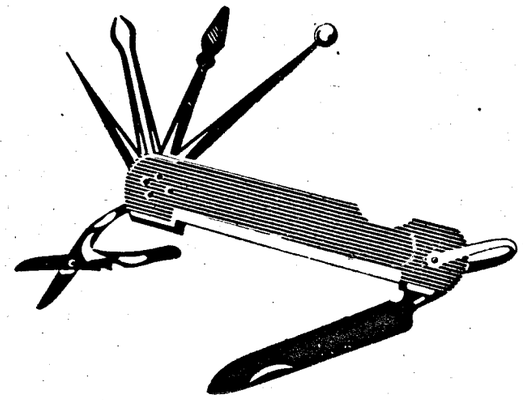

Table I—Showing Consolidated Financial Position of 711 Public Companies and their Deposit Liability

(Rs lakhs)

	1953-54	1954-55
Total Fixed Assets	677,18	740,59
Paid-up capital	368,60	379,12
	308.58	361,47
Fixed assets represented by depreciation and reserves		
Actual depreciation	324,42	352,22
Reserves	272,67	292,18
	597.09	644,40
Surplus depreciation and reserve for compulsory deposit	288.51	282,93
Deposit of 25% -	72,13	70,73
Additional deposit of 50% of depreciation and profits in 1954-55 cash	64,96	70,17

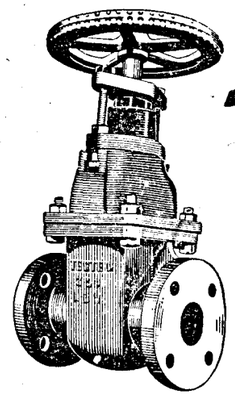
Genuine Willys spare parts always available

The-world's biggest little Vehicle

On the basis of the Reserve Bank's survey figures, the total deposit liability of 10,059 public companies with paid-up capital of Rs 65,600 lakhs in 1954-55 would work out to about Rs 122 crores. On the basis of my survey of the latest balance-sheets of 148 companies the deposit liability of 9,954 public companies in 1955-56 with paid-up capital of Rs 68,400 lakhs would work out to Rs 146 crores. As the coverage of the two surveys is not identical, these figures are not comparable. They may, however, be taken as indicative of the magnitude of the deposit liability involved in respect of past reserves of the public companies.

The liquid reserves position of the 148 companies as revealed by their balance-sheets suggests that approximately 35% of the companies will have to borrow funds to meet their deposit liability. As some liquid funds are absolutely necessary, they will also be required to borrow further or liquidate their investments and other realisable current assets to provide such funds. Of the remaining companies 30% will have their cash resources reduced by 50 to 100% in meeting the deposit liability. Thus nearly two-thirds of the companies will not be able to meet their deposit liability without resort to borrowing or reducing their working captal and possibly productive activity.



Financial Position and Deposit Liability of 148 Companies
(Rs lakhs)

Strain on Liquid Funds

The companies are required to keep their liquid funds with banks. The transfer of funds from commercial banks to the Reserve Bank in the form of deposits of company reserves will naturally affect bank's liquidity. At present the scheduled banks' deposits with the Reserve Bank amount to only Rs 50 crores, out of which they must maintain a statutory balance of Rs 40 crores against their deposits and time liabilities. Unless the Reserve Bank comes to the rescue of the banking system through very liberal rediscounting facilities, advances and open market operations, the large-scale transfer of funds from banks to the Reserve Bank in the middle of next year will cause a serious banking crisis. The curtailment of bank advances will also adversely affect the companies which have to borrow funds for their working capital requirements. Government is of course in a position to avoid such a situation by giving liberal permssion to the companes to continue to use their reserves for financing working capital.

To sum up, the company reserves deposit scheme, though conceived with a noble object of mobilising corporate savings for purposes of the Plan, may have grave repercussions on production, and the liquidity of the banking system if implemented in a bureaucratic manner. Had this scheme been restricted to future corporate savings, there would have been no such serious repercussions. But the demand that companies should withdraw one-fourth of their past reserves, which are already invested in working capital for their own business or in others through the banking system, for depositing with the Reserve Bank, is likely to cause serious difficulties. It also creates an administrative problem of approving the uses of reserves of nearly 30,000 companies. To pass judgment on the need for retaining the reserves within business by these companies for widely varying reasons requires understanding and imagination which would be difficult to achieve in a decentralised administration. Centralisation would bring inevitable delays in decisions with grave repercussions, at least the first time. From the statistics of company finances reproduced earlier it seems unlikely that Government would be able to direct substantial resources to purposes other than those for which they are already being used without disrupting the working of the companies and creating a banking crisis.

Association Meeting

The Indian Chemical Manufacturers Association

Presidential Address of Lala Charat Ram

THE following is the Presidential address of Lala Charat Ram at the Sixteenth Annual General Meeting of the Indian Chemical Manufacturers Association, Calcutta:—

Hon'ble Shri Manubhai Shah, Friends & Fellow Delegates,

It is my privilege to welcome you, Sir, in our midst today. Your presence at our Annual Session is an honour done to us, and an indication of the confidence which our Association enjoys with you and your Ministry. I hope that we shall continue to earn this confidence in the years to come, and that the inauguration of the Annual Session of the Indian Chemical Manufacturers Association by the Minister for Heavy Industries will be a precedent to be continued. As constituents of a growing industry, in the process of a vast expansion, we look to you and your Ministry for guidance and help in solving our many problems.

I would like to take this opportunity of offering our felicitations to Shri Morarji Bhai Desai on the assumption of the portfolios of Commerce & Industry by him. Under the stewardship of so distinguished a statesman, and so able and impartial an administrator, the Ministry of Commerce & Industry will be a most effective and vital instrument, in shaping the industrial and commercial policies of India in a period of great changes.

General Review

The period under review has witnessed events of considerable importance. The States Reorganisation proposals, which earlier in the year, looked like a real danger to our unity as a country, have by patient handling, been implemented in accordance with the democratic will of the community, which is a tribute to the mature genius of our elder statesmen. The year has seen the successful close of the First Plan and a bold initiation of the Second Plan. The Index of Industrial Production moved up from 100 in 1951 to 126 in 1956. The chemical industries, according to the Planning Commission, exceeded their First Plan target of investment of Rs 26 crores by a crore of rupees, a creditable record when it is recalled that the total industrial investment, in both public and private sectors taken together, was 10 per cent short of the target of Rs 327 crores.

The country's economy has recorded a great upsurge in consumption levels all along the line. We welcome this trend, for levels of consumption in India have been low, and creation of new demand is the essence of developmental planning. A continuous watch on the situation however is essential, to ensure that uncontrolled demand does not lead to runaway inflation, and to conserve the foreign exchange resources of the country. Food and cloth between them account for no less than 70 per cent of consumer expenditure, and it is the supply and price positions of precisely these two commodities, which have caused a great deal of anxiety to us all during the year. In this connection, while the emphasis on "Industry" in the Second Plan is to be welcomed, but increased agricultural production must be regarded as pivotal to the entire Plan. We associate ourselves whole-heartedly with the Prime Minister's view that food production during the Plan period must go up by 35 to 40 per cent, if the Plan is not to be endangered. In the matter of cloth we have been awakened to the danger of following a doctrinaire approach, for the basic point is not so much as to who produces the goods, but the achievement of much needed larger supplies. We congratulate the Government on their boldness in reviewing their earlier decisions in the matter, so that the people are not starved of their basic requirements in catering to ideological demands.

During the year, the Industrial Policy Resolution of April 1948 was revised and the spheres of activity for the public and private sectors were re-defined. To my colleagues I would say, that just as we recommend to the Government, not to base their policies on purely a doctrinaire approach we need to guard ourselves against purely a doctrinaire opposition to Government policies. The scope for our initiative and enterprise is still great within the 'limited' fields allotted to us by the new Industrial Policy Resolution. We would do well to stop petty controversies on such issues, and to build boldly into the future, to so organise our industry on firm foundations, that we build up an unassailable case for further expansion of our activity. The 1956 Resolution undoubtedly charts a fresh course, permitting freedom to the private sector, but obviously with checks and balances. It offers a new opportunity to private enterprise to justify its existence in a socialistic State, and its future will depend upon its performance during the years ahead. Changes made by the Government in its declared policies on such important matters as of "Land Ceilings," and of "Limitations on the output of textile industry" are an indication to me, that the Government is basically wedded to the welfare of the people, and to raising their living standards, rather than to any inflexible methods to be followed in the attainment of these objectives.

Chemical industries have an important place in the efforts of the community to attain a balanced and diversified indusrial growth within the frame-work of general economic planning. This role has become vital with our moving into the second of our Five Year Plans. A measure of the challenge posed to the chemical industries is offered by the investment outlay of Rs 125 crores in the Second Plan against the First Plan target of Rs 26 crores. It is obvious that the rate and quantum of progress desired will strain every resource of the industry. Our organisational and financial skills will have to evolve into more sizable strengths. The creation of a trained work-force, and an adequate technical cadre, will have to go hand in hand with a rapid and early expansion of the research facilities. The effectiveness of our marketing policies will have to be reassessed, and labour-management relations will have to be organised on the basis of policies that are flexible and growth-oriented. As a realist, and also as an optimist if I may add, I am confident that the chemical industries will respond adequately to the spirit of challenge and the determination to progress, around which the Second Plan is

built. The performance of the chemical industries during the First Plan period, is reassuring in this context. During this period the chemical industries achieved considerable diversification. Products manufactured for the first time in India make a long list: Calcium Carbide, Hydrogen Peroxide, Rare Earth Compounds, Titanium Dioxide, Rayon Grade Caustic Soda, Ammonium Chloride, Benzene Hexa-Chloride, Penicillin, D.D.T., Isonicotinyl Hydrazid, Sulphur-Black, Azo dyes and so on. The broadening of the base was accompanied by an impressive general growth, in output and installed capacity. For a few products the data is given below, and incidentally it brings out that growth in capacity sometimes outpaced the level of demand as reflected in possible levels of output. (See Table below).

In pointing out the achievements of the First Plan period, we must not forget the fact, that the present achievements only provide a base for the much larger effort necessary, if our industrial structure is to have an adequate base of chemical products to draw on. I do not wish to burden you today with all the too well known proposals for the chemical industries in the Second Plan. By 1960-61 a better balance inter se, and a manifold increase in capacity and output of different types of chemicals will have been achieved. In the very nature of things, many of the targets can only be tentative, the production of each being interdependent on so many other targets which are continuously being reviewed and revised. The upward revision of food production targets, for instance, would step up the targets for fertilisers greatly; likewise, if it is eventually decided to work out a cloth supply policy on the basis of 20 yards per capita, an upward revision in the targets for dye-stuffs, caustic soda etc, will be imperative. The basic strength of the Second Plan is in its flexibility and we are confident that the chemical industry in the private sector will meet the demands made on it, in keeping with its record.

Dye-Stuffs and Intermediates Industry

Proposals in regard to the dye-stuffs and the intermediates industry have recently been elaborated by the Government. I record here our appreciation of the policy which the Government have decided to follow in finalising the programmes for manufacture by the N.I.D.C., only after taking into account the present or proposed schemes of individual dye-stuffs manufacturers. I would only add that if some of the manufacturers desire to produce some of the primary intermediates proposed initially for the N.I.D.C.'s activity, they should be encouraged to go ahead. Some of these have already been tried on a scale sufficient for their own consumption by some of the manufacturers, and it would be advantageous to ask these to go ahead and develop further. In regard to the target itself of 10,000 tons of finished dyes by 1965, this seems to be on the conservative side, while an item like Azo dyes, on the other hand, may not be consumed at all to the extent visualised owing to the changing preference for fast colours.

Another matter which somewhat affects the development of this new industry is the matter of import restrictions. It would appear that strict import restrictions are applied only after a manufacturing unit has accumulated substantial stocks. Apart from financial implications, this situation for a new industry is obviously a great handicap, and retards the rate of development. It is necessary of course for the Government to ascertain by a complete inspection that the plant is in good shape and has the capacity to meet the country's requirements and it should be satisfied by this type of investigation rather than by demanding accumulation of physical stocks.

Pharmaceutical Industry

In regard to the programme in the Second Plan for the pharmaceutical industry, I would like to mention that there is need for closer co-operation between the plans of the State and the industry. There is today a feeling in the industry, that State plans for the manufacture of pharmaceuticals are being formulated without the industry being taken into confidence. To the extent that this feeling is justified, it has not been fair to the industry, as the pharmaceutical manufacturers have struggled against heavy odds in the past to meet nearly 70 per cent of the country's expanded demand for medicines and drugs, even during the period of the last war when no imports were forthcoming. The industry has contributed substantially to the development in many lines of manufacture which are presently under the review of Government. I may also mention that the attention paid to antibiotics, sulpha drugs, anti-dysentry and anti-T.B. drugs by Government has obscured the progress made in many other directions by Indian industry, such as sera and vaccines, surgical dressings, anaesthetics, alkaloids, chemotherapeutic drugs, colloidal preparations and glandular products, and the question of consolidating these gains by giving more attention to the difficulties of the industry has been relegated to the background. I regret to mention that the recommendations made by the Pharmaceutical Enquiry Committee which surveyed in proper perspective the development of the existing branches of the industry have not been given adequate attention by Government. Apart from this, attention has to be paid to the question of considerable unnecessary competition from Government Medical Stores Depots, the prevailing vexatious excise regulations, and the alarming rate of patent registrations by foreign manufacturers in India. I would like to stress here that the existing

Table Showing Growth in Installed Capacity and Output of Some Chemicals

		1950-51		1955-56		1960-61
		Capacity	Output	Capacity	Output	Target: Capacity
1. Nitrogenous Fertilisers (as fixed nitrogen)	Tons	16,000	9,000	85,000	77,000	380,000
2. Phosphatic Fertilizers (as P_2O_5)	"	21,000	9,000	35,000	20,000	120,000
3. Sulphuric Acid	"	150,000	99,000	242,000	170,000	500,000
4. Soda Ash	"	54,000	45,000	90,000	80,000	253,000
5. Caustic Soda	"	19,000	11,000	44,000	36,000	150,000
6. D.D.T.	"	—	—	700	172	2,800
7. Dye-stuffs and Intermediates m. lbs.		—	—	6.6	4.0	27.0
8. Penicillin (m. mega units)		—	—	12.5	6.6	40.0

free sector of the pharmaceutical industry has problems in relation to its consolidation and further progress which need to receive the Government's attention and that in regard to expansions for the future, the industry may be taken into close confidence.

Super Phosphate Industry

A special reference to this industry is deserved for reasons of its important position in the country's agricultural economy. Industrially too, the Superphosphate Industry is recognised as a base, on which a large scale sulphuric acid production is always built up which enables cheap sulphuric acid availability for the economical development of almost all chemical industries. Production of super phosphate is dependent exclusively on the extent of its consumption. Unfortunately, nitrogenous fertilisers are still considered a cure-all for all our agricultural problems; little is it realised, that the surest way to make our soils arid, in course of time, is to feed them continuously with disproportionate doses of nitrogen. It is like feeding a human-being exclusively with fats or protein instead of with a balanced diet. We could usefully learn in this matter from the experience of countries having high agricultural productivity, where almost without exception, the ratio of nitrogen to P_2O_5 is 100:115 as against India's 100:30. Developing an effective system of subsidy as in the U.K., readjustment of railway freights on the same levels as for manures, and more liberal granting of taqavi loans, are some of the measures which could prove of use in attaining an appropriate consumption of super phosphates. The Second Plan target for the industry of 7,20,000 tons as compared to the production of 1,00,000 tons in 1955-56 is a recognition of this vital need, but if this target is to remain not only a target, as was the case in the First Plan, a directed and purposive effort cannot be avoided.

Need for Increase in Plant Capacities

The problem of ensuring economic plant capacities in the chemical industry, is something Sir, which I wish to place before you. Low demand on the one hand, and an excessive number of small-sized plants working at sub-normal capacities on the other, have been a feature of the chemical industry. This could be explained in the past, when there was no control on industrial growth, but there remains the surprising fact that even now licences continue to be granted to plants of sizes, which would be unthinkable for the chemical industry in any other country. We are all too familiar with sulphuric acid plants of 5|10 tons a day capacity, and similarly small plants for chlorine, super phosphate, soda-ash etc. As the Planning Commission have themselves pointed out, it will be healthier for the industry directly concerned, as well as for the general economy, to avoid unit sizes that are fore-doomed to uneconomic existence. I hope that there is no feeling in any quarter of keeping plant capacities low in the chemical industry based on the cottage industry concept. Small sized chemical plants are expensive in their orginal cost, continuously expensive in the cost of their output, and a permanent liability to the country. I venture to suggest, that as in the rest of the Plan, a bold approach is needed in this matter, and the conception of economic size of plants for the chemical industry should be stepped up considerably, even though for some years there is some idle capacity in our developing economy.

Foreign Exchange Resources

It may not be far wrong, if one were to say that the size of our Second Plan will be largely determined by our ability to provide adequate foreign exchange resources It has become today, according to me, a primary duty of us industrialists, to give a new slant to our development plans for specifically augmenting the country's foreign exchange resources, by canalising the development of industry into:—

(a) Products which will reduce imports, and

(b) Products which will increase exports.

The country has still to spend crores of rupees every year on the import of chemical products, including drugs and pharmaceuticals, and this drain appears to grow with the pace of development. The chemical industry has to realise, that as exchange savers, although not immediately as exchange earners of any importance, their contribution to the success of the Plan can be significant. A time must soon come, when the performance of industries is to be judged, not only in terms of levels of output, but whether they are to any extent improvident users of foreign exchange, and to what an extent they contribute to the foreign exchange earnings of the country.

In this connection, our increasing reliance on sulphur needs special mention. From 37,000 tons in 1951-52, imports of sulphur rose to well over 80,000 tons in 1955-56 and will rise drastically over the next five years. A concerted vigorous drive, including specially directed research, to replace sulphur by other substitutable products, must in my opinion form a useful supplement to the basic long-term solutions that can only emerge from intensive geological investigations on pyrites and other sulphur-bearing ores.

The use of hydrochloric acid, to replace sulphuric acid wherever possible, even though with difficulty, must receive persistent attention, as this would be a double saver of foreign exchange viz., in sulphur and caustic soda simultaneously. The manufacture of dicalcium phosphate has the potentialities of using up 60,000 tons chlorine additionally, even if 20 per cent of the toal consumption of phosphatic fertilisers be in this category. This would save us foreign exchange of 70,000 tons of caustic soda per year and vast quantities of sulphur.

As the foreign exchange position gets tighter, there is need, I feel, for paying attention once again to the recovery of sulphur from Smelter Gases at Ghatsila, a scheme which was proposed in the First Five Year Plan also.

One assistance, Sir, which the Government can give to the chemical industry in the matter of helping its development on the lines indicated above, is with regard to the classification of chemicals in the imports list. At present the classification is only in broad categories. It is suggested that the list be prepared in much greater detail, giving as many separate items as possible, duly categorised. Undoubtedly this will entail some additional work, but this must be considered as one of the small helps which will assist the industry in selecting items to be developed and also save valuable foreign exchange.

The services of Development Councils could be utilised much more in the matter of the problem of foreign exchange than is being done uptil now. They should be given special direction to focus their attention intensively in development plans of those industries which would save or earn foreign exchange.

Plant fabrication is another industry which could save large amounts of foreign exchange, and this consideration alone would merit special consideration for developing it, quite apart from many other advantages. Considerable development has already taken place in this field. The Indian manufacturer no longer looks upon the manufacture of chemical plants as an awe-inspiring proposition. Plants for all unit operations, e g, evaporation, distillation, filteration, chilling, digestion, vacuum and pressure equipments etc., are now being made in the country. Complete plants for hydrogenation, caustic soda, sulphuric acid, distilleries etc, need not be imported from abroad in any case. Further Government assistance however is needed for this industry. I wish particularly to bring to your notice the singular anomaly under which a full plant imported is subjected to a duty at 5¼%, but if some imported components are required to complete an otherwise indigenously fabricated plant, a duty of 37% is payable. This almost discriminatory import duty against the development of indigenous plant fabrication industry is a damper on its growth, and we would urge particular attention to this matter.

Transport and Port Facilities

I am a little hesitant in making a reference to the problem of transport, as I hesitate to cover a much traversed ground. For the chemical industry, the basic problem is of coal movement, even though the total coal requirement is negligible as compared to other industries. Undoubtedly every industry claims a privileged treatment for itself, but measure of priorities has to be changed with the requirements of time, and today "Foreign Exchange earning/saving goods" need to have priorities over many other considerations. The products of the chemical industry need a priority on this basis alone, and we are confident that study of this aspect of the chemical industry would justify an up-grading of priorities for the movement of coal for it.

We are glad that the Government is alive now to the need for marshalling all forms of transport, and considers road transport as a vital link in supplementing the resources of the railways. Much time and wagon space could be saved Sir, if there was a restriction on short distance haulage of goods, where the ratio of idle time to the moving time of wagons is very high. There would be hardly any hardship if road transport took over the short haulage of goods, say upto distances of 100 miles. It is expected that this would offer considerable relief and howsoever little initially, it should be welcome in the present situation.

The country's vulnerability in its development plans owing to tightness at port facilities is now being gradually realised. Continuous congestion, delays, and threats of strike at ports, are a regular feature now, and the country pays for this shortage in the shape of increased expenses to shippers waiting to clear their cargo. Development of ports has to be speeded up even from long range defence point of view. I wish here to make a special reference to the port of Kandla, work on which has been in progress for several years now, and with but a little more concentrated attention the Port could be got into commission fully, relieving the congestion in Bombay and cutting out at the same time a wasteful strain on railway transport of about 300 miles for North Indian traffic. On this Sir, as in several other matters, we would be making a separate detailed representation to you in due course.

I should like now to mention a few facts about our Association. The Indian Chemical Manufacturers Association has completed almost a decade of its existence and is today the most representative organisation of the Chemical Industry in India. With a membership of nearly a hundred chemical concerns throughout the country, it is fully representative of the pharmaceutical, acids, alkalis, dye-stuffs and fine chemicals industries in the country. We operate through specialised divisions for various groups of industries, conducted by independent chairmen. We have also started this year a nucleus of a statistical service for our members, as also the publication of the "Chemical Industry News," a monthly journal of the I.C.M.A. This publication is intended to serve as a source of reference and information to our members and others interested in current problems of production, import, export etc., of chemical products.

Before I close, I wish to express on this occasion, our thanks for the co-operation, which our Association has received throughout the year, from your Ministry, and in particular from the Chief Industrial Adviser and the Industrial Adviser (Chemicals). We are grateful to the Government for the initiation and extension of protection granted to many of our industries. The industry has been fully conscious of its attendant responsibilities, and as successive reports of the Tariff Commission will bear out, it has in most cases endeavoured to fulfill the obligations imposed on it by the enquiries of the Commission. The Government have accepted the principle of advance protection which enables a prospective manufacturer to ask for protection before actual start of operations. In our industry where new lines of manufacture are complicated, this assurance of advance protection is particularly welcome. I hope that in the results that the chemical industries will show, the confidence would have been found to have been deserved in full measure.

I have referred at some length to a few of the problems of our industry. These have been mentioned not in the shape of complaints but as suggestions, which if considered and implemented would strengthen the base of this industry. The Annual Meeting of our Association is an occasion for us to express our views on the problems facing this industry. I would like to convey to you, our hope and faith in the great economic endeavour on which we have launched this year and I assure you of our whole-hearted co-operation in the building up of the economic sinews of the country.

Finally, I wish to express my deep sense of gratitude to the members of the Association, my colleagues on the Committee and the Secretary of the Association and his staff, but for whose valued co-operation and assistance it would not have possible for me to discharge my duties as President of the Association.

Gentlemen, I thank you for responding to our invitation, and for giving me a patient hearing. I thank you, Sir, again most heartily, and request you to inaugurate the Sixteenth Annual General Meeting of our Association.

From the London End

Crisis in Another Quarter

IT is clear that the South African Government has taken advantage of the international situation. It has used this occasion for staging another but more dangerous Reichstag Trial, and it hopes to accomplish this at a time when attention is absorbed elsewhere. The dramatic arrest of over 150 people on the prime charge of high treason must, however, be understood as nothing less than an indication of the crisis that has come to characterize race relations in that unhappy country. It has always been known that South Africa was sitting, indeed dangerously poised, on what can be termed as the time-bomb of tension. The mass arrests now suggest that the country has reached the point of racial explosion.

"Economic Murder"

The arrests are in tune with developments in the last two years. It is the culmination of a series of legislative Acts and state measures which by all canons of assessment make South Africa the most undemocratic and repressive state in the world. The Group Areas Act—a piece of legislation which could only have been conceived by a people who have lost all sense of reality and above all decency—is now being implemented. The Act aims at dividing the whole country into racial zones with little reference to the existing areas of settlement. The basic aim of the Act is to reserve for the 2½ million white minority all the developed and richest parts of the country. In the Johannesburg suburb of Sophiatown the forceful removal of 80,000 Africans has been completed. Now the small Indian community is being subjected to this law. They are being forced to give up their dwellings, their trading interests and, indeed, the very basis of their livelihood and it is little wonder that the Congresses of the African and Indian people should condemn this law as nothing short of "economic murder."

In the field of political repression, the all-European Parliament has given the Government arbitrary powers of arrest, of suspending the normal machinery of justice, of bans and of deportations, of press censorship and of control over imports of foreign literature. It has enabled the Government to withhold passports at will, to restrict internal travel and to violate the privacy and property of those who are suspected of opposing the doctrine of racial segregation. All this is designed to control and reduce the effective voice of 11½ million non-Europeans. The most inhuman of all the pieces of recent legislation is the Bantu Education Act. This has been officially described as aiming to inculcate in the African child that he is "innately inferior" and must "serve a life of service to the European."

The Freedom Charter

These laws are only a part of the background to the present arrests. The Strijdom Government fears the positive and overwhelming influence which the non-European Congress movement possesses over the mass of the non-white peoples. A review of the names of those that have been arrested in South Africa suggests that it was the organisation and convening of the massive Congress of the people which the Strijdom Government fears most. The Congress of the People was held in June 1956. It was convened jointly by the African National Congress and the South African Indian Congress, as well as a number of other organisations of the non-European people and liberal-minded Europeans. Some 4,000 delegates attended the Congress in spite of police intimidation and other official acts aimed at making it difficult for the Congress to be held.

The Congress was the most truly national convention ever held in South Africa. No group or opinion was debarred: no citizen was refused the right to vote or to be a delegate. Having regard to the considerable difficulties under which the Congress took place, it must be considered as a feat of organisation on the part of the sponsoring bodies. And from this historic gathering there emerged a statement of democratic faith which could only have been written and agreed upon by people of sincere conviction and of the highest principles. The statement was termed "The Freedom Charter" and it declared that:

"We, the People of South Africa, declare for all our country and the world to know:

that South Africa belongs to all who live in it, black and white, and that no Government can justly claim authority unless it is based on the will of all the people; that our people have been robbed of their birth right to land, liberty and peace by a Government founded on injustice and inequality;

that our country will never be prosperous or free until all our people live in brotherhood, enjoying equal rights and opportunities;

that only a democratic state, based on the will of all the people, can secure to all their birthright without distinction of colour, race, sex or belief;

"And therefore we, the People of South Africa, black and white together—equals, countrymen and brothers—adopt this Freedom Charter. And we pledge ourselves to strive together sparing neither strength nor courage, until the democratic changes here set out have been won."

The delegates pledged themselves (and these were inscribed in the Charter) to struggle for the equality of all national groups in the country, for equality before law, demanded that the doors of learning and culture be opened to all, that the country's wealth and land be available to all and, pledged for peace and friendship among the peoples of the country. For all this, the delegates declared that they would fight "until we have won our liberty".

The fact that this Conference had claimed to be more representative than the all-white Parliament is ostensibly the basis of the charge of high treason. And by overwhelming belief and understanding a charge of this order and conceived on the basis as the adoption of the Freedom Charter must be both absurd and impossible. A review of the definition of high treason as is outlined in South African legislation, however, makes it wellnigh possible for those arrested to

be found guilty of this serious charge for which the penalty is death.

The situation warrants some speculation as to the type of trial which the arrested persons will face. Recently the South African Government appointed Judges to the Bench of the Supreme Court who are known more for their political attachments to the doctrine of Apartheid than for their knowledge of administering and interpreting the law. The "packing" of the Courts just precedes the treason trial now taking place in that country.

The arrested persons face two further possible charges. The first is framed under the provision of the Suppression of Communism Act which gives a blanket definition of Communism and all acts committed within that definition are subject to a maximum imprisonment of ten years. Communism to the South African Government includes enlightened liberalism as well as any doctrine which stands in strict opposition to the social policies of Apartheid or racial segregation. The other charge to be preferred against the arrested arises from the Riotous Assemblies Act. This Act specifies certain penalties against persons found to instil ill-will among the races. The tenability of this charge can be judged by the sentiments on racial unity expressed in the Freedom Charter (and quoted above).

The Congress of the People represents the real, and, because of the absence of franchise rights for the non-Europeans, the extra-Parliamentary opposition to the racial designs of the existing Government. The fact that so serious an attack should now be made on this opposition by the Government justifies the claim that South African race relations have reached a point of sharp crisis. And like all reactionary governments, the South African regime has resorted to undemocratic methods and policies to kill the opposition instead of coming to terms with it. In accordance with this policy, the South African Government has severed its connections with the United Nations. It has, however, always recognised the movement of international opinion and has, therefore, chosen the present situation for its actions.

The illiberal trend in South Africa could, however, still be held back by a vigilant and enlightened world opinion.

Pray consider the case for

Cargo by air

"M'LUD and gentlemen of the Jury, the case for CARGO BY AIR rests on a few simple facts — facts which businessmen are quick to grasp and appreciate. To summarise, M'Lud —

Cargo by air saves time— obviously! But in addition to cutting down actual transit time, it often does away with the need for warehousing at ports of despatch or arrival. Cargo by air, in fact, gets your goods *where* you want them *when* you want them!

Cargo by air costs less— it cuts down handling and warehousing charges, gives you a quick return on capital outlay, costs less for transit insurance.

Cargo by air is MODERN— in this age of speed and competition, the other man has learnt the value of cargo by air. And it is high time, M'Lud and gentlemen of the Jury, that you do, too!"

The Judge, remarking that he could add nothing to this masterly expose, invited the Jury to consider the case. This they did without leaving the box, and all good men and true returned an overwhelming verdict for:

CARGO BY AIR EVERY TIME!

Federal Grants-in-Aid and Article 275

M L Bhatia

GRANTS-IN-AID, as the name suggests, are payments made by a Federal or Central government to the federating units or State governments, either according to the provisions of the constitution or by legislative decision. Grants-in-aid have been used as a balancing factor in all political systems, in one form or another, to correct the maladjustments arising from the allocation of important and relatively elastic sources of revenue to the Central Government and entrusting welfare functions to the Units. This mechanism of adjusting resources to functions is used after all other balancing factors have been commissioned. Its specific objectives have greatly varied, like removing inter-regional disparities in resources, encouraging units to improve particular services, achieving certain national objectives and exercising some measure of Central control. The evolution has been toward sharper definition of objectives, closer attention to conditions and relative State fiscal capacity and more extensive administrative supervision.

Increasing Grants-in-aid

The Federal grants-in-aid are an important aspect of government finance guaranteed by the Constitution of India. The first statutory provision for grants-in-aid was made under Sections 142 and 150 of the Government of India Act, 1935. Federal grants amounted to Rs 3.12 crores in 1937-38, Rs 2.75 crores in 1942-43 and Rs 19.18 crores in 1946-47. Of the total revenues of Provincial Governments such grants formed 3.5 per cent in 1937-38 and 8 per cent in 1946-47. The absolute as well as relative increase in grants was due to the inclusion of developmental grants in the system of grants-in-aid in 1946-47. These grants were for general purpose. Even when specific grants were given, the details of administration and itemisation of schemes of expenditure were left to the discretion of the Provincial Governments.

After the Partition in 1947, the financial provisions of the Government of India Act, 1935, continued to operate subject to the Distribution of Revenue Order of March 17, 1948. The Federal grants-in-aid amounted to Rs 32.42 crores in 1947-48 (7½ months), Rs 38.26 crores in 1948-49, Rs 42.24 crores in 1949-50 and Rs 23.49 crores in 1950-51. In 1950-51 the grants sharply declined on account of a steep fall in development grants. Since then the State Governments are being given grants under Articles 273, 275, 278 and 282 of the Republican Constitution. The grants under these Articles amounted to Rs 33.89 crores in 1951-52, Rs 36.04 crores in 1952-53, Rs 45.30 crores in 1953-54, Rs 51.39 crores in 1954-55, Rs 97.65 crores in 1955-56 (Revised Estimates) and Rs 121.99 crores in 1956-57 (Budget Estimates).

Of the total revenues of the Part A and Part B States they formed 7.4 per cent in 1951-52 and 10.7 per cent in 1954-55. This percentage is likely to be 24 in 1956-57. In addition, grants were also given to the Part C States, mainly to meet revenue deficits. They are likely to amount to Rs 7.30 crores in 1955-56 and Rs 7.94 crores in 1956-57. Lump sum grants have been given to Jammu and Kashmir State, about Rs 4 crores and Rs 3.75 crores in 1955-56 and 1956-57. Thus, total Federal grants are likely to amount to Rs 133.68 crores in 1956-57.

These trends in Federal aid show that, if no new aids are adopted and the present obligations and policies are carried out, there will be substantial increases in these grants-in-aid. In view of the acceptance by Government of the goal of a socialistic pattern of society in India there is every possibility that the Central aids will increase considerably to improve the living standards of the masses in the relatively underdeveloped States of the Union.

"Article 275"

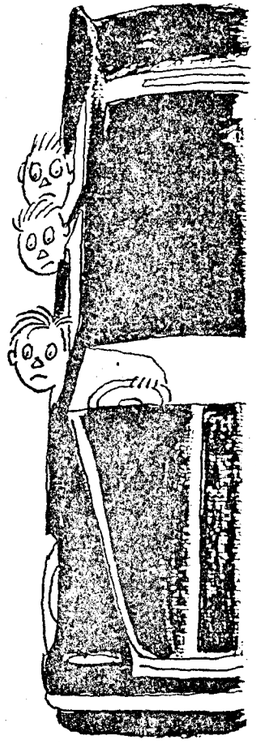
Grants-in-aid have been provided in the Indian Constitution under its various Articles. Space does not permit a detailed study of all these Articles. Therefore only one important Article, i.e., Article 275, is discussed below. This Article is intended to be permanent and is also, partially, in the purview of the Finance Commission (Article 280). An attempt has been made below to examine critically the Federal aid (under Article 275) policies, the significant trends, and the defects indicated by experience, to see what changes are needed.

Article 275 provides for the payment of such sums as Parliament may by law provide as grants-in-aid to such States as Parliament may determine to be in need of assistance. Different sums can be fixed for different States. These grants are to be of the nature of capital and recurring sums as may be necessary to enable that State to meet the costs of such schemes of development as may be undertaken by it with the approval of the Government of India for the purpose of promoting the welfare of the Scheduled Tribes in that State or raising the level of administration of the Scheduled Areas therein to that of the administration of the rest of the areas of that State.

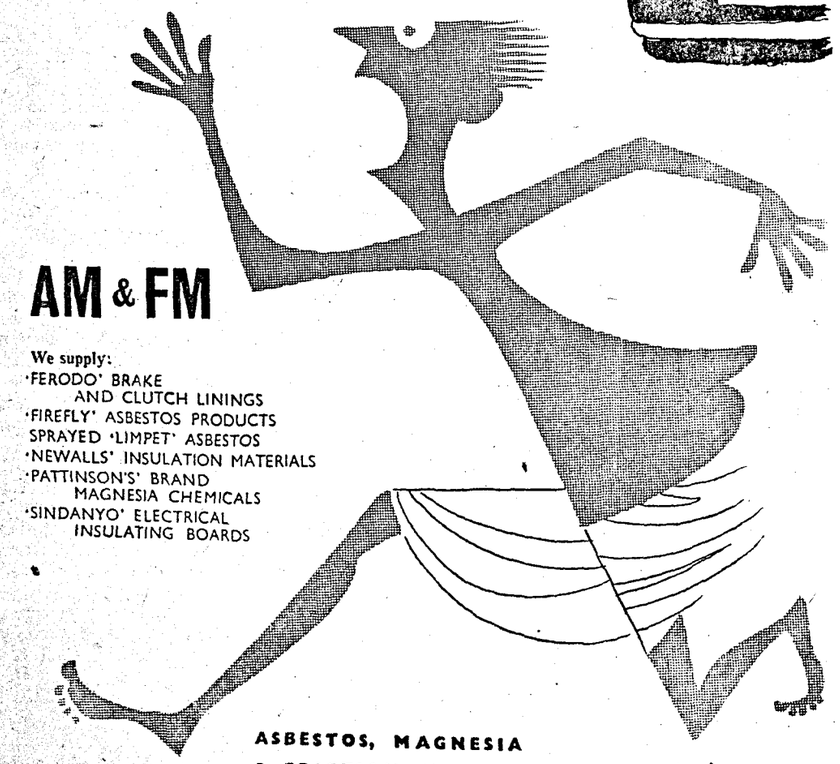
In respect of Assam the second Proviso requires the payment of grants, capital and recurring, equivalent to the average excess of expenditure over the revenues during the two years immediately preceding the commencement of this Constitution in respect of the administration of the Tribal Areas specified in Part A of the table in paragraph 20 of the Sixth Schedule, and the cost of such schemes of development as may be undertaken by that State with the approval of the Government of India for the purpose of raising the level of administration of these areas to that of the administration of the rest of the areas of that State. The amounts of such grants are to be determined by an order of the President until provision is made by Parliament. After a Finance Commission has been constituted, the grants will be made by the President on the recommendations of the Finance Commission.

Balanced Inter-State Development

Under Article 275, grants-in-aid are to be given to States as are in need of financial assistance, and these grants can vary and be discriminatory in nature. Grants are primarily intended to correct inter-State disparities in financial resources and to co-ordinate the maintenance and expansion of the welfare schemes of the State Governments on a uniform national level. The general power of providing grants is left to Parliament, but the Constitution lays down the specific grants in the provisos to Article 275. The first proviso relates to the grants necessary for the wel-



Can your car make a split-second stop ?



As a responsible motorist you know that it should be able to. An emergency may arise any moment...it comes unannounced. So play safe. Among other things, see that you have a really reliable braking system.

Wise motorists all over the world have their brakes tested regularly and have them fitted with FERODO—the brake linings that make motoring safe. FERODO Brake Linings are made with asbestos because they have a tough job to do. In an emergency, their unfailing efficiency can prevent disaster.

There are FERODO Brake and Clutch Linings for every type of vehicle in the country—but these are only a part of the wide range of technical asbestos products which we make at AM & FM to meet the needs of Indian industry. The increasing use of asbestos is an index to India's industrial progress.

Where There's Industry There's Asbestos

fare of Scheduled Tribes and for raising the standard of administration of Scheduled Areas. The second proviso relates to the grants to the Government of Assam for the development of the State Tribal areas.

Centre's Financial Control

From these provisions it can be inferred that grants under this Article can be both general and specific. But there is much emphasis on specific grants viz., education, medical and health, unemployment relief, old age assistance, highways construction, child and maternity welfare, etc. These grants may be unconditional—giving full freedom to the State Governments in respect of the use of the grant. They may also be conditional—imposing upon the State Governments the maintenance of minimum standards of efficiency, advance approval of State plans and budgets, prescribing particular modes of recruitment of personnel, and providing for inspection and audit.

The grants under this Article are to be given if the schemes have been undertaken by a State with the approval of the Government of India. No doubt Government of India cannot compel a State Government to accept Central aid. But once a grant has been accepted the conditions imposed by the Centre must be observed. To the extent to which conditions are imposed by the Centre upon a State Government, the latter relinquishes its powers from fields in which it had supreme authority. Thus, these grants can be an important instrument for central financial control. Since the States do not have adequate resources to meet the obligations imposed upon them by the Constitution, they must not only accept Central aid freely but also clamour for it. The constitutional provisions have so much constrained the States to seek Central aid that they may scarcely realise that they have surrendered their powers to manage their affairs in their own way.

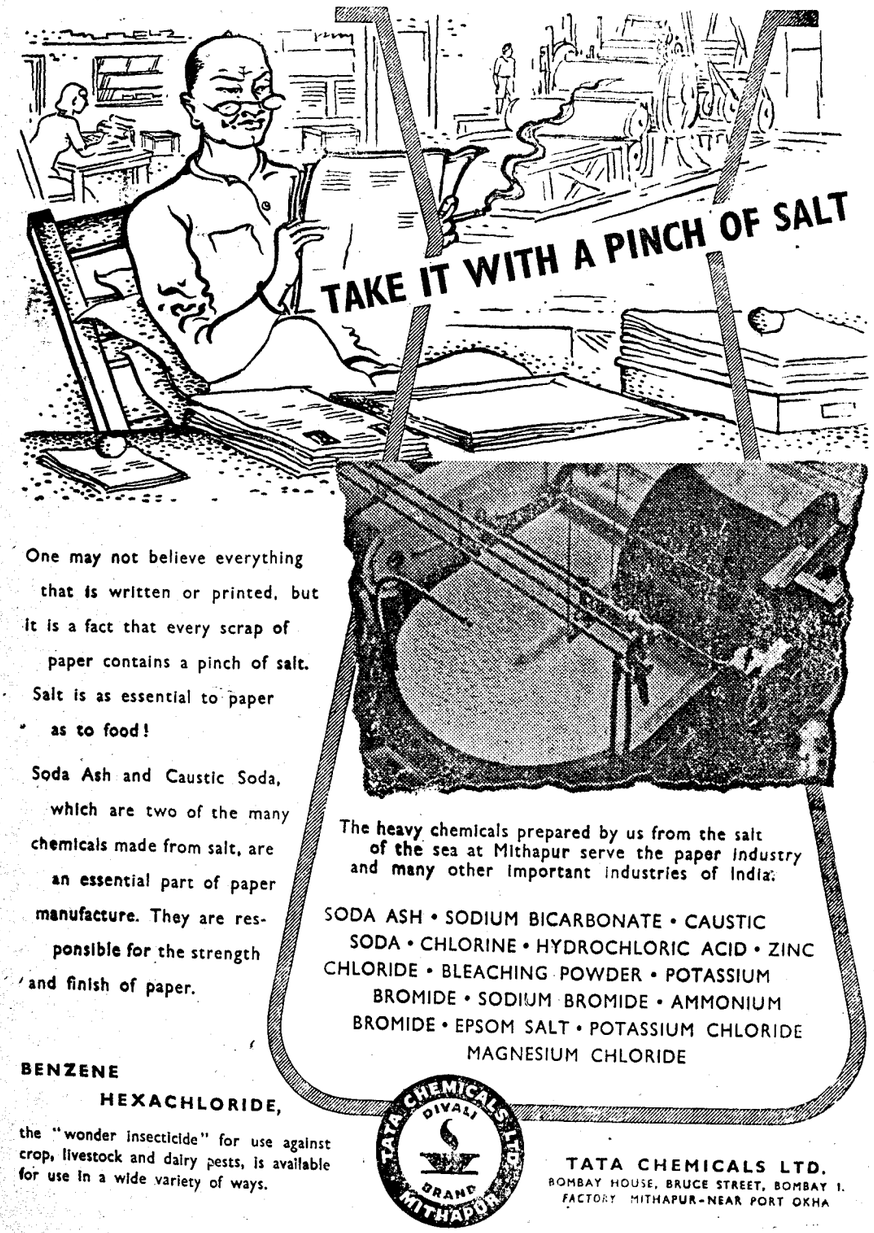
First Finance Commission

The grants given to the States under the Substantive Provision of Article 275(1) amounted to Rs 70 lakhs in 1951-52 and Rs 5.18 crores in 1952-53. This large increase followed the acceptance by the Centre of the recommendations of the first Finance Commission. The grants under this Article, before recommendations of the Finance Commission became operative, were being given to Assam and Orissa. On the recommendation of the Finance Commission, incorporated in the Constitution (Distribution of Revenues) Order, 1953, the following States were given grants: Assam Rs 1 crore, Mysore Rs 40 lakhs, Orissa Rs 75 lakhs, Punjab Rs 1.25 crores. Saurashtra Rs 40 lakhs, Travancore-Cochin Rs 45 lakhs and West Bengal Rs 80 lakhs.

The Commission professes to have recommended these grants after considering the needs of all the States by certain standards and criteria which were applied without any discrimination. The Commission gave sufficient emphasis to the magnitude of backwardness of the States and to various other problems, viz., West Bengal was bearing additional strain due to the influx of refugees from East Pakistan; progress in Orissa had stagnated and it had an accession of a relatively large backward territory in its merged areas; Saurashtra had a large area and sparse population; Punjab had the influx of refugees and the problem of maintaining law and order; Assam had special difficulties resulting from Partition and a relatively large under-developed area; and Mysore and Travancore-Cochin had limited resources. The grants recommended by the Commission under the Substantive portion of Article 275(1) amounted to Rs 5.05 crores.

Some Shortcomings

The Commission could not formulate precisely the needs of individual States. In 1952, the first Five-Year Plan has been finalised, and each State was allocated certain investment programmes. There was not much difficulty in assessing the fiscal requirements of the States from the point of view of development programmes covering both the revenue and capital side of the budget. The Commission ignored another very important aspect of fiscal need that it did not keep in view, factors like famine and other natural calamities, which are a recurring feature in India. As a technical body the Commission could have formulated some flexible formula by which the backward States, which are relatively more exposed to the vagaries of natural calamities, could had been benefitted. Moreover, the Commission recommended the grants largely on the basis of the financial position of the States as disclosed by their actual revenue and expenditure, with only minor corrections. It may be pointed out that it would be difficult, if not impossible, to ascertain the real fiscal needs of the States from their published budgets on Revenue Account. The budgets of the State Governments are, somewhat complex documents and are not easily intelligible. They conceal more than they reveal. The presentation of the budget varies from State to State. Some items of expenditure included under Revenue Account in one State may be seen under Capital Account in another. The Commission did not take care to make these documents comparable. Since grants were given to the States on the basis of comparative fiscal needs, without making the budgetary position comparable and without taking into consideration the capital budget, the recommendations of the Commission were to that extent anomalous.



Grants for Primary Education

The Commission also recommended specific grants for the promotion of primary education. In order to measure the financial needs of different States for primary education, the Commission collected the percentage of children between the ages of 6 and 11 who were actually attending schools. On the basis of the population of the State, the number of children in this age group, and children in this age group attending school, the Commission found that the percentage of children attending schools varied sharply, from 10.6 per cent in Rajasthan and PEPSU to 98.8 per cent in Travancore-Cochin.

The Commission made a modest beginning, and recommended that the eight States, where a large leeway had to be made up, should be given grants to advance the cause of primary education. It recommended that in each of the next four years sums rising from Rs 150 lakhs in 1953-54 to Rs 300 lakhs in 1956-57 should be distributed among the eight States in proportion to the number of children of school-going age not attending school at that time. The grants were arranged on an ascending scale to assist the States in planning for their proper utilisation. The grants shown in the Table (See p 1511) were provided to the States under Distribution of Revenues Order, 1953, para 5(1) b and the States were free to utilise them, in any manner, for the purpose of primary education.

Neglected Factors

In recommending these grants the Commission kept in view the num-

One may not believe everything that is written or printed, but it is a fact that every scrap of paper contains a pinch of salt. Salt is as essential to paper as to food!

Soda Ash and Caustic Soda, which are two of the many chemicals made from salt, are an essential part of paper manufacture. They are responsible for the strength and finish of paper.

BENZENE HEXACHLORIDE, the "wonder insecticide" for use against crop, livestock and dairy pests, is available for use in a wide variety of ways.

The heavy chemicals prepared by us from the salt of the sea at Mithapur serve the paper industry and many other important industries of India:

SODA ASH • SODIUM BICARBONATE • CAUSTIC SODA • CHLORINE • HYDROCHLORIC ACID • ZINC CHLORIDE • BLEACHING POWDER • POTASSIUM BROMIDE • SODIUM BROMIDE • AMMONIUM BROMIDE • EPSOM SALT • POTASSIUM CHLORIDE MAGNESIUM CHLORIDE

TATA CHEMICALS LTD.
BOMBAY HOUSE, BRUCE STREET, BOMBAY 1.
FACTORY MITHAPUR-NEAR PORT OKHA

ber of children of school-going age not attending school. This factor, of course, is important for determining the quantum of grants-in-aid. But there are other important determinants, such as, sparsity of population in a State, efforts of the State Governments for the advancement of primary education, etc, which should have been given due consideration. Subject to the availability of data certain criteria like an increase in the number of primary schools and children attending schools during the past five years, the conversion of ordinary primary schools into basic schools, the efforts made to improve the facilities for the training of primary school teachers and measures adopted for avoidance of wastage in regard to primary education should have been given proper weight. To give grants based upon one factor, is unjust, especially to the States which have put in large efforts to promote primary education. Further, some minimum percentage of the school going children and attending the schools, should have been laid down as a standard criterion.

A Paradox

A haphazard treatment of the question, by not giving any grant to any State having a percentage more than 29.3, does not seem advisable. According to the Commission's recommendations, for example, in 1956-57, Bihar with 29.3 per cent of children in the age groups of 6-11 years attending schools is to receive a sum of Rs 83 lakhs, whereas Uttar Pradesh with 34 per cent of such children is not to receive a single penny. Does this mean that Uttar Pradesh being slightly better than Bihar in this respect should altogether be ignored for the period 1953-57, covered by the recommendations of the Finance Commission? It is quite possible that Bihar with Central grants might have improved its position, rather bettered its position, even in the second year of the receipt of such grants. All these implications should be given proper consideration by a technical body like the Finance Commission.

Welfare of Scheduled Tribes

The grants under the Substantive Provision of Article 275(1) were on ascending scale and their amounts increased every year. The grants during 1953-57 were: Rs. 6.65 crores in 1953-54, Rs 7.05 crores in 1954-55, Rs 7.55 crores in 1955-56 (R.E.) and Rs 8.05 crores in 1956-57 (B.E.). The grants under provisos to Article 275(1) are to meet the costs of such schemes of development as may be undertaken by the State with the approval of the Union Government for the purpose of promoting the welfare of Scheduled Tribes in that State or raising the level of administration of the Scheduled area.

According to the Census of 1951, the number of Scheduled Castes people was 5.13 crores and Scheduled Tribes 1.91 crores. According to an estimate of the Criminal Tribes Act Enquiry Committee (1950), the ex-Criminal Tribes numbered 22.7 lakhs in Part A States and in some Part B and Part C States their numbers were large. Since independence an attempt has been made to promote the welfare of these sections, forming about 20 per cent of the total population of India. The Constitution lays down ample safeguards to ameliorate their condition and protect their interests. Seats for these classes have been reserved in the Parliament and State Legislatures. A special provision has been made to reserve posts for them.

Directive Principles

One of the Directive Principles of State Policy lays down that "the State shall promote with special care the educational and economic interests of weaker sections of the people, and, in particular, of the Scheduled Castes and Scheduled Tribes, and shall protect them from social injustice and all forms of exploitation". Under the Constitution the States are primarily responsible for their welfare. But the Union Government is to extend its executive power, under Article 339, to the States in respect of the preparation and execution of welfare schemes for the Scheduled Tribes in the States and under the provisos to Article 275 it is to give grants-in-aid to the States on approved schemes for promoting their welfare. The Government of India have been giving grants for the Scheduled Castes and the Backward Classes since 1945, and for ex-Criminal Tribes since 1953.

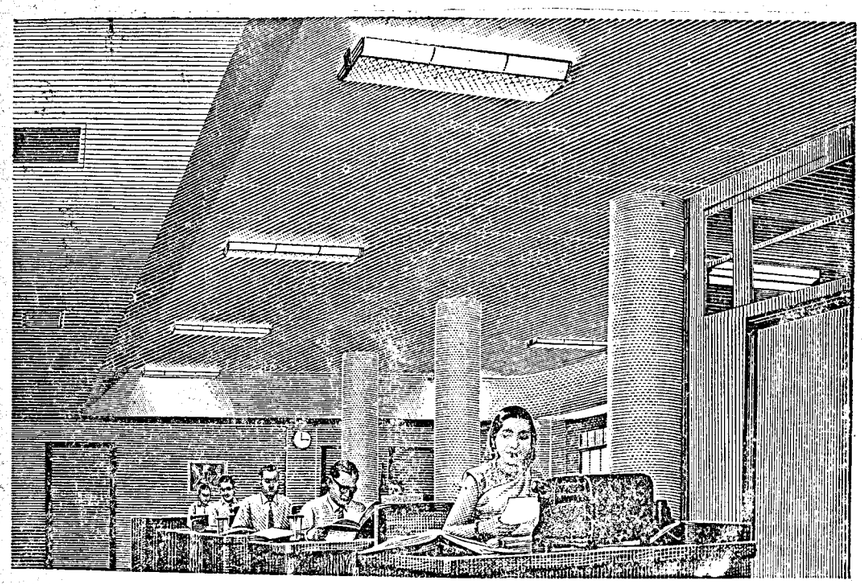
The grants under provisos to Article 275(1) amounted to Rs 1.58 crores in 1951-52, Rs 1.59 crores in 1952-53, Rs 2.25 crores in 1953-54, Rs 3.46 crores in 1954-55, Rs 4.73 crores in 1955-56 (R.E.) and Rs 6.06 crores in 1956-57 (B.E.). Except for the State of UP, PEPSU and Travancore-Cochin, all other States of India are receiving grants under this head, whereas in 1950-51 Assam was the only State receiving such grants. More than 50 percent of the grants under this head are being paid to Assam and Orissa. Though under this head grants are given for specific purposes the States are free to finalise the details in the manner they think fit, and thereby these grants are unconditional.

Administrative Changes Needed

The grants-in-aid, under Article 275, in all, amounted to Rs 2.28 crores in 1951-52, Rs 6.77 crores in 1952-53, Rs 9.90 crores in 1953-54, Rs 10.51 crores in 1954-55, Rs 12.28 crores in 1955-56 (R. E.) and Rs 14.11 crores in 1956-57 (B. E.). They formed 7 per cent in 1951-52 and 11.7 per cent in 1956-57 of the total Federal grants-in-aid. They have increased more in absolute terms than in relative terms because in a developing economy the Union Government, under Article 282, is increasingly assisting the States in financing Plan outlays. Thus, Federal grants in India have increased both in depth and in magnitude. There is need at present to develop satisfactory administration whereby the Union Government is assured that its funds are being wisely, economically and efficiently expended.

It is expected that an efficient administration will not only improve the performance of Federal grants-in-aid but it will also improve the

Table Showing Grants-in-aid for Primary Education



(In lakhs of rupees)

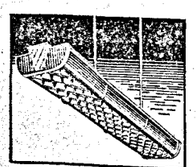
standards of State administration. The administration may be given adequate authority to see that the conditions of grants are strictly adhered to. It should have sufficient technically competent staff with practical experience to render various kinds of services and assistance to the State Governments.

It should, however, be kept in view that as long as the State administration is reasonably satisfactory there should be a minimum of Central interference. The Central aid administration staff should distinguish between what is required as a condition of Federal aid and what is merely suggested or recommended. To sum up, grants-in-aid entail some Central control, assistance and co-operation. In view of the increasing size and future role of grants-in-aid the Government of India should adopt a more consistent and rational policy to correct existing defects in the system of grants-in-aid.



Make your office many times brighter

— AND WATCH OUTPUT INCREASE!

A well lighted office means extra benefits for both staff and employer. Work improves, since good lighting reduces eye-fatigue. Further, output increases because efficient lighting eliminates the errors due to bad lighting.

That's one reason why Philips Fluorescent Lamps are revolutionizing office lighting everywhere. They give a kind light — never a harsh shadow! And they are economical; they give more than three times more light for the same electricity consumption as filament lamps: result — low electricity bills!

Install Philips Fluorescent Lamps and watch output go up—costs come down. Philips Fluorescent Lamps last on an average 7,500 burning hours!

P 13

Tertiary Production in Economic Development

S Dasgupta

THE purpose of this note is to examine the validity of the widely held view that with the progress of economic development, an increased importance is assumed by the tertiary sector. This popular view owes its origin mainly to Colin Clark's thesis that an important index of a higher level of real income per head is to be found in a high percentage of workers in the tertiary occupations. A transfer of the labour force from the primary to the secondary and from both these to the tertiary sector is thus supposed to be the general morphology of economic growth. (The definition of tertiary production used here is that given by Colin Clark in his Conditions of Economic Progress, 2nd Edition, p 401).

This increased importance of the tertiary sector may mean: either, (1) a rise in the percentage of the country's labour force engaged in tertiary activities; or (2) an increase in the relative share of tertiary products in the volume of national output. Many recent writers have the former meaning in their mind (vide the articles by Messrs Bauer and Yamey, Economic Journal 1951 and 1954 and the discussion by S G Triantis in the same journal 1953). From the point of view of economic progress, however, neglect of the latter is absolutely impermissible. The employment aspect of economic development by itself may signify little, it may merely mean that the tertiary sector has in general a higher absorptive capacity. There is no evidence, however, for us to believe that employment in tertiary activities is necessarily more productive than in primary and secondary activities. In such dissimilar economies as those of Australia, New Zealand, Japan, Britain and Egypt, it appears that per capita output is smaller in tertiary than in primary or secondary activities. The Indian National Income Committee's broad estimates showing the comparatively higher productivity in tertiary production conceal the fact that there are many low income types of tertiary employment in transport, commerce, domestic service, etc.

Had there been no disguised unemployment in various tertiary occupations in under-developed economies, we would have been justified in allocating more labour (or, at any rate, in maintaining the existing volume of employment) to the tertiary sector. The excess capacity in this sector only indicates that the per capita real output here can be increased by making certain improvements in the marketing organisation. But this is likely to necessitate an unchanged or even smaller volume of tertiary employment. Clark's own extrapolations for India show a 104 million increase in secondary employment by 1960, whereas the absolute volume of tertiary employment remains constant. The high percentage of tertiary employment in backward regions is just the opposite of being an index of prosperity.

The meaningfulness of Clark's sector classification is open to question because of the residual nature of the tertiary group which is but a collection of such non-homogeneous activities as distribution, transport and public administration at one end of the scale and domestic service at the other. When, therefore, correlation has been claimed between economic progress and tertiary production in different countries, the different instances of correlation have not qualitatively referred to the same two variables. The term "services" has been used by different authors to designate different items or groups of items. The Bombay Plan, for example, regarded as "services" those activities which are ancillary to industry. This is a narrower (though probably more meaningful) grouping than Clark's tertiary employment, "... but even then a precise relation between the rates of growth of industrial and 'service' employment is difficult to establish and any assumption would be almost as valid as another" (B Datta: Economics of Industrialisation, p 135.)

A G B Fisher's tripartite classification sets income elasticity of demand for products as a criterion: tertiary products are those which have a high income elasticity of demand. This clearly is misleading. For the income elasticity of demand for a product (and for that matter, the concept of tertiary production) will vary according to place and time; in backward countries, particularly, the consumption pattern is very considerably governed by institutional factors. The other important factor is the pattern of income distribution. The larger the share of increased national income accruing to low income groups, the smaller is the chance that the nation's average propensity to consume tertiary products will rise. The impact of the fresh purchasing power is likely to fall on food. In advanced countries, too, no predictable pattern has been observed.

What is therefore important for us to note is that the idea of tertiary production is not only conceptually but also operationally misleading. There may not arise any serious controversy regarding the necessity and desirability of occupational shifts in a developing economy, but the concept of teriary production is absolutely irrelevant in that context. An unqualified shift of activities to the Clarkian tertiary sector may not cause economic development of any significance. Professor Fisher makes it clear when he says that "the fundamental truth that there is no invariable natural 'balance' between types of production, and that the relations between them require never-ending readjustment to changing circumstances".

In planned economic development, accordingly, the relation between various occupations will have to be determined not by whether they are primary or secondary or tertiary, but according to their worthwhileness in respect of the target variables. The allocation of labour therefore would be conditioned by the respective needs of the different branches of production, and not the other way round. This suggests the vulnerability of the case for a tertiary-biased occupational reorganisation.

All over the world, all the time,

people are on the move. They may have to cross

continents or just take vegetables to the village markets

a mile away. They may fly by modern airliner, travel swiftly in

a railway train, or sway on a bullock cart. They all need transport.

Oil is playing an important part wherever man and machine are on the move.

Whether it is on the farm, where machinery helps produce good harvests, or

in throbbing factories, which turn out goods needed by the community;

whether it is in tea factories that produce tea for the millions at home

and abroad, or in hydro-electric projects bringing electricity to more and

more homes...in fact everywhere, oil is the prime mover —

limitless in performance and possibility. It is helping man and

machine to move ahead, to progress.

A constant supply of our petroleum products, so vital to

such endeavours, is fundamental to progress.

Nehru-Eisenhower Meeting

(From Our Delhi Correspondent — Delayed in transit)

PANDIT NEHRU'S considerable capacity for backing friends and promoting people is tempered by an unerring instinct. Shri Krishna Menon, Shri S K Dey and, at a lower level, Shri K K Sahni have, in the recent past, needed and received his unwavering support. Significantly however, the Prime Minister's loyalties are limited to persons and do not extend to their policies. The ire roused by Shri Menon in the counsels of the Congress can hardly be compared to the gentle murmurs of disapproval evoked by Shri Dey in some corners of the Planning Commission and the Secretariat. Nor would it be expected that Shri Sahni's proposals for a probe into oil prices and his suggestions for creating a new Ministry for Fuel and Power could easily pass muster.

It must be said to the credit of Pandit Nehru however that he stood by Shri Menon like a rock when the Minister without Portfolio was being criticised trenchantly in the Congress Parliamentary Party and the country for voting against the earlier resolution in the U N General Assembly on Hungary. With some heat, Pandit Nehru told the Congress MP's that Shri Menon's decision was right and India would act on similar lines should occasion arise again. A similar occasion presented itself the very next day and India's vote was different! Since then the views of thinking Indians who have not seen eye to eye with Shri Krishna Menon on this issue have been conveyed to Pandit Nehru at least on two or three occasions. The Prime Minister's answer was invariably bleak silence.

There is no gainsaying that Shri Menon's saturnine personality, his penchant for the brilliant phrase and, his genius for vitriolics excite a certain allergy in the U S State Department. Canada, which has lately been closer to India than most states in the West, does not exactly present a hospitable political front to Shri Menon. And most important of all, the Minister without Portfolio succeeds in irritating quite a few of his country's friends in the Asian-African bloc.

New Delhi is thus looking forward to the Ike-Nehru talks in Washington next week with mixed feelings. It is hoped that proximity of Shri Menon would not weigh heavily on the atmosphere. On the other hand, Mr John Foster Dulles is as unpopular in the uncommitted world as Shri Menon is in certain circles in the United States. That Pandit Nehru and President Eisenhower will be able to get away to Ike's farm in Gettysburg for a day for talks all by themselves, unaccompanied by their advisers, is therefore a prospect that is being regarded with some hope and confidence.

Hungary is bound to figure in the discussions between the two leaders. The Indian views on the Hungarian problem have undergone a wobbly change during the last five weeks and, in the final picture, India today is closer to the West on this issue than on any other in the Cold War. The despatches of Shri K P S Menon and Shri J N Khosla have helped clarify the situation and the fact that Pandit Nehru made a surprise statement in Parliament to reveal their content was evidence of his desire to create a favourable atmosphere for his talks with the U S President.

Pandit Nehru, on his part, is likely to raise the question of military pacts. India is convinced that the Baghdad Pact—a potential source of danger not only to world peace but to peace on her own frontiers—is dead and nothing can revive it except the U S. It is obvious that U S at the moment, is unwilling to join the Pact for fear of splitting the Arab World. America has gained a measure of Arab sympathy because of her stand on the Suez issue; she would forfeit it by aligning herself with Iraq, Iran, Turkey and Pakistan because Syria, Egypt, Saudi Arabia and Jordan would greet the move with positive suspicion if not dire hatred. On the other hand, the U S, which is a member of the Economic Council of the Baghdad pact powers, has recently guaranteed the territorial integrity of the member nations. This virtually means that the U S has underwritten the Pact and whether Pandit Nehru can persuade President Eisenhower to stop at that is a moot point. There seems to be meagre chance however that the U S would regard its recent declaration as merely a "pious wish". Requests for American military aid to the member nations are likely to follow and might even be made on the present if not an enlarged scale. Any defection from the natural course of American policy that Pandit Nehru is able to bring about would be India's gain because there is always a possibility that arms supplied for defence against Communism may actually be used in Kashmir.

If reports that the Indian Prime Minister's good offices may be sought by President Eisenhower for a solution of the Suez problem are correct, as is likely, it would be easier for Pandit Nehru to press home his point: the Baghdad Pact is as much an anathema in Cairo as in New Delhi. On the other hand, a solution of the Suez problem would remove one reason for the State Department's hesitation to join the Pact. India's good offices, if sought, would not however be withheld on that account.

From the Chair

India Steamship Company Limited

Speech of the Chairman Sir A Ramaswami Mudaliar

THE Twenty-eighth Ordinary General Meeting of the Shareholders of the India Steamship Company Ltd, was held on Wednesday, the 12th December at the Registered Office of the Company, 'India Steamship House' 21, Old Court House Street, Calcutta. Sir A. Ramaswami Mudaliar, K.C.S.I. D.C.L. (Oxon.), Chairman, presided.

The proxies received for the meeting were placed on the table and the notice of the meeting was read by the Assistant Secretary. The Chairman delivered his Speech and thereafter asked the Shareholders whether they had any questions to put with reference to the Directors' Report and the Audited Balance Sheet and Profit and Loss Account for the year ended 31st March, 1956.

In answer to a question regarding the sale of the Company's vessel—the 'INDIAN IMPORTER', the Chairman said that as the vessel was built in 1929 and was due for special survey shortly, the Directors decided to sell this vessel. No loss was incurred by the sale.

Another shareholder wanted to have a statement of the tonnage carried by the vessels of the Company. This information was supplied and further reports will show both the tonnage and freight earnings.

Certain items in the Balance Sheet were referred to by one of the shareholders, who wanted information about these items which were furnished. The increase in the salaries and wages was referred to and this was explained as due to the increase in the number of the vessels of the Company as also the revision of the salaries and wages of the staff and more amenities which had to be provided after negotiation with the Unions concerned.

The following resolutions were unanimously adopted:

The Directors' Report and the Audited Balance Sheet and Profit and Loss Account. The dividend of 5% tax free on Preference Shares and an interim dividend of Rs. -|8|- per share and a final dividend of a further Rs. -|8|- per share on the ordinary shares was adopted.

The Meeting adopted the resolution that Sir A. Ramaswami Mudaliar do continue as a Director of the Company and that the age limit under Section 280 of the Companies Act shall not apply to him.

It was also resolved that both Sir A. Ramaswami Mudaliar and Sir Bijoy Prosad Singh Roy who are Directors and members of the Managing Agency Company do continue as Directors of the India Steamship Company Ltd.

It was further resolved that the Maharajadhiraja Sir Udaychand Mehtab Bahadur of Burdwan, Mr. S. C. Roy and Mr. R. K. Mitra, I.C.S., be elected Directors of the Company.

Messrs. G. Basu & Co., and Messrs. Singhi & Co., Chartered Accountants, were appointed Auditors for the current year and their remuneration fixed.

The vote of thanks to the Chair and to the Managing Agents for their excellent management of the Company were adopted unanimously.

Chairman's Speech

The following is the text of the Chairman's Speech:—

Gentlemen,

The Audited Accounts and Directors' Report for the period ending March 31st 1956, has been in your possession for some time. With your permission, I shall take them as read.

Trading Experience

The Directors' Report shows that the freight earned during the year is Rs. 5,26,11,831 against Rs. 4,01,00,132 the freight earned in the previous year. The increase in freight is partly accounted for by the new ships which were added to the fleet by your Company and partly by the slightly less time taken in the turn-round of the ships. The delay in ports, however, has not materially decreased, a fact to which I shall make reference later. It must, therefore, be a matter of satisfaction to you that in spite of these handicaps the Company made a profit of Rs. 80,22,918 before providing for depreciation and a net profit of Rs. 38,72,859 after providing the full amount of depreciation of Rs. 41,50,059.

Delay in Ports

I referred in my Speech last year to the report of the Vasist Committee which dealt with conditions of Dock Labour in the various ports in India and made certain recommendations to improve the position of Dock Labour and promote the better turn-round of ships in these ports. These recommendations were accepted by the Government of India and most of them have since been implemented. In the port of Bombay the piece-rate system has been introduced and is stated to be working fairly satisfactorily. This system has yet to be introduced in the ports of Calcutta and Madras. To the difficulty of getting a satisfactory out-turn of work from Dock Labour in these ports has been added the further difficulty of finding berths for ships both for import and for export. The capacity of these ports to handle freight and to berth ships is limited. The plans of the Government to increase industrialisation both in the public and in the private sector and to force the pace of progress in other directions has necessarily resulted in a greater volume of traffic which has to be handled at these ports and in a larger number of ships entering these ports for which the ports are not adequately equipped. It is a matter of some satisfaction that the Government has become aware of this aspect of the question and that the Transport Department through its Secretary and other officers and through the Chairmen of the various Port Trusts is taking active steps to improve the capacity of these ports. Mechanical equipment, adequate railway sidings, mobile and electric crane facilities for mechanical handling of certain types of cargo and more berths in all the ports are urgently required and I trust that these will be provided for, at a very early date.

Labour at the ports, both Dock Labour and Port Labour have no doubt to be kept in a contented state and Shipping Companies have expressed their willingness more than once to make any reasonable contribution for the satisfaction of the legitimate demands of labour. It must, however, be regretfully

pointed out that certain sections of labour are prone to put forward what should be considered as unreasonable demands and frequently their alarms and excursions to which the Shipping Companies are subjected have a detrimental effect on the international trade and commerce of the country. I do trust that Labour Leaders and those administrators in charge of labour both in the States and at the Centre will devote equal attention to securing the legitimate rights of Labour and enforcing their patent obligations.

Progress

At the last meeting I referred to the fact that the two ships which had been ordered in 1954 were on commission and were added to your fleet and that two more ships of the same class were under construction. These ships have now been delivered, one in March 1956 and the other in June. The 'INDIAN IMPORTER' a second-hand ship of 1929 has been sold and the loan which was taken from the Government for the purchase of the Coastal vessel, the 'INDIAN COMMERCE' has been fully paid-up. There are, therefore, twelve ships including the 'INDIAN COMMERCE' in the Company's fleet. Your Directors aim at having a fleet of eighteen ships before 1960 all operating on the INDIA U.K. CONTINENT route, and orders have been placed for the construction of six more ships which will be delivered at the rate of two per year during the next three years.

The Company has also placed an order with the Hindustan Shipyard Ltd., for a vessel of 5500 tons which may be utilised either in the Coastal trade or in the trade Overseas.

The assistance which the Government of India has readily given by way of loan has enabled the Directors to plan this programme, and in a period where the ship-building yards in foreign countries are fully booked to take advantage of the offer of the German shipbuilding yard of Howaldtswerke, to order these ships.

Since March, 1956, your Company has also undertaken at the instance of the Government, to put two of your ships regularly on the India|Black Sea route to enable exports to and imports from the Soviet Union and in particular to afford shipping facilities for the large quantity of plant machinery and material required for the Bhilai Steel Plant. This undertaking has naturally reduced the number of ships available for the INDIA|U.K.|CONTINENT trade.

I should like to repeat that the Directors have kept the financial commitments of your Company, in regard to the loans taken from the Government, closely under review and are confident that there will be no difficulty in meeting these commitments provided of course there are no serious upsetting developments beyond our control.

The loans granted by the Government for the construction of ships overseas require exchange facilities for payment of instalments to the ship-building yards as they become due. I should like, however, to point out that ships of Indian companies engaged in Overseas trade earn and save enough foreign exchange to meet the requirements for transmission of the instalments due to the ship-building yards abroad. It is needless to add that this is a continuous source of foreign exchange earning and that, therefore, the sooner the tonnage of the Indian companies expand the greater will be the foreign exchange earned by them. These invisible earnings are a considerable factor for every maritime country in dealing with the exchange problem.

Public and Private Sector

The industrial policy statement of the Government of India declares that sea transport belongs to the second category of industries which will be developed both by private enterprise and by the State, so as to accelerate progress. The need for Indian Shipping to operate on various routes on which at present there are no Indian ships operating is unquestionable. The two Shipping Corporations that have been recently promoted in the public sector have, therefore, a free field in which they can operate without in any way jeopardising the interests of the Shipping companies in the private sector. I am glad, therefore, to bring to your attention that the Hon'ble Minister for Transport has stated at the last Annual Meeting of the Indian National Steamship Owners' Association, as follows:—

"I may state it very clearly that it is not our intention that Shipping in the public sector should run in competition on routes in which existing private Shipping companies have established themselves."

I trust this categories statement of the Hon'ble Minister will continue to be a basic policy in the expansion of Shipping in the public sector.

Suez Crisis

I feel bound to refer to the serious problem which has emerged during the last few weeks owing to the fact that the route through the Suez Canal is not now available and will not be available for some considerable period. It will be inappropriate for me on this occasion to deal with the political and other aspects of the crisis which resulted in the closure of the Suez Canal. The Company has had, however, to face a series of problems of readjustment of the sailing schedules of your fleet, problems of insurance and of obtaining bunkers and water at new ports of call consequent on the diversion of your ships to the longer route via Africa. These problems, I am glad to state are being satisfactorily dealt with by your Company.

The policy of your Directors in providing a speed of 17 to 20 knots in the new ships has not only contributed considerably to increased freight earnings but has also enabled the Company to keep its sailing schedules fairly in line with the requirements, a factor which is of so vital importance at a time like the present when the Company's vessels have to take a longer route on account of international developments.

The events which have led to the Suez Canal problem, the conferences that have been convened from time to time to consider the issue, and the position that certain maritime countries have taken with reference to the Suez Canal, all emphasize the need for building up the country's fleet as rapidly as possible. Our status and our dignity as a maritime country seem to require possession of a sufficiently large mercantile fleet despite our position in the international trade of the world, if we desire to have tangible share in the settlement of these grave problems.

I feel certain that the expanding policy which your Directors have adopted will be appreciated whereby there will be at least 18 ships on the INDIA|U.K.|CONTINENT trade apart from the two ships earmarked for the Black Sea Trade by the end of 1960.

Government Loans

I have referred to the loans that have been sanctioned by the Government enabling us to launch on the expansion of your fleet. We are grateful to the Government for the assistance given so far and we trust that this assistance will continue in the same measure for a further and quicker expansion of the fleet of Indian companies. It is further hoped that some of the terms and conditions of these loans may be liberalised to a reasonable extent. I must take this opportunity of stating that the achievements of the Indian Mercantile Marine have been by no means inconsiderable. National Shipping has established itself in the Overseas trade, against heavy odds, by maintaining a high standard of efficiency and service and has in no small measure assisted the development of India's National Overseas trade.

In the matter of training Indian personnel as well, for key positions in the Mercantile Marine, the Indian companies have done their best and in the coming years the dearth of technical personnel I am sure, would not be so seriously felt in this industry. In these circumstances, I have no doubt that the development of National Shipping in the private sector will continue to be encouraged by the Government and any suggestions which would adversely affect such development will not be looked upon with favour by the authorities.

Earnings and Dividend

The earnings of the Company have been noted in the Directors' Report. I have had during the last two years the not very pleasant duty of informing the shareholders that the Directors were unable to declare dividends on Ordinary shares. It is, therefore, some relief and consolation to me that this year we are able to announce the payment of an interim dividend of Rs. -|8|- per share and are now proposing to pay a further final dividend of Rs. -|8|- per share on Ordinary shares.

I should like to take this opportunity of thanking the shippers both here and abroad, for the very generous support that they have given to your Company. Thanks to the fast ships which form our fleet and to the courteous and prompt service which is forthcoming at all ports, the India Steamship Company holds a very high position in the esteem of shippers in different parts of the world. Our shippers have recognised this by their patronage.

Transport Minister's Resignation

I cannot conclude this Speech without reference to the resignation of Shri Lal Bahadur Shastri, Minister-in-Charge of Railways and Transport. I do not wish to make any comments on the constitutional propriety which necessitated such resignation or on the parliamentary traditions which it is stated to have helped in building up. I can only refer to the deep regret which is felt almost universally in India at this resignation. The contribution which Sri Shastri has made to the cause of Indian Shipping, his earnest and enthusiastic support in expanding the Indian fleet and his deep understanding of the problems of Indian Shipping companies has been widely recognised. The personal characteristics of Sri Shastri, his modesty, unassuming manners and his desire to avoid publicity have been appreciated widely. I have no doubt that he will shortly be called upon to fill again high and important posts in the Cabinet of the Government of India. I should like to extend to him on your behalf our good wishes.

New Director

It gives me great pleasure to inform you that the Board has been strengthened by the addition of another Director Mr. R. K. Mitra, I.C.S., Chairman of the Commissioners for the Port of Calcutta. His knowledge of port working and its conditions has been of great help to the Board.

Tribute

The Company has been well served by all its officers afloat and ashore of all ranks and by its Agents and brokers. On your behalf and on behalf of the Directors I wish to convey our thanks to all of them for their good and enthusiastic work throughout the year.

It only remains for me now to thank you gentlemen for your attendance at this meeting and to join you in the hope that the Company will prosper in the years to come thanks to the good and enthusiastic work of our staff.

I shall be glad to answer any questions which shareholders may wish to ask regarding the Accounts.

THE INDIAN IRON & STEEL CO. LTD. 12 MISSION ROW, CALCUTTA

Company Meeting

The Delhi Cloth & General Mills Co. Ltd.

Speech of the Chairman Sir Shri Ram

SPEAKING to the shareholders of the Delhi Cloth & General Mills Co, Ltd, at their Annual General Meeting held on the 18th December, 1956, Sir Shri Ram, Chairman of the Company, stated that the profits continued to be satisfactory. The Company also continued their policy of steady expansion and modernisation the investment on these during the year being of the order of two and a half crores of rupees. During the year, the new textile Mill at Hissar went into fuller production. The Silk unit at Delhi went into production too, and capacity was expanded in the Vanaspati, Caustic Soda and Sugar plants. Proceeding, Sir Shri Ram said:

As constituents of a nation determined to raise its living standards, each one of us has a duty to perform vis-a-vis the Plan. And it is in this spirit of constructive co-operation that I will draw your attention to a few aspects. And I would, in all humility, suggest to brother industrialists that they might give up raising the question of the private sector versus the public sector, in season and out of season, as instead of doing any good, probably it does harm. Enough room has been left for the private sector, I believe, even in the Second Plan.

Cloth Exports

For reasons well-known the gap in foreign exchange resources anticipated in the course of the Second Plan period has further widened. Under the circumstances, even greater responsibility devolves upon the cotton textile industry, one of the more important foreign exchange earners.

I believe that the export of cotton textiles can be raised to 1,000 million yards, and perhaps even higher. For solving the various problems involved in achieving an expansion of our export trade in textiles, I would suggest a meeting of all the interests concerned—the Ministries of Commerce, Industry, Finance, Railways and Labour and the representatives of industrialists and leaders of labour.

While the production of mill-made cloth has gone up year after year, as may be seen from the figures I give below, it is regrettable that the exports have been declining, and have consistently fallen short of the First Plan target of 1,000 million yards. This state of affairs must cause concern to the industry as much as to the Government.

Production and Exports of Mill-made Cloth
(M yards)

	Production of Mill-made cloth	Exports of Mill-made cloth
1953-54 ..	4,964	740
1954-55 ..	5,034	761
1955-56 ..	5,101	680

In other words, on the basis of current indications in 1956-57 India will export only about 127 out of every 1,000 yards of mill-cloth produced as compared to 151 yards in 1954-55.

While on the subject, I am glad to say that the D C M have not only maintained the volume of their exports, but even increased it substantially, very often at profit considerably lower than could have been earned by the sale of the same cloth in India.

D C M Cloth Exports

	Value of D C M Exports (Lakh Rupees)	Index (1953=100)
1953 ..	76	100
1954 ..	156	205
1955 ..	184	242
1956 (approx.)	220	289

Why are exports declining when it is crucial to ensure that exports expand to substantially higher levels? The answers are simple enough. On the one hand, demand in the home market has shot up tremendously making it more profitable for mills to sell in the home market. On the other hand, the Government policy of not allowing the expansion of the mill industry on the weaving side has prevented the supply of mill-cloth from expanding in proportion to the growth of internal demand and has tended to exert a general, upward pressure on prices. The statistics given below bring out the nature of the impact of the higher home demand.

Pressure of Home Demand

In other words, in spite of the limitation on weaving capacity inside mills, the country absorbed in these years nearly twice as much extra mill-made coth as it produced, and secured this excess over the rise in production from two sources—stocks and exports. In 1956-57 alone, as compared to 1955-56, the rise in the demand for mill-cloth will be of the order of 475 m. yards, almost double the growth —250 m. yards—in 1955-56 over the preceding year. May I point out that since stocks have been already reduced drastically, future increases in home demand may affect the level of exports even more decisively?

Attention must be directed to the resolution of this paradox of the imperative need for more cloth exports, on the one hand, and the continuing diversion of exports, on the other to the home market pressed for ever-larger supplies.

The gravity of the situation has now been recognised by the Government, who have already announced an upward revision of the

Table Showing Impact of Higher Home Demand
(M Yards)

	1954-55	1956-57*	Change
1. Production of Mill-cloth	5,034	5,350	+316
2. Exports of Mill-cloth	761	670	— 89
3. Stocks (with mills) of Mill-cloth	(approx) 460	Less than 200	—260

*Estimated on the basis of current trends.

cloth target to 18.5 yards per capita and also promised a further review of this figure. The Government, as you know, have also decided to license the installation of 14,600 automatic looms whose output will be channelised more or less fully into export. I welcome these measures. However, with all humility, I would like to point out that marginal raising of the per capita target by half a yard over its original level of 18 yards is not enough. The target must be raised to at least 20 yards in 1960-61, for reasons now adduced often enough, and all arrangements for attaining the target, inclusive of sanctioning of new weaving capacity for the home market, about 30,000 looms—both pain & automatic, must be taken in hand well in time. The country cannot afford to risk shortage of cloth, next in importance only to foodgrains in the average consumer's budget. And equally, we cannot risk the loss of our export markets.

Handloom Industry

The fear that the increase in mill capacity will adversely affect the handloom industry, is, in my opinion, unwarranted. Anway, to the extent to which it is necessary in the opinion of the Government to augment handloom production, it can be done by fixing annual targets of total cloth requirements, and allowing to the handloom industry a progressively rising proportion of the target in each succeeding year, provided the handloom industry can undertake the necessary productive effort. I will even suggest that if production inside mills is found at any stage to be restrictive of output in handlooms, resort can be had to sealing of a small percentage of mill looms. But in working out our policies in the matter of cloth production, we cannot avoid the the compelling consequence of reduced exports so long as output of mill cloth does not expand more or less in proportion to the growth in home demand, the magnitude of which I indicated earlier.

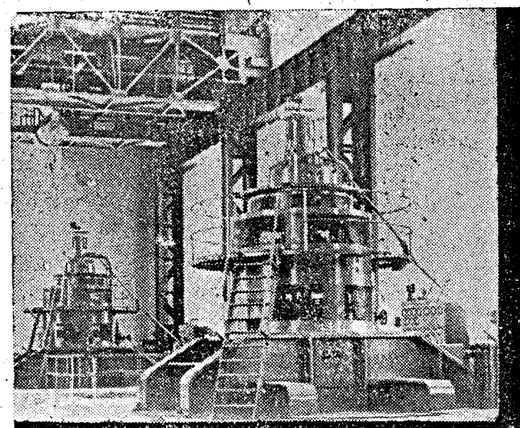
I am sure that the policy of the Government to allow installation of automatic looms, earmarked for export, will afford some relief, but it is obvious that this relief will take a long time to materialise. In fact, I apprehend that about 18 months will lapse between now and the time when the output of these new looms becomes fully available for export. The granting of these licences, I think, is hedged in with too many restrictions, and in view of the much higher capital cost of automatic looms and other required equipment, the level of returns on the investment appears to be unsatisfactory. More so, when viewed in conjunction with the fact that the export price realisation will be definitely on the lower side. It is possible that this will affect adversely the total implementation of this policy in the time desired. I may also point out that time lags are already in evidence in the obtaining of machinery from abroad, a factor of particular importance in the case of automatic looms.

Export Quota

Moreover, under this policy the obligation to maintain the previous level of export rests only on those mills which are sanctioned looms under this new scheme. There is no such obligation on other mills. In the result, it is possible that to a large extent, the effect on the volume of exports will be only substitutive and not additive, as is to be desired in the interest of the country.

While this policy to increase the production of mill cloth is being worked out, it is necessary to maintain and add to the exports. In my opinion, the interest of the country will be served better if the task of exporting cloth is distributed more equitably among all composite mills by insisting on the export of a certain minimum percentage of output of cloth. In the first instance, the percentage might be fixed lower but as soon as possible it should be revised upward, as is required in the overall interest of the exchange position of the country, of course keeping in mind the broad conditions affecting the international trade in textiles. The provision of transferability of quota from mill to mill will generally meet the particular difficulties of any individual producer, without affecting the desired volume of exports in a period of rising and more profitable home demand. The time has come when our export performance must not merely be the sum total of the efforts of a few units but the reflection of an industry-wide effort in the national cause of earning the needed foreign exchange.

Cost Increases

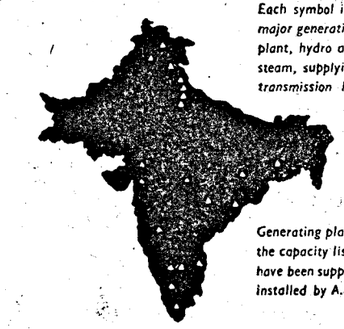


A general impression appears to have arisen that the increase in the prices of cotton cloth during the last one year or so is due to the expansion of the margins of mill profit. I would like to point out that at the same time that profit margins have widened the industry has been faced with the general problem of costs rising in almost every major aspect of its operation. Thus, in the course of the last season cotton prices rose by 20 to 40% for different varieties. Labour costs have risen, dearness allowance rates having gone up by 10 to 25% in different centres in October 1956 as compared to May 1955. And the quantum of the increase may be judged from the fact that the Dearness Allowance payable to a worker in our textile units in Delhi rose from Rs. 48-14 in May 1955 to Rs. 62-12 in December 1956. Likewise, coal rates have increased by nearly 25%; and railway freight charges were revised upward in the last budget by 6-1/4%.

The upward price trend in the cloth market during 1955-56 is thus a reflection, for the most part, of cost increases, and not of unduly extended profit margins for the producer.

I welcome the assurance given by the Finance Minister that in the administration of the recently enacted provisions regarding the compulsory deposit of varying proportions of current and accumulated reserves with the Government no hardship will be caused in the current operations of Companies. Speaking as the Chairman of the Board of Directors of a Company where almost every Board Meeting deals with some sanctions for capital expenditure, I know that fixed capital expenditure in any established concern will be a more or less current flow in time. In administering the new regulations about deposits, care will have to be taken to see that delays do not obstruct the even flow of investment. I am confident that in the actual operation of the scheme by the Finance Ministry, this aspect will receive due attention.

Before I conclude, ladies & gentlemen, let me express my appreciation of the efforts of all my colleagues, big or small. I convey my thanks to them.



Note: This does not purport to be a record of the proceedings of the Annual General Meeting.

Around Calcutta Markets

Hopes and Fears

Wednesday Evening

As TTK sought authority from the Lok Sabha to raise the existing excise duties, subject to a maximum of 50 per cent of the present rates, equities sagged further earlier in the week. At the time of this writing, equities are slightly above the lowest levels touched recently. But investors remain away from the market. And the improvement, whenever it occurs, is mainly due to replacement buying by speculative interests. Speculators are hoping that, as equities remain steady for some days, investors will be induced to enter the market.

That remains to be seen. Meanwhile, the technical position continues to be intriguing. There has been some liquidation by investors since the higher super-tax on dividends and the capital gains tax. But the sharp fall in equities cannot be due to liquidation alone. Indeed, there is absolutely no reason why holders of, say Indian Iron, should have sold out, as the IISCO dividend remains unaffected by the latest tax proposals.

"Short" Interest

Slump in clearing shares is mainly due to the speculative selling pressure. In the recent fall, the technical position has been reversed. In Indian Iron, for instance, there was a considerable "long" interest some time ago. This "bull" position was maintained, despite the adverse interpretation of the Government's policy relating to dividend and to the premium for the right issue. But, in the last three weeks, weak "bulls" have been eliminated.

Not only is there no longer a "long" position in Indian Iron and in some other clearing shares. It is evident that, in active speculative scrips, there is now a "bear" position. If the speculative selling pressure has accentuated that recent fall, the existence of a heavy "short" interest is a reminder that, in the absence of any further untoward development, "bear" covering may push equities up. "Shorts" have not yet covered their sales. When they square-up their positions, equity levels may temporarily move up.

World Bank Loans

Two factors helped the slight recovery in equities in the last two days. Reports about possible loans by the World Bank came at a time when stock markets were in a mood to respond to encouraging news. One World Bank mission will soon visit India. A bigger mission is expected some time later. Press reports indicate that New Delhi is optimistic about World Bank loans for the Second Plan. It is doubtful whether market expectations that World Bank loans will total Rs 500 crores will materialise.

But it was not without significance that stock markets preferred to be optimistic about World Bank loans in justifying a slight recovery in equities. Even those who do not share the optimism of stock markets will concede the importance of World Bank loans for the Second Plan. Nor will it be denied that liberal World Bank loans will have healthy effects on the economy and, hence, on stock markets.

Excise Duties

Another favourable development was the assurance by TTK that he had no intention to use immediately the powers sought by him to raise the existing excise duties. It may be questioned why, or whether, equities should drop on the possibility of increases in excise duties. These excise duties have been justified on many grounds. Higher excise duties may check consumption, and, thus, affect savings. This is debatable so far as excise duties on life's necessities are concerned.

New Delhi is blunt about its intentions. One of the objects of the Bill, which seeks Parliament's authority for raising excise duties, is that, "in the present price situation, it may be necessary both for encouraging exports and for mopping up excessive profits." Stock markets cannot be unconcerned about any move to mop up excess profits. Nor can stock markets be blamed if equities drop when the Government seeks such powers.

Bonus Shares

There is a section of the market which is hopeful that the latest tax proposals will encourage the issue of bonus shares. There are two arguments in support of such an assumption. One is that the tax on bonus issues has not been raised along with the increase in dividend taxes. Another is that bonus shares are not to be treated as capital gains for the purpose of the capital gains tax. So long as the present capital gains tax is not amended, and with no increase in the tax on bonus shares, market expectations cannot be regarded as illogical.

But those who are banking on bonus shares need the reminder that some adjustments in the capital gains tax are inevitable by the next budget time. Here, it is relevant to emphasise that bonus shares are likely to be treated as capital gains when the capital gains tax is properly readjusted. Meanwhile, there is not likely to be a spate of issues of bonus shares.

Engineering Shares

Recovery, in Tea shares has proved to be short-lived. It is still presumed that many tea companies will rather pay the higher dividend taxes than reduce dividend payments. But the hesitant trend in Tea shares seems to be partly due to the irregularly lower trend in weekly auction prices. Despite the continued steadiness in jute goods, jute shares remain inactive. So are Paper and Coal shares. Hesitancy in these groups of shares is not surprising because of the general downward trend in equities.

Inactivity in Miscellaneous and Engineering shares is, no doubt, a reflection of the prevailing nervous feeling in stock markets. But these groups had remained subdued even before the imposition of the latest taxes. This would seem rather surprising. For, it is widely conceded that engineering industries, along with the iron, and steel industry, have expended considerably in the last two years. All this expansion has not yet been reflected in the values of Engineering shares. If and when the stock market moves up Engineering shares should lead the recovery.

Concessional
RETURN TICKETS
DURING X'mas
HOLIDAYS

During the period from December 15, 1956 to January 5, 1957 (both days inclusive) concessional return tickets for Christmas Holidays will be issued provided the chargeable distance between the stations is 150 miles or more.

★ Tickets are available for completion of return journey within 15 days including the date of issue or date of commencement of the journey, in the case of return tickets issued in advance.

★ No break of journey is allowed on the return journey.

★ Passengers are requested to present the return half of the tickets at the Booking Office before commencement of the return journey for dating the actual date of the commencement of the return journey. Passengers, if found travelling on the return journey without having their tickets so dated, or found breaking their journey on return trip, will be treated as travelling without tickets.

★ Full particulars can be had from Station Masters concerned.

Confidence at Low Ebb

Thursday, Morning

THROUGHOUT the week under review, sentiment in the stock market was distinctly bearish due largely to the Union Finance Minister's emphatic reiteration about further taxation. His obsession for more and more taxes and his promise to assume the role of Robin Hood, if need be, and ask for more taxation, twice, three times or even four times in the course of a year was sufficient to unnerve the bulls. As a result there was a perceptible decline of values early in the week. Of course, there was an attempt at recovery towards the middle of the week, only to be followed, at the close, by a fresh setback which underlined the inherent weakness of the market.

The bearish trend of the market, as we have been stressing in these columns, is destined to continue as long as operators have to contend with (i) continued tightness of money; (ii) labour demands for increased wages; and (iii) more and more taxation in the months to come. The only silver lining in an otherwise gloomy prospect is the promise of a chain of bonus issues. This might support the market at these critical times and provide a semblance of recovery. In fact, during the middle of the week, there was a perceptible improvement in share values, on reports of a bonus issue by Calico Mills of Ahmedabad (which was also expected to declare a handsome dividend). Bulls ventured into the arena once again when it was also strongly suggested in market circles that Pandit Nehru's historic visit to the U. S. would result, among others, in India getting a sizeable loan from the World Bank. These factors would naturally give some occasional support to the general level of scrips in the market, while growth scrips, where excellent prospects following huge expansion programmes are taken for granted, could be expected to maintain a more or less steady trend without being unduly affected by the bearish bias elsewhere. In this class come companies like Tata Steel, Tata Locomotives, Indian Iron, ACC, National Carbon, Indian Aluminium, etc.

Tata Steel opened the week at around Rs 178, and after improving to Rs 178-8-0 closed relatively weak at Rs 177. Indian fared no better. In fact, in the course of the week's trading a new low level of Rs 28-9-6 ex. div. was registered before the scrip managed to lift itself up by its bootstrap, as it were, to close, with a modest recovery, at Rs 29-4-0.

In the textile section, despite anticipation of bonus issues in some scrips, the general trend was bearish. Centuries ruled weak despite bonus issues, while Dyeings were quiet although there are still market rumours about a bonus by this Company. The unprecedented manner of the Government of India desiring to assume powers by a notification, to raise the existing excise duties subject to a maximum of 50 per cent of the existing rates, has been a vital factor adversely affecting sentiment in the textile section. Marketmen were completely nonplussed by the Union Finance Minister's extremely unconventional means of meeting his needs. There is every evidence now to show that Shri T T K means business when he says that he is going to assume the role of a Robin Hood! In the circumstances, even the assurance given by the Minister earlier that the February Budget would be a lame-duck session has failed to console the marketman. They feel themselves already properly fleeced. Right now investment confidence is at a very low ebb, and Government is unfortunately bent on its being kept so!

Cotton

Change in By-laws

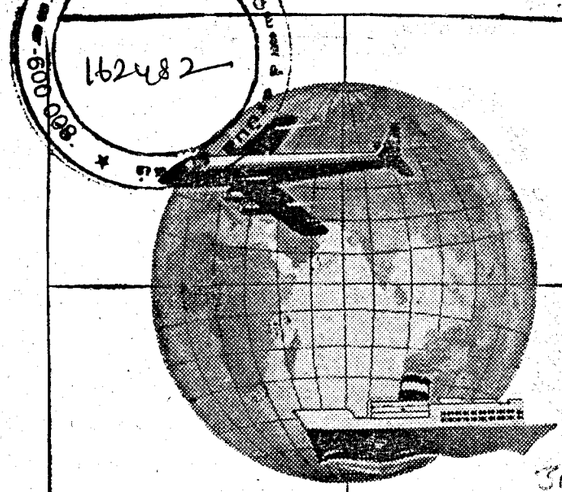
IN THE cotton futures market, conditions of trading were far from satisfactory. Prices tended to rule around the low levels. A notable event of the week was the decision of the East India Cotton Association in respect of its by-law 55 relating to the fixation of tendering differentials. There had been frequent complaints from leading cotton houses in the city that there was need to amend this by-law to remove the distinctly bearish bias from which the current contracts were evidently suffering since futures trading was resumed in Bombay. The by-law in question has been amended whereby the E. I. C. A. has empowered the Board to fix the room rates on the basis of spot prices instead of futures values as prevailing hitherto. The market naturally welcomed this decision by a rise of two to three points, but on the same day that the decision was taken, sentiment suffered towards the close. This was due to two reasons. In the first place, the market was not quite happy over the Board's decision to keep by-law 61 which in effect cancelled out the bullish potential of the change in the other by-law. Secondly, operators were disappointed at the EICA's decision to make the amendment of the by-law 55 effective only from the next settlement and not the current contracts.

In the spot market too, sentiment was generally bearish. Arrivals from upcountry were regular and sizeable, while mill buying was confined to only exportable varieties. Towards the end of the week, even when the Union Finance Minister hinted at the possibility of levy of import duty on foreign cotton, sentiment continued to remain unaffected and the inherent weakness of the cotton market, both spot and futures, was further emphasised.

There has been some speculation as to whether Government would sanction the import of East African cotton. Usually, India accounts for the lion's share of the import of East African cotton. This year, however, though East Africa has already disposed of nearly fifty per cent. of the crop in the four auctions held thus far at Kampala, Government has yet to clarify the position with regard to the import of this cotton. Demand for it has, however, become more keen in the absence of a fair volume of Egyptian cotton owing to the Suez crisis. Unless Government comes out with an announcement immediately, it is felt that India may not at all be able to participate in the Kampala auctions.

Oilseeds

Groundnut Reacts



During the week under review the oilseeds market clearly demonstrated that it would be playing into the hands of Government if prices were allowed to hover around higher levels for longer periods. Groundnut prices had been seeking fresh high levels for some time, both due to the statistical position of the crop as well as on expectation of a large export quota for groundnut oil. During the middle of the week, there was some irregular trend in the groundnut section but this was corrected on Monday when, under the leadership of groundnut, the entire oilseeds market forged ahead, with heavy business in groundnut. Ideas about the crop were being revised downward while actual arrivals were far below the market expectations. Over and above these factors, whatever arrivals were there, were soon absorbed by eager crushers and vanaspati interests. What more was needed for a distinctly bullish trend? There was, of course, the demand and the expectation for an export quota for groundnut oil.

Things then took a turn for the worse with the visit of the Union Minister for Commerce and Consumer Industries to the city. Shri Morarji declared categorically, at a function organised by the Bombay Oilseeds and Oil Exchange, that "if any of the merchants still hoped that the export of oilseeds would be allowed, he would have to suffer". He warned the trade further that if they did not take steps to bring down the prices of oil, a prime necessity of life, Government would have to intervene. This very statement brought about the desired result, namely, a decline in seeds and oil prices all round, without either Government or the trade having to take any steps! Groundnut February, which was around Rs 159-12-0 at the opening of the week, forged ahead on Tuesday to as high as Rs 161 only to suffer a decline on the same day at the kerb to Rs 156-8-0. The actual closing for the week was still lower at Rs 155-4-0. In the same way, sentiment in the castor section, which was sympathetically favourable earlier in the week, suffered adversely towards the close.

WANTED

As there is a demand from new subscribers for the following back copies of **The Economic Weekly**, it would be much appreciated if readers would kindly mail back these copies to the Business Manager, The Economic Weekly, 15, Tamarind Lane, Bombay-1. The copies will be paid for.

Volume VIII—Nos. 14, 15, 27; 28, 29, 31; 32 and 33.
