ON September 14th an important conference will be held in London: the various trade associations concerned with bread will meet to discuss what should be the new price of bread after September 29th when the bread subsidy comes to an end. The millers have not yet made any statement about the price of flour, but by next week the harvest should be far enough advanced to forecast its prices and grades. Assuming for the moment that the basic price of flour remains unchanged, the arithmetic of the bread price would be this: the controlled price for the 1¼ lb loaf was 8½d., to which must be added 1½d. as the value of the lost subsidy. There have also been some minor cost increases which have not yet been assessed, but which might be covered by another farthing; as neither trade nor customers like farthings, this might provide a case for setting the final price at 10½d. The bakers complain, however, that this price assumes no increase in their profit margin (now controlled to produce an average of 7s. per sack of flour used for bread). Therein lies the controversial question.

It is the more controversial because the two sections of the trade have different interests. Many small bakers have made less than the average profit and they have more to

Emergency Issues Reprinted for Binding

The size of the pages in five of the issues of *The Economist* produced during the printing dispute earlier this year was overlarge. These issues (dated March 3, 10, 17, 24 and 31) have now been reprinted in normal size and are available for those who regularly bind copies of the paper. The cost of a set of the five issues is 2s. 6d. including postage. It would be appreciated if remittances could be sent with orders, which should be addressed to:

The Economist (Reprints)
22 Ryder Street, St. James's, London, S.W.1

lose than plant bakeries by the disappearance of the subsidy. As this was adjusted to cover the cost of transporting flour, the country bakery will miss it more than the plant bakery in the town ; and whereas the extra subsidy of 4s. a sack on the first twenty-five sacks covered most of the small man's production, it meant very little for the plant bakery. The small bakers would like to see a new price of 11d. But there is no doubt that the plant bakeries could manage comfortably on 10½d. for the unwrapped loaf and still more comfortably on 11½d. for a wrapped loaf. Let them manage then. It is important that the conference should not pursue uniform prices for all types of bakery and all parts of the country. Quite apart from the general case against monopoly price-fixing, the bakery trade has a heavy responsibility at the present time, since any rise in the price of bread has a psychological impact not to be measured in farthings.

West African Customs

THE report of the inquiry into the Cocoa Purchasing Corporation in the Gold Coast appears just as evidence is being given in the Nigerian banking inquiry. Together they may seem to throw a murky light on financial morality as understood in the young governments in West Africa. The cocoa inquiry not only convicts Dr Nkrumah's government of using the corporation's power to make loans to farmers as a political weapon, but charges him, and his finance minister, with untrustworthiness when answering questions in the witness box about the corruption of the corporation's officials. This has stung him into issuing a white paper complaining of the judicial methods used in the inquiry, and promising new legislation to define procedure in any such inquiry in future. Dr Azikiwe, in Eastern Nigeria, of course, slapped in his white paper about the banking question before the inquiry started.

To people in Britain such goings-on reinforce doubts about African capacity for decent administration. Fears have been expressed that they will inevitably frighten away the overseas capital Africa needs. This may be true, but it is well to keep a sense of proportion. West Africa is not the only area where a measure of corruption prevails without administration breaking down or international capital feeling unable to do business; and in Western Nigeria, at any rate, Mr Awolowo appears to be running an administration that compares more than favourably with some in the Middle East or South East Asia. In the Trusteeship Council, indeed, Britain is accused of having a peculiar and unhealthy puritanical obsession with administrative cleanliness to the detriment of the far bigger issue : the right of colonial peoples to self-government and democracy.

The cocoa report may serve in Britain as useful ammunition to the dissident Ashantis ; but Dr Nkrumah will probably not go short of apologists who will say, in Clive's words, that, considering how much loose cash has been lying about in the Gold Coast in recent years, his henchmen's moderation has been astonishing. And at least he has published the report. The fact had better be faced that the shock to West African public opinion is likely to be very moderate.

On Beef and Milk

APART from the losses of a wet harvest, British agriculture is facing awkward problems of adjustment. The price settlements of the last few years have aimed at discouraging milk production while giving a strong stimulus to the output of beef. Yet while milk output continues to rise, efforts to step up the consumption of liquid milk—the profitable part of the milk business—have so far failed. Even the perennially optimistic Milk Marketing Board is becoming alarmed. Beef producers, on the other hand, are in the doldrums because prices have slumped. Farmers blame the Government for allowing increased imports of Argentine chilled beef, and their union is pressing strongly for import regulation.

In fact the outlook for beef producers is brighter than they seem to think. The price guarantees for fatstock are calculated on a rolling twelve-month average, and guarantee payments are low now simply because market prices were high last summer. Fat cattle prices seem certain—whatever happens to beef imports—to climb back to a satisfactory level by next year ; and since Mr Heathcoat Amory has already promised not to cut the beef guarantee next spring, the further outlook for producers is also reasonably good. Nevertheless, meat production is one of the most hazardous branches of farming ; if the Minister does not want producers to take premature alarm and reduce their stock (as they are beginning to do) he will have to do some more effective explaining.

The milk situation is fundamentally more dangerous. Milk yields on the better dairy farms are rising rapidly—which is wholly to the good. The trouble lies in the vast number of farms whose financial backbone consists of a small and relatively inefficient dairy business. Most of these farmers ought either to specialise much more effectively in milk or else go in wholeheartedly for something else—such as beef. The only way to make them do so is to cut the milk guarantee while leaving the other guarantees untouched. Because this course is so unpopular, there is a real danger of sliding into the alternative expedient of introducing a system of milk production quotas—a course which would spell inefficiency, not only for the dairying industry, but for British farming as a whole. The Milk Marketing Board has so far firmly opposed such ideas ; but neither Board, Government, nor progressive farmers can afford to let the situation drift.

Bonn and Moscow at Odds

DR HAAS, the west German ambassador in Moscow, has returned to his post from Bonn in an atmosphere dominated by recriminations over the repatriation of Germans in Russia and Russians in Germany. These at the moment almost take precedence over the long-promised German note on reunification, which Dr Haas still did not take with him. He went with "more precise verbal instructions" for the conduct of his difficult mission in Moscow ; the note, Bonn says, is now in process of delivery.

Dr Haas will have more scope for persuasiveness on the vexed question of repatriation, about which for months Bonn and Moscow have been exchanging small-arms fire. The latest shot from Moscow has come in the form of a note accusing the federal government of keeping Soviet citizens in Germany by "moral pressure, intimidation, persecution and even physical maltreatment." These improbable allegations have prompted a renewed German protest to Moscow against the Russian refusal to allow Dr Haas's officials to get in touch with some German technicians and scientists, including rocket experts, in the Black Sea area. The Russians claim that the east Berlin government is responsible for these particular Germans. The federal government retorts that international law gives it the right to identify its own citizens.

This is the sort of quarrel that flourishes on bad temper. The Social Democrats have said with justice that relations between Moscow and Bonn are now "worse than they have ever been." Certainly they have not improved since Mr Zorin left Bonn. The Central Committee of the Russian Communist Party has now declared that the ban on the German Communist party makes the "reunification of Germany impossible on a peaceful and democratic basis," adding one more to the list of "impossibles" which bar the way to German unity. The Russians must be more angry than surprised at what was a long-gestating judicial decision ; it is doubtful if their note really marks a change of attitude. But the occasion was too good to ram home the argument that a change of German government next year is an essential preliminary—one of many—to reunification. Since the federal government's purpose in making proposals is largely to persuade home opinion that it is doing something effective about reunification, it has not strengthened its hand by holding this card till now.

Nenni's Qualified "No"

FIRST reports of the meeting of reconciliation between Signor Nenni and Signor Saragat seem to have erred on the side of optimism. The talks on Italian Socialist unity that have followed the initial meeting at Pralognan are not going quickly. In itself, this is no bad thing: protracted talks presuppose an agreement in principle that the Nenni Socialists and the Saragat Social Democrats desire unity, and want to settle the many points of difference that must be reduced if unity is to be achieved. An earlier attempt at an *avvicinamento* between the left and right wings of the Italian socialist movement—marked by a meeting on June 6th between Signor Nenni and the Social Democrat party secretary Signor Matteotti—proved premature and indeed was condemned by Signor Saragat as over-precipitate. The present talks look more like the real thing.

The more detailed reports of the Nenni-Saragat meeting now made public, however, mostly underline the differences between the two parties. The 64-dollar question came from Signor Saragat, who maintains his opposition to a "popular front." He wanted to be sure that Signor Nenni would not accept Communist votes or invite the Communist party to join a coalition government, even if one of these courses would give a unified Socialist party a controlling position in the Chamber of Deputies. The fact that Signor Nenni said "No" is less interesting than his reason for so doing: "The country," he said (according to Signor Saragat), "would not understand it." It may be assumed that Signor Saragat will require evidence of a more radical change of heart before he commits himself to collaboration with such recent fellow-travellers as the Nenni Socialists. Indeed, the subtle overtones of Signor Nenni's observation that it is the business of socialists to be anti-capitalist rather than anti-communist must be ringing disturbingly in Signor Saragat's ears.

It is understandable, therefore, that Signor Saragat should firmly deny suggestions that he is thinking of leaving the Segni government, in which he is deputy premier. His denial merely demonstrates his awareness that there are still obstacles to be got over. Not the least of these is the rivalry between the non-communist trade union federation (UIL) and its bigger and still communist-dominated rival, the CGIL. M. Commin, who has made a start, on behalf of the Socialist International, in bringing the two sides together, said in Rome on Wednesday, after five days of inquiries, that he believes the basic conditions for fusion exist. But the preconditions already listed by both parties suggest a tug of war rather than an imminent joining of hands.

Planning the City

MR SANDYS'S decision to reject the Barbican plan for the bombed area north of St Paul's is hardly surprising. The Minister paid tribute to the imaginative sweep of the proposal, which would have provided office and commercial accommodation, an underground car park, flats and community buildings in a single group of buildings, topped by five towers between 200 and 300 feet high. But all this would have meant a vast increase of employment in an already congested area ; on top of the general expansion of office space in the City of London it might have strained transport beyond the breaking-point ; and it is for these reasons that the Minister—"not without regret"—has vetoed the project.

Mr Sandys is right, but it will be tragic and unpardonable if this is the end of the Barbican idea. The controversy over the Barbican has had the salutary effect of forcing the City of London to produce its own comprehensive plan for the area, and this plan is at least a great improvement upon the undistinguished, piecemeal office development which has so far passed for town "planning" in the City. In particular the City has accepted the Minister's view that it is wrong for its territory "to be choked by day and deserted by night" ; and has included in its plan some residential development and community facilities.

It will, however, be far from easy to persuade individual developers in the Barbican area to co-operate in the City scheme, particularly in developing a true residential neighbourhood rather than a few luxury flats—unless someone can be found (and assisted) to take the financial risk. Past history regrettably suggests that the City authorities, now that the rival challenge is removed, are all too likely to content themselves with licensing individual office projects first and making what they can of the remaining sites afterwards. This is not good enough for the one site in the City where a really bold scheme is still practicable. Mr Sandys should not rule out the possibility of redesigning the Barbican scheme, should the City now fail to display the necessary initiative.

Economics at Sheffield

THE economics section of the British Association has perceptibly shifted its policy this year. In the past, it has dealt with general theoretical themes, broadly indeed and in relation to current events—as Professor Hicks dealt last year with wages—but nevertheless from the aspect of principle. This year, the emphasis was on political economy: directly political in the case of Professor H. D. Dickinson's highly personal views on the effects of automation (discussed in a Business Note on a later page) but more constructively so in other papers whose concern was with special fields and (particularly) with recent legislation. Professor Gilbert Walker and Mr A. D. Peel took transport as their theme, the former, in his presidential address, devoting most of his attention to the effects of the Transport Act of 1953; Mr Sara, discussing progress in the United Kingdom iron and steel industry, laid more stress on technological than on economic factors; Mr Hunter, dealing with the control of monopoly, emphasised its legal and institutional aspects.

There is a great deal to be said, in the proceedings of a body aiming to act as a liaison between scientists and public, for this approach to economic problems. Whatever other economists may feel about it, the lay audience or reading public moves more happily from the particular to the general than vice versa. Nevertheless, something will be lost if this shift of policy turns out to be permanent and is accentuated. The British Association cannot indeed be expected to duplicate the functions, as a form and means of communication within each of the several disciplines represented, of the learned journals. That is not its job. In so far, however, as that job is to communicate to other scientists and to the public at large the current findings (or their currently most important applications) of each specialist group, that aim is frustrated when the reports concerned deal too narrowly with a speciality within a speciality. There is need of at least one "keynote speech" on a major theme. Professor Walker's address on competition in transport was hardly in this category. The perfect recipe for Section F's contribution to the loosely conceived "advancement of science" will never be easy to find; but it should be possible, without reacting too far towards theoretical generalities, to improve on the 1956 formula.

Reformatories for Children

The great meeting of the National Reformatory Union, held at Bristol last week, is one consequence and illustration of the conscientious alarm which begins to prevail as to the defects of our penal jurisprudence, and of the general desire to find some useful supplement to it and a remedy for them. . . . What do these reformers propose? To take children who are criminal, or are neglected and likely to be criminal, under their care—teach them and provide for them. They are in many cases to do the duties of parents to neglected and criminal children. They assume that the parents neglect the children; at the same time the *beau ideal* at which they aim is to establish for these children the relations of the family. Higher than that they do not go. But they suppose their duties in their assumed office as parents will be better performed than the duties of the natural parents; a supposition in general—whatever may be true of some select individuals—as wild and unfounded as ever entered the heads of political schemers. . . . As the rule, natural parents will care much more for their offspring than strangers, and when they neglect them are not always to blame. Where the neglect occurs from poverty—from a difficulty of procuring the means of subsistence, the proper cure is to lessen the poverty, to remove the obstacles in the way of obtaining an easy subsistence, to increase commodities and enlarge the field of productive labour. Now all these reformatory contrivances, as the rule, impede productive labour: they employ so much capital in some other way than in producing, and *pro tanto* they must increase the poverty which is the source of neglect and crime. To all the persons engaged in looking after the reformatories—secretaries, teachers, chaplains, etc., etc.,—they give ease and give comparative opulence. All such institutions are supported by the produce of labour, and the more they are multiplied, the more labour is hampered and the less labour is rewarded.

Slowly Up from Slavery

So much cold water has been poured on the new United Nations convention on slavery that the public is probably already left with the impression that the whole thing has been a waste of time. That is a false impression. It is true that the conference at Geneva which ended on Tuesday generated more heat than light; and that the convention as finally adopted was a much weaker affair than the earlier drafts. Asian, Arab and Soviet votes secured the defeat of the British-sponsored clause which would have authorised the signatories' warships to detain and search vessels suspected of carrying slaves in the waters around the Arabian peninsula. Concessions were also made to the colonial powers' familiar argument that they cannot arbitrarily order far-reaching social changes in states under their protection, or in dependencies in evolution whose own governments and legislatures tend to resist interference in their domestic affairs. In its final form, the convention amounts to little more than a reaffirmation of the 1926 convention on slavery, with additional clauses calling for the early abolition of tenant serfdom, forced marriages, the exploitation of "adopted" children, and similar practices.

It may attract more signatures than did the convention of 1926, but to sign is one thing; to execute is another. No means of coercing laggard governments are provided, and the history of slavery is evidently not going to end in 1956. However, it need not be concluded that the UN discussions have yielded nothing but bad blood. The bad blood is, in fact, an essential ingredient in the only anti-slavery formula that is practicable in this age of new nationalisms. Slaving can no longer be attacked, as it was in the "bad old days" of the last century, by punitive expeditions and naval patrols. Today, even the most backward regime regards those forms of action as intolerable affronts to its sovereignty. Only by publicly arraigning the offending states in an international forum can pressure be put upon them to mend their ways. No state—whether it is an Arab kingdom, a South American

Looking for new markets?

Almost all **COLOMBIA**'s manufactured goods are *imported*

One of South America's biggest potential markets, Colombia represents excellent opportunities for British goods—and almost all Colombia's manufactured goods are *imported.*

With large scale development of a really efficient road, sea and rail transportation system well in hand, Colombia's economy is expanding fast.

Take a long look at Colombia. It's easy to do through the facilities of C.P.V. Colombiana Ltda, the Colombian affiliate of C.P.V.—Britain's leading international advertising, merchandising and public relations agency.

C.P.V. Colombiana Ltda.

Apartado Aereo 4472, BOGOTA, Colombia.

(An affiliate of the C.P.V. World Organisation, currently running campaigns in 82 different countries)

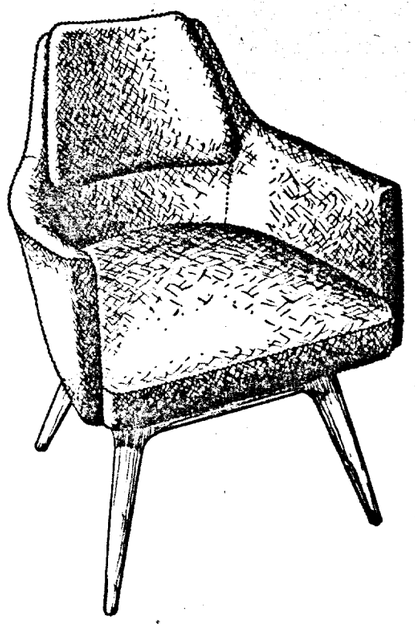
Your turn next?



Many able executives tend to doubt that comfort aids efficiency — until they take a turn in this swivel armchair. Especially designed for men of action who must spend long hours behind a desk, it provides correct posture support and remarkable ease of movement; makes comfort and efficiency synonymous. Based firmly on four teak legs, the well-padded seat swivels easily at the lightest touch.

Come and see it at our Contracts Showrooms, where you will see many other examples of modern furniture for offices and boardrooms. If you cannot come, please write for our leaflet, *Furniture for Special Needs.*

BRISTOL

and the Aviation World

Not only with the versatile Britannia, but also in their work on helicopters, turbojets and turboprops, ramjets and guided missiles, the Bristol Group of Companies is helping to forward the scope of aviation.

THE BRITANNIA
A large part of Bristol's resources is devoted to the production of Britannia airliners and their Proteus engines.

HELICOPTERS
Bristol's research and development programmes for helicopters have resulted in large orders for single- and twin-engined machines being placed with the Group.

AERO-ENGINES
Two world altitude records have been won by an Olympus-engined Canberra. This engine is in production for Avro Vulcan bombers. Two new engines —the lightweight Orpheus and the Orion supercharged turboprop—are being intensively developed by Bristol Aero-Engines Limited.

RAMJETS AND ROCKETS
Work on rocket motors for research during the International Geophysical Year is being undertaken by the Bristol Group. Bristol are also developing guided missiles and their ramjet power units.

Other Bristol activities. The Group also manufactures cars and aircraft plastic drop tanks. The following companies are associated with Bristol: Rotol; British Messier; Short Brothers and Harland. There are associated and subsidiary companies in Australia, Canada, Mexico, New Zealand, France and Spain.

BRISTOL

THE BRISTOL AEROPLANE COMPANY LIMITED

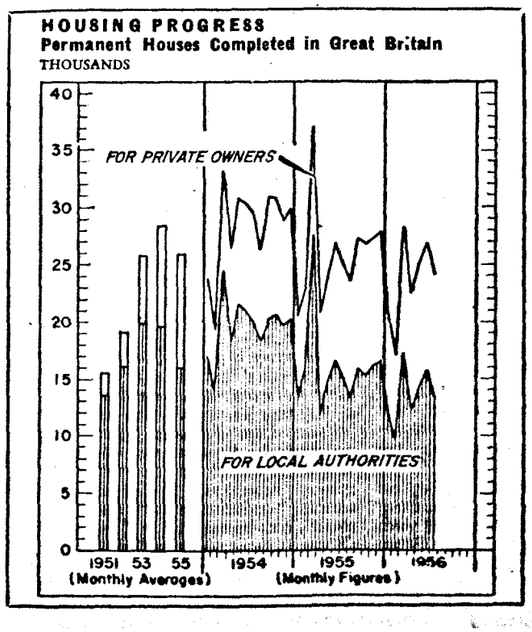
republic or a colonial power—enjoys being pilloried in this fashion, and the fact that there have been bitter exchanges at Geneva only goes to show that some of the anti-slavery campaigners' thrusts have gone home. The important thing now is to keep up the pressure by further periodic discussion in public, and periodic review of the extent to which the new convention is being honestly put into effect. It is a painfully slow method, but better than silent acquiescence.

Optimism in Canberra

THE new Australian budget is less remarkable than Sir Arthur Fadden's comments on it in his speech in the House of Representatives. There have always been two legitimate views about the Australian economy. One, the sceptical, sees the traditional standard of living as threatened by unbridled immigration and excessive capital investment, and favours not merely the governmental brake, but even an "as you were" policy—ideally, no doubt, the *status quo ante* immigration, but since this is impossible, at least a halt to expansion and its attendant discomforts. The other view, that of the optimists, assumes the necessity for continued massive immigration and argues that Australia's rate of expansion is justified by the mineral discoveries of the past few years. This school believes the worst evils of inflation to be susceptible to treatment, and contends that its minor evils are a price worth paying for benefits in store.

In his budget speech, the Federal Treasurer ranged himself firmly with the optimists. Sir Arthur did not share the opinion of those who said that Australia must reduce its rate of economic growth or resign itself to chronic shortages of foreign exchange and perpetual import restrictions. None, he said, could doubt the country's capacity to yield more and more commodities to meet the world's basic needs. In terms of immediate needs, he foresaw a considerable improvement in Australia's trade figures in the coming year. There is still, however, some way to go, since the country's net deficiency in all external transactions is still high at £A73 million for 1955-56—much better than the £A256 million deficit of 1954-55, but a long way from the £A191 million surplus of 1952-53. But the existing import restrictions, together with rises in the value of Australia's staple exports—including wool—are closing the gap.

Internally, the Treasurer seems content to let the drastic medicine of the supplementary budget introduced in March (which provided for increased bank charges and interest rates on overdrafts, and raised taxes or duties on cars, beer, tobacco and petrol) take effect. Hence the present "holding" budget.



Pence and Pens

IT is an old view that sees pence and pens joined together to be mightier than the sword. But surely nobody has accepted it with more wide-eyed candour than the Suez Canal Company in its dealings with the French press. Not, one hastens to add, the Egyptian Canal Authority, whose troubles in placing advertisements for pilots indicate a certain innocence. But the dispossessed company, which has had eighty years in which to learn not to pay the press, at least not openly, for publishing its communiqués—and least of all crypto-Communist papers like *Libération*, which promptly reproduced a photograph of the cheque for 100,000 francs which the company sent to it (as to other Paris papers) accompanied by a duplicated letter of appreciation for services rendered. It is inelegant for the company to be caught distributing even small favours just before announcing the Egyptian seizure of its assets bars it from paying interest on its debenture shares. Its officials have confessed with a blush to having supposed that payment is due for political news as it is for advertisements and company reports. If that were so, the general view is that it values news space rather low; 100,000 francs is not a bribe but a tip. *Le Monde* notes the decay of the gentle art of bribery since the Panama scandal which nearly wrecked Clemenceau's career in the nineties, for 100,000 francs is a mere 500 gold francs to the 20,432,704 which the other canal company dispensed in more opulent days.

Naturally, the Communist press is making much play with the charge of corruption. The *Humanité* has arraigned the "bourgeois" press for keeping silent until *Libération* crowed—its own silence is perhaps due to the company's conviction that it accepts only Moscow gold. The charge is barbed in Paris, where political corruption of the press has for decades been a favourite theme with pamphleteers (almost certainly with more justice in the Third Republic than in the Fourth) and where newspapers are often in financial straits. But it is hardly serious. The routine distribution of duplicated letters and cheques owes less to the traditions of bribery than to a gold-plated view of expenses.

Letters to the Editor

Money for Malta

SIR—Your comment in your issue of August 25th carried on the misrepresentation based upon incorrect facts contained in your previous recent comment.

You say: "First he (Mr Mintoff) refused the original offer of £5 million as inadequate; then he produced a schedule of expenditure which would have required annual subventions rising from £7 million to £10 million and more in later years; then he refused the proposed commission to investigate the figures. . . ." The truth is that the Colonial Office fixed the figure of £5 million without consulting the Maltese Government and without having seen Malta's Five-Year Development programme or the estimates for the current year. Following this, the Colonial Office tried to make out that their limit was recommended by the Round Table Conference. That this was not so has been confirmed by members of that conference. There is no logic behind the unilaterally fixed figure of £5 million and no supporting evidence has ever been produced.

On what evidence, therefore, do you base your assertion that "Britain's offer remains generous and imaginative"? Reference to previous levels of assistance do not impress those who understand the nature of Britain's debt to Malta and who appreciate the past failures to provide the basic public services and a viable economy.

Regarding the budget proposals of the Maltese Government, the first proposal for assistance was for £8.2 million from all sources for all purposes. At no stage did the Colonial Office look at these budget proposals on their merits from an economic point of view: all along they said that the proposals did not offer a basis for discussion since £5 million was the limit. In spite of this negative attitude Mr Mintoff offered the Secretary of State a cut of £0.75 million—not £0.5 as stated incorrectly by the Secretary of State. This offer was not accepted and no agreement was reached: the £5 million barrier remained.

Later the budget was revised and because the CARE programme was reduced, and in order to try to meet the Colonial Office, the figure asked for the United Kingdom contribution was reduced to £6.6 million. Where you get your "£10 million and more later" is a mystery, since no such proposals exist.

You are also wrong in saying that Mr Mintoff refused to accept the suggested economic commission. What he objected to was the manner in which it was proposed to make its appointment, and to the original terms of reference which prejudiced the whole issue. In this connection, it may interest your readers to know that while it took the Maltese Government only 48 hours to reply to the suggested terms of reference and membership of the commission, it took the Colonial Office three weeks to reply to the alternative suggestions which had been discussed with the Imperial side of the Dyarchy locally.—Yours faithfully,

A. PELLEGRINI

Office of the Prime Minister,
Malta

Minding Other People's Business

SIR—Perhaps some of your readers will be interested in the reactions of a United States management consultant to your article on British management consultants in the issue of August 11th.

As your article says, our profession has grown rapidly in the United States during the past two decades—and for the reasons you indicate. But perhaps the greatest single reason for our growth is the fact that in the United States employing a management consultant is no longer regarded by sophisticated management as a reflection on that management's competence. In fact, in this country the most extensive users of management consultants today are the largest, best managed and most successful enterprises.

Perhaps this greater maturity of our profession—as well as our less severe tax structure—makes our staffing problems less severe than those of British firms. In any event, our leading firms are career firms, owned and managed by men who have devoted their careers to the firm. They have achieved success on the basis of their ability as management consultants. Our problems of turnover are much less severe than that of British firms, as described in your article.

Moreover, our firms do not experience the economic squeeze between salaries and fees that is described in your article. Our leading firms do not "sell time." Rather we are compensated on the basis of the values contributed. Sophisticated managements recognise that professional contributions are measured by the worth of the recommendations, not the amount of time spent in their development.

American corporations are calling on management consultants for assistance on more important problems than your article indicates is the case in Great Britain. There are more calls for assistance on questions of major policy, organisation structure, and operational philosophy than for studies to cut costs and simplify paper work.

Finally, our practice reflects recognition by the corporations of other countries that the retaining of United States management consulting firms is one way to import American management know-how. This importation must consist of building in philosophical concepts and basic understandings of management methods rather than learning about our systems or procedures. Such knowledge is, of course, also to be found in British management consulting firms.—Yours faithfully,

MARVIN BOWER

McKinsey and Company Inc.
New York

SIR—Much as I respect Colonel Urwick, I can almost see the Churchillian grin on his face when he wrote paragraph three of his letter. He well knows that the analogy he draws of doctor and patient (as between management consultant and client) would be more accurately described as surgeon and patient. The surgeon cannot be dismissed in the middle of an operation. The "patient" is usually under an anæsthetic.—Yours faithfully,

L. S. DAWSON

Stockport

Expectation of Life and its Value

SIR—Law courts are now quite frequently faced with the new and difficult task of assessing damages for a shortened expectation of life. In addition to these difficulties the ruling of the House of Lords presents further complications, making it almost impossible to find reasonable solutions. According to this ruling the court must be satisfied —before damages are awarded in respect of the shortened life of a given individual —that the circumstances of his life were calculated, on balance, to lead to a positive measure of happiness of which the victim of an accident has been deprived. If, however, his character or habits were calculated to lead him to a future of unhappiness or despondency, that would justify a smaller reward. In other words, the jury or the judge are asked to measure incommensurables. Indeed, not even the wisest human being could possibly know whether it would have been happiness or unhappiness that Providence might have had in store for men or women, if their life had not come to an untimely end.

Only recently the Lord Justices of Appeal could not help admitting that there is no real basis on which to assess a "reasonable sum" in such cases, because these estimates were "wholly erroneous." As a matter of fact, the sum being awarded as compensation for loss of expectation of life at present almost "conventionally" amounts to some £400 in cases of a "happy life." Damages, however, awarded for loss of expectation of life in cases of an allegedly "unhappy life" do not exceed —as far as I know—£75. These decisions stand out in sharp relief against those which—quite sensibly—have taken into account "amenities of life" under the head of "non-pecuniary losses," such as "gardening" or "watching football." Whether justified or not, substantial awards of this kind greatly contribute to a fantastic diversity of decisions, and raise the question whether a uniform scale—though necessarily somewhat arbitrary—might be preferable to a system trying in vain to put a "price on the priceless." Anyhow, known facts such as age, state of health, profession, achievements, special qualifications and the status of a given individual in general, should enable the courts to return to a sense of proportion in such estimates.—Yours faithfully,

London, N.W.6 LEON ZEITLIN

Labour and Its Crisis

SIR—In his letter published on August 25th, Mr Zilliacus points out that the Security Council is neither more nor less inactive than the governments that compose it. This is quite true and the British Government has played a considerable part in its deliberations. Yet upon all major decisions it is the negative activity of Russia, armed with the veto, that has blocked settlement of international disputes referred to it. The only time when the United Nations policy has worked in an international dispute was in Korea. This was made possible only because the Russian delegates had departed from the scene.

Mr Zilliacus has used such generalisations as organised internationalism, based on equality of status, common interests and give and take to support the United Nations. But surely even Mr Zilliacus must face facts as they exist and judge the United Nations upon performance rather than ideals, upon actions rather than words.

The truth is that, apart from Korea, the United Nations has never succeeded in settling any of the major disputes that have troubled the world. How well the Arabs know this. The United Nations passed a resolution on December 11, 1948, for a settlement of the Arab-Israeli dispute—this has neither been accepted by Israel nor implemented by the United Nations. Nearly eight years have elapsed during which time the problem has deteriorated day by day.

Any United Nations resolution would be met with the same scorn as that which Egypt showed over the 1951 resolution regarding Israeli shipping through the Canal. It would not even be considered until the 1948 resolution had been implemented. Perhaps though this is part of the give and take Mr Zilliacus referred to; perhaps he would wish to bargain disputes on this basis. Whatever the answer may be to these conjectures, Mr Zilliacus, I feel sure, would prefer to leave the company of ghosts he does not appear to admire and emerge into a world of reality patterned by facts as they are and not as how he would like to see them.—Yours faithfully,

Books & Publications

Study of the Universe

AN HISTORIAN'S APPROACH TO RELIGION: *Based on the Gifford Lectures for* 1952-3.
By Arnold Toynbee.
Oxford University Press. 316 pages. 21s.

HISTORY and philosophy seldom mix. History deals with rugged, unique, unrepeatable events. Metaphysical philosophy seeks for abstract and general laws; applied to history it finds laws where there are no laws, and resents the concrete rock of the past which will not fit into some manufactured category.

One part of this book consists of the brilliant and far-ranging illustrations and parallels that fascinated the reader of the "Study of History." Humbled like the astronomer before his firmament, we range the centuries and the continents and the civilisations, glimpsing the Megistanes and the Orejones, Naramsin and Ur-Nammur, Har Govind and Govind Singh, rising and falling empires and creeds and cultures and gods. The insular mind cannot read it without being stretched and enlightened, and sometimes bewitched by the magic of distant vistas and exotic names.

Another part of the book consists of the philosophy—and more exotic names, but now they are called Absolute Reality, Peaks in the Time-Space, the Collective Human Intellect, the Essence of Terrestrial Life. Here, there is a modicum of misty language (the word wrong is used to mean both erroneous and sinful but we are not told which; the word self-centredness appears to be used in two different senses throughout the book), and the analysis of several paragraphs would be a healthy exercise for students of theology or logic. There is also some difficulty in Dr Toynbee's apparent claim to read the philosophy from the history, the apparent claim that his empirical observations (wider observations, let it be said, than those of other contemporary historians) enable him to make particular inferences about truth. Dr Toynbee might have said, "this is my personal impression." But on his first page he rejects this interpretation of his book and seems to believe that, whatever varieties of philosophy individual historians may come to, this is the kind of general result which those who are deep in history will attain. It is almost a claim to be propounding, not *religio historici*, but *religio historicorum*. And the most astonishing thing of all about the book is the declaration that every historian ought to be trying to answer the question "What is the nature of the Universe?" It is to be hoped that our coming historians do not accept this view or we shall indeed suffer from a spate of dogmatisms.

This misty aura that pervades Dr Toynbee's book is to be deplored, for it may conceal the wisdom that underlies so much of what he has to say. Stripping away the heavy garments of historical parallelism and the capital letters of neo-Hegelian abstractions, we find the reflections of a gentle and learned sage upon the religious and moral situation of the world. The argument that for him is cogent is (as one might expect) the argument based on widespread experience. Dr Toynbee appears to think little of "intellectual" argument as a means of apprehending or analysing moral or religious truth, and he makes a curious distinction between the truth provided by the intellect and the truth provided by the sub-conscious Psyche, each of which is valid in its own sphere. He has observed people over the world and through the centuries intuitively certain that selflessness is right and selfishness sinful; certain, too, that selflessness is right and possible because it is in line with what he calls "the main Current of the Universe," or—a little more apologetically—because it is in its measure some reflection of the nature of God.

Exercising Sovereignty

TO THE HUSTINGS.
Selected and introduced by H. G. Nicholas.
Cassell. 360 pages. 18s.

MR H. G. NICHOLAS, a foremost figure of that vigorous team of Oxford experts on the postwar general elections, has now called the novelists to the aid of the students of electoral practice. He has brought together, in a most readable form, thirteen election scenes from English fiction, spanning the period from Dickens's Eatanswill to Belloc's study of Mr Clutterbuck's election, and to R. J. Cruikshank's genially penetrating picture of a general election in the early nineteen-thirties.

This use of the tension and passion of a general election to illuminate character had its heyday in the novels dealing with the mid-nineteenth century. The first Reform Bill had widened the electorate enough to give the contest validity, and the Corrupt Practices Act of 1883 had not yet "robbed the British election of all its character as a popular public festival, and made of its ultimate ceremony merely a sense of private rendezvous with the citizens' consciences." Mr

Nicholas protests that despite this decline in the colour and drama there is still a big field for the art of the novelist in portraying the behaviour of the public at this one moment when they do exercise their sovereignty. One hopes he will succeed in this quest. Yet one is also bound to ask whether in fact the true political novel of our time does not belong more to the private meetings of the party committees who select the candidates, and to the tension and clashes of such bodies as the Parliamentary Labour Party, where issues are truly decided and where the real contests for power take place. This is the realm which the novelists of today have left almost completely unexplored.

Meanwhile, Mr Nicholas's book, rich in character and humour, and in the true atmosphere of elections across a century and a half, is a most stimulating volume for both the historian and the general reader.

Revolutionary Prelude

THREE WHO MADE A REVOLUTION: *Lenin, Trotsky, Stalin.*
By Bertram D. Wolfe.
Thames and Hudson. 661 pages. 30s.

AUTHORS often give the impression that they are far more interested in a quite different topic than the one they are writing about. Mr Wolfe's study of the revolutionary prelude in Russia ends before the outbreak of the October Revolution, but he is clearly keen to have his say on the resulting Stalinist society. Such flashes backwards and forward, if they do not disturb the picture, may be illuminating, but the author runs the risk of distorting the image by reading too much into the past.

This is most striking in Mr Wolfe's treatment of Lenin, naturally the most prominent figure in his story. Until recently, Soviet historians attempted to describe Stalin as "Lenin now." Mr Wolfe, unwittingly, backs their case by showing Lenin as "Stalin then," as above all a man manipulating the party machine. It is true that at first he brushes in a social and political background, but Lenin's conception of the party is not set against it. The gap separating Lenin's preparation of his troops in exile or in the underground from Stalin's handling of the monolithic machine when in supreme power is not shown properly. By insisting on Lenin's party manœuvres and devoting much space to "expropriations," Mr Wolfe shows him as Stalin's legitimate ancestor. The road may or may not have led inevitably to Stalinism; its shape was determined by Russia's peculiar conditions rather than by the Leninist conception of the party. It is significant that even in his chapter on Lenin as a philosopher Mr Wolfe is more concerned with "psychobiography" [sic] than with ideas.

Stalin cannot claim pride of place in events up to 1914; there is really comparatively little to say about his role until then. Mr Wolfe is aware of this; yet, as if to fill space, he enters into lengthy polemics with Stalin's panegyrists. (In the light of what is now happening in Moscow the task seems superfluous.) Thus, what properly belongs to the writer's workshop and should at most emerge in footnotes intrudes on the text and slows down the narrative. Trotsky's portrait comes out best, probably because his stature was so striking, his path so scintillating and because he has left so many brilliant landmarks in writing.

Mr Wolfe's book stands out from a mass of rubbish written about the Soviet Union; he knows more about the subject, and is more skilful in exposition, than most. When a reviewer, however, is told by the publisher that no less an authority than Mr Isaiah Berlin considers this the best book ever on the subject, he becomes more exacting, and feels compelled to state that in scholarship, style and historical sweep it cannot be compared with Trotsky's own writings.

The book was first published in the United States in 1948. It is a pity that in this English edition the opportunity was not taken to eliminate some ephemeral gossip, both inaccurate and irrelevant (such as a reference to the late Henrykowski as the man directing Polish policy from Moscow after the war). The book could also gain by a concluding chapter in which the various theoretical and tactical concepts could be tested against the reality of the revolution. The previous quarrels would thus make better sense and some unnecessary excursions into the future could be avoided.

An Historian's Approach to Religion

ARNOLD TOYNBEE

No reader of *A Study of History* should neglect this complementary volume, in which Dr Toynbee considers the attitude of the twentieth-century Western World *towards Christianity. 21s. net*

Family and Neighbourhood

Two Studies in Oxford

J. M. MOGEY

The author examines an obsolescent housing area and a new housing estate in Oxford and contrasts the behaviour and attitudes of the people living in them. The results of his inquiries challenge many widely-held opinions about the harmony of life in a slum and about the quality of family living in our new housing estates. The methods used to collect the information are new. *Illustrated* 30s. *net*

OXFORD UNIVERSITY PRESS

Studying the Market

READINGS IN MARKET RESEARCH.
Edited by Frederick Edwards.
British Market Research Bureau. 271 pages. 35s.

WHEN the Market Research Society was founded ten years ago its sponsors could not assemble even twenty people of proved competence in the planning, execution and analysis of market research surveys. Today the society has over three hundred members and associates, and their numbers are still growing. At present British industry is spending at least £4 million annually on market research, and hundreds of manufacturers are using it systematically to help decide policy on advertising, distribution, packaging, product content, public relations and so on.

This expansion is all the more remarkable when it is remembered that there is no university or technical college in Britain that provides any comprehensive training in the subject. For the most part, the postwar recruits to market research have come from the universities with degrees in economics, history and mathematics (but rarely sociology or psychology) and have acquired their present skills by watching their elders at work, by attending occasional weekend schools and, in exceptional cases, by reading some of the many excellent American journals and books on the subject. No substantial textbook on market research has yet been written in this country, and Mr Edwards and his colleagues have set out to fill the gap by republishing in a single volume fifteen articles by British authors that bear on market research techniques and practices. The only new material is an excellent introductory essay in which Messrs Downham, Shankleman and Treasure describe market research as now practised in Britain, indicate likely future developments and provide a sound bibliography.

All the fifteen articles are good, but their sum is perhaps ill-balanced. Over half the material is provided by academicians and civil servants concerned primarily with social surveys and not with market research. One consequence of this is that, relatively, far too much space is given to techniques of sampling, too little to the construction of questionnaires and the problems of interviewing. Some of the gaps are substantial. There is little or nothing on product testing, communications research, copy tasting, advertising media research other than the press or motivation research, and the only case history is taken not from commercial market research but from a university social survey. These omissions are usually due to the fact that no relevant material has been published by a British author—which makes one doubt the wisdom of nationalism in the compiling of a "Reader." Half-a-dozen essays drawn from American sources would have enabled the book to be of much greater value to those starting a career in market research in this country. Even among the British contributors there are some regrettable omissions: one would have liked to see reprinted Mr Cauter's paper describing in detail the organisation of a large-scale market research agency, and the code of practices adopted by the Market Research Society. However, even as it stands, the book is sufficiently useful to ensure that new editions, with additional material, will be welcome.

Lessons About France

LES FRANCAIS ET LA REPUBLIQUE.
By Charles Morazé.
Paris: Armand Colin. 256 pages. 20s.

IT is a major weakness of British public life that the academic study of politics is at such a low ebb. Even so, M. Morazé can envy us. For him, France is even further behind: however great the individual brilliance of its leading intellects, its public life suffers from the complete lack of serious political education on the part of both French parliamentarians; who cannot learn what France's problems really are until they achieve office, and, consequently, the French electorate, which has to watch totally unreal issues forming the sole subject of party debate.

To fill this gap, to examine France's political situation in relation to its economic and demographic development, to French resources, human and natural (the latter, he reminds us, so often overrated) to its position at the crossroads of Europe and the world, to its immensely complicated and diverse social and geographical structures—this has been M. Morazé's self-imposed mission in the series of remarkable books that have come from him since the liberation. His latest, written after the frustrating experience of the December dissolution and January election, written, so Paris has it, in six weeks and bearing some marks of the eloquence of haste—printed (English publishers, please note) with its 69 maps and graphs in the space of three months—is perhaps the most striking contribution so far.

Where method and approach are concerned, admirers of M. Morazé will find themselves on familiar ground: two disciplines, economic history—including both demography and the history of technology—and geography, are for him the real foundation of any serious study of politics. From these studies derives his general picture of France as a country where, despite early national unity, different societies at different stages of development continue to coexist, and create political complexities that make France incapable of progressing from one technological and social stage to the next with the smoothness achieved by English parliamentarism, but instead demand for each step forward either a revolution or a war. Can France now step into the atomic age without either? Or should it continue, will it be allowed to continue, as an island of "malthusian economics," preferring luxuries (wine) to necessities (bathrooms), and of abstract and outmoded cultural forms?

It is characteristic of M. Morazé's unwillingness to allow any of the difficulties to remain hidden that he uses the same book to explore the anguish of France's position in North Africa, and to suggest historical reasons why the British find "disengagement" so much easier, to see what there is real and what false in the idea of "Europe," and to give the most lucid and convincing interpretation of France's hesitations about "integration." M. Morazé is not impeccable; he shares the continental illusion that there is an Anglo-Saxon form of politics common to Britain and America, and shares it because, like so many of his countrymen, his knowledge of Latin America is not matched by any corresponding knowledge of the northern half of the Western hemisphere. But in a book designed to provoke thought rather than to lay down a doctrine, this is not enormously important. What is difficult is to see whence the French are to derive the inspiration and leadership to make the leap forward into the new world of thought and action that M. Morazé believes essential to their survival. He does not tell us. But where most French books carry a note about special printings on luxury paper for the author and his friends, this one carries the simple legend: "*dix exemplaires de cet ouvrage ont été tirés à part destinés au général de Gaulle.*"

The Golden Horn

BYZANTIUM AND ISTANBUL.
By Robert Liddell.
Cape. 256 pages. 25s.

IF a confidential survey were to be made among armchair travellers who have later been able to check personally on their reading, many of them would be found to have strong feelings about travel-writers with rose-coloured spectacles. Mr Robert Liddell, however, is not open to any strictures on this score in this book. He was not happy in Constantinople and he makes no bones about it. Not that he is unfair to the place; but his feelings are mixed. "So splendid and so squalid; so immortal and so dead. One of the most beautiful cities in the world, one of the most interesting, and one of the most unpleasant." Many people who have striven to fight off disillusion while climbing up the steep streets of Pera will know what he means. (But if Mr Liddell goes again to Constantinople, he could now get away from Pera and stay on the other side of the Golden Horn.)

Part of Mr Liddell's trouble is that he is, on his own confession, a "nostalgic Philhellene"; if, in spirit, he had come to Istanbul from the east, he might have felt better about it. All the same, he does his duty by the city's monuments nobly. He has reservations about the Byzantine churches, not least about Santa Sophia; the lesser ones, he says dryly, must be approached "without great expectations." About the mosques, however, he is uninhibitedly enthusiastic. And wherever he takes the reader, into the churches or mosques, along the walls or into the recesses of the Seraglio, he is clear, informative and never dull. He does, moreover, warn the would-be traveller of the snags. At the end of the sea walls, for instance, there is the "lovely and venerable" Marble Tower; but "it can best be seen from beside an evil-smelling rubbish-heap with scraps of hides here . . . one can hardly stay long enough to photograph it without overpowering nausea."

The two groups of chapters, the first describing the Byzantine monuments and the second the Ottoman ones, are each preceded by a historical survey. These, like so much potted history, are less satisfactory than the rest of the book; but they have a generous sprinkling of amusing, bizarre and sometimes lurid anecdotes. The book is poorly served with plans of the city, but the photographs are splendid; they are enough to make any armchair traveller discount Mr Liddell's warnings about the "spleen of Pera" and take the next plane, train or boat to the Golden Horn.

Books Received

WORDSWORTH: *a re-interpretation. Second edition.* By R. W. Bateson. *Longmans.* 238 pages. 25s.
The first edition of this book was reviewed in *The Economist* of November 6, 1954. The second has a new preface in which the author replies to Mr T. S. Eliot's criticism of the first edition.

THE ATOM: *fifth edition.* By George Thomson. Home University Library. *Oxford University Press.* 211 pages. 7s. 6d. 30.8.56.

BOTTIN INTERNATIONAL 1956: *International Business Register.* Paris: *Didot-Bottin.* 2,241 pages. No price given.

FISHERIES YEAR BOOK AND DIRECTORY 1956.
British-Continental Trade Press. 462 pages. 20s.

LATIN AMERICAN MARKETS.
Compiled by J. Walter Thompson Co. *McGraw-Hill.* 196 pages. £6 15s.

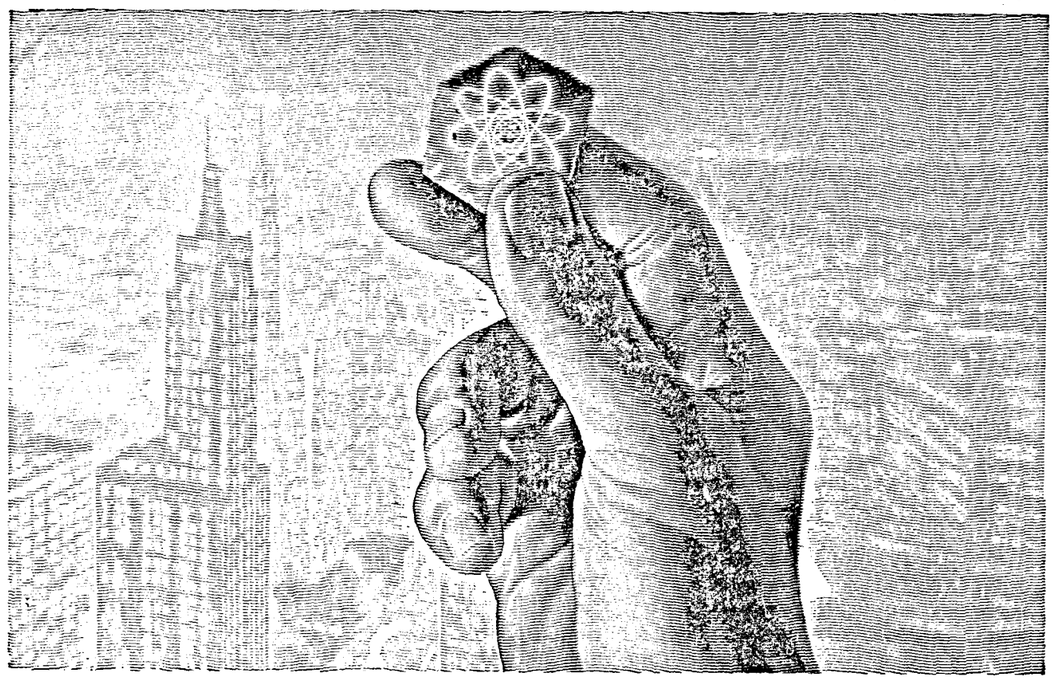
THE BRITISH CARIBBEAN: *Who What Why* 1955-1956.
Edited by Lloyd Sydney Smith. *Lloyd Sydney Smith,* Trinidad. 868 pages. No price given.

STANDING ROOM ONLY: *The Challenge of Over-population.*
By Karl Sax. USA: *The Beacon Press.* London: *Mark Paterson.* 206 pages. 21s. 6d.
This book, which was reviewed in our issue of December 24, 1955, is now available in this country.

MONETARY THEORY AND PRACTICE.
By J. L. Hanson. *Macdonald and Evans.* 374 pages. 30s.

THE WORK OF WHO 1955: *Annual Report of the Director-General to the World Health Assembly and to the United Nations.*
Geneva: *World Health Organisation.* London: *Her Majesty's Stationery Office.* 253 pages. 10s. $2.00. Available in French and Spanish editions.

THE SUPPORT OF MEDICAL RESEARCH: *A Symposium.*
Organised by the Council for International Organisations of Medical Sciences. Established under the joint auspices of Unesco and WHO. *Basil Blackwell.* 181 pages. 17s. 6d.



A pound of fuel to light a city

THAT'S ALL THE URANIUM needed to produce atomic power equal to the energy in 3 million pounds of coal. It could light the city of Chicago in the United States for a full day!

ATOMIC RESEARCH is focused on developing an economical way to produce electricity from atomic energy. Scientists at Oak Ridge National Laboratory in the United States, which Union Carbide operates for the United States Atomic Energy Commission, have already built experimental power producing reactors that are serving as a guide to commercial atom power plants.

PEACEFUL USES for the atom have also been found in the diagnosis and treatment of disease. Radioactivity is uncovering important facts about plant and animal growth. Industry uses the atom's radiation to control production processes, *to test product quality, and for research*

THE CHALLENGING FIELD of atomic energy is not new to the people of Union Carbide. They have been pioneering in every phase of this exciting business—from the mining of uranium ore to harnessing the atom for our future comfort and well-being.

FREE: *To learn more about the atom and the tremendous strides made in the peaceful applications of atomic energy, write for the illustrated booklet "The Atom In Our Hands." Please ask for booklet IE-9.*

UNION CARBIDE INTERNATIONAL COMPANY

A Division of Union Carbide and Carbon Corporation

30 East 42nd Street UCC New York 17, N. Y., U.S.A.

SYNTHETIC ORGANIC CHEMICALS • EVEREADY Flashlights and Batteries • NATIONAL Carbons • ACHESON Electrodes
UNION CARBIDE Silicones • Dynel Textile Fibers • ELECTROMET Alloys and Metals • HAYNES STELLITE Alloys
UNION CARBIDE and VINYLITE Plastics • LINDE Welding and Cutting Equipment • PRESTONE Anti-Freeze

American Survey

AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

Less Little Acres

Washington, D.C.

PRESIDENT EISENHOWER showed his firm grasp of political realities when he announced on Wednesday that he would start off his campaign by defending his farm policies at the national ploughing contest in Iowa. It is true that farmers represent no more than thirteen per cent of the electorate, but general prosperity compels the Democrats to pick up hard luck cases where they can find them. The farmer, moreover, is a sizeable minority in twelve key mid-western states, and his vote is liable to carry with it many businessmen who are economically dependent on his well-being. The "farm" states have between them 154 of the 266 electoral votes needed to win the Presidency. No politician will ever forget that it was their unexpected support for Mr Truman that brought him victory in 1948.

The farmer's mood, however, is more than normally elusive. Early in the year he was sizzling with anger—his net income having dropped painfully in the course of 1955. But now, in harvest time, not a growl is coming forth. The Republicans claim jubilantly that the farm "revolt" is over. They point out that farm income has been stabilised and has even been rising slightly—though, unhappily for them, it fell again by three per cent in August.

But hog prices, which, at 10 cents a lb., were causing mutiny in the deepest Republican strongholds in the spring, have strengthened to 15 or 16 cents. Wheat farmers are said to be pleased that President Eisenhower has stabilised their support price at $2 a bushel, both for this season and next, a move which he took, in departure from his own principle of flexible supports, at the time he vetoed the Democratic farm Bill. And the soil bank, which was the Administration's answer to the double problem of agricultural surpluses and falling prices, is expected to put $225 million in the farmers' pocket book before polling day.

Finally, there is one point that is often overlooked : in his attempts to adjust farming patterns to the size and shape of the market the Secretary of Agriculture, Mr Benson, has always had the American Farm Bureau Federation squarely behind him. The Federation is the largest of the three farm organisations. Its opponents claim that its membership figures are padded out with non-farmers and that many farmers, otherwise out of sympathy with its aims, join because of the good insurance it provides. But whatever may have been the farmer's initial motive for joining, he is exposed, once he is in, to the Federation's skilled and continuous educational campaigns.

Democrats are keeping their spirits up by arguing that the farmer is no fool and knows perfectly well that the benefits that are now bolstering his income are for election year only. A few straws, moreover, seem to be blowing the Democratic way. In Minnesota, one of the farm states which Mr Stevenson ought to recapture if he is to stand a chance this time, a poll taken by the *Minneapolis Tribune* shows considerable advance for the Democrats over a poll taken at the same stage in 1952. Political pundits travelling through Iowa report that the farm revolt, though it has run underground, is still very much alive.

To balance the Farm Bureau Federation, the Democrats have the ardent support of the National Farmers Union, the smallest but fastest growing of the farm organisations. At Chicago, the Democratic platform committee swallowed its views almost whole. One cannot help suspecting that they are rather more to the taste of Senator Kefauver than of his senior partner. Much of the union's propaganda is surrounded with a miasma of rhetoric about the circumstances squeezing out the family farm, which has been the "backbone" of America, for the benefit of "factories in the field," and about the loss of "spiritual values" which this will entail. This is a potent emotional cry ; the rights of the family farmer have been fought over since before the Revolution, and most of the homestead and reclamation laws still on the books proclaim it to be public policy that a man should carve out 160 acres for himself and no more.

★

It is perfectly true that, in the last quarter of a century, a tremendous technological revolution has almost totally changed the face of American farming. Agriculture, if it is to pay, is now big business rather than a "way of life." A young man needs to raise about $50,000 and farm several hundred acres if he is to place himself in control of an efficient, properly capitalised unit. But even in its expanded form it is still overwhelmingly a one-man, or one-family business, in which the managerial decisions and the labour are supplied by one family, except for extra help at harvest time. While such farms have changed beyond recognition, the large corporate farms have remained fairly steady in size and the amount of hired labour on them has actually declined.

The Farm Bureau Federation and the Republican party are candid in their recognition and acceptance of these new conditions. The Farmers Union and the Democrats bow to them when pressed, but devote most of their energies to expressing the frustrations and discontents which changes on this scale must always generate. There are large numbers

of farmers or farmers' sons who, for one reason or another, are unable to cope with the new scale of agricultural operations. Like handcraftsmen at the time of the industrial revolution, they are victims of expansion. More and more family farms become, in effect, farms on which families live, in a state of concealed underemployment. The sharp decline in the number of individual farm units, as farmers of this sort give up and go to the towns, provide splendid, and to some extent justified, material for speeches on the decline of the rugged American way of life. Unfortunately, it is not always the very poorest of the farmers who give up—the 1.5 million families living on incomes below $1,000 a year are mainly in areas in which there are few alternative forms of employment.

Foreclosures are few and farm assets are at a record level, mainly because of land values, which, according to the latest Federal Reserve Bulletin, rose between 1954 and 1955 by $4 billion. The reason is that in most areas there is a shortage of land as those farmers who are capable of remaining in business scramble to extend their acres in order to make full use of their machinery. Owing to the huge agricultural surpluses in government storage, the rising costs, which afflict the new much more immediately than the old forms of farming, and the falling prices only the maximum effort and most efficient techniques keep the successful producer in the running.

In these circumstances, the Federation, with the Republicans more or less in tow, has been trying to remove the distortions caused in the relations between different crops by the government's selective reduction of existing price supports. The Farmers Union wishes to do the same thing by extending what it prefers to call "income protection" to all crops, including perishables. Its main idea resembles the British type of deficiency payment, to be used for that part of the crop destined for home consumption. The remainder would presumably go into export at world market price. Remembering their international responsibilities, the union and the Democrats provide for an international food bank to handle at least part of the overflow. On a global basis, they insist, there are no surpluses but only deficiencies. Sooner or later, whichever party wins, the free world will have to take some responsibility for deciding whether the fruits of American abundance are to be eaten or not.

Tanks in the Schoolyard

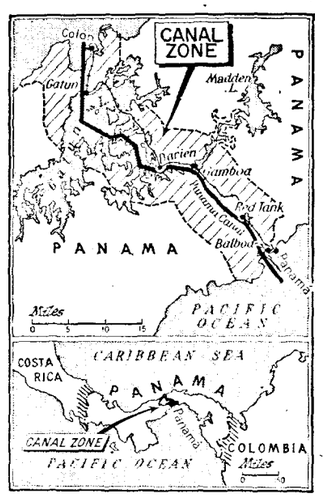
THE start of the school year brought violence and bitter racial hatred to a number of communities in eastern Tennessee and Texas. Exercising the rights granted them in 1954 by the Supreme Court, Negro schoolchildren sought to enter previously segregated schools in Clinton, Tennessee. At first, the presence of a dozen coloured pupils was taken calmly but, as is so often the case, agitators with a vested interest in violence came in from the outside. Quickly the town took on an aspect which recent films have made familiar—the Negroes shut in their houses, mobs made up half of sinister loiterers and actual hoodlums, and everywhere the threat of arson and brutality. With great courage, local police and a group of volunteers faced the mob and held the line until the dramatic appearance of the National Guard sent by Governor Clement to restore the rule of law. The latest news was that the Negro students were attending school in the protecting shadow of the National Guard's tanks and bayonets. But racial clashes were occurring in other towns in the state, such as Dayton and Oliver Springs. In Texas, moreover, Governor Shivers, while ostensibly upholding the law, had done nothing to make it possible for Negro children in the town of Mansfield to go to a hitherto segregated school, and the whites had hung up an effigy making it perfectly plain what they threatened to do if any Negro came.

These incidents—which may well be multiplied in other communities—are the darker side of a gradual revolution. The Southern Education Reporting Service estimates that some 300,000 Negroes will be attending mixed classes in the 17 states and the District of Columbia where segregation prevailed before 1954. That is definite progress. But within that area some 2.5 million Negro pupils are still attending segregated schools, and in Virginia, North Carolina, South Carolina, Georgia, Florida, Alabama, Mississippi and Louisiana regulations have been passed, or are being passed, to strengthen segregation. Voluntary segregation is also deeply rooted and in Lexington, Kentucky, only 21 out of 2,600 Negro students chose to enter mixed schools. Racial integration poses human and psychological problems about which an outside observer, however convinced that it is the right goal, can only speak with great caution. But professional agitators and mob rule are in any circumstances intolerable; and the sooner the South realises this, the sooner can real progress be made towards a gradual solution.

What About Panama?

INTERNATIONAL control over the operation of the Suez Canal might possibly be more palatable to Colonel Nasser if it involved other international waterways, such as the Panama Canal. But any doubt about the likelihood of this was removed last week by the exchanges between Mr Dulles and the Panamanian Foreign Minister, Señor Alberto Boyd. The Panama Canal runs through territory which, until 1903, was part of the Republic of Colombia. In that year Panama, with United States support, declared itself an independent republic, and signed, five days later, a treaty leasing to the United States "in perpetuity" a strip of land ten miles wide for the construction of a canal. In this canal zone, the United States has authority "as if it were sovereign" over functions connected directly with operation, maintenance, and defence, and with sanitation. In return for these rights the United States paid Panama a lump sum of $10 million and an annual sum of $250,000. From 1934, the annual payment was raised to $450,000, and from 1955 it was more than quadrupled to $1,930,000 a year. Tolls on all commercial vessels passing through the canal amount to some $33 million a year, of which roughly half goes towards operating expenses and maintenance.

The Panama Canal is run by the American government itself exercising its perpetual rights, and not by a commercial company operating on a concession of limited duration. And there is no international convention guaranteeing freedom of transit. For these reasons the American government maintains that the status of the Panama Canal is entirely irrelevant to the negotiations on the Suez Canal. But Mr Dulles's assertion that the United States "holds the sole right to exercise sovereignty within the canal zone, to the exclusion of every other government" drew from the Panamanian government the tart rejoinder that the canal was built on Panamanian territory, over which Panama had never relinquished sovereignty, and that all Panama had granted to the United States was "certain powers expressly for the purpose of the canal and nothing else." This exchange has done nothing to improve the relations between the two countries, which were already touchy. But the sporadic unrest in Panama City, the angry newspaper editorials asserting "our sovereign rights," and the Panamanian student demonstrations for Nasser and nationalisation, should not be taken too seriously.



Changes in the Teams

WHILE President Eisenhower and Mr Stevenson are preparing for their return match, attention is focused on crucial preliminaries which may determine the fate of the Senate. The Democrats have 49 seats in the upper house to the Republicans' 47. Thirty-five seats are at stake this year and of these 18 are held by Democrats and 17 by their rivals. Whereas some ten seats, mainly in the South, are considered safely Democratic, 12 seats now held by Republicans are considered marginal. The Republicans must hold these and win two new seats to obtain a majority, as the casting vote in the Senate is held by the Vice President, Mr Nixon. The mathematics of the situation give the Democrats a clear edge, but recent events in New York, Maryland and Texas suggest that political prophets will have a nail-biting autumn.

In New York State, both parties will choose their senatorial candidates next week. Senator Lehman's retirement has left the Democrats with a large void. Yielding to pressures from Mr Stevenson and other party leaders, Mayor Wagner of New York has now agreed to stand for the Senate. The Republican choice is, as yet, unclear. A leading contender for the nomination, Mr Javits, has been charged by one of the most unsavoury McCarthyites still on the loose with being the "*protégé* of important Communists." He has indignantly repudiated this slanderous charge and is seeking to clear his name. But although respectable opinion has rallied to him, some Republicans are seeking to conscript Mr Dewey. The latter has shown no sign of wanting the nomination, but if he can be persuaded the New York race would be one of the most dramatic and unpredictable in the country.

In Maryland, illness has compelled the Democratic candidate, Mr Millard Tydings, to withdraw from the senatorial contest. After a bitter struggle among themselves, the Democrats have chosen Mr George Mahoney in his stead. Mr Mahoney has a long record of defeats and it now looks as if the Republican incumbent, Senator Butler, will win re-election in November to what should be a Democratic seat. In Texas also, the Democrats are displaying a talent for jeopardising what should be certain victory by fighting among themselves. In 1952, Governor Shivers defeated the "loyalists" within his own party and led the state's Democratic organisation into President Eisenhower's camp. In his wake came Senator Price Daniel whom the Republicans did not even oppose. Last spring, the two Texan Democrats who lead Congress, Senator Johnson and Representative Rayburn, recaptured the party's delegation to the national convention. But last week, Senator Daniel defeated the "loyalist" candidate, Mr Ralph Yarborough, in the primary election for the Governorship. This will necessitate a special election for the Senate and, unless the Democrats patch up their ranks, Mr Thad Hutcheson, a popular young Republican, may replace Mr Daniel in Washington.

Off to a Quicnic

FROM A SPECIAL CORRESPONDENT

SOME eighty million disciples of Columbus have been discovering America all over again. Their adventures extend from the bottom of the sea to the top of Pikes Peak and may encompass a sweep of 10,000 miles around the United States. Many, however, need look no farther than their own back yards to discover a "new world" whose frontier begins on the doorstep of every suburban home. *Al fresco* is becoming as American an expression as "hot dog" and this year political oratory must compete with the "call of the wild." While the trend may be unprofitable for politicians, it is turning into a boom for businessmen who have been shrewd enough to see the commercial possibilities of this nationwide instinct for taking to the woods and "roughing it"—in luxury.

Last year, domestic tourists—amounting to almost half the population—spent more than $17.5 billion. This year, it is estimated that this amount will have increased by five to ten per cent. This wanderlust is the product of higher incomes, paid vacations, greater mobility and increasing leisure. The eighty-five per cent who travel by automobile and take advantage of the high-speed toll roads to achieve twenty-five per cent greater distances, are expected to stay mainly in roadside "motels" and to cover a total of fifteen billion miles this year as opposed to eleven and a half billion in 1955. Families with incomes of $5,000 and over, whose number almost doubled between 1948 and 1954, are the most persistent travellers. The modern Incompleat Angler takes his wife and children and fishes uncontemplatively, as much for his children as for trout. Women, according to a recent survey, put travel above all other desires and are the driving force behind most jaunts. Finally, "getting away

from it all" no longer ends on Labour Day — the first Monday in September. Americans now take more than 25 per cent of their trips in the autumn and almost 35 per cent in winter and spring.

Tourists are bringing new wealth to remote corners of the country and individual states are sparing no effort to hold the tourist tide and achieve as much financial irrigation from it as they can. Half of them can show that out-of-state visitors are among their three most profitable sources of revenue.

Last year, for example, Texas valued its guests at $26 million more than its famous Longhorn cattle. With the imaginative co-operation of local chambers of commerce and businesses, the states are developing their natural resources of hospitality, glamour, nature, culture and nostalgia. If this requires that twenty thousand men in Albuquerque, New Mexico, grow beards to make the "Enchantorama" historically atmospheric, the community takes action. The ancient art of waylaying and casting a spell on travellers has changed little, except that today's Ulysses is thoroughly forewarned by neon signs and billboards: "Keep right for Scylla and Charybdis, Nature's most formidable spectacle"; "Forget your troubles at the Lotus Eaterie"; or, "You won't know yourself after a visit to Circe's—only ten more miles."

★

There is, however, an ultimate retreat from such temptations. The deep desires which drive tourists so many miles—a longing to come close to nature, to feel genuine wonder and to know the heart of the country—are fulfilled by more and more people every year in the National Parks. There are conserved some of the most superb scenery and fantastic natural wonders in the world. Here also are symbolised the spiritual, mental, and physical strength of what still likes to think of itself as a frontier people. Almost a third of the population is expected to visit the Parks this year and more than a third of these will camp out. Even those tourists who race through them, scattering litter and remarking on the similarity between the bears and their wives' relatives, have at least been exposed to a breathtaking vision.

The "outdoor" revolution began in the West when the picture window brought nature to the hearth. Then, with the vogue of the patio, the walls were breached and the indoors was moved out, thus producing the ritual of the "barbecue" where the man of the family cooks native dishes to the accompaniment of distaff applause. From there it was only a station wagon ride to "the great outdoors." Unlike the orthodox minority of veteran campers, known by their blackened equipment and pioneer austerity, the greenhorns are delighted with plaid ice chests and civilising gadgets such as a kitchennette which transforms the rear of an automobile into a culinary centre, and a trailer which can be converted into a tent or an outboard motor boat.

Manufacturers of outdoor equipment are probably the only people not taking vacations this year. Even with yearly increases in sales of from 30 to 40 per cent, many companies are far from meeting the demand. The output of sleeping bags by one firm alone jumped from thirteen thousand to seventy five thousand in two years. Barbecue equipment, which has rocketed from a negligible business in 1950 to approximately $70 million last year, can be sold in the middle of a blizzard, and the five billionth "hot dog" of 1955 was eaten on the weekend of July 4th as compared with mid-August the year before. Sports requiring complicated gear, like boating or hunting, are acquiring new converts, and the craze for skin diving—the country's fastest growing sport—has spread even to the oceanless mid-west. The industrial giants have been getting into the act, too, with the Ford Motor Company's publicising "Recreation Unlimited" via automobile or station wagon, and the United States Steel Company sponsoring "quicnics" (picnics out of tins). As with travel, the seasonal character is disappearing from the market for outdoor equipment. The first tree a new tent or camp stove nestles under may be the Christmas tree.

A problem which is giving many prophets pause is what the American, with his puritanical compulsion to work at everything, is going to do with all his leisure. The answer to this may be that he is "learning by doing." The recreation trend, gadgets notwithstanding, is healthy and is one reply to the worriers about national fitness, who fear that the country may be "going soft." As long as Americans can head for the hills and woods on a "quicnic," the problem of leisure in an age of automation can be solved.

Airborne Business

AN American business corporation has placed the first order for three of the new Fairchild 10-seater aircraft powered by four small jet engines. Three other American firms have had Vickers Viscount turboprops for business use on order for over a year. The "junior jets" may not be in commercial service on a significant scale until the 1960's, but to the aircraft manufacturer the market for business aircraft is no mere adjunct to the large orders from the commercial airlines. As early as 1953 business aircraft flew over a million more hours than all of America's scheduled domestic airlines together. The airlines have larger aircraft, and carry more passengers, but ten times as many business planes are in the air. Most of these are single-engined machines seating four or five passengers, but there is now a pronounced trend towards the use of larger twin and even four-engined planes for business purposes. Over 6,000 firms now have their own planes, and some, like the major oil companies, have company fleets of more than a score of aircraft. The makers of executive and utility aircraft, led by the Cessna Aircraft Company, Beech Aircraft Corporation, and Piper Aircraft Corporation delivered no less than 4,044 airplanes, valued at $62 million, in the first seven months of this year, more than 1,000 more than during the same months of last year, and many more orders are on the books.

Unless a firm can use its private aircraft very intensively the costs of operation per seat mile are likely to be greater than the cost of a ticket on a regular airline. But the airlines call at only about 10 per cent of America's 6,000 airports ; the business executives with their own planes can land at any of the others as well, and have the added advantage of a completely flexible flight schedule. By this means executives can keep in close touch with their branches, and salesmen with their more remote customers.

So great are the attractions of business flying, and so great the demand for new aircraft that the Civil Aeronautics Board's estimate of an 80 per cent increase in business flying by 1965 is beginning to look highly conservative. But this growth intensifies the problem of air traffic control which was dramatically emphasised when two airliners crashed recently in mid-air and 128 people were killed. Given adequate ground facilities, many airline pilots feel, the use of "Visual Flight Rules," when a pilot relies only on his sight to avoid mid-air collision, should be drastically limited. But the counterpart of this is that many more business pilots must be intensively trained in instrument flying, and business must foot the bill for the expensive navigational equipment, which is left out of many private planes flying today.

Divided Republicans

Madison, Wisconsin

NEXT Tuesday's primary election in Wisconsin will decide whether the senior Republican on the Senate Foreign Relations Committee, Senator Alexander Wiley, is to go into compulsory retirement for having upheld, in the face of President Eisenhower's seeming ingratitude, the Administration's foreign policy. Although the Republican state convention endorsed a smooth young Congressman, Mr Glenn Davis, to fill Mr Wiley's seat, the Senator has challenged him to come and fight for it at the polls. Mr Wiley's unpopularity with the Republican party workers stems in part from his internationalist voting record and in part from his failure to vote either way on the action to censure his junior colleague, Senator McCarthy.

But McCarthyism and isolationism in their naked form are at such a low ebb that their remaining disciples would never have chosen this year to make a stand if they had not felt confident that Senator Wiley would defeat himself. Mr Wiley is a mixture, half-Bottom the weaver and half-Polonius. He graduated to the Senate in 1938, having held no other major public office, from the headship of the Wisconsin and Upper Michigan branch of the Kiwanis, one of those American organisations for noisy good fellowship. After clowning his way through his first two terms, he was infected with statesmanship just as Senator Vandenberg's death provided him with an opportunity to emerge as the Republican party's chief spokesman in the Senate on foreign affairs. But unfortunately, the Senator's great maturity of outlook did not have an altogether happy effect on his public manner. Towards Wisconsin Republicans, who had never acquired the habit of taking him seriously, Mr Wiley affected a lofty air, a supercilious strut, and a waving aside of local considerations in favour of the global issues that occupied him "in this atomic age." It was this personal factor that contributed greatly to Senator Wiley's rejection by the party.

★

Whatever their expectations, Mr Davis has spent a good deal of time on television wading through statistics to prove that he has been a more regular supporter of President Eisenhower in the House of Representatives than Senator Wiley in the Senate. He is able to produce this surprising calculation, despite his repeated votes against the President on foreign aid and foreign trade, partly because he supported almost the whole of the Administration's domestic programme, whereas the Senator voted with the Democrats over farm supports and public power, and partly by counting Mr. Wiley's absences. Mr Davis's supporters are not behaving now like men who are confident of victory. They are clearly sensitive about the contrast in the public mind between the flashy unanimity of this year's Republican national convention and the attempt to replay in Wisconsin immediately afterwards the match that was fought and lost in the convention of 1952.

Even on the issue of foreign aid Mr Davis has found it prudent to occupy both sides of the street. A private poll taken by his managers in order to select for him the most marketable slogans showed opinion evenly divided. Mr Davis's final poster incorporates the slogan which received the highest positive response: "No more money should be appropriated for foreign aid until we take another look at the whole programme to see what good our money is accomplishing." The first part of the sentence is what Mr Davis's backers mean ; the second is no more than what the President himself has already said.

Senator Wiley, with little campaign money and only a scratch organisation, is circulating around the state on his own, slapping the backs of old acquaintances. So far he has contrived to do this without any of the major ineptitudes on which Mr Davis and his friends had relied.

The result of the election may well be decided by the size of the Democratic contingent which goes into the Republican primary in order to help Senator Wiley. Little interest has been evoked by the Democrats' own contest for the senatorial nomination. Neither of the candidates, Mr Maier, the Democratic leader in the State Senate, and Mr Walstead, a former state chairman, looks like beating the Republicans in November. One point should emphatically be made in advance of next Tuesday's result. A victory for Mr Davis should not be accounted a sign that Senator McCarthy would have been re-elected if his term had expired this year. Outside a hard core of fanatics he has forfeited support in almost every quarter, less from his general iniquity than on account of his vote on the natural gas Bill in favour of the interests of his Texan oil backers and his repeated personal attacks on President Eisenhower. The two years before Mr McCarthy has to face the voters could give him time to seize on an issue that would recoup his fortunes. Failing that, he may well be headed for defeat in the Republic primary of 1958.

Who Pays for Expansion?

FROM A SPECIAL CORRESPONDENT

THE recent increases in wages and prices in the American steel industry have not settled the problem of the relationship between prices and the cost of the expansion of productive facilities. The rise in prices covered the rise in the costs of labour but could not cover the interest and repayment on money borrowed for the construction of new plants. The next round of expansion, which is due to begin late in 1957, will probably cost an average of $3 per ton of steel more than construction completed up to the present. Whether or not the money is borrowed—as most of it will be—steel producers want to have it reflected in current prices.

The United States Steel Corporation, as the dominant producer, has the unenviable task of meeting public criticism of the price increases. The company agrees emphatically that there is a need for more capital funds but feels that it is up to the government to provide more of these by allowing special tax deductions. Specifically, it believes, steel firms should be allowed a more rapid depreciation of their plants. United States Steel argues that further price increases should be postponed until attempts have been made to obtain action by the government to secure this and until the construction of high-cost projects is nearer at hand. Further increases now would put a squeeze on steel consumers or, if passed on to the public, would embarrass the Administration in its battle against inflation.

In effect, this means that the day of reckoning has been postponed. Steel users are on notice that, sooner or later, they must pay for the industry's expansion. It is not only steel but the entire range of manufacturers who face the problem of raising large amounts of cash in the coming year. In addition to expansion programmes already scheduled for 1957 and 1958, industry faces higher operating costs because of this year's wage increases, higher freight rates and the increasing price of raw materials. All this will absorb capital originally intended for plant construction; and construction costs themselves are rising. It is symptomatic of the new situation that the Ford Motor Company, which had intended to finance next year's expansion entirely from internal funds, has had to borrow $250 million from a group of insurance companies.

While a giant such as Ford can meet its needs in this fashion, smaller firms are having trouble. Can they borrow enough if inflation keeps driving up the cost of expansion? Many firms have been refused loans this year, have received less than they asked for, or have been advised to postpone new issues of securities. The conviction is growing that future expansion will have to be financed by larger profits from higher prices rather than by reliance on an already over-extended money market.

Estimates prepared by the Machinery and Allied Products Institute suggest that by 1960 American corporations will need more than $32 billion a year for expansion and the replacement of plant and equipment. This compares with $24 billion spent in 1955. The Institute believes that normal increases in retained profits and depreciation allowances might be sufficient to provide most of the funds required—if the costs of construction were not sharply increased by inflation. But many observers feel that such an inflation is already under way. The long-range outlook for capital investment implies a strong demand for money market funds to pay for expansion in depreciating dollars; and the suspicion is increasing that savings may be in tight supply during the next five years.

The problem is most acute in those industries which must undertake large and long-term investments in capital equipment, such as the steel, electric power, oil and railway industries. These are the fields, moreover, where the price of the final product can be held down either by regulation or by the indirect influence of the government. Almost no one, however, has suggested that the plans for expansion should be cut back, since—with the exception of automobiles—practically all types of industrial capacity are urgently needed to match the growth in consumption. The Federal Reserve Board has, indeed, made borrowing more difficult. But it has not stopped the leading companies from obtaining loans for plant expansion—although speculative borrowing for inventory purposes has undoubtedly been held back.

It remains to be seen whether the next Administration will accept another round of price increases as the way to finance additional investment. Some tax concessions to the heavy industries, in the form of accelerated depreciation, may well be granted before 1956 is over. It would not be surprising if the corporate income tax rate is reduced in 1957, as part of a general tax reduction. And there is sure to be pressure on the Federal Reserve Board to ease its credit policy.

SHORTER NOTES

After a year's delay the Senate before adjourning at last confirmed the nomination of Mr Simon Sobeloff to be a federal judge on the fourth circuit, which covers five southern states. The opposition to Mr Sobeloff, a Republican who has been Solicitor General of the United States for the last two and a half years, came entirely from Southerners who considered that he was "right on the borderline of Red philosophy," because he had argued the government's case against racial segregation in schools before the Supreme Court. Mr J. Lee Rankin has been nominated to succeed him as Solicitor General.

★

The most important agreement so far for the disposal of agricultural surpluses has been concluded between the United States and India. Approximately $400 million worth of wheat, rice and cotton is to be shipped to India over a three-year period in exchange for reimbursement extending over twenty-five years and going, in part, towards the maintenance of American services in India.

★

The government has been authorised to recruit a new "national defence executive reserve" from employees of private industry and the professions. Those enlisted have to undertake a limited amount of training in peacetime and, in the event of war, could immediately be assigned to full-time government jobs.

LIVERPUDLIANA No. 5

Merchant Prysors of Liv'pul

Extract from Liverpool precedents (Municipal records) Circa 1572

'This yere Mr. Mayre bought a certen numbre of Stryks of Manske (Manx) Barlie of Mr. Henrie Stanley, gentylman, late Capitaigne in th' Isle of Man (4th Earl of Derby) at lijs jd (3.1d) the Stricke, and the towne was not well contentyd because he made the bargayne hymselffe. And aftr he caused p'clamacon to be made that ev'ie burgess shud have p'te.'

Apparently it was the custom to buy goods through the offices of the "Merchant Prysors" who bought everything for the community. Each purchase being called a 'towne's bargain.

The modern industrialist seeking opportunities for expansion in Liverpool today doesn't have to 'marry into the family'! The resources of the Corporation and its three great trading estates are all at his disposal. Write for details of sites and financial facilities to

Do American Politics baffle you?

Most of us find it hard to understand their real significance. The United States, so integral to our own security and prosperity, can often seem the most foreign and mysterious of our allies.

You have certainly heard of THE REPORTER, the liberal fortnightly which has brought a new dimension to American journalism. Through its treatment of politics, American and international: through its insight into the changing patterns of American life and work: through its wit and good temper, THE REPORTER has become, in only seven years, one of the most respected journals of fact and opinion in the free world.

From this week onwards you will be able to buy it here in Britain.

The first issue will contain a special report on last month's Republican and Democratic Conventions. The ensuing issues will closely follow the Election Campaign.

Ask your local newsagent for a copy or a subscription. If you have any difficulty write to

TRANSWORLD CIRCULATION COMPANY,
PARK ROYAL ROAD, LONDON, N.W.10.

The World Overseas

Anti-Colonial Front for Students

FROM A SPECIAL CORRESPONDENT IN PRAGUE

CONVENED to give a façade of unity to the "student movement," the Fourth World Congress of the International Union of Students, which met at Prague last week, split asunder on the same issues that divide the globe—Suez, the Israel-Arab conflict, Cyprus and Algeria. In trying to show a post-20th-Party-Congress smile to the Western observers present, the Presidium seriously underestimated the force of Afro-Asian colonial discontent. With unity—or even reconciliation—obviously impossible, a choice became necessary; the Presidium dropped the West. But if the Congress itself was a failure, it was the West alone which suffered a real defeat. When non-political Western national student organisations could not promise the militant anti-colonialism offered by the Soviet bloc, the cords of expediency which tie nationalism to communism pulled tighter than ever.

In its ten years of existence, the IUS has been little more than a shrill echo of the now-defunct Cominform's mournful dirge. Since the Czech coup, when Western students left to form the nucleus of the present world-wide International Student Conference, the Union's membership has shrunk to the Soviet block, a group of more or less "neutral" nations (Iceland, Finland, Burma, the Sudan, Japan, and one of the two major Indian student organisations) who are members either for political or for strategic reasons, and about 20 splinter groups with no claim to represent the students of their countries—the nations or colonies of Asia, Africa, and Latin America. Many delegates in fact represent only colonial students studying in metropolitan countries. But representative organisations from the West and from uncommitted nations have continued to send observers to IUS gatherings, principally to learn new aspects of the Union's tactics, but also to maintain a semblance of contact with its member organisations.

Two Embarrassing Secrets

The Western observers seated in the grotesque Julius Fučik Palace of Culture in Prague last week saw two phenomena not seen since 1948: genuine disagreement among members and what looked like a real loss of control by the Presidium, which had intended to soft-pedal the major issues. But from the moment on August 26th when a Moroccan proposed a minute of silence for the "student martyrs" who had died "fighting for independence in Cyprus and Algeria," to the closing session a week later when the Japanese moved to condemn the United States for "inflicting immeasurable sufferings on the lives of the inhabitants" of Okinawa, the Presidium steadily retreated from most of its original endeavours to contrive a mythical unity.

Clearly, the Presidium's ignorance of the elementary principles of parliamentary procedure was partly responsible for its near-collapse. Past Congresses had been much simpler: the executive never allowed debate or even open discussion. But this year, when, for example, the chair permitted a Syrian to use the floor during a discussion of unity to deliver a hysterical attack on Israel, and then, "in the interests of unity," at first refused Israel permission to answer, the Congress skidded close to complete disruption. Yet the chair also used procedure to advantage. Thrown days behind schedule by the heated political debate, the Congress was forced into long night sessions. On the final evening, while groggy delegates mechanically held up cards for unanimous votes, four members of the Presidium literally re-wrote whole sections of the constitution and railroaded through a hollow resolution on the very unity that the Asians had indicated they opposed. And the late hours of this closing session allowed the IUS to pass over its credentials and financial debate in a few minutes, hiding two of its most embarrassing secrets: that many of its members are completely unrepresentative, and that the greater part of its colossal budget comes from the Soviet government.

Not Even a Western Whisper

If sham procedure, the countless unanimous votes, and the popular music which, during every free moment, flooded congress halls, dining rooms and living quarters, told Western observers something of the nature of the totalitarian political process, these had an opportunity to learn, too, the more important lesson of how far behind they were in the race for the allegiance of the uncommitted countries. Observers from the British, French, Dutch and Belgian national unions of students (no American delegation was present) could only explain their silence on resolution after resolution of solidarity with colonial students with the limp excuse that their constitutions forbid their acting on issues that are clearly political, and not of concern to students *qua* students. When the Canadians proposed a condemnation of all colonialism, including Soviet domination in Eastern Europe, they were hooted down. As one Pakistani observer put it, "these Afro-Asians don't care what happens in Eastern Europe. The vital thing for them is that the Soviet

block screams its support while the West will not even whisper." More important, few of the colonial students realise that the Western student organisations are debarred from action precisely because they represent societies which allow open dissent, while it is the enforced unanimity of the communist world that makes its voice strong.

Typical of the colonial students were the Cypriots studying in Britain, for whom the IUS Secretariat printed and distributed anti-British propaganda, while it did not allow the French to hand out their own material on Algeria. Coming to their first Congress, none of the Cypriots knew anything of the history of the IUS, not even that it was communist-controlled. "Why should we believe there is oppression in Eastern Europe?" the Cypriot leader asked this correspondent. "If there were, the student delegations from those countries would tell us about it here."

Nasser and the Five

FROM A CORRESPONDENT

Cairo, Wednesday

WHILE most of the Cairo press continues to strike a note of defiant valour, the progress of the talks between President Nasser and the Menzies committee has been surrounded by well-kept discretion on both sides. Beyond the simple, and perhaps encouraging, facts that the talks have not just collapsed at the first charge by the other side and that according to amiable, but close-lipped, spokesmen, the atmosphere has been "cordial," at the time of writing nothing substantial or reliable has emerged to indicate the trend of the talks.

All that seems clear is that they have gone beyond the stage of statement and explanation and entered that of "discussions." There is also a growing feeling here that the talks this week represent the real turning-point in the Suez crisis, and that their outcome will decisively influence the future pattern of events. Speculation inevitably centres on the possibilities of that future pattern. One result can probably be ruled out in advance. That is unqualified acceptance by Egypt of the 18-power proposals in their original form. There remain two alternatives. One is complete rejection by Egypt of any assurances or machinery not already contained in the 1888 Convention. The other, which appears more probable, is a less clear-cut situation in which Egypt holds out the possibility of negotiations that might eventually produce a compromise. The target in this case would presumably be new assurances, both on freedom of navigation and on the international economic aspects of Canal operation, embodied in a supplementary convention and in some new international machinery which fell short of complete international control.

The indications are that President Nasser will see it in his interest to be as flexible as possible, short of conceding the principle of full international control with its implied corollary, the complete revocation of nationalisation. By this means he might hope to retain a certain freedom of manœuvre; the sympathy of important sections of world opinion, especially in Asia; the possibility of some diplomatic support from the less committed western nations, including perhaps the United States; and, above all, time.

With the end of the present talks the situation again becomes fluid. Except in the event of unqualified Egyptian acceptance of the 18-power proposals as a basis for negotiation, none of the governments that endorsed the proposals at the London conference is formally committed to any particular course of action. The central problem may then be the varying interpretations which different governments may put on the prospects opened up by the Menzies talks. Whatever President Nasser's ultimate intentions, it is presumably in his interest to take a line which, even if it does not satisfy Britain and France, may convince enough other interested powers, including the United States, that it is worth while continuing negotiations and using their influence to restrain the British and French from any precipitate action.

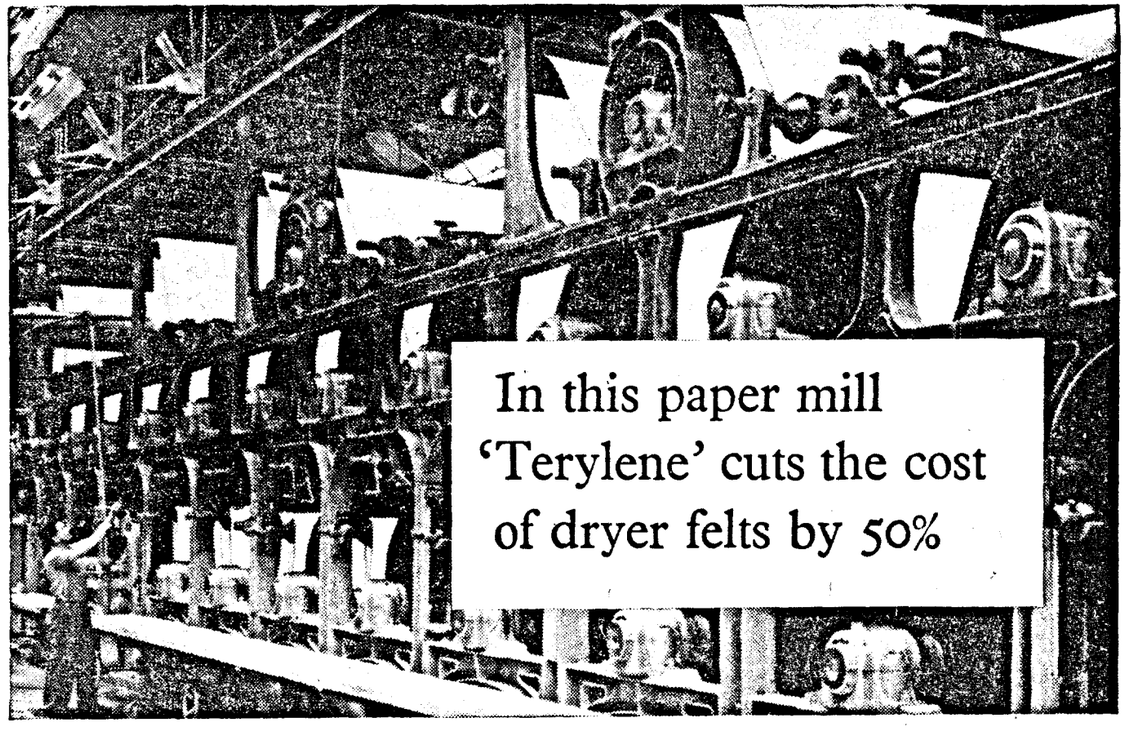
If Britain and France conclude from the Menzies committee report that continued negotiations will not give them international control or any assurances they consider adequate, what will they do? While Sir Anthony Eden continues to tell the British public that the present military measures in the Mediterranean are "precautionary," every indication is being given here that they are intended for use against Egypt if it does not accept international control of the Canal. The intention naturally is to convince President Nasser that Britain is not bluffing or at least to compel him to accept the possibility of military action as a serious factor in his calculations. It is a dangerous test of nerves. But whether President Nasser decides that the British and French threat is real or bluff, there is every sign that he is prepared to take the consequences rather than accept what can be construed here as full international control of the Canal. And despite the undoubted anxieties of several other Arab governments for a peaceful settlement, there is little doubt that in the event of war he would carry most of the Arab world with him.

East African Governors Say No

WITHIN a year of the publication of the radical recommendations of the Royal Commission on East Africa, the comments of the three governors thereon,* and the comments of the Colonial Office on their comments‡ have appeared with commendable promptitude—although not too soon for the Colonial Office, like the governors, to declare that since the commission's tour of East Africa many of its proposals have been implemented. But neither this, nor the fulsome congratulations to the commission on its remarkable grasp of the problem in so short a space of time, will deceive its members. They will realise that the Man on the Spot has hardly been jolted by their work; that their basic gospel has fallen on deaf ears.

Their basic gospel was that after years of failure in applying mainly political solutions to problems which are in large part rooted in economics, those in authority should give economic solutions a chance. They proposed, in particular, that artificial barriers between tribes and races, and especially between producer and market, and between capital and investment outlet, should be swept away. Their fundamental proposition was that the process of transition from communal to individual tenure should be accelerated by setting up authorities to register title on a far bigger scale,

* Cmd. 9801. 7s. ‡ Cmd. 9804. 6d. HMSO.



THIS IS WHY

It was found, after a three-year intensive trial by the East Lancashire Paper Mill, that 'Terylene' *saves 50% in expenditure on felts.*

As a result of this trial the paper mill has decided to replace all conventional dryer felts (which press the wet paper web to the heated roller) with 'Terylene' felts, which have exceptionally high resistance to constant abrasion, heat and acid conditions.

CAN 'TERYLENE' SAVE MONEY IN YOUR BUSINESS?

These exceptional properties of 'Terylene' are already being applied successfully and economically in many industries. Perhaps they can save money for you too. Have you a need for a textile fibre that:

is strong wet or dry, has low stretch, resists corrosion by acid, resists heat, does not rot, has low moisture absorption, has high abrasion resistance, withstands weather, and is ideal for electrical insulation purposes?

Then find out more about 'Terylene' for industry by writing to:

Imperial Chemical Industries Limited, Fibres Division, Hookstone Road, Harrogate, Yorks. Telephone: Harrogate 6802I.

'Terylene' is being used to make: electrical insulation fabrics; lifeboat covers; deck awnings; fire hose; ropes; filtration cloths; sewing threads; fishing nets; laundry machine clothing; dye bags; conveyor belts; industrial clothing, and very much else besides.

'TERYLENE' Polyester ICI Fibre

IMPERIAL CHEMICAL INDUSTRIES LIMITED, LONDON, S.W.1 TRI93A

and that ownership of land should carry the right to sell, lease and mortgage in a free market subject to limited safeguards. Their other recommendations, some of which may well be open to criticism, mostly follow from this ruthless intrusion of Adam Smith into the semi-feudal East African scene.

The outgoing governor of Uganda is by far the most receptive to this basic doctrine, despite his well-known socialist sentiments. In his despatch he clearly accepts the need to get away from tribalism as much in land tenure as in politics, but he urges the need to adapt the pace to the social awareness of the tribe ; and this fatal qualification —fatal because it can mean anything or nothing—is even more strongly pressed by the governor of Tanganyika and his advisers, although they too are prepared to introduce legislation to speed up registration of title. Neither governor is at all happy about the idea that a free market in land should develop to encourage capitalisation, consolidation and a switch from subsistence cultivation to cash cropping. They fear the effect on backward tribes to whom land is security. But the Royal Commission never said that an agricultural and industrial revolution would be painless ; it said that the alternative was worse.

Can Europeans Stand Competition?

The real challenge of the commission's report was, however, to Kenya, where its proposals involved the breaking down of the boundaries of the White Highlands as well as those between tribal reserves in the matter of sale and lease of land. In particular the commission objected to "broad acres of unused or partially used land" in the European area which could not be sold or leased to other races and were a constant source of grievance. As the Kenya comments on the report were in fact largely written not by the governor but by members of his Council of Ministers, it is not surprising that they firmly rejected the idea of removing this restriction, arguing that it would upset the confidence of the white farmers to an extent disastrous to Kenya's economy ; and the Colonial Secretary endorsed this judgment. It is, of course, economic nonsense ; but the fact is that the reservation of the Highlands is a built-in feature of the Kenya situation and its preservation at least until 1960 a part of the Lyttelton agreement, so that while the Royal Commission was right to attack it, there was no chance of immediate action. It would have been more honest, however, if the Kenya despatch had given the true reasons for its opposition to the commission's ideas.

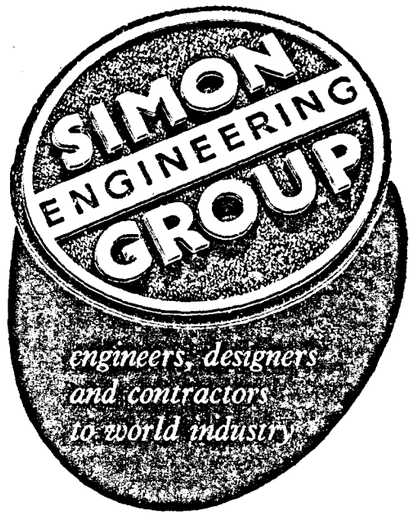
The Kenya despatch inevitably rejects the Royal Commission's proposals for African freehold villages for the workers on European farms and their families, on the ground that they would weaken the tie between employer and farm worker ; but it accepts the commission's view that in lieu of squatting rights farm workers must be paid a family living wage, provided, however, that this should not be so large as to push agricultural costs to an uncompetitive level in world markets. The Royal Commission's logical answer to this is, of course, that if European farming cannot pay in terms of a living wage it is genuinely uncompetitive as such and ought to be put out of business by native cash cropping—which may well be the fate of many, though probably not all, European-grown crops. The proper answer is competition between the two types of economy. But this there can never be when native farming is subsidising low paid native workers in industry and on white farms ; the vital move is to break the tie between the native on the land and in industry or on the plantations. But the Kenya government is not in any case favourably disposed to the argument of the Carpenter Committee that an adult African's wages should cover the full living cost of his family, and should not take into account his holding in the reserve. Here, statutory wage increases are not the entire answer ; if land could be freely bought and sold, a proper balance between employment and wages in industry, plantations and African farming areas would be brought about.

The governors have the weight of much practical experience on their side in giving their reasons for rejecting the policy of a courageous all-out drive to let the free market dominate East African development henceforth ; but this simply means that they defend the *status quo*, the political, or sectional, solution of their problems, which has already been found wanting, and whose failure led to the appointment of the Royal Commission. They must accept the corollary that if in consequence progress is too slow to stave off the political unrest that comes with economic and racial frustration, they will not get enough of the international capital which—as they agree with the Royal Commission—is vital to all their plans. The truth is that they want the capital as a substitute for an intelligible economic policy.

A Windfall for Khrushchev

FORTUNE has smiled at last on Mr Khrushchev in his role as overlord of Soviet agriculture. Nature had been unkind since he took over the leading role in this domain. In 1954 drought in the Volga region spoilt the crop and last year it was the turn of the "new lands" in the east. This year, though spring sowing was affected by rain in the Ukraine, this is apparently more than outweighed by a bumper crop on the virgin lands of Kazakhstan and Siberia. The propaganda machine throughout the country is exhorting farmers to gather in the grain rapidly and appealing for volunteers, and combine harvesters are moving swiftly eastward in a race against time. If the crops are not left standing too long and are not damaged by rain, this year should yield a record harvest. The actual volume of the crop remains unknown ; the Russians have published no absolute figures since 1953, when Mr Malenkov admitted that previous Soviet grain figures had been inflated. However, progress can be measured through the rise in grain deliveries to the state. These amounted to only 40.5 million tons in 1952-53, but are expected to total 62.6 million this year, Kazakhstan accounting for 16 and the Ukraine for 8 million, while the Russian Federal Republic is expected to account for 35.5 million tons, including 16 million from Siberia.

The high proportion coming from the new lands of Siberia and Kazakhstan is understandable, because these are surplus areas with many state farms and with sparsely populated collective farms. A good crop in the east gives the government direct control over a large share of the harvest, and thus strengthens its hand elsewhere in the countryside. At the same time a record harvest based on an eastern bounty has its drawbacks. Mr Khrushchev once stated that out of five harvests on the "new lands" two are expected to be good, two bad and one indifferent. Success in one year is, therefore, a slender basis for future



Simon resources and experience are brought to bear on many industrial developments of national and international importance.

INDIAN STEEL

Simon-Carves have been building coke ovens for the Indian iron and steel industry for nearly fifty years. They have built most of the coke ovens in service in India today, including all those at India's two biggest steelworks, for both of which they are now carrying out important new construction.

This work is a significant contribution to India's vast plans to raise her living standards by industrial development—for industry depends largely on steel and there can be no steel without coke.

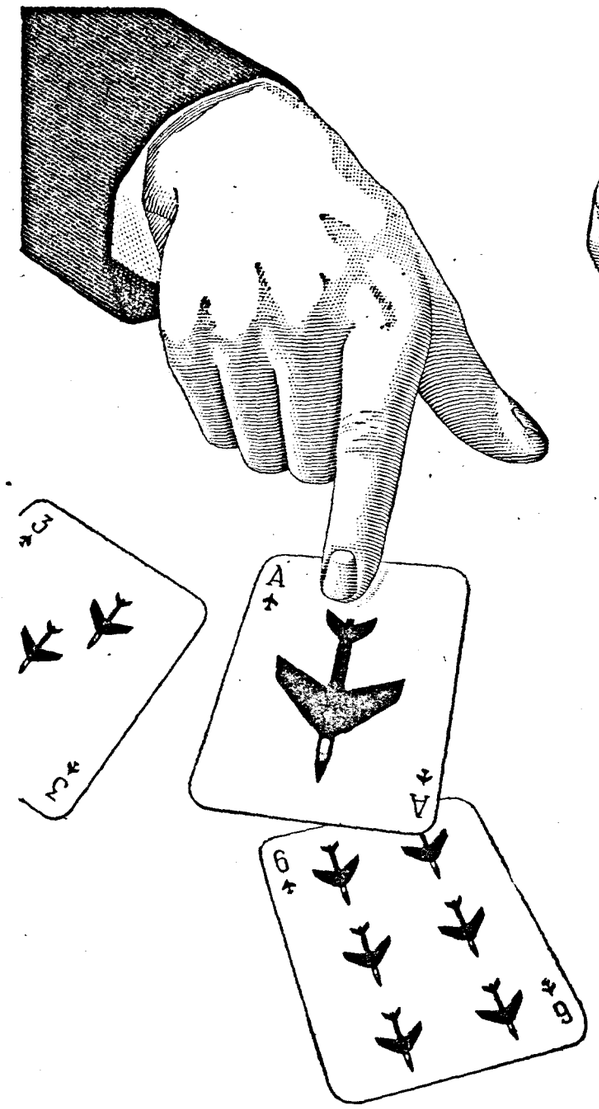
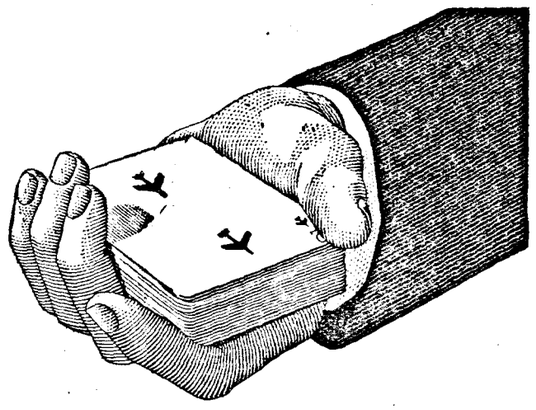
Newnes





Groundwork not guesswork

We prefer to advance into the future through the problems of the present, rather than to by-pass them by guesswork, however brilliant. In this way we build our aircraft engines on an ever-broadening basis of experience, and in this way such engines as the Sapphire—power unit of thirteen front-line aircraft—have been evolved. By applying an inexhaustible curiosity, combined with infinitely methodical approach, to the continuous development of these proven types, we not only meet the needs of today's aircraft, but anticipate those of tomorrow's.

calculations; stocks must be built up and the exportable surpluses are probably not as great as might appear. The planners show no intention of extending the reclamation of land in these areas much beyond the 75 million acres already brought under cultivation. They seem more concerned with improving quality and diminishing fluctuations, while the search for new land is likely to shift to the Far East. Nevertheless, after years of apparent failure, Mr Khrushchev can claim a measure of success for his gigantic drive for "the conquest of virgin lands," and this eastern windfall should assist his efforts both to intensify agricultural production and to change the structure of the countryside.

Stalin's heirs put agricultural recovery high on their agenda as soon as they took power. They frankly admitted the poor state of agricultural production, and announced a series of remedial measures. Some, such as further mechanisation and larger supplies of fertilisers, were long-term projects. Other steps, providing increased incentives, were expected to yield quick results: taxes were cut, compulsory deliveries lowered, prices paid to farmers raised, and farmers were encouraged to cultivate their private plots and to breed their own stock. To top it all, Mr Khrushchev launched his drives first for the reclamation of virgin lands and then for a switch over to maize.

Milk supplies over the last three years apparently rose by 60 per cent (to 9.3 million tons up to July, 1956) and meat deliveries by 10 per cent—(to 1.18 million tons up to mid-1956). The figures for livestock quoted below show that, after two terrible slaughters, the numbers of cattle are regaining their pre-collectivisation level, the stock of sheep has risen considerably and that of pigs has nearly doubled. For 1956, however, only figures for collective stock are available, although a large proportion of cattle and pigs is the private property of the farmers. The withholding of statistics for these animals may reflect a certain disappointment with the policy of incentives. The supplies of meat and dairy produce by the farmers have not come up to expectations. Peasants have been accused of buying cheap grain for feeding cattle which they then sold privately at a high price. Sales of grain have been cut and a tax imposed on private owners of stock. There are also endless complaints that farmers spend more time on their private plots

than in communal work, and to prevent this a measure has been introduced linking the size of the plot with the number of hours worked for the collective.

Mr Khrushchev cannot rest on his temporary laurels. The planned goals—including 180 million tons of grain by 1960, and the doubling of meat and dairy production—still loom far on the horizon. Besides, agriculture still occupies too big a share of the population for its output. According to the latest statistics, out of a total Soviet population of 200 million 87 million live in the towns, the rest in the countryside. Collective farmers form the bulk of the rural population: the 90,000 or so *kolkhozy* group about 19 million households consisting of 83 million people. This seems a tremendous army of labour, but the population statistics themselves partly explain the paradoxical contrast between this high figure and the reported manpower shortages in the countryside. They show that Soviet war losses were incomparably greater than was ever assumed. Since the exodus

SOVIET LIVESTOCK
(million head)

	1928	1940	1953	1955
Cattle	66·8	47·8	56·6	67·1
Of which Cows	*33·2*	*22·8*	*24·3*	*29·2*
Pigs	27·7	22·5	28·5	52·2
Sheep and goats	114·6	76·7	109·9	142·6

from country to town has nevertheless continued, the proportion of able-bodied men in the rural population may be exceptionally low. Statistical deductions thus confirm the impression gained by visitors that Soviet agriculture is "manned" largely by women and aged or partially disabled men.

Since 1950, it is claimed, the total area under cultivation has grown by 115 million acres and the area under grain alone by 75 million. The number of tractors has grown by half. Almost all ploughing, 81 per cent of grain harvesting and over half of potato-sowing has been mechanised and passed on to the MTS (machine and tractor stations) which now employ three million people. Half of the school-trained agronomists now work for the MTS: the civil servants have, in fact, been sent to the fields. The results do not seem to correspond to the efforts involved. Mr Khrushchev has also a major social problem on his hands. The difficulties with farmers' private plots may have reminded him that the peasant property instinct is still alive and revived his old dreams of bridging the gap between the town and the countryside through the creation of "agro-towns." It will be interesting to see how he acts now that a bumper crop in the east looks like giving him a respite, a chance to think of long-term plans and not only of expedients.

Mr Diem Digs In

FROM OUR CORRESPONDENT IN SAIGON

NAPOLEON'S advice has not been taken by the makers of the South Vietnamese constitution, for it is neither short nor obscure. The 101 articles of the still unpromulgated draft suffer if anything from omissions rather than obscurities. Clauses providing for a new national flag and national anthem have still to be drafted; last month the members of the National Assembly sat entranced listening to tape-recordings of suggested new anthems and poring over designs for new flags. The preamble to the constitution has also to be concluded. The Assembly has had a long discussion as to whether a reference to the "Most High" should be included in the preamble. This was

followed by an even longer and more passionate discussion as to what exactly the expression the "Most High" meant. Though the latter question was never satisfactorily elucidated, the deputies seemed to enjoy the debate, and the Most High finally found his, or its, place in the draft constitution.

The draft seems to draw its principles from the American constitution and many of its details from the French. Its outstanding feature is the exceptionally strong powers given to the president of the republic, who is also the chief executive. His veto power on legislation can only be reversed by a three-quarters vote of the single chamber legislature, he can govern by decree during five months of the year when the National Assembly is not in session, and has the power to suspend the constitution completely during the first legislative term of four years. Apart from the president's powers, the constitution follows comparatively unexceptional lines. The Assembly sits for four years and cannot be dissolved; there are 22 articles prescribing elaborate rights and duties for all citizens; one unusual provision sets up a national economic council, representative of the leading economic interests of the country. A curious feature is the omission of almost the entire judicial system, apart from the mention of a few special courts; one assumes that the present French system of justice will continue. As usual, there are not many holes to be picked in the constitution on paper, and the exceptional presidential powers are perhaps not more than are justified in a country where chaos has reigned uninterruptedly for ten years.

"Edification" by Generals

It is pretty certain that many of the elaborate freedoms written into the constitution will remain a dead letter as long as the "state of crisis" exists. For all Vietnamese officials, this justifies the absence of any real freedom in the present regime. Diem is entrenching himself south of the parallel, largely by military means. Since the destruction of the sects two curious military operations, one to the west and the other to the east of Saigon, have been set on foot; each is commanded by a general and each was launched with an imposing order of the day. The laudable official object of these operations is "pacification and edification." They are clearly intended to put all political enemies out of harm's way, and to make the people feel the reality of the military power. In spite of the proclamation of a democratic constitution, there is not much doubt that Diem's government is slowly moving towards a semi-military dictatorship. The Vietnamese make out a plausible case for this, but it has never yet been proved that such methods are the most effective defence against Communism in a divided country.

It is still too early to tell how far the exertions of the government, aided by the gigantic inflow of American aid, are going to resolve the economic and social difficulties of the South. The creation of a free market in the piastre at the end of June has not yet attracted foreign capital, nor has it prevented a rise in the cost of living. There has been determined action by the new minister of national economy, M. Nguyen Ngoc Tho, to cut down the absurd number of small importers, who have risen from 200 to 20,000 in two years and have made the economy unworkable. Despite this action, a heavy *immobilisme*—perhaps a French legacy—seems to hang over the South Vietnamese economy; it arises out of the confusing breakdown of the former French commercial structure, the generous but chaotic impact of American aid, the startling lack of foreign investment, and the uncertainty about the ultimate form of the country's economy.

A certain paralysis also afflicts land reform. The South Vietnamese plan for this is a good one. It consists of four stages; first, the lowering of agricultural rents to from 15 to 25 per cent of the rice crop (as opposed to 40 per cent or more in the past) and the drawing up of tenancy agreements between landlords and tenants; second, loans to farmers at interest rates far lower than any that have prevailed in the past—6 per cent per annum as opposed to 5 or even 10 per cent per *month* formerly; third, the redistribution of state lands; and finally, the limitation of private landownership and distribution of the surplus land. Of these four stages the first two are in operation, though not complete. The third and fourth stages are not off paper and possibly not yet even *on* it. It must be remembered, however, that Mr Diem has been very preoccupied with politics and that anyway it is not easy for a right-wing government to carry out a radical land reform, especially when the minister of agrarian reform and several other ministers are large landowners.

A Newspaper's Fate

The economic and social front is very important, but it is not the only front on which the South needs to fight its battles. The Vietnamese are intensely nationalistic, and under an urbane exterior many of them feel extremely frustrated that their country, on the morrow of independence, should find itself partitioned into two halves, each in the orbit of a foreign power. They dream of their united country, with a population of 24 million, playing a strong part in South Asia. They yearn for economic independence. It cannot be assumed that all Vietnamese south of the parallel, if they were free to speak their minds, would put horror of Communism above unification of their country. There is no provision in South Vietnam for a "unification first" party—such as the Social Democrats in West Germany—for the government and its supporters consider such a line to be a dangerous form of Communist subversion.

There was a significant example of this last month when a Saigon weekly newspaper suggested that a southern delegation should proceed to North Vietnam to inquire into conditions there, as a first step towards talks between the zones. The result of this suggestion was that the newspaper's offices were broken up and the paper driven out of business. The government dissociated itself from the incident; the police, however, did almost nothing to restrain the hooligans, and the editor of the paper has since been arrested.

The government's policy of condemning Geneva and everything to do with it has obvious dangers. Hanoi has already been able to posture as champion of the unification against which Saigon has closed the door; it will be able to do so even more successfully now that July—election month under the Geneva agreements—has passed, because it is clearly Diem's fault that the unifying elections have been indefinitely postponed. Diem must have some policy for reunification more coherent than "Not now" and "Wait and see" if he is not to put a useful weapon into the hands of his astute and watchful opponents across the parallel.

Avro Vulcan

NOW IN SERVICE WITH THE R.A.F.

The Avro Vulcan, the world's first 4-jet delta bomber has entered the Royal Air Force.
Behind the recent Air Ministry announcement lies a brilliant chapter of aeronautical progress that marks the beginning of a new era in Britain's air power.
With its near sonic speed, its great range and altitude and its large carrying capacity, the Vulcan, powered by four Bristol Olympus turbo-jets, is a formidable aircraft.
Add to this its fighter-like manœuvrability, exceptional safety and pleasant handling characteristics and you have the reasons why the Vulcan is the most effective bomber in service today.
But that is not all. The Vulcan has a great development potential.
It has been engineered to allow for new operational requirements which can be met without major alteration to the basic design.
In the tough testing ground of the R.A.F., on routine exercises and on long-range training flights, the Vulcan will soon be showing its paces.
Like its illustrious predecessors from the Avro stable — the Lincoln, the Lancaster, the Anson, the 504 and many others — the Vulcan is destined to become one of the world's really great aircraft.

Research Out of Balance

IN recent years several guesses, more or less informed, have been made about the amount of resources that Britain devotes to scientific and industrial research—and, even more often, judgments have been passed whether the country is spending enough. In these columns two years ago, for example, it was guessed that total expenditure on research and development in 1951 might have been of the order of £200 million; last spring, Sir Harold Hartley* put the figure for 1954 at probably £200-250 million. This week, at the British Association meeting in Sheffield, Mr Ernest Rudd of the Department of Scientific and Industrial Research presented the first estimates of the money and manpower devoted to research and development in Britain that have been derived from any specific and systematic inquiry. Mr Rudd offered figures—estimates with an admittedly large margin of potential error—not judgments. But his valuable figures do broadly support many of the judgments that have been passed on the basis of earlier guesses about the research effort; their implications are roughly the same, only more so.

That is true, in the first place, of his total estimates. On the basis of sample inquiries by DSIR and the Ministry of Labour, he puts total British expenditure on research and development last year at £325 million, with a margin of error that might be as high as £80 million either way. Well over half, he thinks, was done in industry:

	£ million
Government laboratories, etc.	120 (+ or − 35)
Privately-owned industries	185 (+ or − 40)
Publicly-owned industries	4 (+ or − 1)
Research associations, universities and elsewhere	16 (+ or − 5)
	325 (+ or − 80)

This industrial research effort, Mr Rudd calculates, was carried out by about 98,000 people engaged wholly, and another 35,000 people engaged partly, on research and development (in all, perhaps, equivalent to about 106,000 full-time workers). Of the 133,000, about 32,000 were qualified in science or engineering.

The estimates of research employment are based on information from a sample of some 3,700 industrial companies: those of expenditure have been built up by using information on expenditure from only 240 companies so far, plus information in the public domain, specific inquiries and guesses about research spending elsewhere. The industrial coverage of the first inquiry may be reasonably good—there seems little doubt that research is an activity concentrated mainly in the larger companies, a high proportion of which were included—but the possible error of the expenditure figures is inevitably greater. The data have enabled Mr Rudd to show employment and expenditure, per head and in total, on research and development in the main sectors of industry. Some of these figures—which etch out a pattern of sharp contrasts—are shown in the table at the foot of the next page.

★

For purposes of rough comparison, a number of other figures of the output, investment, and productivity of these different industrial groupings have been appended to the figures in this table. Mr Rudd has shown research employment as a percentage of total employment in each industry, which is a good way of expressing the very different proportion of total resources that each devotes to research and development. A more usual way of doing this, inside industry, is to relate research expenditure to turnover. This cannot yet be done even approximately for 1955, since gross output figures from the Census of Production, which correspond to turnover, are not available for last year. In the table following, however, gross output figures for 1954 have been included to give at least some indication of the relative output of the industrial groups concerned. Investment in new plant and equipment,

* "Scientific Research in Britain: Its Structure and Policy." *Progress*, Spring 1955.

moreover, gives some indication at least of the extent to which research and development are applied; fixed investment figures for these industries in 1954, therefore, have also been included. Finally, rough estimates are given of the growth in physical output and of labour productivity in the different sectors.

This DSIR survey provides data, not generalisations. There is, as Mr Rudd points out, a clear distinction between the "science-based industries"—aircraft, oil refining, electrical engineering and the chemical industry—and the traditional industries such as building, wood, cork, paper and printing, and food, which spend only a fraction as much on research and development. The proportionate research effort of some of the technologies in between these two extremes—metal manufacture, for example, and the metal-using industries other than electrical engineering and aircraft—is much more difficult to interpret. It is important to bear in mind that some industries do much more research and development co-operatively in research associations than others: the expenditure and employment shown by industries in the large table shows only work actually done in the laboratories of private industrial concerns.

The bill for this work, totalling £185 million in 1955, is by no means, however, what British industry spends on research. Indeed, industry seems to have paid for only about a third of it. Nearly two-thirds —close on £120 million, Mr Rudd estimates—was research done by industry but paid for by the Government. The Government—primarily the defence services—was in fact responsible for about £200-£210 million of the total British research expenditure of perhaps £325 million last year; the "supply and service departments" spent about £75 million on research and development work in Government laboratories and about £117 million on research done for them by industry and the universities. No indications of the different industries in which the Government financed this vast research effort is available: but it is an open secret that practically the whole of the £90 million spent on aircraft research and development was public money. The development of new equipment, indeed, is as characteristic an activity of any modern aircraft industry as actual production—and whether or not more successful, at least more continuous. These figures of Government spending on defence research, incidentally, leave out the research effort of atomic energy, about which Mr Rudd has been able to obtain no information: for completeness he offers a pure guess of £30 million last year (plus or minus £25 million!).

★

"Enough" has as elusive a meaning in assessing a country's total research effort as in judging its investment. The fashionable postwar substitute has been comparison with the United States; and Mr Rudd's figures offer a reasonably firm basis for this too. Our total expenditure on research and development—defined as widely as the scientists and businessmen concerned choose—amounted last year to roughly 2 per cent of our "gross national product," while the United States, in 1953, was spending about 1½ per cent of its own vastly larger national product for these purposes. The total American expenditure in 1953 was about $5,300 million, at "face" rates of exchange six times ours in 1955 (what a fair rate of exchange between the research dollar and the research pound might be would set scientific administrators arguing for months).

But the United States was also employing, in manufacturing research and development, six times as many graduate scientists and engineers as Britain, with a manufacturing labour force of less than twice the size. And a more damaging comparison still is between what British industry pays for and what American industry does. For the American Government—though its definition of "in the interests of national security" appears far wider than the British Government's when it comes to handing out research and development contracts—nevertheless finances only about 35 per cent of total research and development in the United States against the 60 per cent that the Government pays for here. Mr Rudd does not quote any figure indicating the proportion of the research actually done in American industry that is paid for by the government, but for 1952 the proportion has been put at about 45 per cent. From such figures it could be inferred that American industry might be spending eight or nine times as much on research and development as British industries employing more than half as many men.

Some work remains to be done upon the refinement of these new British figures; much on their interpretation. They might support the proud boast that Britain spends a larger proportion of its national income on research and development than any other country in the world (save perhaps Russia). They equally show, on the other side of the penny, that private industry in Britain lags far behind American industry in what it spends for these purposes from its own resources; the Government is the really heavy investor in British research and development. This disproportion may to some extent be inevitable: certain types of research, as for example the vast supporting research that lies behind high-speed aircraft, require men and money on a wholly different scale from most kinds of civilian research and development. It is nevertheless disquieting. The heaviest cost of defence to the modern British economy, as has been said here before, is not the 10 per cent that it takes of the national income. It is the 60 per cent that defence pre-empts of all the resources this country can assemble to invest in technological progress.

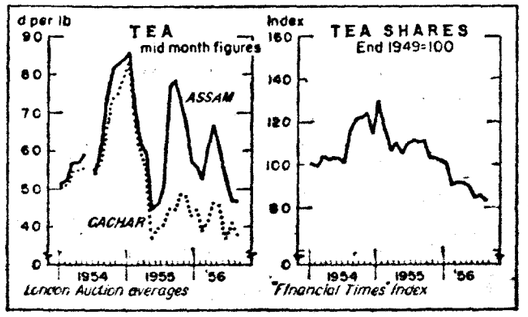
A Junta for Tea

ALMOST £85 million has been invested in India's tea gardens, and of this total £54½ million is non-Indian—that is British. This estimate comes from the three-man commission on the plantation industry that reported to the Indian parliament last week. The commission trounced the industry for not halving its dividend distributions, thus in an unspecified period increasing its internal resources by 25 per cent. Production costs in the sterling companies, the report said, were consistently higher than in the Indian, yet the sterling companies, it claimed, distributed a higher proportion of their total profit.

Without the British investment, without the services of the British agency houses, without the world market in tea that London provides, India would not be the dominant tea producer that it is, and this great and growing industry, two-thirds British, would not be India's largest single source of employment, with a million workers. Its fortunes still have great importance for a large body of patient British investors. Is it true, tea men will ask, that the profit margins on the Indian-owned estates are wider than on the European owned, after proper allowance has been made for maintaining the property? Or has some element of capital consumption crept into the calculation? If Indian managements are more successful than British, why has the commission had to devote so much of its deliberations to schemes—sensible schemes—for raising more capital for the **smaller** Indian-owned estate and so little to finding finance for the European owned? Why has it thought it necessary to advise tighter control over the transfer of estates from sterling owners to (presumably more efficient) rupee owners? Why, above all, is two-thirds of the industry still in British hands?



The commission's proposals are basically not extremist—neither the main report nor the dissenting minute by Mr K. G. Sivaswamy recommends nationalisation; they are pro-Indian rather than anti-foreign. Some helpful recommendations in the report will find supporters in all sections of the industry: greater help from the State bank and the Industrial Finance Corporation, specially for the small producers, and the establishment of co-operative organisations for the supply of stores are examples. The real trouble is that the plan as a whole bristles with immature and amateur thinking.

At no point is this more evident than in the proposals for management remuneration. The abolition of agency commissions and the substitution of fixed fees is proposed even though part at least of the commission is a charge only against profit, while the fixed fee would be payable in good years and in bad. It is also proposed to reduce production costs by savings on non-Indian managerial staff and managing agencies. The Tea Board, it is argued, should have power to examine cases of disproportionately high pay to **senior** staff, and the number of **Indians** in managerial posts should be **increased**. European-owned estates welcome more Indians in managerial posts; they claim they appoint them as fast as suitable applicants come

forward, and they pay the rate for the job (subject only to any special allowance that the Englishman gets for pulling up his roots in his homeland). They would deprecate its use as a back-door access to cheap labour, and they would deny that cheap labour at the top or the scrutiny of managers' salaries by an outside agency could ever promote efficiency.

The least acceptable part of the report is the all-embracing function suggested for the Tea Board. That body of about 40 people drawn from the Government, the industry and the consumers, is offered this list of duties :—

1. Collecting a replanting cess estimated at £3 15s. per acre.
2. Making special arrangements for the provision of selected tea seeds.
3. Drawing up, in consultation with producers, a programme of phased replanting.
4. Granting or withholding approval when it is proposed to sell any garden exceeding 100 acres.
5. Collecting the replanting cess in a lump sum in advance from the buyer as a condition of registration of transfer of an estate.
6. Making a regular study of cost data.
7. Collaborating with state governments in making a survey of land resources.
8. Establishing co-operative organisations for supply of stores.
9. Setting up a plantation finance committee to watch the financial needs of the industry and, if necessary, setting up a new financial institution under its own control.
10. Regulating the sales of tea in the Indian auctions.
11. Examining warehouse and brokerage charges.
12. Setting up a tea promotion directorate.
13. Organising the training of young men in the industry.
14. Reviewing managerial salaries.
15. Valuing estates offered for sale if either the buyer or the seller wishes it.
16. Arranging part of the distribution of tea in India under its own labels.
17. Taking over responsibility for warehousing.
18. Certifying valuations where it is proposed to revalue a company's assets.

The Board, with its regional offices, would require an enormous expert staff. No one can say where it would be recruited, but its powers would be enormous.

How then must the shareholder, still financing most of the industry, view his prospects ? He will not, of course, assume that the Indian Department of Commerce will simply swallow the report unamended. Nor, certainly, will he suppose that violent changes of fortune in the tea industry have been suddenly eliminated in favour of a steadily growing demand and a rising tide of finance from the Industrial Finance Corporation and the Indian National Bank.

The market for tea will still call the tune, and since the boom collapsed early last year quality tea has come into its own, while the producers of plain tea, particularly in India, have found it difficult to make ends meet. This week buyers paid up to 11s. a lb for a good—but not extraordinarily good—Assam tea from the new season's crop, while Indian plain tea, if it was not withdrawn from sale, went for 2s. 10½d. a lb or less. At anything less than a London price of about 3s. 3d. a lb few producers of plain tea can show a profit. In the first few weeks of the new season the average price in London of Assam tea, which is usually of high quality, was 6s. 11½d. a lb, an increase of more than 1s. 5d. a lb over last season, while the average price of tea from Cachar, which produces only plain tea, fell by more than 7d. to 3s. 1½d. a lb.

World production this year is running slightly above last year's rate, and unless bad weather cuts production in North India in September and October, the remaining peak months, prices of plain tea are likely to remain low. Many growers think that the conclusion of a new international tea agreement of which the Indian Commission was, with reservations, in favour, would restore confidence to the market. But there is no sign yet that the differences between the signatory countries have been ironed out. Another possibility is that the Indian government, which still controls exports, might reduce the quantities to be exported later in the season—even though the abolition of the quota system, but not of export control, is one of the recommendations now put forward. Finally, the Indian government might reduce the rate of export duty payable by producers of common tea. At present this duty, which is based on the average price of all Indian tea in London, amounts to 6¾d. a lb. The commission urges the use of a six months' average instead of one month's, which would not in these circumstances be of any help.

	Gross Profits (Including Other Income)	Provision for Taxation	Net Profits after Taxation £'000	Dividends	Total Retained Profits
1939	3,562	860	2,216	1,165	1,051

1953	15,816	5,235	8,308	2,292	6,016
1954*	17,239*	6,349*	8,845*	3,032*	5,813*

* Figures from half this sample, i.e. 123 companies with about half the acreage of the earlier years.

For investors in Indian tea shares the wheel of fortune has turned half a cycle. The facts today are vastly different from those based largely on the years up to 1953, which the commission collected and on which it based its report. It used the results of 1953, which was a fairly good year, almost forgetting 1952, when net profits were a negative quantity and bankers lent some tea companies more than their collateral was worth. The commission was also without complete data for 1954, the best year for tea profits ever known. The full tally of share bonuses and free scrip issues for 1954 no doubt shocked the commission, but that year also strengthened the tea companies greatly, for profit retentions were also higher. That is one fact distinguishing the depression of 1955 and 1956 from its predecessors ; the other is the specially good showing for 1955 still coming from the producers of fine teas.

The present tone of the tea market suggests—though it is early in the season to guess—that the 1956 results for the general run of companies may be even worse than for 1955, and that for the well-managed fine tea producers they may be even better. The market in tea shares has slid to a yield basis that is high even for tea shares, and business has dried up. This happens often enough in the narrow, highly speculative tea share market, but it is an odd moment for the commission to have suggested that debenture issues (of all things) are likely to be popular. Save for the favoured companies that obviously do not need money, issues of any kind are impossible. And at the best of times a tea company is a field only for equity investment, or failing that for a loan stock convertible into ordinary shares on attractive terms. It is the bait of the occasional boom year—like 1954—that draws private capital into tea. The commission, with all its searching for more capital for the weaker companies, with all its plans for making the Tea Board into a public nursemaid to supervise and prescribe allocations to reserves and how they shall be invested, with its proposal to bring the sterling tea companies under the Indian capital issues control, will not stimulate the flow of investment that it desires.

Business Notes

Suez and the Reserves

THE Chancellor's warning last week had prepared markets for the heavy gold loss during August, and in the event the figures announced last Tuesday were shrugged off as no worse—or even a shade better—than the pessimistic imaginings his statement had conjured up. The loss of $129 million reduced the reserves to $2,276 million and extinguished the whole of the gain achieved in the preceding four months. This was much the biggest loss since the summer of 1955—when Britain was in deficit on its whole current balance of payments and sterling was under speculative fire because of the rumours that the permitted range for fluctuations would be widened. This time, since the current account is in moderate credit, the main influence apart from seasonal ones has been the movement of funds—including precautionary covering of commercial requirements—provoked by the Suez crisis.

There were special influences in August that increased the gold drain; the deficit (or surplus) with the European Payments Union is settled a month in arrear, and the reserves were burdened in August by a payment of $51 million in settlement of the gold portion of the big deficit of £24 million incurred with EPU in July. Only part of that EPU deficit could have been attributable to the Suez strains during the last few days of that month. Last month's EPU deficit, though still substantial at £16 million, was a good deal smaller ; it will involve a gold payment of $34 million this month. The August statement was also affected by at least one substantial non-recurring payment—the $14½ million subscription by Britain to the newly-formed International Finance Corporation. American defence aid, which had been unusually large in July, reverted to the more normal figure of $4 million, while the monthly payments under the bilateral agreements covering former EPU debt rose from $2 million to $3 million.

The impact of the Suez crisis on the reserves can be best gauged by recalculating the figures to exclude the non-recurring items and defence aid and to show the EPU payments in the month to which they relate. On this basis, there were deficits of $21 million in June, $40 million in July and $102 million in August. Hence the true increase from July to August, part of which was attributable to seasonal factors, was much less striking than is suggested by the unadjusted figures. As a further guide to the extent of Suez nerves, it may be noted that parallel calculations

* Settlements with EPU governed by balance in previous month.

for the months of exceptional strain last year would have shown deficits of $166 million in July, $114 million in August and $135 million in September. By such tests, recent experience looks more reassuring: but the dangers that may lurk ahead for sterling are not of a kind that can this time be obliterated by any facile "Istanbul" assurances about sterling policy. The $180 million paid this week for the sale of Trinidad Oil comes opportunely into the emptying coffers of the Exchange Account.

New Zealand Comes to Market

MARKETS have behaved well in the face of this week's three severe tests, the gold and dollar loss, the talking in Cairo and the shouting in Brighton. Prices were sagging at the beginning of the week. On Monday and Tuesday the *Financial Times* index of Government securities stood at 84.28, a drop of 1.31 compared with Tuesday of the previous week. The industrial index stood at 181.2, a drop of 5.2. Business had dried up particularly at the short-dated end of the list of Government stocks which were affected by the new rule against bond washing. Commodity markets, too, were stagnant. Nevertheless when the new Stock Exchange Account opened on Wednesday business in industrial securities did perk up, the industrial index rising 0.8 in distinctly steadier markets. Naturally that bright opening was not fully maintained on Thursday afternoon. There was over £60 million of Trinidad Oil money paid out that day, but there was also the news that Parliament had been recalled.

It was probably not the week that New Zealand would have desired for floating a loan in the London market, nor probably was £5 million all the money that New Zealand would have liked to have raised here, for the Dominion's requirements for capital expenditure are heavy. Nevertheless the prompt success of issue of £5 million 5¼ per cent stock 1978-82 at £96 10s. was a considerable achievement in these lean markets. The lists closed oversubscribed at 10.15 on Thursday morning and the basis of allotment—applicants for up to £50,000 of stock receiving full allotment and larger applicants 91 per cent of their requirements suggests that the loan has been just comfortably oversubscribed without any stagging.

New Zealand is an excellent borrower, and the loan despite its small size and the inauspicious timing, seems to have had the wide appeal that it deserved. It offers a flat yield of £5 9s. per cent for a minimum of 22 years and a gross redemption yield to 1982 of a shade over 5¼ per cent. The proceeds will help to pay for the Dominion's programme of hydro-electric schemes, land development, forestry and road construction estimated to cost £70 million during 1956-57. The greater part of that cost has already been raised in New Zealand.

Overdrafts of State Boards

A TREASURY innovation this week has pointedly set an example before the banks in the matter of banking statistics. Under the new arrangements for financing the nationalised industries the Treasury is disclosing regularly not only the amount of its own advances to these bodies (as it has a statutory duty to do), but also the amount of the outstanding bank advances to them. This information is being released each month to coincide with the issue of the combined make-up (or balance sheet) statement of the clearing banks. The first release was made at the end of last week, showing that at August 15th total bank advances to the seven nationalised bodies concerned were £123.4 million, of which £111.7 million had been granted by clearing banks and £11.7 million by Scottish banks. Comparative figures, set out below, were given for the two preceding accounting dates.

This welcome innovation might suggest to the uninitiated that only a series of simple subtractions is now needed to yield from the clearing banks' monthly statements a clear indication of the trend of their advances to all other

BANK BORROWINGS OF NATIONALISED BOARDS
(£ million)

1956	From Clearing Banks	From Scottish Banks	Total
June 30	94·2	6·6	100·8
July 18	98·2	8·7	106·9
Aug. 15	111·7	11·7	123·4

borrowers (broadly the private sector, plus local authorities). Unfortunately, this is not so. The relevant subtractions show residuals of £1,881 million at June 30th, £1,832 million at July 18th and £1,819 million at August 15th. The decline of £13 million between July and August may be reasonably indicative (though only the banks can say for sure), but the £49 million for the first eighteen days of July certainly is not.

This large movement reflects a fluctuation of unknown extent in the major category of extraneous items that nearly

all banks include in their so-called "advances" total—the amount of cheques, etc., in course of clearing between branches within each bank. These internal clearings (like those passing from bank to bank through the clearing house, which are shown separately in bank statements) are subject to large and often unpredictable variations, and always cause big distortions of unascertainable amount in the "advances" total at the end of each half-year. The

fact that the Treasury has seized its first opportunity to make the banks' own figures of advances a little more intelligible should surely shame the banks into taking the next step themselves. If the monthly advances figures cannot be published on the same "clean" basis as that used for the quarterly classified return, surely the banks can segregate from them these troublesome "internal transit" items?

Engine Designers' Farnborough

THE air show at Farnborough has never been more attractively laid out than it was this year, with its silver exhibition hall at the top of a hill garlanded with flags and the blue-and-white awnings of the exhibitors' caravans carpeting the slopes. When the sun shone, as it did on the opening day, this setting had heraldic overtones that were picked up in the armoured polish of multi-coloured aircraft formed up at the foot of the hill with trappings of orange missiles, black mines and red, green and black rockets. The impression was heightened by two Fairey deltas standing side by side, with needle-thin noses projected like lances ahead of an improbably slight pair of wings, one nose hinged downwards in an attitude of rest, and the other pointing straight ahead. But in terms of showmanship, as well as hard technical progress, this was an engine designer's show: the aircraft were vehicles for showing off the ingenuity of the engine shops.

There are more really good engines in Britain today than there are aircraft for them to drive; design talent has always, indeed, been clustered more thickly in the British engine factories than in the rest of the industry. Both Rolls-Royce and Bristol are flying new turbo-prop engines in the 4,000 horse-power class and de Havilland is developing a smaller, lighter engine from its massive Gyron. Bristol has been lucky to be able to use a Britannia airframe for some of the flight testing, while Rolls-Royce has a make-shift installation in the nose of an old Lincoln bomber that makes the Lincoln look even more of a backwoodsman among the jets than aircraft like the Handley Page Herald or the Scottish Aviation Pioneer that are designed for genuine backwoods operations.

The most notable refinements of existing engines are Avon developments carried out by Rolls-Royce for the Comet IV. The civil Avons, giving 10,500 pounds thrust, are quiet by modern jet standards and the company has made progress with the system of reversing some of the jet thrust to brake the aircraft as it lands. Rolls-Royce demonstrated this on a Hunter, using smoke to show the change in the flow of gas from the jet efflux into louvres in the sides of the jet pipe. A propeller, whether attached to a piston engine or a turbine, can be put into reverse pitch

Stocks and Economists

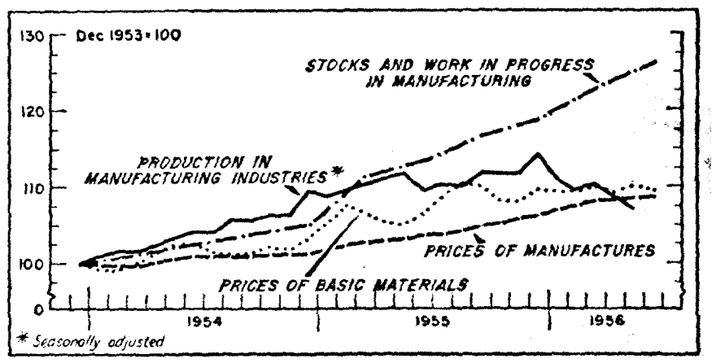
IN well-hedged guesses about the probable changes in supply and demand in Britain this year, most economists—and *The Economist*—have agreed on one thing: that stocks and work in progress would rise less this year, in real terms, than they did last, if indeed they rise at all. Last year an extremely high proportion of the extra resources available in the ecomony went into building up stocks. This year, with these large stocks in hand and disinflation moderating any further rise in output, it seems logical that they should not rise nearly as much.

The latest expert guess about the balance of the economy so far this year—an estimate of changes in real demand and supply in the first two quarters of the year, with some attempt at seasonal adjustment, in the current *London and Cambridge Economic Service*—repeats the same assumption. It puts the increase in total stocks and work in progress throughout the economy as increasing in the first quarter by something of the order of £130-£200 million at 1948 prices, which would suggest say £185-£300 million at 1955 prices; but assumes that for the change in the second quarter, "zero would seem as plausible a figure as any other."

It would, indeed. But the fact remains that this week the Board of Trade published figures which show that stocks and work in progress in manufacturing industry—which amount to close on half of the total value of stocks in the economy as a whole—have continued to rise. The value rose 3 per cent during the second quarter of 1956, bringing the rise for the first half of the year to 6 per cent—during a period when the prices of basic materials have remained steady and the prices of finished manufactures have risen by only about 1½ per cent.

The increase has been mainly, as might be expected, in the value of work in progress. Industries faced with slackening demand have presumably waited to be sure before cutting output in full proportion. As a result, stocks of finished and semi-manufactured components have accumulated on their hands. When a higher proportion of an industry's stocks is held at stages where more has been done to the material, value is automatically added to the total stocks.

It is too early to abandon even the hypothesis that total stocks in the British economy, in real terms, may not have changed in value during the second quarter of 1956—let alone the continued prognosis that over the year stocks will not rise as much as they did in 1955. Changes in the value of stocks in the rest of the economy, outside manufacturing, could have outweighed the rise in manufacturing stocks during the second quarter; in manufacturing itself, stocks may run down in the second half of the year. But the evidence so far, however inadequate, is that a large proportion of the country's stock was still rising halfway up to June.



* Times Review of Industry, September.

to give braking power; in a jet the whole force is taken on the wheels. Foreign airlines, particularly American operators, are not prepared to risk landing a jet airliner weighing in the order of 90 tons on a slippery runway without some additional help from the engines, and reverse jet thrust will have to be perfected before these airliners go into service.

In Search of Customers

THE roar, the smoke and the sheets of flame that some of the aircraft left as they climbed at Farnborough this week partly concealed the fact that these were tricks like after-burning and rocket take-off used by engine designers to put a new lift into essentially conservative aircraft. Either of two conclusions might be drawn from the absence of any new aircraft but the Supermarine N113, the long-awaited naval fighter from Vickers-Armstrongs. The appearance of bigger Britannias and bigger Viscounts, the fact that de Havilland is dismantling the Comet III preparatory to starting construction of the Comet IV, the improvements in engine thrust, and the delivery of Vulcan bombers to the RAF (somewhat modified from the white bats that floated over Farnborough in earlier years)—all these could all be read as signs that British factories have learnt the importance of consolidating before they advance. But the absence of high-speed aircraft of the types that other countries already have flying might, like the lack of any big jet transport, be a sign that all is not well in the factories working on such projects. The Russian visitors, when they spoke in complimentary terms of the Fairey delta's world speed record, added that they, too, had aircraft flying at similar speeds; and there is no reason to think this is an exaggeration.

There is a certain irony in the industry's contention that the aircraft being shown this year at Farnborough are almost all available for sale: some of them have been searching hard for customers. Vickers, indeed, passed the 350 mark in Viscount orders early this week, and has delivered 138 of them, but its order books for the bigger Vanguard are still practically empty. Some of the best money earners in the industry are, like the Viscount, its oldest aircraft. The de Havilland Vampire trainer makes up for technical obsolescence by versatility. Air forces on a tight budget have appreciated its ability to change from trainer to fighter, to bomber, to ground attack fighter and back again as the need arises. The English Electric Canberra bomber, a team of which went through aerobatics that would not have shamed a fighter, has shrugged off its years in the same manner, but it remains to be seen whether the Hunter, appearing for the first time as a ground-attack fighter, or the Javelin will prove as flexible. The Folland Gnat, impeccable in the air and firing its guns at altitudes that have put more elaborate fighters in difficulties, needs modifications to curb its scalded landing run before it meets the requirements of countries looking for light fighters to operate off small airfields. As to the Fairey deltas, they were built for speed and nothing else, as research aircraft for future designs. The one military aircraft that might have stolen the fire and the thunder from the engines, the English Electric P1, was not flown. Foreign visitors at Farnborough were saying that the price the Government may have to pay for its present economies, which have whittled down development contracts to one design for each basic aircraft type, is the loss of 10 years if that single design turns sour.

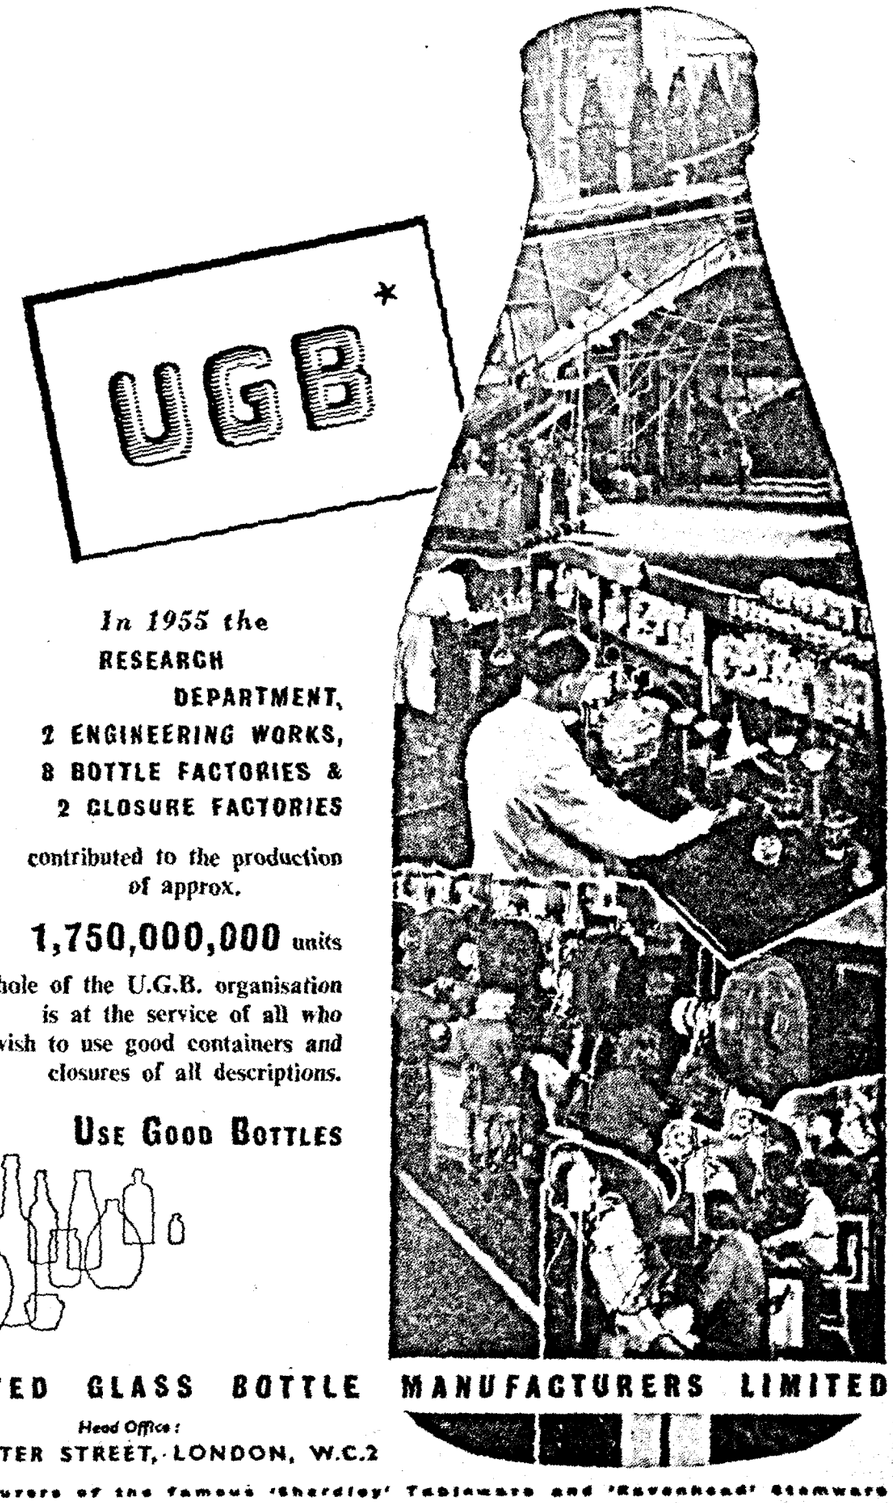
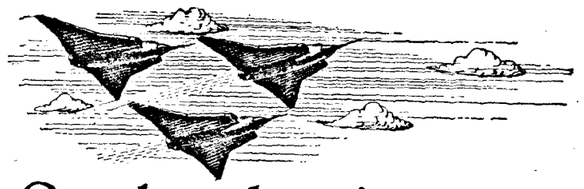
"Washing" and "Reverse Washing"

THE Stock Exchange Council has recently been engaged in a tidying up operation on some of its rules, and one form of dealing that has proved costly to the national revenue has now been, if not stopped, at least severely curtailed. It is known in City jargon as "bond washing," with its counter-part "reverse bond washing." This is a form of dealing in the half-yearly payments on various stocks, profitable because investors do not all pay the same rate of tax. One type of investor, including the investment trusts and the fire and accident departments of the insurance companies, pays the full standard rate (at present 8s. 6d. in the £); a second type, the life funds of the insurance companies, pays a special rate (at present 7s. 6d. in the £); and a third type, including finance houses, discount houses and the gilt edged jobbers themselves, pays tax only on the profit of the business as a whole.

The amount by which the price of a stock falls when it goes "ex interest" in the market depends on the relative pull of these different types of investor and there may be a substantial potential profit for investors of one class to buy "cum interest" and sell ex interest claiming a proportionate refund of any tax that has been suffered. That is known as "bond washing," and is in effect trading in interest payments rather than in stock. There may also be a substantial gain for a fund on a different tax basis to sell cum interest and buy back ex interest, gaining more from the fall in the price stock than the net value to that fund of the interest payment sacrificed. That is "reverse bond washing." Those operations have to be tolerated. What is frowned upon both in Whitehall and in Threadneedle Street is the washing of the same bond again and again within the 21 days before it is quoted ex interest—a period within which it has hitherto been permissible to deal either ex interest or cum interest. The Treasury was at risk of having to pay out in tax refunds more than it collected in tax.

A simple amendment to the Stock Exchange rules has now come into force that limits the scope for such transactions. It has long been the rule with 3½ per cent War Loan





On the alert in northern skies

Jet fighters streaking across the Swedish skies remind us that traditional neutrality is no head-in-the-sand affair. Sweden's air defence force is one of the three largest in Europe; fifty powerful squadrons equipped with some of the world's fastest jets. Nearly all of these jets come from the famous SAAB works, in Sweden, one of the world's pioneers of the air.

Streamlined SAAB production methods see to it that Sweden's air force is as up-to-date as any in the world. On the busy assembly lines, compressed air helps speed construction. Run from Atlas Copco compressors, thousands of Atlas Copco hand tools are riveting, drilling and reaming with precision to build aircraft to protect Sweden's freedom.

Your beer is under pressure

Compressed air is versatile. Atlas Copco provide the means for all its many applications. In many breweries the mash inside fermenting vats is now stirred by air supplied from special Atlas Copco compressors, a method found to be more efficient than mechanical agitators. Atlas Copco air compressors are also moving beer under pressure into filling machines, and bottles into crates.

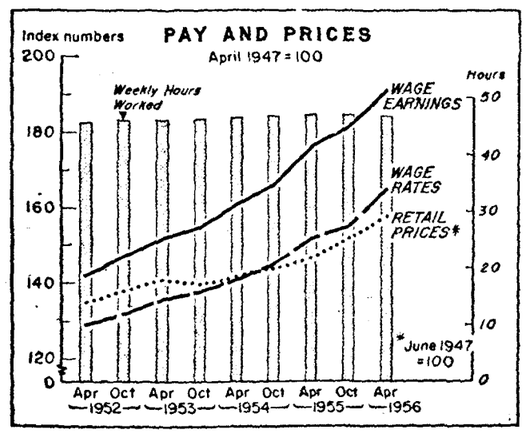
The Atlas Copco Group of Companies is responsible for the manufacture of compressed air equipment and its distribution and servicing in 90 countries throughout the world. Group Headquarters: Atlas Copco AB, Stockholm 1.

Atlas Copco puts compressed air to work for the world

that it may not be dealt in ex dividend before it is officially so quoted or cum dividend after it has ceased to be quoted in that form. To the War Loan has now been added the whole range of Government stocks normally quoted subject to accrued interest. That is the Government stocks with dates shorter than five years. Bond washing will not thereby be wholly stopped, there will still be stocks both inside and outside the gilt-edged market—for instance Japanese bonds—in which it could be done, but the expectation is that it will be reduced to proportions that do not really matter because the temptation is removed from those stocks that are dealt in in great volume by discount houses and some other institutions. Therefore the Treasury should not need to intervene. That hope is reinforced by the understanding in the gilt-edged market that all sales of stock will actually be delivered, so that the same stock cannot turn over and over without settlement.

Wage Rates and the Wage Bill

BETWEEN October, 1955, and April this year earnings in industry rose rather less than the index of basic wage rates—for the first time since 1952. Earnings rose by 6 per cent—to a peak of £11 15s. 4d. a week for men working in a large sample of industries, including all manufacturing—but wage rates had risen by 7 per cent. The shift, though small, is significant: wage rates are what a man's trade unions bargain about, and earnings are what he actually achieves in a week, after overtime and production bonuses of various kinds. It was predictable at the beginning of this year that as soon as disinflation began to grip, that cushion of earnings over and above basic wages would be squeezed somewhat. The process by which earnings rose less than basic wage rates was that the average hours



worked weekly in April were very slightly lower than in October, because less overtime was being worked and short time was beginning to increase slightly. Both processes have probably continued during the summer; but the amount of overtime being worked, in the economy as a whole, remains very high.

Whether wages are considered in terms of basic rates or of actual earnings, it may be added that they rose more than prices during these months. The monthly index of retail prices was only 4 per cent higher in April than in October, and since then it has fallen. Admittedly the comparison over the previous six months is less favourable to wages; but over the twelve months from April, 1955, to April, 1956, earnings and rates rose 8½ per cent and prices 7½ per cent.

New Ideas in Steel

TWO new departures in steel technology, in fairly early stages of development, made headlines during the British Association's annual meeting: equally unconventional suggestions about the economic development of the industry went largely unnoticed. Sir Charles Goodeve, of the British Iron and Steel Research Association, mentioned a new process of making steel direct from iron ore called "Cyclo-Steel," which would bypass the blast furnace; and Mr E. T. Sara of the United Steel Companies referred to some tentative development being done here and in the United States upon the chemical separation of iron from certain iron ores, particularly those in which the iron is mixed with more expensive metals such as vanadium or nickel. Mr Sara's remarks about the development of re-rolling in the steel industry of this country, and his question whether iron ore and now coal, are the right things for British steel to be importing, received less attention.

No details are available of the chemical separation processes in which United Steel is interested; Sir Charles Goodeve was comparatively forthcoming about BISRA's "Cyclo-Steel." This, in a sense, would reverse the existing Bessemer process, in which air bubbles are blown through a liquid metal; the idea is to inject liquid metal as droplets into a stream of very hot reducing gas. Neither silicon, carbon nor phosphorous would then enter into the liquid metal thus produced, which would be drawn off with slag by precipitation. The research association is a long way from having the process ready; but it has already made small quantities of what Sir Charles calls "very crude steel" with it.

Mr Sara's two unconventional suggestions about developing the industry were that the large number of independent re-rollers in the British steel industry, who buy steel billets and roll them into sections as the market requires, should re-equip their mills to take larger billets, because extra quantities of such large billets can readily be produced at a variety of existing steel plants. This is one solution to the difficulties in supplying extra billets cheaply for the re-roller; the other is that a new continuous billet mill, which alone could produce smaller billets economically, should be put down. More will be heard of this argument. Whether other people in the industry will rise to Mr Sara's second suggestion—that Britain might do better at some stage in the future to import pig iron, or "some other suitable cold melting base," instead of bringing in the ore and now some of the coal and making the iron here—remains to be seen.

New Money for John Brown

THE need for new money must be imperative to drive a company into the market for new capital in these days of stringency and uncertainty. That company, too, must have a strong belief in its own future prosperity. John Brown, the shipbuilding and engineering firm, will take the plunge at the end of this month. Since the war, the group has been able to finance its capital needs from retained profits and compensation payments from nationalisation. Now, with about £3 million in liquid assets and fixed capital commitments of about £1.3 million on March 31st, it has to appeal to the market to finance the fixed and working capital needs of its programme of expansion.

The directors have chosen—and in the present market there was really no other choice—to make a rights issue, by offering one new £1 ordinary share "at an appropriate price" for every five units held; the current market price on the existing shares is 35s. 6d., and the company should have little difficulty in fixing an issue price attractive to shareholders. The rights issue will be followed by a free scrip issue of one for six ordinary shares. On the new capital, the directors intend to pay a tax-free dividend of 1s. per share (exactly equivalent to the tax-free payment of 1s. 2d. on the present capital).

The background against which the issue stands is not a sombre one. The subsidiaries are working at full pace and profits have been rising; they went up from £2,512,163 to £3,629,451 in the year to March 31st. The group's order books are full. In particular, its shipbuilding subsidiary is assured of work for some time ahead, new contracts last year exceeding deliveries, and it is planning to increase its building capacity for large tankers. A safe equity, with some growth possibilities as the John Brown units possess, is unlikely to fail in an appeal to the market.

Automation Again

PUBLIC discussion of automation broke out again at Brighton and Sheffield this week: much sense and some nonsense was talked at both places about it, but when one compares the technical background of the people talking, the Trades Union Congress deserves more credit for the understanding it displayed than the British Association. Mr James Crawford, speaking for the general council at Brighton, set the keynote:

> We will co-operate fully if we are brought in on the ground floor. If the employers will put into the pool in the right spirit, we will face technical change with courage, knowing that our members are being protected all the way.

BOAC's Falling Traffic

THE chairman of the British Overseas Airways Corporation did not mince his words when he described the circumstances that have led to the airline's poor financial showing in its last financial year, and its even poorer prospects for the current one. The steady downward trend set in train by the Comet disasters has continued uninterrupted. It will not be checked until the gaps have been filled that were left in the BOAC fleet by the loss not only of the Comet Is, but the Comet IIs that were due to enter service, and the Britannias whose introduction has been so long delayed. The profit of £1 million which the corporation made in 1953-54 after meeting all charges had shrunk in 1955-56 to £118,000, although revenue had gone up from £38 to £43 million and operating costs had actually shown a slight decline. Although BOAC has succeeded in wiping out entirely its accumulated deficit, it is likely to show a net loss again this year.

The figures that show most plainly the reason for this decline are those that measure what proportion of the capacity offered for sale was in fact filled:—

1951-52	65·7 per cent
1952-53	64·5 per cent
1953-54	64·5 per cent
1954-55	63·7 per cent
1955-56	61·7 per cent

Had costs not also fallen over the period, BOAC would by now be well in the red.

This occurred when the traffic of other airlines was booming. BOAC has an ageing and makeshift fleet of Stratocruisers, Constellations and Canadair IVs and passengers are tending to fly more and more by other airlines with more modern equipment.

The short-term prospects suggest that the worst is now over. By October, BOAC should both be getting delivery of its Douglas Seven Seas and putting Britannias into service. Britannia costs are likely to remain high until the overhaul life of the engines is comparable to that of an established piston engine;

PASSENGER TRAFFIC BETWEEN BRITAIN AND THE US

	Total Traffic	BOAC's Share
1951-52	90,570	40 per cent
1952-53	124,000	37 per cent
1953-54	139,000	No change
1954-55	152,000	30 per cent
1955-56	191,900	29 per cent

at present the life is much shorter and maintenance costs are therefore excessively high. But the financial year 1957-58 should see an improvement and in 1958-59 the Comet IVs should arrive. These three new types will give BOAC a reasonably competitive fleet. But the effect will be nullified by 1959 when the first of the big American jets begin to appear on the North Atlantic.

BOAC's future as a major airline therefore depends on getting equipment that will enable it to win back a reasonable share of North Atlantic traffic, which the board thinks should be about 50 per cent. The corporation can probably get by on its other routes where competition is much less intensive but the traffic is also thinner.

Much turns on the government's decision on BOAC's request to buy 17 Boeing 707s at a round cost, in dollars, of £2 million apiece, excluding their engines, which would be provided by Rolls-Royce. The corporation's aircraft commitments so far are:—

Britannias	£22 million
Comets	£27 million
Seven Seas	£11 million
Viscounts	£5 million
TOTAL	£65 million
To which the Boeings would add, say	£40 million

Its accounts show that it has made progress payments amounting to £23 million for aircraft under construction up to March 31st this year.

The government is not expected to announce its decision about buying the American jets before the end of the month. A total refusal, according to Mr d'Erlanger, would be sufficient to put BOAC out of business. Meanwhile the huge size of the BOAC staff continues to amaze other operators. BOAC's equipment troubles, serious though they are, should not be allowed to create the impression that they are the only aspect of the corporation's operations that need attention.

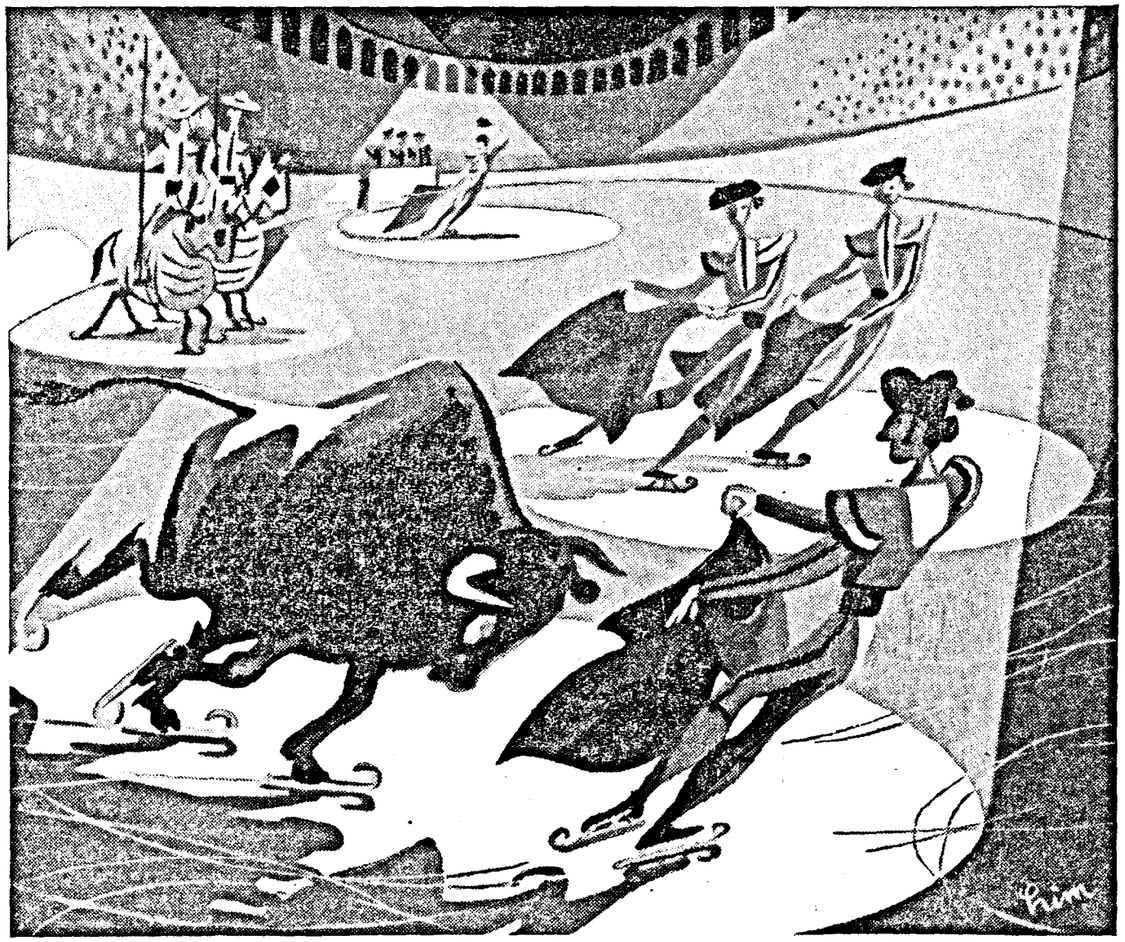
WINGS DAY SEPT. 15th



EUROPE IN PERSCHWEPPTIVE

Last comes our surprise report from SPAIN. Our corps of Schweppesialists, unpaid (but on an exschweppes account) have reported that in Spain there is no sign of any Perschwepptive whatever. To clarify their findings in a phrase — was is is, is is was. Dr. Rudelsbein, the American member of our team, an ethnoeducationist, researching on the Spanish tendency to be slightly late, was able to prove, by living for two months in a *choza* above Torremolinos, that he "found no progress among teen-age groups in the awareness of the core activities vital to life-adjustment problems, so that there were as yet few of the basic social processes one would hope would evolve from a more balanced behaviour relationship."

But if Old is New and New is Old, there is some hope that western influences may before long be making their mark on Spanish peninsularity. If there are still areas untouched by chewing gum, and restaurants which make no attempt to serve warmed-up shepherd's pie and stewed bottled rhubarb, there are definite signs of soccer in Madrid, the ladies of the flounce and the castanet have been observed casting anonymous glances at the more or less two piece, and the fact that the biggest bull-ring in Barcelona has recently seen a performance of Cinderella on ice suggests a glorious future, even a more pleasing present. If in Spain the Perschwepptive is intangible, we can still say it is a land of prospwepts.

Written by Stephen Potter: designed by George Him.

SCHWEPPERVESCENCE LASTS THE WHOLE DRINK THROUGH

That is as much as one could expect as a general reaction from the trade union movement: the general council's resolution showed that it would interpret "protection" as full consultation well in advance, recruitment and training policies geared to the technical changes, avoidance of redundancy where possible and "adequate maintenance" where labour has to be displaced—plus "reduction in the price of the commodities being produced." Mr Haxell of the Electrical Trades Union was sourer, but not unrealistic: he observed darkly that automation could only bring prosperity in an expanding economy, which is probably true enough. Nor was discussion from the floor too haunted with Luddite fears—while a doctrinaire resolution about a Minister and a national planning board to control the introduction of automation was rejected by the common sense of the congress.

At Sheffield the major aspects of automation were discussed by experts, most of whom displayed the same qualities as at the several conferences at which they have made roughly the same speeches before. Lord Halsbury entered his customary objection to the very word "automation," while defending firmly his own excellent list of the things that the word had better mean since it exists (he will not have this called a definition). One newcomer to this particular palaver was Professor Dickinson of Bristol University, who had the courage to discuss the "Economic Effects of Automation." He was concerned with its effects on labour transference and income distribution in the "medium-long" period (presumably when we are all rather old). He thought that automation might bring about simultaneously a considerable amount of general unemployment with a great shortage of highly specialised labour; that it might tend to reduce wages relative to property incomes, unless prices were reduced or taxation made more redistributive; and that glaring inequalities might be created between the few workers left in "automated" industries and those in other jobs. His premises for these conclusions were that automation might often offer savings in labour (at least direct labour) of 75-80 per cent: and that in most cases labour-saving innovations will result in the displacement of labour from the industry concerned. Part of the reasoning behind his conclusions was impeccable; but both his premises appear somewhat removed from recent general experience.

Sheen on the Copper Belt

THE Rhodesian Selection Trust group of copper companies sells its copper at fixed but not unchanging prices: with a suitable time lag the group has accommodated its prices to the London Metal Exchange price, but as it happens has more often been below it than above it. The preliminary figures for the two operating companies, Roan Antelope and Mufulira, show that the average prices received from the sale of copper over the year to June 30th were about £337 a ton for Roan and £341 a ton for Mufulira. Though costs were higher, these prices were well above those obtained in 1954-55 and this, together with the increase in the tons of copper sold, sent profits up. After a provision for replacement (which may be increased when the full accounts are published), Roan's profits after tax jumped from £9.8 million to £14.6 million and Mufulira's from £10.9 million to £16.8 million. Bigger dividends to shareholders seem probable.

The latest yearly figures of the two companies, reproduced in the accompanying table, include the 9,245 tons of copper bought by each company from Government stocks. The cost of these stocks and the marketing of them is shown at £396 per ton. The Board of Trade

SALES AND PROFITS
(£'000's)

Years to June 30	Roan Antelope		Mufulira	
	1955	1956	1955	1956
Sales revenue	22,625	32,548	23,808	35,192
Operating costs	12,765	18,527	12,272	18,389
Gross surplus	10,627	15,030	12,071	17,640
Replacement	744	443*	1,191	857*
Profit before tax	9,833	14,587	10,880	16,783
Sales (long tons)	*82,982*	*95,078*	*86,391*	*101,829*

* Subject to revision in the full accounts.

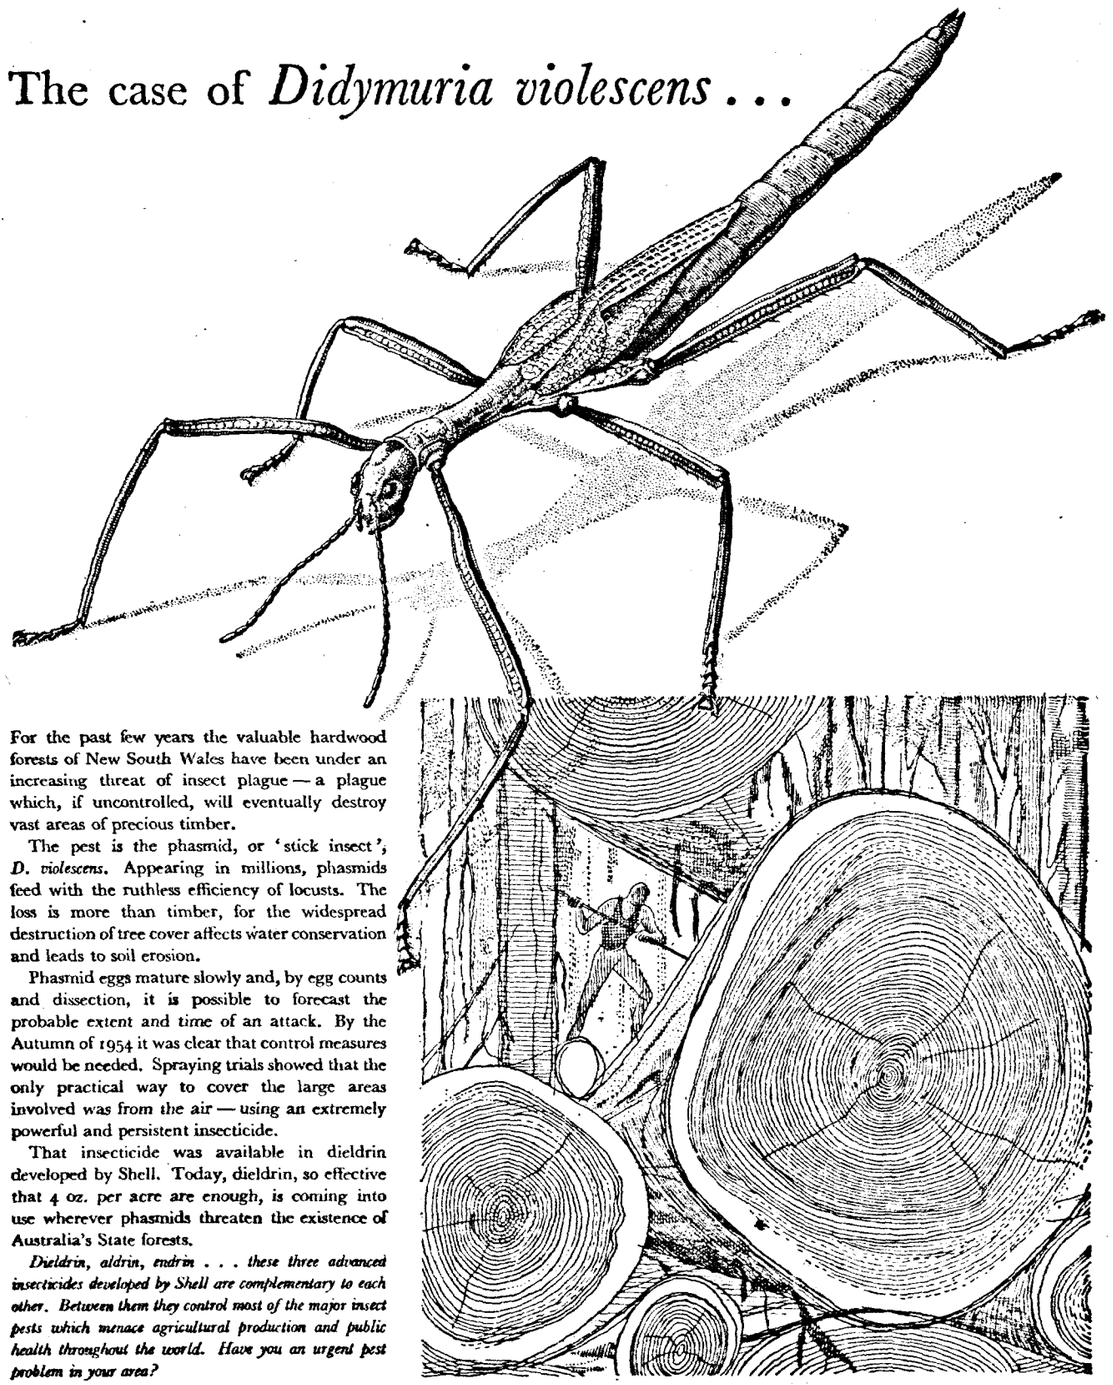
adopted the sensible rule of handing back to each maker his own brands. The RST group has not cut itself entirely from the metal exchange and much of this stock of copper was sold in the market; as prices there were at one time well over £400 per ton it cannot be presumed that the RST group made a loss on this transaction. The group's highest fixed selling price in the period was £385 a ton, thus underlining the fact that on balance the group has been making a concession to consumers. It also served to preserve a connection—all too thin—between the copper companies and the market, and provided a narrow market with a few much-needed "chips." The fixed price is now £300, the market price £308½, and copper obviously is still highly profitable, though not so profitable as it was.

Oil in the Haven

BOTH the nature and the location of the new oil tanker terminal that British Petroleum this week announced it is going to build at Milford Haven are significant. The new terminal, which will cost £5 million, is to be capable of berthing super-tankers of 50,000 tons deadweight "and over"; though BP owns tankers up to 32,000 dw tons, it has not until recently shown much inclination to invest in tankers of the size for which it is to build the terminal. Moreover, the choice of Milford Haven may have considerable implications for the area; local enthusiasts for this magnificent landlocked anchorage in Pembrokeshire have been arguing its virtues for many years, but until now it has never attracted the industrial development for which they hope.

The new oil terminal will be linked by a 16-18 inch pipeline with BP's refinery at Llandarcy, near Swansea; it will be at Popton Point, across the anchorage from Milford Docks. The pipe will be able to move 5 million tons of crude oil a year. The Milford Dock Company has for some time been planning to build a new dry dock, capable of accommodating and repairing tankers of up to 45,000 tons deadweight, and following BP's announcement the com-

The case of *Didymuria violescens* . . .



For the past few years the valuable hardwood forests of New South Wales have been under an increasing threat of insect plague — a plague which, if uncontrolled, will eventually destroy vast areas of precious timber.

The pest is the phasmid, or 'stick insect', *D. violescens*. Appearing in millions, phasmids feed with the ruthless efficiency of locusts. The loss is more than timber, for the widespread destruction of tree cover affects water conservation and leads to soil erosion.

Phasmid eggs mature slowly and, by egg counts and dissection, it is possible to forecast the probable extent and time of an attack. By the Autumn of 1954 it was clear that control measures would be needed. Spraying trials showed that the only practical way to cover the large areas involved was from the air — using an extremely powerful and persistent insecticide.

That insecticide was available in dieldrin developed by Shell. Today, dieldrin, so effective that 4 oz. per acre are enough, is coming into use wherever phasmids threaten the existence of Australia's State forests.

Dieldrin, aldrin, endrin . . . these three advanced insecticides developed by Shell are complementary to each other. Between them they control most of the major insect pests which menace agricultural production and public health throughout the world. Have you an urgent pest problem in your area?

dieldrin

dieldrin, aldrin and endrin are SHELL insecticides for world-wide use

For further information apply to your Shell Company.

Issued by The Shell Petroleum Company Limited, London E.C.3, England.

pany's shares showed a rise. The Esso Company also owns some 300 acres of land in the area of Milford Haven on the same side as the docks, but it has not yet finally decided what it wants to do there.

Sentinels Pass

BY buying Sentinel (Shrewsbury), Rolls-Royce is broadening the base of its activities. By selling its controlling interest, Metal Industries is cutting its losses and reinforcing its liquid assets. Both the buyer and seller thus have reason to be happy with the deal. Rolls-Royce has offered 20s. 6d. a share for the 96 per cent holding Metal Industries has in Sentinel's preference capital of 90,000 shares and 32s. a share for its 90 per cent holding of 910,000 £1 ordinary shares. Rolls-Royce is offering to buy the minority holdings on the same terms, though minority ordinary shareholders can choose instead to accept Rolls-Royce's ordinary shares in exchange at a value of £5 on the Rolls-Royce units.

Sentinel (Shrewsbury), whose operations contributed to the heavy losses that Metal Industries has recently suffered, makes locomotives, diesel vehicles, machine tools and specialised vehicles for the Ministry of Supply. Rolls-Royce will continue these lines of production, which should fit into the pattern of its own production of small oil engines. The acquisition of Sentinel will thus broaden Rolls-Royce's activities outside the aircraft industry. But, making probably well over half of the aircraft engines in this country, Rolls-Royce's primary concern remains with aircraft. It has said that it will use any surplus capacity at Sentinel to meet the demands of its own expanding business and that might make the difference between loss and profit. Sentinel will be making components for aircraft engines which at the moment are made by Rolls-Royce's sub-contractors. The willingness of Rolls-Royce to spend over £1½ million on buying a going concern suggests that in the face of gloomy prognostications in the aircraft industry, Rolls-Royce is taking a confident view of the future.

German Bank Rate Reduced

A DECISION of the Council of the Bank deutscher Länder this week provides one point of light in the sombre setting that at present surrounds sterling. On Wednesday the West German central bank reduced its discount rate from 5½ to 5 per cent and its advances rate from 6½ to 6 per cent, thus making the first relaxation since the dear money phase opened last March—with an increase in the discount rate from 3½ to 4½ per cent, followed by the much-criticised further rise in May.

The significance for Britain of this reduction derives from the fact that an important part of the pressure to which sterling has been subjected since the spring has been attributable to the sustained strength of the D-mark—a strength founded upon Germany's large external surplus, and then exaggerated by a big speculative inflow of international funds induced by hopes of exchange revaluation. As in Britain in 1954, when sterling was buoyed up by an excessive influx of hot money, the German authorities have ruled out revaluation; but, for fear of domestic inflation, Herr Vocke, the President of the Bank deutscher Länder, had hitherto also ruled out the corrective of a lower bank rate. The influx of funds, by creating liquidity in the commercial banking system, was threatening to undermine his policy of credit restriction—but less than a month ago he was suggesting that he might meet that difficulty by raising minimum reserve requirements.

The easing of bank rate is a natural concession to these pressures, but it is being emphasised that the policy of credit restriction is not being reversed. Meanwhile, the pace of the inflow of funds has become more moderate. Germany's surplus with EPU for August amounted to $67 million, compared with $106 million for July, and the increase in total exchange reserves shrank from DM 726 million to DM 297 million.

Royal Dutch-Shell Holds the Pace

THIS year the Royal Dutch-Shell group will spend about £300 million on capital account. That sum will be found from depreciation provisions and retained profits. A fall in profit margins, even only a slight fall, will therefore operate against any chance that the Shell ordinary dividend will be bigger than the tax free payment of 15 per cent already forecast by the directors. Stockholders must therefore look not merely at the rate of expansion in sales and income in the group's interim reports but also at changes in profit margins.

INCOME AND SALES
(£ million)

	Jan.-Mar., 1955	Jan.-Mar., 1956	Apr.-June, 1955	Apr.-June, 1956
Sales, etc.	473·6	535·4	509·0	559·7
Operating costs	272·1	308·0	283·1	309·5
Sales, taxes, etc.	93·2	102·9	115·2	122·6
Depreciation	41·7	45·0	44·4	46·4
Gross income	*67·2*	*80·2*	*68·8*	*83·0*
Net income	*34·1*	*40·7*	*36·6*	*43·3*
Gross income/sales	14·2%	14·8%	13·5%	14·8%
Net income/sales	7·2%	7·6%	7·2%	7·6%

On both counts the latest interim report should cause stockholders no concern, even though it does not provide any ground for excessive optimism. In the quarter to June 30th sales did not rise so fast as they did in the first quarter of the year, but the group's net income, rising by 18.4 per cent to £43.3 million in the April-June quarter, has grown only slightly more slowly than in the January-March quarter, when it rose by 19.4 per cent to £40.7 million. Over the half year to June 30th the group's net income rose by £13.3 million to £84 million so that an increase for the whole of 1956 commensurate with the increase of £25½ million in 1955 does not seem to be impossible. Profit margins have been maintained; the ratio of gross profits to sales at 14.8 per cent and of net income to sales at 7.6 per cent shows no change over the first two quarters of this year. Thus the fear that a rise in costs would erode still further the benefits gained from the

increase in oil prices last autumn has been lessened. That does not mean that the group can let profit margins fall much below their present levels, but it does suggest that progress so far has been good.

Sauce for the Goose

ORDINARY stockholders in Triplex Safety Glass whose rate of dividend was recently cut from 25 to 20 per cent, must have rubbed their eyes as they read this resolution to be proposed by a stockholder at the general meeting:

> That the directors be paid a sum of £10,000 as additional remuneration for their services in respect of the year ended June 30, 1957, in addition to all sums to which they are entitled under the articles of association or as employees of the company, such sum to be distributed among them as they shall agree or in default of agreement equally.

To explain the 20 per cent dividend, payable on a capital of £1,012,933 as increased by the conversion of preference shares and the acquisition of the balance of the share capital of Triplex (Northern), the directors give three reasons: the profits of the parent company, thanks to the recession in the motor industry, have fallen, the loss being made good by increased profits from engineering subsidiaries and by the absorption of Triplex (Northern); second, the group has heavy capital commitments and must preserve its liquid assets to meet that cost; finally and more strangely the directors say:

> The country's struggle against economic inflation still needs and will continue to need financial restraint in every possible way. In recommending a reduction of dividend despite higher profits the board considers that it is assisting the country in this struggle.

How embarrassing to the Triplex directors the inflationary shareholder must be. But there is an escape for them. They might have appealed for proxies against the resolution; they can still refuse the extra payment if it is voted.

Company Notes

GREAT UNIVERSAL STORES. Nothing, it seems, can dim Mr Isaac Wolfson's confidence. Great Universal Stores has had to make a big switch from hire purchase to cash or short term credit sales—through the loophole presumably that the Board of Trade deliberately left when it excluded instalment sales of less than nine months' duration from the hire purchase controls; yet in the year to March 31st new records in sales and profits were achieved. The rate of growth in the group's profits, as was shown in these columns on August 4th, is slowing down while operating costs are going up; yet Mr Wolfson goes on adding new businesses to the empire, though not perhaps quite so fast as he once did.

How, when other businesses were groaning in the chains of hire purchase restrictions, has GUS managed to do so well? The answer is the skill of the "top brass" of the business. And some facts revealed by Mr Wolfson show how the directors and managers redeployed their forces to meet the new and difficult circumstances. The first is that the group seems to be more diversified than ever; domestic sales in the year to March 31st fell in the following pattern: 44.4 per cent in clothing and footwear, 15.3 per cent in household linens, 8.4 per cent in fancy goods, 9.1 in hardware and 22.8 per cent in furniture, radio and television. The second is that the percentage of sales made on hire purchase terms fell from about 20 per cent to 14.1 per cent. That decline the group could not probably avoid but its sales and profits record suggest that the management was able to adjust itself quickly to a new type of market. The greater proportion of the group's business is now transacted upon cash or short credit terms and in the climate of the present controls that proportion must grow.

The impact of these changes is seen in the balance sheet of the group. The fall in hire purchase business has reduced the amount of accounts outstanding and this has resulted in the release of £2,861,506, previously provided in respect of unrealised profit (subject to the cost of collection), for inclusion in the year's profits. Hire purchase debts have fallen by £9,419,854 to £41,929,906; the unrealised profit (subject to collection charges) on these debts is £14,286,777, compared with £17,148,283 the year before. But debts on short credit sales have risen by £4,974,199 to £18,900,187 while the provision for collection charges on these debts has gone up by £306,539 to £2,423,904. Stocks, too, have risen, from £22,561,084 to £25,338,329. Taking stocks and the debts of the group's customers together, GUS has about £59 million tied up in its wares. That is one reminder of the dangers if trade turned sour.

	Years to Mar. 31, 1955	1956

5s. "A" ordinary share at 37s. 7½d. xd. yields £8 5s. per cent.

But it does not seem that it will. The furniture division, having experienced a decline in sales, is now securing bigger sales than it enjoyed in the corresponding period last year. And, speaking about the group as a whole, Mr Wolfson says that "for the period to date sales and consequent trading profits are in excess of the same period last year." That may owe something to the inclusion of the figures of recently acquired subsidiaries. It, perhaps, owes more to the fact that 86 per cent of the group's retail trade at home is upon cash or short credit terms, suggesting that GUS can adapt itself to controls without losing its customers. And when the time comes Mr Wolfson and his managers are clearly prepared to switch their efforts back to longer dated hire purchase.

★

BEECHAM GROUP. It is clear from the full accounts of the Beecham Group that the "administrative" difficulties in the proprietary foods division of the business were serious. Sales of these foods at home went up from £5.9 million to £8.8 million and about another £1 million came from sales in overseas markets. These were the most significant items in the growth of total sales by all divisions in the group from £22.8 million to £27.2 million. Of this increase of £4.4 million, £3.2 million of the extra sales were achieved in the home market. Yet, Lord Dovercourt, the chairman says that the fall in profits by £195,019 to £3,665,808 was more than accounted for by the reduction in the profits of the proprietary food businesses. The difficulties experienced by this side of the business, he says, have now been overcome.

Lord Dovercourt does not go into any more detail than this, except to say that debtors in the food businesses were about £1 million above their "normal" levels and that this accounted for the appearance of a bank overdraft of £952,630 in the balance sheet at the end of the financial year. The bulk of these debts has now been remitted and the group is no longer in debt to its bankers. Lord Dovercourt then adds that the proprietary food businesses will earn "substantially increased profits in the current financial year." A less spectacular expansion in the sales of proprietary medicines (which rose from £4.1 million to £4.2 million in overseas markets and remained practically unchanged at just over £4.1 million at home) and of toilet preparations (which at home went up from £4.5 million to £4.8 million and which were maintained at £4.2 million abroad) has been recorded. But there is a reasonable prospect that profits for the group as a whole should show a recovery in the current year and there should be no difficulty in maintaining the 30 per cent ordinary dividend.

A. C. COSSOR. This company has had one of the most chequered records of all the radio and television manufacturers since the end of the war. Between 1948 and 1951 it paid no ordinary dividend and its preference dividend was in arrears. It came back to the dividend list in 1952 with a payment of 10 per cent; last year the dividend was raised to 15 per cent. For the year to March 31, 1956, however, no dividend is being paid on the 5s. ordinary shares.

The directors could do nothing else but to pass the dividend, for the accounts show a loss of £87,445, compared with a net profit of £254,740 (after charging £239,152 for tax) in the previous year. The actual loss on trading must have been still higher, for the figure is struck after crediting a net tax recovery of £32,426. The consolidated balance carried forward has been reduced from £278,408 to £148,314. These figures must come as an unpleasant surprise to shareholders; they show just how vulnerable the company is.

It is to the directors' credit that in the preliminary statement they do explain why the loss occurred and what they are doing to set the company on its feet again. They say that the company's operations were "severely affected both by very heavy cancellations of Government orders and by the setback to the radio and television business caused by the imposition of more onerous hire purchase terms, increased purchase tax, restriction of hiring contracts, credit restraint and increased interest rates." The directors add that "the loss for the year includes provision necessary for the writing down of stocks of television and radio sets and components left on hand at the end of the period. Measures taken with the object of minimising losses and restoring trading to a profitable basis have included the running down of the company's workpeople and staffs by 1,200 and the enforcement of economies in expenses of all kinds." The 5s. shares now stand at 5s. 4½d., having fallen 1s. 3d. since the preliminary figures were published. A report such as this reminds investors of the present troubles of the television and radio industry. But not all the companies are faring equally badly. The chairman of Pye, for instance, speaks of a greater concentration of effort on export markets while the chairman of Thorn Electrical Industries speaks of expansion of the Ferguson radio and television division, though the parent company has had to postpone its plans to build cathode ray tubes in association with the American company, Sylvania Electric Products.

LONDON STOCK EXCHANGE

Next Account begins: September 19th

Next Contango Day: September 19th

Next Settlement Day: September 11th

DESPITE several disturbing influences in markets, prices during the past week have declined only modestly. The *Financial Times* index for Government Securities has moved down from 85.51 to 84.35 and the Industrial Ordinary index starting the week at 186.4 dipped to 181.2 and rallied to 183.1 on Wednesday.

Early in the week the Chancellor's warning about the economic situation lowered gilt-edged prices by about ½ per cent and the losses have since increased to about a point. Three per cent Savings Bonds 1955-65, which were 86½, have fallen to 85⅝, 3 per cent Gas Stock 1990-95 lost ⅛ and 2½ per cent Savings Bonds 1964-7 declined from 79½ to 78½. A steadier tendency developed on Tuesday which the fall in gold reserves failed to upset. The tendency in the industrial market has been similar. Early declines were followed by a quiet but steadier close to the account. And on Wednesday, when the new account opened, the tone was more cheerful though business remained restricted and markets declined again on Thursday. The Farnborough air show drew interest towards aircraft shares; Hawker Siddeley rose 1s. 7½d. to 48s. 4½d. Rolls-Royce rose 5s. 3d. on Wednesday and at 111s. 6d. showed a net rise on the week. Shell advanced 4s. 4½d. to 152s. 6d. and Royal Dutch gaining 25s. at £79½.

The projected plan by British Petroleum to build a tanker terminal at Popton Point on Milford Haven influenced the shares of Milford Docks which rose 2s. on Wednesday to 66s. Great Universal Stores were bought on the publication of the full report, the "A" shares being 2s. 4½d. higher at 37s. 7½d. ex-dividend. Hudson's Bay were supported from the US and showed a 4s. 6d. rise at 219s. 6d.

Kaffirs were firmer on Tuesday but on Wednesday most of the gains were lost. Tin shares have been a firm market, Pengkalen rising from 13s. 7½d. to 15s. 6d.

THE MONEY MARKET

By far the biggest single influence throughout this past week has been the payment of *£60 million* to shareholders of the Trinidad Oil Company. It was evident that the disbursement might cause a temporary glut of credit. Hence at last week's Treasury bill tender the discount houses substantially reversed the previous week's reduction of their tender price—offering 3d. more, at £98 14s. 11d. per cent—and concentrated the greater part of their applications upon bills dated Wednesday and later days. Total applications declined from *£405* to *£385* million, and the market's allotment rose from 50 to 80 per cent.

In consequence of the excess of bill maturities early in the week, the easing of credit supplies became more pronounced on Monday and Tuesday. On the first of these days, indeed, the authorities found it necessary to mop up supplies by "reverse" sales of bills. New money in the market ranged from 4¼ to 3¼ per cent, and there was a fair turnover in November and "hot" bills at 4⅛ per cent. In the event, the credit position on Wednesday was fairly evenly balanced but, as expected, supplies were very unevenly distributed. The bank recipients of the Trinidad funds lent actively early in the day at 3¼ and 4 per *cent, but other banks were short.* Two or three discount houses found it necessary to take new seven-day loans at Bank rate.

AFTER ALL—INDIVIDUAL PENSIONS NEED INDIVIDUAL ADVICE

What is best for one man may not be best for another. When I rang the Prudential's local office for their booklet on pensions for the self-employed and others like ourselves, I understood that much depended on one's tax position. Since then I've talked it over with one of their representatives and I'm very glad I did.

I suggest you do as I've done—

ASK THE MAN FROM THE PRUDENTIAL

COMPANY MEETINGS

WM. CORY & SON LIMITED

THE HONOURABLE F. A. LEATHERS'S REVIEW

The Honourable F. A. Leathers, the Chairman of the Company, presided at the Sixtieth Annual General Meeting of Wm. Cory & Son, Limited, held on August 30th at Cory Buildings, Fenchurch Street, London, E.C.3.

The following is an extract from his statement circulated with the report and accounts:

At your Company's discharging wharves on the Thames and Medway there has been an increase in tonnage of coal and other products. Progress is being made on the construction of the new jetty at Erith.

I have to report in the Lighterage Department an increase in tonnage and profits. We have taken delivery of a specialised craft for salvage and mooring work on the River Thames. A contract has been placed for a self-propelled tank barge.

The Seaborne and Railborne Coal Departments have had a good year compared with the previous year. Coal has been in more plentiful supply. Every assistance is given to industrial concerns who wish to turn over to oil fuel.

The Coal Export Department has had a better year.

All the ships have been fully employed. Your Company suffered a great misfortune in the tragic loss of the *Corchester* with eight lives. The *Cordale* has been sold and we have taken delivery of the *Corstream*. The *Corstar*, *Corbank* and *Corsea* have been launched and will be in commission shortly, leaving the *Corbeach* to be launched later in the year. There is every indication that we shall not order any further colliers. Contracts have been placed for three 18,000 tons deadweight tankers due to be delivered at the end of 1958, during the latter half of 1959 and in 1960 respectively.

A contract has been placed for two ore-carrying vessels of 15,000 tons deadweight, in partnership with BISC (Ore), Limited, and these ships should be in service at the end of 1959 and 1960 respectively.

The Oil Departments have shown up to advantage. A record tonnage was achieved during the year.

John Kelly Limited had increased business during 1955, although the final profit for the year was lower.

As a result of the acquisition of another road transport concern, your Company now operates, in addition to its road tankers, about 150 vehicles. Orders have been placed for large road tank wagons for general purpose work.

The remaining half-interest has been purchased in the holding company operating through subsidiaries, the recovery of ballast by sea dredging. A ready-mixed concrete plant is now being built.

In South Africa, Mann, George & Company Limited, has not had a successful year, owing chiefly to the embargo on coal exports imposed by the South African Government. Our ship agency, forwarding and clearing sections have been able to expand. A business in Nyasaland has been acquired.

The report and accounts were adopted.

MUREX LIMITED

OVERALL VOLUME OF SALES INCREASED

The thirty-seventh annual general meeting of Murex Limited will be held on September 27th in London.

The following is an extract from the circulated statement of the Chairman, Sir Arthur Smout, LLD:

The financial results of the year under review have again shown a satisfactory advance over those of the previous year. The story is one of increased activities combined with improved technical efficiencies. Thus we have been able to absorb the greater part of the additional costs which arose during the year. These increases in turn were reflected in the higher prices British industry has had to pay for consumable stores, freight, fuel, electricity and other services essential to the conduct of the nation's business. It was not possible to absorb altogether the higher prices that had to be paid for some of our raw materials, and increases in the selling prices of some of our products were accordingly unavoidable; on the other hand, where the price of raw materials fell the reduction was passed on to our customers without delay. In spite of keen competition throughout the year in many fields of our activity, the overall volume of sales increased.

Scientific advances of the past ten years in such fields as atomic energy, gas turbines, jet aircraft and electronics are slowly but surely altering the pattern of Murex products. I have referred in my earlier statements to the part our production people are playing in these matters and to the encouraging developments which are taking place. I have also clearly indicated the Board's intentions to follow up this work speedily by spending money freely but at the same time with care and discretion on worthwhile projects, where the expected return is commensurate with the risks taken. In pursuance of this policy, capital expenditure on new fixed assets during the year at £300,000 was some £44,000 higher than the previous year. Firm commitments entered into at April 30, 1956, amounted to £192,000, and in addition the Board authorised at that date further expenditure of £330,000 for which orders had yet to be placed. Further immediate expenditure envisaged, apart from increased production capacity in established products and ventures into new fields, includes additional office accommodation and the provision of further laboratories to handle our growing business.

The Consolidated Balance Sheet is extremely strong and in spite of a progressive capital expenditure policy, the liquid resources are greater than ever. It is reassuring to know that in these days of financial stringency there are sufficient liquid funds available for all our foreseeable needs.

The opening months of the current financial year show no appreciable change in the level of our activities, nevertheless, with rising costs and keener competition, both home and overseas, with the soundness of the country's present financial policy as yet unproven and with a world situation growing more complex daily, it would be unwise to do anything other than exercise extreme caution in making any pronouncement as to future prospects.

Personally, I have great faith in the future of our Company; it occupies a leading position in the metallurgical world and is the most important producer of the less common metals in this country, if not in Europe. It is the largest manufacturer of welding electrodes and electric welding equipment in the UK and covers the widest range.

RUSTON & HORNSBY, LIMITED

SOUND ORDER BOOK

The sixty-seventh annual general meeting of Ruston & Hornsby, Limited, was held on September 5th in London, Mr W. J. Ruston, chairman, presiding.

The following are extracts from his circulated comments on the report and accounts for the year to March 31, 1956:

After taxation, the Earnings of your Company and its Subsidiaries at £779,024 compare with £1,060,753 in the previous year. Your Directors recommend a dividend at the rate of 9 per cent on the Ordinary Stock. The total distribution to Shareholders is £331,776, an increase of £23,870 on the previous year. The distribution must be regarded as modest, representing as it does less than half (43 per cent in fact) of the Net Profits of the Group.

Taxation is having a crippling effect on the finances of a Company such as ours, and the greatest encouragement the Government could give to industry, especially an exporting industry such as that of your Company, would be to effect serious economies in the enormous and ever-mounting scale of Government expenditure. I feel I must join the ranks of others who have raised their voices in protest against Profits Tax and the two increases recently made in the rate at which this tax is levied on distributed profits. I would emphasise that this tax is charged on all profits, distributed or otherwise.

It is a matter of regret that the expansion of the past few years has not brought greater, instead of reduced, earnings. I emphasise expansion because over the past six years profits ploughed back have exceeded £4 million, but earnings have not moved in step, so that it may be said that the bulk of this investment has yielded only a meagre return—the result of the constantly rising level of costs which forces us to work to ever-narrowing margins in markets which are becoming increasingly competitive.

OUTPUT

Although there has been some fall in output during the year, following on the drop in the order book to which I referred last year, and the diminishing Defence Programme, this fall would have been greater were it not for the fact that we have kept down our selling prices.

Exports, direct and indirect, continue to represent something over 70 per cent of our output in our main line of production. The currency problems and shortage of sterling continued to affect our business in many of our more important export markets, though other markets I am glad to say have expanded, mainly due to a general world expansion of the oil production industry.

As regards the future, our order book is sound, representing on the average about ten months' production, but price competition, particularly from German and American competitors, is increasing in our most important markets and the growth of secondary industries continues in many countries on an increasingly competitive scale. If any further demands from Labour have to be conceded, or if the price of essential services and materials continues to rise on the same scale as that experienced in recent months, and if there is no alleviation in the present penal rate of taxation and high interest charges, it may be that our profits will fall again during the current year.

The report and accounts were adopted.

L M ERICSSON TELEPHONE COMPANY

Stockholm—Sweden

ORDERS INCREASED BY 50 PER CENT

NEW PLANT FACILITIES AT HOME AND ABROAD

GOOD RESULTS IN SPITE OF INCREASED MANUFACTURING COSTS

The English edition of the Ericsson Group's annual report for 1955 has now been published, and copies are available upon request to the Swedish Ericsson Company, Limited, 329 High Holborn, London, W.C.1. In the following is given a brief outline of the Directors' Report:

A GOOD YEAR DESPITE INFLATION

World political developments during the past year did not discourage, with a few exceptions, telephone administrations from long-term investment programmes, including automation of their telephone systems. In the United States, Western Europe, and in other parts of the world as well, economic conditions showed a continuing upward trend and the resulting activity in turn affected the economy of the raw material producing countries. In most of the countries where the Company is active there were noticeable inflationary tendencies, and various economic and political measures were taken to combat these trends, such as import and credit restrictions, combined with increased bank rates.

Sweden was subjected to heavy inflationary pressure and the general price level rose by 5 to 6 per cent, principally owing to substantial wage increases becoming effective at the beginning of 1955. Increased labour costs and rising world prices for metals and other industrial raw materials resulted in an increase in the Parent Company's production costs, in addition to which it has had to bear additional expenses arising from various anti-inflationary measures introduced during the past year. The Swedish bank rate was raised by 1 per cent in April, an investment tax of 12 per cent was levied and the corporation tax was increased from 40 per cent to 45 per cent on 1955 earnings and to 50 per cent for ensuing years. These measures have naturally placed the Parent Company in an unfavourable competitive position against foreign manufacturers not burdened with similar wage and tax loads.

ORDERS

Business nevertheless was maintained at a satisfactory level. Orders rose approximately by 50 per cent over the previous year, and, since deliveries could not be increased by more than 10 per cent, the order book reached a new record level.

Orders received from the Swedish Telecommunications Board increased over the previous year and comprised largely equipment for further extension of the automated long distance traffic. Equipment was also ordered for new automatic exchanges in three Swedish towns and their environs.

Foreign orders indicated increased interest abroad for automating the long distance traffic. Substantial orders for crossbar long distance equipment were placed by Denmark, Finland and Holland, including a trunk office in Copenhagen for semi-automatic service of international telephone traffic.

In 1955, a long-term contract was negotiated with the Turkish Telephone Administration for the successive deliveries of automatic telephone exchanges of the Ericsson 500-point selector system for a total of 125,000 lines. Large orders of this type of central office equipment were also placed in Colombia (25,000 lines) and in Venezuela (22,900 lines).

The Ericsson crossbar system continues its market expansion. Orders were received from Odense, Denmark, for a crossbar office with 23,000 lines and from Rotterdam for 16,000 lines. The first crossbar installation in Eire was also booked with the Company, for an exchange in Limerick.

The Company's Network Department has undertaken large sub-contracting work in Portugal, Colombia, and Brazil for the planning and construction of long-distance cable lines.

The demand for subscriber sets continued to grow and the factory in Karlskrona increased its production to the neighbourhood of 400,000 sets a year.

The rapid expansion of the market for telephone equipment in many countries, particularly in Latin America, has necessitated extensive long-term credits during the year.

SALES

The Parent Company's sales for 1955 showed a 10 per cent increase and reached 238 million Crowns, as against 216 million Crowns the previous year. Export sales rose by about 11 per cent from 98 million Crowns to 110 million Crowns. Total sales of the Parent Company and its Swedish subsidiaries reached 408 million Crowns, as against 368 million Crowns in 1954. The sales result of the entire Ericsson Group—but not including the revenues of the operating companies—amounted to 741 million Crowns, an increase of 68 million Crowns from 1954.

INCREASED SHARE CAPITAL

During 1955, the Parent Company's share capital was increased from 122.3 to 163.1 million Crowns through the issue of new shares at 110 per cent of par value, which provided new capital to the amount of 44.9 million Crowns after deducting the necessary expenses. The new capital was invested in property and plant facilities, in addition to financing increased inventories resulting from the expanded operations.

RESEARCH AND DEVELOPMENT

During 1955 research and technical development were intensified, and 17 million Crowns were invested for that purpose by the Parent Company. Of particular interest is the agreement signed during the year with the Swedish Board of Telecommunications for pooling research and development in the field of electronic switching.

The new research laboratory established in Darmstadt is now operating according to plan.

The Transmission Department concluded the development work of a new single-channel carrier system for open wire lines with automatic pilot regulation. In addition, several new multi-channel systems for radio links were developed, including a 47-channel radio link for pulse time modulation in the 6 cm band, based on a grid-operated reflex clystron developed by the subsidiary company AB Svenska Elektronrör.

A simplified crossbar switchboard with pushbutton operation was designed and delivered.

An automatic fire alarm, designed on new principles, was brought to the prototype stage. Progress was also made in developing plastic insulated and sheathed cables, as a substitute for conventional types of paper insulated lead covered cables, in order to save lead and simplify installation work.

A committee was formed by the Parent Company and the Telecommunications Board for the purpose of developing new types of subscriber sets.

PERSONNEL

The average number of employees of the Parent Company during 1955 was 9,166 (up from 7,859 in 1954) of which 3,034 were office and 6,132 factory employees.

Salaries and wages during the year were 53,992,058 (43,758,782) Crowns paid to factory employees and 38,110,620 (30,893,086) Crowns to office employees. Directors' fees and management salaries amounted to 1,925,222 (1,664,816) Crowns. (Figures in brackets refer to 1954.)

Total number of employees in the Parent Company and its Swedish subsidiaries increased during the year from 13,246 to 14,319. Including foreign subsidiary and associated companies the Group employed 38,800 people at the end of the year, an increase of about 3,000.

MAIN SUBSIDIARIES AND ASSOCIATED COMPANIES

EUROPE

Sieverts Kabelverk, Sundbyberg, Sweden, reported net earnings of 2.1 million Crowns on sales amounting to 119.7 million Crowns, an increase of about 25 per cent over 1954. The share capital was increased from 20 to 30 million Crowns and 75,000 sq. ft. of new factory space was acquired. Construction was started on a new factory for the manufacture of high tension cable.

AB Ermi, Stockholm, formed in 1955, obtained a satisfactory sales volume but reported a small loss resulting from the activities of the former company. The manufacture of electrical instruments was reorganised and some of the plant facilities were transferred to the Parent Company.

Svenska Radio AB, Stockholm, increased its sales of radio equipment from 22.6 to 23.4 million Crowns. Sales of radio receivers declined somewhat and television sets continued in small demand owing to the restricted transmission programme. A new laboratory and office building will be completed for occupation in 1956.

AB Rifa, Stockholm, manufacturer of condensers and rectifiers, reported sales about the same volume as in 1954. Operating results improved somewhat over previous years.

AB Alpha, Sundbyberg, Sweden, supplying the Swedish Group companies with miscellaneous bakelite components, operated at nearly full capacity during 1955. Considerable interest was shown in the company's new record press.

L M Ericsson A/S, Copenhagen, had a satisfactory year and its capital stock was increased from 1.5 to 3.0 million D. Crowns through conversion of sums due to the Parent Company.

Dansk Signal Industri A/S, Copenhagen, maintained its sales and net earnings at about the same level as in 1954.

O/Y L M Ericsson A/B, Helsinki, increased its sales by about 25 per cent, and showed a satisfactory net for the year.

A/S Elektrisk Bureau, Oslo, had net earnings of 1.1 million N. Crowns and declared an 8 per cent dividend.

Ericsson Telefoon-Maatschappij, NV, Rijen, Holland, showed net earnings of 561,000 Guilders, of which 180,000 Guilders were paid in dividends. Another addition to the Dutch factory is planned to permit expansion of the manufacturing programme.

Société des Téléphones Ericsson, Colombes, France, operated at nearly full capacity throughout the year. A crossbar exchange modified to French requirements, for 2,000 lines was manufactured and installed in Beauvais. Property was acquired in Paris for a planned electronics research laboratory. The share capital was increased from 810 million to 1,000 million Francs.

SETEMER, Soc. per Az., in Milan, reported net earnings of 843 million Lire for the financial year, 1954-55 and declared a 6 per cent dividend. The share capital was increased in October, 1955 to 7,344 million Lire by a stock dividend of 2,448 million Lire. All companies of the SETEMER group showed increased sales and satisfactory earnings.

SET, Soc. per Az., telephone operating company in Naples, increased its number of subscribers by 16 per cent, from 201,000 in 1954 to 233,000. Long distance traffic increased by 27 per cent. A 6.5 per cent dividend was declared.

Compañia Española Ericsson, S.A., Madrid, had a satisfactory year, and the share capital was increased from 4.75 to 10 million Pesetas.

ASIA

Sales in Asia are conducted by branch offices in Calcutta, India, and Bandung, Indonesia, as well as by local agents. The Calcutta office had considerable difficulties obtaining a satisfactory sales volume, whereas Bandung, operating in an old established market, booked substantial orders for the reconstruction of the Indonesian telephone system.

WESTERN HEMISPHERE

North Electric Company, Galion, Ohio, increased its US sales from $14.3 to $16.6 million and reported net earnings of $406,000, as against $325,000 for 1954. Plant additions of altogether 58,000 square feet were taken into use, and the manufacture of crossbar switching equipment is proceeding according to plan. Orders for crossbar facilities now amount to 31,900 lines, planned to serve altogether 77,000 plural party line subscribers.

Teleric, Inc., the Panama holding company, reported net earnings of $151,000 which were reinvested in the business. No dividend was declared.

Teléfonos de México, S.A., Mexico City, encountered financing difficulties and had to defer its new construction programme, resulting in a net increase for the year of only 8,200 subscriber lines, or about 2.8 per cent, as against 18,000 new lines in 1954. Net earnings for 1955 were 35.9 million Pesos. A 10 per cent dividend was declared.

Ericsson do Brasil Comércio e Indústria S.A., Rio de Janeiro, increased its sales volume. The new telephone factory in Saõ José dos Campos was put into production.

The Argentine subsidiaries operated at about the same level as in previous years. *Industrias Eléctricas de Quilmes, S.A.*, Buenos Aires, engaged in the manufacture of lamps and cables, had net earnings of 2,224,000 Pesos, as against 1,267,000 Pesos in 1954, and its share capital was increased from 17 to 20 million Pesos, principally by means of a stock dividend. The sales company *Compañia Sudamericana de Teléfonos, S.A.*, increased its share capital from 7 to 12 million Pesos out of 1955 earnings to offset the effects of the inflation in Argentina. The telephone operating companies, *Compañia Argentina de Teléfonos, S.A.* and *Compañia Entrerriana de Teléfonos, S.A.* again reported satisfactory earnings. The new Argentine government has not shown any inclination to nationalise the companies or acquire their installations, but, on the other hand, imports of Swedish-made equipment remained insignificant owing to import restrictions.

Sociedad Telefónica del Perú, S.A. the telephone operating company in Peru, reported about the same revenue as for the previous year and declared the same dividend as before, or 450,000 Soles.

Compañia Anónima Ericsson, Caracas, obtained a number of substantial contracts with the Venezuelan government for new installations. The share capital was increased from 100,000 to 500,000 Bolivares, out of earnings. The sales company, *Teléfonos Ericsson, S.A.*, which caters to the private market operated at a loss during 1955.

Compañia Ericsson de Chile, S.A., Santiago de Chile, increased its share capital from 15 million to 25 million Chilean Pesos out of retained earnings to offset the effects of inflation.

Compañia Comercial Ericsson, S.A., Mexico City, had to sustain substantial losses owing to the devaluation of the Mexican Peso in April, 1954. Its position in the private market remains strong, despite increased competition.

Compañia Ericsson Ltda., Bogotá, had a satisfactory year, with increased sales, although net earnings did not come up to those of the previous year.

Compañia Ericsson, S.A., Montivideo, showed a profit on about the same volume of business as in 1954.

Compañia Ericsson, S.A., Lima, has shown a net loss for the year.

Ericsson Telephone Sales of Canada, Ltd., Montreal, is not yet firmly established on the Canadian market.

CONSOLIDATED BALANCE SHEET

The Consolidated Balance Sheet shows that retained earnings at December 31, 1955, amounted to 88,087,000 Crowns, of which 20,070,000 Crowns were net income for 1955. The Boards of Directors of the respective companies have proposed that out of this amount 3,371,000 Crowns be appropriated to reserves not available for distribution.

The availability of retained earnings shown in the Consolidated Balance Sheet may be affected by exchange restrictions and other uncertain factors, such as taxation.

DISPOSAL OF RETAINED EARNINGS OF THE PARENT COMPANY

In addition to the general reserve, the following amount was available for distribution at the Annual Stockholders' Meeting:

	Crowns
Net income for 1955	14,141,497.05
Accumulated earnings brought forward from previous year	11,041,394.24
	25,182,891.29

The Board of Directors and the General manager proposed that the amount available be distributed as follows:

	Crowns
To the legal reserve	2,421,940.00
To the shareholders, against Coupon No. 29, a cash dividend of 2.50 Crowns per share, equivalent to 4.7 per cent of the Company's net worth	11,651,605.00
Balance carried forward	11,109,346.29
	25,182,891.29

The report and accounts were adopted by the General Meeting. Chairman of the Board is Mr Marcus Wallenberg and Managing Director Mr Sven T. Aberg.

TATA IRON & STEEL COMPANY, LIMITED

VITAL ROLE OF FREE ENTERPRISE IN NATION'S FUTURE DEVELOPMENT

The Annual General Meeting of Tata Iron & Steel Company, Limited, was held on August 30, 1956, in Bombay.

Mr J. R. D. Tata (Chairman of the Company) presided. The Chairman said: "We all realise that since Independence our Government have performed a tremendous task. We also realise," he continued, "that their task in the coming years will remain a formidable one; that the success of India's plans of economic development is essential to the future prosperity and happiness of our people. We in the industrial and business field are therefore at one with Government in their objective of a prosperous, democratic and happy nation emerging from the years of toil ahead. Where we differ is in the respective roles of the State and of the individual in the economic activity of the nation. We sincerely feel that some of Government's policies are based on economic theories on capitalism and socialism which no longer fit the facts, if ever they did. They seem to ignore the lessons of the social and economic experiments undertaken elsewhere in the world during the last few decades; for instance, the fact that, apart from the US, countries in Europe, which have relied largely on free enterprise and given it the necessary support and encouragement, have achieved not only economic prosperity but also, through realistic fiscal and administrative measures, the socialist dream of an equalitarian Welfare State."

While pointing to the dangers inherent in such developments which seemed to threaten the balance of the mixed economy, Mr Tata said that he had consistently made it clear that free enterprise in India unreservedly accepted the national objectives of increased production and equitable distribution and was anxious to co-operate with Government in the building of a practical Welfare State in which State Enterprise and Free Enterprise joined hands in the common task.

CONCENTRATION OF ECONOMIC POWER

Mr Tata, however, felt that he must reiterate the concern with which he and many others viewed the ever increasing centralisation of economic power in the hands of Government.

Referring to the uninterrupted growth of Governmental power in the economic field, Mr Tata observed that India was well on the way to a strange and unnatural combination of political democracy and economic autocracy. "The question that should agitate the minds of all of us," continued Mr Tata, "is whether our political freedoms can long survive if our economic freedoms continue to be whittled away. Once all economic power is centred in Government, will it not be found equally necessary to curtail other freedoms in the interests of the people? Although there may be no danger that the able men in power today, motivated as they are by democratic ideals, will abuse their powers, history shows that the danger lies in the very existence of unlimited power which may one day fall into less worthy hands."

NATIONALISATION OF LIFE INSURANCE

Commenting on the nationalisation of life insurance, Mr Tata observed, "Although spokesmen of Government have stated in the past that ideology played no part in the formulation of their economic policies, it is noteworthy that, during the debate in Parliament on the Life Insurance Corporation Bill, the then Finance Minister said:

> 'There was no need for Government to make out a case that private enterprise had failed in order to effect nationalisation. Nationalisation could be justified on grounds of ideology and philosophy.'

"This statement, coupled with the fact that every practical object which the Government sought to achieve could have been secured without recourse to nationalisation, must lead to the conclusion that political or ideological considerations were largely responsible for the measure and that they are likely to motivate future economic decisions."

PRIVATE SECTOR'S PERFORMANCE

Commenting on the view held in certain quarters that Indian capitalism had failed to deliver the goods, that it had shown no initiative and that it could not in an economically backward country like India produce the dynamic results obtained in the highly developed economies of the West, Mr Tata said that this view overlooked a number of facts such as that the Private Sector had fulfilled and in some cases exceeded its production quotas under the first Five-Year Plan; that private enterprise in India had not up to now had the freedom of action and the incentives it enjoyed in the countries where it had proved so strikingly successful; and that there was enough evidence available that the introduction of socialism of the kind, and by the means, contemplated in India had not proved an unqualified success in other countries. "Still, even if we accept the premise that the magnitude and urgency of the task in India render its performance beyond the capacity of free enterprise alone," said Mr Tata, "the correct solution, which until not so long ago seemed to have been accepted by Government, lies in a mixed economy in which both Free Enterprise and State Enterprise are harnessed to the country's needs."

Continuing, Mr Tata observed: "I feel the charge that free enterprise in India has shown no initiative in recent years is particularly hard to take. I for one am in fact surprised at the amount of initiative displayed considering the discouragement and disincentives to which it has been subjected. While saying this, it is only fair that I should acknowledge the help and advice which industry in the Private Sector has received in recent years from our dynamic Minister for Commerce and Industry." Without his encouragement and quickness of decision, their Two Million Ton Project might not have come into being or would still be at the stage of discussion and correspondence.

Mr Tata said that Indian industry needed no compulsion to induce it to collaborate with Government or to make its full contribution to the economic development of the country. "It is prepared," said Mr Tata, "to take the necessary risks and to make the necessary sacrifices, but it asks to be left in reasonable peace to do its allotted job."

FINANCIAL RESULTS

Commenting on the working of the Company, Mr Tata said that the financial results of the year's operations were characterised by a decrease of Rs. 34 lakhs (£255,000 or $715,789) in disposable profit, largely due to lower sales of ferro-manganese and by the large accretions exceeding Rs. 4 crores (£3 million or $8,421,054)—to the Plan Rehabilitation and Development Fund and the Development Reserve under Government's new retention price scheme.

TWO MILLION TON PROGRAMME

Mr Tata referred to the proposal reported by him to the shareholders at the last annual meeting to increase the Company's ingot steel production from the target of 1.3 million tons per annum under the current modernisation and expansion programme to a new target of 2 million tons per annum within a period of 3 years and at a cost of about Rs. 60 crores (£45 million or $126 million) on the new plant. He informed the meeting that the contract for the engineering, procurement, construction and supervision services for this further expansion programme, styled as the Two Million Ton Programme, had been placed with two Divisions of the Henry J. Kaiser Corporation of California, known for their industrial and engineering experience and their ability to get things done quickly. The first orders for the principal items, such as the three main rolling mills and electrical equipment, were placed by March, 1956.

Referring to potential sources of delay in rail and road transport difficulties, bottlenecks in steel fabrication and congestion in the Calcutta Docks, Mr Tata stated that the chances of completing the job in time were improved by the co-operation extended by the Ministry of Commerce and Industry and the Finance Ministry of the Government of India.

PROJECT COST

The cost of the new plant was estimated to amount to Rs. 62 crores (about £46.5 million or $130 million). Including, however, the related items of work to be undertaken departmentally by the Company, such as site clearance, modifications to existing shops and mills, provision of rolling stock and other items and expenditure on the collieries, mines, quarries, etc., the entire project would cost Rs. 75 crores (about £56 million or $157 million).

WORLD BANK LOAN

Mr Tata referred to the loan of $75 million or £27 million which the Company had negotiated with the International Bank for Reconstruction and Development, the agreement for which was signed on June 26, 1956.

A striking aspect of this loan, Mr Tata mentioned, was the fact that it was the largest loan granted up to now by the Bank for an industrial undertaking anywhere in the world and also the largest single loan granted for any purpose to any country in Asia.

One aspect of the negotiations with the Bank was the remarkable speed at which they were conducted and concluded. Mr Tata expressed the Company's gratitude to Mr Eugene Black, the distinguished President of the Bank and to his associates for so kindly expediting, in response to the Company's request, the detailed and complex procedures which the Bank normally follows in disposing of loan applications.

This loan of $75 million and the additional

share capital of $28 million or £10 million authorised by the shareholders towards the end of the previous year, would provide the Company about $103 million or £37 million out of the total of $157 million or £56 million required for the Two Million Ton Programme. The balance of about $54 million or £19 million, Mr Tata said, would be secured from retained earnings over a period of five years ending 1960 and from further borrowings.

AGREEMENT WITH THE UNION

Referring to the agreement with the Union, Mr Tata pointed out that it set out the rights and obligations of the Company and the Union and recorded agreement on a number of outstanding issues. "A special feature of this Agreement," observed Mr Tata, "was that it contained an important declaration of intention to bring about a closer association of employees with Management in the working of the industry."

ASSOCIATION OF EMPLOYEES

The shareholders were informed that under a Supplemental Agreement signed between the Company and the Union on August 4th, the considerable machinery already existing at Jamshedpur for joint consultation would be rationalised and, with the exclusion of matters concerned with collective bargaining or grievance procedures, would be brought within a three-tier structure of Consultative Councils. It was pointed out that while the function of these Councils would be of an advisory character and Management would remain, as before, in control of the Company's affairs, due weight would naturally be given to the views and recommendations of the councils.

Mr Tata emphasised that the Company had no intention of surrendering its managerial functions and responsibilities. "I for one do not believe in the concept prevalent in some labour circles that factories, whether owned by the State or by shareholders, should ultimately be handed over to workers who would provide both the labour and management of the enterprise. In my opinion, such a view is both unsound and impractical, and its pursuit can only lead to barren disagreements and ultimate disillusion."

"The Management of mechanised industries," observed Mr Tata, "is becoming more and more complex and requires increasingly high standards of technical and administrative experience and competence. Any worker, however humble his beginnings may have been in the industry employing him, should have the opportunity of rising in the organisation, his progress being determined by merit and his ability to discharge his allotted responsibilities. But this obviously implies that at a certain stage such a worker leaves the ranks of labour and becomes part of Management. This is a very different proposition from that of handing over the management of a factory to the workers collectively."

At the close of his speech Mr Tata said: "We have already come a long way in developing sound industrial relations at Jamshedpur for which I feel both the Management and the leadership of the Union deserve credit. We have not by any means solved all our problems; discipline, morale and productivity are not yet what they should be. No doubt, our standards of management themselves can be further improved; but I think it can be said that the present Management of the Company and of the Union have the will to co-operate for the good of the industry and the country as a whole."

The report and accounts were adopted.

FURNESS, WITHY & COMPANY

EARNINGS, LESS TAXES, OUTPACED BY REPLACEMENT COSTS

SIR ERNEST H. MURRANT ON "FLAGS OF CONVENIENCE"

The sixty-fifth annual general meeting of Furness, Withy & Company Limited will be held on September 26th at Furness House, Leadenhall Street, London, E.C.3.

The following is an extract from the circulated statement of the Chairman, Sir Ernest H. Murrant, KCMG, MBE:

The Consolidated Balance Sheet and Consolidated Profit and Loss Account show a very satisfactory situation.

In reviewing the accounts of the Parent Company, the chairman said: On the general subject of taxation, about which so much has been said and written, and which is at the root of the current controversy about ships flying "flags of convenience," and the decline in Britain's proportion of world tonnage, Stockholders will no doubt be interested to learn of the following figures.

In the past ten years we, and our Shipowning Subsidiaries, have paid in cash, or by deduction from income at source, in respect of United Kingdom taxes, £10.673,282. We have incurred a deferred liability to account for taxes on £7,644,262 by reason of Initial Allowances. We are obliged to bring into account and settle in cash, or by set off, the tax liability on Balancing Charges (which have amounted to £3,106,219) in respect of ships lost or otherwise disposed of. These figures bring out with realistic force the fact, of which I have no doubt, that our taxation burdens are far in excess of those of any other unaided Maritime Nation.

No British Shipowner would wish to pass over, without generous acknowledgement, the most helpful gesture of the Chancellor of the Exchequer, in continuing the Investment Allowance to the Shipping Industry when it was withdrawn from others. This was undoubtedly a clear admission that our case for alleviation is a strong and good one. But one must ask the question: is it enough to ensure the maintenance of an adequate and efficient Merchant Marine in the future?

In the Consolidated Balance sheet Shipping Property and Payments on account of new Tonnage figure at £25,404,874 compared with £24,151,142 at April 30, 1955. Four new ships came into commission at varying dates during the year, and three were disposed of. As at the date of the Accounts there were fourteen ships under construction or contracted for in the Group, and the estimated balance of liability therefore amounted at April 30th to £13,787,000.

It will be recalled that in my Statement a year ago I mentioned (in reference to the Group's liquid resources) that the figures were likely to read very differently in the course of the next year or two, and that forecast is gradually being borne out as our replacements eat into our resources. The point must again be emphasised as it is already inevitable that, planning ahead for 1960, still further contracts must be placed during the current year if our business is to be kept alive and competitive.

In short, what the Shipping Industry has been saying for years past is now passing from the theoretical to the practically demonstrable stage viz. that earnings, less taxes, cannot keep pace with the increased cost of replacing the older units of the fleet.

If existing conditions continue, it is probable that (a) it will be increasingly difficult to maintain the actual amount of tonnage under the British flag and (b) the relative proportion of the British share of world tonnage will continue to decline.

"FLAGS OF CONVENIENCE"

Part of the increase in world tonnage has benefited by the use of so-called "flags of convenience." The Organisation for European Economic Co-operation (OEEC) in its recent report commented on this subject in the following terms:

"Resort to flags of convenience is not directly instigated by Governments, though their actions, particularly in the field of taxation, may indirectly create conditions in which the practice presents attractions to Shipowners. Whether these attractions are real and permanent may be open to question, but there is no doubt that they can easily bring about conditions which may provoke counter-measures."

There are several British Colonies in which registration facilities exist, similar, so far as taxation is concerned, to the most popular "flags of convenience," such as Panama, Liberia, Honduras, etc., and one obvious "counter-measure" would be for British Shipowners to take advantage of the protection afforded by suitable Colonial flags in order to build up their fleets by means which are denied to them through excessive taxation in the Mother country.

It may well be that this would be following an example which in some quarters would be held to be a bad example, but I am not aware of any practical method of preventing, or restraining, a practice which is becoming a serious threat to the future welfare of the British Shipping Industry.

The total net revenue from all sources was £5,391,203, an increase of £605,982 compared with last year. Depreciation at £2,608,565 absorbed £464,293 of this increase, and taxation at £1,063,193 absorbed a further £21,887. We are left with the Parent Company's proportion of the net profit at £1,036,586, an increase of £262,625. It is your Directors' recommendation that the dividend be increased by 2 per cent (absorbing more than half the available surplus, viz. £552,000 after deduction of tax), that £400.000 be allocated to Fleet Replacement Reserve, and that the amount carried forward into the current year should be £448,035, compared with £406,574.

Increases in operating costs are demonstrable, but the actual increases in Capital costs, and the consequential effects thereof, flow through the whole structure of Shipping finance. The vital necessity is to retain, or plough back—to use a more popular phrase—sufficient of our net earnings to provide for the replacement of our wasting assets. But here again the bogey of taxation raises its head as any increase in earnings creates an increased liability for taxation as a first charge.

In all the circumstances as they at present exist, we can do no more than endeavour to establish a reasonably fair division of such surplus net earnings as remain after normal depreciation and taxes, between the amount which can be ploughed back into Reserves towards replacement costs, and the amount to be distributed upon the risk bearing Capital which belongs to our Stockholders.

APPOINTMENTS

AUSTRALIA-CANBERRA UNIVERSITY COLLEGE

Applications are invited for appointment to the following posts:—

Lecturer or Senior Lecturer in Law.

Lecturer or Senior Lecturer in Geography (with qualifications in Economic Geography).

Lecturer in German.

Salary range: Senior Lecturers, £1,824-£2,174 per annum; Lecturers, £1,224-£1,774 per annum (Australian currency). Commencing point within the range will be determined in accordance with the qualifications and experience of the applicant. Annual increments are £70.

Further particulars, conditions of appointment and the summary form, which must accompany applications, may be obtained from the Secretary, Association of Universities of the British Commonwealth, 36 Gordon Square, London, W.C.1.

Applications close in London and Australia on October 15, 1956.

UNIVERSITY COLLEGE, IBADAN NIGERIA

Applications are invited for Lectureship (a) (Grade II or (b) (Grade II) in PUBLIC ADMINISTRATION. Revised salary scales (a) £1,400 x £50 to £1,650 p.a., (b) £1,000 x £50 to £1,300 p.a. Entry point on (b) scale according to age and qualifications. Appointment for three years in first instance. Child allowance £50 p.a. per child resident in Nigeria (max. £150 p.a.), or £100 p.a. per child resident elsewhere (max. £300 p.a.). Part furnished accommodation at rent up to 7.7 per cent of salary. Passages for Lecturer, wife and up to three children under 11 years on appointment, overseas leave and termination. F.S.S.U. Outfit allowance £60.

Applications (six copies) detailing qualifications and experience and naming three referees, by September 29, 1956, to Secretary, Inter-University Council for Higher Education Overseas, 29 Woburn Square, London, W.C.1, from whom further particulars may be obtained.

MARKETING OFFICER required for Nigerian Federal Government Marketing and Exports Department for one tour of 15-24 months in first instance. Commencing salary according to experience in scale (including inducement addition), £840, rising to £1,530 a year. Gratuity at rate of £100-£150 a year. Outfit allowance £60. Free passages for officer and wife. Assistance towards children's passages and grant up to £150 annually for maintenance in U.K. Leave on full salary. Candidates, preferably under 35, should have had several years' good commercial experience in a responsible capacity, or hold a degree in Economics or Commerce and a diploma from, or membership of, a recognised Institute of Commerce. Administrative ability essential.—Write to the Crown Agents, 4, Millbank, London, S.W.1, State age, name in block letters, full qualifications and experience, and quote MIB/43051/EN.

EASTERN GAS BOARD

APPOINTMENT IN THE AREA STATISTICIAN'S OFFICE

Applications are invited for appointment to a vacancy in the office of the Area Statistician at Tottenham. Applicants should hold an Honours degree in Economics or Commerce or have had equivalent training.

The work will be concerned partly with the compilation of statistics and partly with the preparation of statistical reports for the guidance of management. Calls for attention to detail and the ability to write clearly rather than a high level of mathematical statistics.

The successful candidate may be required to pass a medical examination and, unless already subject to a pension scheme by virtue of the Gas (Pension Rights) Regulations, 1950, will be required, if eligible, to join the Board's staff pension scheme within six months from taking up the appointment.

The salary will be in accordance with grade APT 6 (£640 to £720 per annum) of the National Salary Scales for Gas Staffs, and the initial placing within this grade will be subject to the candidate's qualifications and experience. Promotion beyond this grade would be dependent upon proved ability.

Applications, stating age and qualifications, should be addressed to the Secretary, Eastern Gas Board, 2 The Abbey Gardens, Great College Street, Westminster, S.W.1, to reach him not later than October 6, 1956.

THE BRITISH COTTON INDUSTRY RESEARCH ASSOCIATION

(SHIRLEY INSTITUTE)

There is a vacancy for a graduate in the department concerned with operational research and the relations and interactions of technology and economics. Applicants should have a good honours degree in economics, preferably with statistics as a subsidiary subject. They should also have an interest in manufacturing industries, and some aptitude for mathematical methods. The person appointed will interest himself primarily in problems concerning costs, but will also participate in the other work of the department. The work is non-routine and offers variety and scope for fresh thinking. A salary in the range of £550 to £640 per annum will be paid, and the post qualifies for participation in the Federated Superannuation Scheme for Universities.—Applications should be made to Dr. D. W. Hill, Director of Research, The B.C.I.R.A., Shirley Institute, Manchester, 20.

SPECIAL OPENING FOR YOUNG GRADUATES TO ENTER ADVERTISING WITH COMPLETE TRAINING

Large international advertising agency offers intensive 12-month training in all branches of advertising to selected men (with starting salary of £600 p.a.) and women (£500 p.a.). Prospects are exceptional and selection will be rigorous. First judgement will be made on quality of letters of application, which should be typed, if possible, and should attempt to do more than list qualifications and ambitions. Writers of suitable letters will be invited to take written aptitude tests. Interview will follow if these are successful. Essential qualifications: age 21-27, Honours Degree, lively imagination, plenty of common sense, flair for good English, enterprise, initiative, ability to get on with people, good nerves, good nature and well-developed inclination for hard work.—Box 494.

THE UNIVERSITY OF LEEDS

DEPARTMENT OF ECONOMICS AND COMMERCE

Applications are invited for a temporary appointment, for one year only, as Lecturer or Assistant Lecturer to assist in teaching management subjects to undergraduates working for degrees in the Faculty of Technology and in organising seminar courses for established managers. Salary will be within the range of £650-£1,350 for a Lecturer, or £550-£650 for an Assistant Lecturer. Candidates may offer qualifications for teaching in one or more of the following fields: Accounting and statistical methods as used in management, administrative practice and policy, methods study, human relations.—Applications (three copies), stating date of birth, qualifications and experience, together with the names of three referees, should reach the Registrar, The University, Leeds, 2 (from whom further particulars may be obtained), not later than September 24, 1956.

THE UNIVERSITY OF HULL

Applications are invited for a Research Assistantship in the Department of Economics and Commerce to undertake research into problems of the distribution of the British industrial working population between different industries over the next 25 years. Salary scale £500 x £50 to £750 per annum with F.S.S.U. and children's allowances.—Further particulars from the undermentioned, to whom applications (five copies) should be sent not later than September 29, 1956.

W. D. CRAIG,
Registrar.

THE UNIVERSITY OF HULL

Applications are invited for a Lectureship in Statistics. The person appointed will be required to teach Economic Statistics in the Department of Economics and Commerce. Salary scale £650 x £50 to £1,350 per annum with F.S.S.U. and children's allowances.—Further particulars from the undermentioned, to whom applications (six copies) should be sent not later than September 29, 1956.

W. D. CRAIG,
Registrar.

UNIVERSITY COLLEGE OF NORTH STAFFORDSHIRE

Applications are invited for the post of Assistant Lecturer or Lecturer to be held jointly in the Departments of Geography and Education. Salary: Lecturer, £650 x £50 to £1,000 (Efficiency Bar) x £50 to £1,350. Assistant Lecturer, £600 x £25 to £650. F.S.S.U. provident scheme available and Children's Allowances are payable.—Further information and application forms may be obtained from The Registrar, The College, Keele, Staffs, to whom completed applications must be returned not later than September 18, 1956.

WOOLWICH POLYTECHNIC

LONDON, S.E.18

Principal: I. S. Tait, Ph.D., B.Sc., A.R.T.C., M.I.E.E., M.I.Mech.E.

Applications invited for:—

(iii) Lecturer in Industrial Relations, Applied Economics and Management Studies from honours graduates who should have specialised in Applied Economics in their final degree. Industrial experience in Labour Management or Personnel Department of a manufacturing concern, teaching or lecturing experience desirable.

(iv) Assistant Grade B to teach Costing, Accounting, Office Organisation and Methods and Allied Subjects. Candidates should be qualified Professional or Cost Accountants with good industrial and teaching experience.

The proposed salary scales are: Lecturer, £1,200 to £1,450; Assistant Grade B, £650 x £25 to £1,200, starting salary according to qualifications and experience; plus London Allowance of £30 to £48.

Particulars and application form from Clerk to Governors, to be returned by September 21, 1956.

B.B.C. REQUIRES PROGRAMME ASSISTANT, Greek Section (British subject). Duties include writing, editing and initiating scripts, deputising for Programme Organiser, assisting in administration of section, allocating duties to programme assistants and planning and supervising output. Essential qualifications: Sound, up-to-date knowledge of Anglo-Greek relations, interest in world affairs, and good knowledge of Greek language and people. Salary £975 (possibly higher if qualifications exceptional), rising by five annual increments to £1,200 maximum. Requests for application forms (enclosing addressed envelope and quoting Reference "2030 Ec") should reach Appointments Officer, B.B.C., Broadcasting House, London, W.1, within five days.

MARKETING RESEARCH.—An unusual opportunity exists for a man with some practical Research experience to join one of the top ten Advertising Agencies to handle the Marketing and Research activities of an important client. A four-figure salary is envisaged for the right man. The successful applicant need not have been in sole charge of a Research Department, but he should know from his own experience how competent Research is carried, and the use that is made of it. Familiarity with the Nielsen Index would be an advantage. This is a permanent and progressive appointment.—Box 493.

HOOVER (WASHING MACHINES) LIMITED

Merthyr Tydfil, South Wales

Invites applications for the post of

ASSISTANT TO THE COST ACCOUNTANT.

Applicants should not be less than 30 years of age, and should either hold A.C.W.A., or have passed finals. Previous experience of industrial cost accounting systems, preferably in a supervisory capacity, will be an advantage.—Applications should be made by letter, to the Employment Officer, giving full details of qualifications, experience and age.

MECHANICAL ENGINEER.—A well-known steel and engineering company requires, for its large works in India, an experienced engineer, aged between 30 and 40. Candidates must have served a full engineering apprenticeship or be Graduate Engineers. Although not essential, some railway experience would be an advantage. The post carries great responsibility, and salary and conditions offered are in keeping with the high standard required.—Applications, which will be treated in strict confidence, should give full details of age, qualifications and career to date, and should be addressed to Box 528, c/o Walter Judd, Ltd., 47 Gresham Street, London, E.C.2.

THE NATIONAL INSTITUTE OF ECONOMIC AND SOCIAL RESEARCH

SECOND ADVERTISEMENT

The Executive Committee invites applications for the post of Secretary, lately made vacant by the death of Mrs. F. S. Stone. The appointment will be for a year, in the first instance, with prospects of continuance. The salary will be in the range of £1,100 to £1,450, with F.S.S.U. provision and family allowances. Applications, with the names of two referees, should be sent to the Acting Secretary (from whom further particulars may be obtained), at 2 Dean Trench Street, London, S.W.1, not later than September 30th.

SALES ADMINISTRATION

Vacancy occurs (through promotion) at Glasgow Branch of progressive company. Applications sought from young men of intelligence, initiative and tact who can fit into a dynamic team. Experience of sales planning, office procedures and customer contacts an advantage. Attractive salary with good prospects in expanding company. Give full details of career, including present salary, in confidence, to Black and Decker Ltd., Personnel Department, Harmondsworth, Middlesex.

GRIFFIN & SPALDING LTD., Nottingham, invite applications from men and women seeking advancement in retail distribution for the posts of Under-Buyer in Fashion, Furnishing and Accessories Departments.—Send full details confidentially to Managing Director.

ACTUARY, preferably under age 30, required at Head Office by Australian Life Office operating in Commonwealth countries. Staff are distribution and expansion of business offer excellent prospects of promotion.—Apply, in confidence, Box 502.

INCORPORATED ACCOUNTANTS'

The Society of Incorporated Accountants' Examinations EXAMINATIONS, NOVEMBER, 1956

The Society's November, 1956, Examinations will be held on the following dates:

Preliminary:	November 13 and 14, 1956
Intermediate:	November 15 and 16, 1956
Final Part I:	November 13 and 14, 1956
Final Part II:	November 15 and 16, 1956

The Centres will be Belfast, Birmingham, Cardiff, Dublin, Glasgow, Leeds, Liverpool, London, Manchester, Newcastle-upon-Tyne and Southampton.

Applications on the appropriate forms must be lodged with the Secretary, Incorporated Accountants' Hall, Temple Place, Victoria Embankment, W.C.2, not later than Thursday, September 20, 1956.

B.Sc.(ECON.) LONDON UNIVERSITY

UNIVERSITY CORRESPONDENCE COLLEGE

provides postal tuition for the above Degree obtainable without residence, which is a valuable qualification for those seeking executive appointments in commerce or industry, appointment of municipal posts. The College, established 1887, is an Educational Trust. Highly qualified Tutors. Low fees. Prospectus of U.C.C. Courses for London Degrees and Diplomas in G.C.E. free from the Registrar, 60 Burlington House, Cambridge.

AUSTRALIAN NATIONAL UNIVERSITY, CANBERRA

RESEARCH SCHOLARSHIPS

Applications are invited from post-graduate students with research experience for Scholarships in Anthropology and Sociology, Demography, Economics (including Economic History and Economic Statistics), Geography, Australian History, Far Eastern History (China and Japan), a substantial knowledge of the relevant language as a pre-requisite, Pacific History, International Relations, Law, Political Science (including Public Administration), Philosophy, Political and Social Philosophy, and Statistics, including Mathematical Statistics.

The Scholarships are tenable for an initial period of two years, and may be extended for a third year. Scholars will be expected to enrol for a Ph.D degree, and to commence their studies in March, 1957.

The present value of a scholarship is £A771 per annum. Married scholars with dependent children may be granted additional allowances. The University will make a contribution not exceeding £stg.135 towards a scholar's fares to Canberra from the United Kingdom, and the same amount towards his return fare.

Application forms and further information may be obtained from the undersigned or from the Secretary, the Association of Universities of the British Commonwealth, 36 Gordon Square, London, W.C.1. Applications should be lodged with the undersigned by October 15, 1956.

R. A. HOHNEN, Registrar.
Box 4, G.P.O., Canberra, A.C.T., Australia.

SUCCESSFUL TUITION FOR THE B.Sc.(ECON.) DEGREE

Wolsey Hall (Est. 1894) provides Postal Courses in a wide range of subjects for the two examinations for Lond. Univ. B.Sc.(Econ.) (three if Entrance is included). Moderate fees, instalments. Over 1,000 Wolsey Hall students have secured this valuable degree since 1925.—Prospectus from C. D. Parker, M.A., LL.D., Director of Studies, Dept. P.16, WOLSEY HALL, OXFORD.

EL CID.—Do you know the name? Yes, he was a Spanish Knight of the 11th century. But EL CID is also the name of a very fine sherry, shipped by Duff Gordon. You'll find it wherever good wine is to be had.

THE CHARTERED INSTITUTE OF SECRETARIES

Employers requiring the services of CHARTERED SECRETARIES to fill secretarial and similar executive posts are invited to communicate with the Secretary of the Institute (Dept. D), 14 New Bridge Street, London, E.C.4.

ENGLISH POSTAL TUITION

for Examinations—University, Law, Accountancy, Costing, Secretarial, Civil Service, Management, Export, Commercial, General Certificate of Education, etc. Also many practical (non-examination) courses in business subjects. Write today for free prospectus and/or advice, mentioning examination or subjects in which interested, to the Secretary (Dept. 2),

METROPOLITAN COLLEGE, ST. ALBANS

or call at 30 Queen Victoria Street, London, E.C.4.

The Key to Greater Export Sales

The Key to increased export sales often lies in advertising . . . and in advertising three words are of great significance—**who . . . where . . . how.**

Consider first the word—**who.** As a business man, you know how much depends on *who* reads your selling message. When you advertise in LIFE INTERNATIONAL and LIFE EN ESPAÑOL, you can be certain your advertisement is being read by people who can do something about it. The readers of these international editions of LIFE are men of influence—leaders in business, government and the professions.

Now consider the second word—**where.** *Where* do you want your advertising message to go? Wherever there is an export opportunity, LIFE INTERNATIONAL and LIFE EN ESPAÑOL will be found to circulate. The former reaches the top of the market around the world and the latter concentrates its coverage in Latin America.

How is your product presented? This is the third important point. And the *how*, of course, partly depends on you. But, the beautifully printed, large-size pages of LIFE's International Editions can certainly help you in this regard . . . giving you the opportunity to control your own advertising . . . to see that all the important selling points are properly made . . . and that your product or service is presented in a manner that does it full justice.

It is for these reasons that leading companies in Britain and on the Continent have more than doubled their investment in LIFE's International Editions in the last four years.

LIFE INTERNATIONAL—advertising rates based on average net paid circulation of 260,000 copies printed in English and distributed in 120 countries outside North America.

LIFE EN ESPAÑOL—advertising rates based on average net paid circulation of 300,000 copies printed in Spanish covering all of Latin America.

These are the INTERNATIONAL EDITIONS of LIFE magazine, with a combined current circulation of over 600,000 copies every fortnight.

damp

is at best a nuisance and is always far more costly than specifying

LEAD for all flashings and weatherings

LEAD LASTS

Flashings are strips of Lead Sheet used to exclude rain from the junction between a roof and another part of the structure—for example, where a roof is penetrated by a chimney stack or pipe or where it abuts a wall, and around roof lights and similar projections.

Weatherings are coverings of Lead Sheet to parts of a structure that need protection to prevent the penetration of rain—for example, coverings to cornices, door heads, canopies and similar surfaces.

The Frozen Wastes of England

LET'S look into the problem of large cold storage buildings and freezing rooms. There are a variety of reasons why these are wanted—storage of foodstuffs, chemicals, industrial process preparations, and for general 'conditioned' storage of many perishable goods. The success of companies undertaking the storage of such goods depends upon the efficiency of their cold stores, which in turn depends upon the effectiveness of the low temperature insulation. Rising temperatures waste money and this could be avoided by economic application of suitable thermal insulation materials.

Newalls have for nearly six decades manufactured and applied insulation materials in a temperature range of minus 300°F upwards—and the wealth of experience accumulated over the years has enabled Newalls to create a service second to none.

From start to finish, Newalls are equipped to tackle any thermal insulation job; in fact they are skilled in the art of eliminating the frozen wastes of England—and those abroad.

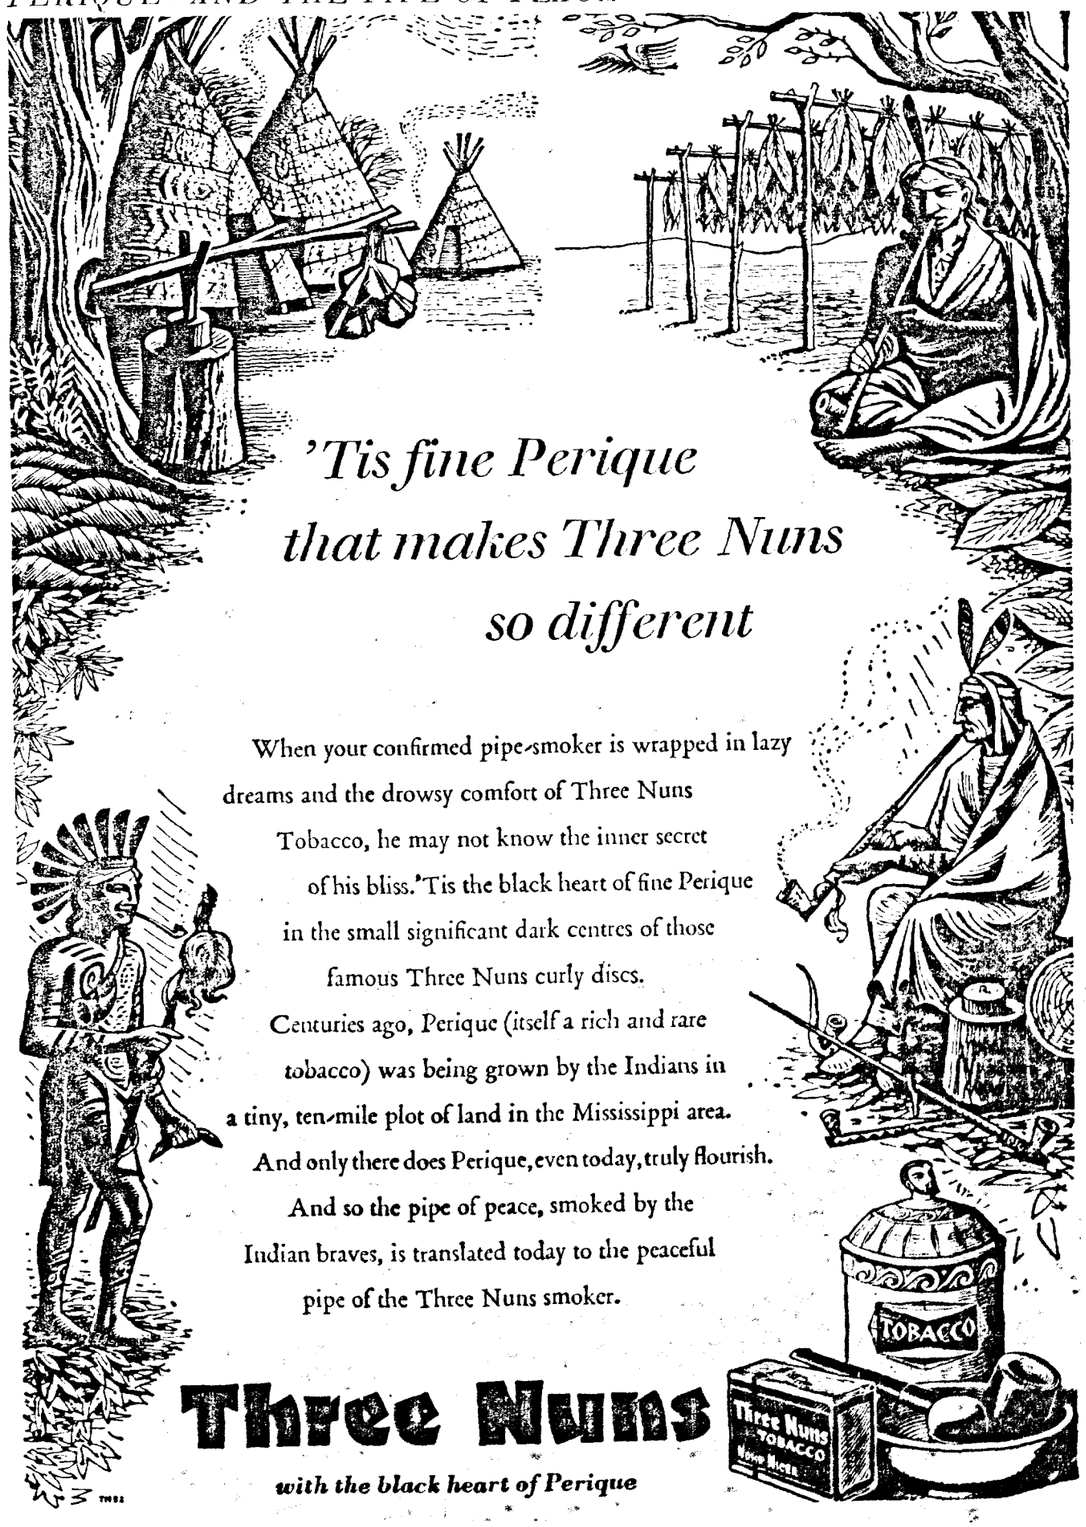
PERIQUE—AND THE PIPE OF PEACE



'Tis fine Perique that makes Three Nuns so different

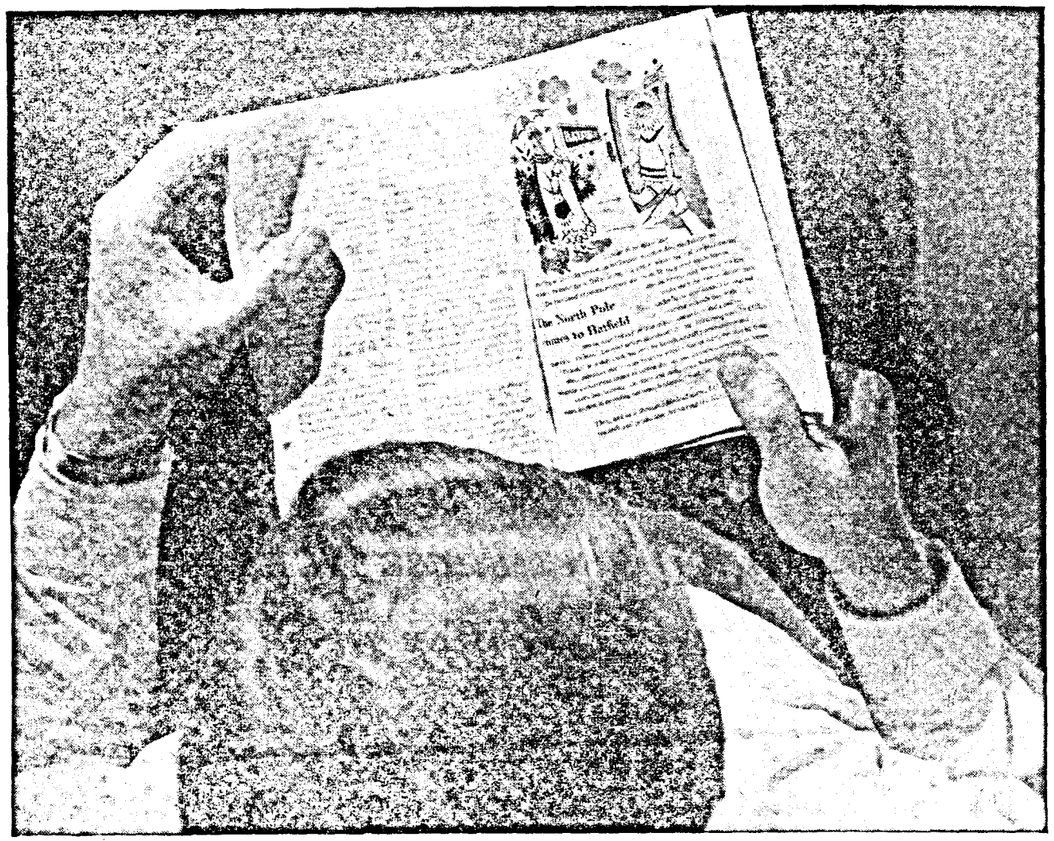
When your confirmed pipe-smoker is wrapped in lazy dreams and the drowsy comfort of Three Nuns Tobacco, he may not know the inner secret of his bliss. 'Tis the black heart of fine Perique in the small significant dark centres of those famous Three Nuns curly discs.

Centuries ago, Perique (itself a rich and rare tobacco) was being grown by the Indians in a tiny, ten-mile plot of land in the Mississippi area. And only there does Perique, even today, truly flourish.

And so the pipe of peace, smoked by the Indian braves, is translated today to the peaceful pipe of the Three Nuns smoker.

Three Nuns

with the black heart of Perique



How to enter one human head—or 5,000,000

If your advertising aim is to get into the minds of about 5,000,000 people intelligent enough to like *reading*, the key is in your hands: The Reader's Digest opens the door at a touch—indeed, holds it open for you.

Why do the men and women who enjoy this magazine each month provide such a productive market? One reason is that they are comfortably above the average in income—over a million of our readers own their own houses, and nearly a million have motor-cars. Well over two million of them are women, with the household spending responsibilities that this implies.

But more important still is our readers' *character*. The Reader's Digest deliberately sets out to please people with inquiring minds, receptive to new ideas. Its phenomenal success—over a million sale in Britain, a *world* sale of over eighteen million—is the measure of the opportunity it offers to the advertiser. Its readers really *read* it—pick up each issue many times as they browse through its articles. There is ample evidence that they read the advertisements, too. And they are exactly the kind of people, better informed than most, whose example is apt to influence their friends.

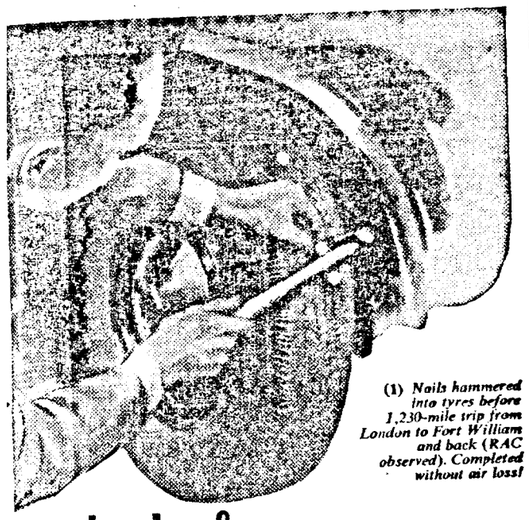
It is because of the character of its readers and their pleasure in *reading* it that The Reader's Digest is one of the great advertising media of Britain.

OVERSEAS *International editions, 37 of them, cover key export markets. The British exporter can book space in London and, usually, pay in sterling.*

NO WONDER IT'S CALLED

The Reader's Digest

A MAGAZINE FOR *READERS* WITH A GUARANTEED 1,100,000 SALE



(1) Nails hammered into tyres before 1,230-mile trip from London to Fort William and back (RAC observed). Completed without air loss!

no bed of roses...

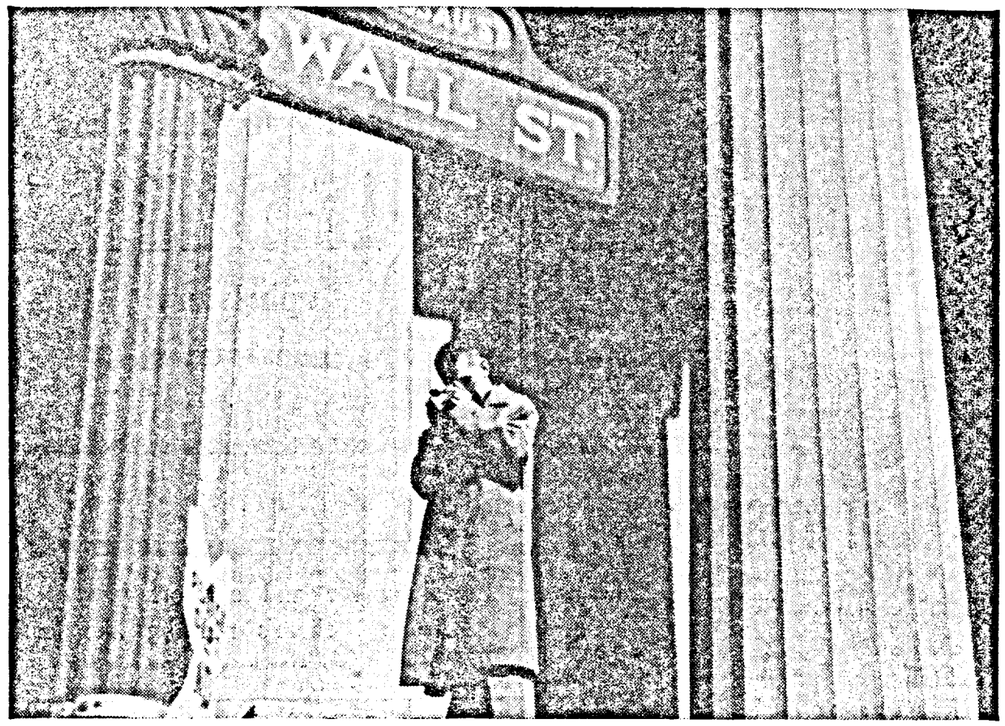
You can start your business trip at Southampton



...you're in America the moment you step on board

*IN THE PERFECT ATMOSPHERE FOR BUSINESS CONTACTS**

ALL THE THINGS that say "America"—the easy courtesy of the Deep South, the streamlined efficiency, the glamour, the glitter, the heart-warming friendliness—all these are yours only two hours away from London!

Over the fifty feet of gangplank onto the famed "United States" or her running-mate the "America" and you're *in* America; the luxury, the hospitality and the gaiety of this friendly country surround you.

And if you're a businessman, remember that here is the perfect atmosphere to lay the foundations of a really successful business trip. In informal, friendly surroundings you meet the men who might make all the difference. But there's fun aboard, too, lots of it. You'll find the few days that separate you from New York pass all too quickly. You travel fast in the utmost comfort when you travel by United States Lines.

***IMPORTANT!** *MEMO TO A BUSINESSMAN*

As a British businessman, you have great advantages to reap if you travel by United States Lines. You have time, first of all, to adjust yourself to the American atmosphere and the American tempo before you arrive in New York.

And, most important, a fresh contact is more easily made under the sociable conditions aboard ship than over an office desk; the people you meet may turn out to be more than just good friends—they may be useful friends.

Wielding the Users' Club

IN the days that preceded the reassembly of Parliament on Wednesday, authoritative hints had multiplied that the Government was, after all, inclined to take the Suez Canal dispute to the Security Council of the United Nations. By the time it met this intention (for it must be presumed to have been an intention, if only three-quarters formed) had been changed. The United Nations is for the present left out of it, except in the theoretical sense that the three powers, when they seek a solution by "peaceful means of their own choice," can claim to be acting under Article 33 of the Charter. This claim, which Mr Selwyn Lloyd made on Thursday afternoon, can be made legitimately so long as the means chosen are peaceful; Article 33 does not permit violent action. Instead, Sir Anthony Eden announced a new and startling scheme, which, as he stated it, left many things obscure, but at least made it clear that, while recourse to the United Nations had been shelved, it had not been shelved in favour of negotiation with Colonel Nasser.

Britain, France, and the United States had decided, he said, to form a provisional organisation "to enable the users of the canal to exercise their rights." In the context it is the American participation which is remarkable. The passages which followed leave little doubt that these rights are to be assumed, not negotiated: the users' association "will employ pilots, will undertake the responsibility for co-ordination of traffic through the canal, and, in general, will act as a voluntary association for the exercise of the rights of the Suez Canal users." Egypt will "be requested to co-operate" and "would receive appropriate remuneration"; but the users' association will collect the dues. Discussions were still going on between the three powers about the details. Most fascinating of these as yet undisclosed details of the scheme is the manner in which President Nasser is to be got to agree to it. Obviously, since President Nasser claims to have nationalised the canal, he holds that the right to employ the pilots and marshal the ships belongs to him. There can hardly be two organisations marshalling and piloting ships through one waterway in competition; therefore, when the three powers communicate to him (as presumably they will) their intention of assuming these duties, they are in effect inviting him to relinquish them for himself, which, as he had already made clear enough, he is not prepared to do.

On the face of it, therefore, the new three-power plan is not a plan at all but a device for bringing matters to a head, producing the "clear-cut situation" after which there has been so much hankering. M. Mollet, speaking in Paris at about the same time as Sir Anthony Eden spoke in London, contributed to this impression by his statement that the users' association "will begin to function and to exercise its powers immediately.". What is meant by this phrase, "exercise its powers"? Many of the pilots are believed to be about to leave their posts, not because of any conspiracy by the governments of the countries from which they come, but because they personally see no future in the

position in which Colonel Nasser has landed them. As it appears, the users' association intends to be their new employer ; but in the eyes of the Egyptian government, once the pilots have left the Egyptian canal administration they will have no standing, no right to work, and presumably no right to be on Egyptian soil at all.

How do the three powers propose to employ them, in the absence of Egyptian assent ? Unlike most canals, the Suez Canal runs from sea to sea at one level, with no locks ; ships go through under their own power ; at a pinch, they could go through without services from the shore, provided that someone obligingly left the swing-bridge at El Ferdan open, and provided that no other ship was coming through the other way. But in practice, and in spite of the baffling language of the Prime Minister's statement, it has to be assumed that " users' " convoys are not going to set off through the canal without Egyptian permission and face the awkward situation that would arise if they met an " Egyptian " convoy head-on. The three western powers must have something else in mind.

The key to what they have in mind must probably be sought in the sentence: " Transit dues will be paid to the users' association, not to the Egyptian authorities." From the start of the dispute Britain and France have been withholding the transit dues in respect of their ships. The United States, which has not, now agrees to join their club. No doubt a time would in any event have come when the Egyptians would have stopped ships which refused to pay dues to them. But the three powers may have calculated that, before that happened, the traffic would in any case be greatly cut down by the defection of the pilots ; this seems to be the expectation in Egypt, as our Cairo correspondent indicates in a message on page 890. Anticipating both these hindrances, the three powers have in effect adopted a scheme which, if it does not work—and plainly it is unlikely to work—must entail sending their ships by other routes, rather than send a diminished volume through the canal on Colonel Nasser's terms. This was made plain by M. Mollet ; it has been confirmed by Mr Dulles.

★

Thus the new plan is, in effect, a decision to boycott the canal ; such a boycott, with the United States in, promises to be many times more effective than if Britain and France had embarked on it alone. The most surprising feature of the scheme is that it is an American scheme, originating with the American government, which so far (after administering its initial rebuff to Colonel Nasser by withdrawing the offer of aid for the High Dam) had been much milder than Britain or France in its treatment of the Egyptians. So far as can be learned—and the exchanges between Washington and London in the days between the failure of the Menzies mission and the reassembly of Parliament will one day make a fascinating chapter in diplomatic history—it is the American preference for the way of economic pressure on Egypt which caused the recourse to the Security Council to be put on the shelf. But almost certainly the overriding motive in American minds has been the need to avoid war.

The way they have chosen does not, on the face of it, strengthen the western legal position in the dispute: how many governments, and what court, would accept the powers which they have assumed as flowing indubitably—as the Prime Minister implied—from the Convention of 1888 ? But it confronts President Nasser with a heavy economic penalty for his folly. A nation if it is united can bear such a penalty for a long time ; nobody can say for how long the Egyptians will choose to bear it, with the rash young dictator who has brought it upon them. The course of action which the three western powers have adopted is not only an alternative to negotiation ; it is also an alternative to war. Sir Anthony Eden took care when he spoke in the Commons to keep the possibility of military action open for the future and, admittedly, the plan would be perfectly consistent with an intention to use force against Colonel Nasser if he were to obstruct the users' association or deny passage to its pilots. But if that were the intention, the United States government would not have joined in this scheme, much less suggested it.

★

Mr Dulles said explicitly on Thursday that, if Egypt blocked the passage of ships travelling under the association's auspices, " the United States does not intend to shoot its way through the Suez Canal." Instead, oil and other traffic would be diverted round the Cape ; and Mr Dulles revealed that the decision had already been made to take the American reserve fleet of tankers " out of mothballs " for the purpose. Mr Dulles's statement made the Commons debate on the use of force, which was reaching its climax as he spoke, irrelevant. The three-power course of action has been charted ; it is a pity that the Government did not see fit to disarm Labour reproaches by telling the House this at the start.

So, as it seems, there is to be a period—perhaps prolonged—in which the users' club will keep its merchant ships away from Suez. The canal traffic is too vital to Britain and France to have permitted them to apply this sanction alone ; for they could neither have found the ships to carry a huge volume of oil round the Cape nor have kept their economies running unimpaired on much diminished oil supplies. Such vulnerability makes it difficult and hazardous to act in the manner traditional to great powers. The United States can supply the deficiencies of oil and ships, or most of them ; evidently it is contemplating steps to supply, too, the deficiencies in dollars that will result. It is a heavy price for a nation to pay to keep its allies at peace. Too many men in this country and in France have sneered at the American determination to prevent war in the Middle East ; they should, rather, respect it.

Dialogue in Cairo

THE Menzies mission did its job in Cairo and failed. Its work is summarised in a long exchange of letters between Mr Menzies and President Nasser, displaying unbridgeable differences on two matters—sovereignty and freedom of passage.

On a third important subject—the efficient working of the canal—the Nasser letter does not dwell for long enough to reveal a third difference, certainly no less important. In the heat generated by the first two topics, Mr Dulles's original wish to concentrate on the " actual practical conditions " of " reliability of passage " seems to have got pushed to one side ; this fact is worth recording because it is the problem of practical working, and of keeping traffic at the volume needed to finance improvements, that may turn out to be in the end the starting point towards a settlement.

On the first two issues—sovereignty and freedom of passage—the interchange as revealed in the letters seems to have run as follows. On sovereignty:—

Menzies : We must " both in law and in fact ensure that the Suez Canal . . . be operated free of politics or national discrimination"; there should therefore " be a body charged with operation, maintenance and development . . . to be constituted of people from various countries, including Egypt. . . . Nowhere in our proposals is there a denial of Egypt's territorial sovereignty."

Nasser : We keep constantly in mind the vital importance of genuine international co-operation, as distinct from the domination of any country, be it single domination, as the one Egypt has just got rid of, or collective domination, as would inevitably be considered the system proposed by the committee. . . . It is obvious that (Egypt's) indispensable co-operation cannot be had if the people will consider the operating body as hostile and as against their sovereignty, their rights and their dignity.

And, on freedom of passage:—

Menzies : Your Excellency has told us with clarity and frankness that you do not believe the canal could be excluded from the politics of Egypt since it is part of Egyptian territory and assets. To this we have pointed out that . . . then the many nations using the canal will have to realise that their pattern of overseas trade will be at any time subject to the decision of Egypt alone.

Nasser : It can be asked whether it was the Suez Canal Company which guaranteed freedom of passage. Was it not indeed the government of Egypt who safeguarded and still safeguards it ? . . . We believe that the real insulation of the canal from politics would best be guaranteed by a reaffirmation or renewal of the 1888 Convention. . . . If the real objective is to secure freedom of passage, the answer is there, namely that passage through the canal has always been and continues to be free.

These exchanges are worth quotation because they display that the real issue is one of confidence on both sides. President Nasser has no confidence in a multinational board because he will not—he says he could not—sell his public a project that looks like occupation all over again. He cites, as justification for his fears, the fact that Egypt is currently subject to " threats, the deployment of armed forces and . . . economic pressure " ; further, the Big Three stacked the pack when they picked the nations invited to London.

Simultaneously, the eighteen nations have no confidence in Egypt's word that it will keep, and is keeping, the canal open in the spirit of the 1888 Convention. What trust can they put in the word of a man who, for demagogic purposes, on July 26th snaps short a concession on grounds that " the Suez Canal Company annually takes £35 million ; why shouldn't we take it ourselves ? " and on September 9th affirms that " we have announced our intention . . . to divert none of the revenues needed for (Canal) development to other channels " ?

When a ruler needs money and has destroyed the confidence of foreign lenders, are not his home budgetary considerations bound to come first ? Are not foreign misgivings justified when Egyptian servants on the Canal bank remind passers-by that it is in their power to send disfavoured nations to the back of the shipping queue ? Lastly, are they not justified in querying Egyptian assurances when they reflect on the case of Israel ? Only this week a small Greek vessel limped back to Haifa after detention at Port Said since May in concentration camp conditions, because it was carrying cement bound for Elath—Israel's port on the Red Sea. Admittedly, Egypt's critics are on weak ground when they cite Israel's case, because they are themselves at fault through having condoned since 1951 Egypt's flouting of the Security Council resolution of that year. Nevertheless, the treatment Israel has had is relevant to current assurances, for what is happening to its goods today could happen to someone else's tomorrow.

Other comment on the repercussions of the Suez crisis will be found in Notes of the Week : " How They Split " (page 864), " Boomerang from Canberra " (page 865), " Bypass by Pipeline " (page 865), " Do our Rulers Read History ? " (page 873) ; in a despatch from our Cairo correspondent on page 890 ; and in a Business Note on page 903.

This atmosphere of no confidence intensifies when attention turns to the question of operation and the possibilities of creeping closure caused by inefficiency and other involuntary lapses. The Menzies team put the danger to President Nasser but its thrusts were parried with generalities. Mr Menzies therefore returned to London convinced that Egypt was underestimating the problems involved, particularly the financial ones. He pointed out that if the canal was to be improved in the way which the company had planned and which Egypt still envisaged, continuous assurance of custom from the larger ships that are big payers was imperative. Nothing short of complete confidence between users and management would establish this, and he and his colleagues seem to have agreed that it was doubtful whether the Egyptians could induce such confidence:—

> If expansion would not be necessary, it would be because the users' confidence would be lacking and many of them would have found ways to avoid being dependent on the canal. . . . We have therefore, in the interests of Egypt and the users, urged that the structure of the body actually conducting the canal operations should be such as to inspire worldwide confidence and bring about a capacity to raise the necessary capital sums because of a prevailing feeling of security. . . .

But the warning fell flat. Egyptians, though so versatile, are often confident that mere wishes will produce results.

For instance, they are proven wishful thinkers over the question of pilotage. Had they produced their nationalisation law in less of a hurry, or after consultation with Egyptians already inside the Suez Canal Company, they might have noticed that its directors' report only this year stated that

> it has been impossible to find the necessary number of applicants (for pilots' posts), even outside Egypt.

and might from the start have realised the need to tempt serving pilots to stay, at least for the time being. Instead, they confronted irreplaceable servants with deterrents—threats of prison, advertisement for substitutes, sequestration of the houses of absent colleagues—and so are confronted with the position that our Cairo correspondent describes on page 890.

President Nasser's positive action, which must have been planned before the Menzies team left, for it was taken within an hour of its departure, was to communicate to all governments (except Israel) and to the Secretary General of the United Nations his desire for the creation of a negotiating body charged with finding a peaceful solution. His motives were patent. He had resented the London conference, with its picked cluster of maritime nations, and the assumptions, adverse to him, on which it was called. He wanted a wider range of opinion, including the many Asians who depend heavily on the canal for dry goods carried in other people's ships. The gesture was bound to appeal to all of these—indeed, to all the Bandoeng states. It might, he seems to have reckoned, also drive a wedge between Anglo-French fire-eaters and United States Republicans bent on finding a peaceful solution before their election. It has achieved his end in Asia. It has not done so in the West, where the hard practical purposes that were the core of the original Dulles proposal have bulked larger than he anticipated.

Air Bases?

THE agonising reappraisal of the problem of bases overseas, on which the services gingerly embarked when the shrinkage of the colonial empire became almost a matter of predictable dates, must become more painful and urgent as the result of the Suez crisis. This follows the bitter and still unsettled wrangle over the Singapore base, the abrupt decision of the new and neutralist government of Ceylon to take over the naval and RAF bases on the island, and the dismissal of Glubb Pasha from Jordan; for service directors of operations it is only the worst shock in a year of shocks.

A previous article in *The Economist*, which appeared before the Suez crisis—on June 16th—examined the Navy's base problem and found that it centred on Singapore. Between the home dockyards and Australia, the irreducible minimum of main fleet bases seems to be Malta and Singapore. The uncertainty in the Middle East and the loss of the Ceylon bases are primarily a headache for the RAF. For, though bombers and troop transports can make long hops, yawning gaps in the network of secure air bases now make those hops uncomfortably long; and the string of staging posts along which fighter and close-support aircraft can be moved is in complete jeopardy. Moreover, the capacity of air command to bring air power to bear in limited wars, and continuously and deterrently over large areas in the cold war, depends on a network of operational bases rather than on a few main bases. And, while the Navy can cruise anywhere at sea in peace and war, the air over a land mass is sovereign property and flying through it by military aircraft is strictly by permission.

In terms of the great deterrent—global hot war—there is as yet no serious air base problem. Both the American strategic air force and the British V-bomber force would operate mainly from British and continental airfields. Strategists consider that the ring of western air bases round Russia confers an important deterrent advantage, and for this reason the security of the North African bases is important; but developments in the Middle East are less so, since the Turkish bases would be better placed for offensive action.

The loss of colonial sovereignty and the defection of allies is much more serious in terms of the use of air power to prevent limited wars, or to fight them if they should break out. There are now two main threats to be met. The first of these—and present concentration of attention upon the Middle East should be a reminder of, not a detraction from, its gravity—is the maintenance of air communications between Britain and South East Asia: the problem not merely of normal replacements and movements, but of the reinforcement of overseas garrisons and operational aircraft in times of tension. The second is the preservation of a network of bases from which tactical aircraft can operate to deal with any areas, including the Middle East, in which threats of limited war may develop. Upon adequate bases the whole concept of a highly mobile airborne reserve (economising in manpower and poised for quick action) manifestly depends.

★

It will be best to deal with communications with East Asia first; as and if the clouds over Suez clear, this is likely to emerge as the RAF's main long-term problem. The great difficulty here is the "gap" between Aden and Singapore, left by Ceylon's neutralism. Even before Ceylon withdrew its bases, the difficulty of moving short-range aircraft had arisen. In Imperial days, short-range aircraft could fly out to Singapore via the Middle East, India and the Andamans. Today there exists an agreement with India under which British military aircraft operating in South East Asia may be replaced by flights over India on a one-for-one basis. But this is a purely peacetime arrangement. Unless India's neutralism changed to an alliance, it would not be possible to operate via India at all in war. In the Korean war, freedom to operate long-range aircraft from Ceylon was shown to be vital.

Today, the position is that though Britannias (especially the new version to be delivered to the RAF, which has a still-air range of 4,500 miles) can be flown from Aden, or possibly East Africa, to Singapore in one hop, it is an uncomfortable operation—and even more so for Canberras, our main close support aircraft. Fighters, of course, must in any case go by sea. The need for a base in the Indian Ocean is the plain conclusion of a glance at the map—which equally plainly points to the Maldive Islands as the sole remaining haven. They are equidistant from Aden, Singapore and the Australian base on the Cocos Islands—about 2,100 miles from each. There is a case for alternative bases on Socotra (to reinforce Aden) and on the Seychelles. But the Maldives would be the key to air communications in war if India and Ceylon had to be by-passed. The only alternative is the "west about" route via Canada or the United States; the former is handicapped by weather and both cost dollars.

★

In the Middle East, by contrast, the difficulty is not a vast expanse of sea, but the fact that a string of vital British staging posts depends on treaty relations with sovereign states, which foreign policy must keep friendly if the posts are to be usable in time of stress. These bases have been hinged to the idea that defence must look north to Communist Russia or inwards to the allies of Saudi Arabia. But once it is clear that warlike preparations, or any action against an Arab country, would overstrain the friendship of Iraq or Jordan, and perhaps even make it impossible to use Bahrain and Kuwait, the RAF's whole position is undermined. The RAF believed that the system whereby it trained the local air force in return for base facilities—as in Iraq and Jordan—was an almost perfect substitute for a base under full British sovereignty; indeed it even claimed that this was a superior and cheaper arrangement to the American system of renting bases (which was hardly true when the subsidies to Jordan or Libya are taken into account). The defect in these arrangements, however, should have been clear enough from the reservations made by Libya that the leased base should not be used against any Arab state.

It follows that the RAF inevitably places far more emphasis now upon the importance of retaining both Cyprus and Aden as the vital—indeed the only—safe links in the chain of air communications between the Mediterranean and Africa and the East. Almost certainly they are now the only two bases from which any kind of air power could be exerted against Arab states. Yet they are only serviceable as links for long-range transport or support aircraft—such as Britannias or Canberras. Except in peace, fighter aircraft can no

longer be operated along the strategic air route from the Mediterranean to Singapore and Australia. For the same reasons, air power as part of the "little deterrent" in the Middle East is now gravely circumscribed.

Is there any way out of this difficulty? Is it possible to bring technology to bear to redress the balance? There are a number of possibilities. Improved engines and design may further lengthen the range of long-range aircraft. There is also scope for the development of flight refuelling, which still further extends the range of bombers and transports, and may double the operational range of fighters. Greater extensions to the range of fighters and close support aircraft may be achieved by the pick-a-back (or "buddy") method, whereby a long-range aircraft releases a fighter in the air and retrieves it when its mission is completed. But though flight refuelling was pioneered in Britain, the RAF (like the Navy) has felt too secure in its apparent wealth of bases to develop it; the Americans, faced with the vastness of the Pacific and Arctic circle as operational areas, and lacking colonial bases, have made all the running in these techniques. These chickens are now coming home to roost.

The other alternative, and the one more likely to be studied carefully, is the greater use of aircraft carriers as mobile bases for launching strike aircraft inland. The Navy, totting up the bills for the RAF's bases in the Middle East, now contends—a little smugly—that carriers at £20 million a time would have proved far cheaper. Unfortunately, they are not a complete substitute, for RAF short-range aircraft cannot use them, and the naval air arm possesses only obsolete carrier planes (such as Sea Venoms and Sea Hawks). These could cover amphibious operations in a limited war against an ill-equipped power; but the lack of such modern naval strike aircraft as the de Havilland 110, and the poor prospects for a really up-to-date aircraft, curtail the usefulness of British carrier forces.

Clearly one lesson of this year's succession of crises in base areas is that naval aircraft should have had a far higher priority in production—or else (one is coming round more and more to this view) they should have been bought long ago from the United States. Another lesson is that the carrier's role in the cold war is vital to Britain, and sweeping criticisms of it on the ground that it is useless in a hot war (which may or may not be true) misses the basic point: that, until and unless there is a complete revolution in aircraft ranges, air power will somehow have to be increasingly seaborne when allies and colonies are lacking.

Beauty and the Bench

A HUNDRED and ten years ago an Englishman, drunk or sober, could negligently cause the death of a fellow-citizen and not be liable to anyone for a pennyworth of damages. A beater, with a family of ten dependent on him, might be shot dead by a careless sportsman; a pedestrian might be killed in the streets by a brewer's dray; and no one could ever bring an action against the offender. Our Common Law did not permit it.

In 1846 Lord Campbell's Act changed the law by giving damages to the dead man's wife, parents and children; and since that date at least six more acts have been passed extending the rights of defendants and adding to the number of potential claimants. Today the dead man himself may bring an action from the grave against the man who put him there; the courts are constantly trying actions brought by next of kin as well as by dependants; and the judges regularly face the task of deciding on the value of a man's life (a) to his wife and children and (b) to himself. It is often a difficult decision to make, and though certain rules have been established by case law, the business is complicated by subtleties introduced by the untiring skill of our lawyers. These subtleties have been explained and analysed in a book* recently written by a man and wife (both lawyers)—one of those rare books that can be read by practitioners with advantage and by amateurs with interest and amusement. The situation it reveals, without itself commenting upon, is one that most laymen will consider very odd.

When a judge fixes the sum to be paid to widows, parents and orphans, how does he go about his task? First he must remove from his mind any sympathy with the plaintiffs and forget the fact that a woman has lost her life's companion and children their natural protector. He will concern himself only with £ s. d.—the wages the dead man earned or might expect to earn. That gives the judge his starting figure. From that he must deduct the dead man's living expenses; and what is left after the subtraction is called the "dependency value." Multiply that figure by the number of years appropriate to the man's expectation of life, and you have the gross damages.

So far the process sounds reasonably simple; but now the subtleties begin. Further deductions must be made, and for a wide variety of reasons. For example, the husband may have worked in an unusually dangerous trade and been likely to have his span of life shortened by the chances of his employment; or he may have been killed shortly before the outbreak of a war in which he could have been called up. In either case the damages given his dependants could be reduced. But, of all the reasons for bringing damages down, the most delicate is the question of the widow's remarriage. Is she likely or not likely to be wooed by a second husband—a matter (as Lord Wright said in Davies v. Powell Duffryn Associate Collieries, Ltd.) of speculation and doubt. It is also a matter of good looks.

What happens is apparently this. The plaintiff goes into the witness box and the judge in the discharge of his duty has a good look at her. He may like her appearance, or he may find her unpleasing. Opinions will differ, and naturally some judges are better judges in this sphere than other judges; but each must do his best in the light of his own taste and experiences. He must mark the plaintiff's looks to the best of his ability. If he gives her only gamma minus, he will make no deduction for the possibility of remarriage, and the lucky plaintiff will get the full arithmetical damages. If, on the other hand, his Lordship is favourably impressed and puts her in the beta or beta plus class, then there will be a substantial cut, and the damages may come down by twenty or twenty-five per cent.

In the rare event of an alpha or alpha plus stepping into the box, the judge is in a cruel predicament. As a man of the world he surmises that before her marriage the plaintiff had a queue of suitors. As a man of sentiment he knows that many young men must have remained single for her sake, still carrying through the years her image in their hearts. Remarriage will certainly be open to her as soon as she wishes it, and it looks as though the judge must stifle his feelings, knock 100 per cent off the dependency value and award no damages at all.

★

For the good-looking young woman who is unfortunate enough to be the plaintiff in a fatal accident case the lesson is clear. For weeks or months before the action comes on she must concentrate on her personal appearance. She must search the shops for the most unbecoming dress she can find. It should fit badly. It will be useful if the colours clash; they cannot fight each other too fiercely for her purpose. She should keep away from the hairdresser for a long period, and if she can borrow a pair of glasses with very thick lenses, they will be helpful. Nature may have given her a voice like Cordelia's, but she must try to shout her evidence raucously and make her answers to counsel's questions as waspish as possible. If, when she leaves the box, the judge says to himself "what a dreadful woman," she will have scored a triumph and secured her hundred per cent.

There is a lesson, too, in this book for men (with wives and families) who daily face death in the London streets. Take two men of saving habits, both of whom by thrift have been able to save £20,000. Both are killed by some motorist's negligence, and both widows make the appropriate claim. But one of the men has achieved his fortune by paying yearly premiums on life policies, and the other by making his own investments on the Stock Exchange. By common sense standards both would seem to be entitled, *ceteris paribus*, to the same damages. But they are not. The law says that the £20,000 which results from investments must be taken into account. A deduction must be made from the dependency value corresponding to the widow's benefit from a premature enjoyment of her husband's estate. The £20,000 paid out on the life policies must *not* be taken into account. No deduction may be made for it—a subtle and perplexing distinction.

These reflections will not be found in Mr and Mrs Kemp's excellent book, which is an exposition, not a criticism, of the law. But it would be interesting to know what they say about it to one another in private. Would they say that the attempt to keep a perfect balance between tort-feasor and tort-receiver has been carried to the point at which the law looks ridiculous? Would they agree that, while the scales of justice must undoubtedly be kept in good working order, we should not try to adjust them with the nicety of a physical research laboratory? And might the public in general consider that, if seven acts in just over a century have brought us to this sort of legal pass, the time might almost be ripe for an eighth?

* The Quantum of Damages: *Volume 2, Fatal Injury Claims.* By D. A. McI. and M. S. Kemp. *Sweet and Maxwell.* 326 pages. 32s. 6d.

The Disposal of Refuse

Amongst the matters recently referred to by the Registrar-General as affecting the health of the metropolis . . . are "the cleansing of the streets, now covered with horse-dung . . . " The subject has two distinct aspects, the material and the moral, or what should be done with the refuse matter we must get rid of or perish, and who should do it. As to the refuse matter, many modes are adopted or recommended of removing it; but the mode at present in use and considered the most agreeable—washing the bulk of it away . . . and running it into sewers, and ultimately into the river—though quite a modern plan . . . begins to be generally condemned. It fills our streets with noxious gases . . . and wastes the elements of fertility. To make it cease to be a gigantic nuisance, poisoning the river and the whole atmosphere of the metropolis, a gigantic and costly system of sewerage is required, such as never yet has been carried into effect. . . . The other branch of the subject . . . is equally worthy of attention. . . . Who should remove these refuse matters? The Government? Certainly not. We are all now agreed that it should not feed the people: why should it clean away their dirt?—why be their scavenger? Should the municipalities, the parish authorities remove it? Certainly not, except as a matter of contract or convenience, not of duty. . . . Nothing is clearer than that every man is bound to remove his own refuse or dirt. . . . Parish, municipal, and Government authorities may compel him to perform it, but most certainly they are not bound to perform it for him. . . . Under the present division of labour . . . each individual may bargain with others to remove the refuse. . . . Nor does it require a degraded class to perform the work . . . it demands much chemical knowledge and skilful mechanical contrivances. . . .

Then let every toil be hallowed
That man performs for man,
And have its share of honour
As part of one great plan.

The Economist

and Iran exports which at present travel via Suez. The deduction to draw from the new venture is that a squeeze by any monopolist, whether Egypt, Lebanon or Syria, breeds resilience in the victim.

The Liberals Start by Running

WHEN the annual Liberal Assembly meets in ten days' time the "delegates" (which means pretty well any Liberal who is willing to buy a ticket to Folkestone) will be in a cheerful mood; the party has done surprisingly well in this year's by-elections. That is why it must expect the compliment of having rather more outside advice offered to it than usual. First, about candidates. It was announced this week that there are already 113 prospective Liberal candidates (three more than at last year's election), with another 40 or so being negotiated. Past experience suggests that some of these will fall by the wayside, while others will be added; but, in general, this total seems about enough. The assembly would be well advised to adopt the formula proposed by Westmorland: "the maximum number of suitable Liberal candidates that can be effectively presented to the electorate"—and to lay heavy emphasis on both "suitable" and "effectively."

Secondly, about policy. The agenda for the assembly is not very promising. The platform has only two motions down—one supporting the report on co-ownership, the other calling for the end of the de-rating of industry and (progressively) farm buildings. The leadership will also put up an emergency resolution on Suez. On general economic policy the assembly will debate two oddly cautious proposals: that committees should be set up to bring the free trade doctrine up to date, and to work out a "true radical solution" to inflation. Eleven years after the war seems late for a small party out of office to begin working out its solution to the main postwar problem. Later in the assembly Mr Grimond will be introducing a wide-ranging motion on automation; whether the buck-passers like it or not, his speech is likely to set the tone for the Liberal approach to the economic events—including the trade union events—of this crucial winter. Finally, one constituency motion demands that the Liberals should have equal broadcasting time with the other two parties—a proposal which the executive wants to modify to "a more equitable distribution." This is a small instance of how the Liberal leaders need to educate some of their followers into learning to walk before they can run.

Rain on the Just?

FARM output this "summer" is going to be very badly down. Crops have not only ripened late, but when ripe have often been impossible to gather. Corn has been laid flat, peas and beans have been destroyed by storms, and although roots are not doing at all badly, there is likely to be difficulty in harvesting them because men will still be busy with the abnormally late grain at the end of this month. In some areas the new strong-stemmed wheats have stood up well to the storms, and have been successfully harvested by combines: but most of this wheat needs to be artificially dried. Farmers using reapers and binders find much of their grain sprouting in the stook. In Lancashire, which the Minister of Agriculture has been visiting, many fields are severely flooded; and much land not actually under water has been so wet that machines could not get into the fields. Even those farmers who have been lucky or skilful enough to get their crops home will find their production costs considerably increased.

Inevitably, the farmers are calling for extra aid; and they have already got some in the reopening of eleven state-owned silos for the drying of wheat. These silos were used by the Ministry of Food until 1954 for the storage of its own purchases. When grain purchasing was decontrolled, the twenty-two national silos were offered for sale *en bloc* to the National Farmers' Union, which refused the deal. The silos were available to farmers for drying the harvests of 1954 and 1955, but were so little used that the Treasury decided to cut down this expensive service. It is fair to add that the NFU attributed the small use of the silos in 1954, a bad harvest year, to the unfamilarity of the service, to farmers' reluctance to pool their grain before sale for drying purposes, and to inadequate publicity. 1955 was a notably dry harvest when very few dryers were needed anyway. In May this year the service was closed down. Nine of the silos were disposed of to private firms (including only one farmers' co-operative), while the rest were used for defence storage. Dryers were kept available for an emergency like the present one.

What other forms of Government action are possible? There is no case for increasing guaranteed prices; quite apart from the need to avoid the principle that farmers can always shunt any unexpected rise in their costs on to the market, such an increase would benefit only the more fortunate farmers who have saved much of their crop. But this year's experience does seem to underline the need for better drainage in many areas—not only areas actually flooded, but those where machines were unable to get into the fields. And cannot something be done to even out farmers' income—not to increase it—by fostering wider insurance of crops?

Alarm on the Copperbelt

THE growing tension produced by the latest "strike" on the copperbelt has frightened the Northern Rhodesian government into declaring a state of emergency. The refusal of the African mineworkers to wear identity discs and greaves is in fact an act of mass industrial disobedience, even though it is ostensibly aimed at "discrimination." Discs are worn underground by white and black alike to enable managements to check who is in the workings, a necessary precaution against major accidents; while greaves are a natural defence against minor accidents to labourers moving equipment. But the African miners turn up for work and have to be sent home again, and apparently their demeanour is alarming the authorities. The reasons behind this demonstration are likely to be the same as for the previous strikes which at times halved copper production—the anger of the African Mineworkers Union over the companies' recognition of the African Staff Association. Although the leaders of the mass union did originally agree to recognition, they now repent this decision because they see that Africans who take up jobs under the new schedules of "advanced" jobs join the Staff Association; in consequence, the mass union, though it represents over 90 per cent of the black copper miners, is being deprived of the membership of the more skilled and perhaps more intelligent men.

It seems clear that political motives are becoming an increasingly important factor with the leaders of the mass union, and the government seems to have recognised this by arresting them (but on what grounds?). The African Mineworkers Union and the African National Congress have drawn steadily closer in the last year with a view to presenting a solid African front to the Europeans, and the mere existence of the African Staff Association—with its moderate leadership, middle-class ideas, and repudiation of the strike weapon — cuts across this strategy. Meanwhile, the strikes are holding up the work of the arbitrator who is examining the Africans' claims for higher pay for all black workers. They are also frightening the white mineworkers, who otherwise have come to accept the whole principle of African advancement; until now, the work of job evaluation has been going forward fairly rapidly, and promises to create thousands of new "intermediate" jobs for African workers in 1958. Growing African political bitterness darkens this prospect. It is a pity that the Northern Rhodesian government has persisted so long in its somewhat reactionary attitude to Congress. It should have recognised that Congress must be treated as an increasingly important opposition party, and tried to guide it into moderate channels. Even now it should face anew the question of extending the territorial franchise. On these two points the commissioner who is enquiring into the causes of the industrial unrest may find himself unable to remain entirely silent.

Pakistan's New Look

FOR the first time in four years, there is now the heartening sight of a government in Karachi that corresponds to the actual balance of party forces. This is a decidedly hopeful outcome of the recent tortuous series of clashes and realignments. If the "new look" of Pakistani politics is not marred by further fissions between volatile party leaders, there may be an end to the need for perennial interventions by the official hierarchy to prevent the party politicians from endangering the stability of the state. And even if things do not go all that well, the impossible position of recent months will at least have been liquidated.

Since Mr Mohamad Ali became Prime Minister in August, 1955, at the head of a coalition of the Muslim League and the Bengali group misleadingly named the United Front, both these parties had continued to disintegrate. With the Prime Minister's tacit approval, many of the better elements in the League had gone over to the new Republican party founded by Dr Khan Sahib, the Chief Minister of the western province. A point was reached at which Mr Mohamad Ali was being sustained by the Republicans against the intrigues of the rump of his own party, the League. In East Pakistan, meanwhile, the United Front provincial government had lost control of the local assembly, and its helplessness in face of this summer's severe food shortage had made it necessary to call in the army to distribute food and to deal with speculating hoarders. The Prime Minister found association with his nominal supporters increasingly intolerable, and finally decided to force a showdown.

At first sight it may seem strange that after breaking with the League and putting it in its place, securing the confidence of a majority in parliament, and being asked by President Mirza to remain in office, Mr Mohamad Ali should have insisted on resigning. Basically non-partisan, he could almost certainly have rallied a new coalition around him. But, quite apart from his reported ill health, he may well have reasoned that the time has come when the tangled skein of party politics can at last be straightened out and party politicians made responsible for the burdens that have too long rested on the shoulders of others. Mr Suhrawardy's coalition of Republicans and his own Awami League (hitherto the main Bengali opposition party) can command a clear majority in the central parliament; and, untainted by the deplorable record of the once omnipotent Muslim League, it may prove able to see the country safely through a general election next year.

Reunification Revived

THE Bonn government's Note to Moscow on German reunification is new in tone rather than in substance. True, it expresses willingness to countenance a demilitarised zone in a reunited Germany—probably in what is now the German Democratic Republic—and by envisaging Germany joining a European Mutual Security pact of the kind the Russians have suggested, it shows a new concern for the Russian point of view. But the proposals themselves go no further than those of the western powers at the Geneva conference last October.

At that time the Russians demanded a demilitarised zone and a security pact before Germany could be reunited; the federal government now repeats the objection the west then made, that this would "petrify" the division of Germany and perpetuate tension instead of removing it. The effort to reopen the dialogue is also hampered by the Russians' retreat from last year's positions. They are now entrenched, if Mr Gromyko has said their last word, behind the doctrine that the banning of the west German Communist party makes reunification "impossible." Herr Ulbricht, the head of the east German Communist party, recently put the Soviet motives more plainly: it is "senseless" to talk of all-German elections so long as "the west German . . . warmongering forces are able to use their economic and political power to influence the election." This implies that Moscow might think again if a new Bonn government were to emerge from next year's elections, but not before.

Thus the federal government has not initiated negotiations so much as given itself a case to argue before the

elections. This is probably what it now most wants. As the memorandum puts it, it is not a bad case. By being conciliatory on security questions the Chancellor has left himself freer to concentrate, with relish, on the weak spot in the Russian argument, the refusal of all-German free elections. For the world, up to its neck in the Suez crisis, here is a reminder that the German problem remains. At home, where the Note has been fairly well received, it makes it easier for the government to show the electors it is prepared to talk seriously with the Russians. But the appeal is weakened by the contrast between its reasonableness of tone and the ostracism of the Russian ambassador that drove Mr Zorin away from Bonn during the period of gestation of this very memorandum. It still remains harder for Dr Adenauer to claim that none can talk to the Russians better than he, than for the opposition—with Russian help—to suggest that almost anybody could.

Bread in Our Philosophy

ON September 29th the bread subsidy is due to end and the bread to which the subsidy applied—that made from "national" flour—is due simultaneously to disappear. The row that this is likely to arouse about the price of bread, and the classical muddle it is likely to cause about the necessary imperfections of cost-of-living indices, was discussed in *The Economist* last week. Now more evidence has been produced about the dieticians' quarrel which is going to be associated with it. The background to this quarrel is that a Government-appointed advisory panel reported last May that the proposed decrease in the extraction rate (from 80 per cent to 70 per cent), which had been decided by the National Association of British and Irish Millers, was "very unlikely" to have any adverse effect on the public health—given, of course, that the new whiter "basic" flour is, like the "national" flour which it supersedes, to be enriched. It was known that the Medical Research Council was opposed to this report. The council's counter-statement has now been issued; its main charge is that although the proposed change would not necessarily lead to an increase in recognisable illnesses, it is "a risk that can be avoided."

It is at once obvious from reading these documents that the clash is less a matter of nutritional expertise than of social attitude. To the council, no avoidable risk to health can ever be justified; one may suspect that its feelings in this instance are sharpened by the special mystique dating from the days when bread really was the staple food of the people, and not merely a filler or convenient means of conveying butter, margarine, jam, cheese, or fish paste to the mouth. To the advisory panel, the almost universal public preference (however astonishing to natives of other lands) for steam-processed cotton wool justifies its introduction as long as the risk to health is minimal; the panel feels that if the public cannot get the bread it wants, it is likely to eat more of other manufactured foods which are less nourishing; and it stands by the general liberal principle that the onus of proof must always lie with those who wish to make people eat, drink, or use other commodities than those which they prefer.

This is one of those almost undebatable questions of social philosophy on which people divide by instinct, rather than by reason. It is, however, an interesting comment on the *mores* of the times that many of those in the school of feeling that supports the council do not recognise that the school that supports the panel has any ethical right to exist.

Mr Mintoff Mollified

THE agreement reached between Mr Mintoff and the Colonial Office last week is disappointing, and it will probably purchase peace only for a short time. Financially, the Colonial Office did not yield a lot of ground. It agreed to pay promptly against Malta's statements of account, but only at the promised rate of £5 million a year for eighteen months; on balance Mr Mintoff may have screwed a little more out of the Colonial Office, but not much. But all this is recognised to be purely temporary accommodation until integration comes into force. Even the financial commission, whose composition—Sir William Scott and Sir George Schuster and a secretary—is now agreed, is merely to make recommendations on the budgetary position for the interim period. This means that the financial terms to be embodied in the integration bill to be presented to Parliament at Westminster have still to be fought out; originally the financial commission was to prepare them. Mr Mintoff would not be Mr Mintoff if between now and the preparation of the bill, which the Colonial Office is supposed to be working on, he did not think up a new formula designed to give him the subsidies he wants.

The upshot of this patched-up quarrel is that Mr Mintoff is more than ever convinced that the economic question is what integration is mainly about: he thinks that it will somehow bring, or can be made to bring, a large enough British subvention to jack up the Maltese standard of living to something like parity with Britain. But this is precisely what no subvention can quickly do; and Mr Mintoff may lose sight of the other and real advantages of integration as he gradually finds this out. It would be foolish to expect the truce or Mr Mintoff's temper, in the present state of the dyarchy, to last long.

Japanese Table-Turning

MR SHIGEMITSU, the Japanese foreign minister, has returned from the abortive Russo-Japanese negotiations for a peace treaty to find his Liberal-Democrat colleagues involved in political intrigues of rare complexity. It is possible that Mr Shepilov hoped to increase the confusion within the governing party when he refused to grant any territorial concessions to Japan. If so he must be pleased by the results.

Japanese business interests, tempted by the Russian offer of a £90 million trade agreement, are pressing for a settlement with Russia at all costs. They have, therefore, hitherto supported Mr Shigemitsu against Mr Hatoyama, the prime minister, who, they say, has reached the limit of his usefulness. But Mr Hatoyama, having refused to allow Mr Shigemitsu to negotiate a peace on Russian terms, is now angling with some success for a settlement on the basis of "an Adenauer formula," whereby the question of the disputed Kurile Islands would be indefinitely shelved. Mr Shigemitsu and his supporters oppose the idea bitterly, but it looks as if it is the only possible way out of the deadlock. If it is adopted it will add considerably to the power and prestige of Mr Kono, the minister of agriculture and fisheries, who has for some time been using the old and sick prime minister as a stalking horse for his own ambitions.

★

Mr Hatoyama has succeeded, in the face of stiff opposition, in getting his cabinet to allow him to go to Moscow personally to negotiate a settlement. The question now is whether he will be able to dismiss Mr Shigemitsu, who would otherwise act as his deputy, before he goes. Other cabinet members, and particularly Mr Kishi, who has been described as the heir apparent to the party leadership, are afraid that it would not only be Mr Shigemitsu who would lose his post if there was a reshuffle.

Mr Shigemitsu, backed as he is by the men who brought down the Yoshida administration, seems to have a reasonable chance of turning the tables on his attackers, and perhaps of becoming prime minister himself. But Mr Hatoyama has hung on to his office for more than a year after his fall was prophesied, and if his health allows it he may stay there for some time yet, simply because the party cannot agree on his successor. Japanese politicians have taken to heart the maxim: "Always keep a hold on nurse, for fear of finding something worse."

The Russian Visitors

THE Air Ministry and the Ministry of Supply were hosts last week to two parties of Russian air experts, one led by the head of the Russian air force, Chief Marshal of Aviation Zhigarev, one of the few fervent Stalinists to achieve promotion under the new regime, and the other by the Minister in charge of the aircraft industry, P. V. Dementjev. The visit, timed to cover the period of the Farnborough air show, was in return for Russian hospitality to a roughly similar British mission that went to Moscow for the air display in July, and although the Russian teams between them covered a good deal of ground, including visits to RAF stations and aircraft factories, it is improbable that they saw or learned anything of more value than the British took away with them from Moscow. The aircraft that they were allowed to inspect closely, and in one case to fly, were both trainers; the Sapphire engine they saw in production is not as widely used in the RAF as other types of engine that they did not see.

There is a marked difference between the style of flying put on in Britain and in Russia at air displays. A Russian air show consists almost entirely of fly pasts at speed without aerobatics. The Farnborough display at which the Russians spent a good deal of time is made up of highly individual displays that vary considerably in quality, while at the RAF bomber station at Honington, one of the few places where they appeared in uniform, the members of the Russian air force were given a small and elegant display of team flying by the newer RAF aircraft, including the carefully unscheduled appearance of a Vulcan bomber in the clouds, that was as skilled and precise and as different from Farnborough as dressage is from hunter trials. This close formation flying was warmly applauded by the Russians as a novelty they do not possess at home, but it left them none the wiser about British military potential.

The Russians, for their part, were equally circumspect. After a morning spent at Westminster Abbey they expressed a disarming preference for walking the London streets to visiting St Paul's. They gave some new details about their 180-seater turbo-prop airliner that is due to fly next year, and pointed out mildly enough that aircraft are flying as fast in Russia as they are in Britain. But they would not say how many people work in aircraft factories in Russia, nor would aircraft designer Antonev, who was in the minister's party, be persuaded to be more specific about the time it took to develop an aircraft in Russia beyond claiming that it seemed to be shorter than in this country. Visits like this are made by other military missions without causing more than a ripple in the smooth RAF hospitality machine, but Russian visitors to the West are still unusual enough to raise the wild hope that they might do the utterly unpredictable. Chief Marshal of Aviation Zhigarev may not be the first man to have got a headache from Cinerama, but he has earned a small measure of immortality by leaving the performance because of it.

Breaking the Ring

SIR BASIL BLACKWELL and his supporters are to be congratulated on their part in bringing about the decision of the Antiquarian Booksellers Association to advance into respectability. Hitherto the association has agreed to expel members only if they are convicted of breaking the law against rings (the Darling Act); as nobody ever is convicted, it has been common knowledge that the association has had some law-breakers in its ranks. Under the amended rule it is contravention, not conviction, which is to disqualify firms from belonging to the association; and in its new role as guardian of the law the association is to be helped by a tribunal which is to have outside members—i.e., members who are not booksellers at all (presumably lawyers). This ought to mean that the rigging of auctions even in country sales will now become the exception; if not, Sir Basil Blackwell still has the ammunition to enable him to force the association to add further sanctions.

Now is the time for public opinion to demand, loudly and insistently, that bodies like the British Antique Dealers Association should adopt similar rules for their own members. Given such rules and such co-operation, the police (whose own record in this matter has never seemed very efficient) ought at last to be able to bring some of the culprits to justice. The time is also ripe to try to spread the campaign against auction rigging abroad. The British booksellers, now that they have cleaned their hands,

have an opportunity to focus attention on conditions in other countries, by bringing the question of rings before the International League of Antiquarian Booksellers, to which they are hosts during its meeting in London. If they do, they could isolate the main offenders that remain—the French and Belgians.

Dollar Goods for Delhi

THE new "food-loan" agreement between India and the United States (briefly noticed last week on p. 798 of *The Economist*) is the most massive of its kind. The Americans are to deliver $305,900,000 worth of agricultural surplus products, mainly wheat, and are to pay $54,200,000 towards shipping charges. Sixty-five per cent of the total American outlay—$234 million—will be a loan intended to help India's economic development; duration and rate of interest are to be arranged later. Of the remainder, $54 million will be an outright grant to India, and $72 million will be spent by the American government inside India for its own purposes — including the building of a new $2 million embassy, and the purchase of strategic materials.

By any standard, this is bold and imaginative. It will provide $288 million for India's economic development, of which $54 million will not have to be repaid. An Indian government statement has remarked that 3,500,000 tons of American wheat and 200,000 tons of rice will not only enable current consumption to be increased, but will make it possible to build up reserve stocks. The agreement will also reduce India's requirements of foreign exchange—a critical element in the second five-year plan. For the United States, it has undeniable political advantages. At farm-support prices, the commodities involved cost the United States $550 million (over 80 per cent more than their probable cost to India); on the other hand, as the American Secretary of Agriculture remarked after the agreement had been announced, it will bring about "a helpful reduction in our surplus stocks, particularly wheat, cotton and rice, which have been among our most burdensome." But there is more to it than that. In the context of the economic struggle which the Russian leaders call "competitive co-existence," the agreement compares favourably with the Soviet loan of $100 million to India for the building of a steel plant, even if, as is likely, the interest charged on the loan portion of the American deal is higher than the Russians' 2½ per cent.

In the same context, America's huge farming surpluses are more than physically "burdensome"; they are an embarrassment to the American government as the champion of free enterprise and therefore a gift to communist propaganda; any move to reduce them to manageable proportions is thus doubly welcome. The Americans have sought to avoid offending either their competitors in the free world or the private sector of the Indian economy. Thus, the agreement stipulates that the wheat, cotton and rice shipments will be additional to India's normal imports from all countries, and that not less than $55 million of the $234 million "counterpart fund" will be used to promote Indian private enterprise.

Aid designed to better the prospects of India's relatively free economy in competition with China's is money well spent. This point of view is far from universally accepted in President Eisenhower's Administration, and there are doubtless official critics who dislike seeing American resources go to help a resolutely neutralist country. Washington has done well to disregard their arguments.

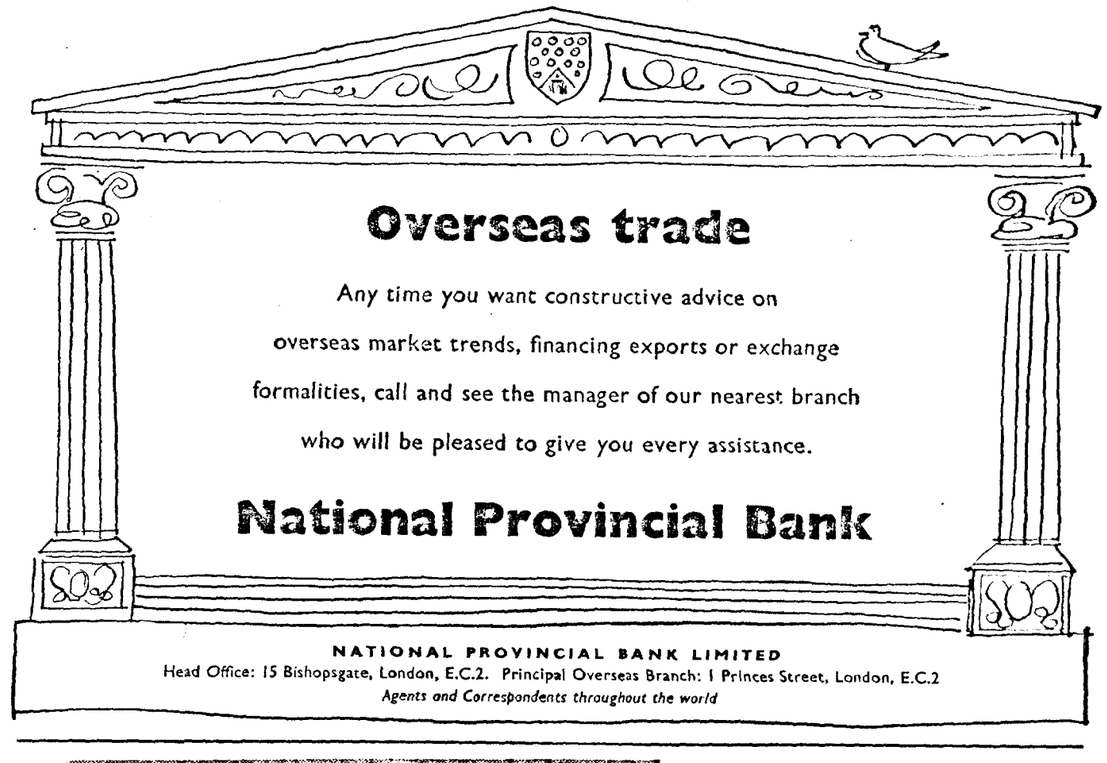
Henry VI and All That

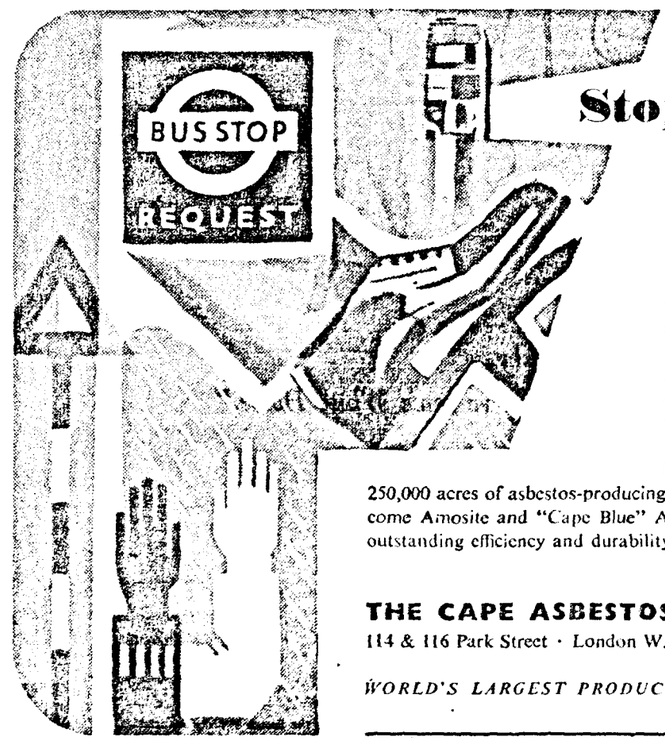
THE Home Secretary, who clearly feels that he will be ruffling sufficient hornets' nests next Parliamentary session with his promise to reform the betting laws, replied decisively to a *démarche* from a motor-cycle racing club during the recess that there is very little prospect of early government legislation on the "highly controversial subject of Sunday entertainment." This means that the law will continue to permit an infinite amount of sophistry both by those who wish to see it observed and by those who wish to evade it. Although there are still on the statute book laws of Henry VI and of 1625, the main bulk of restrictive legislation is contained in an Act of 1780, mitigated by that of 1932 which permits the Sunday opening of cinemas and museums and certain forms of concert that must not be in costume. Typical anomalies are that in a Sunday concert a man might tell funny stories by himself, but must not have a companion with whom to exchange equally funny repartee: a Scotsman might with impunity wear a kilt on a stage on Sunday, while an Englishman doing the same might lay himself open to prosecution. There are also certain dodges for the sale of tickets to a charity concert on a Sunday, and exemptions from the law for clubs.

Mr Lloyd-George's reply to the latest bout of pressure for reform represents another victory for that strange and lynx-eyed body, the Lord's Day Observance Society, whose purpose it is to ensure that nobody gets away with any infringement of the Sunday laws. The society is adamant, campaigning against the existing Sunday privileges, using every legal means to stop Sunday activities. It claims, not without reason, that the anomalies in the law arise out of the "compromises" made in this century, and so has no compunction about using legal points which might seem to others to have fallen into a deserved neglect. Its publicity is of a curiously nineteenth-century flavour: "An honoured Sunday means an exalted Empire" (with picture of Union Jack). It is, in fact, a last stronghold of vigorous Puritanism, with a surprisingly large membership coming from a surprisingly large cross-section of the community, for it is quite wrong to suppose that it is representative of elderly members of the low churches only. The obvious and heated sincerity of this large minority provides a case for saying that it is democratically acceptable, as it is clearly also politically convenient, that the law should remain an ass. It is now certain to do so for at least another three or four years.

Mr Lim Emerges

WHEN Mr Lim Yew Hock took over from Mr David Marshall as Chief Minister of Singapore it was widely but over hastily predicted that as a right-wing leader he would look too obviously a Colonial Office instrument to last long. In fact under his leadership Singapore has had





Stopping the bus

A hand is raised, a foot goes down. Seven tons of loaded bus come swiftly, surely, safely to a standstill. It happens thousands of times a day, almost without a thought—yet not without considerable assistance from Cape Asbestos.

CAPASCO moulded brake linings, which are fitted to London buses and coaches as well as to a high proportion of all British heavy commercial vehicles, are made by The Cape Asbestos Company.

"Cape" today is a group organisation embracing factories in many countries and owning more than 250,000 acres of asbestos-producing properties. From our own South African mines come Amosite and "Cape Blue" Asbestos whose special qualities contribute to the outstanding efficiency and durability of the range of "Cape" manufactured products.

THE CAPE ASBESTOS COMPANY LTD.

CAPE

WORLD'S LARGEST PRODUCER OF AMOSITE AND BLUE ASBESTOS

"I think I'd like a little whisky.
I happen to know they've some White Horse."

MAXIMUM PRICES: Bottles 36/-, ½-Bottles 18·9, ¼-Bottles 9·9, Miniature Bottles 3·9, as fixed by the Scotch Whisky Association

a period of relative quiet for reflection, and last week Mr Lim won a unanimous vote of confidence for his government—which is no longer described as a "caretaker" ministry—in the Singapore Assembly, after trouncing Mr Lee Kuan Yew, leader of the People's Action Party, in debate. But he did so on a policy of going to London to negotiate for self-government early next year; he merely refused to be tied by Mr Lee's "conditions," though he agreed to the most important of them—that there shall be all-party agreement on what Singapore will then demand. Clearly Mr Lim intends to take up the negotiations where Mr Marshall left off, and on that basis nobody in the Assembly could well vote against him.

He has, however, strengthened his own position, and that is important, for in matters of method, if not in purposes, he is a moderate. He has, moreover, scored off Mr Lee Kuan Yew, whom he successfully reproved for attacking the Chief Minister of Malaya on the grounds that his policy was worsening Malay-Chinese relations. The development both of a Singapore military force and the Royal Malayan Navy is, in fact, increasing co-operation between the two countries, as the visit of Tengku Abdul Rahman to Singapore suggests. But Mr Lee put his finger on the sore point in the Federation; and Mr Lim could hardly deny that Singapore still predominantly expresses the Chinese point of view, and the Federation the Malay point of view. The gulf between them remains—and so does that between Malaya and Singapore. But it is more likely to be bridged by practical men like Lim Yew Hock than theorists like Lee Kuan Yew—or those who stand behind him.

Do our Rulers Read History?

It is axiomatic that the proposer of internationalisation of the Suez Canal is never the man in possession.

Take 1885. It is three years since the British occupation of Egypt; the powers have met in Paris to draw up a draft treaty intended to guarantee the free use of the Canal. Sir Julian Pauncefote represents Britain. *Procès Verbal* of May 11th:—

> The Delegate of Great Britain observes that these authors were speaking of natural straits, and not of artificial passages, such as the Suez Canal or the Caledonian Canal, created by human industry within the territory of an independent Power. It cannot be admitted that such channels of communication, although connecting two seas, should be burdened with an international servitude.

Or take 1947. Egypt, represented by Nokrashy Pasha, is appealing to the Security Council for an end to occupation by Great Britain. *Procès Verbal* of August 5th:—

> The status of the Suez Canal is quite different from that of other artificial waterways which serve as arteries of international communication, for it is fixed by that multipartite international agreement to which I have just referred. The Suez Canal was an international enterprise from the very beginning, and then a few years after it was opened all the principal powers of Europe joined with the Ottoman Empire, acting for Egypt, to regulate its traffic, its neutrality and its defence. . . .
>
> It is understandable of course that the United Kingdom should be interested in the security of the Canal. It is not alone in this interest however. Other European countries whose territories extend to Africa and Asia are similarly and equally interested.
>
> The United Kingdom's pretensions to sole responsibility for safeguarding the Canal cannot be reconciled with the principle of universality, equality and neutrality established by the 1888 agreement.

The Other Haley

"LIKE many of the upper class," wrote Hilaire Belloc, "he liked the sound of broken glass." This traditional U-taste has been spreading fast in the last fifteen years: instead of hearties from the Bollinger Club putting aesthetes in Oxford fountains, "youths" (a Bad Word, meaning potential delinquents) have recently been turning hoses on cinema managers, excited by rhythmical music rather than by drink. The main difference between the two phenomena is that the undergraduate was confined within the walls of his college, or at worst within a town which had many centuries in which to build up a defence of scornful tolerance against this kind of behaviour. The young people who now find themselves excited by the rhythms of Mr Bill Haley, the Rock 'n' Roll maestro, are not only unconfined to one area, but are much more numerous. Their nuisance value is therefore much greater than that of their upper class precursors, although this form of intoxication is probably less violent as well as less toxic than that caused by drink.

★

The saddening thing about it all is that Rock 'n' Roll is not more rhythmical than any other form of jazz: it is just more blatantly rhythmical. The basic combination of electric and steel guitars supports shouted words whose *doubles entendres* are as subtle as pile-drivers, and it has been well described as "music for morons." But around the juke-boxes are clusters of young people putting in their three-pences to hear it all over again, and the film which has caused all the trouble has attracted great crowds both here and in the United States. The main attraction is that in enjoying this music there is an esoteric bond between the addicts: those who don't dig Bill Haley are square, those whom he "sends" are really in the groove, inside a charmed circle of enthusiasts. A national newspaper this week took a speaker at the TUC to task for his concern about the waste of all this enthusiasm, when he said how much better employed it would be in the trade union movement. But the speaker was, although over-serious, perhaps on the right lines, for it is a very similar emotion which leads a public-school boy to fanatical attachment to his house, or a Cypriot schoolboy to throwing bombs at Englishmen. If there is no outlet for the natural feelings of loyalty and devotion to a group, they will turn towards the oddest objects, especially when canalised by skilful publicity. And what objects for loyalty are offered in the aimless years between school and National Service? If there is more open hooliganism, then more towns will have to ban Mr Haley's film; but let us realise, please, that that would be a pity.

Letters to the Editor

White Man of Asia

SIR—It was a rude shock to read the article in your issue of August 11th. How a high-minded, reputable, usually accurate and intelligent periodical could stoop to such gutter journalism is beyond understanding.

If "A Correspondent in Seoul" really exists, he should be indicted for violation of everything for which Great Britain and Englishmen stand. His position is anti-British, anti-American, anti-Free World. It is, in other words, pro-Communist. Set forth very briefly, these are some fundamental policies of Korea that were distorted, twisted, and completely misrepresented in *The Economist* article:

Diplomatic relations.—Korea seeks friendly relations with all Free World nations, and it believes in a policy of toughness only against those that are bent upon its destruction. Unfortunately, formal diplomatic relations can be maintained with only a few countries because of the excessive cost of such overseas missions.

Japan.—President Syngman Rhee and Korea have been seeking friendly relations with the Japanese ever since the Liberation of 1945. But Japan continues to claim 85 per cent of Korean property and to challenge the sovereign existence of the Republic. Both actions are in open violation of the San Francisco Peace Treaty by which Japan regained its independence. Once Japan abides by agreements already made, the Korean Government stands ready to reopen negotiations for the adjustment of all outstanding differences.

Communism.—The Republic of Korea was wantonly attacked by the Communists in 1950, and was saved by the intervention of the United States and 15 other countries of the United Nations. Red China later joined the north Korean puppets in the invasion, and both regimes were branded aggressors by open, democratic vote of the United Nations. The Korean War still has not ended, and the Communists are building up strong forces for renewed attack. Until the Communists give up what they have taken by force, and abandon their conspiracy of international conquest, the Korean nation and people believe that there can be no lasting peace in Korea or anywhere else.

Unification.—Korea has never insisted on anything except assurances of free and democratic procedures. The unification formulae of Korea and the United Nations are identical.

Relations with the United States.—Korea and America have mutual respect and consideration for one another, as all friendly nations should. Differences have always been adjusted amicably, and there has been no dictation from America and no intransigence on the part of Korea. Both are proud of the fact that the alliance between them has been constructive and highly successful for both sides.

Military Forces.—Korea is compelled to maintain large armed forces by the continuing threat of even larger land and air units in the Communist-held north. But these forces remain under orders of the United Nations Command and have neither the power nor the intention to unleash offensive warfare.

We of Korea hope sincerely that *The Economist* will make an honest effort to set the record straight about our country and its policies, and that it will also make amends for the great disservice its Seoul correspondent has done the British-Free World cause.—Yours faithfully,

IL SUN YUN
President
Seoul National University, Korea

Bundles for Germany?

SIR—I read with some dismay of the efforts of the Germans, with the apparent sympathy of the United States Administration, to recover some, if not all, of the German property seized in the United States.

By the Paris Act of 1946, the Allies undertook not to return the German property they seized. By the Bonn Convention the validity of the seizure was recognised by the West German Federal Republic, which undertook to compensate its nationals accordingly.

It is hard to understand why the United States should apparently be willing by a unilateral act to disregard such treaty obligations.

Moreover, what will be the effect on our European Allies? Success in the United States will undoubtedly lead to German pressure on the French, Belgians and Dutch. The future clearly emerges.

The Germans occupied these countries and subjected them to economic pillage and, as you reported in an earlier issue, the claims of Holland for the restitution of securities looted during the occupation are as yet denied by the Germans. Unless something is done to stop the present trend, a nation which from the economic viewpoint has emerged from defeat stronger than before will succeed in recovering all its foreign assets, and the victors who paid the price for their victory will be the poorer and finally be deprived of reparation for the damage they suffered.

It is to be hoped that the United Kingdom Government, at least, will point out to the United States the obligations it apparently now intends to disregard.—Yours faithfully,

ROGER W. SEWILL
Director-General,
London, S.W.1 Aims of Industry

Anti-Colonial Front for Students

SIR—While your correspondent's report on the Congress of the International Union of Students in Prague is admirable, his conclusions are unnecessarily alarmist. To suggest that the West is losing the race for the allegiance of the colonial and Asian countries is to attach too much importance to the unrepresentative delegations from these countries. The significant feature at Prague was, in this respect, the absence of the National Union of Students of the Gold Coast, Nigeria, the West Indies, Malta, Ceylon, Kenya, Pakistan and many other similar countries. They will, in fact, be meeting at the International Student Conference in Ceylon this week, an organisation founded by the Western Unions in 1950 and now by far the most representative gathering of its kind. This year, indeed, the Afro-Asians will be in an absolute majority for the first time. There cannot, therefore, be much doubt who has won the race for their support.—Yours faithfully,

ROLAND FREEMAN
Leader of the British Group of
Observers at the Prague Conference
National Union of Students, W.C.2

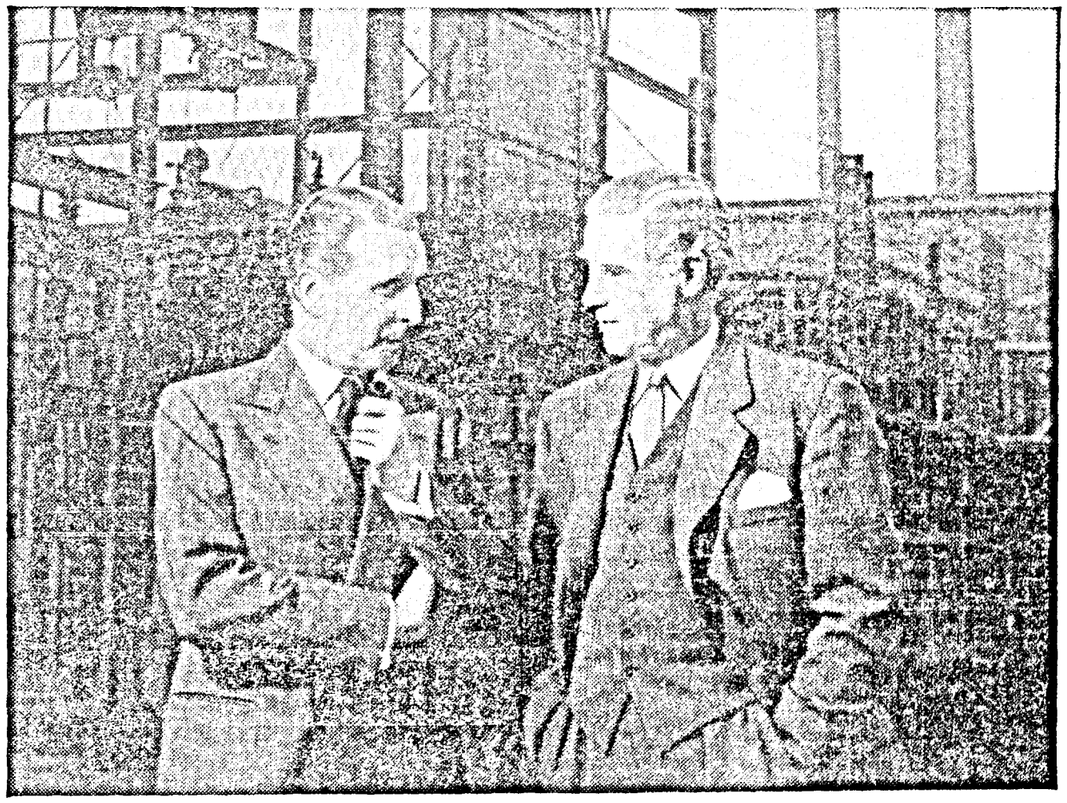
New Ideas in Steel

SIR—One of the "unconventional suggestions," which you attribute to me in your Business Note of page 821, is not quite correctly described. It was not my intention to suggest that the independent re-rollers "should re-equip their mills to take larger billets." My suggestion was that new re-rolling plants producing 4,000 tons per week might be built at some of the existing smaller steelworks, who could contrive to expand their melting capacity sufficiently and use larger billets from their existing rolling mills. I did, in fact, mention that this has already happened in this country as well as abroad.—Yours faithfully, EDWARD T. SARA
United Steel Co., Sheffield

University College Students

SIR—Unfortunately, we have got records of the careers and up-to-date addresses of only a very small proportion of the old students of University College London, of whom we calculate that there must be some 30,000 either in this country or overseas. We are anxious to get in touch with them, to invite them when possible to appropriate college functions, and on occasion to seek their advice. We hope that old students will write, even a postcard, to the Secretary of University College London, Gower Street, London, W.C.1, giving their addresses, dates at college, and subjects.—Yours faithfully, IFOR EVANS
University College, London

"I feel much safer since we got Nu-Swift fire protection..."



"... yes, I did read about that factory—terrible reminder that fire not only burns but *kills*. Actually, we've never believed in taking chances with fire. That's why we got the best fire-fighting equipment. What's that? Oh, you're thinking of getting Nu-Swift too? Wise man!

"As I was saying, we have quite a few small fires here—unavoidable really in a factory like this. But Nu-Swift extinguishers are just right for the job. After all, most fires have small beginnings; and it's what you do about them in the first few minutes that really counts. Remember, Nu-Swift extinguishers are all pressure-charge-operated for *instant* action—and the 95 m.p.h. jet of the Universal Extinguisher (that's the sort we've got) literally *stuffs* out the flames. What's more, Nu-Swift extinguishers are easy to use, easy to maintain—and absolutely reliable. Now you see why I feel much safer since we got Nu-Swift".

...and so will you

because Nu-Swift extinguishers combine these four essential advantages.

★ **INSTANT ACTION** *immediately the Knob is struck—thanks to the principle of pressure-charge operation.*

★ **GREATER RELIABILITY** *through extra care in design and manufacture. The sealed pressure-charges do not leak, evaporate or cause corrosion.*

★ **HIGH-SPEED RECHARGING** *thanks to easy-to-drop-in pressure-charge, pioneered by Nu-Swift. All 2-gallon models can be recharged in 30 seconds.*

★ **STANDARD SYSTEM** *throughout the range. All models are used in the commonsense upright position. Different colours show at a glance the risk for which each extinguisher is designed.*

Quintessential Economics

A REVISION OF DEMAND THEORY.
By J. R. Hicks.
Oxford University Press. 203 pages. 18s.

PROFESSOR HICKS is one of our contemporary economists who writes with style. Not that his text is embellished with flourishes or manifest witticisms; his gift goes deeper. He takes the reader comfortably into his confidence; he confronts him with some (carefully selected) obstacles that have impeded the progress of his thoughts; he asks him to share in his delight at the suddenly perceived way through a thicket of difficulties, sometimes almost in the manner of Henry James seeking to make us share his perception of some psychological fine shade.

The subject matter is of the highest degree of abstraction. Taking problems perplexed by the contortions of mathematicians, he has applied some logical principles, expressible in simple English, and some arithmetic, or most elementary algebra, and brought to his aid a few diagrams of outstanding informativeness, and thereby brought us to his conclusions. It is a superb exercise of exposition.

He is mainly concerned to deduce the law of demand, generalised to include the demand for groups of commodities, from the sole premise of consistent preference.

> In one set of market conditions he [the ideal consumer] makes one choice, in others other choices; but the choices he makes always express the same ordering, and must therefore be consistent with one another.

He does not think that this hypothesis can itself be tested, as some have argued, by observing market behaviour; the variety of tastes, and of incomes, in a group of consumers would generate apparently, but not really, inconsistent phenomena. "The only way of testing the hypothesis is by seeing how far such explorations [viz. in terms of changes in other variables than current prices or incomes] do in fact satisfy us, in the inconsistent cases which we find." Teachers have long been expounding that the law of demand stems from the bare assumption of rationality, and does not require some alleged psychological principle of diminishing reaction to stimuli; but they have had no such clear account of the stemming as that now provided by Professor Hicks.

He makes some other deductions too from the bare principle of consistency, such as, subject to appropriate assumptions, the equality of cross elasticities. Simple-minded readers will be pleased to learn that the Giffen exceptions to the law of demand "can hardly occur, as soon as consumption is reasonably diversified," though they will be terrified to discover the possibility of an "anti-Giffen" case, when the enhanced real income due to the greater abundance of a "normal"—the opposite of an "inferior"—article might raise its marginal valuation. Happily this case could not "show up in actual market behaviour." As may be expected, Professor Hicks touches on the great cardinalist-ordinalist controversy; he holds, albeit not dogmatically, that we do not require the hypothesis that a cardinal measurement of utility is possible.

It may perhaps be complained that there are not enough clear fingerposts to the general bearing of certain passages, pellucid though these may be in themselves. The fingerposts are there all right, just as they are there in Henry James. But, while in a work which primarily stimulates æsthetic apprehensions, one is on the alert for obscurely placed fingerposts, when the current text is taxing all one's intellectual powers, one may fail to perceive inconspicuous fingerposts, anyhow till the second or third reading. And it must be frankly stated that this book does tease the intellect, and tax it to its full capacity; but the teasing and taxing are made as pleasant as it is possible for those processes to be.

In Shady Cloister Mew'd

IN A GREAT TRADITION: *Tribute to Dame Laurentia McLachlan, Abbess of Stanbrook.*
By the Benedictines of Stanbrook.
John Murray. 324 pages. 25s. net.

THIS is a profoundly interesting book. Mainly the account of a most remarkable woman who spent her long life from girlhood in an enclosed Benedictine nunnery near Worcester, it also records the vicissitudes during three centuries of the community to which she belonged. The community was established at Cambrai on New Year's eve, 1623. Among nine voluntary exiles to Flanders, sisters of the new "Monastery of our Lady of Comfort of the English Dames of Cambrai," were Gertrude More, great-great-granddaughter of the author of *Utopia*, and Catherine Gascoigne, claiming descent from Lord Chief Justice Gascoigne who sent the future Henry V to prison.

The book sketches the general history of English Benedictine monasticism before and after the Reformation, but its framework is essentially biographical, a narrative of this nunnery's varying fortunes under the leadership of successive Abbesses, from Dame Catherine Gascoigne (1600-1676) to Dame Laurentia McLachlan (1866-1953). The Cambrai nuns escaped to England during the French Revolution, destitute and in the clothing of Carmelite nuns who had shared imprisonment with them at Compiègne before being guillotined. After further and rather grim vicissitudes in England, the returned Benedictines were able in 1838 to occupy their present home in Worcestershire, the Abbey of Stanbrook.

Margaret McLachlan, a brilliant girl from Lanarkshire, entered Stanbrook's convent school in 1881, joined the community in 1884 as Sister Laurentia, and was elected Abbess in 1931. She became an excellent musician, a learned scholar in musicology who greatly influenced the revival of plainsong, an eminent authority on illuminated manuscripts, and an outstanding administrator. With these gifts and accomplishments was a genius for friendship. The most interesting part of her biography describes how the radiant charm, abundant sympathy, and wit, of an enclosed nun brought her the devoted friendship of GBS, who was introduced to her in 1924 by Sir Sydney Cockerell, secretary to William Morris and afterwards re-creator of the Fitzwilliam Museum at Cambridge. Sir Sydney had known Dame Laurentia since 1907, but at that time she had never even heard of Bernard Shaw. Accompanying Shaw on one of his visits to Stanbrook, Cockerell beheld a GBS bereft of his customary ebullience. Many years later he remarked to a member of the community: "With Morris and your dear Abbess he was on his good behaviour and seemed to admit that he was in the presence of a being superior to himself."

Extracts from letters exchanged between Dame Laurentia, GBS and Cockerell are extraordinarily interesting. This dazzling and strangely assorted trio were—inevitably—much concerned with problems of belief and unbelief. The dedicated and disciplined Roman Catholic nun, the deistic Shaw, and the immutably sceptical Sydney Cockerell furnish a fascinating series of epistolary debates.

The book is admirably written and illustrated. It appears to be the work of one anonymous author with a lively narrative style. This author should, however, have verified the quotation on page 205 from *Dedicatory Ode* by her (or his) co-religionist, Hilaire Belloc.

Prospectus for World Union

MINOS OR MINOTAUR? *The Dilemma of Political Power.*
By John Bowle.
Cape. 209 pages. 15s.

MR JOHN BOWLE has made a niche for himself as an exponent of the lines of development in European political thought which may be quoted in support of west European and "Atlantic" union. His latest book goes further; it is a sort of prospectus for world union and a world state. In its total effect the book is somewhat discursive; it is not the reasoned analysis which the author sometimes claims to be offering, but more of a succession of linked commonplaces, with many of which a reader will find it easy to agree.

Some distinct trains of thought can be isolated. The main one, which will have a familiar ring to readers of certain works of sociology, particularly Professor Popper's "Open Society," starts from the proposition that the central problem of politics is the control of power. Such control can be guaranteed publicly only by a constitutional form of government, and privately, Mr Bowle adds, by "conscience." The key to progress in a society which satisfies these conditions is "social engineering," the application of the social sciences. Contrasted with this world view at the present moment are on one side conservatism and traditionalism and on the other dialectical materialism and Marxism-Leninism, either of which favours a closed rather than an open society.

To this thread of argument Mr Bowle attaches his beads of opinion, warmly felt and rotundly expressed; his unquestioned support of western diplomacy, with its various strategic devices, Nato, Seato, and so on; and a sonorous partisanship of the United Nations idea, with all those activities and agencies—WHO, FAO, ILO, TAB, and the rest—which he regards as enduring examples of applied social science, destined, as embryonic world institutions, to supersede the more ephemeral manifestations of western defence. These last are made necessary because the world he is seeking to unify is divided, into a liberal-democratic half, animated by conscience, and a communist half, bemused by myth.

How the transition to world harmony is to be effected is the problem confronting not only Mr Bowle but also those who would be content with something short of a world state. He passes over the important fact that the communists are more explicitly dedicated to the unification of the world than their many-hued opponents. He puts before humanity the well-known alternative, total destruction by atomic war or the peaceful evolution of a world state. But how, short of war, he will persuade the communist countries to give up their own dream of a world union and accept his uncompromisingly western one instead, he does not say. Perhaps he envisages, as many do, a future in which the west, having followed his prescriptions, will be so overwhelmingly successful that the communists will have no choice but to join the enlarged western community. The prescriptions themselves often seem little more than an inventory of western institutions and attitudes with the attachment of a "good" or "bad" label to each: colour prejudice—bad; public schools—good; over-population of the United Kingdom —bad; Asian awakening—good; Asian and African poverty and backwardness —bad; religion (of Eisenhower's all-embracing kind)—good; and so on.

The trouble is, as a more considered analysis would have brought out, that the various tendencies of which Mr Bowle approves do not necessarily reinforce one another but may be in conflict. It may be, for instance, that some development or other in the direction of European union will not be a stage to world union but stand in its way. The interests of Commonwealth unity and Atlantic union are not always easy to reconcile. Awkward facts like these are the affair of practical statesmen, the "realists" and "power politicians" at whom Mr Bowle rails for their lack of enthusiasm for Unesco and some other United Nations (or "United Europe") activities. Yet these same realists are certainly the architects of the western defensive arrangements of which Mr Bowle also approves. They may even share some of his likes and dislikes, though they might not rank them all so equally. What they might, however, ask is whether the addition of a world state to western aims is not an unnecessary additional complication in the business of coming to terms with the communist and neutralist states.

Why Man Gardens

MEN AND GARDENS.
By Nan Fairbrother.
The Hogarth Press. 240 pages. 21s.

THIS disquisition into the reasons why men want gardens, and the kind of gardens they make, is conducted on very personal lines. History, impressions, anecdotes and quotations are strung together so lightly as to make it an attractive bedside book. There is, however, a good deal more to it than this, much of it of considerable interest. The chapter on the gardens of Tudor England is excellent, while the account of the formal gardens of the seventeenth century is written with an understanding that leaves one feeling almost warm-hearted about Louis XIV. On present-day gardens, too, Miss Fairbrother's approach is just what is needed; although unorthodox, it is a great deal more to the point than the so-called "practical" gardening books.

To the English school of landscape gardening she does rather less than justice. This is a pity, for the English park and the *jardin anglais* are among our few contributions to the art forms of the world. And Humphrey Repton was not merely a "fashionable writer." Many of the ideas and designs contained in his famous red books were carried out by the landowner clients for whom the books were prepared. They form the basis of much of the beauty of the English countryside today. His analysis of the "Sources of Pleasure in Landscape Gardening," given in the appendix to his "Sketches and Hints" and reprinted in Loudon's "Landscape Gardening," is as valid now as when it was written and might be read with advantage by all who contemplate laying out a garden.

Lending on Houses

URBAN MORTGAGE LENDING.
By J. E. Morton.
Princeton University Press. 207 pages. $4.00.

THE United States National Bureau of Economic Research has been engaged for some time on an urban real estate finance project, and has already published several monographs on the urban mortgage market. This volume summarises the findings of some of the earlier studies and draws together information relating to the principal institutional lenders—insurance companies, commercial banks, mutual savings banks and savings and loan associations. It is thus a study of the supply side of the mortgage market in the United States, dealing with a group of lenders which have considerably increased their share of the total outstanding debt over the past thirty years. They have done so, not because they have increased the proportion of mortgages in their portfolios, but rather because they have secured a greater share of total savings and maintained the proportion of their funds invested in mortgages. The sharp increase in the number of owner-occupied houses which has occurred in recent years (from 11.4 million in 1940 to 19.8 million in 1950) has provided much of the impetus to the expansion; and the introduction of federal mortgage loan insurance in 1934 and the Veterans' Administration loan guarantee programme in 1944 have materially helped to make the owner-occupier mortgage a more attractive investment medium.

The study contains much statistical material which emphasises (as in the case of hire-purchase finance) how much more is known about mortgage finance in the United States than in this country. A similar investigation of the financing of investment and owner-occupier houses and flats by insurance companies, building societies, local authorities and housing associations would be of more than passing interest. Probably we should find that some of the findings were broadly parallel to those of Professor Morton. We know, for instance, that building societies have become by far the biggest lenders on single family houses, and this development is paralleled in the United States by the savings and loan associations. We know, too, that mortgages rarely survive their contractual repayment terms, and we should probably find that loan-to-value ratios and interest rates have followed much the same trends in this country.

This is a valuable survey of a particular field of finance. If there is a criticism it is that the prewar and postwar phases could with advantage have been separated instead of being treated as a whole.

PLANT LOCATION FACTS

on financial assistance the free enterprise way

Financing a new plant today is a problem for any business, large or small.

In New York State, many banks, insurance companies and investment houses are willing individually to help you in making arrangements to finance new operations or build new plants. In addition, by special charter of the State Legislature, there has been established in the State of New York the New York Business Development Corporation. This organization is privately financed and managed and specifically designed to assist qualified enterprises in financing new or expanded operations in the State.

If you have a financing problem, our business is to put you in touch with the proper sources of capital. Therefore, whether you need mortgage money to help finance your new plant in New York State or working capital to cover expanded operations or to offset expenditures for moving into the State, do not hesitate to get in touch with us.

Financing won't be your only consideration in deciding on a new plant. You will want complete facts on labor, markets, water, available sites or buildings, power, fuel, transportation and raw materials, to mention just a few. And you will want information on these as they apply to the successful operation of a specific plant.

A tailor-made report

Any or all of the factors important to your analysis will be covered in a confidential report to you—tailored to your needs. It will be prepared by a professional and experienced staff to cover either New York State locations of your choice, or, if you wish, sites which we will select on the basis of your needs.

Our booklet, "Industrial Location Services," explains what we can do for you. To get your free copy, write me at the New York State Department of Commerce, Room 690F, 112 State Street, Albany 7, New York.

GOING TO CANADA?

Fly TCA to Canada at new lowest-ever fare

From October 1st*, you can fly to Canada on TCA's new 15-day Excursion and save *more than* £34. With this notable economy you get the same comfort, the same excellent meals, the same choice of frequent, direct flights that have made TCA's Super Constellation service the most popular way to fly to Canada. Your Travel Agent will give you full details of TCA's new 15-day Excursion to Canada—the considerable sums you can save, and the magnificent service you get.

* *Subject to Government approval*

TRANS-CANADA AIR LINES

27 Pall Mall, London, S.W.1, and Glasgow.

Serving Europe, all Canada, U.S.A., Bermuda, Nassau, the Caribbean

American Survey

AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

South of the Law

Washington, D.C.

ON Monday, after a week in which angry small town mobs were held back from the schoolhouse by the National Guard in the Tennessee mountain town of Clinton and the mining settlement of Sturgis in Kentucky, racial segregation was abolished without incident throughout the entire publicly financed school system of Louisville—Kentucky's principal city. This contrast may for some time be the mark of the "border" zone separating the deep South from the rest of the country. As was to be expected, a substantial city, with a strong liberal newspaper, a university which has already been integrated and two years of intensive preparation by social agencies, managed a major social reversal with more grace than small, backward communities with long traditions of rugged conservatism.

The outbreaks of violence in Kentucky and Tennessee and the threats of violence in Texas have produced varied reactions. In the famous state capitol at Richmond, Virginia, where public debates have been going on all this week and last about new plans to buttress racial segregation, it was eagerly noted that the incidents took place in counties where there were relatively few Negroes. This was taken to prove that southerners will not stomach integration in the schools under any circumstances even where it would not create major practical difficulties. Ardent segregationists concluded that Virginia's south-western mountain counties, which are similar in character to those in eastern Tennessee, might back even more intransigent defiance of the Supreme Court than had been expected.

Observers in Washington, however, less than an hour's flying time away from the completely southern atmosphere of Richmond, were drawing different conclusions. In Sturgis and Clinton, despite the hostile crowds, Negro children were still going to previously segregated schools because the Governor of Kentucky, immediately, and the Governor of Tennessee, after an interval of painful hesitation, had used force to uphold the law. In Clinton, agitation was whipped up from outside by a racist fanatic from Washington. He was sent to prison for contempt of court and the boycott of the school by white children soon began to dwindle away. On the other hand in Mansfield, Texas, where there was also trouble, Governor Shivers, an ardent segregationist, merely sent a handful of Texas Rangers to "keep order" while maintaining neutrality towards a court order to admit Negro children into the school. As a result no Negroes have been able to register.

These two types of reaction are not mutually exclusive. They both emphasise that the crucial feature is the attitude adopted by the individual state governments. Five states have formally proclaimed it to be their policy to defy the Supreme Court and "interpose" their "sovereignty" between their citizens and the "usurping" justices so as to shield the local authorities from the Court's decision. The example of Texas, where "interposition" has just been adopted by Democratic voters in their primary election, although not yet ratified by the state legislature, shows how difficult it will be to give reality to a court order wherever this strategy is in effect.

*

Broadly speaking, two forms of resistance are merging in the deep South. There are variations of the "pupil assignment" plan, under which the local school board or the state authorities will direct pupils to particular schools according to such criteria as "health" or "intelligence," which would be contrived to keep the races separate. Secondly, there are various strategems of delay ending with the brick wall of the total abolition of the publicly supported school system. The original Virginian plan, a delicately balanced compromise between different sections of the state, provided for counties to decide by local option whether to assign pupils in a manner which the courts would accept or whether, when all delaying tactics were exhausted, to abolish the schools. Tuition grants would be available to parents if the local school had been integrated and they did not wish their children to attend it, or if the school was no longer there. It is substantially this scheme which was adopted by constitutional referendum in North Carolina last week.

But in Virginia itself, under Senator Byrd's new policy of "massive resistance," the state government is now asking the General Assembly to reject any policy that would assist racial integration anywhere in the state. Under the new scheme all state funds would be cut off from a school board which complied with a court order to integrate. Senator Byrd's objective is to force both the Virginian public and the federal judges to acknowledge the absence of any middle ground between "the ultimates." The state can have either segregation or a public school system—but not both.

The debate in Richmond is being watched with intense interest on account of the primacy of esteem in which Virginia is traditionally held in the South. Its progress suggests that, however cautious one should be in such an emotional issue, President Eisenhower's attitude of relaxed decency may not be enough. It suffers from at least two disadvantages. The defence of a major constitutional prin-

ciple against the opposition of state and local officials is being left entirely to the courts. This puts the onus of setting the pace and deciding the tactics on the shoulders of a private organisation, the National Association for the Advancement of Coloured People, which picks the law suits. This is scarcely fair; the NAACP is vulnerable to local pressures and to attack under state laws, as has already been demonstrated in Alabama and Louisiana. Moreover, since moderates, including the President, have developed the habit of establishing their good faith by criticising "extremists on both sides," the NAACP has been made to look like the counterpart to the extreme segregationists and White Citizens Councils. This, as one of its leaders recently admitted, has seriously damaged its public standing.

But the second objection is perhaps more serious. As Mr Lippman has pointed out, the gradual adjustment of the South to the Court's decision involves social and political decisions, not just legal ones. A former Republican candidate for the Governorship of Virginia has just produced a four-stage timetable for the whole southern region, starting with counties that have few Negroes and moving on through cities such as Norfolk, Virginia, where the pattern of housing would ease the problem, to a large zone where compliance cannot be expected for a very long period. But unless the President gives a real lead and supplies some machinery, however informal, through which this and alternative schedules can be considered, the embattled southern moderates will lose heart and the upholders of "active resistance" consolidate strength. For it is precisely because they are afraid that compliance in the cities and the easier counties will weaken the principle of state sovereignty on which they stand, that the Virginian leaders are calling for retaliation against areas that comply with the law. The experience of the last three years suggests that time is not to be relied on indiscriminately as the great healer.

How Maine Went

PRESIDENT EISENHOWER and the five hundred Republican leaders who gathered at Gettysburg to launch their party's electoral campaign hoped that they could disprove once and for all the old adage—"As Maine goes, so goes the nation." For in its elections, which come eight weeks before the nation-wide presidential and congressional ones, Maine went Democratic in no uncertain way. Running on the slogan of "one good term deserves another," Governor Edmund Muskie, a lanky Democrat of Polish descent, was re-elected by a larger margin than in 1954 in a state long identified with dour conservatism. Mr Muskie's victory may represent a vote for a personality rather than a party but the same is not true of the congressional and local results. Of the state's three seats in the House of Representatives, one went to the Republicans, one to the Democrats and the third will probably fall to the Democrats after a re-count of an extremely close vote. This will be the first time in twenty-two years that Democrats will represent Maine in Congress. The same trend was apparent in the elections for the state legislature; six of the seven seats from the city of Portland were captured by the Democrats.

Republican strategists were probably less worried by the actual results in Maine than by the fact that the Democrats were so successful in getting people to go out and vote. For if anything can mar the strong prospects of the President's re-election it is the threat of over-confidence and resultant apathy among Republicans or those independents who went to the polls in support of General Eisenhower in 1952. This problem was neatly illustrated in this week's primary elections in Wisconsin. There, Senator Wiley, the staunchest Republican supporter of the Administration's foreign policy, retained the senatorial nomination by defeating Mr Glenn Davis, a right-wing Congressman whom the Republican party in the state had endorsed in May. Senator Wiley probably owed his survival not to support from the White House—which was conspicuously lacking—but to the fact that many Republicans in Wisconsin refused to accept the lead of their party organisation—and Democrats may have voted in a Republican primary for the lesser of two evils.

In order to meet the threat of apathy squarely, Vice President Nixon is starting out on a 15,000 mile campaign trip through thirty-two states. This vigorous tactic may, however, backfire, for not only is Mr Nixon the weaker link in the Republican chain but his ubiquity will underscore President Eisenhower's absence. That is just what Mr Stevenson needs to keep the issue of the President's health in the voters' minds.

Rising Investment Abroad

A HEALTHY increase during 1955 both in American private investment abroad and in foreign investment in the United States is reported in the Department of Commerce's annual review of international investment, published in the August issue of the *Survey of Current Business*. American private investors added $2.4 billion to their overseas assets in 1955, bringing the total invested abroad to $29 billion; assets held by foreigners in the United States increased in value by nearly $2.8 billion to a total of $29.6 billion. Over 90 per cent of the increase in American private investments abroad was in long term investments, and $1.6 billion of this consisted of new investments and reinvestment of earnings in the foreign branches and subsidiaries of American companies. By contrast, most of the rise in foreign assets in the United States came from the higher market values of foreign holdings of American corporate stocks and from a rise in liquid dollar resources, such as bank deposits and obligations of the American government, held by foreigners.

The greatest attractions for American investors outside their own country are still in Canada where, although less was invested than in the earlier postwar years, American holdings, mainly in manufacturing and in the petroleum industry, rose by nearly $600 million in 1955. More than $300 million was invested in Latin America, also mostly in manufacturing concerns. American investment in manufacturing plants and petroleum refineries and distribution facilities in Western Europe also rose by over $300 million. But the underdeveloped countries of Asia and Africa shared in the general acquisition of new American private capital on a much smaller scale.

With more foreign subsidiaries reaching the earning stage, helped by the strong world demand and rising prices of both raw materials and manufactures, American private investors earned a record $3.1 billion from their overseas ventures in 1955, a jump of almost 20 per cent over the previous year. Of these earnings $1.2 billion came from the petroleum industry, reflecting a 15 per cent increase in the production of crude oil by American-controlled oil companies overseas. It is significant that many American companies abroad earned their own dollars to pay dividends to their American shareholders, for about one-third of American imports from Canada and Latin America and about one-tenth of American imports from the rest of the world were produced by American companies established abroad.

Foreign held assets in the United States, nearly three-fifths of which are short term investments, earned only $640 million in 1955, although this was a 20 per cent increase over the previous year.

To Span America

ON August 2nd, the State Highway Department of Missouri awarded a contract for the construction of a multi-lane motor road between two local communities, Lebanon and Hazelgreen. This project, which covers less than three miles, is the opening gun in a vast programme that will span America with 41,000 miles of new road. The federal government will spend more than $33 billion—to be matched in the forty-eight states by state, local and municipal funds—and construction is expected to take from thirteen to fifteen years. Ohio, California, Texas and Kansas rapidly followed Missouri in beginning work on a mosaic of local construction which when completed will allow the American driver to speed safely and freely from Boston to San Francisco and from the Canadian border to Texas. Only some 200 miles of new road will be paved in the coming year, but 3,000 miles of "super-highway" are scheduled for service by the middle of 1959.

It is already becoming possible to estimate some of the economic consequences of this enterprise. The road equipment industries are at present operating at 50 per cent of capacity and a third of their equipment is idle. But by the end of 1957, it is expected that they will be working at full stretch. It is estimated that highway construction will require nearly 3.5 million tons of steel in the next twelve months, and a grand total of 50 million tons for the entire programme. The steel strike aggravated a chronic shortage of structural steel and this will only be overcome when new rolling mills are completed. An even more acute problem is the lack of engineers. As one observer put it in Oregon, "it seems that we will be building our highways with high school engineers." But several states, with California in the lead, are trying to solve this difficulty by using new electronic calculators. These machines can compute and analyse traffic statistics, calculate traverses and the amount of earth that must be shifted for a given section of the road, and perform other mathematical chores, thus freeing available engineers for actual design and construction.

The government is seeking to reassure state and local authorities who are worried lest the federal highway programme should spell the end of toll roads built by the individual states. Toll roads which adequately serve the traffic needs of the local area will not be duplicated by the new highways and under special fiscal conditions they may be integrated into the interstate network. Congress has ordered a study with a view to deciding, in January, 1958, which toll roads should be included in the system of free highways and investors in these roads will then be compensated.

Conscience at the Bar

FROM A SPECIAL CORRESPONDENT

WHEN Judge John Bigelow was appointed in July to the newly created board of governors of Rutgers University, New Jersey, the Judiciary Committee of the State Senate first rejected the nomination and then agreed to confirm it only after a storm of public protest. The committee was reluctant because Judge Bigelow, after his retirement from the bench, had responded to a request from the Essex County Bar Association to represent a teacher who invoked the Fifth Amendment, which protects a witness against self-incrimination, before the House Un-American Activities Committee. This provoked attacks on the Bar Association's "destructive leadership" in helping to provide counsel for "Fifth Amendment pleaders."

Earlier in the year, a senior official in the Department of Justice attacked the Cleveland Bar Association, in a public address, on the ground that it had been "duped" into furnishing counsel for Communist party officials standing trial in Cleveland. Before the week was out, the President of the Cleveland Bar Association had called on the Attorney General in Washington and Assistant Attorney General Tompkins had denied making the statement. The officials of most other Bar associations, however, maintained an embarrassed silence. Local Bar associations in Philadelphia and Denver had set a somewhat reluctant example in providing counsel from leading firms for groups of Communist party officials charged with advocating the violent overthrow of the government; and the American Bar Association as a whole had gone on record as early as 1953 about the obligation to provide counsel for unpopular defendants, "without being penalised by having imputed to him his client's reputation, views, or character." But, by and large, lawyers seem to be more sensitive to the popular identification of the lawyer with his client than they are to the tradition that enjoins the Bar to provide counsel for any man accused of a crime.

The tradition was enshrined in the canons of ethics adopted by the American Bar Association half a century ago, but in a way which exonerates the individual lawyer from any direct responsibility. One article which deals with the right of the lawyer "to undertake the defence of a person accused of crime regardless of his personal opinion as to the guilt of the accused"—and *a fortiori* as to the opinion of the community—is counteracted by another which permits the individual lawyer to choose his briefs, and to reject any that he finds distasteful, without accounting for his choice to the Bar or to the public. It has been said that the responsibility for representing unpopular

Heir from the West

San Francisco

THE Republican convention confirmed that Mr Nixon is now heir presumptive not only to the Presidency but also to the leadership of the party. But the convention also made it clear that, if Mr Nixon has not succeeded to the Presidency itself in the meantime, his right to the succession in the party will be hotly contested as 1960, the next presidential year, approaches. It was Republicans who were murmuring "Stick with Ike, stuck with Dick" in San Francisco. More significantly, the only sustained opposition to Mr Nixon's nomination developed in the delegation from his home state, California. Admittedly, the revolt, which was only suppressed after some complicated negotiations, was led by one of the Vice President's bitter rivals, Governor Knight, but Mr Knight objected to supporting Mr Nixon on the ground that independent voters, particularly trade unionists, would not vote Republican if he was one of the party's candidates.

This type of independent support was first drawn to the Republican party in California by Mr Knight's predecessor, Governor Warren. He ran the state on almost non-partisan lines and, as a result, Californian elections have consistently been won by Republicans in recent years, although the party lags far behind the Democrats in the number of voters it can claim in the state. California is the second largest state in the country and one where the results in the presidential election are likely to be close. Furthermore the main reason why Mr Eisenhower is thought to be unbeatable is because he appeals to the type of voter who is supposedly repelled by Mr Nixon; Republican votes alone are not enough to elect a President today.

In fact Mr Nixon is most criticised by members of his own party in the place where he is best known. Many Republicans resent just as much as do Democrats the way in which he won his seat in the House of Representatives in 1946 and his seat in the Senate in 1950. His opponent in each case was a well-known liberal Democrat against whom Mr Nixon's supporters used distorted evidence to show that they had close connections with the Communist party. When Mr Nixon's friends defend him by claiming that his lieutenants were merely too energetic on his behalf, his critics reply that he has never repudiated them.

The second main charge which has been made against Mr Nixon is that no one can find out what he really believes in. His voting record in Congress was inconsistent and suggests that he is guided by expediency rather than principle; in so far as it provides any indication, it shows him as leaning towards the isolationist wing of the Republican party. To this Mr Nixon's admirers—and there are many of them—reply that those who dislike him are jealous of his sensational and effortless rise to national prominence. These friends admit that he was young and inexperienced when he was in Congress but assert that he has grown with his new responsibilities. Moreover, they say, both his record as Vice President and Mr Eisenhower's praise for him prove that he has loyally supported the Administration's progressive internationalism.

This is apparently Mr Dewey's view, for this epitome of Republican liberalism rather unexpectedly came out in favour of Mr Nixon's nomination last month. But Mr Nixon has also succeeded in winning over Senator Knowland, long one of his most prominent enemies in California and the most influential of the Republican isolationists. Both men have presumably come to share the view of the officials of the party organisation, who see Mr Nixon as the strong young leader, the symbol of the future, which the new Republican party will need so badly once Mr Eisenhower retires.

Old Leaguer

Bismark, North Dakota

SENATOR WILLIAM LANGER, who is chronically diabetic and practically blind, has announced that he will remain in the Republican party, despite a realignment of political forces that gives North Dakota its first straightforward two party election in forty years. During that period the decisive battles have been fought in the Republican primary elections between the radical Non Partisan League, in which Mr Langer has spent most of his tempestuous political career, and the orthodox Republicans. The small Democratic party was usually swamped in November by whichever faction had won the Republican nomination.

This year, after a long period of preparation, the Non-Partisan League switched from the Republicans to the Democrats. This was a logical step. The League had been founded in 1916 as an instrument of the farmers' revolt against the business interests which they felt were cheating them. It rested on the theory that national party divisions were irrelevant to the real problems of North Dakota and merely helped outside forces "divide and rule" the farmers. Rather than attempt to launch a third party the founders of the League, of whom Mr Langer is now the lone survivor, decided to form a private association which should capture the official machinery of the Republican party.

But the political setting has radically changed. Early this year the "old guard" joined in forming a united Republican party, thus clearing the way for the League, under fresh leadership, to move in with the Democrats. The League formally retains its identity; the Democrats have endorsed all its candidates and its programme, which markedly reflects the views of one of the principal match-makers, the National Farmers' Union. This radical farm organisation owes its exceptional power in this state to its close connection with the co-operatives to which many of the farmers belong.

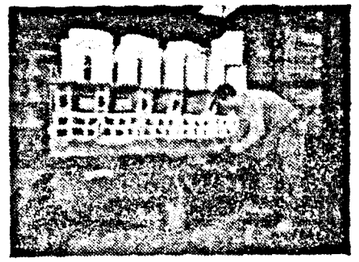
It is clear from the voting figures in this year's primaries that a substantial proportion of the League's rank and file has joined the Democratic column. The Democrats are pinning their campaign on the danger of family farm ownership being replaced, under another four years of "big business" in Washington, by large soulless "General Foods" corporations. But the effects of Senator Langer's decision to stay with the Republicans and the other issue which it highlighted have still to be seen. The old Leaguer explained that, although he was on the side of the Democrats on all major domestic issues and had been promised the retention of his seniority in the Senate if he came over to them, he must "keep faith with the dead rather than with the living." His governing consideration was that three Democratic Presidents had led the country into war, while President Eisenhower was succeeding in keeping it at peace.

"UCON" FLUIDS AND LUBRICANTS WITH "BUILT-IN" ADVANTAGES

UCON metal-working fluids are water-soluble, forming clear solutions with all proportions of water.

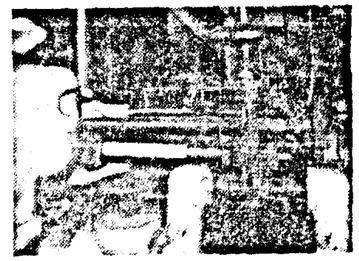
They're *different* in performance because they're *chemically different from animal, vegetable or mineral oils.* UCON polyalkylene glycol fluids and lubricants are "man-made" substances with unique "built-in" advantages for every lubrication process. Just check this idea-stimulating list of properties and uses.

USES	PROPERTIES
Compressor lubricants	High viscosity indexes
Vacuum pump oils	Low pour points
Stuffing gland lubricants	Excellent lubricity
Gear lubricants	Sludge resistant
Heat-transfer media	Non-carbonizing
Anti-foam agents	Non-corrosive to metals
Rubber lubricants	Unusual solvent action
Textile fiber lubricants	Negligible effect on rubber
Hydraulic fluids	Wax-free
Solvents and plasticizers	Sulphur-free
...and many others	



UCON high temperature lubricants mixed with graphite, are easily applied to kiln-car wheels with a hand gun.

UCON lubricants practically eliminated downtime for cleaning carbon deposits from this flash-bulb stem machine.



Because UCON lubricants prevent ice-adhesion in these low-temperature liquid pumps, packing life is extended phenomenally.

OTHER ...USEFUL "UNION CARBIDE" CHEMICALS

CARBOWAX polyethylene glycols
Primary Amyl Alcohols • Amines
Primary Decyl Alcohols • Primary Amyl Acetates

For detailed information, write today to the *Chemicals* Department for the *free* booklet CE-9 "UCON Fluids and Lubricants".

Australorp, Rhode Island, Leghorn, Sussex; there is hardly a part of the world that has not contributed something to the vocabulary of poultry raising. And farmer tending chickens is a traditional scene as valid for Kent as for Carolina or the Cape. In recent times, however, the scene has changed in one small, but important, particular. The meal now comes to the farm in paper sacks—multiwall sacks, strong, of several thicknesses—that bring the feed clean and then go for burning. Quietly, these paper sacks have effected a revolution in the hygienic carriage of all kinds of materials, from poultry meal to chemical powders. And this revolution is by no means confined to farming. Manufacturers now use Bowater packaging for all manner of goods. Shop windows, shelves and counters are gayer, neater, cleaner—thanks to protective Bowater wrappings.

The tree from the far-off Bowater forest is much more today than just a provider of newsprint. Your cleansing tissues, madam; your hardboard, sir; all owe their origin to that most versatile of raw materials—timber.

The harvest of the forest is given many forms by **BOWATERS**

Ireland's "1951"

FROM OUR CORRESPONDENT IN DUBLIN

THE Republic of Ireland is at present traversing one of those periods in which everything seems to be going wrong economically at the same time. The balance of payments has severely deteriorated after three years in which the deficit was contained within manageable limits. The £30 million gap in 1955 was much greater than that in the three previous years put together. An attempt has been made to discourage imports by means of two sets of import levies (that is, special tariff increases) imposed in March and July; but for the first seven months of 1956 the visible deficit has been reduced by only some £4 million below last year's level. The position is made more serious by the sharp fall in Ireland's exchange reserves, out of which past deficits have been covered.

In 1955 the "net external assets of the banking system"—the front line reserves—fell by about as much as the payments deficit. This loss was the highest in any postwar year, and there are now only £80 million of these assets left. Pessimism is reinforced by the fairly general feeling that the import levies, by themselves, will not arrest the adverse trend. Finally, the result of the census in April, which showed that in the last five years the population has fallen by over 60,000, to less than 2.9 million, came as a severe blow to the Irish people. The combination of a falling population with a declining standard of living and drooping exchange reserves seems an eloquent judgment on current economic policies.

This position is inevitably described as a crisis. In fact, however, it is very largely a self-created situation, due to factors within Irish control. The fall in population is not such a factor: it reflects the lure of high wages and over-full employment in Britain. The sharp fall in the price of cattle, which has severely reduced the value of exports, is also outside domestic control; though the fact that cattle are by far the greatest agricultural export is a consequence of past and present agricultural policies. But the main problems must be attributed to the high volume of imports, which derives from persistent inflation, which derives in turn from unbalanced budgets, the working of the capital investment programme and the maintenance of low interest rates. These are domestic decisions. There can be no doubt that a heavy programme of capital investment is badly needed in Ireland; but in practice the investment programme here has been concentrated on objects of high social and employment value, such as housing and public health, to the exclusion of increasing production in the exporting industries, of which agriculture is the chief. The programme has been financed by the incurring of external debt and by the realisation of the sterling assets. Savings have been sparse and, granted the present divergence between British and Irish rates of interest, there is little inducement for any saver to leave his money in Ireland. The funds to support the long spending spree are running low.

This, however, still does not amount to a crisis, in the strict sense of the word. Ireland is not a major trading nation, and it could support itself on the present level of exchange reserves, especially as there are substantial private holdings of foreign investments; Britain might regard almost with envy a country where there is no need for a dramatic call to rebuild the reserves, but only for a warning that the reserves must not drop any further. Unfortunately, however, the situation now emerging is quite unfamiliar in Ireland, where the substantial assets of the banking system have provided a cushion for recurring deficits (which have therefore come to be regarded as a natural right). This is "1951" in the Irish calendar—the point at which policies that have become traditional need to be examined and reframed.

Bipartisan Neglect

In the short run, no doubt, restrictions such as the import levies are inevitable. But sooner or later—and much better sooner, while there is still room for freedom of action—Ireland will have to tackle the problem more directly by a revision of the policies that invite heavy imports; it should be obvious, for example, that the expensive maintenance of cheap money cannot be prolonged much further. The longer-run need is for policies that will restore confidence and productive power to agriculture, which, for more than twenty years, has been overshadowed by industrial protectionism and capital programmes that have favoured the cities.

It is ironic that at this juncture the *Fine Gael* party should hold the major posts in the government. Throughout its long exile from office between 1932 and 1948, it never ceased to preach the necessity of agricultural development and the need for sound financial policy, and to predict the collapse that would inevitably be caused by neglect of these principles. All these gloomy prophecies are now coming true, but the present government, as the circumstances of office alter cases, has been content to adopt the general aims of policy that were laid down by Mr de Valera's *Fianna Fail*, now in opposition. Since *Fine Gael*

came to office in 1954, it has been unlucky in that the price of cattle has fallen and that competing rates of interest in Britain have risen, but its main economic enthusiasm seems to have been for such matters as copper-mining development and for planning the oil refinery at Cork. These are enticing industrial toys; but they are not answers to the present difficulties. The greatest danger to the government's survival is the very general feeling that it is not facing these problems. That danger has not yet been translated into positive support for *Fianna Fail*. Mr de Valera may yet return to office as the apostle of austerity and self-reliance; but his chief lieutenant and heir-apparent, Mr Lemass, is wholly concerned with industrialisation and urban issues. The pessimism to which any Irish economist must give vent on surveying the Irish scene is therefore not so much the result of an inevitable crisis—two years on a new tack of economic policy would comfortably avoid the rocks—as of a feeling that no remedy will be found in the policy which both major parties are content to maintain.

No Pleasure at the Helm

FROM OUR CAIRO CORRESPONDENT

PRESIDENT NASSER refuses to be provoked. European canal pilots who resign this week will be bowed out with cold courtesy from Egypt, untouched by the Suez Canal Nationalisation Law which threatened them with imprisonment if they abandoned their work. Thus ends for them a period of several restless weeks. Quite apart from the persuasion of the international company and the crusading Monsieur Picot, their departure had become inevitable in the political situation which made of them an enemy within nationalised gates. They came to feel that whatever the outcome of current events they had little future to expect in Egypt.

The effect on the canal will be immediate. The number of experienced pilots remaining will not be enough to handle more than about one quarter of the usual traffic. Since, moreover, most of the pilots who are leaving are those with the longest experience and therefore used to handling big ships, the size of the vessels which can travel through the canal will probably be reduced. One assumes a steep rise in insurance rates and a general reluctance of companies to risk big ships through the canal. It may well be in these circumstances that there will not be more than about a quarter of the usual traffic seeking to pass through the Suez canal.

The Egyptian authorities believe that the withdrawal of pilots will not have as serious an effect as western maritime nations seem anxious to anticipate. They will put on to the larger ships those remaining pilots who already have experience of the canal, and on smaller ships the new pilots whose six weeks' training is, they contend, enough for this less difficult work. There will nevertheless be a shortage of pilots for some time, although reduction of traffic may prevent it from being felt.

Only an expert navigator can say how difficult the pilots' task is. It appears, however, that the few feet of water between the ship's bottom and the canal floor play tricks with the helm in a manner which sometimes produces a reaction converse to normal. This kind of thing seemingly takes much experience to understand and with large ships there is no small danger of accidents in so narrow a channel. Certainly, the international company took great pains to secure the best navigators and give them a lengthy training in the roads outside Port Said and Suez and on the smallest ships in the canal, before considering them fully-fledged pilots. The Egyptians contend that there was in this much mumbo-jumbo designed primarily and deliberately to restrict the employment of Egyptians. They may take a chance in navigating the canal in proof of their contention. Sir Anthony Eden and M. Mollet may find an unexpected ally in those few tricky feet of water between keel and floor.

Delays in canal traffic will meet with a mixed reception by the world at large, and even among those allies of France and Britain who, though in sympathy with their general aim, lack their determination. Western Germany, for example, busily forging trade links east of Suez, and in any case lacking enthusiasm for the old company, regards the prospect of the long Cape haul with dismay. Among Arabs and in further Asia, the withdrawal of pilots will be regarded simply as an act of sabotage by Britain and France.

Colonel Mahmoud Yunis, who is now chief administrator of the canal, has described the withdrawal of pilots as "conspiracy prepared in advance" and his opinion will be shared by a large part of the Arab world. Some Arab leaders may blame President Nasser for trapping them in a dangerous net of his own nationalism, but the less critical peoples see in the evolution of events a simple campaign to destroy the Egyptian regime. President Nasser, they say, is willing to write into the new convention not only freedom of navigation but, in considerable detail, the terms on which the nationalised company will administer the canal. The western refusal to examine the question of calling a conference to organise negotiations, or even to see whether President Nasser's proposals offer any of the guarantees it wants, is in their view more brusque than President Nasser's rejection of Mr Dulles's proposals and can only mean that President Nasser himself has been totally rejected along with nationalisation.

Need to Live with the Arabs

Whether or not the new western plans can succeed, whether or not Egypt will submit to imposed international pilotage or can be forced to submit, is not in the long run the crux of the problem. Essentially it is a question of finding terms whereby the West can continue to live with the Arabs, and it is to be doubted whether the firmness of western governments will do anything to achieve this long term aim. For it must not be forgotten that the security of the West's oil supplies, on which so much of the importance of the Suez crisis has been built, does not depend solely on the security of transit through the canal. It rests ultimately on western relations with the Arabs. The Suez crisis is not simply due to the perversity of President Nasser nor to the intransigence of his predecessors. It is the product of a long period in which the mind of the West has become so divorced from the mind of urban Arabs that even the most elementary postulates of policy have lost their meaning. It seems from here that the kind of western victory sought in the Suez crisis will worsen, not improve, the long term position. The West will try to cure a decade of decay with a bandage of strength. The result is likely to be gangrenous.

Swedish Voters and the Socialist Record

FROM OUR SCANDINAVIAN CORRESPONDENT

ON Sunday Swedes will go to the polls to elect a new Second Chamber. The Second Chamber or Lower House of the Riksdag, which is elected every four years, today numbers 230 members; after the elections it will have 231. The Social Democrats (110) and Farmers' Party (26) form the so-called "Red-Green" coalition government, while the People's Party or Liberals (59), Conservatives (31) and Communists (5) constitute the opposition. The election campaign has been conducted with the staid decorum which characterises Swedish politics. Most meetings have been thinly attended, although they have sometimes been enlivened by films on the horrors of alcoholism which, after the abolition of liquor rationing last year, were deemed by the main parties to provide a stimulating, if non-partisan, curtain-raiser. Radio debates and interviews with party leaders have been keenly followed, while for the first time television has had an important influence.

The almost costive conservatism of Swedish electors, who tend to vote as their fathers and grandfathers voted, is a byword. Surprises are not, however, entirely ruled out. In 1948 the Liberals replaced the Conservatives as second largest party, and more than doubled their mandates. This year the Conservatives show guarded optimism. They staged a moderate come-back in 1952, and the 1954 local elections went distinctly in their favour. Local elections in Sweden mirror national trends closely; on the 1954 showing, the Conservatives would now stand to win seven seats and the Social Democrats and Communists one each, while the Liberals and Farmers would lose five and one respectively.

The Social Democrats have had an exceptionally long innings. Apart from a three-month interval in the summer of 1936, they have been in office since 1932. They have taken the Farmers into alliance with them twice, in 1936-9 and from 1951 onwards. During the war they headed a national coalition of all parties except the Communists. Although some leading Social Democrats might privately welcome the invigorating effect of a spell in opposition, the party's official aim is to win an absolute majority in the lower house. (In the upper house they already hold 78 out of 150 seats.) This would relieve them of their dependence on the Farmers, whose partnership—especially in the fixing of food prices—is often embarrassing.

Axes for Taxes

The main planks of the Social Democrat platform are full employment, a shorter working week and pension reform. The first two are non-controversial; but over pensions the parties differ considerably. At present everyone over 67 draws a "people's pension." The Social Democrats, however, now propose that all wage and salary earners shall receive a pension commensurate with their previous earnings. The Liberals, Conservatives and Farmers favour increased "people's pensions" plus a voluntary self-pensioning scheme. The Social Democrats' record of social reform is marred by their inability to alleviate the acute housing shortage, and the opposition parties have also attacked the compulsory enrolment of trade unionists in the Social Democrat party by majority vote.

The Liberals demand more scope for private enterprise, while supporting a high degree of social security. The Conservatives outdo them both in condemning the *dirigiste* state and in calling for lower taxes. (A Swedish family with two children and an income of £900 today pays no less than 31 per cent in taxation and social contributions.) The tax cuts advocated by the Conservatives would decrease the Swedish taxpayers' burden by £52 million next year. The Liberals propose reducing taxes by £32 million; and even the Social Democrats have clambered belatedly on to the bandwagon with a proposed cut of £23 million.

All parties support the traditional "alliance-free" policy, based on muscular defences. There are, however, considerable differences of emphasis in foreign affairs. The Conservative leader, Hr Hjalmarsson, would like a clearer definition of Sweden's ideological adherence to the western camp, and unequivocal recognition that Russia is the only potential aggressor. Hr Ohlin, the Liberal leader, holds similar views. This summer's Swedish naval visit to Riga was described by opposition speakers as an affront to the enslaved Latvians, while the prime minister, Hr Erlander, and the foreign minister, Hr Unden, thought it a welcome sign of improved relations with Russia. The recent uncovering of yet another spy ring directed by the Soviet embassy in Stockholm, and the continued lack of definite news about the missing Swedish diplomat, Hr Wallenberg, have provided further ammunition for the opposition parties. Nevertheless, domestic policies are likely to decide the outcome of Sunday's elections; and, as Sweden still enjoys full employment and an unusually high standard of living, it is reasonable to read the barometer as pointing to "no change."

The Other Togoland

FROM OUR UNITED NATIONS CORRESPONDENT

THE United Nations Trusteeship Council has now recommended that the trustee agreement for British Togoland should be terminated so that the territory can unite with an independent Gold Coast. In regard to French Togoland, however, the Council has been in deep water, and it ended its summer session without coming to any conclusion on France's proposal for the future status of the territory. Some months ago the French delegation informed the Council, in a somewhat vague statement, that reforms had been effected in French Togoland and that the objectives of

"MOTOR BUSINESS"

The September issue of this quarterly research bulletin for the motor and allied industries includes:

The long-term growth in domestic passenger car demand.
The domestic and export markets for agricultural tractors.
The South African market for vehicles and tractors.
Notes on the East German motor industry.

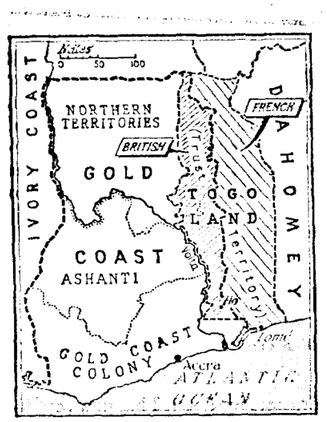
The Bulletin is fully illustrated by charts, amongst which are:

Price indexes of used cars and vans.
World exports of vehicles.
Vehicle exports by countries of origin.

For full particulars of this Bulletin, apply to:
THE ECONOMIST INTELLIGENCE UNIT LIMITED
22 Ryder Street, St. James's, London, S.W.1.
Whitehall 1511. Ext. 49.

the trusteeship system were close to achievement. On July 30th it elaborated the earlier statement, announcing that a draft statute had been prepared by which the administration of French Togoland would pass into the hands of a Council of Ministers responsible to a legislature elected by universal suffrage. The territory would continue to be represented in the French Parliament and the Assembly of the French Union. The Trusteeship Council was asked to " make immediate arrangements to appoint a mission of observers to follow the operation of the referendum " in which the people would be asked to choose between the new statute and a continuance of trusteeship. The referendum was to take place in October.

The Council was placed in a difficult position by this unexpected and maladroit French move. It was highly doubtful whether the proposed statute and the method of its presentation was consistent with the objectives of the trusteeship system. There was general satisfaction at the United Nations with the way Britain had allowed the UN to play a dignified and responsible role in the final stages of British Togoland's emergence to self-governing status. There was considerable hesitation about the idea of the United Nations supervising a referendum which might result in French Togoland having a status which fell short of the objectives of the UN Charter. On the other hand, to refuse to supervise the referendum might be interpreted in the underdeveloped areas of the world as a sign of the United Nations' inability to safeguard the rights of dependent peoples. The problem for the Trusteeship Council was not eased by the fact that the matter did not arise until the last week of an already extended 10-week session which had left some delegates exhausted and irritable.



To avoid the necessity of coming to a hasty decision, it was suggested that the proposed referendum be postponed for twelve months. The French delegate, however, insisted that the referendum could not be deferred. He said that the only question before the Trusteeship Council was whether the referendum would be carried out with or without UN observers. He then submitted a draft resolution to enable the Council to comply with the French request.

In an effort to save the situation, the forthright American delegate, Mr Mason Sears, proposed certain amendments to the French text designed to make it more acceptable to the critics of France's colonial policy. In particular, the United Nations would reserve its position as to the terms of the referendum and its stand with regard to future action. However, even the amended resolution was unacceptable to the anti-colonial group and was rejected by a tie vote of 7 to 7. All the colonial powers voted for the resolution and all the non-colonial countries (including Nationalist China and Guatemala) opposed it.

Meanwhile the territorial assembly of French Togoland has proposed certain changes in the draft statute, and these have been accepted by the French cabinet. The territory has been declared a republic within the French Union ; its new prime minister took office this week ; and the referendum is to take place, without UN supervision, on October 28—a fortnight before the opening of the UN Assembly.

New Attitudes in Brazil

FROM OUR CORRESPONDENT IN RIO DE JANEIRO

SEVEN months have elapsed since President Kubitscheck took office in a cloud of mistrust, and those who predicted that he might not celebrate even half a year in office have been disabused. Some foreign onlookers are still inclined to predict an inevitable explosion ; yet they may well be proved wrong, too. The great mass of Brazilians, despite the galloping inflation and brazen speculation which this government has not yet been able to contain, still show a characteristic tolerance and restraint. Had the ordinary citizen in certain other South American countries been exposed to similar provocations, an explosion would indeed have been almost inevitable. But there are more tangible indications that Brazil will neither plunge away to the far left nor follow Argentina along the road of civil strife.

With the recent increases in minimum wages, the government has to some extent pacified the masses ; but it has a long way to go to secure even a truce with its enemies. Yet there is a new political atmosphere in Brazil, even though it is still having to be maintained by the one organised body in the country which can impose its will—the army. The army guaranteed this government's taking office and its continuance as a "freely elected authority which must be given the chance to prove it can govern." This military tutelage is deeply resented even by Brazilians who have no strong feelings about Snr Kubitscheck. But the situation is inspiring a new, if wry, reasoning: what might be the alternative situation if the distracting political hubbub continues too long ? Fratricide is something unthinkable from which every Brazilian recoils. But there is another possibility: the army might become far more exigent in pursuing its mission of tutelage. What would then become of the democratic regime of which Brazilians are fiercely proud, even though some of them interpret it as licence for confusion ?

President Kubitscheck said recently that the regime had become consolidated and that favourable winds were beginning to blow. To some extent this claim seems justified. Brazil today may well be on the doorstep of a new phase. A number of foreign countries, not only the United States, are now offering it help which could at last put it on the road to the destiny which nature has so lavishly designed. The Americans have agreed to finance Brazilian development on a basis which will not only help Brazil and American suppliers, but will also release funds and provide new opportunities for European enterprise. A first credit is of $100 million for re-equipment of the almost obsolete railways ; a further $26.4 million will be granted for hydro-electric development, and $25 million for ports. Other projects will be considered and financed according to necessity and merit. This financing agreement, however,

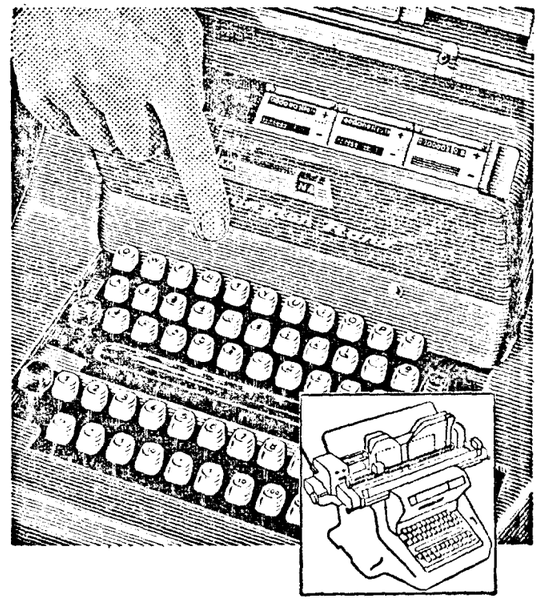
● For new ideas in business...



THESE ARE THE KEYS
to low cost, speedy accounting

Hitherto, the insuperable argument against mechanised accounting in the small business has been its high initial cost. That argument no longer holds. For the 224 Accounting Machine has been developed by Remington Rand to meet the needs of the small business, at a price within its means. Now, for a nominal outlay, you can enjoy the full advantages of mechanised accounting—with all its speed, accuracy and economy—which until now have only been offered by more expensive machines.

The 224 Accounting Machine is merely one of the many modern methods devised by Remington to streamline the day-by-day efficiency of business operations. The Man from Remington Rand will gladly call upon you to discuss their application to your own problems—without obligation.

the economic problem can be solved simply by curtailing profits and redistributing income. They ignore the fact that 80 per cent of the national income already goes to the small earner and that the real problem is not redistribution but augmentation of the national income. They never tire of pointing to the easy earnings of the *nouveaux riches*, which are indeed conspicuous in a small country which until recently was accustomed to very plain living. While Mapam maintains its siren song, economic issues will continue to be decided on largely political grounds.

India's Nagas

BY A CORRESPONDENT

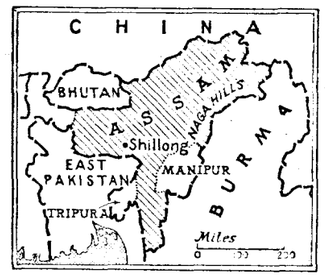
SCATTERED in the centre and in the eastern borderlands of India, in jungle-clad hill tracts difficult of access, are several primitive peoples who have never been assimilated to Hindu or Islamic civilisation and have retained to the present day their ancient ways of life. Among these are the Nagas of Assam along the frontier of Burma, whose insurrection against the authority of the Indian Union has recently attracted world-wide attention. It has attracted attention in India, too, for the Nagas have a representative in the central Indian parliament, a Mr Keishang, who has been pleading the cause of his people before the forum of Indian public opinion. He has alleged that the troops sent to quell the uprising have burned four-fifths of the Naga villages and have treated the rebels with excessive severity. He has appealed to Mr Nehru to use in his government's dealing with the tribesmen "the patience and spirit of peaceful negotiation for which he is famous in the field of international relations."

The Nagas and other "aboriginal" tribes of India — though the Nagas, who speak a Tibeto-Burman language and appear to have come from the north-east in relatively recent times, cannot be regarded as aboriginal in the sense that the Khasis, Santals and some other Indian peoples can claim that distinction—were formerly left more or less to themselves by the Indian kingdoms which governed the plains; when in the nineteenth century they were subjugated by the British Raj, their territories were usually designated as special areas kept separate from the regular administration of the provinces. In this way they retained to a great extent their ethnic identities and a consciousness of being different from the more numerous civilised plain-dwellers around them. In the eyes of Indian nationalists, however, this British tendency to insulate them and preserve their primitive folkways was simply part of an imperialist divide-and-rule technique aimed at accentuating the diversity of the Indian nation; the destiny of all these minor peoples in an independent India was to take their place as ordinary citizens and be integrated into the body social and politic of India as soon as possible.

Free Debate

In a few cases special administrative units under the central government have been retained for tribal areas since independence, but in other cases minority peoples have been placed under the regular administration of the states in which they are located. The Nagas came into the latter category, and have been treated as an integral part of Assam. But there has never been any love lost between the Nagas and the Assamese, from whom they differ in language, religion and custom. The Assam government appears to have started out with the best of intentions; it was determined to civilise the Nagas, to make them wear clothes, to send them to school, to raise their economic level and to turn them into good citizens of India and Assam. Unfortunately, these efforts have met with little co-operation from the side of the Nagas, who have killed or driven out Assamese officials sent to administer them and have even talked of setting up an independent state. Conditions finally became so bad that a considerable military expedition had to be sent to quell Naga turbulence, and the pacification seems to have been attended by the kind of incidents which commonly occur in operations of the regular forces of an organised state against a primitive population carrying on an obstinate guerrilla warfare.

The Indian authorities have merely promoted the bad impression which they now claim the world unjustly has of their campaign by measures taken to prevent foreigners from entering the Naga country on the ground that their safety there cannot be guaranteed. It should, on the other hand, be emphasised in India's favour that the issue has been freely discussed in the Indian parliament and press and that Indian opinion is very disturbed about what has been happening. Under the totalitarian system of Communist China similar repressions of tribal minorities, such as the Goloks, can receive no comparable publicity, and there can be no criticism of official versions, if any, of what takes place. In the Soviet Union likewise the mass repressions and deportations of the Chechens and other peoples of the Caucasus which Mr Khrushchev has now admitted as counts in his indictment of Stalin were at the time completely concealed, except for vague rumours, both from the Soviet public and from the outside world. If so much more is known about the troubles in the Naga hills, despite the security regulations imposed by the local authorities, it is primarily because India remains a political democracy in which scandals, however inconvenient to the government, can be exposed and discussed.



The attention given to the problem in the Indian parliament and press affords ground for hope that official policies towards the Nagas and similar minorities will now be reconsidered. Indian nationalists have too easily persuaded themselves that any one within the boundaries of the Union can immediately be turned into a patriotic Indian citizen. But the building of a genuinely united nation requires time, tact and patience when there are numerous elements ethnically and culturally divergent from the main core of the population. If Indian national consciousness tends to wear thin when Mahratta and Gujerati are contending for control of Bombay, it is even thinner among people whose mental horizon has never before extended beyond a jungle-girt valley in the hills. Nagas will not be turned into Indians by burning their villages, but only, as Mr Keishang says, by application of the principles of which the Indian Prime Minister is so notable an exponent.

ALEXANDRIA: More than three centuries before Christ, Alexander the Great marked out the foundations of the city which was to prove his most enduring memorial. Originally, he conceived it as a naval base to support his army in his Persian campaigns, but he also wished to create a meeting-place for East and West, and a trading centre for all the Mediterranean. The later story of Alexandria is studded with the names of some of the most vivid personalities ever to cross the stage of history; from Julius Caesar to Napoleon famous commanders have sought to possess it. Illustrious philosophers such as Aristarchus and Philo Judaeus taught within its walls; it boasted mathematicians and poets, and all the arts flourished. The city was famous in ancient times for its Library: its lighthouse, over 400 ft. in height, was one of the Seven Wonders of the World.

Business men who require information on current commercial conditions in modern Egypt are invited to get into touch with our Intelligence Department, 54 Lombard Street, London, E.C.3. Up-to-date reports from our branches in Alexandria and elsewhere are readily obtainable on request.

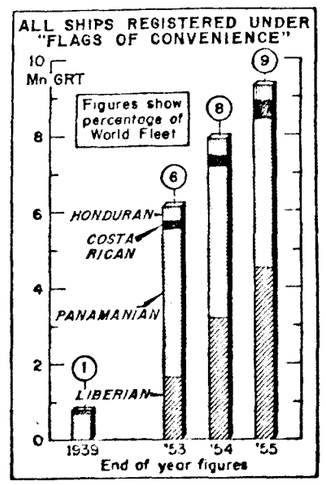
THE BUSINESS WORLD

Ticket to Bermuda

MORE shipping companies are setting sail for Bermuda. Company registration in the island needs an act of the local parliament: there are said to be almost 60 such bills in the September queue. Not all of them, naturally, are the offspring of British shipping companies. Financial institutions and others interested in trusts where capital growth rather than dividend is the main objective have been making their arrangements, as have some companies in the precious stone business. But every speech by chairmen of the major shipping companies this year has dwelt on "flags of convenience" and the tax burdens of staying at home in Britain: shipping is the industry to which the still unvexed Bermoothes make their strongest call.

The almost tax-free island is beckoning them in. A brochure from the Bank of Bermuda, now to be seen on many a shipowner's desk, tells just how to form a company in Bermuda and for which jobs to employ locals (it is thought advisable that the secretary and three directors, including the vice president, should be residents). It propounds Bermuda's financial bliss without excessive modesty. The taxation of companies is simple—a stamp tax of ¼ per cent on the par value of capital on issue, another of 1/5 per cent on a mortgage or the transfer of a property and a flat company tax of £200 a year. "No other taxes are payable. There is no income tax, profits tax, or capital gains tax. There are no taxes on dividends. There is no estate duty." How long can this El Dorado last? Proposals for an income tax have been before the local parliament several times in recent years. But the brochure points out that in each of those bills relief was provided for non-Bermudians deriving more than 90 per cent of their income from sources outside Bermuda—with complete relief for trusts and local companies beneficially owned by such people.



Bermuda is thus in the company registration business—in it to the extent of being willing to accord to the company that has no business in Bermuda privileges that the company actually doing trade and owning property there may not enjoy. That is the meaning of the exemption orders that the new companies registered in Bermuda negotiate and receive. These orders last up to thirty years; they are specifically granted to companies not trading in the island. They amount, in effect, almost to a contract between the government and the company that its rate of tax will not be changed for thirty years—though like other undertakings of governments they could be upset by the subsequent actions of parliament. The fact that one of the big groups that has been thinking about Bermuda—Furness Withy—has a company registered there and has properties, including an hotel, in the island does not appear to exclude it from the extra benefits now offered to companies that do not trade in the island. The properties are not held by the same Bermudian company that would own the ships.

On the Bermudian side Barkis is more than willing. How does the proposition appear to the British shipowner—and to the Inland Revenue Department here? The shipowner's case can be summarised thus: despite the fact that the investment allowance has been continued for shipping, while other industries have been

put back on initial allowances alone, the burden of British tax is excessive for an international business like shipping. Not enough profit is left to keep pace with the rise in shipbuilding costs caused by inflation. Therefore, the British shipping becomes a shrinking fraction of world tonnage, and the fleets that sail under flags of convenience—the flags of Panama, Liberia and Costa Rica—are as the charts show, a rising proportion. The names Niarchos and Onassis, leading exponents of keeping clear of tax jurisdictions, are on every tongue and their growing fleets are on every sea.

A Bermuda Profit Timetable

A tanker and a dry cargo ship each costing £1 million are assumed to be built by a British resident company. Both attract once only investment allowance of 20 per cent. Both are depreciated on the reducing balance system, the dry cargo vessel at 12½ per cent and the tanker at 15 per cent. The two assumptions of long-term average voyage profit on bareboat charter are 15 per cent and 11 per cent on the investment. It will be seen that the dry cargo vessel starts earning a profit in excess of its allowances in either its fifth or its eighth year and the tanker in either its sixth or its ninth year.

£'000

End of Year	Cumulative voyage profit at 11%	Cumulative voyage profit at 15%	Cumulative tax allowances: Tramp 20% once +12½% annually	Cumulative tax allowances: Tanker 20% once +15% annually
1	110	150	325	350
2	220	300	434	477
3	330	450	530	586
4	440	600	614	678
5	550	750	687	756
6	660	900	751	823
7	770	1,050	807	880
8	880	1,200	856	928
9	990	1,350	899	968
10	1,100	1,500	937	1,003

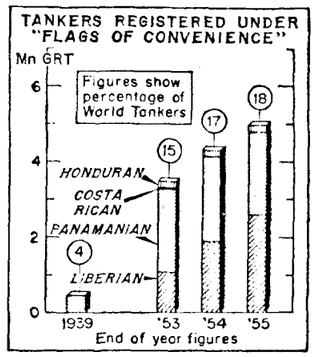
It is not the British mercantile marine, but the mercantile marine of the United States, with its fantastically high labour costs, that has lost most ground to Panama and Liberia. Nor is there any reason to think that the British Treasury would look with favour on a proposal to transfer a shipping asset outside the sterling area. But British shipowners have been looking round and seeking a flag of convenience within the sterling area.

Bermuda may be that flag. It is a sterling area country with strong dollar associations. It is a net earner of dollars and the Bank of England does not speak harshly to it. Unlike some other candidates—Jamaica for example—it offers the hope that taxes there can remain low. Under the general consent for starting new enterprises in the sterling area granted by Mr Gaitskell in 1951 no application to the Treasury to start a company in Bermuda is needed, provided that it is a new undertaking and not the transfer of an existing business that is contemplated. Consent would be needed (and might well be refused) to any proposal to transfer an existing company. But that is not what the shipowners are doing. They are moving cautiously. Several of the big ones, including some that have been most forthright in their speeches, have taken no action as yet. Those that have acted—apart from the Shell group, which is international in character and which has already 21 tankers in Bermuda ownership—are largely the small and medium-sized groups.

These groups have not made their Bermuda offshoots subsidiaries. London and Overseas Freighters has gone "half and half" with its financial associates, led by Philip Hill and Partners. Stanhope Steamship has taken only 49 per cent of the capital of its Bermudian associate. Silver Line has brought in two shipping associates, so that none of them has a controlling interest. Aviation & Shipping is still negotiating. Boldly Mr Jack Bilmeir of Stanhope has let it be known that he proposes that all his new tanker building should be through his Bermudian offshoot. Mr Basil Mavroleon of London and Overseas Freighters, on the other hand, intends to pursue a vigorous building policy from London while London and Overseas Tankers in Bermuda is also building. Save for the Silver Line group, which may eventually have a mixed tanker and dry cargo ship fleet in Bermuda, all the plans are for tankers.

There is both a legal and an administrative trap that explains the caution. The legal pitfall is "constructive transfer of assets." To start a new and additional venture in Bermuda is acceptable to the Inland Revenue here, but if it were clear that the new venture contained all the group's building plans, so that in the course of time, as the British company's fleet became obsolescent, the Bermuda enterprise was intended to supersede it, the intention might be challenged. Secondly, the severance of management and control must be effective. How much ship management can be done remote from the freight market? The answer seems to be either bareboat chartering to the associate in London or a management agreement with that company. In either event, is it advisable that the financial links between parent and offshoot should be too pronounced?

Thus a trip to Bermuda is an occasion for careful thought and good legal advice. Investors may wonder what makes it worth the candle. At least one bright shareholder has seen an answer for himself and written to his company offering to reside in Bermuda and represent them. Others may need to know the arithmetic. There are no likely gains in running costs. British maritime rules and rates of pay apply. The ships will be built just as at present—principally in Britain. They may be registered in this country, as London and Overseas Tankers intends, or in Bermuda as Mr Bilmeir intends, or indeed anywhere in the Commonwealth; it makes no difference, so far as British tax is concerned. The object is emphatically not to pay a dividend. It is to accumulate a tax-exempt income and use it to build ships. American money, it is believed, will be available in Bermuda for building tankers on the near "hire purchase" terms that Mr Niarchos and others have used. The technique will be much easier to apply with a tanker that can be fixed on long time charter with an oil company long before it is launched than with a dry cargo vessel, and the management of a tanker so fixed, by remote control, is much easier than the management of a dry cargo tramp.



Bermuda is nevertheless long-range planning for any shipowner. Many years must pass before an appreciable tax saving can arise—one big group that has not yet made its decision known has worked out that no appreciable saving would be likely in the first ten years. Among the earliest of the new Bermudian ventures to get delivery of its first tankers will be London and Overseas Tankers—at the end of 1958. Even after that no advantage arises until the investment allowances and depreciation that would have been enjoyed in Britain have been overtaken by earnings—that is, until the company would have had a taxable profit had it been UK registered. The table shows, on two different assumptions of earnings and for both dry cargo vessels and tankers, that this period might be as much as nine years or as little as five. More favourable results could naturally be obtained if present high earnings on shipping persist or if something more ambitious than bareboat chartering can be undertaken. But the tax allowances that a young and growing shipping company enjoys in this country are large.

London and Overseas Freighters, for example, has hardly paid tax since its formation in 1949. Yet it is in the vanguard of those who are to use Bermuda as a refuge from the burden of British taxes. That is not the paradox it seems to be. Tax reserves in the balance sheet at £1.6 million are a foretaste of a contingent liability that is building up. Moreover, if inflation continues and if it ever becomes desirable to sell, a ship belonging to the Bermudian associate would attract no balancing charge: a ship in the ownership of the UK company would attract tax on any excess of the sale price realised over the written down value subject to a maximum of the original cost.

Family-controlled shipping companies that can afford to look into the distant future will continue to use Bermuda and it is difficult to suggest that the British revenue authorities should try to stop them, for their actions are to the ultimate advantage of the Commonwealth's mercantile marine. The giants of the industry will face the question with much more circumspection. They are pulled back by tradition and by large vocal bodies of shareholders, who must realise that the whole object of the exercise is frustrated if the Bermudian company pays out any substantial part of its earnings as dividend. That dividend would come into the English company's income and would suffer the full blast of British income tax and profits tax with no benefit from investment allowance. For many big companies the choice must be narrow—so narrow that a further small concession from the Chancellor, for instance in the size of the investment allowances, might sway the balance.

Staying Put on Wheels

IT may seem surprising that two-thirds or so of the caravans dotted around Britain are used as permanent living places, eleven years and 2½ million new houses after the end of the war. But translated into actual numbers this two-thirds—which is the industry's estimate—is only 60,000 to 70,000 caravans, living space for perhaps 160,000 to 190,000 people. And from the few surveys that have been made of these successors to the gypsies, it would also appear that about half of them actually prefer to live in their mobile homes of plywood and aluminium rather than in a more conventional residence of bricks and mortar. Whether they prefer to live there or not, these wheeled householders have been the mainstay of the caravan builders' postwar boom.

In the thirties about 3,000 caravans were made and sold in Britain each year. Production took a long time to restart after the war when materials were almost impossible to obtain, but by 1947 most caravan builders were able to get back into business. As supplies of materials gradually eased, the housing shortage made salesmanship almost unnecessary, and production simply leapt upward. According to the Census of Production, caravan output topped the prewar level of 3,000 a year as early as 1948 and hit 18,200 in 1951. A minor shakeout followed; many of the "back-yard" caravan builders that had been attracted in by the industry's boom then disappeared. But the industry estimates today that its yearly output approaches 20,000. The 45 manufacturers who were members of

the National Caravan Council last year raised their output to 12,200, seven per cent more than in 1954. This year already their production rate is about ten per cent greater. How many caravans are being produced by other makers can only be guessed, but there are about thirty firms of any significance outside the Council's membership, plus an uncertain number of builders producing caravans for profit or, with purchased components, for their own use. If caravan output is taken as now about 20,000 a year, then at an average price of £500 or so for a caravan and the equipment that goes in it, the industry can claim a turnover of some £10 million a year—about £2 million in distribution margins and about £8 million from manufacturing.

But it is still an industry for the small man. Almost anyone could assemble his own caravan, given certain components and the plans or simple designing experience. The largest firm, built up since the war, now makes about 4,000-5,000 caravans a year; there are several others with four-figure outputs; but the majority of firms measure their annual performance more in scores or fifties. Within the maximum dimensions laid down by road trailer construction regulations —22 ft. in length and 7 ft. 6 in. in width—they make any size caravan down to midgets of 9 ft. x 6 ft. x 6½ ft. at prices from £1,750 to as little as £175. For this space and price the builder provides sleeping accommodation for between two and four persons, lavatory, hot plate and kitchen facilities, and upholstered seats or chairs. In the mammoth "Atlantic Homestead," a 35 ft. six-sleeping caravan made to special order for United States and Canadian servicemen on Continental bases —it is too big for British road regulations—room has been found for four rooms, with space heating, a bathroom, and a 7 cu. ft. refrigerator. Exports, however, are comparatively small, not more than 800 or so a year. The present lack of suitable building facilities abroad sharply limits overseas assembly of "knocked-down" components, and the empty space in a caravan can be expensive to ship.

★

Saving space and weight has been brought to a fine art by these builders. Extra equipment to raise amenities and appeal makes a caravan heavier to shift, but the light-weight materials used for chassis and shell keep most caravan weights into the remarkable range of 11 cwt to 2 tons. A caravan shell normally consists of two skins around a softwood or welded tubular steel frame—an outer skin of aluminium and an inner panel of hardboard. Plastics are even lighter in weight, and glass fibre reinforced resins are appearing for outer skins, but cost limits their wider use at present.

Quality is important and caravan users are quick to complain if they do not get it for the prices they pay. A caravan is relatively simple to construct and contains few working parts; but those few—cooking, ventilation, weather-proofing, and perhaps heating, too—are essential requirements for the holiday-maker or householder in the British climate, and the industry is highly sensitive of the shoddy standards of performance of a few makers on its fringes. Faults of design or construction do not normally become apparent until the caravan is in use, and the price or rent has been paid. The National Caravan Council has been considering a mutual trading scheme based on lists of approved manufacturers and dealers conforming to certain standards of construction and after-sales service. No manufacturer would be allowed to supply dealers not on the list, and no dealer to stock the caravans of unlisted makers. But this introduction of private regulation into a highly individualistic industry was bound to be controversial and the industry's largest manufacturer has so far refused to join. The new scheme would also presumably have to pass the critical eye of the new Registrar of Restrictive Practices.

★

This new industry feels that it is still on the edge of its potential market. Although a caravan is not a cheap luxury, there are the usual facilities for credit payment and for hiring, and about half of current sales are in fact now carried out on hire purchase. Since manufacturers and distributors had always pressed for down payments of as much as 20 per cent to 33 per cent, the recent tightening of hire purchase regulations has not made much impression upon sales. The number of transactions this year is only slightly lower than in 1955; it is still above the 1954 level and total sales have risen notwithstanding. Rental, too, has been expanding rapidly in recent years, particularly the form known as "static hire," or the renting of caravans that never leave their holiday sites. Counting the caravans used to live in and those kept by their owners the whole year round in one spot for renting at holiday times, the proportion of caravans that never leave their site is in fact very high. This should encourage the manufacturers to provide detachable undergear and so reduce the caravan's initial cost, but a far more important consequence is the heavy pressure placed upon the limited capacity of caravan sites. This might be eased as the housing shortage diminishes, but sites for residential caravans are not normally those chosen by holiday-makers.

At present the shortage of sites is more acute for residential needs, mainly around the larger cities, but there are problems too for the operator wishing to develop sites for holiday makers. Licences under the Public Health Act, 1936, are usually readily granted once local authority regulations about sanitation, refuse disposal and water supply are complied with; but the obtaining of planning consent under the Town and Country Planning Act, 1947, is not always so simple. A number of local authorities, jealous of local amenities, are now withholding their consent for additional caravan sites; others give their approval for fairly short periods of five years or so.

This limited "tenure" of caravan sites is probably convenient for authorities that may have to review their planning policies after every few years, but it bedevils long-term planning by the site operator. The industry estimates that it costs upwards of £100 to £120 a caravan pitch to provide the minimum site amenities and services—which cannot be got back within five years without charging excessive rents or skimping on basic investment. Although in practice most authorities have not rescinded their consent at the end of the first period (those that have done so have been faced with the far more difficult problem of "suggesting" an alternative site for the displaced operator and his tenants), this element of uncertainty in site development accounts for many of the bad sites and disgruntled caravan users. This is a problem that strikes at the very heart of the industry's hopes for expansion, and both caravan makers and local planning authorities realise that it cannot be left entirely to local hands, to be tackled piecemeal in each area. The industry's desire for "a national policy for caravan sites" sounds rather grandiose: translated into "some ministerial advice on the matter for local councils," it sounds more reasonable.

Business Notes

Markets Shrug it Off

THE extraordinary fact about investment markets this week must surely be the absence of extraordinary behaviour. With sterling under continuous pressure, with a poor set of overseas trade figures for August, with Parliament meeting, and the Suez dispute obviously moving towards a new crisis, no explanation of the modest fall in security prices and the modest rise in commodity prices is needed. Suez Canal stocks dropped a full point; some tanker company shares rose steeply. But the reaction has been really modest. Over the week ended on Wednesday the *Financial Times* industrial index has declined from 183.1 to 181.2, and the Government security index from 84.35 to 83.54. Demand for transatlantic securities has remained strong, the official premium (over the rate of the day, not over $2.80 to the £) has risen from 5½ per cent to 6½ per cent and the Exchange Equalisation Account has done nothing to check it; this seems to dispose of the market supposition that some secret point existed in the region of 6½ per cent premium at which the Government broker would again sell American Treasury shorts to limit the rise.

Despite these symptoms the extent to which business has remained unruffled is remarkable. In the gilt edged market, business has shrunk sadly, but it has shown redeeming features. Without any kind of official help 3½ per cent War Loan has rallied promptly whenever it fell to 70. There is roughly £1 of gross accumulated interest in the price (so that the true resistance point is lower), but the resilience has been noteworthy. Secondly the £5 million New Zealand Loan, quickly oversubscribed last week, has retained a small premium throughout a week of idle conditions, emphasising that even in narrow markets the genuine subscription of a £5 million issue is not impossible.

Even now the flow of new borrowers has not ceased. Southend-on-Sea has this week placed firm an issue of £1 million 5¼ per cent stock dated 1964-66 with arrangements for dealings to start yesterday. At the price at which Messrs Pidgeon and Stebbing have placed the stock (£98 10s. per cent) it looks reasonably attractive compared with the Stoke-on-Trent 5¼ per cent stock (1964) also recently issued at £98 10s. and now commanding a premium of £1. The flat yield on the Southend stock is £5 6s. 7d. per cent and the redemption yield to the latest date £5 9s. per cent.

Reactions to Suez

To assimilate the implications on market prices of the Prime Minister's new plan for Suez is a problem on which market operators have barely had time for first thoughts, and on which they may possibly need second thoughts. First reactions in the market were that the line looked strong, but that the probability of a quick settlement looked dimmer. Therefore prices began to adjust themselves to a pattern that looked closer to the Korean model than anything that the Suez crisis has produced so far. In the gilt-edged market and in the industrial share market business shrank and prices idled away without falling. The oil shares most directly to be affected by any diversion of shipping round the Cape of Good Hope were adjusted downwards and American investors unloaded a small quantity of shares onto London.

Commodity prices on the other hand rose as they always do when war clouds gather. For most of the commodity advances shown in the table special reasons can be adduced that are not obviously connected with Suez. Copper is affected by the labour dispute in Rhodesia, and wool top futures by the strong consumer demand for wool. Probably because of the risks that ships may be requisitioned, the advance has not so far been quotably imparted to shipping freights, nor save for the tanker companies, to shipping

shares. There is an element of moving into commodities such as often happens when political tension grows. And the conflicting supposition that if more shipping is to be occupied in plying round the Cape there must be less shipping to be used in other directions, for example to the Mediterranean, seems not yet to have occurred to market operators. It could, however, happen that economic sanctions short of war might injure certain classes of British exports.

Squeeze on Sterling

STERLING has been under further pressure this week. The Suez crisis, second thoughts on the proceedings at the TUC and on the size of the August gold and dollar losses, and the publication of the preliminary trade returns for August, have all combined to hold the official dollar/sterling rate close to the effective support point of $2.78¼. On some days official intervention has been needed to prevent the rate falling below that point. Intervention has also been necessary to hold the rate for transferable sterling just above $2.75. Transferable sterling has been sold substantially on Chinese and Middle East account through the Zürich market. The Communist Chinese authorities are converting some of their considerable sterling balances into Swiss francs and have placed some of these francs at the disposal of Egypt to finance trade between the two countries. The Middle East is a large holder of sterling and, in face of the Suez crisis, has attempted to convert some of it into dollars.

Part of this pressure against sterling is speculative, as the slight widening of the discount on forward sterling suggests. In terms of dollars the one month discount is equal to an interest rate of 2½ per cent per annum. As the cost of one month's money in New York is about 3½ per cent, this would make the cost of selling sterling short about 5¾ per cent—a high rate which supports the suggestion that bear operations have indeed been undertaken. But it also explains why some operators have grown tired of speculating against sterling and have covered. These covering operations would have had greater impact on the rate were it not that commercial demand for dollars has inevitably been anticipated because of political fears. The commercial bidding for dollars has been unusually keen this week, even allowing for the fact that the normal seasonal peak is approaching. The bad harvest in Western Europe seems certain to increase the demand for dollars to pay for cereal imports from North America.

Pressure against sterling continues to come from the German mark which throughout the week has kept close to its upper limit. The discount on forward sterling against the mark is completely out of alignment with the relative level of interest rates in the two countries. The rate for monthly money in Germany is about 6½ per cent. Adding to this the 2½ per cent which represents the cost of the forward swap operation, the total cost of a bear sale of sterling, financed in Germany, would be 9 per cent per annum. The one corner of the European scene from which relief for sterling has been apparent is France, where the franc remains depressed in terms of all other European currencies.

Investment Nearing A Peak?

IT is too early yet to say that the industrial investment boom which began with an upsurge of ordering in late 1953 is passing its peak, but there are some indications that it may do so by about next spring, and with the probable decline in housing activity by the end of this year, total fixed investment in the economy might level off or turn downwards a little earlier. Figures of building starts and of orders for machine tools have recently tended to fit this interpretation: so, for what they are worth, are the forecasts of fixed capital expenditure for 1957 that the Board of Trade has now obtained from about 400 of the 600 industrial companies that provide it with regular details of their fixed investment quarter by quarter (the total sample is believed to account for nearly half of fixed investment by all British manufacturing industry). These forecasts show that the companies consulted in the manufacturing industries expected, at the end of June, that their total expenditure in 1957 would be about 1 per cent lower than in 1956, with only those in chemicals and metal manu-

Progress in Electronics

Fusing the Extra High Tension connection to the bulb of a television picture tube.

Which is the end product?

The great new Mullard TV Tube factory at Simonstone in Lancashire is probably the most advanced in the world. In it is machinery and equipment so revolutionary in conception that visitors are startled by its Wellsian appearance.

The greater part of this machinery was designed, developed and built by Mullard's own engineering department. It is, in effect, an end-product in itself.

Plants such as this are typical of the Mullard attitude towards production. Constant research into manufacturing techniques and progressive development of plant and machinery are among the reasons why Mullard products enjoy a world-wide reputation for performance and reliability.

* See a Mullard factory one day, and you'll see the end-products of industrial team-work—from research to manufacture.

** If you are interested in visiting a Mullard factory, and if you belong to an organisation concerned with the application of electronics, write to the address below on your official letter heading mentioning your position in the organisation.*

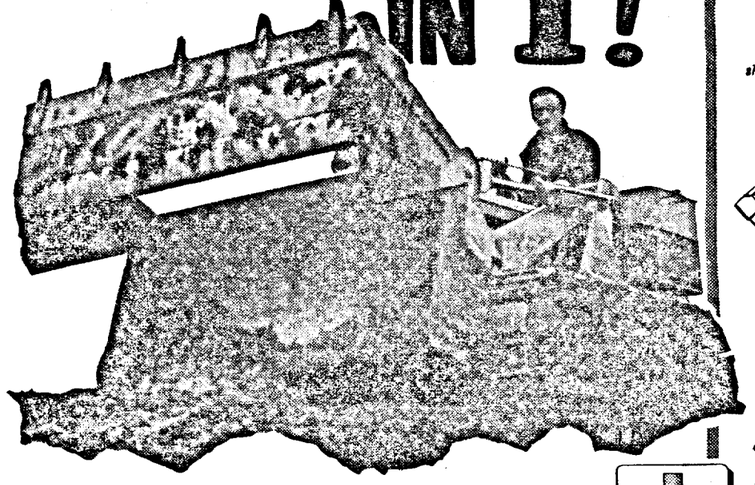
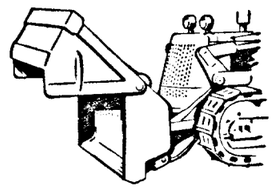
4 MIGHTY DIRT MOVERS IN 1!



INTERNATIONAL BTD-6 CRAWLER AND DROTT SKID-SHOVEL

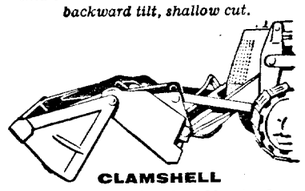
Mounted on the rugged new BTD-6 crawler, the Drott Skid-Shovel is the fastest, toughest, handiest front-end loader in existence! When the unique 4-in-1 attachment is fitted, in place of the standard bucket, the Drott is instantly convertible to bulldozer, clamshell, bullclam or skid-shovel by the adjustment of a single lever, and can unload by bottom-dump method where extra height is needed. See the Drott as soon as you can—there's been nothing in the dirt-moving line to touch it. Also available with regular 1¼ yard bucket, 1 yard heavy duty bucket or bullangledozer attachment.

With the Amazing 4-in-1 Attachment DROTT Does The Lot!



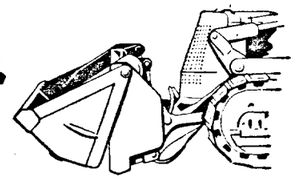
BULLDOZER

Blade moves forward, resting on skid-shoes. Forward tilt gives deep cut; backward tilt, shallow cut.



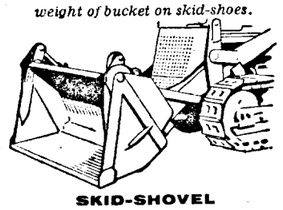
CLAMSHELL

Loose material gathered by simple clam action; transported with weight of bucket on skid shoes.



BULLCLAM

After cutting, dirt is gathered by clam action, then transported with weight of bucket on skid-shoes.



SKID-SHOVEL

Powerful pry-action break-out rolls bucket back on skid-shoes into non-spill position, ready for transporting

facturing forecasting increases; among shipping companies, expenditure on tankers was expected to rise significantly next year, but expenditure on dry-cargo ships to decline.

The decline of 1 per cent expected in manufacturing industry next year comprised a rise of 1 per cent in purchases of plant and machinery, offset by a decline of 9 per cent in expenditure on building, as completion of the new factories and workshops gives way to the delivery of the new equipment for them. These forecasts are provisional in the extreme, and may understate expenditure in 1957. But as an indicator of businessmen's confidence, they have to be compared with the increases in fixed investment by manufacturing industry of 27 per cent between 1954 and 1955, and with the increase of 21 per cent expected this year over 1955.

The Squeeze at Work

THE latest quarterly classification of bank advances suggests that the credit squeeze has lately taken a tighter grip—if not in the sense of a toughening of banking policy, at least by way of a contraction of customers' net requirements. In the three months to mid-August total bank advances rose by £17 million to £2,002 million, but the public utilities absorbed an additional £40 million and the local authorities £8 million. Hence the borrowings of the private sector, which had started to rise again in the previous quarter, declined by some £31 million. This carries them 6½ per cent below the peak reached twelve months previously—still an appreciably smaller reduction than the banks expected to make when the squeeze "by request" began. The latest reduction has, however, been well spread. The only industrial groups that are increasing their borrowings for other than seasonal reasons appear to be the major expanding and export industries—engineering (up by £16 million over the quarter and £40 million over the year), iron and steel (£1.6 million on the quarter but £13 million on the year), shipping and shipbuilding (£2.4 million and £5.4 million), and chemicals (£3.3 million and £3.5 million). Agriculture absorbed an extra £4.7 million during the quarter, a less than seasonal rise that leaves its total £15 million down on the year at £224 million. Fishing, now shown separately for the first time, rose from £3.1 million to £3.8 million, and is also slightly higher on the year.

The quarter's main declines in the industrial categories occurred in retail trade (down £23 million, or much more than in corresponding quarters of the previous three years), food, drink and tobacco (£18 million, or rather less than in earlier years), non-ferrous metals (£7.2 million), builders and contractors (£3.8 million), and leather and rubber (£2.3 million). The contraction of the large personal and professional group continued, but at a slower pace—by £6 million, carrying it to £72 million (or 18 per cent) below the peak reached in May, 1955. Loans to hire-purchase finance houses declined by a further £5 million to £25.5 million. The large "other financial" category, however, expanded by £5 million and, at £180 million, is the only other group that shows an increase over the year; this group includes, *inter alia*, loans to the FCI and ICFC and the newer finance corporations.

"Clean" Advances Totals

A WELCOME new feature of the return, which is to be repeated in future, goes some way towards meeting the criticism, made in *The Economist* last week, of the advances figures of the clearing banks. Hitherto, the only published "clean" figures of bank advances—even of total advances—have been those compiled for the purpose of this quarterly return, which embraces not only the clearing banks but also all other members of the British Bankers' Association. None of those other members publishes a monthly statement. The only monthly figures were those shown in the so-called advances item in the clearing banks' make-up statements, but the coverage of this item differs in three major respects from that of the association's quarterly total. It includes advances made outside Great Britain; it is subject to distortions due to the differing accounting procedures of the several banks and, subject to these differences, generally shows advances "gross" without allowance for offsetting credit balances; and it is further distorted by the inclusion of entirely extraneous items—notably, in most banks, the highly-variable amounts of cheques, etc., in course of clearing between their own branches. The resultant aggregate thus afforded no reliable measure of the behaviour of true advances; and this meant that there was no "clean" figure, not even the quarterly one of the BBA, that could be related to the corresponding bank deposits and other bank assets.

ADVANCES WITHIN GREAT BRITAIN
(£ million)

	August, 1955	May, 1956	August, 1956
British Bankers Association:—			
All members	2,215·2	1,985·1	2,002·0
Clearing banks	1,934·3	1,724·7	1,748·4
Other banks.....	280·9	260·4	253·6

This serious deficiency is now to be remedied, for one month in three, by the publication in the association's return of the aggregate of clearing bank advances computed on the same "clean" basis as that employed for the full BBA classification. The first figures, set out in the accompanying table, show that in August the clearing banks accounted for just over 87 per cent of the BBA total; the clearing banks' "clean" total of £1,748 million was £182 million less than the "advances" shown in their make-up statement for the same date. The disparity three months previously was £185 million and in August, 1955, £171 million. The true decline in clearing bank advances within Great Britain over the twelve months amounted to £186 million (9.6 per cent), whereas the decline shown by the make-up figures was £175 million.

Trade "Gap" Widens

IT is seldom wise to base firm conclusions on the overseas trade figures of a single month, especially when that happens to be a holiday month. So it is possible to

look upon the preliminary returns for August, thoroughly bad though they appear, as no more than a warning signal. It is permissible to recall that a year ago the August exports were swelled by the aftermath of a dock strike and that though the comparison runs badly with July of this year also, there is normally a holiday slackening in August. It will be for the active trading months of the autumn to reveal whether the check to the improvement in Britain's visible trade balance was a transient effect of holidays and motor strikes, or the onset of a new and serious problem. It will be for the figures of those autumn months also to show the first effects of the Suez crisis on British trade. It can hardly have affected the August figures.

British exports in August at £253.4 million were nearly £13 million less than in July, although July had only 25 working days and August 27. The figure was nearly £11 million less than in August last year when the total was swollen by the aftermath of the dock strike. Imports were £322.3 million, £2 million more than in July and £20 million less than in August last year. Re-exports

* Provisional

continued to decline; at £8.2 million they compared with £9.8 million in July and with £10.0 million in August, 1955. The result is a trade "gap" (an excess of imports cif over exports and re-exports fob) of £60.7 million. This is the highest figure since January and £16½ million more than in July.

It is still true to claim that 1956 so far is running in much happier balance than did 1955. The monthly average of exports of July and August, though it is down by about 2 per cent compared with the monthly average of the first half of this year, was about 7 per cent higher than the rate for 1955. For the same two months the import average was about 2½ per cent lower than in the first six months of this year and one per cent lower than the monthly rate for 1955. The visible adverse balance in July and August was at a rate about £1½ million more than the monthly rate for the first half of 1956, but £20 million lower than the monthly rate for last year. To the vital dollar markets of North America the export figure for August was £34.4 million (compared with £35.6 million in July). It was again distorted by a return to America of £2½ million of lend lease silver. The total of those repayments over the past five months amounts to £11½ million. Excluding those quasi-capital transactions, the monthly rate of exports to North America in July and August was about one per cent below the average for the first half of this year.

Dr. Delfino's Grand Tour

THE Argentine financial mission headed by Dr Mendes Delfino is now on a round of the European countries to which Argentina owes money. Its main task is to negotiate funding agreements on the lines that were mapped out in Paris last August when Argentina undertook to move from bilateralism to multilateralism in its trade and payments arrangements with Europe. The tour began in London, where talks ended a fortnight ago in a draft agreement. Argentina offered to fund and repay over a period of ten years the £25 million of commercial and government debts owed to this country. It was, however, decided that the Anglo-Argentine Agreement should not be formalised until arrangements had also been completed for funding Argentina's debt to her two most important creditors, Western Germany and Italy. The mission has since visited Bonn and discussed with the German authorities the funding of their commercial and governmental debt amounting to the equivalent of about $200 million. The Bonn visit ended without definite agreement, the German Government apparently raising objections to the proposed repayment period of ten years. They claimed that because they were the largest creditors they should have preferential treatment and quicker repayment. This is not an argument that will sound pleasantly in the ears of other creditors, notably the London creditors.

Independently of the discussions with European creditors, Argentina has made similar arrangements with Japan. It has funded its $60 million debt with Japan to be repaid over the next ten years and has substituted for the previous bilateral payments arrangement, which was based on "treaty dollars," a multilateral clearing system by which the bulk of the trade between the two countries will be paid for in transferable sterling. In this way Anglo-Japanese trade and payments will be linked with the new multilateral system through which trade and payments between Argentina and Western Europe are being conducted.

The problem of arrears of financial remittances was discussed but not solved when the Argentine financial mission was in London. Since its departure, however, an announcement has been made in Buenos Aires notifying a partial release of funds blocked on foreign account in Argentina. The total amount of these blocked funds has been estimated at 2,000 million pesos, equal to £25 million at the current free market rate of exchange. Of this total 100 million pesos, or £1,250,000, has been released and may be remitted over the exchanges at the free market rate.

Slower Spending?

ABOUT 5 per cent more money seems to have been spent on consumers' clothing, household goods, drink and tobacco in the second quarter of this year than in the same period of 1955. Revalued at 1948 prices, however, the increase is limited to 1.3 per cent, which is much lower than the rate of quarterly increases during 1954-55. In 1954 and early 1955 the volume in which these particular goods were being bought was bounding up each quarter at

...most practical solution to materials handling problems of any sort

Just as the constant old windmill solved a problem of another age, so YALE* Industrial Lift Trucks provide the ideal solution to today's problems of materials handling.

Whether your handling problems involve drums, steel coils, bags or crates, there is a YALE Lift Truck fitted for your particular job. These world-famous trucks are fast, safe and efficient—and their records of operation show that they can lower handling costs as much as 50%. Discover for yourself how well YALE Trucks can solve your specific handling needs—how they save valuable storage space—how they help increase production and speed shipments. Your YALE representative will be glad to show you his complete line of YALE Industrial Lift Trucks and discuss your particular materials handling problems. Get in touch with him today.

Titanium

is to the metals of today

At rare intervals, *new developments touch off* sweeping changes in traditional methods. Today, titanium—at last harnessed to the needs of industry—heralds new conceptions in engineering design.

Already, aircraft designers are finding in it the answer to some of their most exacting problems.

It may provide the answer to yours.

I.C.I. are now producing titanium as a raw metal, and are also making sheet, strip, rod, tube, wire, plate and forging stock from titanium and its alloys. For full technical information about this remarkable new metal, write for the booklet "Wrought Titanium."

Mr Rank, Manufacturer

IT would be a gross exaggeration to suggest that the Rank Organisation is edging sideways out of the film business. But there is no doubt which side of its activities is developing fastest, and this is not films. It is the mixed bag of optical and electronic companies that the vast cinema group shows in its schedule of trading results under the label "Manufacturing."

Six years ago, in its 1949-50 accounts, the Rank Organisation showed net trading profits of £265,000 on those activities —representing, in a year when the group's net profits in the film business were suffering heavily from big losses on film production, about 15 per cent of the heavily depleted total profits. In the accounts for the year ending June 30th, issued this week, manufacturing profits are shown as £2,052,034 net. Allowing for a slight change in the presentation of the accounts, these net trading profits are more than 7½ times what they were in 1949-50; and this year they accounted for nearly a third of the group's total net trading profit of £6,375,215.

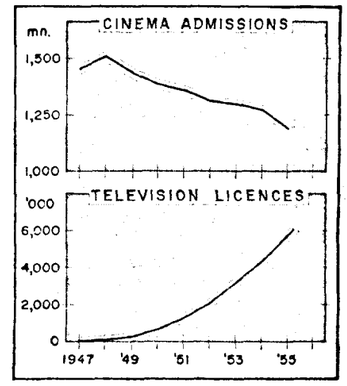
By no means all the Rank manufacturing units are associated with the film industry, though several began or were acquired as ancillaries. Rank Precision Industries builds cameras and projection equipment for the amateur as well as for the industry—noting proudly this year that it can offer an 8-mm cine camera and a home projector for less than the price of the average television set; its subsidiary Taylor, Taylor and Hobson is expanding output of the lenses and instruments that it exports throughout the world; and it is beginning to make office dictating equipment as well as sound equipment for cinemas and studios. Cinema-Television, Ltd.—television studio equipment, test gear and instruments—and Bush Radio are more or less completely outside the film world. At a guess, between a third and a half of Rank manufacturing is connected with the film industry; the rest is not.

The latest expansion in this non-film field was announced last week, when the Rank Organisation joined the Haloid Company of Rochester, NY, in forming Rank-Xerox, a company to develop the rights outside the United States and Canada of a new process of electronic printing. The fixed capital of all Rank manufacturing activities is shown in the balance sheet at a book value, written down, of only £1,748,170, compared with £38,168,363 for cinemas; but the group made more than three-quarters as much profit on manufacturing as on cinemas.

Those cinemas were built, almost entirely before the war, for nearly £53 million, and since 1939 the cost of building a cinema has risen about four and a half times. The index offers no neat multiplication; to say that the replacement value of Rank cinemas would be well over £200 million would only make sense if one assumed that anyone would be prepared today to replace every one of them with cinemas, which is unlikely. Nevertheless, their values as buildings for alternative purposes—such as dance-halls or super-markets—must be very considerable, and recently the group has been taking advantage of this in rationalising its cinema circuits.

Last week the Rank Organisation announced that by the end of October it would close 40 of its cinemas; in his statement with the accounts Mr Rank said that 39 more will be closed in the next few months. The pruning is easily explained: during 1955-56, out of the 570-odd cinemas in the two Rank circuits, 184 made a loss, at the rate of £444,000 a year. He added: "I say with great regret that I believe that some hundreds of cinemas will close in this country in the next year."

His own group, however, is not merely cutting out dead cinemas (and hoping to make useful capital profits in disposing of them); it is at the same time adding live ones, or ones in live places. During the year it completed three of which building was suspended at the outbreak of war, rebuilt another three that had been closed since being bombed, and bought 14 others. It is also buying 12 more in Northern Ireland (plus seven that it has had on lease from the American company Paramount): in all, about 40.



The report, for the first time in several years, does not record the box-office takings at the group's cinemas, so that it becomes impossible to see whether the Rank circuits have been holding their share of the generally declining cinema business. In the twelve months ending March 31st this year cinema admissions in Britain were down by about 7 per cent and gross takings down about 5 per cent: Sir Philip Warter of Associated British Picture Corporation, the most important rival of the Rank circuits, said at the annual meeting in July that attendances at ABC cinemas had fallen less than the average for the trade.

Sir Philip is directly concerned in commercial television: Mr Rank's interest in it is only as a customer for equipment (he makes no direct mention this year of selling it television films) and as a powerful competitor. As such, he pays it due credit: "As the stations opened independently it was possible to measure the effect over the first 6 or 7 months, showing a 10 per cent fall in attendances in the areas covered by the new service compared with the rest of the country."

Against such priceless competition for the viewer's time, he argues that the only hope of putting the film and cinema business back on to a comfortably profitable basis lies in reduction of the Entertainments Duty that at present takes 33 per cent of box-office receipts. In his printed statement Mr Rank duly expressed himself as "confident that relief will be given" by the Chancellor; at a press conference this week he was more laconically realistic: "Hope springs eternal—if the man has any brass to spare."

(*Continued from page 908*)

figures which touched nearly 10 per cent at the end of 1954, though consumption generally was rising at a much more sober rate.

The consumer boom was thus centred largely on durable goods: cars, household equipment, radio and television, and it is in these goods that the recession has taken place. It would be unwise, therefore, to read too much into these preliminary figures for personal consumption in the second quarter; the goods included account for only about one-third of consumers' total expenditure and tend to be considerably revised as fuller returns come in. The fact that people are buying fewer television sets than they did a year ago does not necessarily mean that they have cut back their spending in other fields: indeed, retailers believe that the money which their erstwhile customers will not save in order to put down a hire purchase deposit is only being spent in other ways.

Where the Motorway Ends

If road transport in Britain is to reap the full advantage of the system of national arterial motorways to which the country is now committed, improvements will be necessary also in the terminal routes by which these motorways are connected to the centres of the cities at each end. One kind of terminal that has been adopted in many American cities and is planned for several in Europe is the "urban motorway." As its name implies, this runs into the central areas of cities a route embodying, on a slightly smaller scale, many of the features of the arterial motorway—restricted access, except at key points, to the ordinary network of surface roads; grade segregation of traffic going different ways; and high average speeds for the motor vehicles that alone are allowed to use it. The urban motorway has no pavement and no shops along the edges; it is generally taken along cuttings or over viaducts, with ramps giving access at selected points to the ordinary surface roads in the city centre. In some ways, it has more in common with a railway than a normal road; and in certain cities it is said to be cheaper to build than a first class road. But not everywhere: one around the built up centre of London, it has been estimated, would cost £130 million for 11.1 miles—nearly £12 million a mile, or three times the cost per mile of driving a new deep tube railway through London.

A distinguished body of traffic experts is being gathered in London next week to discuss the virtues of the urban motorway and its possible application to British cities. This week they have had an advance contribution to their discussion—a study of American experience of traffic problems by Political and Economic Planning.* This, without coming to any final conclusions, mentions the disillusion with which some American traffic experts are now beginning to regard the urban motorway and other solutions that, by attracting and generating extra peak-hour traffic into a city, may tend over the years to aggravate the very problem they are designed to solve. A system of "freeways" into central urban areas, such critics argue

> entails enormous expense. It constantly disrupts city operation. And regardless of the millions of dollars spent, no city yet has solved the downtown problem by this alternative.

Urban motorways, like extra parking facilities in the centre of the city, may have a useful part to play in the integrated planning of city transport. But it remains open for discussion whether both may not require consequential regulation, primarily by the price mechanism, of the motorcar commuters whose cars they bring in to choke the circulation of the city. Few American traffic experts are today so confident of having solved the problem of the car-clogged city as they were a few years ago, in the first flush of enthusiasm about turnpikes, expressways and mechanical parking systems; and in this country city traffic is relatively even more important than in the United States.

Boeings for Australia

The announcements that the Australian nationalised airline, Qantas Empire Airways, has ordered seven Boeing jet airliners for delivery in 1959 is a sharp reminder that American competition to British aircraft extends well beyond the North Atlantic route. The type ordered by Qantas is not the huge version of the Boeing 707 intended for non-stop North Atlantic operation, but a smaller, earlier mark with less powerful American-built engines which had been developed primarily for coast-to-coast operations inside the United States. Qantas is the first airline outside America to buy this type of American jet; all the earlier foreign orders placed with Boeing and Douglas, including that of Japan Air Lines, were for the transatlantic giants that will come into service in the 1960s.

There is no jet aircraft under development in Britain that is capable of crossing the North Atlantic non-stop; but either the Comet IV or the Britannia might have seemed suitable for the kind of operations for which Qantas has ordered the Boeing jets. The reason for rejecting the turbo-prop Britannia—not, perhaps, without reluctance—comes from a fairly strong conviction in Qantas that when other airlines were re-equipping with jet fleets, a comparatively small airline (Qantas has a fleet of 12 Super-Constellations, 6 Douglas DC6s and several smaller aircraft) could stand out against the trend. The Comet IV, which could have been delivered at the same time as the Boeings, was rejected principally because it has not enough range for the South Pacific routes to San Francisco, where Qantas has to meet its stiffest competition. The Comet is a little smaller and a little slower than the Boeing, but it is doubtful whether these reasons alone would have led the Australian government to sanction the expenditure of $42 million on alternative American jet airliners.

* "Solving Traffic Problems." PEP. 2s. 6d.

More from Sir Eric

Sir Eric Bowater and his fellow-directors of the Bowater Paper Corporation have now published their first half-yearly statement of profits. They have compared the 1956 results with half of the total of 1955 and not with the corresponding months of that year. It is a statement which will please stockholders—on both sides of the Atlantic. It contains figures of sales as well as consolidated profits; it has been released in North America as well as this country; the figures are set out in dollars as well as pounds; Sir Eric makes a short interim statement; and the general tone of the report is bullish. The most important titbit is the effective increase in the interim ordinary dividend from 3¾ to 4½ per cent. That is backed by a statement which shows a further increase in sales and earnings; part of that increase reflects the inclusion in the latest results of the figures of British-Australian Paper and two months' figures of Mersey Paper. The results of two other recently acquired subsidiaries, Bowater-Scott and Bowater-Eburite, are not included.

Six months to June 30	1955	1956
	£'000s	£'000s
Sales	41,421	44,729
Trading profit	6,605	7,715
Depreciation	1,671	1,990
Taxation (excluding distributed profits tax)	2,166	2,600
Net profit	2,161	2,557

Sir Eric in his statement draws attention to the "further overall improvement" in earnings, adding that "subsidiaries overseas have, as heretofore, contributed the major part." With a due proviso about any deterioration in the international situation, Sir Eric says that "the prospects for the second half of the current financial year would appear to be satisfactory."

Summer Savings

The new savings certificate, launched on August 1st, is still going strong. The moderate slackening of sales in its fourth and fifth weeks—from £15 million to £13 million, and then to £10 million—gave place to a stronger demand in the week to Saturday last, when £12 million were sold. This brought the total to fully £66 million—in contrast with sales of only £18½ million of the ninth issue during the corresponding weeks last year. For a security issued at the crest of the holiday season, this is a remarkable performance: perhaps it is not only the cinemas that have benefited from the wet summer. The one adverse trend, noticeable in the latest two weeks, has been a sharp increase in the encashments of old certificates—to nearly £19 million in the fortnight, so that net receipts were small. Since end-July, however, sales have exceeded encashments by £34 million; in the similar period of 1955 the excess was only £2 million.

This gain has not been made at the expense of other "national" savings. These showed a moderate deficiency during August, but a smaller one than in August, 1955. The new savings certificate had, however, cast its shadow over the early months of the fiscal year: in the first seventeen weeks (before the present issue was available). Sales of savings certificates showed a substantial net deficit. At end-July, total national savings, before allowing for accrued interest, were in cumulative deficit to the extent of £26 million, despite the launching in May of the new 4½ per cent Defence Bond, whereas at the similar date in 1955 the deficit was £4 million. By September 1st last the deficit had been reduced to £5¼ million, whilst in 1955 it had risen to over £19 million.

Brisk Wool Sales

All the evidence pointed to a brisk start to the September wool sales, the first in London of the new season. The strong opening to the season in Australia and South Africa, the high prices bid at the sales of English wool that have preceded this London series, the vigorous demand of the worsted industries of this country and of Western Europe, together with the reduced quantities available in Australia because of the cancellation of the first Melbourne and Brisbane sales, all emphasised that the market must be brisk. The prophets have not been disappointed. Compared with the previous (July) London series, prices of merino wools show a rise of 10 per cent and sometimes of 12½ per cent, Australian crossbreds a rise of 10 per cent and occasionally more, while New Zealand crossbred wools are 5 to 10 per cent dearer. The British home trade and the near Continent seem to have divided the buying fairly equally between them, with no sign of Eastern Europe in the market.

That was as expected. Some experts had guessed that Suez might force the market up even further. Clearly if the fact of ships going round the Cape of Good Hope instead of through the Suez Canal was going to make an appreciable delay in the arrivals of wool in Europe, London as the spot market for Western Europe might develop a stiff premium. If, in addition, British military preparedness caused the Government to reconsider selling from the British stockpile, that premium could have been still further increased. Neither of those events has happened. Many ships are going round the Cape, but the Orient Line, for example, which takes some of the Australian wool, is to take only one day longer for the voyage and the talk of delayed arrivals on account of Suez seems much exaggerated. The effect of the diversion of shipping may indeed eventually operate not in withholding raw wool from London, but in making it more difficult for British experts

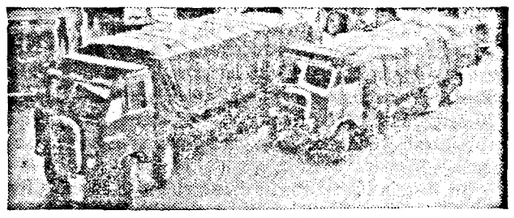
How complicated is YOUR transport?

Moving your largest, most awkward, or most urgent loads by BRITISH ROAD SERVICES can be as simple as a single telephone call

IN THE FIELD of road haulage, British Road Services offer you an outstanding, thoroughly reliable and economic transport service. *And they offer you simplicity.*

This is because B.R.S. are a highly organized and nationwide concern with great resources behind them. They are geared to carry all kinds of traffic, in any quantity, over any distance, speedily, carefully and economically. A B.R.S. teleprinter network, unique in the road haulage business, ensures smooth, fast, behind-the-scenes communications. *These are substantial advantages which only a large organization can offer.*

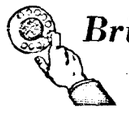
Good transport needs planning. And British Road Services have experienced men ready and eager to discuss your transport problems with you, to advise on the most efficient and time-saving methods, including mechanical handling and palletization. With their massive resources and lively enthusiasm, no transport problem is too great or too small for this stalwart organization. Why not telephone them now?



1 Thoroughly reliable, speedy service. Regularly every night, from hundreds of B.R.S. depots throughout the British Isles, thousands of vehicles set out on journeys to far destinations. Most of these loads will be delivered the next morning. Are you making use of these services?

2 The most suitable vehicles. This articulated vehicle operates on the ferry services to Ireland. It reduces the handling of goods and avoids costly packing.

3 Vehicles maintained in peak condition. The B.R.S. nationwide engineering service keeps vehicles in first-class order. Preventive maintenance ensures a fully reliable fleet — always.



British Road Services Ltd

Look up your nearest depot in your telephone directory

of woollen goods to reach certain destinations, particularly in the Mediterranean area. The British stockpile, despite Bradford rumours, is also still selling as expected. Its offerings in this London series have comprised 9,700 bales out of total supplies offered of 53,000 bales.

Split-Second Photography

MORE than 300 delegates arrived in London this week from all parts of the world, including the USSR, for the third international meeting on high-speed photography since the end of the war and the first to be held in this country. They belong to the small and select band of experts in this special photography and the exhibits put on by 25 bodies from Los Angeles to Hamburg comprise the largest assembly of high-speed photographic equipment yet collected under one roof.

High-speed photography is not photography as the layman knows it. It is taking pictures with ultra-short exposures—sometimes as short as a millionth of a second—that can freeze for an instant events so rapid that the eye has never a chance to see them. It deals in two time systems—the fast and the fantastically fast. The less exacting system simply requires a clearly defined record of events taking place at high speeds and beyond the range of normal cameras. An example of the merely fast is the tracking of missiles in flight, sometimes from the target aircraft, sometimes with cameras mounted on the missile itself, which watch its booster rockets fall away, or its fins disintegrate under the strain of light; for this a camera taking pictures at a rate of 100 to 1,000 frames a second is generally sufficient, provided that it can stand up to violent heat, friction, vibration and acceleration.

In the class of the fantastically fast, the picture must show in detail what the eye could never see—the impact of bullets; the sometimes violent cavitation effects set up by droplets of water on the casing of an underwater missile cleaving through them; the process of an atomic explosion. These call for speeds that run from a ten-thousandth to a millionth of a second and may be taken by drum cameras weighing a ton in which the prism spins like a dynamo while the film remains stationary, or with cameras based on cathode tube principles. The defence ministries are much the biggest customers for high-speed equipment; for them photography is in one sense a substitute for the test pilot, and in the development of guided missiles it is the only possible agency. But a certain amount of use is made of these techniques in industry, especially those using stroboscope systems, and in research laboratories.

Statistics for Research

NEARLY ten years ago, at the beginning of 1947, a standing committee was set up to survey and advise upon social and economic research in government departments. This committee, under the chairmanship of Sir George North, has now published its third report (HMSO, 2s. 6d.) following previous ones in 1948 and 1950.

The committee has no powers of enforcement but in the course of its lifetime it has made 164 recommendations to government departments and 70 per cent of these have been accepted, in principle at least. The latest report records the work of four sub-committees reviewing some of the services of the Board of Trade, the 1951 Census, local government statistics and food statistics. Recommendations have ranged over one for a detailed analysis of patent specifications, the publication of actual prices to supplement index numbers, advice on the tabulation of census figures, a fuller analysis of the finance of town and country planning, and the need for statistical information about distribution costs and profit margins in the food trades.

This appraisal of government statistics is all to the good, but does it go far enough or fast enough? Over the last five years only a part of the government information services has been scrutinised and on one particular score the committee's work has gone disappointingly slowly; the intention to replace the prewar *Guides to Current Official Statistics*. Only three booklets have so far been published, the last—on local government statistics—three years ago. Moreover, the committee is bent on looking after the interests of outside research workers but, it would seem, mainly those in universities. One of its duties is to encourage the flow of unpublished official material which could be made available to research workers and lists of such documents are circulated periodically to certain libraries. But the wants of industry and the public are not represented. If there is need for such a committee—and it would seem to have many useful functions—there is surely something to be said for one with wider advisory powers keeping the statistical service under regular review and the demands of the various users of it in proper balance.

When is a Proxy Not a Proxy?

THE struggle in Amalgamated Tobacco over coupon trading and the reduction in its capital has not been particularly edifying. On one side has stood the chairman, Mr E. E. Mills, and directors of the company, and on the other a shareholders' committee headed by a group of City trusts, which would like to vote the present board out of office. But unedifying though the fight has been, the latest move in the struggle has given rise to an important point about shareholders' rights and the validity of their proxy votes at a meeting.

At a meeting this week, the sitting board gained approval for its scheme to reorganise the company's capital structure but failed to gain the necessary vote to reduce the capital by £180,000. In the course of this meeting the chairman, having sought legal advice, declared invalid a number of proxies cast in favour of his opponents. His grounds for doing so were that some of the statements put out in the opposition's circulars—particularly those in reference to the reduction in capital giving him, the chairman, control of the company—were misleading. The opposition in turn has sought legal advice—and quickly—for a further extraordinary meeting was due.

Mr Mills' action poses a number of questions. Has any chairman the right to accept or reject proxies? If he has

what principles should guide his action? Must he state his reasons? Can he do so simply because the opposition's circulars seem to him to be misleading? These questions must be answered promptly and decisively, and the decision of Mr Justice Diplock to grant an interim injunction suggests that they will be.

SHORTER NOTES

A significant drop in opencast coal production is tending to nullify the slight increase in output from the mines that the National Coal Board has managed so far this year with slightly fewer miners. The contractors who get the coal at these surface sites are inclined mainly to blame the Ministry of Fuel and Power, which as usual is having difficulty with the Ministry of Agriculture in obtaining agreement upon the opening of new opencast sites. Coal stocks, however, are still about 3 million tons higher than a year ago—and particularly high in dealers' yards, since the domestic consumer is as yet showing no sign of stocking up his own cellar.

Expectations that the Canadian official wheat crop estimates would show a better than average crop have been amply fulfilled. The first estimate from the Bureau of Statistics is 512,250,000 bushels, whereas the general expectation was for a figure of about 500 million bushels.

★

The Atomic Energy Authority opened its greatly enlarged reactor school at Harwell this week. It can now accommodate 55 students on the long, 14-week course compared with only 30 previously. These courses are mainly for engineers from the large electrical engineering companies involved in atomic design, and for foreign students. Shorter courses lasting only six weeks are held for university lecturers and scientific staff who do not want to go into reactor design in the same detail.

★

Costain-John Brown, in collaboration with William Brothers Ltd. of Oklahoma, has obtained a £5½ million contract from the North Atlantic Treaty Organisation for the construction of oil-line pumping stations, marine terminals, and storage facilities which are to be erected as part of the Nato "infra-structure" for Turkey.

Company Notes

A. C. COSSOR. The report of A. C. Cossor shows how severely the credit squeeze can work. Indeed, this company has the unenviable distinction of being among those most heavily buffeted—as yet—by it. Even if Cossor was more vulnerable than some, it is instructive to follow Lord Exeter, the chairman, through his frank explanation why a profit was turned into a loss in the year to March 31st; the lesson has importance for others besides Cossor shareholders.

Sales fell from £9.2 million to £7.4 million; trading profits fell from £652,545 to £76,190; a profit before tax of £492,147 (thanks in part to heavier interest charges on bank loans) was turned into a loss of £134,939; and no ordinary dividend (against 15 per cent) is to be paid. Stocks and work in progress rose from £2,737,854 to £3,691,513 and bank overdrafts rose from £431,943 to £1,386,343.

The first step along the road to misfortune was the cancellation of about £6 million of orders by the Ministry of Supply and other Government departments. To fill the gap made by these cancellations, the company planned to double its production of radio and television sets. A few weeks later came the Autumn budget, increasing purchase tax, and sales collapsed. For a time some of the stocks were absorbed by the demand for sets on rental; then in February this trade was restricted by the "control of hiring" regulations. The group had begun to cut back production and to dismiss some of its workpeople after the autumn budget but at the end of the financial year it had about £1 million of radio and television sets in stock or in the course of manufacture. Along with other manufacturers, Cossor tried to keep trade moving by offering lower prices or better terms but at the same time costs were rising and profits were squeezed. In the equipment division, the group had a little more success and its export sales went up from £1.6 million to £2.1 million.

There is a moral to this story: a mistake in timing or a misjudgment in forecasting by the management can play havoc with profits in a period of stringency. Can Cossor recover from this setback? Lord Exeter admits that he is not very optimistic about the current year's outturn. But there are a few facts on the credit side. The company has written down its stocks; this, presumably, is largely a non-recurring provision. And it is extending its business in the electronic instrument and telecommunication fields, but other radio and television manufacturers are in this field too and competition is likely to be severe.

★

ORANGE FREE STATE DIVIDENDS. Three of the OFS gold producers from the Anglo American stable have declared their half-yearly dividends. The payment by President Brand (at 2s. a share) and by President Steyn (at 1s. a share) are both in line with market expectations, but the dividend of 2s. a share from Western Holdings, which has been going through a mediocre patch, was slightly better than had been anticipated. Gold share prices reacted favourably to the announcement, Western Holdings rising 1s. 3d. to 76s. 3d., and President Steyn 1½d. to 32s. 10½d. None of the three mines has yet approached full production. At the moment President Brand is milling nearly 60,000 tons a month and by the end of the year this rate should have risen to about 70,000 tons; its eventual capacity is put at 125,000 tons. So, too, is the capacity of President Steyn, which is currently milling ore at about 93,000 tons a month, a rate which should go up to about 100,000 tons by the end of the year. A rather bigger increase in production is expected from Western Holdings, where the rate should go up from the current

	Sept. 1955	Mar. 1956	Sept. 1956
Dividends:	*s. d.*	*s. d.*	*s. d.*
President Brand	1 0	1 6	2 0
President Steyn	0 6	0 9	1 0
Western Holdings	1 6	1 6	2 0

83,000 tons a month to 100,000 tons by the end of the year; its eventual capacity is put at 150,000 tons. Of the three mines Brand is not expected to pay tax on its profits until 1958, Western Holdings not until 1959 and Steyn not until 1960.

Uranium profits are never likely to be as important for these mines as they are for some of the Rand producers. Currently President Brand is earning about £60,000 in profits from uranium and as its gold production rises these profits may approach £100,000 quarterly—a target already reached by President Steyn. Western Holdings is a scheduled uranium producer but as yet the ore raised has not warranted treatment for uranium. What is of more importance for Western Holdings is the results that will be shown in the next two quarterly reports of Free State Geduld. These two properties are

adjacent and the "jackpot" area, where the boreholes revealed such rich values, lies near and seems to spread across the boundary of the two mines. Development results from this area, which are likely to be revealed in the next quarterly statements, are important for the whole of the OFS field as well as for F. S. Geduld and Western Holdings.

★

INTERNATIONAL TEA. The credit squeeze has cast a faint shadow only across the consolidated balance sheet of International Tea Company's Stores. That document shows that stocks in the year to April 28th rose from £4,865,960 to £5,550,692, absorbing a good part of the group's liquid resources. One reason for this increase in stocks was that, because of the credit squeeze, some of the group's smaller suppliers could not finance their own holdings of stocks and the buyer, International Tea, to ensure the availability of supplies, took these stocks off their

5s. ordinary share at 13s. 9d. yields £5 9s. per cent.

hands earlier than it would otherwise have done. A second reason for the increase in stocks was the seasonal stocking up of dried and canned fruits in rather a greater quantity than is usual. A third was the increase in turnover both in the retail and wholesale sections of the company. So the group's liquid assets have been put to more vigorous work, but consumer demand for edible goods has not been curtailed. The extra profits deriving from these extra sales were partly offset by a rise in costs but trading profits rose from £1,701,410 to £1,950,717. The directors took this opportunity to raise the ordinary dividend from 13⅓ to 15 per cent. Costs are still rising and the group will have to pay more in rates this year. But though profit margins were being squeezed the group was able to secure a further increase in sales in the first quarter of its current financial year.

★

ALBRIGHT AND WILSON. The latest half-yearly figures of Albright and Wilson, the chemical manufacturers, include the profits of Marchon Products, which was acquired in 1955 and whose principal subsidiary, Solway Chemicals, did not begin operations until the second half of 1955. To help stockholders, the directors have published figures showing the profits of the group in the first half of 1955 with and without the Marchon figures. The trading profit in the first half of this year came to £2,292,000; in the same period last year the profit (including Marchon) was £1,781,000 and excluding it

*Including Marchon. †Excluding Marchon.

£1,577,000. The interim dividend has been left unchanged at 5 per cent, but this is payable on a bigger capital as increased by the rights issue; thus more distributed profits tax is attracted and this has prevented net profits from rising proportionately in line with the trading surplus.

The turnover of each of the constituent companies of the group has been higher than in the corresponding period of 1955, but the directors, like many others in the chemical and other industries, draw attention to a further increase in costs. Declining profit margins and the possibility that Marchon will take some time to make a notable contribution to earnings are two facts that investors must consider in looking at the low yield of 4½ per cent offered by the 5s. units at the current price of 20s. on the indicated dividend of 18 per cent.

LONDON STOCK EXCHANGE

Next Account begins: September 19th
Next Contango Day: September 19th
Next Settlement Day: September 25th

STOCK markets remained quiet before the reassembly of Parliament and the Prime Minister's statement on the Suez Canal crisis and they remained equally quiet after it. The market was thin and there were no sudden movements in prices. Gilt-edged prices slipped slowly downwards until on Wednesday the *Financial Times* Government securities index touched 83.54, the lowest point of the year, compared with 84.35 a week earlier. Industrial share prices wavered narrowly backwards and forwards and on Wednesday the *Financial Times* ordinary index stood at 181.2, compared with 181.1 on Monday and 183.1 a week earlier.

The biggest movements in prices were recorded in the oil and shipping markets. After days of erratic movements in a sensitive market, British Petroleum at the close on Wednesday stood at 145s. 3d. (compared with 146s. 3d. a week earlier); Burmah Oil over the same period fell from 89s. 4½d. to 87s. 6d., but Shell rose from 148s. 13d. to 150s. The most spectacular rise in the shipping market was recorded by London and Overseas Freighters, which in three days' trading to Wednesday's close went up from 112s. 6d. to 125s. (after touching 130s. on Wednesday). Other tanker shares were higher, with John I. Jacobs closing on Wednesday at 18s. Lyle Shipping remained unchanged at 32s., despite the enormous increase in profits reported in the preliminary statement. The Suez Canal shares weakened and on Wednesday the Capital shares fell 2½ to 54, the Jouissance units 2 to 34½ and the Founder shares 1½ to 33½, but recovered on Thursday.

Kaffir shares were usually quiet, but FS Geduld gained 2s. to 87s. 7½d. on Wednesday on rumours of high development values. Anglo-American improved to 148s. 9d. on Wednesday on interim dividend anticipations. In the copper market interest centred on Messina, which were marked up in anticipation of next month's dividend.

(1) Annual figures are for June of each year. (2) Engineering, shipbuilding, electrical goods, vehicles, metal goods, precision instruments and jewellery. (3) Textiles, leather goods, clothing, food, drink and tobacco, manufactures of wood and cork, paper and printing. (4) Number registered as unemployed expressed as a percentage of the estimated number of employees. (5) From June, 1956, onwards comparison with earlier figures is affected by the revocation of the Notification of Vacancies Order, 1952. (6) United Kingdom.

(1) Relates to wholesale prices in Athens and Piraeus only for Greece. Figures for Ireland are based on January, 1952=100. (2) July-December. (3) Relates to prices in capital cities only for Austria, France, Greece and Turkey. Belgium excludes rent. Denmark includes direct taxes. Figures for Ireland are based on August, 1953=100. (4) Excluding rent. (5) Including direct taxes. (6) Index numbers of unit value which compare the current average value of trade with its value in 1953; they are influenced by changes in the composition of trade as well as price movements. (7) Deposit money and notes and coins held by business, individuals and foreigners. Except for Greece holdings of the issuing authority and other banks are excluded. (8) Holdings of the government and central bank at end of period. Figures for Greece are gold reserves only; foreign exchange figures for Norway exclude government holdings; Norway and Sweden include foreign investments. (9) Beginning May, 1954, a new drachma equal to 1,000 old drachmas introduced. (10) Including some long-term securities. (11) Average for first quarter.

Financial Statistics

EXCHEQUER RETURNS

For the week ended September 8th, 1956, there was an "above-line" deficit (after allowing for Sinking Funds) of £11,797,000 compared with a deficit of £22,197,000 in the previous week and a deficit of £34,736,000 in the corresponding period of last year. Net expenditure "below-line" last week reached £20,743,000, bringing the total deficit to £377,333,000 (£455,682,000 in 1955-56).

THE MONEY MARKET

CREDIT shortage has persisted throughout this past week. On each of the six days covered by the latest Bank return the authorities gave aid by purchases of bills. On Thursday of last week such purchases were unusually large, yet one or two discount houses were "in the Bank" for a small amount; and on Monday, despite the disbursement of Health and Milk moneys, further borrowings at the Bank were made by two or three houses. The most general rate for new money has been 4½ per cent, but on most days a fair business has taken place at 5 per cent.

At the tender for the £290 million of Treasury bills, the discount market reversed the tactics adopted before the Trinidad Oil pay-out, and reduced its bid by 3d. to £98 14s. 8d. per cent. Total applications rose steeply, by £45 million, and the allotted proportion of the market tenders dropped back to 55 per cent from the abnormal 80 per cent secured in the previous week. Before the tender November and "hot" bills had changed hands at 4 1/8-3/8 per cent, but since then the discount houses, under pressure of credit shortage, have been unable to sell at better than 5 per cent.

The gold price rose from 251s. 5½d. to 251s. 7½d. a fine ounce on Monday, lost ½d. on Tuesday when sterling was momentarily firmer, and on the following day receded to 251s. 6¼d., although sterling relapsed to $2.81 5/8.

COMPANY MEETINGS

PINCHIN, JOHNSON & ASSOCIATES LIMITED

RECORD YEAR'S TRADING

FURTHER EXPANSION

SIR HORACE W. CLARKE'S STATEMENT

The Annual General Meeting of Pinchin, Johnson & Associates Limited was held on September 11th at the Connaught Rooms, Kingsway, W.C.2, Sir Horace W. Clarke (the Chairman) presiding. The following is the Chairman's Statement circulated with the Report and Accounts for the year ended March 31, 1956:

The Report of the Directors has referred to the resignation in June last of Mr G. R. T. Taylor, who considered that the time had arrived to reduce his business activities.

I am honoured to have been chosen to succeed him as Chairman and feel sure that you share my appreciation of the high quality of Mr Taylor's leadership and the able manner in which he has used his vast experience to direct your Company's affairs so successfully.

Mr P. Evans, who has decided not to seek re-election, has been connected with the Company for 54 years, and many of you will know the important part he has taken in your Company's affairs. I am sure that you will endorse your Board's good wishes to both Mr Taylor and Mr Evans.

In February last, your Board unanimously elected Sir James Reid Young as a Director. This gentleman has taken a prominent part in the control of several important Companies and your Directors are confident that his extensive commercial and administrative experience will be of great value to the Group.

ACCOUNTS

Shareholders will be pleased to note from the Report of the Directors that your Company and its Subsidiary Companies have concluded another satisfactory year, the final net profit applicable to the Parent Company, after taxation, amounting to £678,572 for the year to March 31, 1956, a new record, compared with £659,313 for 1954-5. As in previous years, the ratio of net profits to sales has declined, the satisfactory result being achieved largely because of a substantial increase in turnover.

The Balance Sheet of the Parent Company discloses that a large sum was invested during the past year, approximately £540,000 being expended to acquire further shares in Subsidiary Companies and about £36,000 in other trade investments. The larger part of the additional investments made in Subsidiary Companies was met by the capitalisation of loans previously made by the Parent Company.

The Consolidated Balance Sheet set out on pages 8 and 9 incorporates the Balance Sheets of the Parent Company and all Subsidiary Companies. It reflects the accelerated expansion which has taken place throughout the past year. Land and Buildings, Machinery, Plant, etc., increased by nearly £800,000, major extensions taking place in the United Kingdom, Australia and Canada. The larger Group turnover led to an increase in Debtors but Group stock values were held at approximately the previous year's levels, despite increased sales and higher raw material values, by an improvement in the rate of stock turnover.

Under the heading of Goodwill, an increase is shown in the item "Excess of book value over nominal value of shares held in Subsidiary Companies." This is merely a balancing entry arising from the consolidation of the accounts, the increase being due mainly to additional investments by the Parent Company in the Australian and Canadian undertakings.

Alterations in reserves are fully detailed in the Accounts, the most important being in Share Premium Account by reason of capital issues by the Parent Company and by Taubmans Industries Limited, the Australian Company.

Shareholders' Funds at March 31, 1956, at £8,949,622 compares with £8,527,727 at the end of the previous year.

Your Directors have transferred £100,000 to General Reserve and recommend the payment of a Final Ordinary Dividend of 11½ per cent, less tax, making a total of 16⅔ per cent for the year, less tax. The total rate is equivalent to 25 per cent on the Ordinary Share Capital at the date of the last Accounts, prior to the capitalisation of reserves which took place during the past year, which was the rate paid for 1954-5.

THE HOME MARKET

The Directors' Report has stated that gross and net profit margins declined in 1955-6, particularly in the United Kingdom, owing to the absorption of increased material, production and overhead costs, and I would like to amplify that statement.

During our financial year 1955-6, the weighted cost index of raw materials used in our industry increased by approximately 10 per cent, the advance being accentuated in the second half of the year. In addition, in the year under review, substantial increases occurred in the majority of other expenses, most of these being absorbed, thus aggravating the decline in net profit ratios.

The lower profit for each unit of output was partially offset by a record volume of sales whilst an increase in investment income, accruing from capital outlays of recent years, contributed to the satisfactory final net profit figures.

Operating Reports indicate that Home trading for the first three months of the current financial year has yielded a slightly lower net profit than that earned in the same period of 1955-6, the decline being due to a further absorption of additional costs.

It is doubtful if the effect of inflation on costs has yet been eradicated. This, and the reduction in home demand which has occurred in some industries, due to credit stringency, together with a decline in the export sales of a number of our customers' products, may result in a reduction for the time being in your Company's turnover and profits derived from Home trading.

However, a temporary reduction in demand often leads to greater activity at a subsequent stage, and I am confident that our production facilities will permit your Company to share in any such welcome development.

OVERSEAS PROGRESS

The Overseas Companies of the Group collectively improved upon their previous year's trading results and contributed a larger proportion of the Group profits.

Sales and net profit records were again achieved by the Australian Companies, where production facilities have been substantially extended in recent years, and further progress is reported by the New Zealand Company which is now wholly owned by the Australian Group.

Improved profits were obtained by the Companies operating in India, USA, Belgium, Italy and Germany, but the earnings of Pinchin, Johnson & Associates SA (Pty) Limited, our South African Subsidiary Company, continue to be disappointing, whilst the French and Canadian Companies returned a trading loss. The Canadian Company, however, has reported a substantial increase in turnover and shows a net profit for the year to date. Although the earnings yield on this investment is not yet adequate, your Directors feel that reasonable returns should be obtained in the future.

The Argentine Company is trading under extremely difficult conditions, and it is not surprising that the profits of this Company declined.

The greater industrialisation which has taken place in recent years in some of the overseas markets is resulting in an appropriate growth of our local Companies operating in those territories.

Reports received to date from abroad indicate that the profits of our overseas Companies for the current year may increase.

CONCLUSION

The wide geographical spread of your Group's activities and its ability to supply an immense variety of high quality materials at competitive prices confirm my confidence in the continued success of our undertaking.

I extend our thanks to the Management, members of the staff, and all other workers in the Group throughout the world for their continued co-operation and loyalty.

The report and accounts were adopted.

CLIFFORD MOTOR COMPONENTS

GREATER EFFICIENCY AND INCREASED PRODUCTION

The twenty-seventh ordinary general meeting of Clifford Motor Components Limited was held on September 7th at Birmingham.

The following is an extract from the circulated statement of the chairman, Mr S. C. Joseph: The trading profits of the Group amount to £645,682 (last year £589,647), an increase of £56,035. Taxation totals £298,986 (£284,895) and after deducting this amount there is left a net profit to the Group of £346,696 (£304,752).

After the deduction of dividends paid by the parent company £101,674 (£87,952), and transfer to reserve £175,000 (£150,000), the undistributed profits of the Group to be carried forward are £550,472 (£480,450).

The following is an extract from the Report of the Directors: Your directors recommend a final dividend of 20 per cent less tax.

In December, 1955, we acquired the whole of the issued share capital of Girdex Engineering Company, Limited, and since March 31, 1956, we have purchased further shares in Standard Valves Limited with the result that that company now becomes a wholly owned subsidiary.

Having in mind the increasing competition in home and export markets we have, during the year under review, operated on lower profit margins. The result shown in the accounts has been achieved by improved manufacturing methods and increased production.

Today it would be unwise to forecast the results for the current year. Changing circumstances in the automobile industry naturally cause us some concern, but I would point out that the several units comprising our Group facilitate redeployment where such an operation may be helpful.

The report and accounts were adopted.

DIDIER-WERKE AG, WIESBADEN

Balance Sheet at 31st December, 1955

Dividend Notice

Our General Meeting on 21st July, 1956, resolved on payment of a dividend of 10 per cent for the year 1955.

BOARD OF DIRECTORS:

Dr. jur. Robert Frowein, Chairman; Dr.-Ing. h.c. Adolf Schondorff, Vice-Chairman; Alfred Broese; Dr. Dr.-Ing. Fritz Harders; Fritz Höfermann; Dr.-Ing. Hugo Krueger. Staff Representatives: Jakob Eckes, labourer; Rolf Racky, clerk; Georg Richter, labourer.

BOARD OF MANAGERS:

Edmund Bieneck, Wiesbaden, Chairman; Karl Springer, Wiesbaden; Dipl.-Ing. Erich Schroth, Wiesbaden; Johannes Dietze, Wiesbaden (Acting).

INTERNATIONAL TEA STORES

RECORD PROFIT

The annual general meeting of The International Tea Company's Stores, Limited, will be held on October 2nd, in London.

The following is an extract from the circulated statement by the chairman, Mr William Bolwell, for the year to April 28, 1956:

It is with pleasure that I announce a year of achievement in turnover and a further improvement in the earnings of the company. Referring to the Profit and Loss account it will be seen that our Group trading profit is up by £249,307 as compared with last year and at £1,950,717 constitutes a record in the company's history. I am very pleased to pay tribute to all sections of our business for increased earnings. The improvement is shared by factories, bakeries and the retail branches of both the parent and all subsidiary companies.

A NOTABLE IMPROVEMENT

The wholesale department of Kearley and Tonge, Limited, has achieved a notable improvement. It is pleasing also to be able to report that Ridgways, Limited, following the very disappointing results in the tea trade generally during the previous year, have made a remarkable recovery and produced record profits.

The turnover of both retail and wholesale sections of the whole group has shown considerable expansion during the year. The *extra profit from this* increased trade was partially offset, however, by substantially increased wages and other expenses. In all the circumstances, I feel sure you will regard the final result as satisfactory.

PROFITS AND ALLOCATIONS

The profits, before taxation, at £1,554,596 are £226,549 more than last year. Income Tax and Profits Tax once again combine to curtail substantially the benefit of increased profits and at £921,354 are £190,577 up on last year, leaving the consolidated net profit only £35,972 higher at £633,242. Of this amount £41,932 has been retained in the accounts of subsidiaries and £210,319 has already been distributed by way of dividend to preference and ordinary stockholders. Of the balance remaining we propose that £200,000 be added to General Reserve to enable us to *continue with our programme* of expansion and modernisation and that a final dividend be declared on the ordinary stock of 10 per cent, bringing the total dividend for the year to 15 per cent, as compared with 13⅓ per cent last year (7½ per cent on the old capital and 10 per cent on the capital as increased by capitalisation issue), leaving £1,273 to be added to the balance of Profit and Loss account to be carried forward by the parent company.

The year under review has been one in which we have met a further rise in wages and there is yet no sign of a halt in the inflationary process which brings this about. In a trade as competitive as ours, this trend is *bound* to have its impact on profits. There is obviously a limit to the extent to which increased costs can be recovered by higher selling prices and we must, therefore, exert every effort to offset these increased costs. We know we can never let up. Amongst the specific increases in expenses which will have to be faced during *the current* year is that on local rates. I can report that our experience during the first three months of the current year is that turnover continues to show an increase on the corresponding period of the previous year.

CITY CENTRE PROPERTIES LIMITED

£10 MILLION DEVELOPMENT PLANS

The seventy-fourth Annual General Meeting of City Centre Properties Limited was held on September 7th at 32, Victoria Street, Westminster, S.W.1, Mr F. W. Lindgren, FCA, Chairman of the Company, presiding.

The following are extracts from his statement which had been circulated with the Report and Accounts:

The Income of the Group for the year to March, 1956, increased to £687,700 from £598,350 for the year to March, 1955, notwithstanding the sale during 1955 of Chesham House which produced over £90,000 per annum. Outgoings, including interest but not taxation, increased from £444,418 to £517,241. The excess of Income over Outgoings increased from £153,932 to £170,459.

During the year under review, your Company has completed negotiations for the development of the Monico site in Piccadilly Circus in association with the Legal & General Assurance Society Limited. A new company is in course of formation to carry through this scheme. This project serves to emphasise that the Group is active not only in the centre of cities in general but also in the very hub of the Empire and Commonwealth. This important and valuable property has been included in the Balance Sheet at cost, and I am assured that a valuation would show a substantial surplus.

BIRMINGHAM AND LIVERPOOL

In Birmingham we are proceeding, through Raventop Developments Limited, in association with Land Securities Investment Trust Limited, with the development of the most important site in the centre of the city, which covers an area of some three and a half acres. Our interest in Raventop Developments Limited is included in the Balance Sheet at Cost £1. It is obviously of great value.

The first section of our Lord Street, Liverpool, development has been completed. Work is proceeding on the adjoining sections. In Eastgate, Leeds, the Contractors have almost completed Shell BP House. In Bristol a new building on a site in Wine Street, leased from the Bristol Corporation, is proceeding satisfactorily.

The total capital expenditure involved in developments in various parts of the country in which the Group is interested exceeds £10 million. These are expected to be completed over the next three to five years and will add very considerably to the revenue of the Group.

The Directors still have under consideration the question of bringing the Issued Capital of the Company more into line with the value of the assets, which involves the capitalisation of reserves. At the appropriate time they will take the necessary steps to apply for the consent of the Capital Issues Committee.

The report was adopted.

APPOINTMENTS

SENIOR INFORMATION OFFICER (UNESTABLISHED) required by Central Office of Information to take charge of Unit providing service of reference information on United Kingdom, Commonwealth and World economic affairs. Essential qualifications are a sound background of basic economic reading; knowledge of current affairs and of sources of information; ability to marshal facts, to report clearly and concisely, and to plan, supervise and edit Unit's work. APPOINTMENTS

METEOROLOGICAL OFFICE, SCIENTIFIC OFFICERS. The Civil Service Commissioners invite applications for permanent posts. Early application is advised. The duties include research in atmospheric physics, covering the study of cloud structure, synoptic and dynamical meteorology, large and small scale diffusion and turbulence, climatology, and development of instruments. There is a limited number of posts for graduates who are more interested in mathematics. Successful candidates will be given a course in meteorology before being assigned to a research or forecasting establishment for further training and experience. In some instances candidates with national service obligations can be commissioned in the R.A.F. for forecasting duties at R.A.F. stations for further information should be obtained from the Director, Meteorological Office (M.O.10), Air Ministry, Kingsway, London, W.C.2.
Candidates must be between 21 and 28 on 1st January 1956 (up to 31 for permanent members of the Experimental Officer class). They must have (or obtain in Summer, 1956) a First or Second Class Honours degree (preferably in physics or mathematics). Salaries (London rates) £605-£1,085. Women's scales lower but being improved under equal pay scheme. Somewhat lower rates in provinces. Opportunities for promotion to Senior Scientific Officer (£1,145-£1,545), and higher posts.
Particulars from Civil Service Commission, Scientific Branch, 30 Old Burlington Street, London, W.1, quoting No. 852/56 (M).

MARKET RESEARCH HEAD

A young executive age 30 to 40 with modern techniques of market research required to head new department with 100-year-old North British Rubber Co. currently engaged on £5 million modernisation and expansion programme in conjunction with the United States Rubber Co., one of America's largest rubber manufacturers. The company is preparing to market research carefully and new rubber and plastic products in the field of Tyres, Footwear and General Mechanicals. Applicants should have a knowledge of statistical method to degree standard and should have spent a number of years in this type of work. A man with real initiative and desire to teach a position of responsibility is the one being sought. Details of qualifications and experience should be addressed to The Industrial Relations Division, Castle Mills, Edinburgh.

MECHANICAL ENGINEER—A well-known steel and engineering company requires, for its large works in India, an experienced engineer, aged between 30 and 40. Candidates must have served a full engineering apprenticeship or be Graduate Engineers. Although not essential, some railway experience would be an advantage. The post carries great responsibility, and salary and conditions offered will be kept in line with the standard required.—Applications, which will be treated in strict confidence, should give full details of age, qualifications and career to date, and should be addressed to Box 5.S., c/o Walter Judd, Ltd., 47 Gresham Street, London, E.C.2.

WE require an Account Executive to work on the Schweppes Account. The person, either male or female, should preferably have had no advertising experience whatever, but should be of suitable educational quality, have a feeling for contemporary life and since the job of an Account Executive is a harassing one a balanced personality. Starting salary good and prospects excellent.—Write, Managing Director, Clifford Bloxham & Partners Ltd., Dane House, Red Lion Street, W.C.1.

(AMENDED ADVERTISEMENT)

THE LOCAL AUTHORITIES' CONDITIONS OF SERVICE ADVISORY BOARD

invite applications for the appointment of SECRETARY

to succeed the present Secretary who is to retire in 1957. The salary for the appointment, which is pensionable, is £4,500 a year. The appointment will be held at the pleasure of the Board and will be terminable on three months' notice on either side. Conditions of service will be those normally applying to chief officers of local authorities. The successful applicant will be required to take up duty on a date to be arranged in 1957. The Secretary of the Board is responsible for:
(1) advising the Board and the Employers' Sides of the wage negotiating bodies concerned with fixing wages and working conditions of employees in local government in England and Wales, and in Scotland also to some extent, numbering about 900,000 in many classes of employment;
(2) acting as Employers' Secretary to these wage negotiating bodies, and negotiating with the professional associations and trade unions representing such employees;
(3) the application of agreements on wages and working conditions arising from these negotiations;
(4) representing the Board and the Employers' Sides at meetings and conferences in connection with their activities;
(5) advising local authorities in matters concerning industrial relations.
A local government background would be helpful but it is not essential. The main requisite of the post is a thorough practical experience in wage negotiations over a very wide field, ability to assume responsibility for negotiations on a large scale and at all levels, and an extensive experience of industrial relations. Form of application, which is obtainable by October 6, 1956, may be had on application to the Secretary,
37 Upper Grosvenor Street, London, W.1.

CENTRAL ELECTRICITY AUTHORITY

SOUTH WALES DIVISION

Applications invited for superannuable N.J.R. appointment of SECOND OR THIRD ASSISTANT ENGINEER (STATISTICAL INFORMATION) (OPERATION) DEPARTMENT, DIVISIONAL HEADQUARTERS.
Salary: Grade AN/IN2 £1,015 to £1,240 per annum
Grade AN/IN4 £810 to £1,010 per annum
according to experience.
The successful applicant will be in charge of the Statistics Section and should have had experience in the application of statistical method to problems.
A university degree including statistical method or an equivalent qualification desirable.
Application forms obtainable from Secretary, South Wales Division, Central Electricity Authority, Twyn-yr-felwen Road, Gabalfa, Cardiff, to be returned by September 21, 1956.

ACCOUNTANT,

with at least intermediate qualifications, required in NIGERIA, WEST AFRICA,
by an associate company of RICHARD COSTAIN LTD.
Should have a minimum of three years in a professional accounts office or in Head Office accounts department of commercial firm. Must be capable of supervising African clerks.
Tours of 18 months' duration followed by three months' paid leave in U.K. Kit allowance and free single furnished accommodation provided.
Salary £1,456 to £1,820 per annum, according to experience.
Write, giving full details of experience, to:
Chief Personnel Officer,
Richard Costain Limited,
111 Westminster Bridge Road,
London, S.E.1.

SALES ADMINISTRATION

Vacancy occurs (through promotion) at Glasgow Branch of progressive company. Applications sought from young men of intelligence, initiative and tact who can fit into a dynamic team. Experience of sales planning, office procedures and customer contacts an advantage. Attractive salary with good prospects in expanding company.—Give full details of career, including present salary, in confidence, to: Black and Decker Ltd., Personnel Department, Harmondsworth, Middlesex.

IMPERIAL CHEMICAL INDUSTRIES LIMITED, Dyestuffs Division, has vacancies for one of two PROGRAMMERS for an Electronic Computer and Data Processing System to be installed shortly. The work will be concerned with commercial data processing and the application of the computer to various commercial procedures and problems. Applications are invited from experienced programmers, or persons with a degree in mathematics or an accountancy or kindred qualification, interested in being trained in this work. Starting salary will be commensurate with qualifications and experience and the posts offer good prospects. Please write, giving brief details of age, experience and qualifications, to Staff Department, Hexagon House, Blackley, Manchester, 9.

NATIONAL COAL BOARD, East Midlands Division, invite applications for Superannuable appointments in their Organisation and Methods Branch.
The Work involves the conduct of studies of office methods, organisation and staffing throughout the Division.
Commencing salaries will be between £1,085 and £1,475 for those who are already occupied in all respects for these posts. If further experience or training is necessary appointments may be made initially within the scale £940 to £1,200.
Applications, with full particulars of age, education, qualifications, experience and present salary, to: The Staff Director, National Coal Board, East Midlands Division, Sherwood Lodge Arnold, Notts (within 14 days.
Envelopes and applications to be marked S.V. 620 G.

ACTUARY, preferably under age 40, required at Head Office in Australian Life Office operating in Commonwealth countries. Staff age distribution and expansion of business offer excellent prospects of promotion.—Apply, in confidence, Box 502.

APPOINTMENTS

UNIVERSITY OF CAMBRIDGE

INDUSTRIAL MANAGEMENT

The Appointments Committee of the Faculty of Engineering hope shortly to be in a position to appoint an Assistant Director of Research in Industrial Management. The person appointed will be expected to engage in research in the field of Industrial Management and to take part in the undergraduate teaching in the Department of Engineering. He will be expected to enter upon his duties not later than January 1, 1957.
Forms of application and further particulars may be obtained from the Secretary of the Appointments Committee, Engineering Laboratory, Trumpington Street, Cambridge. The closing date for applications is November 12, 1956.

UNIVERSITY OF LONDON

The Senate invite applications for the Readership in Economics tenable at the London School of Economics and Political Science (salary £1,500-£1,850 a year). Applications (10 copies) must be received not later than October 25, 1956, by the Academic Registrar, University of London, Senate House, W.C.1, from whom further particulars may be obtained.

SENIOR SCIENTIFIC OFFICERS; SCIENTIFIC OFFICERS. The Civil Service Commissioners invite applications for pensionable appointments covering a wide range of scientific research and development in most of the major fields of fundamental and applied science. In biological subjects a number of vacancies is small; individual vacancies exist in the Natural History Museum for candidates who have special knowledge of, or who are interested in, palaeobotany, malacology, helminthology, acarology, foraminifera, mammalian taxonomy.
Candidates must have obtained a university degree with first or second class honours in an appropriate scientific subject (including engineering) or in Mathematics, or an equivalent qualification or record of professional attainments. *Candidates for Senior Scientific Officer posts* must in addition have had at least three years' postgraduate or other approved experience.
Interview Boards sit at frequent intervals.
Candidates taking their degrees in 1956 may apply before the result of their degree examination is known.
Age limits: Senior Scientific Officers, between 26 and 31; but specially suitable candidates under 26 may be admitted; for Scientific Officers between 21 and 28 during 1956 (or 31 for permanent members of the Experimental Officer class). Salary (London): Senior Scientific Officers: (men) £1,145-£1,545; (women) £1,026-£1,240. Scientific Officers: (men) £605-£1,085; (women) £605-£962. Women's scales being improved under equal pay scheme. Somewhat lower rates in the provinces.
Further particulars, for which early application is advised, from Civil Service Commission, Scientific Branch, 30 Old Burlington Street, London, W.1, quoting No. 853/56 for Senior Scientific Officers and 852/56 for Scientific Officers.

METEOROLOGICAL OFFICE, SCIENTIFIC OFFICERS. The Civil Service Commissioners invite applications for permanent posts. Early application is advised. The duties include research in atmospheric physics, covering the study of cloud structure, synoptic and dynamical meteorology, large and small scale diffusion and turbulence, climatology, and development of instruments. There is a limited number of posts for graduates who are more interested in mathematics. Successful candidates will be given a course in meteorology before being assigned to a research or forecasting establishment for further training and experience. In some instances candidates with national service obligations can be commissioned in the R.A.F. for forecasting duties at R.A.F. stations; further information should be obtained from the Director, Meteorological Office (M.O.10), Air Ministry, Kingsway, London, W.C.2.
Candidates must be between 21 and 28 on 1st January 1956 (up to 31 for permanent members of the Experimental Officer class). They must have (or obtain in Summer, 1956) a First or Second Class Honours degree (preferably in physics or mathematics). Salaries (London rates) £605-£1,085. Women's scales lower but being improved under equal pay scheme. Somewhat lower rates in provinces. Opportunities for promotion to Senior Scientific Officer (£1,145-£1,545), and higher posts.
Particulars from Civil Service Commission, Scientific Branch, 30 Old Burlington Street, London, W.1, quoting No. 852/56 (M).(2).

STATISTICIAN

A Statistician is required with a good knowledge of mathematics or statistical theory for research work in Management problems in a large Company just outside London. The work is akin to operational research, and the applicant will have the opportunity later of moving into a Management Job. Experience is not essential and some posts straight from a University would be acceptable. Salary will vary according to experience, but will not be less than £600 per annum to start.—Apply Box 508.

RESEARCH WORKER required in the Research, Economic Intelligence and International Affairs Section of the N.C.L.'s Industrial Relations Department at London HQ. The duties include analysing statistics, preparing reports and participating, when necessary, in research projects undertaken in co-operating areas. Knowledge of statistical principles and methods is essential; educational qualifications in sociology, or any related social study an advantage. Appointment (superannuable) according to qualifications and experience within inclusive scale £864 to £1,661 male.
Write, with full particulars of age, education, qualifications and experience, to: National Coal Board, Staff Dept., Hobart House, London, S.W.1, *marking envelope* SS/382, before September 22, 1956.

ACTUARY, early 30s, for several years head of stockbrokers' investment department, seeks change larger firm or institution where ability to deal with institutional business will have more scope. Capable all aspects of work, including report writing and gilt switching. Box 503.

PERSONNEL MANAGERESS, 28, requires post with challenge. Cambridge economist, experienced welfare, canteen, hostel and Box 504.

AUSTRALIAN NATIONAL UNIVERSITY

GENERAL MOTORS HOLDEN'S FELLOWSHIPS

Through the generous foundation of General Motors-Holden's the University is pleased to invite applications *for study in Canberra from university graduates.*
Three awards are offered, each tenable for one year, commencing in 1957. In the discretion of the University these awards may be made with the expectation of renewal for a further period not exceeding two years.
Preference in selection will be given to students preparing for careers in industry, or other activities, including teaching, and who have graduated in disciplines related to the Sciences, Engineering, Commerce or Economics.
The value of the Fellowships, which will not be less than £A800 per annum nor more than £A1,200 per annum, will be determined according to the needs and maturity of the applicant. These emoluments will be exempt from Australian income tax.
Those to whom Fellowships are awarded will be required to take up their Fellowships at the beginning of the 1957 academic year (March). Applicants must be University graduates with some research experience. Successful applicants must be able to enrol for a degree (Ph.D., M.A., or M.Sc.).
Further particulars and application forms should be obtained from the Secretary, Association of Universities of the British Commonwealth, 36 Gordon Square, London, W.C.1.
Applications close on October 15, 1956.

All enquiries treated with utmost confidence.—In first instance they should outline history, present situation and financial aspects to Managing Director, Box 507.

SUCCESSFUL TUITION FOR THE B.Sc.(ECON.) DEGREE

Wolsey Hall (Est. 1894) provides Postal Courses in a wide range of subjects for the two examinations for Lond. Univ. B.Sc.(Econ.)—those if Entrance is included. Moderate fees, instalments. Over 1,000 Wolsey Hall students have secured this valuable degree since 1925.—Prospectus from C. D. Parker, M.A., LL.D., Director of Studies, Dept. P.16, WOLSEY HALL, OXFORD.

WHERE'ER GOOD SHERRY is to be had, you will find Dudley Dunn Gordon's P.L. CID. It's a fine light Amontillado—a sherry for the connoisseur. Named, appropriately enough, after a Spanish hero of the 11th century.

THE Economist Bookshop has the world's widest range of books on Economics, Politics, History, Anthropology and the Social Sciences. World-wide mailing service. Second-hand books bought.—11-12 Clements Inn Passage, Aldwych, London, W.C.2.

FOR SALE.—*The Economist*, April, 1949-December, 1955.—Offers to Box 501.

EXPERT POSTAL TUITION

for Examinations: University Law, Accountancy, Costing, Secretarial, Civil Service, Management, Export, Commercial, General Certificate of Education, etc. Also many practical (non-examination) courses in business subjects.—Write today for free prospectus, and/or advice, mentioning examination or subjects in which interested, to the Secretary (C.9.2.),
METROPOLITAN COLLEGE, ST. ALBANS
or call at 30 Queen Victoria Street, London, E.C.4.

Imagine a marine world without oil!

Hard to do, isn't it? Yet how much harder it would be to live in such a world. In the marine field alone, oil has contributed in so many essential ways. It has facilitated trade and commerce. It has drawn together the community of nations. It has helped people everywhere to live better, to progress and prosper. In supplying finer marine products to the peoples of 67 free nations, and through more than 350 world ports, Caltex has for years played a significant role in this dynamic industry.

Building costs slashed. Concrete is poured on forms of CORRUGATED board

It takes a strong man to lift a cubic foot of concrete. But these new pouring forms made of corrugated board, first introduced in the United States, can stand up under nearly six times the weight. Yet they're less expensive and easier to install than any other kind.

Instead of storing and handling cumbersome metal pans or wooden frames, builders can simply staple these pre-cut corrugated forms together at the site and mount them in place. Besides saving time and money, they eliminate the storage problem and effect a sizeable gain in man-hour productivity.

Corrugated forms are being used today in practically all kinds of concrete construction: slab on fill, slab on fill-joist, and second story slab on joist. Additional time can be saved by installing conduit and lath in advance—before the concrete is poured—and by leaving the forms in place.

This latest step forward in the building industry is dramatic proof of the strength and economy of corrugated board. When you need new shipping containers for your products, heavy or light, sturdy or fragile, think first of corrugated.

Langston doesn't sell corrugated; only the machines that make it. Since 1902, these machines have led the field in efficiency and dependability. *Samuel M. Langston Co., Camden 4, N.J., U.S.A.*

Do you still wind your watch?

Winding a watch is a nuisance. Outmoded. Unnecessary!

But, you never have to wind a Mido. It starts winding itself the instant you put it on, keeps winding as you wear it. Yet for all its slim elegance, a Mido wants no pampering. Swim with your Mido. Play tennis with it. 100% waterproof. Shock-protected. Anti-magnetic. Unbreakable mainspring. The worry-free watch!

Mido makes only self-winding watches—the world's largest gift selection. And, isn't it time you replaced your own watch with a modern, self-winding timepiece?

Mido watches are sold and serviced in 65 countries. Ask to see them at better jewellers. For our new catalogue E, write

Mido Watch Company, Bienne, Switzerland, or

Mido Watch Company of America, Inc., 580 Fifth Avenue, New York 36, N.Y.

Mido Powerwind

Stainless steel case with 18 carat gold markers
14 or 18 carat gold case with 18 carat gold markers and hands

THE WATCH YOU NEVER HAVE TO WIND

There are clear difficulties in using this selection of countries to illustrate comparative questions, despite the loading of the text with frequent cross-references. With Great Britain and France a fairly similar treatment on conventional lines can be adopted and the differences in essence dealt with in an introductory chapter to each of the two sections. On the other hand, with Germany, where the Federal Republic has still to establish itself, the approach is much more historical and ranges over almost the whole of Germany's past in order to demonstrate Mr Finer's justifiable pessimism about the ability of Germans to run a democratic system of government satisfactorily. Soviet Russia presents problems of yet another kind. Here the question is one of principle. Mr Finer has understandably as much dislike of the Soviet system as of the Nazi one. He therefore makes no attempt to view it other than by comparison with the norms of a free western society. His revulsion is so great, indeed, that it leads him not merely to put the worst interpretation upon every aspect of Soviet society, but also to blacken unwarrantably the progress made in the century before the Bolshevik Revolution. It is clear that he does not like Russians whatever their political colour.

The student, therefore, has in fact very little material to illustrate the major institutional forms that countries inspired by western constitutionalism have adopted, and none with which to assess calmly the model of government which much of the world beyond Russia has adopted or may in some form come to adopt. A further difficulty from the student's point of view is added by the fact that the whole book is written in emotive language and suggests a transcript of lectures delivered at high speed in an enormous American auditorium, probably with the use of microphones for transmitting it to adjacent classrooms.

Nevertheless, the book does include a great deal of valuable material, particularly on Britain and France, and for the tougher student whom Professor Finer has in mind it might well serve a distinctly useful purpose. It has the merit of being a fresh look, particularly at these two countries, and not simply an attempt to patch previous classical treatments. It is not seriously marred by a number of errors due to bad proof reading, but one is bound to express surprise that Professor Finer should believe that up to 1356 the mediæval Empire was in continuous hereditary succession in the family of Charles the Great, or that he should suppose that the sale of offices was unknown in Prussia or other German states in the seventeenth and eighteenth centuries. It was not the Allies who wished Berlin included in the German Basic Law and the Germans who wished to leave it out, as Professor Finer suggests, but precisely the contrary. Lord Attlee is not a Wykehamist; Macaulay was a glory of Trinity, Cambridge, not of Trinity, Oxford; and (let us hope for the last time) Lenin's christian name was not Nikolai.

Letters to the Editor

When is a Liberal not a Liberal?

SIR—It is encouraging that twice within a fortnight (once shortly, and once at length) you should have given advice to the Liberals. Your advice covers leadership, function and tactics.

On the first the matter is now settled, and it remains only to add that a man of great reputation and long experience will be followed by a man of growing reputation but who, because of his limited experience, will receive all the support that the Liberal party is longing to give him.

On function you pose a non-existent cleavage. Carefully sought applause, especially through an attack upon another party, is easy to attain. But, during my recent two years' experience as chairman of the party's executive, I always found the most ready response to the claim that "if ever Liberals look upon the Liberal party itself as more important than those aims for which the Liberal party stands, it will deserve to die."

On tactics we are not hopeful, as you suggest we should be, of making "the other two parties as much like Liberals as possible." But we may be able to make them act as though they were Liberals. We shall be successful in this strictly according to our visible support from the voters. Thus we do not contest elections, as you suggest "for fun." We contest them to prove to other parties the strength of opinion behind us, and to secure increasing representation of our own in the House of Commons. We know that our present small membership there is our greatest single handicap; we believe that if once we can increase it against the efforts of both our opponents that handicap will disappear, and our progress will be rapid.

We therefore see no sense in your suggested limitation of fighting in only one-fifth of the constituencies. Rather, we hope to fight on a front that will be limited only by the availability of suitable candidates backed by genuine and efficient organisation.—Yours faithfully,

GEOFFREY ACLAND

Press Publicity Dept.,
Liberal Party Organisation, S.W.1

Trimming a Bad Egg

SIR—Though I have no interest in eggs except as a consumer, I must protest that your note on eggs and your correspondents' comments miss the point and the facts of the present subsidy, control and marketing position.

These are the essential facts about the average English farm:

1. 90 per cent of the input is controlled by trade agreements, whether union, association or statutory.
2. All our suppliers shelter under tariffs.
3. Even a medium-size unit is a weak buyer and seller. Bargaining as buyers is impossible—it is either against the law or would be in breach of some agreement signed by our suppliers. Bargaining as sellers is ludicrous—we are one of too many.
4. All our overseas competitors sell by means of co-operative or government marketing boards which have the financial resources and expertise to sell at the right price and time.
5. Though production per man hour on an efficient English farm is two or three times that of suppliers and customers and is higher even than that of Imperial Chemical Industries or Associated Electrical Industries or an oil refinery, we cannot afford to pay comparable wages.

If these facts are accepted, the conclusion must be that subsidies are largely absorbed in support of suppliers and customers.

In the case of our own farm this is easily proven and it is also easy to prove that while the efficiency of suppliers and customers is far lower than ours, their profit per £ of turnover is three to four times as great with far less risk.

No efficient English farmer would mind the return of "freedom," but what is sauce for the goose must be sauce for the gander. This is what I was brought up to believe was the definition of Free Trade.—Yours faithfully,

HENRY HOBHOUSE

Castle Cary, Somerset

Open Door to Europe

SIR—No one can predict what the remaining forty-four years of the present century may bring forth; but nothing more momentous has occurred during its first fifty-six years than the pronouncement about the possibility of uniting Western Europe with the British Commonwealth in some kind of economic union.

Vested interests in all these countries will make a desperate attempt to kill this great conception at birth; but those who understand what it means should not be intimidated by them.

According to press reports, agricul-

tural products would be excluded from this vast common market. I would suggest that this exclusion would be a ruinous blunder; for it would impose upon the people inhabiting these territories the burden of dearer food. How, then, could competition be successfully maintained with countries lying outside this economic union and having lower food prices? Unless the prices of all goods, agricultural and industrial, are brought by competition into their proper relations, free trade cannot work.

The salutary pressure of competition would compel the farmer to turn his skill, energy, and resource to the best account.—Yours faithfully,

London, E.C.2 PAUL DE HEVESY

South of Khartoum

SIR—Your correspondent who was lately in the Southern Sudan deserves to be congratulated for managing to grasp a complicated situation dominant therein in so short a time. His article in your issue of September 22nd is both fairly accurate and constructive. But nevertheless I am urged by a feeling of doing the Government of the Sudan justice to bring into light a few facts.

For fifty years the South has been declared by the ex-Co-domini rule a closed area in the face of whatever emanated from the North: people, ideas or trade. What the Government has done in the last few months could not have possibly been sufficient to uproot the results of half a century of highly organised deliberate alienation. Hence the present air of distrust.

Naturally, efforts to arrest some 150 mutineers so far unaccounted for justifies the continuance of a state of emergency declared in the South since August, 1955, so that by March, 1957, general elections for the Constituent Assembly proceed unhampered.

The troubles of the past were, however, associated with one man and his party at present away from rule; and chief amongst the responsibilities with which Parliament shouldered the new Government when it first came to office is to bridge the gap between South and North. Since then they have left no stone unturned to fulfil their pledge to Parliament.

Administrators are being specially selected to man the chief executive and judicial posts in the South. At the same time Southerners are being promoted to positions of greater responsibilities, but not at the expense of efficiency.

A commission with a Southerner Deputy Chairman has already started work to develop the South. It was given wide powers to implement its decisions without reference to the Government except in a few cases involving security issues or financial expenditure.

Radios were lavishly distributed to remote villages to keep the people informed up to date. Finally and most comforting is that a South problem has been recognised.

The Christian missionaries are being financially aided by the Government. Instructions, frank and to the point, were issued to administrators in the South not to interfere with missionary activities as long as they kept away from politics.

As far as federation is concerned, it may be surprising to mention that the idea is existing only in the minds of a few ambitious politicians lacking public support, a clique of Southerner communists and a small number of missionary school teachers or/and graduates. The bulk of the South is for a united Sudan.

One final point: The area in turmoil is not quite south of Khartoum except in the sense that Portsmouth is south of Glasgow. The area is separated from Khartoum by a province bigger in area and population than any two of the three provinces combined, i.e., far away from effective control by Headquarters in Khartoum.—Yours faithfully,

OMER EL ZEIN,
Council of Ministers

Khartoum, Sudan

John Bull's Model Ireland

SIR—In the interesting Ulster Supplement to your issue of October 6th there appears a short article, "Finance under Devolution." In the second paragraph reference is made to the "imperial contribution," which sum you go on to say "is in theory agreed by the Joint Exchequer Board, which, however, meets very rarely; and its procedure is obscure."

As chairman of the board I feel I cannot allow that statement to pass without saying that not only in theory but in practice is the sum agreed by the board, which meets as may be necessary to fulfil its statutory duties. The last two meetings were held at Stormont within the space of twelve months, on the occasions of the Finance Minister making his budget statement, which was listened to by the members of the board.

May we apply the words of Thomas Carlyle to the board—Happy the people whose annals are blank in history books!—Yours faithfully,

Edinburgh J. M. ERSKINE

Israel, Armistice and War

SIR—I was astonished by your note in your last issue. In fact, you suggest that Colonel Nasser may, after all, be justified in stopping Israeli cargoes from passing through the Suez Canal.

It appears that your note betrays an emotional bias in assessing Middle Eastern affairs. The Israeli raid, which you are so eager to condemn, was only the effect of a cause which you prefer to minimise. The cause which makes retaliation inevitable is the stubborn refusal of the Arab states to recognise the state of Israel, and the disastrous consequences of this refusal. Israel's defensive actions must be seen in the light of the fact that the Arab states refuse even to discuss the possibility of entering into the peace negotiations which Israel has advocated since its very inception. I doubt whether any government, including our own, would tolerate continuous acts of violence perpetrated by hostile neighbours, within their own territory, without adopting effective counter-measures.

The arms balance in the Middle East has been tilted against Israel, and it is probable that the present border crisis has been caused by the tensions inherent in this disparity in armaments. By restoring the balance of power, we may well avert a full-scale war in the Middle East. Your argument that Israel's "bellicosity" indicates that it does not really need Sabre jets is most unconvincing. Israel has to undertake defensive actions just because the quality and quantity of its weapons are not impressive enough to deter by their very existence violations of Israel's frontiers.—Yours faithfully, LIONEL BLOCH

London, N.W.8

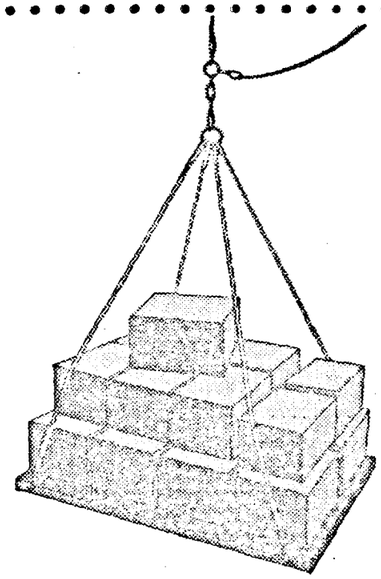
Town, Gown and Mr Sandys

SIR—There could be no better illustration of the "remote and ineffectual don" than Mr Beloff's latest letter. He says "it would seem obvious that the best people to decide on how the university can be preserved are those who have made their working life within it." But when Mr Macmillan sold his university and Oxford City over the Clarendon Hotel scandal, a Conservative university councillor, Mr A. B. Brown, said it was quite disastrous "that a bigger Woolworths is to appear in the centre of the city where it is bound, and designed, to attract increasing traffic." Now the mercenary dons of Christ Church hope to add to the confusion with a vastly enlarged Marks and Spencer—"in time a new and fine modern building will face Messrs Woolworths . . ." (*Oxford*, May, 1956). Similarly, St John's, to whom we owe the spoliation of the Woodstock Road entrance to Oxford, have recently persuaded the Minister to allow them to industrialise Aristotle Lane. Preservation? William Morris complained nearly seventy years ago that

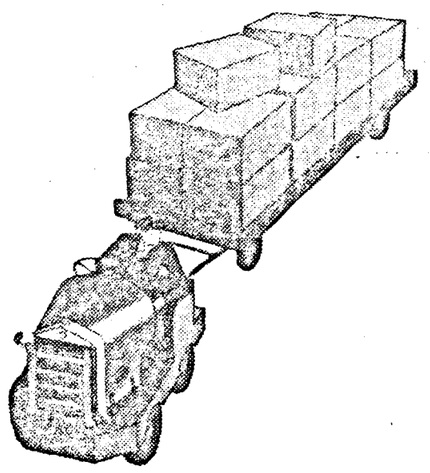
> the guardians of this beauty and romance, so fertile of education . . . have made its preservation give way to the pressure of commercial exigencies, and are determined apparently to destroy it altogether.

No, Sir. Oxford needs to be saved from mercenary dons (*Dominus Nuffield Illuminatio Mea*), and the two great anti-Liberal parties who are out to sabotage the national educational system—the one on grounds of expediency, the other on ideological grounds. If the essential Oxford is to be saved it will only be through a Royal Commission. The college comments on the original road plans showed—*tot homines, tot sententiae* (only Balliol took an extra-mural view) "where self the wavering balance shakes, 'tis rarely right adjusted." It seems that the colleges wish to hang separately, not together.—Yours faithfully, D. G. AMBROSE

Oxford



Formula for increasing your export sales



Tell your sales story the world over . . . tell it to the right people . . . tell it in the right way.

This is the three-fold formula that many outstanding companies have found to be a useful tool for increasing export sales.

One of the best ways of putting this formula to work is by advertising in LIFE INTERNATIONAL and LIFE EN ESPAÑOL — telling your sales story the world over.

Since the readers of these editions are men of influence — leaders in business, government and the professions — you know you are telling your sales story to the right people.

And you know you are telling it in the right way — because you yourself have control of your advertising when you place it in LIFE INTERNATIONAL and LIFE EN ESPAÑOL. You have the opportunity of seeing that the most important selling points are made in the most effective manner . . . that your product is shown to best advantage . . . that your prestige is properly maintained.

It is for these reasons that leading companies in Britain and on the Continent have more than doubled their investment in LIFE's International Editions in the last four years.

LIFE INTERNATIONAL — advertising rates based on average net paid circulation of 260,000 copies, printed in English and distributed in 120 countries outside North America.

LIFE EN ESPAÑOL — advertising rates based on average net paid circulation of 300,000 copies, printed in Spanish covering all of Latin America.

These are the INTERNATIONAL EDITIONS of LIFE magazine, with a combined current circulation of over 600,000 copies every fortnight.

For further information, write or telephone The Advertisement Director, Life International Editions, Time & Life Building, New Bond Street, London W.1. Grosvenor 4080.

LIFE INTERNATIONAL EDITIONS

are than with "averages" of statistical prosperity. Moreover, despite the general well-being and pride in the supposed absence of class consciousness in America to which Vice President Nixon invariably appeals, interviewers in industrial areas find that the view that "Democrats favour the workers" is held with remarkable tenacity.

The traditionally powerful issues—peace and prosperity—the two-term habit and the personal popularity of the candidate all point to a Republican victory in this election. But the electoral statistics, showing that 1952 was a Republican peak and that since then the Republicans have consistently lost elections of all kinds—culminating in September's losses in Maine—suggest that Mr Stevenson might just be dragged into office if he could catch the coat-tails of enough locally popular Democrats. Therefore both parties for opposite reasons are trying to bully the electorate into voting logically for all of one party's candidates for all the offices at stake. But, although no President has yet been elected without his party winning a majority in Congress, such an outcome seems distinctly possible this year.

The "vote-splitter" who picks and chooses feels that he is having things both ways and he can, if need be, rationalise his conduct as a mature display of discrimination. Moreover, unless Mr Stevenson can make some dent in the widespread conviction that Mr Eisenhower has an especial ability as a keeper of the peace, this is just the kind of issue on which "economic Democrats" are likely to split their votes between Mr Eisenhower and local candidates of their own party. It is too soon to tell whether Mr Stevenson's two attempts to capture a share of the "peace issue"—his speculation about an approaching end to conscription and his proposal to stop tests of large nuclear bombs in advance of general disarmament—will succeed. The Republicans hope that it will strengthen the view that he lacks Mr Eisenhower's judgment on world affairs. But if the theory is correct that people make up their minds how to vote weeks in advance of polling day, these efforts may have no effect whatsoever.

John L. Lewis Partnership

THE new "golden age" of co-operation between capital and labour in the American coalmines entered its seventh year last week when Mr John L. Lewis, the president of the United Mine Workers, announced the wage agreement which he had been negotiating unobtrusively with Mr Edward Fox, the new president of the Bituminous Coal Operators Association. As usual, Mr Lewis has done his miners proud. Their wages will rise, in two steps, by $2 a day (to $22.25 for 6½ hours' productive time in an 8-hour shift) and they will also receive more pay for holiday and weekend work. Even before the increase, according to the miners' union, average hourly earnings in the coal mines were $2.83, compared with $2.69 an hour paid under the new contract in the steel industry, and $2.31 in the automobile factories. The latest agreement, bettering the rise recently won by the steel workers, pushes the miners' position still nearer to the top of the industrial wage scale.

It is significant that the new coal agreement makes no mention of the guaranteed annual wage which has been a major demand of the trade unions in the automobile and steel industries. The miners have long had their welfare fund, which paid out over $127 million in pensions, medical care and other benefits in the year ending June, 1956, and still has over $130 million in hand. With this fund, which is financed entirely by employers' contributions at the rate of 40 cents a ton of coal mined, the union feels secure enough to concentrate on demanding higher wages, and follows a consistent policy of stimulating efficiency in the industry so that it may be able to pay them. An advocate of increased mechanisation in the mines, the union takes pride in the fact that productivity has risen from 6.8 to over 11 tons per man day since 1950, even though, as a result of this policy, only 229,000 miners are now employed in the industry, compared with 416,000 in 1950, when output was only slightly higher than it is today. The welfare fund takes care of those who lose their jobs.

The only inconsistency in this community of interests between the miners and their employers is the renewed complacency with which both regard the prospect of rising prices at the pit head. Three years ago a similar wage increase, which weakened the competitive position of coal compared with other fuels, intensified a depression from which some companies are still recovering. As a result of Mr Lewis's latest contract, coal prices may rise by as much as a dollar a ton over the next year, in an economy which is already tight at the seams with inflationary pressure.

Detroit's Autumn Showing

FROM A SPECIAL CORRESPONDENT

AFTER a year that Detroit will be happy to forget, the automobile industry is coming out with its 1957 models. Output is scheduled to rise to 1.8 million cars in the next three months, compared with just over 1 million in the period from July to September. This increase is partly seasonal, since the "model year" or marketing year begins in October—as it does for most lines of retail trade in the United States. But the scheduled rise in production also assumes that sales will be favourably influenced by the drastic restyling of this year's cars. These feature lower bodies, smaller wheels and a continuing attempt to make cars look more like aeroplanes by shaping the rear wings as tail-fins. Some purchasers will be pleased to find that colours are more subdued this year, although it may be very difficult to get a car that is in one colour only.

The public taste for luxury has led the Ford Company to discontinue its plain but inexpensive "Mainline" series, and to introduce a new high-style "Fairline 500" series. Moreover, Ford raised prices as much as $104 for its family saloon in the cheapest remaining class, citing low volume of output as the excuse. The company feels that it can make a profit without increasing prices for the more expensive station-wagon and convertible models because there will be a greater demand for them. All firms are aiming at the middle-income market, which seems to want as much style and luxury as it can get within the limits of the low-to-medium price field.

In spite of the obvious appeal of the new models, no one in Detroit predicts that sales in 1957 will equal the peaks of 1955. There is no backlog to be filled this time,

SIAMESE FABRICS FROM FRANKLIN IMPORTS, LOS ANGELES

Smooth . . as Siamese silk!

Smooth silken strands are today tightening the commercial and cultural bonds between Thailand and the United States. Developed since the war, the Thailand silk industry now exports a growing quantity of hand-woven silk fabrics to this country . . . fabrics that are noted for their brilliance of color, their tightness of weave, their strength of texture. Commanding top prices in American fashion centers, Siamese silks are air shipped to New York . . . Chicago . . . San Francisco . . . where they are used by exclusive dress designers and interior decorators to create wearing apparel and home furnishings of unusual beauty.

Financing exporters and importers of Siamese silk . . . speeding consignments on their way by knowing the local regulations, the procedures, and the people . . . is all part of a day's work to Bank of America men abroad. If you are in a business or industry that could benefit from this fast, efficient international banking service, why not get in touch with our International Department today?

Supreme the World over

as there was after the Korean war and the 1954 recession. Nor is there much chance that demand can be stimulated, as it was in the later part of 1955, by reductions in dealers' prices or easier credit. Margins of profit are low for dealers now, and credit terms have been stretched about as far as lenders think is wise. Moreover, some of the lenders on automobiles—particularly the smaller banks and consumer finance companies—are short of funds because of the generally tight money market, and all are screening their risks more carefully.

People who paid cash for their cars—usually wealthy individuals—have been less numerous in 1956 than in 1955, and many of these are likely to want a new model in 1957. A large number of people who bought cars late in 1954 on an 18- to 24-month hire purchase agreement are also expected to be back in the market. The favourable terms for used cars now offered in exchange are a strong inducement to these two groups to invest in new models during the next few months. However, by the spring the market will depend more on the usual type of buyer on credit, who may have purchased his car in 1955 with thirty months to pay and may therefore have to wait until 1958 to buy again; this will leave the new car market less buoyant in the second half of 1957. The industry is predicting sales of 6.5 to 7 million new cars, compared with 7.5 million in 1955 and about 6 million in 1956.

★

To achieve a comeback in sales this year has made the industry spend lavishly on new equipment. It is only two years since the major style change of 1955, and the cost of tooling for the 1957 models has been even greater. In addition to the special dies, cutting tools, jigs and fixtures for shaping the bodies in new forms, it has been necessary to rearrange assembly facilities to handle the longer, heavier shapes. New equipment for painting and welding was required, and new forging machines to make stronger axles. Altogether, the total outlay connected with style changes is estimated at over $1 billion, most of which must be recovered during the two years in which the present models will be on the production line. This is in addition to expenditures of at least $1.5 billion on permanent additions to the industry's manufacturing capacity, consisting of new assembly lines and new buildings and equipment to make engines, transmissions and other mechanical components. It is in this latter field that most of the costly automatic devices are being installed, but the cost of style changes is beginning to overtake even the cost of automation.

As the industry looks ahead, it is the expense of styling which dominates thinking about capital requirements. The basic capacity is in place to handle a considerable expansion of automotive sales over the next five years. This much automation has achieved, and continuing improvements may be expected to yield more capacity for standard items at relatively low capital cost from now on. But the designs of 1959 cars, which are already on the drawing boards, would call for another huge expenditure on facilities to produce differently styled bodies. If the engines were also to be changed—a step that would mean replacing many automated machine-tools with others of different design—the cost of changing models would become astronomical.

Some observers believe that only the General Motors Corporation could afford both to introduce a major change in engines—such as the gas turbine—and to maintain the present cycle of biennial changes in body styles. Even for GM it might not be profitable and mechanical changes may come slowly over the next five years. The real dilemma is how to pay for style. The smaller companies will be hard pressed to find the cash for model changes every two years, on the scale that Ford and General Motors are setting. Yet this is clearly what sells cars. In fact, considering the public enthusiasm for change in 1955 and the apathy about the same cars in 1956, there is likely to be some restyling every year in future. All this must be accomplished, according to the dictates of competition, without large price increases. The leading companies have done it for 1957, and they plan to keep on in 1958 and 1959. This year may tell whether their smaller competitors can stay in the race.

Communists Go American

THE rickety affairs of the American Communist Party have taken a public lurch for the worst and Mr Brownell, the Attorney General, is happily claiming the credit. Mr William Z. Foster, the party chairman, has written an article attacking the "Draft of Political Resolutions" approved by the national committee to go before the party's convention next February. His was the only vote cast against these admissions of past errors in leadership. He accuses the committee of "trying to downgrade Lenin," of showing a "strong right tendency" and of under-emphasising the "aggressive role of American imperialism." History has been unkind to Mr Foster's past success in keeping the unusually turbulent American Communist Party to the Stalinist line.

The authors of the resolutions attacked by Mr Foster speak of the "uncritical acceptance" and the "dogmatic application" of the ideas of Marxists foreign to the American scene. The authors confess to exaggerating the likelihood of an industrial recession with America then provoking a third world war. "Negative attitudes" have been held towards "non-left Negro" and other "libertarian" organisations. These Communists argue vigorously that the American Party has "long since discarded . . . Stalin's thesis about . . . inevitable proletarian revolt." They admit that these errors, the general level of prosperity, the repressive legislation against them, and the plausibility of "the lie" that they were agents of "a foreign power," have dangerously weakened the Party. They pledge themselves to attain socialism by peaceful and constitutional means.

The Attorney General has released a "memorandum to the President" giving the draft resolutions free publicity and underlining the credit the Communists give to his department for their plight: the prosecutions for violation of the Smith Act (against conspiracy to overthrow the government by violence); prosecutions for perjury before public committees; the denaturalisation and deportation of subversive persons and the elimination of "security risks" from government employment. If anyone ever accused the Administration of being soft to Communists, Mr Brownell seems to argue, the Communist Party itself has now given the reply conclusive.

products of UNION CARBIDE polyethylene
TRADE-MARK

With finished products molded or extruded of versatile UNION CARBIDE polyethylene, you can draw customers almost magnetically, and greater sales mean rising profits for you. Whether ease of handling in production or building greater customer loyalty for your products, UNION CARBIDE quality—the invisible ingredient—*works* for you.

The lightness, toughness and modulated flexibility-rigidity of UNION CARBIDE polyethylene, combined with its chemical and abrasion resistance, adapt it to a wide variety of uses. From wire insulation and film for packaging to water pipe and squeezable bottles, or in the ever widening range of future applications, you can mold more quality into your products with UNION CARBIDE polyethylene plastic materials.

New facilities for the production of UNION CARBIDE polyethylene are making increasing quantities available for sales-conscious producers of plastic finished products. For further information on how polyethylene can serve you and your customers, write for booklet PE-10 "UNION CARBIDE Polyethylene".

Atomic Fair

FROM A CORRESPONDENT AT CHICAGO

IT was in a squash court under a football arena on Chicago's Southside that the first atomic pile was built and a sustained chain reaction produced in December, 1942, opening, for better or worse, the Atomic Era. Last month the atom, very well developed for a teenager, returned to the Windy City. On Navy Pier, jutting out over a mile into Lake Michigan, nearly 25,000 persons from all over the world trooped in to view the machines and minutiæ of nuclear energy on display at the Second Annual Atomic Trade Fair.

The fair was sponsored by the Atomic Industrial Forum, a unique trade association with more than 500 members from industry, labour and the professions. The Forum, which has often acted as a link between the government's Atomic Energy Commission and the American business community, stresses the exchange of information and tries to avoid taking sides in controversial issues. Its first fair, held in Washington a year ago, drew 78 exhibitors ; this time there were 121. Thirty per cent of the exhibitors at the fair were manufacturers of reactors and components, with every major builder represented. Companies making instruments and suppliers of raw materials each accounted for another twenty per cent, and the remainder was a mixed bag which included universities, technical publishers and governmental agencies.

On the whole, the exhibits were splendidly mounted. Those few organisations which have actually built nuclear reactors in the past focused attention on their accomplishments ; other firms wistfully offered tangible evidence of what they will do as soon as they are given their chance. The Westinghouse Electric Corporation, which has enjoyed enormous prestige in the budding atomic field because of the success of its pressurised water reactor, provided one of the most extensive displays, featuring photographs of the submarine *U.S.S. Nautilus* powered by Westinghouse's nuclear plant ; the company has now been awarded a contract for reactors for another six submarines. Nearby stood an exhibit of similar proportions sponsored by another industrial titan, the General Electric Company. GE, which has recently become extremely active in the development of a nuclear aircraft engine, is closely identified with the boiling water reactor, which was given prominence.

A smaller display which drew large crowds was that of still another builder of heavy reactors, the Leeds and Northrup Company of Philadelphia. Here a model system artfully simulated the actual performance of an integrated nuclear power plant. In a twelve-minute lecture-demonstration. the animated reactor was brought into operation under full load, worked through automatic controls, and finally shut down, or " scrammed," on reaching the allowable limits of heat and radiation. The Union Carbide and Carbon Corporation, one of the most highly diversified of the colossi which characterise the American economy, featured in its display a continuous showing of a new motion picture on uranium and its uses which excited great interest.

When glutted with geiger counters and surfeited with scintillometers, the contemplative nuclearphile could reflect on the extent to which the fair faithfully mirrors the present state of the atomic energy programme in the United States. At the age of fourteen the estimated annual dollar volume of American nuclear industry is $2.5 billion. The AEC employs directly only about 6,000 people, but its contractors have another 107,000 on their payrolls ; at least 20,000 additional persons are engaged on research and other pursuits in non-governmental enterprises. Much of this activity is of recent origin, since until the Atomic Energy Act was amended in 1954, the field offered little scope for private industry.

In this early phase, it is doubtful whether many of those working with the tiny fragment of matter are realising anything more than correspondingly tiny profits. Among the relatively few companies known to be making money is the Anaconda Company, a sprawling giant in the raw materials field which now derives a substantial portion of its income from uranium mining and milling operations on the Colorado Plateau. Anaconda was not an exhibitor at the fair ; neither were the Climax Molybdenum or the Homestake Mining companies, both of which are profiting from the mining of nuclear materials. Another successful producer of uranium, understandably missing, was the Atchison, Topeka and Santa Fé Railway Company.

★

This, then, is the stage in the development of an atomic energy industry in which some of the raw material suppliers bask in a kind of mild sunlight. But few manufacturers of heavy equipment and fewer makers of radiation instruments are reaping large returns from their present atomic energy undertakings, which consist mainly of fulfilling parsimonious contracts with the AEC. At the fair, however, a feeling of restrained optimism about the near future was noticeable ; a basic reason for this limited ebullience is the surprising progress recently made in the field of atomic propulsion. In recent months, the time it is expected to take to develop a nuclear aircraft has been repeatedly shortened, and there is a persistent rumour that an atomic plane will fly before the end of next year.

The capital requirements of the American nuclear power programme have been estimated at $3-5 to $7 billion over the next ten years. The Chase Manhattan Bank of New York is making a special drive for pre-eminence in the financing of this development. It was one of the first financial institutions to establish an atomic energy division. The banking system, however, cannot supply the long-term financing or venture capital which is now required by expanding atomic industry ; the fair included a display by one source of such money, the Atomic Development Mutual Fund. This is an " open-end " investment trust through which American investors have channelled $44 million into corporations active in nuclear energy.

Except for the full budget of technical speeches, there was little to distinguish this gathering of nuclear industry from similar meetings in less complex areas of endeavour. There was considerable trade gossip and window shopping for the products and personnel of competitors, shapely model girls appeared on reactors and some, not much, serious business got transacted. A minor innovation was a vodka concoction imaginatively labelled " the Atomic Icebreaker," which was offered to visitors at the " hospitality centre " of a leading producer of generators. This drink, which seemed to justify its title, appeared somewhat in advance of a Russian nuclear vessel of the same name, scheduled to traverse the Arctic seas in about two years.

The World Overseas

Canada Eyes the Trade Plan

FROM OUR CORRESPONDENT IN OTTAWA

EVER since Messrs Macmillan and Thorneycroft unveiled the British plan for a European free trade area, built around the Messina common market, Ottawa has been pouring forth contradictory press reports about the Canadian reaction to the plan. The confusion of reports has at least one virtue: it reflected, though without fully revealing, the intensity of the debate which the British plan has stirred up in Canadian official circles. Probably nothing which has happened since the war has driven the entrenched Liberal administration to such a thorough re-examination of trade and fiscal policies.

The Canadian government will find it difficult to resolve the multiplicity of views within its own official family into any sort of clear answer. Already it appears inevitable that this answer will consist of a general acquiescence with a considerable number of provisos. The precise degree of warmth to be given to the acquiescence, and the exact note of sternness to be injected into the provisos, have still to be settled. The resulting document will be a state paper in which, if all goes well, every phrase will be claimed as a triumph for one or other of the conflicting departmental groups. To report this is not to denigrate the earnestness or vision of the Canadian ministers and officials who are puzzling over the British plan. It is rather to compliment them. It means that the arteries of thought are not yet hardened after this doctrinaire decade. It also means that no department is judging the merits of the proposed British European free trade area solely by its short-run effect on Canadian trade.

Canada must be concerned and disappointed that the free trade area, as now envisaged by the British Government, puts paid to all hopes of expanding the export of Canadian manufactures to Britain. It is not comforting to hear British ministers brush off—as Mr Macmillan has done—the " mere 10 per cent " of present Canadian exports which would be affected by the plan. The fact is that the present 10 per cent of manufactured goods in Canada's total exports to Britain have been won through a series of unofficial negotiations between the Canadian government and the Board of Trade ; and only the officials concerned know how tough and difficult they have been. Most of the 10 per cent consists of semi-fabricated goods like paper of various kinds, chemicals (whenever import licences could be obtained), and some synthetic fibres. All of them benefit from substantial preferences. If the quota restrictions can be overcome, the tariff has been favourable. All these commodities represent the fractional beginnings of what Canada has always hoped might develop into considerable lines of trade. The short experience of recent years in being able to obtain import licences for manufactured goods has fortified the belief that some Canadian manufactures at least could compete in Britain if only they could gain admission ; this has seemed to be true of a considerable range of products—mostly in the semi-processed class—where Canada has natural advantages in processing its own raw materials. Some of the most important products concerned, moreover, have been things like chemicals, where Canada is establishing new domestic industries to which even a limited export market was of great importance. When, therefore, Canada is invited to give up all preference on its manufactured goods as against Europe, the reluctance stems chiefly, not from attachment to the present 10 per cent of exports, but rather from the shattered dream of the exports that might have been.

If all the other doubts and hesitations could be removed, however, this concern about Canadian exports would not be allowed to stop Canadian approval of a scheme which might promise so much in the longer run. The worst anxiety of all can be summed up as a fear that the European free trade area, with Britain as a member, could become the embodiment of a regionalism which would utterly rupture Canada's cherished conception of an Atlantic Community. " European integration," in the political and military sense, has always been an object of Canadian policy, but only as part and parcel of Nato. The spectre which now appears before Ottawa's horrified eyes is a scene in which France, indignant and disillusioned by Mr Dulles's tactics over Suez, and Germany, accepting Dr Adenauer's new rejection of United States " patronage," draw Britain into a political grouping which regards European unity as a sufficient goal.

A precisely parallel anxiety obtains in regard to trade. For all Mr Thorneycroft's lip-service to non-discrimination and abolition of quotas, the obvious logic of the situation leads Canadians to suppose that once the European regional dream supersedes the transatlantic and multilateral dream the " liberalisation " of dollar trade will be at best postponed. If all British tariffs and all quota restrictions against Europe are to be reduced over twelve or fifteen years few Canadians are optimistic enough to suppose that Britain would have much time or effort left to devote to dismantling quotas against dollar goods. At the best, most people here believe, achievement of the European free trade area would postpone any significant advance towards greater dollar

liberalisation at least until the reduction of European barriers had been completed.

That brings up the other brooding fear which haunts Canadian deliberations on this matter. On the assumption that the six-nation common market does get launched, and the free trade area gets started around it, is it prudent to expect that either or both can be carried through to the full fruition of free trade—even without food products, agriculture, horticulture and tobacco? For Canada this is a vital question. If the Canadian government can manage to convince itself that the Macmillan-Thorneycroft proposals will bear the fruit their authors promise, then it might not merely acquiesce but actively welcome the British initiative. Twelve or fifteen years is, in any case, a long time. If it can be believed that Western Europe will steadfastly maintain its march towards free trade as it planned at the outset and avoid the temptations of a regional isolationism, then Ottawa can see as clearly as anyone else all the advantages that would be gained.

But it is hard to accept immediate disadvantages unless the ultimate prospect seems to have a very good chance of becoming real. No one here doubts the good faith of Mr Thorneycroft when he pledges that as far as Britain is concerned the annual reduction of tariffs and quotas against Europe shall be immutable. But is French resolution to be assumed as readily? Can it even be assumed that Mr Thorneycroft's determination will carry the day five years hence—even in a Conservative government, let alone a Socialist?

Beside the desired goal appears another ghostly shape. It shows Britain and Western Europe, embarked on the brave road towards a free trade area, and bogged down or thrown into the ditch half way along it. If it should be this vision and not the other one which eventually takes the form of reality, Canadians cannot help thinking that everybody will be much worse off than if the brave adventure had never been undertaken. We should then be left with a "regionalism manqué" which would quite defeat all the aims of Canada, of Britain and of the world. We should face a new preferential system, unable to get out of the chrysalis into the beautiful form of free trade, stuck forever in the rigid and unlovely form of a cocoon.

The British proposals are most welcome to Canada, if they can strengthen Europe's political unity within Nato and its economic viability within an eventual Atlantic and world sphere. But if they are to end, in spite of all good intentions, in regional separatism either politically or economically, then the price Canada is asked to pay is liable to swell from a minor consideration to a heavy sacrifice.

Between Gold Coast and Ghana

IN five months the Gold Coast will become fully sovereign and independent. There is much to be done, however, apart from organising the celebrations, before the country is ready for its new status. The constitution is, of course, the most urgent matter. The opposition, centred in Ashanti, the Northern Territories, and Transvolta-Togoland, has now become more reasonable. To the last moment it could not believe that the British Government would agree to grant unconditional independence on the strength of Dr Nkrumah's electoral victory, decisive as it was; and in accordance with African methods, so long as there was any hope left to it, it did not abate one tittle of its full demand for federalism, which for two years it has upheld by its refusal to discuss any compromise. But now the date has been fixed the demand for federalism has been dropped, and the opposition merely insists that the constitution must be agreed before March 6th, or else Ashanti and the other regions will secede.

This is an abrupt reduction of the asking-price. But what the present demand is, remains vague. It no doubt includes all the Bourne proposals for regional devolution, including the special safeguards for chiefs. The main argument in fact is not over terms but procedure. The opposition has agreed to treat in an all-party conference outside the Assembly, which is to begin next Tuesday. But Dr Nkrumah has already promised that the constitution, which is to be ventilated in a new white paper, must come before the House which would indeed hardly forgive him if he tried to by-pass it. The Convention People's Party is evidently determined that the chiefs shall not get away with undue powers, and certainly not with undue emoluments; "traditional dignities" are readily conceded. After all, there are some 10,000 chiefs in the territory to share those. To the "small boys" of Accra, chieftainship has virtually had its day, except as a minor executive office and a honorific title; the major paramount chiefs naturally hope to postpone the evil day, though they are probably now heartily sorry that they ever engaged in party politics.

Powers of the Chiefs

It remains to be seen whether compromise can be reached. Until it is, disorder and vendetta will be endemic in Kumasi and other areas, but it is now unlikely that the Asanteman council can count on large numbers of Ashantis being ready to take up arms in defence of either vested interests in chieftainship, or to support secession, which can hardly be legally sustained in the terms of the original treaties between Britain and the chiefs. Those treaties did not concede to the chiefs the sovereign powers which, for example, were conceded to many Indian states, which nonetheless reverted to India upon its independence. But much will depend on the care with which the government plays its cards.

There are, however, many other loose ends to be tied up. The United Nations has still to make up its mind finally about Togoland; and the creation of a French Republic of Togoland now makes a new and far stronger appeal to Ewe nationalism. It is far from certain even now that, despite British support, Ghana will get southern Togoland. A good deal of work has also to be done on Ghana's relations with Britain and the outside world. Nothing has yet been said of a defence treaty which would give Britain some use of Takoradi or the air bases in Ghana in peace or war; but both are important, and presumably discussions on a defence link-up are in progress, perhaps on the Ceylon model. A very small Gold Coast *corps diplomatique* is being trained, but clearly Britain (or will it be India?) will have to be asked to look after Ghana's interests in most areas of the world at first. Britain has to think about two key appointments: the Governor-General who will succeed Sir Charles Arden-Clarke, and the High Commissioner. Sir Charles is known to want to make his governor-generalship a matter of a few months, at most; and while it is possible that Dr Nkrumah might like to find an African for the post, he is more likely to wish to keep it in cold storage behind a British figurehead for some time; nonetheless, the figurehead needs to be an able and tactful man, for he has to demonstrate how the "head of state" reigns without ruling. The High Commissioner needs to be carefully chosen, and his staff carefully instructed also. For they will represent Britain in a country many of whose higher civil servants are still British—but it would be utterly fatal if they did not observe the very strictest protocol in all dealings, whether private or official, both with them and with British business men. The idea that the High Commissioner's office could "get at" the expatriate civil servants would ruin good relations; this is a tricky situation for which there has been no real precedent, not even in Pakistan. These are matters which the Commonwealth Relations Office should ponder; the Colonial Office, of course, has here no advice to give, except that the Gold Coasters are determined not only to be free, but to be seen to be free.

The Gold Coasters (there is as yet no noun of assembly for Ghana, though an African, recently asked what he would be when Ghana was his country, replied happily "a Ghanation") will probably wish their country to remain a monarchy, and would welcome a visit from their Queen. Dr Nkrumah has recently denied that he was thinking of a republic on the Indian model. Yet there is much natural republican sentiment in the country, and the position may change. But it is certain that Ghana wishes to remain in the Commonwealth, and assumes that even an exchange of letters between the other members is a mere formality.

For the rest, the new currency notes are ready printed (though not, as has been urged, on the metric system), a bank of issue is being organised, and Mr Gbedemah, the Minister of Finance, has been to Washington to see about joining the World Bank. Ghana will lose Colonial Development and Welfare money, and is not in the Colombo Plan; and independence will coincide with the lowest cocoa prices for many years, low sterling reserves and a somewhat doubtful business outlook. But if this encourages caution in the new state, which is still the richest colonial territory in Africa, it may prove a blessing in disguise.

Jordan in the Toils

FROM OUR CORRESPONDENTS IN THE MIDDLE EAST

AN election this month—it is due on October 21st—is an unsuitable activity for a country in Jordan's plight. The economy is unstable; military needs on the Israel frontier are expensive, and exacting; another reprisal raid by the Israel army was launched on Wednesday and was followed, for the first time, by Jordanian army counter-action. But notwithstanding these dangers the country is riven by factions arguing for and against Egypt, or for and against Iraq. King Hussein would like to ride above the babel and to get help from as many as possible of his Arab neighbours, whatever their relations with one another. He has therefore renewed his efforts to secure a meeting of the heads of all the Arab states, and is exchanging messages with everybody.

He has also sought to curry favour with his nationalists at home by asking his Arab neighbours how far they would go towards helping him financially if he were to free himself from his treaty commitments with (and his financial support from) Great Britain. The response is not proving immediate, although the Saudi Arabians and Iraqis have already given him cheques; the former is said to be for £250,000, and to be the first of four quarterly payments that are to be Saudi Arabia's contribution to an Arab Fund for the upkeep of the Jordanian National Guard. At an Arab military conference held at Riyadh last month, promises of subscription to this fund were said to tot up to £3,600,000. But this royal quest for general Arab support is being conducted to a most discordant accompaniment of election noises. For instance, left-wing and pro-Egyptian parties, the strongest of which is the National Socialist Ba'ath party, are promising their voters detachment from Iraq by means they do not specify, and are derisively referring to Iraqi troops as "soldiers of the Turkish alliance," thus branding them with a double stamp of colonialism—once from Turkey and once from Iraq's British ally. Simultaneously, the government has chosen Iraq as the first port of call for its Foreign Minister, Sayed Auni Abdel-Hadi, who is embarking on a round of visits to Arab capitals in quest of further support against Israel; his second visit is to Cairo.

Chagrin After Baghdad Talks

His trip to Baghdad is locally considered disappointing. He went there immediately after Israel's reprisal raid on Jordan positions near Jerusalem on September 26-27th: the atmosphere was one of crisis, and the omens looked good. Iraq is said to have given him an outright £250,000 for the Jordanian National Guard. But when details of possible military aid were discussed, stumbling blocks arose. Jordan had already asked for the stationing of Iraqi troops on Jordanian soil, and Iraq has given so many assurances that it will stand by Jordan that such a request ought to have been hard to refuse. But Iraq raised the question of a joint army under a single commander, who was bound—by sheer *avoirdupois*—to be an Iraqi. This condition both the King of Jordan and his young C-in-C, Ali Abu Nuwar, would find difficult to swallow at any time. The Iraqis were also said to be claiming some powers in the realm of internal security; it is probable that they have not much confidence in the capacity of the National Guard to sustain calm in view of its composition—which is largely ex-Palestinian, left wing and pro-Egyptian.

The Jordanians swallowed their chagrin for three days before agreeing to the issue of a joint official statement on their talks with Iraq, but on October 4th consented to a face-saving formula which might read—to the uninitiated—as if "technical talks" were all that is needed to produce agreement. But most Jordanians see through the platitudes; the press has dubbed the talks a failure:

> The reply of the brotherly state's government has all along been the same: "Iraq is preoccupied with reconstruction and development."

At the same time, Auni Abdel Hadi has told the Egyptians that Iraq imposed no conditions in return for its help to Jordan, nor did it press the Jordanians to join the Baghdad Pact. The current position, therefore, is, firstly, that King Hussein is still appealing for help, but has told his home public in a broadcast that was phrased with the electorate in mind that he is bent on refusing it unless "given with goodwill and without ulterior purpose." Secondly, that aid must be obtained from somewhere or Jordan would collapse at the first serious blow from outside—whether delivered overtly from Israel or covertly from the Egyptian allies of the left wing and anti-monarchic parties; and lastly, that

the neighbouring monarchies—Iraqi as well as Saudi—are trying to keep Jordanian attention riveted on the Israeli danger so as to minimise the chances of disintegration from within. It is possible that King Hussein will find or manufacture some excuse to postpone the elections. Israel's fresh burst of reprisal raiding provides one good one.

Fighting the Drug Traffic

FROM OUR UNITED NATIONS CORRESPONDENT

THE latest report of the United Nations Narcotics Commission shows some progress in the control of illicit drug traffic. But a lot remains to be done on the purely administrative and technical planes. One problem, for example, is the existence of several international agencies whose functions overlap. Apart from three UN bodies—the Commission on Narcotic Drugs, the Permanent Central Opium Board and the Drug Supervisory Body—there is a Committee of the World Health Organisation and the Arab League's Anti-Narcotics Bureau; while the International Criminal Police Commission is particularly concerned with combating illicit international traffic.

A second problem is that there are now in force nine different conventions, agreements or protocols, concluded between 1912 and 1953, on narcotics control. It is urgently necessary that these treaties be consolidated into a single convention. The UN Narcotics Commission has been working on this for a number of years but has been unable to produce a generally acceptable draft. In its latest report the commission proposes that a committee of five nations should meet in Geneva next January to prepare a simplified draft convention.

According to the commission's statistics there are 1½ million drug addicts in Iran, causing 5,000 suicides annually, 100,000 premature deaths and the abandonment to destitution of some 50,000 children. In Egypt there are 400,000 addicts to cannabis and 100,000 to opium, and a further 500,000 are reported to be on the way to becoming addicted. High estimates of addiction are reported from many of the countries of the Middle and Far East. In the United States there are said to be 60,000 addicts and in Canada 3,300.

The heaviest illicit traffic in drugs is in the Far East, but in the Middle East it is almost as bad. Opium and its derivatives are the most important drugs seized. Much of the crude morphine comes from clandestine sources in or near Northern Siam. Traffic in hashish is most serious in the Middle East, with the Lebanon and Syria as countries of origin and Egypt as the principal market. Consumption of hashish and other forms of cannabis is the most widespread form of drug addiction and consumers are numbered in millions. The quantities of cocaine seized have continued to decline, though a small traffic in this drug still persists.

Ingenious methods are used to conceal drugs during illicit traffic. Drugs (especially heroin) are concealed within the natural cavities of the body or in rubber containers which are swallowed when an accused person is accosted by an enforcement officer. Morphine and its derivatives have been found inside medications, soap and tinned food. Drugs are moved by modern and traditional forms of transport, and in Egypt stores of narcotic drugs have been discovered in the stomachs of camels. Siam is a particularly black spot; more than 35,000 kg of raw opium were seized there last year. The commission noted that Siam had not prohibited opium smoking, and the American delegate described an incident concerning the offer for sale of 200 tons of opium by a Siamese firm. A considerable quantity of the narcotics seized in Singapore and Hongkong apparently originate in Siam.

The proceedings of the Narcotics Commission were enlivened by an exchange between the delegates of Britain and Nationalist China. The Chinese annual report for 1954 had made some disparaging references to the "somewhat" lax control of narcotics in Hongkong. The British delegate indignantly denied this allegation and added that the Taiwan authorities had never furnished to the Hongkong government any information which might help in controlling illicit traffic. The Chinese delegate then switched his ground and said that the real source of danger was the Chinese mainland under Communist control, though Hongkong and Macao were ports of transit.

The commission's report described the Lebanon as "a centre of illicit activity involving opium and opiates and cannabis." The Lebanese observer described the methods used by his government to prevent cultivation of narcotic plants and the traffic in narcotic substances. He insisted that the Lebanon was an area of transit rather than a source of narcotics, and that illicit traffic was a problem for the whole region.

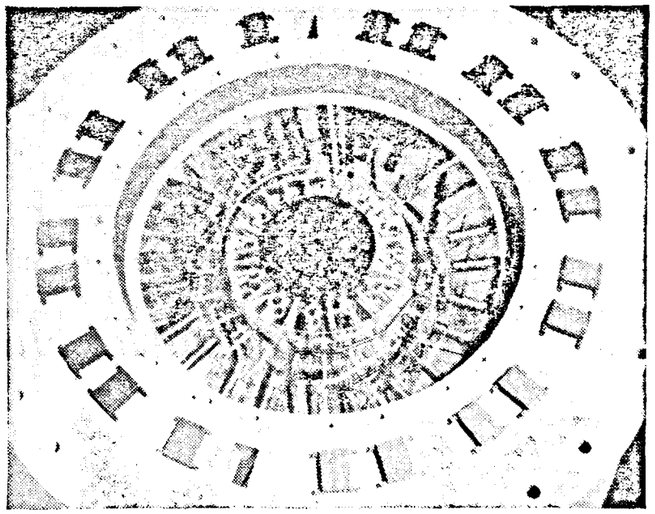
The commission was given a relatively encouraging report on the situation in Iran. The cultivation of poppies had been banned and free treatment was being provided for addicts. Nevertheless, the Iranian representative proposed a draft resolution—which was approved in principle—under which UN technical assistance would be offered to Iran for a five-year programme of narcotics control. A resolution sponsored by Canada and the United States, which was adopted unanimously, would initiate a general programme of technical assistance in narcotics control. This would take the form of advisory services of experts, fellowships, "seminars," and laboratory services for the determination of the origins of narcotics found in illicit trade. The trouble is that, with a limited budget for the United Nations' expanded programme of technical assistance, such an extension could only be effected at the expense of some other form of aid.

East German Realities II

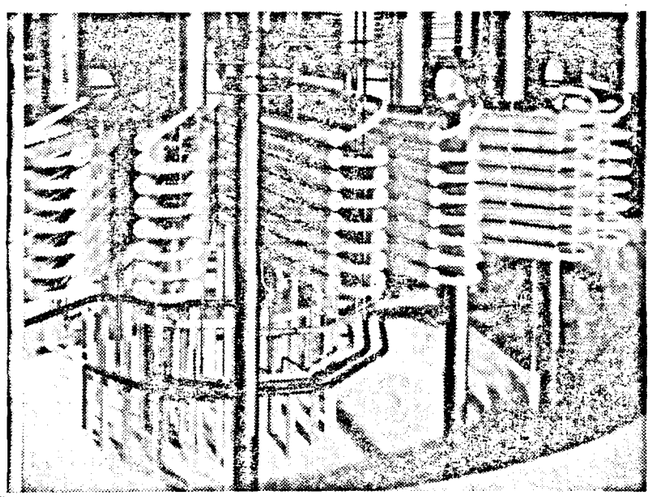
BY OUR SPECIAL CORRESPONDENT

MOST visitors to East Germany are accompanied by a guide, courteous, helpful, invaluable in finding trains and hotels, but a Marxist of pristine purity whose presence is somewhat inhibiting to conversation with third parties. Yet even the brief occasions when it is possible to evade one's Marxist guide are enough to reveal the deep and sometimes bitter opposition to his government that is felt by the average East German. The most obvious opponents of the regime are the underprivileged—the old, the lower paid workers, the dispossessed struggling to survive. But the core of the opposition, as in 1953, remains the working class. The flight of refugees is sometimes attributed today to economic factors, and certainly the better living stan-

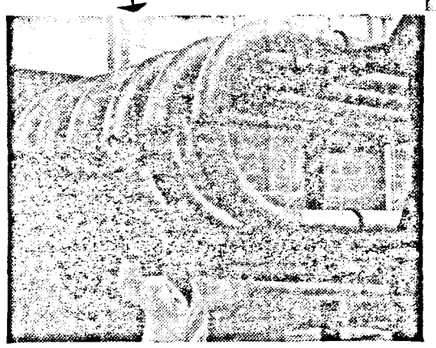
NUCLEAR POWER ENGINEERING



Two views of the accurate scale model of the Dounreay fast reactor showing the arrangement of the primary heat exchanger circuits in relation to the central reactor vessel. The complete primary heat exchange section, in which heat from the reactor is transferred from primary to secondary liquid metal circuits, is enclosed in a concrete biological shield which is here shown partially cut-away



Radiographing welded joints in the actual stainless steel heat exchange units in John Thompson's works. Compare this unit for scale with the illustrations of the model



The scale model above has been built by John Thompson to aid construction of the U.K. Atomic Energy Authority's fast reactor at Dounreay. John Thompson are manufacturing the stainless steel reactor vessel, all the liquid metal circuits, primary and secondary heat exchangers, ancillary vessels, boiler drums, instrumentation and associated equipment including water treatment plant.

6 *Good Reasons for choosing*

SOUTH AFRICAN SHERRY

1 Because South African Sherry is very good sherry: *real* sherry, most carefully matured, expertly selected—genuine in every way.

2 Because South African Sherry costs *you* less: as it benefits by a preferential import duty.

3 Because you can count on a South African Sherry to suit your personal taste—from light and very dry to full, rich and sweet.

4 Because the wonderful climate and soil of the Cape makes South Africa one of the finest wine producing countries of the world.

5 Because there is a guarantee of quality in South Africa's 300 years of wine-growing experience.

6 Because once you've chosen South African Sherry you'll choose it again.

SOUTH AFRICAN SHERRY

dards of the west play a part. But resistance springs also from political causes, from resentment against the ceaseless drive to work ; from the loss of all the traditional workers' rights ; from bitter disillusion with the fair words about the "workers state," and above all from the irksome political pressure to join the party and show political conformity, the incessant fear and anxiety that one is being watched. It is to seek security from these things that many working people flee to the west and East Berliners come to visit their friends in West Berlin for a day, merely to sit and sleep in peace for a while. The ceaseless political pressure has given the working people a greater solidarity than ever before. In many factories they know exactly who the security agents are and watch each newcomer carefully before admitting him to their community. And their morale and knowledge of the outside world are preserved by listening to the western radio and by personal contacts.

The working class are the sole organised cohesive opposition group, but the peasant too remains a passive opponent. Since the economic pressure on him has eased, his resentment has cooled, but his resistance to collectivisation remains absolute and successful. There are collective farms, run efficiently and profitably, but their members tend to be refugees, ex-labourers, former agricultural officials ; and the few former peasants who do join collectives generally own uneconomic land. The vital importance of food production has forced the regime to relax for the moment its pressure for collectivisation, and despite all inducements the bulk of farm land remains in individual hands.

Core of Fanatics

Opposition is of course not universal. At the head of the system, in the party, in the bureaucracy, there is a core of convinced believers. Ambition no doubt plays a part in their attitude, but there is a group of old-guard communist workers, young people converted in the chaos of the postwar period and intellectuals who all have an impressive belief in their ideology. But in the party itself, sometimes in high places, there are many opponents of the regime who are seeking to mitigate its ill effects. Among professional people too there is a large group which is working to make the best of things, paying lip service, without wholly agreeing with the methods and aims of the communists. They are paid well and given some political leeway, because they are valuable. But the pressure to conform politically continues. This academic year, for example, several school and university syllabuses have been given a further political twist and more than one professor, who has held out until now, has given up and fled west. The higher these people are, the less easy is it for them to reconcile the demands of political conformity with their consciences, the less they sleep at night. Nor is it easy for them to find a job and start a new life in the west. Isolated and alone, these professional people are under much greater pressure to succumb to Marxist notions than are the organised workers. The remaining owners of private businesses, though of course basically opposed to the regime, are also isolated and sometimes cowed, and one finds amongst them an unattractive willingness to compromise in order to survive.

Has the regime then achieved nothing ? It has provided one or two social advantages which contrast favourably with Western Germany—cheap annual holidays, a most generous system of grants for students and school children, a health service and kindergartens which, though held back by the weakness of the economy as a whole, do provide, in some areas, facilities absent in West Germany. Yet these careful copies of Russian practice are soured by the political use to which they are often turned. They inspire little gratitude from the people as a whole.

Herr Ulbricht and his circle rely in the last resort on the Red Army's tanks and on the ingenious system of political pressure and fear which binds every Communist society ; but they have also been under pressure from Moscow to relax. When they did so on Russian orders in 1953, the zone blew up. This time Russia has allowed Ulbricht to pick his way more carefully. Mild reforms, like a scheme to bring more democracy to local government, a suggestion that the trade unions occupy themselves more with the workers' interests and less with politics have been put forward at intervals. But any real move towards democracy would lead to the overthrow of the regime. Some changes of leadership may occur. But it is Ulbricht himself who is hated most of all by working people, and no changes which leave him in effective political power can satisfy their bitter discontent.

One potential source of strength for the regime lies in its power over the young. All the meagre resources of the zone are squeezed to provide funds for education, for sport, for youth organisations. The state is seeking to capture the minds of the young, to collectivise their personalities by filling their brief leisure time with collective pursuits. Parents and teachers have so far succeeded in protecting the children to a remarkable extent, but the communists are also steadily gaining ground. Even if they are not convinced of Ulbricht's virtues, many young East Germans brought up collectively are unfit to stand on their feet in a free society. And hence a fifth of young refugees return to the drab shelter of the east.

One other political success must be credited to the regime. If its propaganda about its own achievements has generally failed, its appeals to fear and resentment have not. The danger of nuclear war is endlessly rubbed in. The creditable and successful efforts to convince East Germans of the evils of nazism and of German responsibility for the last war have also been poisoned and turned into a weapon of hate and fear against the west. In Leipzig there stood recently a huge poster of a red figure with two faces :

Are you

remain outside. The population of these five countries and Britain amounts to 78 million ; with the 161 million of the common market the free trade area would have nearly 240 million consumers.

This group of countries absorbs one-fifth of Britain's total exports and also provides one-fifth of Britain's total imports. The bulk of this trade consists of semi-finished and manufactured goods, and it is the industries that make these goods which will benefit, or suffer,

from the gradual removal of tariffs. Within the group British trade is naturally largest with the countries sponsoring the common market, and in this trade Britain sells more than it buys: its exports to these countries are, in fact, half as large again as its imports from them. As the table shows, the balance of trade varies considerably with particular items. Britain now buys from these countries more chemicals, cotton and synthetic textiles, iron and steel than it sells to them, but in wool textiles, non-electric machinery and all the other groups listed it sells them more—sometimes much more —than it buys. About one-quarter of Britain's total exports of non-ferrous metals go to these countries, one-fifth of its exports of metal manufactures and one-sixth of its exports of non-electric machinery and wool textiles. In almost all the items listed, however, Britain's preferential markets in the Commonwealth provide by far the largest, though not the fastest-growing, market.

The table exposes what may prove to be Britain's main weakness—trade in cotton and rayon textiles. Some of Britain's chief competitors are countries that would be in the common market ; the value of the cotton and rayon textiles that they sell to Britain is nearly five times larger than Britain's sales to them. The table conceals, however, another possible weak spot—British trade in motor cars. Imports of motor cars into Britain are limited by quota, as are British exports to several countries in the common market. But judged by British experience in Switzerland, one of the few free markets of Europe, Britain might, on present showing, lose rather than gain from freedom of trade in motor cars.

The Spaak report proposes that tariffs within the common market should be eliminated within twelve years, with a possible extension to fifteen. Each country would start from the rates in its existing tariff, or from the average rates in force between 1953/55, whichever was the lower. One year after the treaty entered into force the rates would be cut by 10 per cent ; every eighteen months during the next six years they would be cut by a further 10 per cent, and in the following (eighth) year, by 10 per cent again, making a total reduction of 60 per cent below the initial tariff level. The remaining 40 per cent would be abolished within the next four (or possibly seven) years.

The process of tariff reduction would not necessarily be exactly even throughout the items listed in the

tariff, but there is a proviso to ensure that it was reasonably spread. All items would be grouped into tranches, according to rates of duty. Items which initially carried a duty of up to 10 per cent and above 50 per cent would be grouped into tranches of 5 percentage points each. Items carrying rates of duty above 10 per cent and below 50 per cent—the great bulk of existing duties are stated to be in this range—would be grouped into tranches of 2½ percentage points each. After the first reduction had been made, each successive cut of 10 per cent over the eight year period would be applied to the average rates in each tranche. Reductions on each item within the tranche would be weighted by the value of trade in that item.

Governments would therefore be able to vary the rate of reduction on individual commodities, as long as the average reduction on all goods within the tranche amounted to 10 per cent. The scope for variation would be extended still further by the right of members to link any two tranches together. The exception is that items carrying a duty of more than 30 per cent would have to be reduced by at least one-half of the average reduction in their tranche.

Reduction of tariffs, however, would be of little help to industries whose markets are still restricted by quotas. So the report suggests that all quotas should be increased year by year by 20 per cent of the preceding quota. "Minute" quotas would first have to be raised either to a value equal to one per cent of domestic output of the goods affected, or to a value equal to the average of imports per head in the six countries, multiplied by the population of the country concerned.

* National income in 1954.

Apart from the provision for slowing down the rate of tariff reduction on particular items, the report does not specify any escape clauses as such. Though its recommendations, on this as on other points, apply only to the common market, present British thinking would also be against escape clauses—not excepting the McKenna and key industry duties. But the report suggests that the method of reducing duties after the first four years could be modified by majority decisions, and that some escape clauses of a temporary nature might have to be accepted. No country would fail to save itself from a payments crisis, but it is not proposed that tariffs should be the method used. Strategic industries if need be could be helped by subsidy and the British watch industry's new life might be preserved that way. Such devices might prevent the grand idea being whittled away by numerous demands for exceptions.

The report also suggests that industries particularly exposed to foreign competition should be helped to move into other fields of manufacture by a special investment fund. A relief fund for industries hit by unexpected competition, rather than investment in the commercial sense, seems the proper description for this technically difficult idea. The present British government, for one, is reluctant to guide industrial investment along any but the broadest lines.

How then would the British system of imperial preferences fare as Britain began scaling its tariffs down towards nothing on imports from the other members of the area ? Vis-à-vis the non-members there need not be any change. The General Agreement on Tariffs and Trade prohibits the creation of wider preferences, but existing ones can remain. Vis-à-vis the other members of the area the preference would disappear as the duty vanished. Though the few Commonwealth countries that are exporters of manufactures may be prepared to accept this loss as the price of a more prosperous Europe, real difficulties must be faced.

The countries affected are Canada (whose attitude is discussed on page 145), India and Pakistan and the colony of Hong Kong. Imports of manufactures from the three Asian members of the Commonwealth consist mainly of cotton and jute textiles, which enjoy duty-free entry and a preference of 17½ to 20 per cent. Canada is interested in preserving the preference on the few manufactures it exports to Britain but it is still more interested in getting import restrictions removed.

In theory Britain might have tariff-free entry for the club members, a preferential level for the Commonwealth and a general tariff for the outside world. In practice there is no doubt that if free entry were progressively granted to the club members the Commonwealth would in general get it too. But a few exceptions might be contemplated. If the tariff on motor cars from Europe were eventually abolished, could Britain avoid admitting Canadian motor cars, which are produced by American-owned companies, duty-free ? The standard rate of duty is 33⅓ per cent (shortly to be reduced to 30 per cent) and the preferential duty is 22 per cent. Yet if only a moderate duty of, say, 10 per cent had then to be imposed on Canadian cars, the value of the preference over American imports would be doubled. As Britain is prevented by the rules of Gatt from increasing preferences, the standard rate would have to be correspondingly reduced.

The Spaak report does not, indeed could not, make it clear whether countries which participated in the

Business Notes

The Chancellor Takes Stock

THE economic progress report that tradition makes the substance of the Chancellor's speech to the annual Bankers' Dinner at the Mansion House has this year added a little—but only a little—to what was already known about economic policy and the state of the economy. The additional government expenditure arising from the Suez crisis, "of which we do not know the end," has not, Mr Macmillan indicated on Tuesday, so far given any reason for fearing that the "broad structure of the budget will not be maintained," and the wider economic effects have not been significant. Since the budget, the boom has been slowing down; vacancies still exceed the numbers unemployed, but not by much; consumption is only slightly above last year's level; savings are increasing; the business world has become "a little more cautious" in its new commitments for fixed investment and in stock-building; and thus the pull of the home market has been reduced. The fruit of this modest progress has been seen in the balance of payments: anticipating the detailed estimates given in the White Paper issued on the following day (and discussed below), the Chancellor revealed that the surplus earned in the first half of this year had well surpassed the cautious indication given some months ago—it amounted to £144 million.

But this, Mr Macmillan wisely reaffirms, is not enough, and "we must not relax." The halt in the rise in imports is due partly to reduction in some stocks and partly to the fact that industrial production has not been rising in the last year or so. When it begins to increase again, so will the demand for imports. Development schemes in countries of the overseas sterling area will involve drafts on their accumulated sterling assets, and there is in any case need to rebuild the gold reserves of the area as a whole. Moreover, even aside from the capital strains that the Suez crisis has imposed upon those reserves, the performance of the balance of payments in the second half of the year cannot be judged by the first half, since that is seasonally the more favourable. For all these reasons the efforts to contain domestic demand, to shift resources to exports and to keep export prices competitive must go on.

Bank Rate Still Flexible?

FAMILIAR though these arguments are, their reiteration is helpful. More has to be done, but the Chancellor seems satisfied that no additional measures of disinflation are needed. He said again that he does not believe the monetary instrument alone can solve all the problems, but he did not this time allude to the possibility of further recourse to direct controls. Perhaps because he was talking to bankers, nearly all his emphasis was reserved for the several devices of monetary action—the squeeze-by-request, the drive for National Savings (which in the first half of this fiscal year has netted £29 million if defence bond redemptions are not subtracted, the best performance since 1948), the forcing of the local authorities into the markets, and the coming premium bond ("please be kind" to that!). The policy of making money "both dear and scarce," the Chancellor believes, has "done a great deal to curtail spending and encourage saving." He expects the rate of growth of profits to slacken further, and predicts a squeeze upon profit margins. But the requisite disinflation, he seemed to imply, may be attained without a further toughening of money policy: for he remarked again that "in practice, if not in theory," there is "a limit beyond which the rate for money could not be driven."

At this point Mr Macmillan seemed to be echoing, *pianissimo*, his end-June speech, which was generally taken to mean that he regarded that limit as having been reached already—except for circumstances of "extreme emergency." Tuesday's speech from the Governor of the Bank of England appeared at first glance to be trying to correct this widespread impression; the Governor emphasised that "no commitment has been given, or will be given, to anybody about the future course of Bank rate . . . it will be considered week by week and left unchanged or altered in either direction as circumstances require." It is not certain, however, that Mr Cobbold would countenance a further rise any more readily than would the Chancellor; for although the Governor emphasised that the battle against inflation is "certainly not yet won" and that "the coming months are crucial," he gave no warning about higher rates. On the contrary, his only reference was to an easing: "we shall obviously feel more comfortable when circumstances justify a somewhat lower pattern of short-term rates." He is satisfied that monetary policy has been increasingly effective since about April, 1955—at first negatively, and this year more positively—though he does not regard the monetary brake as a long-term method of offsetting inflation if that is caused by putting one foot on the "accelerator of public expenditure."

Meanwhile, he made it clear that the much discussed device of compulsory and variable liquidity ratios has been considered and rejected, at least for the time being. He definitely prefers the present approach, which seeks to regulate bank liquidity by regulating the floating debt—by a policy that puts its emphasis on "savings, funding and economy" and also relies at times upon "co-operation" between the authorities and the commercial banks. He recognises, however—and this is a very notable point—that the very responsiveness of the banks to official wishes "carries dangers with it," for the national economy as well as for the banks themselves.

The £144 Million Surplus

THE British public should take real, but limited, encouragement from the Balance of Payments returns for the first half of this year. The surplus on total current payments of £144 million represents, as the tables show, a turnround of over £250 million compared with the second half of last year, and of £126 million compared with the first half. The small changes in defence aid make the true improvement even a little better than that. The figures are certainly good enough to provide modest encouragement at home and a growth of confidence abroad, provided that the limitations of the presentation are understood. It is essential to remember that the first half of any year is nearly always better than the second half, partly because of the incidence of the dollar debt service on the end-year and partly because visible trade has a seasonal pattern that favours the first six months. The British economy is not

*Residual; includes errors and omissions.

running at a true surplus at the rate of £288 million per annum or anything approaching that figure. The sensible conclusion is that financial policy has begun to show noteworthy results and that with continued firmness it could be made to show better.

The recovery springs largely, if comparison is drawn against the first half of 1955, from visible trade and its improvement comes from a rise in exports offset only slightly by a higher import bill. The visible trade deficit on this method of counting, which reckons both imports and exports fob, and is therefore not comparable with the monthly Board of Trade figures, reveals a decline in those trade deficits from £169 million in the first half of 1955 to £37 million in the first half of this year. The invisibles have been less spectacular, but the net oil credit has been a helpful item, for the 1955 figures were reduced by higher payments, including big payments for royalties and tax to the Middle East states and by the initial costs of resuming operations in Persia. In the end the total invisible credit shows a modest improvement compared with the first half of 1955 at £172 million compared with £154 million, but there was a marked improvement compared with the second half, when the invisible credit was only £79 million.

The outstanding feature of the improvement, however, has been geographical. There has been almost no change in the United Kingdom's balance with the rest of the sterling area, which shows up as a credit of £113 million compared with £112 million in the first half of 1955 and £107 million in the second half. There has, however, been a marked change for the better in the British balance with the other main currency areas. In particular, the balance with the dollar area, which was in deficit to the tune of £76 million in the first half of 1955 and of £131 million in the second half, has swung over to a credit of £61 million in the first half of this year.

Sterling Area Investment

ONE less satisfactory by-product of the finance squeeze which comes out clearly in the Balance of Payments White Paper is that overseas investment, in the sterling area, has had to suffer. The figures are necessarily tentative. Much of the investment is unidentifiable, so that there is a "balancing item" in the latest half year of approximately £50 million. It is built up from the fact that gold and dollar reserves increased during the period by £95 million, which was £49 million less than the current surplus, while other identifiable capital movements amounted to about £100 million. But it seems clear that long term investment has suffered. Net long term commercial investment by the United Kingdom in the rest of the world is provisionally estimated at £50 million for the half year compared with £125 million in 1955 and £175 million in 1954. For investment in the rest of the sterling area UK investment is put at £25 million, compared with £100 million in the whole of 1955 and with £175 million in 1954. The figure for the first half of this year has nothing to do with the Trinidad oil sale which occurred, in the financial sense, in the second half year.

A clearer picture is now available as a result of rearranging the presentation of the sterling holdings of overseas countries. These are now shown excluding the long term debt expressed in sterling and the change has made it possible to incorporate an item representing the net effect of the repayment of government loans. On the old presentation the repayment of a loan simply meant that the lender continued to hold sterling in another form and there was no net change in sterling holdings. In the new presentation total overseas holdings of sterling amounted to £4,022

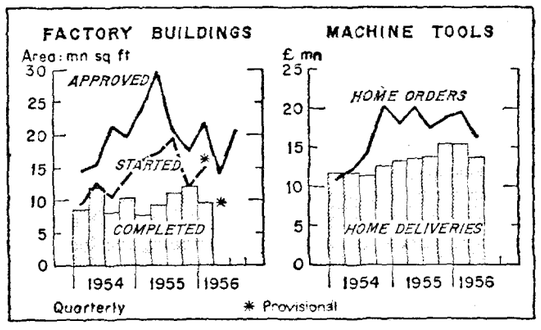
THE REGIONAL BALANCE

(£ million)	1955 1st half	1955 2nd half	1956 1st half
Current balance including Defence Aid with—			
Dollar area	− 76	− 131	+ 61
Other Western Hemisphere	+ 6	− 6	nil
OEEC countries	− 2	− 49	− 38
Other non-sterling countries	− 17	− 27	+ 12
Rest of Sterling Area	+ 112	+ 107	+ 113
Non-territorial organisations	− 5	− 1	− 4
Total	+ 18	− 107	+ 144

million at end-June, compared with £4,166 million at mid-1955 and £4,041 million at the year-end. A guide to the effect of the change in presentation can be gained from the fact that the end-1955 figure was previously returned at £4,211 million: so that about £190 million of sterling holdings have been excluded. The decline in sterling holdings compared with a year ago occurred wholly in the holdings of the non-sterling countries which on the new basis of presentation are down from £751 million to £649 million. The running down of Japanese sterling balances has clearly been one of the significant items in that account, but holdings in the dollar area and in the OEEC countries have also been reduced, reflecting no doubt the lack of confidence in sterling in international money markets.

Caution in Investment

THE caution of which the Chancellor spoke on Tuesday in "the business community's plans for modernisation and expansion" can be seen quite clearly in the latest information about machine tool orders and schemes for new industrial buildings. The machine tool makers report that they took £36 million worth of new orders from their home customers in the first half of this year, or 8 per cent less than last year; and new factory schemes, which totalled 57 million square feet in floor space between January and September, were down by a quarter on the same months of last year. This augurs a marked slackening in the rate



of new industrial investment in 1957, though these figures are, at best, very rough guides. Not all the plans for new buildings, for example, go further than the drawing board (on past performance about a quarter are usually dropped); and occasional huge projects can further distort these statistics, as in the spring of 1955 when the vehicle industry placed very large, and belated, orders for machine tools and when, more recently, extensions at Margam and the Caltex refinery at Southampton contributed over five million square feet—roughly a quarter—to the latest batch of factory plans. But the general trend of these figures fits in with the first forecast of industrial capital expenditure in 1957 from the Board of Trade's regular investment survey. This suggests that manufacturing industry would be spending next year about the same or very slightly less than it spent this year.

This levelling off comes after a 27 per cent annual increase in 1955 and an estimated 21 per cent increase this year. Up to June the manufacturing companies contributing to the survey reported that they had spent 26 per cent more than in the first half of 1955—47 per cent more on building work, 22 per cent more on plant and machinery, and 12 per cent more on vehicles. This may mean some slackening in the rate of increase in spending during the rest of the year, though returns in the last quarter will probably be inflated, as they were in 1955, by the accounting practices of some of the companies that tell the Board of Trade what they are investing.

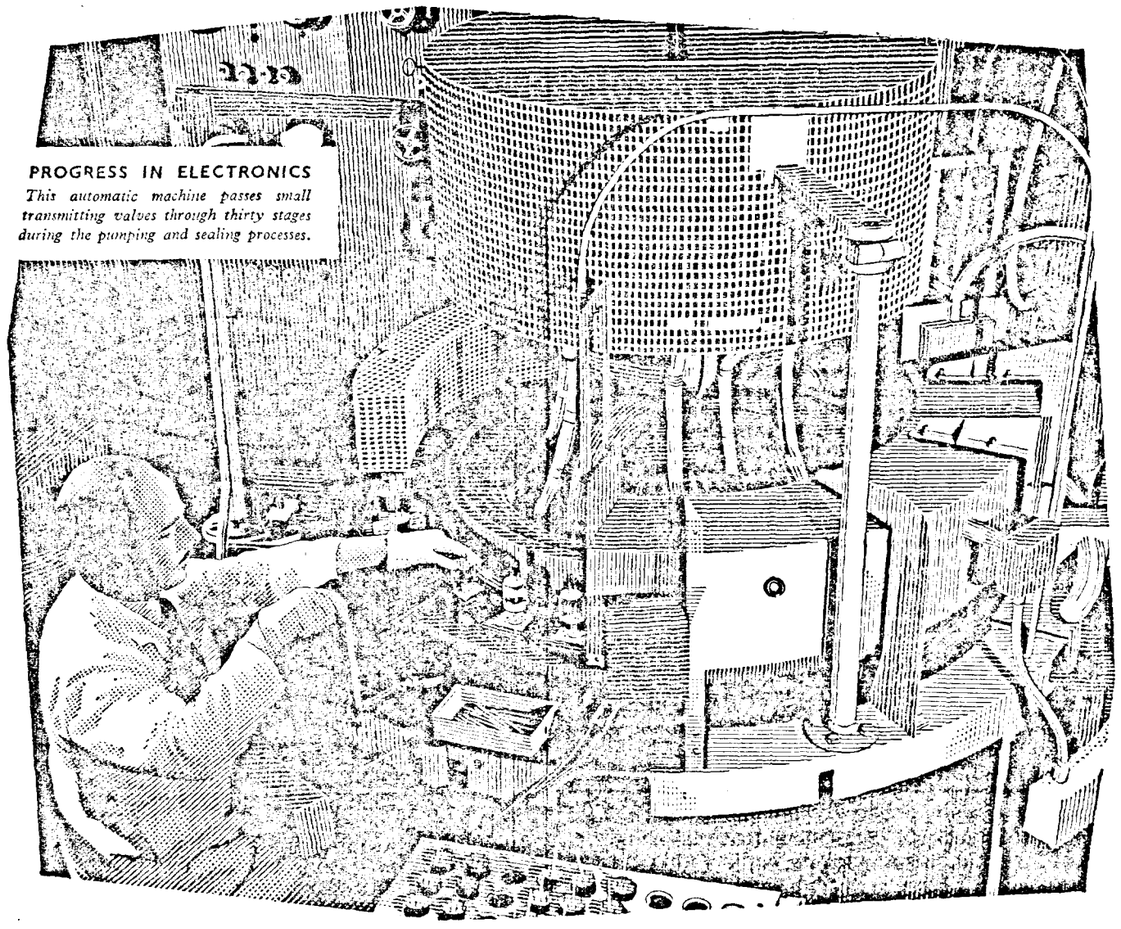
LCC Borrows £15 million

THE explanation of why the Bank of England wished to keep the first half of October relatively clear of big industrial issues has not been long delayed. The London County Council has come to market this week to borrow £15 million and that issue, especially if it is followed almost at once by a refunding of the maturing £7 million of Australian 3½ per cent stock, will test the lending power of a thin market. London is the first county council to swallow the bitter pill of issuing a medium-long dated 5½ per cent stock. The issue of £15 million 5½ per cent stock 1977-81 at £99 10s. per cent reflects a first-class trustee borrower having to bid high for investors' limited resources. The flat yield on the new stock is £5 10s. 7d. per cent and the gross redemption yield to the final date £5 10s. 9d. per cent. To those institutions reckoning to acquire their investment as underwriters, the flat yield becomes £5 11s. 8d. and the gross redemption yield £5 12s. 3d. The sum of money required is greater than in any of the recent trustee issues. And the very fact that the borrower has had to offer a 5½ per cent coupon, a small discount and a date such as institutions are now demanding, made some downward adjustment in the prices of other home corporation issues inevitable. Many of them fell by about a quarter after the news came out on Tuesday, and indeed there was a short-lived downward adjustment through the gilt-edged list as a whole.

London's new issue, for which lists opened and closed yesterday, should appeal to institutions that will like the minimum life of 21 years (and maximum of 25). It should also release some of the temporary money which the council has recently had to borrow for its capital expenditure. The only doubt in the market was not whether it would be a good stock attractive to investors but whether the subscribing power of the present narrow market was adequate, but the prospectus was well received. The necessity of mobilising all potential investors has been fully recognised both by the sponsors of the loan and by the council. Advertising of the issue through the local press of the country has been unusually wide, and the LCC's Finance Committee's report of October 9th promises preferential allotment to small applicants with a minimum of £100 each.

Fuel Oil Bandwagon

FIRST fruits of the purchase of Trinidad Oil by the Texas Company are likely to be found in the financing of the new refinery that is to be built near Southampton for Regent Oil, the joint subsidiary of Trinidad Oil and Caltex. Although the site has now been chosen and



This machine is part of the product

In the final stages of manufacture, Mullard valves and television tubes part company with the machines on which they are processed. But until they do, the machines are virtually part of the product.

Machines on which electronic valves and tubes are manufactured can be used for no other purpose. Their design is so closely related to the design of the product that the introduction of a development in one is rarely possible without a modification or adjustment in the construction of the other. In many cases, the valves or tubes are activated while still on the machines which process them.

That is why the greater part of Mullard machinery and equipment is designed, developed and built in Mullard's own engineering department. Constant research into manufacturing techniques and progressive development of plant and machinery are among the reasons why Mullard products enjoy a world-wide reputation for performance and reliability.

Canadian market. More Canadian oil leases have been offered in the New York market and in addition two sizeable loans, one of them for Quebec Hydro, are being underwritten in New York.

Strength of the Mark

IN the market for continental currencies the Deutschmark continues to rule the roost. The impending meeting of OEEC ministers, although intended to discuss the common market plan, has revived rumours of an adjustment of European exchange rates involving a revaluation of the mark is also likely to be considered. Hot money movements and the "leads" and "lags" in commercial payments are for this reason pulling constantly in favour of the mark which has strengthened to 11.69¾ against sterling. The strength of the mark has been accompanied by that of the French franc—not for any reason flattering to that currency but because it has for some time past been at its lower "gold point" against the mark. With the Bank of France compelled to support its currency against the mark the strength of the latter has inevitably pulled up the French franc against most other European currencies, including sterling.

Trinidad Petroleum—a New Bid

THE affairs of Trinidad Petroleum Development took a new and unexpected turn on Saturday when it was announced that British Petroleum was to make an offer for the whole of the company's ordinary capital. Trinidad Petroleum had recently been in negotiation with Colorado Oil and Gas Corporation and a provisional basis had been agreed, but doubt had arisen as to whether the Treasury would consent to the sale of a sterling company to a dollar owner against an exchange of shares. Now British Petroleum, in which the British Government holds a controlling interest, comes forward with an offer which the directors of Trinidad Petroleum Development are recommending for acceptance.

The offer is in two parts; for the two million 5s. units held by the liquidator of British Controlled Oilfields it is 47s. 6d. in cash; to the public that holds the other two million TPD units it is one £1 British Petroleum unit for every three TPD units. It is conditional on acceptance by the liquidator and by holders of 80 per cent of the other half of the capital. Shareholders accepting will retain the 50 per cent gross dividend which it is proposed that TPD should pay for the year ended July 31st. The key to success or failure is clearly the Canadian-appointed liquidator of British Controlled Oilfields and the impression in London is that he intends to accept. Some of the ordinary shareholders may feel a tinge of disappointment, for the offer (including the net amount of the dividend to be retained) is worth about 49s. 9d. whereas the shares have recently changed hands at 50s. It is nevertheless a good price in relation to the long-term average of these shares. Ordinary and Preference shareholders of British Controlled Oilfields have apparently little say since that company is already in the hands of a liquidator. The outstanding 5,241,185 of 7 per cent non-cumulative preference shares are entitled to their $5 per share of capital in priority to the 3,606,951 common voting trust certificates. It is believed in the market that after paying off the secured loan there may be about 31s. per share available for the preference, whose full claim at present exchange rates is a little over 36s. It would leave nothing for the common stockholders. Holders of that stock who have latterly paid up to 2s. per unit will hate the idea that their stock is worthless. Hopes that it may still have a nuisance value account for BCO common still commanding a price of over 1s. in the market, but it seems a tenuous hope.

Trade Deficit Up Again

BRITISH exports fell sharply last month; imports fell by rather less and the trade deficit rose almost to the highest figure reached this year. Provisional figures show that exports amounted to £222.2 million fob, £31.2 million less than in August. This is not necessarily alarming. Shipments in September, as in the previous month, are usually low because of the holidays, and September contained only 24 working days, three fewer than August. The Board of Trade states also that shipments were slightly affected by the requisitioning of ships following the Suez dispute. Though the sharp decline in exports may be wholly attributable to extraneous factors, the October figures will be expected to show a sharp recovery. Meanwhile, it is comforting that exports for the first nine months of the year were still 10 per cent higher than in the same period last year, thus maintaining the previous rate of increase.

Imports in September fell by £27.2 million to £295.1 million cif; unfortunately there is no encouragement to be drawn from that, for once again seasonal influences and the requisitioning of ships were no doubt responsible; and total imports in the first nine months remained one per cent higher than in the same period of last year. With re-exports at £9.2 million, £1 million more than in August, the gross visible trade deficit rose by £3.1 million to £63.7 million. This brought the average monthly deficit in the third quarter to £57.4 million, £6.5 million higher than the

THE SILENT REVOLUTION

No merciless clacking of knitting-needles. Instead, a peaceful revolution—the painless rising of the working classes, which has changed the nation's economic structure.

Between 1949 and 1954 the number of people in the middle income group, between £500 and £1,000 after payment of tax, *more than trebled.* It is into this category that the averagely successful working man can now expect to graduate.

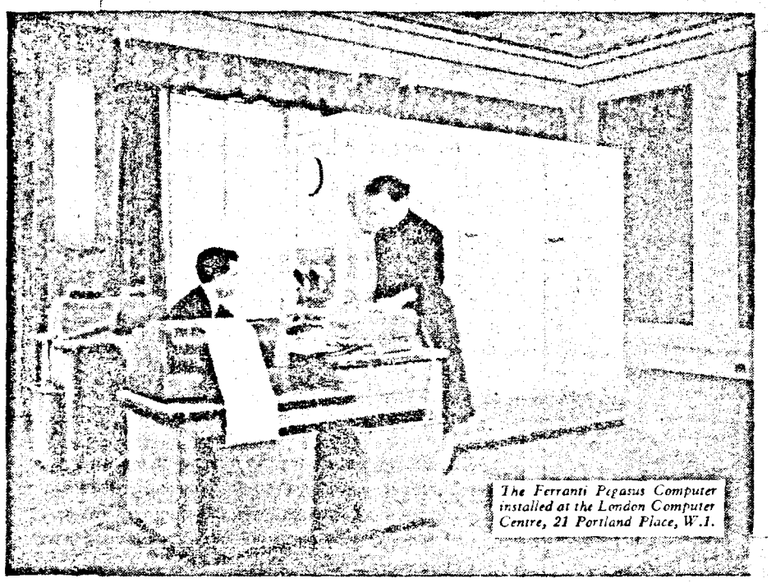
Industrial and factory workers have benefited most. They, and their tastes, have been 'Americanised' into what used to be considered the middle-class standard of living. This in turn is why the Empire News & Sunday Chronicle—read by one fifth of the country's adult population—has greatly strengthened its already strong position, and why it can help others to do likewise.

For the Empire News & Sunday Chronicle is indispensable to any advertiser aiming to cover the vital Midlands and North, the great industrial regions. The IPA Survey showed that 64% of Empire News & Sunday Chronicle readers were concentrated in the North—32% more than any other national Sunday newspaper.

Here too are concentrated the greatest number of multi-income households. Families with four-figure earnings and low overheads can well afford what were recently middle-class 'luxuries'. The Empire News & Sunday Chronicle's unequalled penetration into these homes confirms the paper's dominant advertising significance.

'The most interesting phenomenon of recent years' is how The Economist describes this revolution. As a phenomenon it is not only to be marvelled at. It alters the work of the statistician, the social worker, the politician. It also strengthens the living bond between the advertiser and the Empire News & Sunday Chronicle.

THE FERRANTI PEGASUS COMPUTER



The Ferranti Pegasus Computer installed at the London Computer Centre, 21 Portland Place, W.1.

The Ferranti Pegasus Computer is a new, very versatile electronic machine whose uses include many different types of accounting and statistical work. One of its principal features is the exceptionally wide range of operations which can be performed, making it much simpler to "programme" than most machines of its type. For full information on Pegasus write to Ferranti Ltd., Computer Department, West Gorton, Manchester 12, or London Computer Centre, 21 Portland Place, London, W.1.

Bound for Australia?

P&O

offer a saving of £130

YES! At least £130. That's the difference between the normal First Class fares out and home to 'Down Under' and the Special First Class return ticket known as 'Boomerang'.

To qualify for this concession simply arrange to sail outward between the 1st of February and the end of May—the quiet season. You can return to Britain between September 1st and December 31st of that same year or next. Thus your visit can be of 3 or 18 months duration as you wish. Why not take advantage of this special inducement.

On the journey itself you will be treated as a welcome guest. Your comfort and convenience will be studied from every angle. You will find the appointments, the service and the cuisine well up to luxury hotel standards. Ports of call normally include Port Said, Aden, Bombay, Colombo, Fremantle, Adelaide, Melbourne and Sydney.

ONE WAY ONLY

Again quiet season travelling has advantages. Travel during February to May offers a wider choice of first class accommodation—more for your money.

Drambuie

average for the first half of the year. For the first nine months as a whole, however, the average deficit was £53.1 million, £22.2 million less than in the same period of last year.

Exports to North America in September fell only slightly, by £1.3 million to £33.1 million, owing entirely to smaller shipments to Canada. Exports to the United States included a further instalment, worth nearly £3 million, of repayments of silver bullion. Excluding this item, exports to the United States in the first nine months of this year amounted to £159 million, 23 per cent more than in the same period of last year; exports to Canada amounted to £133 million, an increase of 30 per cent.

Innovation—New Styles and Old

SIR DONALD ANDERSON, in his presidential address to the Institute of Marine Engineers this week, had a certain amount of justified fun with the advocates of "Buy British at all costs" in the airline business:

> That is a comparatively new attitude to what for some reason is still called business. . . . "We will astonish the world with speed and luxury, and you taxpayers will make up in reflected glory what it costs you in cash" . . . shows an outlook becoming widely accepted and entirely different from that of the shipping industry, which works for filthy lucre and, as it happens, earns more of it from the world for its fellow citizens than any other industry in this country.

This "sordid outlook," he added, necessarily conditioned the demands that shipping makes on the marine engineering industry: the marine engineer was not given contracts to design and develop engines over several years which shipping could use if they worked and taxpayers could pay for if they did not. For shipping, advances in engineering technique had ultimately to be measured in terms of cost. The cheapest was not necessarily the most competitive on the sea routes of the world; operating patterns could be adjusted to suit the particular advantages of new technical developments. But the cost criterion was final; nuclear power for ships would be no better than other methods of raising steam or turning a turbine rotor until it showed a net advantage in the voyage account.

The age, the history, and the facts of life and defence of aircraft development are obviously vastly different from those of shipbuilding and marine engineering; but lacking this immense outside impetus, and actuated simply by the "natural" economic impulse of demand in a competitive market, do these older engineering arts advance as much as they potentially might? That question, in many fields of technology, is becoming of critical importance for British industry. In this field, Sir Donald was honestly confident—"I can see no commercially economic line of progress that has not been pursued and brought into use." At times in the last 25 years, he thought, the United States had been ahead in turbine practice, or the Continent in diesels; Britain might be a little more wedded to past practice than some—"no defect when carried no further than prudence." The last remark might well have come from many other industries assessing their technology. But could all of them back it with such searching confidence?

High Copper Dividends

THE Selection Trust Group of Rhodesian copper mining companies, of which Sir Ronald Prain is chairman, shows so much of its results in its quarterly statements that the higher dividends announced last week occasioned little surprise. Roan Antelope is to pay a total of 100 per cent for the year ending June 30th, compared with 80 per cent last year; Mufulira owned as to 64 per cent by Rhodesian Selection Trust and as to most of the balance by the opposition (Rhodesian Anglo-American group) is to pay 125 per cent, compared with 100 per cent; while Rhodesian Selection Trust, which derives almost its whole income from its investment in Mufulira, is to pay 120 per cent, compared with 95 per cent. After deducting local tax Roan pays a net 62½ per cent, Mufulira 78⅛ per cent and Rhodesian Selection Trust 75 per cent.

Profits, as were foreseen, amply justify those higher payments. The gross earnings of Roan Antelope rose by £4.7 million to £15.5 million, those of Mufulira by £5.9 to £18.2 million and those of Rhodesian Selection Trust by £900,000 to £4.4 million. The only variable in the earnings figures which investors did not already know is the allocation to replacement and obsolescence reserve which is always fixed at the end of the financial year and does not normally agree with the provisional apportionments made in the quarterly statement. On this occasion Roan Antelope has provided £1.5 million, against £1 million, for replacement and obsolescence and Mufulira £2.3 million, against £1.5 million. After tax net profits of the two operating companies still show handsome rises. Roan Antelope earned £8.4 million, against £5.9 million, and Mufulira £9.3 million, against £6.4 million.

The year happened to include the peak of the recent boom in copper prices. Copper in London touched its recent ceiling of £435½ per ton in March and had fallen to £264 per ton by the end of these companies' financial years. Even allowing for the fact that this group has been selling its copper at fixed prices, which on the average have been a little below market price, the average for the year must have compared favourably with the figure of about £270 reported a year ago. Investors will naturally take into account the fact that since then copper has been substantially cheaper, but at its present level of around £290 a ton and at the group's fixed price of £300 per ton it must remain highly remunerative. If prices this year are lower the effect will be cushioned by the fact that two elements in cost rise and fall with the market price of copper—the European mineworkers' bonus and the royalty payable to the British South African Company.

Now in its second year

The Paper Bulletin

This is a bulletin service for paper users and makers. It deals with the supply, demand and price trends for paper, paper products and raw materials. The seventh quarterly issue will shortly be available. *Full details from:*

THE ECONOMIST INTELLIGENCE UNIT LTD.

Seven Years of Gas

THE genial progress of the gas supply industry has seldom been distinguished by any large ripple since it was nationalised just over seven years ago; but this surface calm was a trifle disturbed during its latest financial year, which ended in March. Sales of its main product, gas, rose barely one per cent against a five per cent increase the year before, and its revenue from sales of appliances fell away sharply, because of restrictions on hiring, for the first time for several years. Although sales of by-products such as coke were up by rather more than usual, the industry's net surplus fell as a result from £2,473,000 to £532,000, eight of the area gas boards making a surplus and the other four recording a deficit. But this paper surplus was reached after charging £21 million for depreciation of the industry's assets valued at their original cost; at replacement cost another £10 million or so would have to be deducted in order to give a measure of the industry's profitability or, this year, unprofitability in real terms. The boards in fact set aside only about £1 million to a replacement reserve out of the accumulated surplus.

More significant in the long-run, perhaps, are the deeper currents in the industry's operations. Although the number of householders using gas is still rising steadily, between them they are just as steadily using a smaller total quantity gas. On the other hand industrial consumption is slowly rising, although paradoxically the number of individual industrial customers is declining. Industry now takes almost 30 per cent of the industry's total sales while the share of the domestic user has slipped to just over half (most of the rest is bought by commercial users). At the same time too the industry is steadily making rather less of the gas it sells. Last year it bought about a seventh of its total supplies, mainly from the steel industry, and the two further contracts concluded since March for the supply of refinery "tail" gases, from Fawley and Shellhaven, presage an increase in another outside source of supply—though the quantities yet taken or envisaged are relatively tiny.

Throughout these seven years the industry has been gradually improving the efficiency of gas making and distribution. It calculates that it would have required to use 30 million tons of coal last year at the industry's production efficiency of 1948 instead of the 28 million tons it actually used, and that it has raised its charges since vesting day in 1949 by £15 million less than the total increase in costs. These gains have come more from heavy capital expenditure on the replacement of obsolete equipment than from the fruits of any significant research effort of its own. Last year this cost less than £1 million, out of a total turnover of £346 million.

Freights, Apart from Suez

FREIGHT rates for tramp shipping have tended to move upwards in recent weeks. This is the normal tendency at this time of the year; the Suez Canal crisis is having no very noticeable effect on the market though a certain amount of postponed demand for ships may have built up. In the initial stages there was the natural tendency for business that might be affected if the Canal were closed to be suspended until the outcome was clearer, but rates did not shift downwards, while the requisitioning by the British Government of 75 or so ships—some of which have since been released—removed quite a substantial block of tonnage from the open market. Although grain is moving steadily about the world in a number of directions, the mainstay of that open market remains the movement of American coal across the Atlantic.

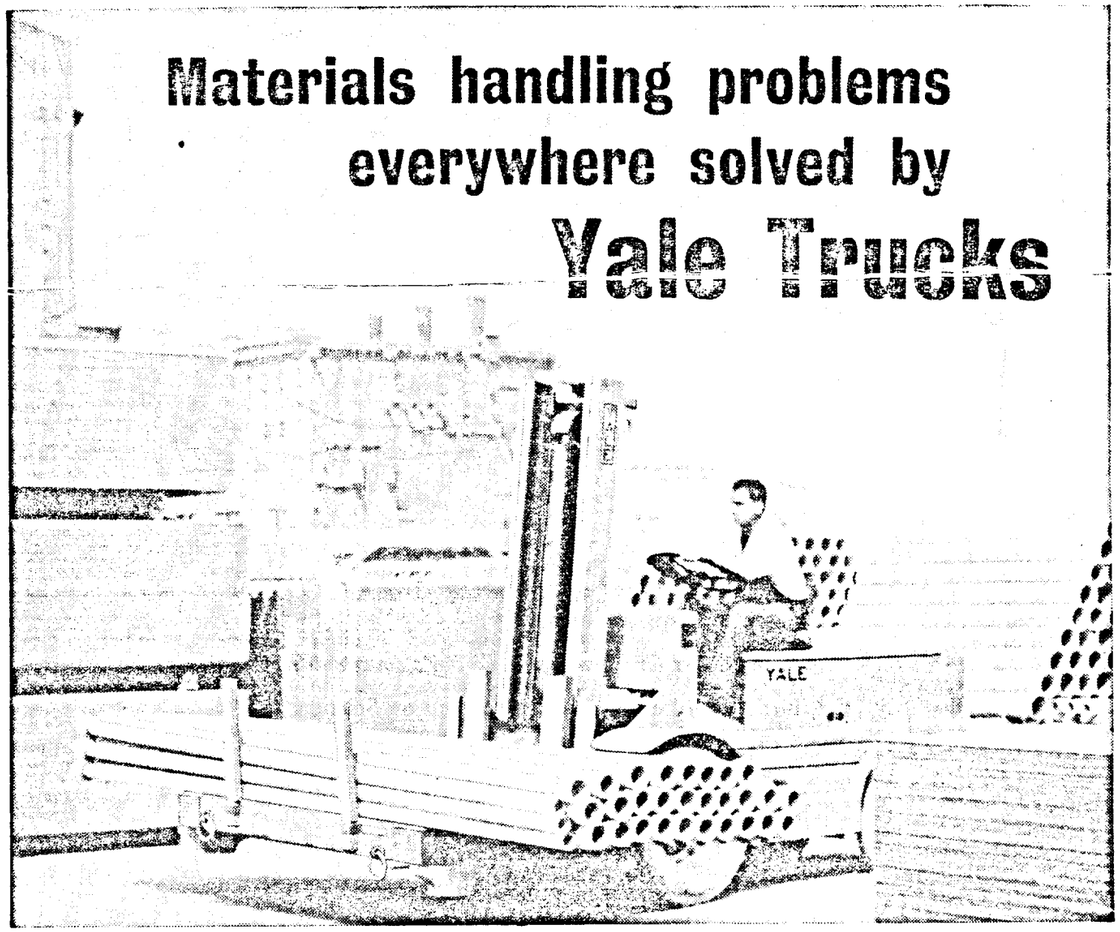
Autumn is the time when this trade normally increases in volume, but the amount of forward chartering now taking place seems likely to ensure a high level of activity throughout next year. For voyages from Hampton Roads to Northern Europe in the first half of next year, rates of between 70s. and 80s. per ton are being agreed, while a remarkable example of extreme forward booking is the signing of a contract for the carriage of three million tons of coal between 1960 and 1966. The necessary approval from American Government departments has been obtained for the chartering of government tonnage from the reserve fleet by a company representing US coal interests. If this scheme materialises it will add 30 Liberty ships to the transatlantic coal fleet: but brokers doubt whether even this sizeable addition of tonnage will have little effect on transatlantic rates.

Hague Club in Rio

THE European countries that have joined the Brazilian system of multilateral payments sent a delegation to Rio de Janeiro last week to return the visit that the Brazilians made to Europe earlier this year and to review the initial operations of the new commercial and payments system. The review revealed highly satisfactory results, notably for the United Kingdom; British trade with Brazil is no longer bedevilled by the bilateral arrangements under which the bulk of the sterling earned by Brazil was earmarked for oil payments, leaving little for other imports from the sterling area. Since the new system of multilateral payments came into force British exports to Brazil have gone ahead satisfactorily, and Britain is now responsible for one-third of Western Europe's exports to Brazil, British exports to Brazil amounting to £9,321,000 in the first eight months of this year, against £4,171,000 in the corresponding period of last year.

The discussions in Rio were also concerned with the possibility of other countries joining the multilateral payments system. The Scandinavian countries are likely to be included in the near future. There is also the possibility that Japan will later on adhere to it. The mechanism of the new system has been run in smoothly. The Brazilian central bank collects in its own accounts the various currencies earned by Brazilian exports to the European members of the system. A part of these currencies is retained to pay for direct government imports and to meet debt payments. Experience suggests that about half of these earnings are in fact kept back for the Government's needs. The other half is then put up for auction, not as so many separate European currencies, but under the generic title of ACL dollars—Limited Convertibility Dollars. To pay for category three imports which include many important items of machinery and materials ACL dollars have

Materials handling problems everywhere solved by Yale Trucks



Notice how this sturdy YALE Industrial Lift Truck moves these pre-cast concrete pipes with ease and safety. Stacking this awkward load takes only a matter of minutes.

In fact, YALE Industrial Lift Trucks offer practical solutions to all kinds of handling problems. They operate with speed and dependability — moving materials such as dies, drums, steel coils, crates and bags. And records reveal that they often lower handling costs as much as 50%. You can make similar economies, speed shipments, save space and help increase production with these sturdy trucks. Let your YALE representative show you how. And no matter where you buy them you'll find world famous YALE Trucks manufactured consistently to the highest standards of quality and durability.

the things they say!

85 marks for Chemistry — the boy's doing well!

Yes, but I wish he wasn't quite so keen on Science.

Why? What have you got against Science?

I don't think it's the best course for someone who really wants to get on.

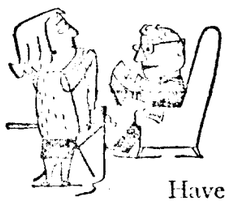
Nonsense! The scientist is going to be the key man of the future.

They're certainly not at present. The highest posts don't go to the scientists.

You're wrong, you know. This careers book from I.C.I. shows that the technical man has first-class opportunities with them. And not only on the scientific side — on the commercial and administrative sides, too.

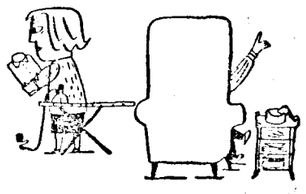
Oh, a few good posts go to them, no doubt.

More than a few. It says here that 12 out of the 17 full-time Directors of I.C.I. are graduates in Science or Engineering.



Directors? That's a bit ambitious, isn't it?

All right. Listen to this: "of the men holding the 254 most senior posts, 160 are graduate scientists or engineers".



Have it your own way! You always get the better of me in the end.

Imperial Chemical Industries Limited

recently been bid for at about 135 per cent premium over the official rate compared with a 156 per cent premium for United States dollars. The buyer of ACL dollars can then obtain from the central bank an equivalent amount of whatever European currency he requires. If the demand for one of these currencies outruns the supply available to the central bank, the necessary conversion is done by the central bank. The total of ACL dollars offered at the auctions is not greater than the mixed bag of appropriate European currencies held by the Brazilian central bank, so that if the demand for sterling is greater than the sterling actually held by the central bank, the bank provides the necessary supply by converting into sterling D-Marks or French francs or whatever European currency it holds.

Government Sells Copper

THE Board of Trade has now decided how it will dispose of the 36,000 tons of copper released from the strategic stock. The plan, drawn after consultation with the producers and the London Metal Exchange, is the same as that adopted in the past for disposals from the trading stock. Delivery and pricing will be spread more or less evenly over the five months beginning in November. About half the total quantity will be offered for sale by open competitive tender, and application forms will be available next week. The remainder will be offered to the original suppliers, principally the Rhodesian producers, on closely comparable terms. The decision had been expected and had no effect on prices; indeed cash copper rallied on Thursday to close at £284 10s. a ton, though it was still £9 lower over the week. But this extra quality is becoming available at a time when—strikes in the producing countries apart—the supply is already ample. Moreover, the present disposal may be followed by a further release in the financial year beginning next April.

Where the Steel Went

ONE of the missing economic statistics that in a year like 1956 Britain badly needs but has not got—but unlike many others, one that requires ingenuity in Whitehall rather than more forms for industry to fill in—is a rough distinction between capital goods and durable consumer goods in engineering output. In default of this, figures of steel consumption act as a partial, oblique indicator, though these too are hampered for the purpose by the classification of their customers into groups that may lump together builders of machinery, home equipment and weapons quite inseparably. As the table of finished steel deliveries from January to August shows, deliveries of steel to the "motors, cycles and aircraft" industries have this year been significantly smaller than in 1955; some of steel's customer industries where the purchases clearly go into investment, such as coal mining, railways and rolling stock, shipbuilding and constructional engineering, show rises in demand. But "General engineering," "Wire and wire products," and "All other consumers," where rises in deliveries have also been recorded, contain an inextricable and significant element of metal goods for the home consumer market; while "Hollow-ware, metal furniture, and canning" appear to have been taking as much steel this year as last.

NET HOME DELIVERIES OF FINISHED STEEL
(Weekly average—'000 tons)

	January–August	
	1955	1956*

Climate to Measure

SINCE Britain cannot be called the best of markets for air-conditioning equipment, manufacturers here have to seek most of their business either in shipbuilding or overseas. The largest firm of manufacturers—Thermotank in Glasgow—which has pioneered many new developments in this industry and produces perhaps 70 per cent now of all British-made equipment, still finds about four-fifths of its business in marine work. But in the last six years it has made a most successful entry into the American market, the present home of air-conditioning, which recently culminated in the completion of a $6 million installation at the new Ford administrative building at Dearborn. This success followed an equally notable contract worth $5½ million for the new General Motors Technical Centre, near Detroit, which was also finished this year. Altogether more than $12 million worth of business has been earned by this firm, by its air-conditioning know-how, particularly by its experience with high-velocity equipment, since three of its Glasgow technicians set up their office in a small Detroit hotel bedroom in 1951. One of these three is now executive vice president of the firm's American subsidiary.

But hopes of expanding the market here for air-conditioning have not been lost. Last week Rootes acquired a controlling interest in Tempair (Dorking), a new firm founded about a year ago, and the Dryer division of Birlec held an exhibition of air-conditioning and dehumidification plant at Birmingham. Factories where the dust or moisture content of the air is an important element in production—nuclear energy is merely one of the more recent examples—are perhaps the major market in a country that seldom swelters. Hotels, shops, and offices are other markets the manufacturers are hoping to develop further, but the cost of the equipment does not make the task easy, and virtually rules out sales to householders on any large scale.

At home in any company*

The ability to be selective in the choice of words and sensitive to a tone of voice is as valuable an asset of good social behaviour as of successful advertising. To be at ease in any company requires a proper appreciation of the significance of a particular situation. So with advertising. The versatility that enables an agency to handle with competence the appropriate advertising of the products from a wide range of companies is bred only of a proper understanding of a number of individual problems. Such understanding is found at Samson Clarks, acquired through a long association with many companies they have been privileged to serve in Britain and Britain's markets overseas.

*This is the company Samson Clarks keep.
The manufacturers of world-famous products, purveyors of unusual materials, suppliers of everyday services, creators of brilliant ideas. The designers of intercontinental jet-liners, the builders of infant carriages. The importers of wines, the marketers of petroleum products. The arbiters of fashion, the vendors of haberdashery. The producers of vestas and refrigerators, of furs and photographic materials. Structural engineers and precision instrument makers . . . . The list goes on and on but there is capacity for more.

World Exports of Manufactures Up

THE remarkable growth of world exports of manufactures shows no sign of slowing down. According to provisional figures published by the Board of Trade, exports of manufactures reached a record value of $9,916 million in the second quarter of this year ; that was 6 per cent higher than the previous peak in the fourth quarter of last year and no less than 20 per cent higher than in the second quarter of last year. The Board considers that comparison between the second quarters probably exaggerates the real increase, one reason being the fall in British exports caused by the transport strikes of May and June last year. In the first half of 1956 as a whole exports of manufactures were valued at $18,899 million, a rise of nearly 16 per cent over the first half of 1955. No estimate of the volume of exports in the second quarter of 1956 is yet available ; in the first quarter, however, the volume was nearly 6 per cent higher than in the first half of 1955, and export prices have probably changed little since the first quarter.

Company Notes

MORPHY-RICHARDS. This company is lucky in that hire purchase restrictions can have had little effect on its trade. Making the smaller electrical appliances, most of its sales must be for cash. It is unlucky in that two of its principal products, electric irons and toasters, are now subject to purchase tax. But building on an established reputation in the British market, it has been expanding its export sales. In their interim report for the first half of the year the directors spoke of an increase in sales, which enabled the company to absorb higher costs and return a bigger profit. The story was evidently repeated in the second half of the year, for over the whole of the year to June 30th gross profits rose from £472,728 to £578,118. This is a good result from a company engaged in a highly competitive business.

Depreciation (up from £42,068 to £70,672) and taxation (up from £219,533 to £262,495) have eaten into earnings, but net profits have risen from £197,285 to £230,531. The company has had no difficulty in maintaining the dividend at 50 per cent, paid on a capital slightly increased by the issue of shares on the acquisition of Astral Equipment. The directors have also decided to make a big free scrip issue, by capitalising £389,235 from reserves to issue three new ordinary shares for every two held.

Currently the 4s. ordinary shares at 25s. 9d. yield 7¾ per cent. That is not the yield of a growth stock and it is unlikely that the free scrip issue is anything more than a book-keeping transaction. It is unlikely because the company is to raise £500,000 on a convertible loan stock in the market ; a company which needs new money in today's markets can hardly be contemplating any large immediate increase in dividend payments. In the preliminary statement the directors do do not say why the new money is being raised. Is it simply to meet the cost of new plant and equipment in the new factory, designed to double capacity, the company is building ? Or have the directors other plans in mind ?

METAL INDUSTRIES. "Curiouser and Curiouser" is the only epithet which can be tagged on to Colonel S. J. L. Hardie's intervention at the annual general meeting of Metal Industries. Colonel Hardie, the first chairman of the Iron and Steel Corporation in the days of nationalisation, is one of the honorary presidents of Metal Industries, a company with which he was long associated in the past, and from which he drew last year a pension of £3,000.

At the meeting, Sir Charles Westlake, the new chairman of the company, added an up-to-date supplement to the full statement he had already circulated to stockholders. He said that "the figures so far available show a heartening measure of recovery" ; "that there is every prospect that this recovery will continue steadily," and that he hoped it would be possible "to pay a modest dividend in respect of the current year." He added that the six-monthly estimates he had seen that morning gave him "greater confidence" and made him even "more optimistic."

Such a statement could not fail to please stockholders and it suggested a stronger measure of recovery than had been anticipated in Throgmorton Street. But that was where Colonel Hardie, with-

SHORTER NOTES

Since City Centre Properties now controls Robinson and Cleaver, if only by a narrow majority, it seems likely that Mr F. W. Lindgren's proposal that the ordinary dividend should be 25 per cent, as in the previous year, instead of the 40 per cent dividend proposed by the board when it was trying to fight off the bid will carry the day.

★

Export quotas under the International Sugar Agreement have been cut by two per cent to 4.348,000 tons, and the price of raw sugar in the "free" world market after recovering to the prescribed minimum of 3.25 cents a lb has now slipped one point below it. Meanwhile the United Nations sugar conference is meeting in Geneva to try to broaden the membership of the agreement.

★

The reduction of 4s. in the price of flour has proved to be short-lived. The price has been restored to 99s. for a 280 lb sack, but as bakers customarily buy their requirements three months ahead the new price will not take full effect before the end of the year.

★

Wall Paper Manufacturers, Limited, has added a 5 per cent bonus to its final dividend of 15 per cent on the deferred capital. This raises the total dividend for the year to 25 per cent, compared with 20 per cent last year. After taxation of £2,166,069 net profits for the year to June 30th are £1,533.492. Last year the tax charge was £1,810,108, leaving a net profit of £1,287,643.

out apparently more than a few minutes' warning to the Chairman, stepped in. He wanted the meeting to be adjourned for a month to enable fuller information to be put before stockholders, and when his proposal was defeated on a show of hands he claimed to hold 300,000 proxy votes and demanded a poll. The chairman suggested an adjournment until after luncheon. During that break he and Colonel Hardie seem to have composed their differences and after it Sir Charles explained that Colonel Hardie had thought the chairman had been too cautious in forecasting a "modest" dividend. Sir Charles added that he would soon issue a report to stockholders covering the first six four-weekly periods of the current year. The promise of an interim report—which is in keeping with Sir Charles' wish to provide stockholders with the fullest information—seems to be the only result of Colonel Hardie's intervention. But one tangible result of the meeting was to put the ordinary units up by 1s. 1½d. to 22s. 10½d.

★

WESTLAND AIRCRAFT. One new recruit to this autumn's queue of borrowers is Westland Aircraft, in which John Brown owns a 50 per cent interest. Prominent in the production of helicopters, the company is expanding quickly—as the increase in net profits from £288,281 to £476,983 in the year to June 30th and the payment of a tax-free dividend of 6¼ per cent (against 5 per cent net) shows. The company is to offer to existing shareholders 2,400,000 5s. shares in the ratio of one for two at 7s. 6d. each (compared with the current market price of 9s. 1½d.) John Brown, the largest shareholder, will continue to take an active part in the management of the concern, but will take up only two-thirds of its entitlement of new shares.

John Brown is giving up part of its entitlement because if it accepted a full allocation of the shares the investment in view of the growth of Westland would "represent an unduly large proportion of its resources in relation to its other interests." Most of the remainder of the new issue will be placed with financial institutions, but some will be made available to shareholders applying for excess shares. An issue thus carefully planned and with an element of bonus in the rights can hardly fail. After the cash issue Westland will capitalise £450,000 to make a 25 per cent free scrip issue of 1,800,000 ordinary shares.

On the new capital after the two issues, the directors hope to pay a tax-free dividend of 5 per cent for the year to June 30th next. This will represent an effective increase, for the new payment is equivalent to 6¼ per cent, tax free, on the capital after the cash issue but before the free scrip issue.

★

EASTWOODS. New records in sales and production were established by Eastwoods, the bricks, cement and tile manufacturers, in the year to March 31st. But its directors support the policy of price stabilisation within the industry and as costs have risen profit margins have narrowed. Hence the group's trading profits show an advance but it is only a slight one—from £956,256 to £1,012,784. To step up production the group has had to spend heavily on capital account—to the tune of £800,000 in the last financial year.

To find the new money the group made a rights issue last November, which raised the issued ordinary capital from £1,500,000 to £2,000,000. On this capital the directors are maintaining the ordinary dividend rate at 17½ per cent. The profit figures would hardly allow them to do more. The net ordinary dividend absorbs £201,250 out of a net profit of £302,679. This net profit, thanks to heavier charges for taxation and depreciation, is lower than the £323,579 recorded in the previous year.

ALTHOUGH gilt-edged weakened on Tuesday, when the terms of the LCC loan were known, a sharp recovery on Wednesday left most stocks higher on balance. Short-dated stocks shared in the improvement, 2 per cent Conversion 1958/59 gaining ⅜ to 94$\frac{13}{32}$, while 3 per cent Transport 1978/88 rose ½ to 68⅛ and 3½ per cent War Loan gained ⅛ to 71¼. On Thursday, gilt-edged prices were firm but there was a further decline in Industrials. The market in industrial stocks broadened a little, but losses predominated, the *Financial Times* index of industrial ordinary shares falling from 179.4 to 177.5 on Wednesday.

Brewery shares were again firm and the counter-bid for Charles Kinloch raised the shares to 45s. Wall Paper deferred rose 6s. 9d. to 72s. 6d. on Thursday following the results. Ford Motor lost 1s. 4½d. to 30s. in anticipation of the results but remained firm after the announcement. Dunlop, which fell to 15s. 6d. last week, was firm at 16s. 9d. Dowty rose at first to 34s. 7½d., but then fell to 30s. 3d. after the dividend announcement. Among the stores, John Barker has gained 5s. 10½d. to 60s. 7½d. since Tuesday. C. A. Parsons lost 7s. 6d. to 82s. 6d. on Tuesday and Reyrolle 12s. to 96s. following rumours of a rights issue, but both recovered on Wednesday, C. A. Parsons to 86s. and Reyrolle to 98s. ICI drifted down to 40s. xd. Steel shares were again weak; Stewarts and Lloyds lost 2s. 7½d. to 57s. and John Summers 1s. 10½d. to 34s. 7½d., but Swan Hunter were firm at 57s. 3d. Most sectors of the industrial market were weak on Thursday.

Oil shares improved on Wednesday, but BCO common were lowered to 10½d. on the offer by British Petroleum. Coppers advanced, Rhodesia-Katanga being very active and advancing 3s. 9d. to 47s. Tin shares were strong, large gains being made by the Gopeng group of companies, which has announced projected capital repayments. Rubbers have been quiet and tea shares irregular.

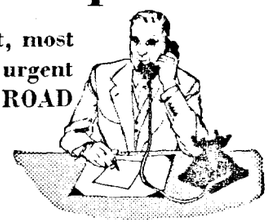
How complicated is YOUR transport?



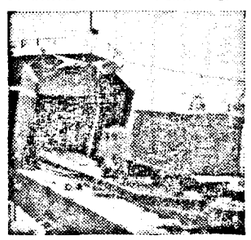
Moving your largest, most awkward, or most urgent loads by BRITISH ROAD SERVICES can be as simple as a single telephone call

IN THE FIELD of road haulage, British Road Services offer you an outstanding, thoroughly reliable and economic transport service. *And they offer you simplicity.*

This is because B.R.S. are a highly organized and nationwide concern with great resources behind them. They are geared to carry all kinds of traffic, in any quantity, over any distance, speedily, carefully and economically. A B.R.S. teleprinter network, unique in the road haulage business, ensures smooth, fast, behind-the-scenes communications. *These are substantial advantages which only a large organization can offer.*

Good transport needs planning. And British Road Services have experienced men ready and eager to discuss your transport problems with you, to advise on the most efficient and time-saving methods, including mechanical handling and palletization. With their massive resources and lively enthusiasm, no transport problem is too great or too small for this stalwart organization. Why not telephone them now?

1 Thoroughly reliable, speedy service. Regularly every night, from hundreds of B.R.S. depots throughout the British Isles, thousands of vehicles set out on journeys to far destinations. Most of these loads will be delivered the next morning. Are you making use of these services?



2 The most suitable vehicles. This articulated vehicle operates on the ferry services to Ireland. It reduces the handling of goods and avoids costly packing.

3 Vehicles maintained in peak condition. The B.R.S. nationwide engineering service keeps vehicles in first-class order. Preventive maintenance ensures a fully reliable fleet — always.

Industrial Profits and Assets

THE tables below continue the analysis of company balance sheets and profit and loss accounts which was introduced in *The Economist* of January 22, 1949; the figures are discussed on an earlier page in this issue.

Comparative analysis of 530 profit and loss accounts published July-September, 1956 (£'000)

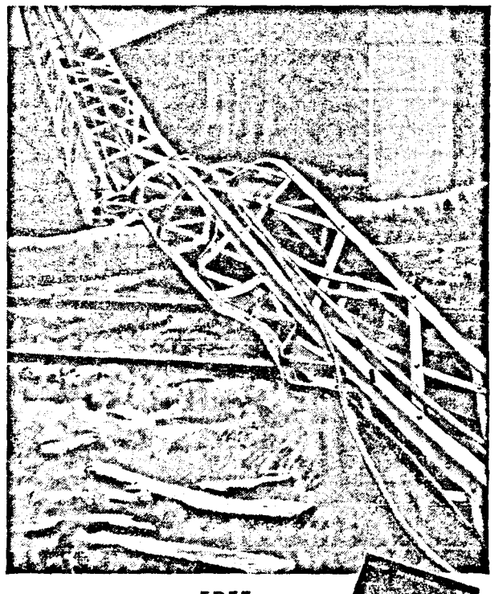
SOMEBODY JIBBED AT THE OVERHAUL



WHEN the derricking clutch of this electric derrick crane broke, the jib, no longer under control, crashed with considerable damage to the owner's property.

What **Vulcan** *say about it . . .*

This was as much a human as a mechanical failure, for a complete dismantled thorough examination of the crane by a certain date had been most earnestly advised, and this was overdue.

What Vulcan insure, Vulcan inspect. With their highly specialised knowledge, Vulcan's engineer-surveyors spot accidents before they happen, and give the necessary warning. Boilers and steam engines, electrical apparatus, pressure and vacuum vessels, cranes, lifts and hoists — these all need Vulcan's specialised insurance — and the specialised inspection that it implies.

FREE
For news of industrial accidents and ways to avoid them, ask us for "Vulcan"—a Quarterly Journal for Power users. Please write to Dept. 17.

ZIM ISRAEL NAVIGATION COMPANY LIMITED

Haifa, Israel

The Annual General Meeting of Zim Israel Navigation Company, Limited, was held recently, and the following are details of the report presented by the Board of Directors:

The Zim Israel Navigation Company, Limited, is Israel's principal sea transport organisation, and the Group includes the following companies:

Subsidiary Companies.—Shoham Maritime Services Limited; M. Dizengoff and Company Limited; American Israeli Shipping Company Inc., etc.

Associated Companies.—The Israel Shipyards and Engineering Works "Hayama" Limited; El-Al Israel Airlines Limited; "Delek" Israel Fuel Corporation Limited, etc.

On the Mediterranean Line the Company maintains sailings between Haifa-Genoa-Marseilles-Naples-Haifa, and on the American Line there is one sailing every three weeks between *Haifa* - Naples - Malta - Gibraltar-Halifax (Canada)-New York.

Cargo ships serve Cyprus, Turkey, Greece, Trieste, *Genoa*, Marseilles, *Sicily*, Spain, Portugal, France, Britain, Belgium, Holland, Germany, Poland, the Scandinavian countries, the United States (Northern and Southern ports), Canada, West Africa, East Africa, South Africa, South East Asia, the Far East, USSR, Rumania and Bulgaria.

The policy initiated in 1954 of disposing of the older ships was continued in 1955, when four cargo vessels were sold and delivery was taken of eleven new ones, built to the Company's order within the framework of the Restitution Payments Agreement, including s.s. *Israel* and s.s. *Zion*, two liners for the US run, and a 18,700-ton tanker.

The delivery of two new 10,000-ton passenger liners now under construction, the s.s. *Theodore Herzl* and her sister ship in the spring and summer of 1957, should enable the Company to dispose of one or two of its existing passenger vessels.

EXPANSION

The first real expansion of the Company's fleet will now take place, following the renewal carried out during the last few years.

The new ships so far approved consist of:

Two cargo ships of 14,500 tons deadweight each;

Three cargo ships of 1,500 tons deadweight each;

One tanker of 18,500 tons deadweight;

Two small refrigerated ships of 500 tons deadweight each;

One gas tanker of 350 tons deadweight.

Furthermore, to cope with increasing bulk exports, and with the import of bulk cargoes which hitherto have been carried to a very large extent by foreign flags, the Company will certainly need to add to the number of large ships at its disposal.

PASSENGER TRAFFIC

During 1955, the number of passengers carried on the Company's vessels (approximately 30,000) remained almost the same as in the previous year.

Zim's share in the country's seaborne passenger traffic was 60 per cent as in 1954, but if the Turkish traffic, in which the Company does not compete, be eliminated, the percentage rises to 66.

CARGO BUSINESS

The total cargo tonnage carried by Zim ships during 1955 (681,500 tons) fell by 12 per cent in relation to 1954 (775,000 tons). The cargo carried on chartered ships also recorded a slight decrease (1955—142,000 tons; 1954—157,000 tons).

Net profit for the year, after charging depreciation of IL.2.5m. and interest of IL.1.1m., amounted to IL.671,001, which, with the balance of IL.685,257 brought forward from the previous year, made a grand total of IL.1,356,258 available for distribution. After making various provisions, it is proposed to distribute dividends of 7 per cent on preference shares, 6 per cent on ordinary shares and 1 per cent on deferred shares, leaving a balance of IL.712,575 to be carried forward.

The report, the accounts and the proposals put forward by the Board were adopted.

MANAGING DIRECTORS

Mr Joseph Barpal, Mr Shlomo Eisenberg, Dr Naftali Wydra, Mr Zwi Yechieli.

A. C. COSSOR

SEVERE EFFECT OF RESTRICTIONS

The eighteenth annual general meeting of A. C. Cossor, Limited, was held on October 5th, in London.

In his circulated address, The Most Honourable The Marquess of Exeter recalled his warning last year that the return of Government restrictions on the sale of television and radio sets might prevent the Company from reaping the full benefit of increased factory capacity which had been allocated to that side of their business in view of the falling off in the requirements of the Services for equipment. That was, in fact, what happened, but the imposition of still further restrictions rendered the effect on the Company's business much more severe than the Board then feared might be the case.

The accounts showed that the Company had sustained, not merely a reduction in profits, but actually a loss. The Chairman said that the reversal in their fortunes had arisen almost entirely from the operations of the Parent Company itself. The trading subsidiaries, with one minor exception, did well during the year.

The cancellation of Government contracts exceeding £6 million left a large gap in the Company's production programme, and their attempt to keep their factories full by a greatly increased television and radio programme was not successful. The Trade Unions had again extracted from the engineering and other industries another large wage increase. This not only put up the Company's operating costs, but brought an all-round rise in the cost of many materials and components. The lower profit margin and decline in turnover had entailed the painful business of discharging about one-third of the Parent Company's total personnel.

The Chairman outlined the efforts which the Board were making to improve the Company's position both in traditional and new fields.

The report was adopted.

CALCUTTA TRAMWAYS COMPANY, LIMITED

RECORD TRAFFIC RECEIPTS

The annual general meeting of the Calcutta Tramways Company, Limited, was held on October 9th in London.

Mr D. E. Webb, FCA, the chairman, in the course of his speech, said: The accounts for the year ended December 31, 1955, show a continuation of the improved conditions of the previous year. The period was once more free from major incidents and, as a result, it has been possible to strengthen the company's position still further.

The popularity of the trams was once more evinced by the increase in the number of passengers carried to a total of 584 million. In order to achieve this figure, each tramcar in service had to run about one hundred miles a day through crowded streets, continually stopping and starting, and it is a matter for congratulation to our engineers and workshop and depot staffs that they not only keep the trams in first-class mechanical condition, but present them to the public in a condition of cleanliness comparable with the best of those in any world capital.

Traffic receipts, which amounted to £1,891,939, were a record in the company's history and were a direct result of the increase in confidence of the travelling public as a result of the absence of major disturbances. At the same time expenses rose by some £40,000, of which increased payments to the staff in India amounted to £23,000. After charging London Office expenses, setting aside £80,000 to Renewals and Replacements Account and including £10,331 expenditure on Development Account, the balance carried to Revenue Appropriation Account was £206,018 compared with £189,639 in the previous year.

An interim dividend on the Ordinary shares of 3½ per cent free of tax was paid in March, and your Board now recommend the payment of a final dividend of 5 per cent, free of tax, making a total for the year of 8½ per cent, free of tax, compared with 7½ per cent, free of tax, for the preceding year.

The expenditure on Renewals and Replacements Account amounted to £102,495 and has exceeded the allocation of £80,000 as foreshadowed last year. The liquid cash position has further improved to a more satisfactory level.

NEED FOR FARE INCREASE

Once more I would reiterate how badly we need an increase in fares. There is still a feeling in Calcutta that increased fares will mean increased profits for the shareholders. One cannot repeat too often that the amount available for shareholders is fixed under the agreement with Government. Even if the surplus on running the undertaking were to increase tenfold the amount available for the shareholders would not increase by one rupee. Any increase in the surplus can only accrue for the benefit of the Government and the people of Calcutta. One of the great objects behind the agreement with Government was to ensure that never again would an increase in fares be questioned on the grounds that it would benefit the shareholders. Such an increase, when necessary, can only result in a surplus to be used in improving and modernising the undertaking and alleviating the travelling worries of the public.

The results of the current year to date are comparable with those under review.

The report and accounts were adopted.

APPOINTMENTS

UNIVERSITY OF GLASGOW

ASSISTANTSHIP IN POLITICAL SCIENCE

Applications are invited for an Assistantship in Political Science. Salary scale: £550-£650. Initial salary according to experience and qualifications. F.S.S.U. and family allowance benefits.

Applications (3 copies) should be lodged, not later than October 31, 1956, with the undersigned, from whom further particulars may be obtained.

METALS DIVISION
requires an
Education
and
Training
Officer

for the Swansea factory of the company. The successful applicant will be responsible for the establishment of the Section of the Division's Education and Training Department, and will assist in developing a complete scheme of education and training schemes. In the first instance, emphasis will be placed on operative and general shop-floor training.

Applicants, preferably between 28 and 40 years of age, should possess a degree and some industrial experience is desirable.

A generous commencing salary is offered and the company operates both a contributory pension fund and a profit-sharing scheme. On joining the staff, a married man would receive a reasonable refund of removal expenses.

Apply, in writing, for application form, to the Staff Manager, Imperial Chemical Industries Limited, Metals Division, Kynoch Works, Witton, Birmingham 6, quoting D.D./E.

THE UNITED KINGDOM ATOMIC ENERGY AUTHORITY

ANNOUNCE TWO SENIOR ENGINEERING POSTS

These are responsible posts requiring good professional qualifications and considerable practical experience allied with a wide knowledge of design work for Post 1294 and with a definite ability of a high order for Post 1295.

Post Ref. 1294/231. Responsible for the design of a wide range of complex equipment for Service and Trials use. Experience in handling a large team of professional engineers and draughtsmen is essential, combined with a comprehensive knowledge of electrical and electronic and mechanical development over a wide field.

Applicants must have a degree in Engineering or equivalent qualifications.

Post Ref. 1295/231. Responsible for control of manufacturing services including large high precision mechanical and electronic workshops, and the utilisation of the resources of industry. Applicants must be capable of leading a large team of mechanical and electrical engineers and must have had considerable experience in controlling a large industrial force.

A degree in Engineering or equivalent qualification is required.

Salaries in the range £2,500 to £3,000.

Contributory Superannuation Scheme. Modern houses with garages available, or assistance towards legal expenses in house purchase.

Please write to J. R. V. Dolphin, Esq., Chief Engineer, through Chief Personnel Officer, A.W.R.E., Aldermaston, Berks, stating the reference number of the post in which interested.

THE G.K.N. GROUP OF COMPANIES

An experienced mechanical engineer is required at the steel and engineering works of Guest, Keen, Williams, Private Ltd., in Calcutta.

Candidates should be aged between 30 and 40 and must be graduate engineers or have served a full engineering apprenticeship. This is a permanent post carrying great responsibility. The selected candidate will in the first instance be required to assist in carrying out a large development scheme. The post carries excellent prospects and salary and conditions offered are in keeping with the exceptionally high standard required.

Applications, which will be treated in strict confidence, should give full details of age, qualifications and career to date, and should be addressed to The Group Personnel Officer, 66 Cannon Street, E.C.4.

AGRICULTURAL RESEARCH COUNCIL require an Assistant Statistician in their Unit of Statistics, University of Aberdeen. Degree in Science or mathematics and some knowledge of statistical techniques desirable. Younger candidates with G.C.E. (advanced level in mathematics) or equivalent can be considered. Appointment as Assistant Experimental Officer (£350-£755) or Experimental Officer (£875-£1,075) grade according to age and experience. Contributory superannuation scheme. —Applications, with names of three referees, to the Secretary, Agricultural Research Council, 15 Regent Street, London, S.W.1, within two weeks.

ORGANISATION AND METHODS TEAM LEADER, based on Sheffield, required by N.E. Division of N.C.B. The work entails efficiency studies in a large scale organisation and offers considerable scope for men with progressive ideas and initiative. Salary £1,085-£1,475; good conditions of service. Previous O. and M. or similar experience essential; an accountancy qualification an advantage. Apply to Staff Director, N.C.B., Holmwood House, Ecclesall Road South, Sheffield 11, within 14 days. Mark envelope "Staff Vacancy."

RESEARCH OFFICER required to assist study group on project on "Budgetary Practices in Public Authorities." Duration 2 years. Research experience important; some knowledge of financial administration desirable but not essential. Salary in range £750-£900 according to qualifications. Royal Institute of Public Administration, 76A New Cavendish Street, London, W.1.

ADMINISTRATIVE ASSISTANTS (male) for Granada TV Network Ltd. Company Directors. Previous administrative and/or commercial experience essential. Required sometimes to work long and irregular hours in London and/or Manchester. Good prospects, superannuation scheme, five-day week, salary according to qualifications.—Write, giving age, present salary and fullest particulars of previous experience, to Managing Director, 36 Golden Square, London, W.1.

MARKETING EXECUTIVE

London advertising agency has vacancy with attractive prospects for a young executive with some years' experience of the broader aspects of marketing, including product presentation, sales promotion and advertising. Good education (university graduate preferred), imagination and a capacity for hard work are desirable attributes. —Please write fully to Box 531.

THE NATIONAL FEDERATION OF BUILDING TRADES EMPLOYERS

invites applications from consultants with experience in making surveys and advising on costing, work study, clerical methods, planning and programming, and capable of taking charge of, and developing, the existing Advisory Service for the Building Industry. Experience in supervising and directing the work of specialist consultants is essential. Work involves an appreciable amount of travel in the U.K. Salary according to age and experience. Contributory Pension Scheme.—Write, giving details of age, education, experience and present salary, to the Director of the Federation, at 82 New Cavendish Street, London, W.1.

Applications are invited for a

SENIOR APPOINTMENT

in the Secretary's Department of
RICHARD COSTAIN, LTD.,
111 Westminster Bridge Road, London, S.E.1.

Candidates should be aged 30-45 and possess one of the following qualifications:—
A.C.A., A.C.I.S., A.C.W.A. or A.A.C.C.A.
Experience in qualifying must include at least five years in the Secretary's department of a group organisation. A sound knowledge of U.K. Taxation is necessary.

A commencing salary of up to £1,300 per annum will be offered.—Applications should be addressed to the Chief Personnel Officer.

MANAGEMENT SELECTION LIMITED

have been retained by a leading

AMERICAN MANAGEMENT CONSULTING FIRM

Outstanding opportunity to young men wanting to make a career in the United States. This long-established firm assists leading companies in solving major management problems, providing the stimulation of new problems and association with top-level executives.

Candidates must be graduates, hold a professional qualification, and have experience in one or more of these fields: marketing, production, accountancy, finance or personnel administration.

Candidates must be able to deal effectively at top executive level; after training must be able to plan and carry out assignments without detailed supervision. Knowledge of French, Spanish or German an advantage. Age 28-35. Starting salary $6,000 to $12,000 according to qualifications. Policy of promotion from within. Travel in U.S. and overseas not excessive.

No information will be passed to our client without candidate's permission at interview. Please send brief details, in confidence, to P. J. H. Frye (ref. 1577), Management Selection Limited, 8 Clarges Street, W.1.

LARGE-SCALE INDUSTRIAL ORGANISATION on Tyneside requires an able man to head and develop their Organisation and Office Methods Department. Applicants should have a good University Degree and/or professional qualifications and should preferably have experience of consultancy work. The post is pensionable and the salary will be in the range of about £1,700-£2,250, depending on qualifications and experience.—Replies by October 27th to Box 529.

SMALL South Coast Company offers a unique opportunity to a young man of good education and personality with Engineering background (preferably with some D.O. experience) as Works Management Trainee. A man is required prepared to work hard in order to achieve Management Status and rewards in due course. Clock watchers and any who think the world owes them a living need not apply. Write, in confidence, giving full particulars of age, education, previous training, experience, and starting salary required, to Managing Director.- Box 539.

CHARTERED ACCOUNTANT/COMPANY SECRETARY required by international firm of Wool Merchants with head offices in Bradford. The position entails full responsibility for the financial side of the firm's business which requires close co-operation with Merchant Bankers and experience of Foreign Exchange Transactions. Applicants should preferably have an economics degree and possibly a certain amount of legal background and should be under 40. Salary is dependent on ability and experience.—Apply, Box 536.

RICHARD THOMAS & BALDWINS LIMITED invite applications from men 24/30 years of age for a position in the Economics and Market Research Department, London, dealing with market analysis, forecasts and economic problems related to the iron and steel industry. Qualifications required are a degree in Economics/Statistics, or practical experience in this type of work.—Apply Central Staffing Department, 47 Park Street, W.1.

LONDON BANKERS active Foreign Exchange Market require experienced dealer. Good salary and prospects. Applications treated with absolute discretion. Write Box OC12, c/o 95 Bishopsgate, E.C.2.

Eggs shipped in CORRUGATED boxes ... safer, cheaper, lighter

Few things are as fragile as eggs—or as protective as corrugated boxes. The two just go naturally together, and are doing so today at many Dutch egg-packing plants.

Eggs joined the trend toward corrugated boxes several years ago primarily as an economy move. Savings were effected in both the cost of the boxes and the shipping weight. What's more, experience shows corrugated boxes protect better, because bottoms are more secure and sides are stronger.

Corrugated boxes speed up packing, handling and unpacking wherever they're used. They're easier to open and close. They slide smoothly without scratching hands, clothing, counters, or trucks.

If corrugated can carry eggs safely, it can be used for practically any fragile product—heavy or light, large or small. When you need shipping containers, think first of corrugated. Have a talk with your nearby boxmaker.

Langston doesn't sell corrugated, only the machines that make it. Since 1902, these machines have led the field in efficiency and dependability. *Samuel M. Langston Co., Camden 4, N. J., U.S.A.*

B. ELLIOTT & Co. Ltd.

MANUFACTURERS OF MACHINE TOOLS AND ENGINEERING EQUIPMENT

Our Ref: AES PD

The British European Airways,
Dorland House,
Lower Regent Street, S.W.1.

Gentlemen,

Some four weeks ago, your Representative Mr. G. R. Allen, called upon us about air-freight. . . . Quite frankly, we did not consider even a remote possibility that our machines could be transported in this manner. However, in view of the constant increase in surface transport costs, we decided to send two machines by air to the Continent for exhibition. These weighed 2100 Kg. and 2500 Kg. and owing to their design, left us in doubt as to whether this would be a reasonable experiment.

We were most impressed by the manner in which they were handled. Despatches of this nature will obviously afford us not only a considerable saving of time, but show also a reduction in overall costs, and in the instances mentioned, the saving amounted to something like 20%.

The two clients concerned have written to us recently stating that both machines arrived in first-class condition (even though they were unpacked) and commending us for the initiative taken by using this method. Finally, we have already received further orders from the Continent, with a request that we send them by air.

Yours faithfully,

SGD: A. E. Sutton,
Shipping Manager.

The types of goods you can send by BEA are almost unlimited. Low insurance costs. No pilfering. Minimum packing. Low BEA rates. For full details ask your usual Shipping or Forwarding Agent or write to BEA, Waterloo Air Terminal, London, S.E.1. Telephone: WATerloo 8030.

"Gentlemen, we are installing TELEX"

"and about time too" muttered the Sales Director.

Every day more and more commercial and industrial organisations are becoming Telex subscribers. Go-ahead concerns can no longer afford to be without this new communication system that combines the speed of the telephone with the authority of the printed word. Telex is a 24-hour Post Office Teleprinter Service that enables you to exchange messages with any other Telex subscriber either at home or overseas. A Telex call to a subscriber beyond a 25-mile radius costs about half as much as a telephone call of the same duration. Most overseas calls, too, are cheaper than their telephone equivalents. Telex requires no special staff ; a competent typist is an efficient operator after the briefest instruction.

" Are you on Telex yet ? If not, shouldn't you be ? Ask for the Telex booklet from your local Telephone Manager or from the address below. Your Telephone Manager will be pleased to arrange for his representative to call and discuss the service with you and for you to see Telex in action at your nearest Demonstration Centre."

It's worth looking for LEATHER at the Motor Show

A car with leather upholstery never looks its age. Throughout its long life leather looks good. There is nothing to compare with its day-long comfort in Summer or in Winter. And when the time comes to sell, the leather-upholstered car invariably produces a higher price.

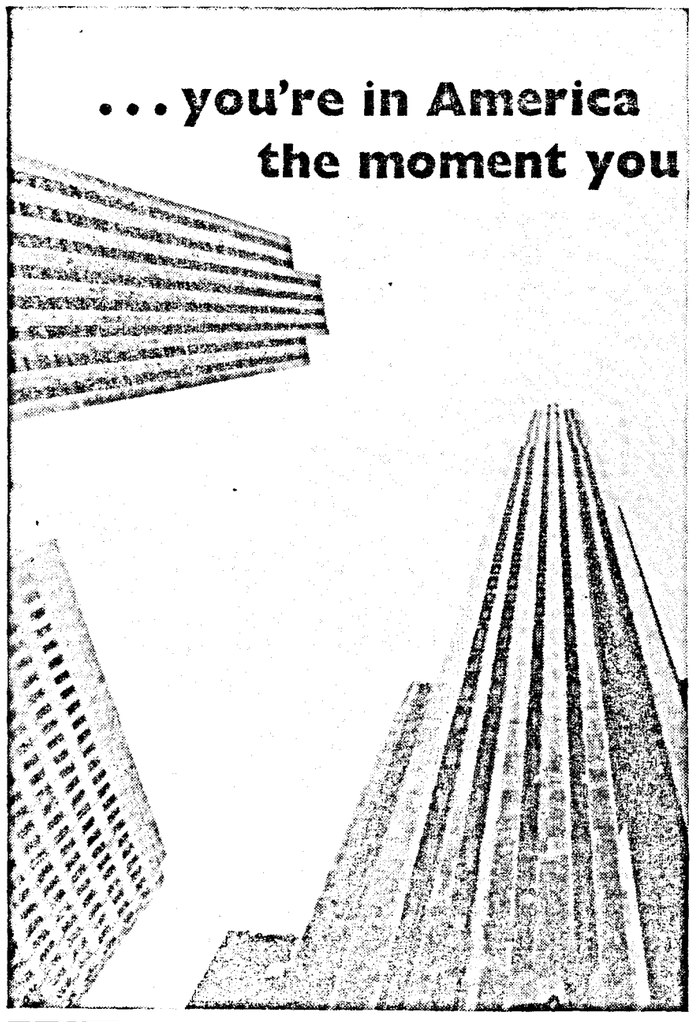
BELGIAN World AIRLINES

Vanderlei

You can start your business trip at Southampton...

...you're in America the moment you step on board



*IN THE PERFECT ATMOSPHERE FOR BUSINESS CONTACTS:**

ALL THE THINGS that say "America" — the easy courtesy of the Deep South, the streamlined efficiency, the glamour, the glitter, the heart-warming friendliness—all these are yours only two hours away from London!

Over the fifty feet of gangplank onto the famed "United States" or her running-mate the "America" and you're *in* America; the luxury, the hospitality and the gaiety of this friendly country surround you.

And if you're a businessman, remember that here is the perfect atmosphere to lay the foundations of a really successful business trip. In informal, friendly surroundings you meet the men who might make all the difference. The extra reserve of speed of the "United States" (the Blue Riband holder) helps you, too, for it means that she has an outstanding record for punctuality. And if you have a business appointment soon after you land, that's important!

But there's fun aboard, too, lots of it. You'll find unexcelled food and superb wine, magnificent cinemas equipped with CinemaScope, top-grade orchestras, every "keep-fit" facility, well-stocked libraries, and, of course, just rest and relaxation if you prefer. Yes, the few days that separate you from New York pass all too quickly. You travel fast in the utmost comfort when you travel by United States Lines.

***IMPORTANT**

MEMO TO A BUSINESSMAN

As a British businessman, you have great advantages to reap if you travel by United States Lines. You have time, first of all, to adjust yourself to the American atmosphere and the American tempo before you arrive in New York.

And, most important, a fresh contact is more easily made under the sociable conditions aboard ship than over an office desk; the people you meet may turn out to be more than just good friends—they may be useful friends.

SCRAP PROFITS

Scrap, the most vital raw material for iron and steel production, already commands high prices. With quick, clean and *continuous* cutting it will show even greater profits.

The *continuous* supply of high purity oxygen required is supplied by the BUTTERLEY OXYGENERATOR. It is the only self-contained on-site plant to do so; needs a minimum of maintenance, and makes you independent of transport and handling charges.

Profit by oxygen, as pure as you want it, generated on site, piped direct to points of usage.

Profit by eliminating costly hold-ups—the supply is always there.

Profit by eliminating wastage. Make only what you use and use only what you make.

Profit by supplying field locations from your own oxygen storage bank, replenished from your own Butterley Oxygenerator.

Profit by scrap more cleanly cut, more easily handled.

Please write for further details

eleven Security Council members. True, the first and unanimously accepted half of the resolution, the "six requirements" worked out in private meetings with Mr Fawzi through Mr Hammarskjöld's good offices, is vague. What they will mean in practice will depend on how they are interpreted. Still, the second (vetoed) half of the resolution contained an interpretation. It said plainly enough that the eighteen-power proposals meet the six requirements, and asked Egypt for proposals offering guarantees "not less effective."

President Nasser can choose whether or not he will comply with this vetoed request for equivalent guarantees; he is under no legal compulsion; in the face of the Soviet veto the machinery of the United Nations cannot be used against him. In practice, however, the task of bringing about further talks is left in Mr Hammarskjöld's hands, and a plain obligation is placed on both sides to co-operate in arranging the talks and, when they start, to engage in them in good faith. Serious negotiation has become virtually unavoidable.

All the same, a settlement is still much too distant for its probable outlines to be descried. The hardest-fought point in the negotiations, when they come, promises to be the third of the six agreed requirements:

> The operation of the Canal should be insulated from the politics of any country.

This, though it has been called the "teeth" of the six points, is capable of widely divergent interpretations. Does this mean that the operation of the canal should be taken out of Egyptian hands and put into the hands of an international body? Plainly the Egyptians will not freely give way to that extent. They can argue that plenty of institutions in many countries are "insulated" from politics, more or less, without international boards of control—as is apparent if the New York formula is read again with, say, the term "BBC" substituted for "Canal."

The users will be thrown on their own resources of argument and pressure to make their view prevail. They may have to be content with something less than international operation of the canal. Mr Walter Lippmann, contemplating the practical snags of an international operating agency, wondered this week "whether we are not well rid of it." Well rid or not, the proposal dates from the phase of the dispute when maximum, not minimum, demands were being stated. If efforts are to be concentrated on a negotiated, not an imposed, settlement that will satisfy the users' indispensable requirements, then the practical target must be much as Mr Lippmann states it: "a treaty that sets up a regime under which the Egyptian authority will operate," defining a code of rights and duties, with an agency on the spot representing Egypt and the users, able to adjudicate on disputes and grievances.

Such a treaty would not take the canal out of Egypt's hands—what can?—but it would serve the essential purpose of ensuring that any future Egyptian transgression there will take place not in the undefined borderland between sovereignty and international law, but on ground plainly demarcated by treaty. But if the users' sights are lowered to this extent, the Canal Company's right—full compensation and a just and orderly settlement—needs more vigorous assertion than the British and French Governments, preoccupied with the wider political menace of President Nasser, have yet given to it. If investment in the under-developed countries is to go on, such rights need to be upheld.

Time, it is often said, is on the Egyptian side in the Suez dispute; but it should be remembered that President Nasser, the young man in a hurry, suffers two heavy disabilities so long as he remains in a state of dispute with the users. He is losing a large part of the canal dues which he had calculated on diverting to his own ends, whether domestic development or military aggrandisement. The users' association should pluck up its courage and see to it, as it can, that no profit reaches Egypt so long as the dispute is unresolved. Further, such military power as he commands is neutralised by the Anglo-French forces in the eastern Mediterranean. What is happening to his aspiration to build the super-state of pan-Arab dreams? His resources are tied up and, now that Jordan is threatened by Israeli pressure and internal disintegration, he is powerless to intervene there by military or economic means. Only one weapon, his political grip on popular feeling in the Arab world, remains as strong as ever.

★

Yet the vacuum in Jordan, the sick man of the moment in the Arab world, offers no cause for British complacency, but merely serves to underline the appalling fragility of the British position in the Middle East. A strong presumption exists that the scheme to move Iraqi troops into Jordan had as its real purpose less the defence of the frontier against Israel than the protection of the Hashemite kingdom against its internal opponents. No doubt the two aims are related, since a state incapable of governing its people is hardly in a position to police its frontiers, either. The Jordan government, however, proved to be too weak or too mistrustful, or both, to agree to the entry of Iraqi troops when the time came a few days ago. If it is so weak now, it is hard to see how it can survive tomorrow's elections unshaken.

Britain's treaty commitments to the Arabs, its failure to stem the adverse flow of Arab feeling, and its dispute with Egypt, have together produced a position in which British action threatens to defeat itself. Iraq, Britain's ally in the Baghdad pact, is not being permitted to fill the vacuum in Jordan. Egypt for the moment is debarred from filling it by the Anglo-Egyptian confrontation over Suez. The British government has felt obliged to reassert its readiness to defend Jordan against Israel, if the Israeli pressure mounts to the point of full aggression. But for how long can Jordan be counted upon as a British ally? Here is a pledge which it would be disastrous to have to fulfil.

Conservative Counter-Attack?

THE most important feature of the Conservative conference was not the middle-class revolt which did not come off—the reasons why it did not are discussed in an article on page 216—but the wide range of policy decisions that were either announced or presaged during it. Too many of us had forgotten before Llandudno that Mr Butler has now been the Conservatives' re-thinker without portfolio for ten months, and that is a long time for Mr Butler to be broody. To an extent that does not seem to have been sufficiently noted, some parts of this brood have now been revealed, both in the ministerial statements from the Pier Pavilion and in Mr. Butler's own remarkable speech at the Conservative Political Centre meeting at Llandudno Town Hall. They suggest that the Conservatives have a new programme of varied parts, and quite specific points. It is a programme that is going to need a lot of discussion—and perhaps in places quite a lot of criticism—in the next few months. But, as a preliminary, let us at least try to unravel what the programme is.

First, Mr Butler told the Conservative Political Centre that the party was "looking again at some of the proposals . . . in our Workers' Charter of 1947"; and next day Mr Macleod uncovered one of these in his proposal for establishing for every wage earner in industry, "if necessary by legislation," a contract of service—which means a right to adequate notice before dismissal ("adequate" being defined according to the length of the particular worker's service to his firm). There need be no argument about the principle of this; it is the normal principle of a good employer. But the immediate aims behind the proposal seem patent: partly to persuade the unions that this year they should concentrate on increased "fringe benefits" rather than on increased wages, and partly to advertise a new Tory political initiative in the trade union field. One has had some hopes that union resistance to the first aim might be decreasing, but (Mr Cousins's party political attitudes being what they are) it is not entirely certain that Tory attachment to the second aim will help.

Secondly, the proposals for freer trade with Europe—although these, it should be noted, are not a Butlerite initiative—are going to play a very large part on the political stage in the next twelve months. Ministers were noticeably cautious at the conference about the form the freer trade arrangements will take: "I hope we shall always reserve power to deal with balance of payments difficulties," said Mr Butler in a pregnant reference to this problem—a reference that served as a reminder of reports that Mr Butler may be afraid that a D-mark problem, in some ways analogous to the familiar dollar problem, may loom ahead for this country. But although Mr Butler—together, possibly, with the Colonial and Commonwealth Relations Offices—does not seem to be in the vanguard of this reform, there is little doubt that the Government intends to go forward with it, and that this will flutter more industrial dovecotes than industry yet realises. Incidentally, the Restrictive Trade Practices Act, which comes into force next month, may be going to cause some fluttering, too.

Thirdly, there were more hints at Llandudno that the Government regards the long-term review of agricultural policy as an exceedingly important affair. Mr Heathcoat-Amory did no more than indicate again his preference for direct grants rather than price guarantees, and his dislike of his "annual wrangles" over prices with the National Farmers' Union—neither of which points is very surprising. But Mr Butler, in his CPC speech, after laying particular emphasis on the value of farmers' co-operatives, said that the Government would like to see farmers manage more of their own affairs. It is to be hoped that this does not mean that the Government is going to encourage the formation of more producers' marketing boards; there were disturbing hints that it might. Another suggestion which has had some airing behind the scenes, however, is that, while Parliament should continue to decide how much it is ready to grant for agricultural subsidies—over, say, a five-year period—some body representative of farmers might be allowed most of the say in allocating it. There is no real indication that the Government is prepared to take this suggestion seriously, and it would of course spell the end of official planning of agriculture's productive effort; but it would be better to let farmers spend their subsidies as they like, rather than allow marketing boards to rig prices as they choose.

★

Fourthly, those old bugbears of the Conservative conscience—excessive expenditure on the nationalised industries and extravagant expenditure on local government—were the subject of several references at the conference. Mr Butler not only laid considerable emphasis on the role of the new select committee on the nationalised industries, but also announced that the Conservative Party was setting up an additional watchdog committee of its own. This sounds rather frightening; if there could be a body worse fitted than the House of Commons to discuss the day-to-day problems of any industry's management, it would be a body wrested from the rumbling bowels of the Conservative party. But the hope must be that the Conservative committee is going to turn its main attention to problems of finance, rather than of expenditure; Mr Macmillan promised last April that the present system of finance, by direct loans from the Exchequer below the line in the budget accounts, will be used for an interim two years only. As for local government, both Mr Butler and Mr Sandys promised that the white paper on its finances will be published before the end of this year; and Mr Sandys's parliamentary secretary said that the true conservative principle was that local

authorities should not only have more direct control over spending in their own field, but also that they should raise more of their own revenue. This could clearly be the presage of a very important change indeed in Britain's financial, and local democratic, system. The Government should be urged to be radical about this.

Fifthly, education attracted more attention at the conference than the bare report of the speeches made there might suggest. Sir David Eccles was allowed only one contribution, replying to a motion about fee-paying schools. But Mr Butler—again, the passage is from his CPC speech—went out of his way to say that, when he had brought in his 1944 Education Act, he had never envisaged that he was "laying down inflexible laws about the date at which children should move irrevocably into one or other of the secondary choices"; he had "always thought that there should be much elasticity of choice and provision for later transfer, at least between the ages of 11 and 13," and had "never minded the idea of experiments in different types of schools." There might be a hint here of a coming Tory attempt to steal at least part of Labour's clothes.

All this is quite a programme. To it must be added such other major measures as Mr Sandys's scheme of rent reform (which was discussed in these columns last week), and the Bill to allow the establishment of betting shops (which was not discussed at Llandudno); together with such slightly lesser measures as the Gower proposals for regulating working conditions in shops and offices ("we shall have to our credit," said Mr Butler, "legislation such as Shaftesbury would be proud of"), and Mr Boyd-Carpenter's promised bill to allow pensioners, at present caught by the earnings rule, to "de-retire" and earn pension increments for subsequent retirement at the age of 70. For later action, too, Ministers laid great emphasis on their determination to tackle the whole problem of compulsory purchase once the Franks Committee has reported; and "at the proper time," said Mr Butler, "we may well have to examine the composition of the House of Lords."

There seems to be enough material here not merely to fill the Queen's Speech that will open the new session in two and a half weeks' time, but also to engage the two other remaining sessions that can be expected in this Parliament. It is evidence that the Conservatives' system of delegating their re-thinking to Mr Butler in private has brought a quicker harvest than Labour's system of delegating its re-thinking to committees producing reports in public. If one reads the signs aright, the real message of Llandudno was not "more Conservatism more quickly," but "more Butlerism more briskly." That could be a good thing for British politics, and a very bracing one for Parliament—and for the Opposition—when MPs reassemble next week.

Burma's Troubles

U BA SWE, the Prime Minister of Burma, has announced that negotiations with China over frontier questions are taking a satisfactory course, and that China has already agreed to withdraw its troops to the frontier defined in 1941. This is good news. Since July, when the Chinese army's incursions drew official representations from Rangoon to Peking, the Burmese have gone through an anxious time. Sao Hkun Hkio, their Foreign Minister, has been to Delhi, and at one time they were reported to be contemplating an appeal to the United Nations. Now, it seems, they may be able to breathe more freely—although China has probably already secured one of its objectives, the diversion of the Burmese army from its pursuit of Than Tun's bands of communist rebels, and there is also concern in Rangoon at the continuing infiltration of Chinese civilians across the border.

But even if the military episode can be considered closed, it remains highly instructive. Throughout, Peking's attitude has been one of indignation about alleged attempts "to create ill-will between the Chinese People's Republic and Burma, in order to inveigle Burma into Seato and to counter the growing neutralist trend in free Asia." It might be supposed by an innocent observer that it was China which was creating the ill-will by its military inroads. The Peking government, however, has firmly taken the line that if the Burmese opposed its claims, and still more if they sought support from other nations, they would be guilty of departing from their "neutral" policy and of showing hostility towards China. This attitude strengthens the suspicion that Peking has been aiming at something more than the mere acquisition of some obscure border areas, and that its real purpose may have been to rock the boat of the present government in Rangoon.

A weak state like Burma, unprotected by alliances, is faced with a difficult dilemma. If the government accepts an armed *fait accompli*, it must lose prestige internally and weaken its position for resisting further encroachments. If, on the other hand, it adopts an attitude of defiance and seeks international support for its stand, it may not be able to rally the full support of the nation for so hazardous a course—particularly if there is already an organised fifth column within the country to advocate "friendship" with the aggressor. If Siam were confronted with such a situation, it would have the support of the Seato alliance; but Burma has chosen the path of neutrality.

Burma would be better able to stand up to external pressure if its own house were in good order. The continuing failure to establish law and order is the first of its difficulties. The government has certainly had considerable success in mastering the various revolts—particularly the insurrection of the Karens—which at one time seemed about to overwhelm it. But it has not succeeded in rounding up the rebels, or even in providing an effective police for the main roads and railways. Much of the guerrilla activity is mere banditry. But there is a hard core of convinced communists in the jungle to give leadership to all the disaffected elements, and they maintain links with their co-partisans in the towns, where the Communist party is illegal but operates through front organisations which the democratic constitution allows to function. This sporadic civil war and simmering revolutionary violence inevitably cause economic distress, which in turn provides more recruits for the guerrilla bands.

The government might have managed to break through the vicious circle of disorder, hardship and more disorder if it had been more successful in economic policy. But it has failed to make efficient use of its resources. In starting on its career as an independent nation in the modern world, Burma had the advantage of being able to export several commodities in demand on the world market—in the first place rice, and additionally oil, teak, tin and tungsten. But these assets have not brought in the plentiful foreign exchange that they should have done, and next to the effects of armed disorder the mismanagement of the export trade in rice has been the most important factor in wrecking the Burmese economy. As a result of a government control of the trade which assumed an indefinite continuation of a sellers' market and paid fixed prices to the growers without regard to the grades and qualities of rice—of which over fifty are distinguished in the Far East—Burma suddenly found itself faced not only with a sharp fall in prices, but also with a quantity of rice on its hands not good enough for sale in the open market.

The remedy found for this catastrophe only raised new problems; it consisted in sale on a barter basis to Russia, which involved not only a Communist political exploitation of this "aid" to Burma, but also the economic disadvantages formerly well known to the customers of Herr Schacht—the necessity of taking in return goods that often either are unsuitable or could be purchased more cheaply elsewhere. The Burmese government is today trying to correct its former mistakes and provide inducements for growers and millers to produce better quality rice—at the beginning of this year even the best mills were producing 25 per cent "brokens"—but it will take time.

The third adverse factor has been a plan of industrialisation which, though it has produced some spectacular new installations, has been hardly at all related to ordinary consumers' needs, and has left the people suffering from chronic shortages of foodstuffs, textiles and other necessities and a continual rise in the cost of living. To neglect consumers' demands in favour of capital projects of no immediate benefit can be highly dangerous for a constitutional government such as that of Burma. Attempts to control prices and ensure fair distribution of scarce commodities have been frustrated by the deficiencies of administration; hoarding, speculation and an extensive black market have defeated the government's intentions; and the opposition parties and fellow-travellers have made the most of the ensuing hardships.

The government party, the Anti-Fascist People's Freedom League—the Burmese equivalent of the Indian Congress party—survived a general election in April, winning 169 out of 250 seats, but the opposition greatly increased its poll. The League's obvious loss of popularity led the former Prime Minister, U Nu, to hand over his office as head of the government to U Ba Swe and devote himself to reform of the party, particularly to cleansing it of corruption. He has now, it seems, decided to give up active politics altogether and concentrate on Buddhist missionary work—he has always been a deeply religious man—to bring about a moral revival of the nation. Meanwhile, the government has to cope with urgent economic problems, which are no easier to solve because they are so largely of its own making, as well as with internal disorder and the manœuvres of its

Knowing Ourselves

The eclipse of the moon on Monday was an object of great interest to many thousands, and, perhaps, millions of persons. The windows and the streets were crowded with eager gazers. It was so in London, so in Brighton, and so probably in every part of the empire and in every part of Europe, Asia, and America wherever the phenomenon was visible. No alarm was felt, but the interest was entirely that of pleased curiosity. . . . In olden times much terror was caused by such phenomena, and terror inspired many strange explanations of them. Now, an accurate knowledge of the cause of the eclipse being widely spread, the event being foretold, and the very minute it was to commence and the very minute it was to cease specified, it was beheld almost universally only with delight . . . The race has now become practically familiar, so as not to be lost in astonishment, with the wonders of their own being—with all the things and laws with which and by which they must act, and their habits will not now . . . be disturbed or interfered with by inquiring into the mysteries of their own existence and of all things around them. The knowledge of the laws followed by the planetary bodies gives, as we are taught by the eclipse, only pleasure; by analogy it may be inferred that the knowledge of all the laws, be they what they may, which regulate man's own existence—and they are obviously part of the laws which give him seed-time and harvest—will also be to him an enduring pleasure. Some deductions in political economy and in metaphysics have been spurned or scoffed at as lowering the assumed dignity of man; but if they be true, like deductions in astronomy, a knowledge of them will only add to the happiness of all. We ought not, therefore, to be deterred by any preconceived notions from following out a principle wherever it justly leads, relying confidently that every prejudice dissipated, whether it concern the heavenly bodies or the existence of man in society, will only increase our welfare and our power.

The Economist
October 18, 1856

mighty neighbour. Its predicament should arouse sympathy abroad among all those who wish well to the Burmese nation. Three years ago, Burma rejected American aid because of the political strings attached, which seemed incompatible with its chosen policy of strict neutrality. But the West would be wise not to seek to drive too hard a bargain in sustaining a weak, but proud, nation which is trying to maintain an independent position on the frontiers of the communist world. Nor is Burma alone involved; its transformation into a People's Democracy would deprive India and Pakistan of the buffer state which now covers their eastern marches. Rangoon is on the way to Dacca, Calcutta and Delhi.

The Bishops' Bench

THE general public does not take a deep interest in its bishops, except when, too seldom perhaps, some member of the bench expresses an unusual view about the Royal Family or teddy boys or divorce. On the whole deans, whether red or gloomy, get much better publicity. Nevertheless, bishops today are a type, and an important type. Although the collection of statistics about them has become quite a hobby, it seems worthwhile to set down some that *The Economist* has collected of its own; they are a sort of extended by-product of a study of the structure of the English nobility, the results of which were set down in these columns on July 21st and 28th.

There are now in this country some 110 men of the rank of bishop in the Church of England. The most senior of these, led by the two Archbishops of Canterbury and York, are forty-one diocesan bishops. They, in turn, may have suffragan bishoprics within their dioceses, and may be supported by assistant bishops: the pattern of rule is feudal, under the sovereign. The suffragans (average age 56, against the diocesan bishops' 61) are often in a line for further preferment; the assistants (average age 69, or higher than the diocesan bishops) have mostly retired from active work, usually work overseas. There are also some retired bishops who are by courtesy still addressed by their titles. Only the arch and diocesan bishops, however, and they only as long as they hold office, are full peers of the realm; the non-diocesan bishops are called "My Lord" merely by courtesy. The two archbishops and the bishops of Winchester, London and Durham sit automatically in the House of Lords, together with the twenty-one diocesan bishops with longest seniority.

The appointment of diocesan bishops is carried out in a way which might seem to a foreigner, according to his bias, a supreme example either of the British genius for muddling through or of the innate hypocrisy of the race. When a bishop dies, the dean and chapter of his cathedral inform the sovereign, and, to quote the "Encyclopædia Britannica":

> A licence under the Great Seal to proceed to the election of a bishop, known as the *congée d'élire*, together with a letter missive containing the name of the Queen's nominee, is thereupon sent to the dean and chapter, who are bound under the penalties of *praemunire* to proceed within twelve days to the election of the person named on it. In the event of their refusing obedience or neglecting to elect, the bishop may be appointed by letters patent under the Great Seal without the form of election.

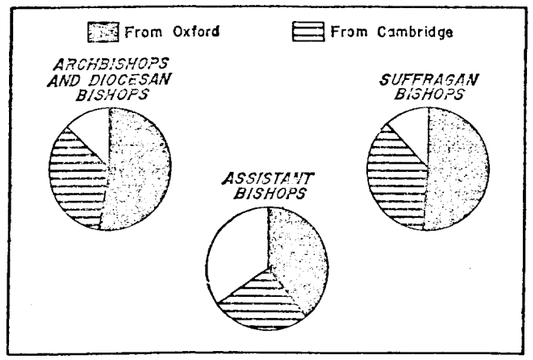
Since the sovereign rarely decides upon her own nominee, and since deans and chapters never "refuse obedience," this is constitutional English for saying that bishops should be appointed by the Prime Minister; in practice, however, during the last twenty years, Prime Ministers are believed to have allowed the job to be devolved. Sir Winston Churchill is known to have been rather uninterested in such other-worldly matters as the appointment of bishops while he was busy with winning the war. When Lord Attlee took over, several Labour intellectuals urged him to drive to democratise the bench; but, remembering the results of the MacDonald Government's essay in democracy when it appointed the present Dean of Canterbury, he was apparently rather loth to do this. It can be presumed that Sir Anthony Eden, thanks to the complication of his divorce, has been more loth still.

In consequence, the task of selecting bishops devolves upon an established civil servant, the Prime Minister's Patronage Secretary; the present holder of this office (Mr D. Stephens) is a former Treasury official, while his predecessor (Sir Anthony Bevir) came up through the Colonial Office. The job is obscure, anachronistic and, one suspects, rather fun. It is known that the former Patronage Secretary, at any rate, spent many Sundays listening incognito to sermons from the back of country churches; and that his entry into the Athenæum during a convocation at Lambeth would cause much rustling of newspapers. Above the sound of that rustling, however, it may be whispered that the Archbishop of Canterbury's personal advice to the Patronage Secretary clearly carries very great weight.

★

What sort of bishops are appointed as a result of this system? The usual answer is "Upper class intellectuals only," and conformers at that. Certainly a study of the reference books confirms that nearly all bishops are the children of those who would not have been too greatly fluttered by the coming of a bishop to tea. To begin with, a very high proportion (45 per cent of the diocesan bishops, 35 per cent of the suffragans and 26 per cent of the assistants) were themselves the sons of clergy. To carry on, the great majority went to a public school; rather interestingly, however, on the present bench Marlborough, Merchant Taylors and Rugby lead the field—with Eton and Harrow contributing only two bishops each. After public school nearly all senior bishops went to one of the older universities; Oxford,

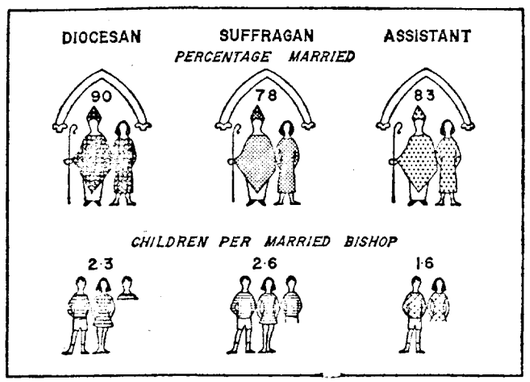
Chart I—Bishops from Oxford and Cambridge



the great seat of conformity, educated 52 per cent of diocesan bishops and Cambridge 35 per cent. (As Chart I shows, however, by no means all assistant bishops were educated there.) In their private lives after university, as Chart II shows, the old influence of the Roman church is still felt in reaction, causing most Protestant clergymen to marry. Among bishops who admit to recreations in "Who's Who," gardening and golf are the eminently respectable leaders, while a few say "former rowing man" or list their achievements in football (rugger, of course).

What of their workaday lives after university? A conspicuous number of bishops (no less than 40 per cent among diocesan bishops, but only 34 per cent of suffragans and 27 per cent of assistants) have been

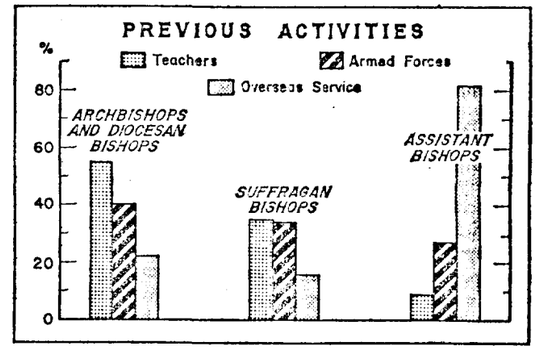
Chart II—Bishops' Mate



officers in the armed forces, either as fighting men or as chaplains: the first world war caught their generation, either before or after ordination, and the extraordinarily high proportion of one-fifth of all present bishops were decorated, either for gallantry or for good service. Probably the most interesting, and perhaps the most disturbing, figure of all, however, emerges from Chart III. This shows that no less than 55 per cent of diocesan bishops (and 34 per cent of suffragans) have spent a large part of their active life as schoolmasters or dons; many of the rest have been chaplains of theological colleges, chaplains to bishops or secretaries of various diocesan boards. Among the assistant bishops, the chart shows, those with university and schoolteaching experience (only 9 per cent) is very much smaller, while only 2 per cent (compared with 20 per cent among diocesan bishops) have been chaplains to bishops and another 2 per cent (compared with 25 per cent) have been chaplains to the Sovereign. The high road to an assistant bishopric lies through the foreign missionary field: 82 per cent of assistant bishops have seen service overseas, compared with 22 per cent of diocesans and 16 per cent of suffragans.

The most common criticisms of the bench, and they may be reinforced by publication of these figures, concern the bishops' method of appointment, their tendency

Chart III—Bishops' Background



to come from a single social stratum, their frequent lack of any widespread day-to-day ministerial experience and their lack for the most part nowadays of distinct or cross-bench opinions. But those who criticise the method of appointment have never really been able to suggest a better one; any change that is required is almost certainly in mood rather than in mechanisms. At first glance, the criticism on grounds of class bias looks better-founded; but those who are acquainted with the sad lack of first-class material that enters the service of the church, apart from material enswathed in the old school tie, say that, on closer examination, the criticism disappears.

There remains the criticism that so many bishops have spent most of their lives in theological work other than parish work. It is only fair to say that those who become dons or administrators are often the cream of the clergy. But the death of Cardinal Griffin showed that the Roman Catholics had a leader who started as a parish priest and whose passing inspired a sense of loss far outside his own church. There is here, one would suggest, a challenge to be faced.

New Blood and Old Guts

The report below is written by our special correspondent who spent last week with the Conservative party at Llandudno.

THE Conservative conference was not after all, in Mr Butler's lovely phrase, "feeding time at the zoo." Perhaps one should have foreseen that there would be no middle-class revolt as soon as one had taken stock of the delegates who assembled at it: nearly half of them women (the welcoming local dignitary got a laugh when he called them the fair sex), shepherded into groups by collie-like constituency agents, most of them stolidly comfortable people and fairly well off. These were not themselves the depressed middle classes, or else they could not have afforded to come to Llandudno; only some of the Young Conservatives and of the (still too few) Conservative trade unionists were getting reimbursement of their expenses—and they only if they asked. The delegations could be divided, reading from right to left, into three groups.

The outside rights at a Tory conference are still mostly the county gentry and the solider suburbanites. It was they who had put down the motions about the middle class—intriguingly, practically all the critical resolutions on the agenda came from south and west England—and they politely clapped those who spoke to their own motions, but not from the bitter heart; it was not themselves they were perfunctorily demonstrating for, but for poor Miss Smith, the children's ex-nannie, who was having a very bad time in retirement—as also was Major Jones, who had only his army pension to live off and was, moreover, a gentleman, which made things worse (Major Jones himself was not at Llandudno; whenever one thought one had found this sympathetic old soldier, he turned out to be a paid constituency agent, and therefore fanatically loyal). Thus, on the receding wave of secondhand enthusiasm, on a reedy salute to absent friends, died the middle-class revolt.

Instead, only three things really moved—one is tempted to use Mr Bill Haley's term "dug"—the outside rights: capital punishment (they wanted more of it), trade unions (they are frightened of them) and nationalisation (they feel by now successfully contemptuous of it). They also booed Mr Yates for being too pro-Nasser in the Suez debate, but booing at that stage seemed almost conventional. If asked if there was anything positive they wanted, the outside rights would say merely that they wanted "to see more guts." This was not a literal demand that they should be present at public executions by disembowelment (although at times in the capital punishment debate, one might have assumed that it was), but something very much vaguer. "Guts," as defined at Llandudno, are any quality which Arabophils and socialists have not got, but which must always be applauded when shown in speeches by "fine young fellows" (i.e., right-wing young or pseudo-young Conservatives, such as Mr Anthony Nutting). This is not the specific stuff of which successful revolts are made. So much for the outside rights.

The inside rights—the more carefully deliberate pressure groups—could conceivably be more dangerously effective, although one came away from Llandudno increasingly doubting it. For it is a dwindling band of people who come to Conservative conferences in specific defence of their interests, as distinct from the large number who still come in instinctive defence of their class. The active pressure groups are now represented almost solely by the farmers, the cotton people and a handful of other industrialists. The farmers put on their usual show; they held out their begging bowls, and some completely invented statistics, with a bland constancy which anybody who is not irritated by truly imperious log-rolling must eventually come to admire. But the cotton and other protection-minded industrialists had a bad time at this conference. Their first spokesman called again for the resignation of Mr Thorneycroft, and was loudly applauded by only one man—and that was a grinning Mr Thorneycroft himself. They launched a few isolated attacks on the idea of more competition through freer trade from Europe, and whenever they said that this meant they were speaking in defence of the Empire some outside rights gave them polite applause; but as these same outside rights also applauded Mr Macmillan when he said precisely the opposite, not very much can be deduced from this exchange. One's only fear is that the inside rights might have more power in the running and financing of constituency organisations than they do at the conference; indeed they must have, for at Llandudno they seemed to exert no influence at all.

★

There remains, in sharp and welcome distinction, the third group of delegates, whom one had called Butlerites up to 1954 and who after Llandudno must be called Butlerites again. These were not necessarily Young Conservatives; indeed as a very rough generalisation, although the university or ex-university Young Conservatives are Butlerite, their non-university contemporaries tend to be non-Butlerite—but usually look as if they could be trained. Much more interesting, however, is the increasing flock of efficient and knowledgeable middle-aged women who—Labour can laugh at this point only at its peril—have quite clearly joined the Conservative party as a form of social service. There was a revealing incident on the last day, when a savage and silly little motion was moved calling for much stricter penalties in cases of cruelty to children; the outside rights thumped their conventional applause—apparently in happy envisagement of seeing some of the cruel parents' guts. Then a brisk and admirable middle-aged woman strode to the rostrum, totally unequipped with notes, a Reigate constituency badge flapping from her lapel. Did the conference know its facts about the law, she asked? Did it really think it would be in the interests of a child to say that it should be mandatory on a court to send his cruel father or mother to a long term in prison—and leave him in a home bereft of its breadwinner or else with the sort of father who had permitted a mother to be cruel? Did it not know that in the cases of leniency cited there would be follow-up supervision in the child's home? "Hear-hear," said the Reigate lady's images in the audience, leaning eagerly forward with their badges flapping in unison on their bosoms; and one suddenly realised that there really were quite a lot of these sensible people about. "Interesting woman," said the astonished outside rights to one another, "she's got some points there, I suppose." In the end the cruelty motion was carried, but only by a very small majority.

It was the Reigate lady's images who made up the major part of the audience at Mr Butler's Conservative Political Centre meeting on the Thursday. This was a memorable affair, several hundred people crushed into a hall several times too small for them, and drinking deep from the re-ordained fount of the new intellectual Conservatism. Mr Butler, among his own folk, did not let them down; indeed he gave them their motto:

> We must not encourage a Conservative Users' Association. People must not be led to suppose that they can simply use the Conservative party for their own ends. . . . The politician should not spend his time cajoling in the light of candelabra.

And his devotees shrilled their applause. One wondered what the outside rights, and still more the inside rights, at the main conference would have made of all this; for them, joining a party for what one can get out of it is what they have always thought politics to be mainly about.

★

Such, then, is the fairest impressionistic account one can give of these varied Tory stalwarts, whom one had come down to see in what was supposed to be the revolt of Llandudno. Three main impressions emerge. First, although the outside rights remain in a majority at the conference, they are mostly of the easily unfanatical type of which revolts are simply not made. Indeed, except when they undressed their embarrassing subconsciouses in the debate on capital punishment, the outside rights were not even repellent. At bottom, these large country ladies and their squires are the sort of people who find it easier to be polite, rather than rude, to either a politician or a waiter.

Secondly, the social service type of Tory is now a much commoner animal than would have been believed possible ten years ago, or than Labour believes now. The major development of this year's conference is that this group has re-assembled, as it was assembled before 1952, under the undisputed intellectual leadership of an extraordinarily revitalised Mr Butler. Mr Butler re-emerges without question as the Queen's second Minister. But he is not challenging Sir Anthony Eden in his present office. The ordinary Tory's devotion to the *Führerprinzip* ensures that; and although Mr Butler himself is an extraordinary Tory rather than an ordinary one, he is a politician versed in the art of the possible. His devotees may build a new engine for the boat, but they will not rock it.

Thirdly, although rumoured discontents in the constituencies have failed to shake party policy, they might still weaken party organisation; it must be remembered that the Miss Smiths and Major Joneses, who stayed away from the polls at Tonbridge, also kept away from the conference. But, here again, even if the party should lose some of the eager services of these former vote-canvassers, its organisation remains much more impressive than Labour's; look, first, at the efficiency of its constituency agents, and, secondly, at its army of Young Conservatives—for whom there is now to be a new recruiting drive. All told, therefore, the Tories can leave Llandudno fairly happy with the state of things in their party. This is not to say, of course, that they can yet be happy with the state of their party in the country; those on show at Llandudno were representatives merely of the thousands who actively work for the party, and there may have been much more serious changes of view and allegiance on the vital fringes of the millions who in 1955 less actively voted for it. But on the activists, this report can be clear. The Conservative party is a party of new blood as well as of old guts. At Llandudno, against forecast, we saw the new blood coursing.

Notes of the Week

Firing Blank

THE fall of Herr Blank and his replacement by Herr Strauss, lately Minister for Atomic Affairs, is the most spectacular of the changes which Dr Adenauer has made in his cabinet. Herr Blank, who was originally appointed to give the new German army as unmilitary a flavour as possible, has used up his political credit in fighting for Dr Adenauer's policies. As Minister he has come to be associated with a policy—the speedy raising of a large conscript army armed with existing conventional weapons—which seems to have been rendered obsolete by the changing methods of war which the great powers are adopting. Critics in Germany, first from the opposition and then from men like Herr Strauss within the coalition itself, have been putting growing pressure on Dr Adenauer to change course and develop a new style German army, smaller than at first planned, mobile, and armed with atomic weapons. And their immediate charges, that Herr Blank is ordering obsolete equipment and cannot in practice fulfil the recruiting schedule he had planned, have rung more and more true in recent months. Dr Adenauer's decision to fix the term of conscription at a year instead of eighteen months was a first major concession to the critics; the sacrifice of Herr Blank is a second. It has been accompanied by an admission by the Chancellor that the Federal Republic will not be able to keep up with its original rearmament timetable.

The cabinet shuffle has also involved the departure of two of the four ministers from the Free People's Party. The presence of four national liberals in the cabinet has had little political justification ever since the bulk of their former party, the Free Democrats, withdrew its support from the

coalition. It has irritated other coalition parties, above all the Bavarian CSU, which was less strongly represented despite its greater parliamentary strength. The departure of the liberals has removed this sore ; the CSU should now be well satisfied, for it holds two key ministries, Defence and Finance, as well as the less important posts of Atomic Affairs and Family Affairs.

Dr Adenauer, however, did not carry out one vital change which was expected, the replacement of Herr Blücher, the liberal Vice-Chancellor, by a Christian Democrat. (Herr Von Brentano had been thought a likely choice.) Once more the Chancellor has avoided any gesture which might seem to designate a successor.

The changes, too, while they strengthen the cabinet for business purposes, may weaken the CDU politically in one sense. The dropping of the trade unionist Herr Blank is resented by the Christian trade unionist groups, even though Herr Storch and Herr Kaiser remain in office as representatives of the Christian left. Nor has any political compensation, like the rumoured offer of the vice-chancellorship to Herr Arnold, been given. The cabinet in fact has moved further to the right and has shrunk back upon its conservative catholic core. This is not a development which seems likely to attract the marginal voter next year and it may encourage still further the tendency of the Christian left to form round Herr Arnold an " opposition " to the Chancellor.

A Douche for the Wages Ferment

WHAT are the hopes that this year's round of wage claims can be diverted into an acceptable round of claims for increased " fringe benefits " instead ? The mineworkers are to meet the Coal Board next week to discuss such benefits—bonus schemes, incentive plans, pensions, and security schemes ; the Boilermakers' Society is working on similar plans. But the most interesting news on the wages front this week, of course, has been the progress—or rather lack of it—of the railwaymen's claim. It was always inevitable that the National Union of Railwaymen would issue their usual annual demand, and for a rise of at least 10 per cent ; the separate footplatemen's union had already put in a claim for 15 per cent, and the NUR's obvious tactics were to portray themselves as slightly more " realistic," but certainly no less militant, than their colleagues and rivals. The question on Wednesday was whether the Transport Salaried Staffs' Association—that is, the railway clerks' union—would join with the NUR. Last year the railway clerks began by saying that stable prices were more important than rising wages, but they joined with the other unions in the end. This time they have made a courageous declaration of independence. Their general secretary walked out of his meeting with the NUR on Wednesday, saying that he did not think that the present moment was opportune for making a claim.

It remains to be seen how far this douche of economic common sense will help to damp the wages ferment, which has already suffered some damping in the past few weeks. Probably, it would be unwise to be too optimistic. For the unions are at present waiting for a bell-wether. The railway claim will not be that bell-wether ; both on it and on some of the other claims that have been in the news—such as the long-standing engineering claim and the new demand of the building workers for an extra fourpence an hour—it now seems likely that it will be January before the employers and workers finally fail to agree. Long before that, the result will have been announced of arbitration on the busworkers' claims, and perhaps the whole wages pattern for this year will have been set by what the busworkers get.

—But By Bus Off the Fringes?

THE bus claims, which are now about to move into the centre of the wages spotlight, fall into three groups: municipal bus workers, provincial bus company workers, and London Transport employees. Although it is the provincial claim that has been in the news this week (because it has just been formally submitted), the most advanced—and therefore the most immediately important—of the three claims is that of the municipal workers. Having gone through the regular chain of disagreement and been rejected by the industry's Joint Industrial Council, it is due to be heard before the Industrial Disputes Tribunal on October 26th. The municipal bus workers are claiming increases of between 9s. and 18s. for drivers and conductors, and between 19s. and 25s. 3d. for maintenance men. They will not, of course, get them. But since their last increase, dated November, 1955, the index of retail prices has risen by 4.7 per cent, representing a cash value in their wages of 7s. 5d. They seem to be confident that the tribunal will award them an increase of at least this amount, and that the men on London Transport and in the provincial companies will then get about the same. They may well be right. Some of the bus employers are not resisting very strongly—on the good economic grounds that they need to attract more drivers.

A last minute effort is being made by some bus employers to find an incentive or bonus scheme that the tribunal might be persuaded to recommend in place of a straight wage increase ; there is an incentive scheme in operation in Manchester, which London Transport is known to have its eye on. But the employers are up against the perennial problem of the unpredictability and frequent immobility of city traffic, which is no fault of the bus workers. They would be delighted to improve productivity by rewards for efficiency (probably on a basis of the collective efficiency of the garages), but they have not been able to suggest any scheme that would not seem unfair in some way. The municipal employers have now only a week in which to find one.

Parliament's First Business

PARLIAMENT reassembles on Tuesday of next week, will be prorogued some time in the week after, and the new session is to be opened with the Queen's Speech on Tuesday, November 6th. Just before the House rose in the summer, Mr Gaitskell asked that these last two weeks of the session should include not only the usual tag-end debate on the nationalised industries, but also (rather hopefully) a full scale debate on defence. Next week's business, however, will be wholly concerned with clearing away the dying session's few remaining legislative leftovers. The most important and time-consuming of these will be the report and third reading stage of the Copyright Bill.

This bill has been fairly exhaustively discussed in *The Economist*. It started out as a depressingly restrictive measure, but during its long, slow crawl through both Houses has had many—though not all—of its worst blemishes removed. The realistic thing for liberals to decide upon at this stage, and after all the argument, is that there is not much hope of doing anything now to make the bill any better. The job for this week is to help resist last-minute attempts to make it worse. The most important battlefield is likely to be the one that *The Economist* has found itself fighting over all along: it arises from the failure of some people to appreciate that copyright restrictions on widespread enjoyment of a mechanical reproduction are a much less desirable thing than copyright protection of an original work.

The most powerful of the last-minute attempts to confuse this issue has come, with a long letter to *The Times* and a flurry of other communications to the press, from a distinguished group of composers and lyric writers. They ask in their letter to *The Times* for three changes. First, they oppose one of the anti-monopoly clauses in the bill, which says that once an author has allowed one record manufacturer to record his work, he must allow others to do so ; since these manufacturers still have to pay the proper royalty stamp for every record sold, why not ? Secondly, they oppose the right given to the BBC and other broadcasting organisations to make an " ephemeral " record of a work, without incurring a separate recording fee, subject to destroying this record within 28 days ; this provision is merely a sensible recognition of the fact that broadcasting artistes are often not available at a time when broadcasts can best be made. Thirdly, the composers feel they are entitled to a separate fee from broadcast relay services, which merely transmit to their customers broadcasts made (and paid for) by other people ; it is very difficult to understand their case here. The protesting composers, led by the Master of the Queen's Music, are an august and authoritative body. But Parliament and the Government, which have done quite a lot between them to make an originally bad bill very much better, would be wise to round off this story by standing firm.

China's Turbulent Doorstep

MR CHOU EN-LAI'S strictures on the Hongkong riots contained an ominous undertone. The Chinese premier told correspondents that his government could "not allow such disorders on the doorstep of China." Does this remark, together with his criticisms of the manner in which the situation was handled by the Hongkong authorities, amount to a lapse from the third of the famous " five principles "—non-interference in the internal affairs of other countries ? Mr Chou also protested to the British *chargé d'affaires* in Peking, Mr O'Neill. The British reply implicitly conceded that the Chinese premier was within his rights in protesting, on the ground that the lives of Chinese nationals were endangered by the rioting, which was apparently engineered by Chinese Nationalists. On the other hand, the reply rejected the Chinese criticism of the way the situation was handled by the local authorities.

It is difficult to see what else the government could say, but an article from our Hongkong correspondent on page 250 suggests that the authorities were in fact caught napping, in the absence of the governor, Sir Alexander Grantham. The drastic measures he has now taken—including the arrest of six thousand Chinese—will no doubt restore law and order in the overcrowded colony, for a time at least. Of those arrested, only one in four was a suspected rioter ; the others are charged with curfew-breaking. All are being cleared through the courts at commendable speed and fined or gaoled according to the offence. So far, fewer than three per cent have been found not guilty. But it is clear that Sir Alexander cannot entirely meet Mr Chou's basic grievance (as expressed in his remarks to correspondents) by banning all political activities by the Nationalists.

The future now seems to depend on Sir Alexander's success in preventing rival groups of Chinese from flying at each other's throats or running amok. If he is successful—and the job is far from easy—no more may be heard of Peking's latest protests than of those made in the Chinese press nearly two years ago after strikes and disturbances attributed to the Nationalists. But in the long run, China's continued acquiescence in the British presence in Hongkong will depend on whether the indirect commercial and other benefits it brings are considered to outweigh its disadvantages as a centre of Nationalist—and American—influence.

Cold Comfort for Singapore

THE contrast between Mr Chou En-lai's protest to Mr O'Neill and his soothing remarks to Mr David Marshall, former chief minister of Singapore, is striking. The Chinese premier told Mr Marshall, who has been visiting Peking, that in his government's view the Chinese living in Singapore should be able, if they wished, to surrender Chinese nationality and assume Singapore citizenship after the colony had achieved independence. The formula suggested is much the same as that which formed the basis of the Sino-Indonesian treaty on dual nationality signed in Bandoeng in April, 1955. It suggests that China's policy is now to conclude similar treaties with all the Far Eastern countries that have substantial Chinese minorities.

Different assumptions underlie Mr Chou's statements to Mr O'Neill and to Mr Marshall. In protesting to the British *chargé d'affaires* in Peking, Mr Chou, in effect, reiterated China's general claim that the activities of Chinese Nationalists everywhere are a matter of concern to Peking. In reassuring Mr Marshall, Mr Chou seemed to be saying that any Chinese who took on Singapore (or, by implication, Malayan) citizenship would automatically pass outside China's sphere of interest.

This is a proposition beguiling to territories on the verge of independence, but it would be as well to consider its probable purpose. Only three communist rebellions of consequence persist in Asia—those in Burma, Malaya and the Philippines—and in all three cases, the rebels are fighting a losing battle. Peking is no longer disposed to help them, even with words, but in line with world communist policy, is doing everything it can to ensure that the rebels are taken back into the normal political life of their respective countries, where they can now do most damage. In this context, it is desirable that as many Chinese as possible should be given citizenship in the Federation of Malaya and in Singapore, for to be without citizenship is to be deprived of the vote. That is why the letter sent to the recent Chinese Communist Party congress by the nominal head of the Malayan Communist Party, Musa bin Ahmad, will probably bring no comfort to the remnants of its terrorist movement in the jungle. The Malayan Communists may not, as the chief minister, Tengku Abdul Rahman, claimed a fortnight ago, be on the point of surrendering, but it is clear that no alternative is in sight for them.

Hungarians To and Fro

The East European communists who are now making pilgrimage to Belgrade must be finding it something of an ordeal. The Jugoslavs apparently scarcely troubled to conceal their disapproval of the Bulgarians. But the Hungarians who arrived in Belgrade last Monday have been doing their best to mollify their hosts. After the reburial of Rajk and the arrest of the former defence minister, Mihaly Farkas, on a charge of gravely "violating socialist legality," comes the decision to re-admit the former premier, Mr Imre Nagy, to the party. The Jugoslavs have been openly pressing for this. Mr Nagy rejected suggestions that he should buy back his membership card at the price of an abject apology for his "mistakes." Now the Hungarian Politburo has evolved a formula which somewhat saves its own face but in effect allows Mr Nagy to rejoin the party with his flag flying.

In the Hungarian press and on the radio these steps have been accompanied by sudden fulsome praise of all things Jugoslav (so much, it seems, for the famous Soviet warning against the Jugoslav example), by nice remarks about Mr Nagy, and by a brisk barrage against Mr Rakosi, whose name is being rapidly torn down from street corners and factory entrances. It is bluntly stated that he did not resign as party first secretary, but was told to go; and he is being blamed often openly, sometimes by implication, for the treatment of Mr Nagy, for the excesses of the political police, and for much else. But whether Mr Rakosi will actually be brought to trial is doubtful. One Hungarian newspaper has divulged that he has left the country, and it added that "our party and our people would not have it otherwise"—which may indicate that the present leaders fear they might burn their own fingers if they brought Rakosi to trial.

Of more practical importance is the future of Mr Nagy. Will Mr Gerö, the present party boss, who is well tarred with the Stalinist brush, feel compelled to make him premier again? And if so, will he give him a free hand, or will he try to keep him merely as a figurehead and a sop to the reformers? Mr Nagy's return to office would certainly be popular in Belgrade and, much more important, in his own country. Since he fell from office in February 1955 his reputation as a "liberal"—whether deserved or not—has given him a kind of retrospective glory. He was clapped when he went to the opera, and on his sixtieth birthday last June he was visited by over seventy people, including several cabinet ministers, and even by a leading Soviet politician, Mr Suslov. The Russians are believed to have protected Mr Nagy from Rakosi's wrath, and might not be unwilling to see him in office again. A bleak economic outlook—in particular, a serious fuel crisis—on the threshold of winter could be a further argument in favour of reinstating a man who has gained a reputation as the advocate of a better deal for the common people.

Scot in Scott's Chair

The British newspaper of best repute in the world is the *Manchester Guardian*, and for a dozen years or more the *Manchester Guardian* has been Mr A. P. Wadsworth, its editor. Now, because of illness, he passes as editor emeritus to what may be called (though he would say perish the thought) the paper's House of Lords. For the first time C. P. Scott's famous editorial chair goes to a young man, Mr Alastair Hetherington, who was not one of Scott's own colleagues. Here is one more example of the cross-breeding that keeps the best journalism still lively, and successful, in these days of mass newspapers. Mr Hetherington came to Manchester six years ago from the proving ground of the *Glasgow Herald*, which has sent so many good journalists south of the border; and he takes charge of the newspaper which more than any other has fertilised the upper reaches of journalism—from London (not excluding Printing House Square) to Sydney and Winnipeg—with its products.

Wadsworth's *Guardian*, in fact, has lived by losing its best men, and has more than doubled its sales in the process. It could do that because the best of them all, as practitioner and teacher, with a generation of characteristic writing and reporting for the paper behind him, was the editor himself. His sad abdication now may close a long chapter, but there need be no lapse in the new one. A great working journalist, "A. P." has done much more than just carry on the legend of C. P. Scott; in his own empirical and pragmatic fashion, he has put the paper into modern dress, not only typographically, and given it a forward look; and, although he would disclaim it puncturingly, the tradition he hands on is his own. The *Guardian* stands independent of everything an independent newspaper should be independent of—and independent, too, of the more constricting kinds of collective efficiency. Journalism at Cross Street is a day-to-day craft, with none of the pretence and pomposity that lurk round the corner in newspaper offices. Stubbornly liberal always (the big "L" has gone), the *Guardian* has ideas without an ideology, principles without being doctrinaire, strong views without intolerance. In all matters it backs its fancy (except on the racecourse), and believes that what is written should be written well. It is the mirror, in its virtues and its limitations alike, of the civilised—and impatient—common sense of the rare individualist who is now retiring. May it stay itself, with whatever reinforcement Mr Hetherington and his team of colleagues can now bring, for the good of all journalism. And may it, as the circle of *Guardian* readers grows, never lose its Manchester accent.

Broadcasting's Purse Strings

Two warnings were contained in the tart rejoinder which the Director-General of the BBC made this week to the Public Accounts Committee: the one on which he was explicit, and one that was implicit in the rest of his speech. Sir Ian Jacob's explicit point was that the committee's recent report, "in which they said that they did not think it right that the corporation should build up any kind of reserve," was indicative of a desire "to put the BBC into the position of a Government department, not operating as an independent corporation, but subject to the usual Treasury control." Sir Ian was right to insist that any such arrangement would "go far to destroy the BBC's independence." That should be agreed both by those who hold Sir Ian's orthodox views about broadcasting finance, and those who would prefer the system that has often been proposed in *The Economist*: namely that several corporations should be able to draw on the pool provided by licence fees, that each should also derive some revenue from advertising, and that there should be as much competition as possible between them. However many corporations there are, and under whatever system of finance, it is important that they should be allowed to retain themselves any money that they do not spend.

From this high point of principle, however, Sir Ian descended to the low realities of finance. He said that the BBC's accumulated cash reserve, £3¾ million on March 31st last, is, in any event, likely to disappear by March, 1957. He based this forecast not on any rising trend of capital expenditure (this is being pegged at £5 million a year), but on an expected rise in current costs—"salaries and wages, artists, sport, power and fuel, and all the many materials that go to the running of a national organisation." Not everybody would agree to the inevitability of Sir Ian's estimates; but clearly, if the BBC thinks its reserves may be taken away from it, it will have every incentive to spend sufficiently voraciously to make them come true. Idle reserves held by the BBC are just as useful from the taxpayer's point of view as idle reserves swept into the Treasury's maw. Since the Government plainly does not intend any early reform of the whole structure of broadcasting finance, its best course now is clear: it should take the first opportunity after the re-assembly of Parliament to say that the views of the Public Accounts Committee get no support from it whatever.

Shopkeepers in Rust and Blue

Delegates both at Blackpool and at Llandudno were notified by a distribution of leaflets, strikingly entitled SOS (for Save Our Shops), that the National Union of Small Shopkeepers is not happy. At Blackpool, the leaflet was printed in rust-colour—not quite red, but near enough to inspire a conditional hope of support—and handed out by pickets dressed as lifeboatmen. At Llandudno the letters—handed out by "mourners" in traditional funeral dress—were true blue, suggesting an appeal to traditional loyalty. Further differences appeared in the actual letterpress; no prizes are offered for a correct attribution, to rust-colour or blue, of the following excerpts:

(1) ". . . It is only the small business which is being 'squeezed.' The 'Big Boys' of the business world are well protected."

(2) "Twenty-five thousand small shopkeepers are leaving the retail distributive trade yearly because of irksome restrictions."

(3) "The National Union of Small Shopkeepers strongly repudiates the 'parrot cry' that the small shop is an uneconomic unit in distribution. Take heed of the fact that claims of this nature receive subtle 'behind the scenes' support from powerful business interests who dearly want a straight fight between the Multiple Chain Store Organisations and the Co-operative Movement."

(4) "The Town and Country Planning policy . . . is responsible for the 'closing down' of hundreds of little shops."

Other complaints are fairly interchangeable. On new estates, shop tenancies pass almost automatically into the hands of the highest bidder—apparently a shocking thing; "real" protection is needed against rent increases by grasping landlords; there should be no interference with the tenant shopkeeper's right to dispose of his business as he pleases on leaving; and, of course, the new rating assessments are an abomination in any colour, rust or blue. Behind the choice of bogies—compulsory purchase orders or sinister and venal economists, Big Business, grasping landlords, or the credit squeeze—there subsists a single idea: once anyone anywhere has acquired a shop it is the duty of society to keep him in it.

Solidarity is no doubt a great thing. So, however, is ability to see beyond the end of one's nose. For the well-sited, well-run, and appropriately stocked small shop, even the most absurdly cupboard-sized, there will always be a place; its handiness and friendliness are proof against any competition by remote impersonal emporia. But the vast weakly swarm of ill-sited, ill-run, ill-stocked small shops, existing, on a regime of price maintenance and privileged tenancies, in what doctors call a state of medicated survival, can and does infect the potentially thriving and sturdy small enterprise with its own debility. The compilers of the SOS leaflets should take a trip to France, where these matters are ordered even worse; but their style hardly indicates that they would profit by the lesson.

Frenchmen and Radicals

This week's review of the government's policy in the French National Assembly has amounted to nothing beyond the ventilation of grievances over the disillusions of the last few weeks. The conservatives reproached M. Mollet with having failed to follow up its sabre-rattling against Egypt with action. The Communists blamed him for using Suez as yet another pretext for inaction in Algeria. But most of the critics were disinclined to apply the ultimate

sanction of voting against the government, and tacitly expressed themselves as resigned to M. Mollet's continuance in office. The ministers, like tired conjurers, keep on repeating: wait, the trick will come off. The spectators no longer believe, but keep up the pretence of being under the spell.

More significant was the Radical Party congress which ended its stormy debates earlier in the week at Lyons. This was the occasion for M. Mendès-France to reassert his hold of the party machine. The operation was not painless ; it involved the confirmation of M. Edgar Faure's expulsion and the breakaway of an important faction. The schism had been inevitable from the moment last year when M. Mendès-France set out to transform the old Radical club into a disciplined political party. The general elections had only postponed it.

M. Mendès-France finds himself at the head of a more dynamic, if somewhat reduced, political force. But even he does not seem to know exactly where he wants to lead his troops. He has resigned from the government over the handling of the Algerian situation, yet is unwilling to help in bringing the government down. He has now openly proclaimed that the policy of force in Algeria is simply "nonsensical," but is not very explicit about what should actually be done. A curious paralysing muddle seems to surround French thinking on Algeria at this stage. It is generally agreed that to impose a statute, however good, will no longer serve much purpose. Few people outside the Communist camp, however, are willing to proclaim the only logical alternative: that it is necessary to negotiate one.

The Relief of Birmingham

THE idea that a new town should be speedily built somewhere in the West Midlands is gaining ground. This week a conference at Birmingham, attended by more than 70 local authorities and a number of industrialists, gave general support for the project ; they also agreed

The Fall and Rise of Comrade Gomulka

THREE years after Stalin's death the time has come in Eastern Europe for the rehabilitation of his victims. It reached a gruesome climax recently with the solemn re-interment in Budapest of the bodies of Rajk and those who were hanged with him. Yet almost everywhere the laurels are for dead men. The only one to have survived and to be able now to reclaim a position of power is Wladyslaw Gomulka, once general secretary of the Polish communist party. For four years he had sat in jail awaiting a fate similar to Rajk's or Kostov's ; for three more, after Stalin's death, he bided his time. Now his hour has struck. The meeting of the party's central committee this weekend in Warsaw seems merely a prelude to his triumphant return to the summit of power. Who is this man who had the courage to resist and the miraculous luck to survive?

Mr Gomulka's second coming is certainly more sensational than was his original climb to power, which was indirectly assisted by Stalin. But for the massacre of the Polish communist élite in Russia, he might have remained one of those obscure but devoted members—at most a regional secretary—who wore themselves out in an illegal and persecuted party. Born in 1905 in a small town of Eastern Galicia, he had his first taste of prison in his early twenties, and until the war his life followed the routine of the "activist," alternating between jail and party or trade union work in the provinces. His chance came during the German occupation. The Polish Communist Party, disbanded by Stalin, was resurrected in 1942 under the name of the Polish Workers' Party. Hunted by the Germans and persecuted by the London-controlled resistance movement, it had a tough assignment. Its first two secretaries had been killed when Mr Gomulka —or "Comrade Wieslaw" as he was then known—took over. He gained the reputation of a ruthless organiser and he won fame when his men threw bombs at Germans sitting in a café in the centre of Warsaw.

The Lublin government was brought to Poland in the baggage of the Red Army. At the time of its arrival, it was Stalin himself who was talking of "avoiding Russia's mistakes" and of each country's own road to socialism. Those among the Polish communists who had been in Russia may have been sceptical, but the "innocent" Gomulka, who had spent the war years in Poland, took the words at their face value, and felt in his element during the first nationalist phase in Eastern Europe. Indeed, he then earned the nickname of "little Stalin." Firmly believing in the idea of revolution from above, he presided over the phoney postwar elections, crushed Mikolajczyk's Peasant Party and treated other parties as satellites. He was no orator or theoretician, but a determined organiser capable of choosing his men well. He presided over the resettling of Poles in the formerly German territories ; he entrusted General Spychalski with the reorganisation of the army, and brooded with the now disgraced Mr Minc over economic plans.

Then came the cold war, Marshall Aid and the break with Marshal Tito. Only the naïve Gomulka apparently did not realise that the nationalist phase was over. He may have thought at first that the Tsar of Moscow was misinformed. When wiser, or more cynical, men bowed to the inevitable, he refused to go to Bucharest for the Cominform meeting that impeached Tito. Words of repentance apparently had to be "dragged from his throat" and generally he behaved as if unaware what fate the party reserved for heretics. He rapidly found himself almost alone ; at a dramatic meeting of the central committee in 1948 he found that even Mr Minc and the present Prime Minister, Mr Cyrankiewicz, had deserted him.

The sequel was most curious. The very men who had publicly denounced Gomulka and "Gomulkovism" shielded the man from Moscow's demands for a trial. They did not want to start a chain-reaction which might consume them all. It was this passive resistance by his apparent enemies rather than his own personal courage that saved his head. But Moscow remained insistent, and at the time of Stalin's death the stage was already set for another ghastly trial. Stalin's departure meant freedom for Gomulka. Physically broken, bitter, he stubbornly refused to be readmitted into the party through the back door. It took the Moscow congress last February and the Poznan riots in June to convince the Polish communists that they needed the cloak of his popularity to cover their tarnished record.

What plans, beyond those of personal revenge, did this man of action rather than thought evolve in the well of loneliness? His proud nationalism must have been strengthened, but how will his views about strong communist discipline fit into his new surroundings? In assessing the outlook for the man often dubbed the Polish Tito, it must be remembered that the Polish regime, unlike the Jugoslav, is still ultimately dependent on the Red Army's bayonets.

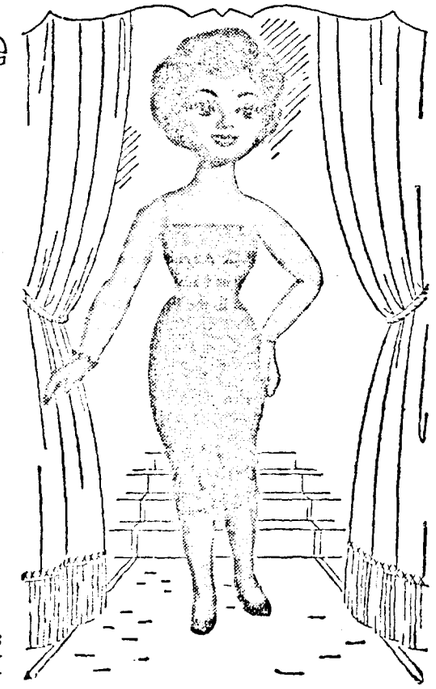
DAISEE JUTE presents the two-way stretch



WHO SAYS jute can't make news? Look at this: it's revolutionary. Hessian (that's jute) sewn on the bias to form a tube with a two-way stretch. Now when manufacturers want to package things like carpets, linoleum, blankets, they draw the tube straight on to the product, cut it to the required length, and tie both ends. The hessian clings to whatever's inside it. And packaging becomes that much quicker, neater, more efficient and cheaper.

And jute doesn't only wrap things up. It ties them up (it's twine and cord and rope). It backs them up (look at the back of your carpets and lino). It lines shoes and stiffens the shoulders of suits. And of course it makes the vital, unsung sack.

Wonderful stuff, jute. We'd be lost without it.

JUTE INDUSTRIES LTD.

There may be an application of jute to your business. Why not write to us:—

—makers of jute bags and sacks ; twines, cords and ropes ; yarns for woven carpets ; cloth for tufted carpets and needlefelts, for backing linoleum, for tarpaulins ; roofing felt, damp-courses and plasterers' scrim ; webbing ; and cotton belting.

JUTE INDUSTRIES LIMITED, MEADOW PLACE BUILDINGS, DUNDEE.

7. In the transactions of agricultural non-credit societies there was a very appreciable increase. The purchase and sale societies bought goods to the value of Rs. 3,69,444 and sold goods, for Rs. 17,03,884 as against Rs. 2,95,227 and Rs. 4,69,486 respectively in the previous year. The Government have been providing staff wherever necessary for the supervision of this class of societies in their initial stages, and look forward to a considerable improvement in the condition of agriculturists through the efforts of these societies in the marketing of their produce.

8. There was further progress in the transactions of the Central Land Mortgage Bank. It issued, during the year, debentures to the extent of Rs. 28,72,800 against Rs. 24,79,500 in 1933-34. In accordance with its policy of converting high interest bearing debentures into ones carrying a lower rate of interest, the bank converted debentures of a total value of Rs. 10,83,200 and the benefit of the reduction in the rate of interest on debentures was passed on to the ultimate borrowers in the primary banks. Funds are now made available to them at 6 per cent interest. The working of the primary land mortgage banks also showed an improvement, and the utility of these institutions in the redemption of prior debts is being increasingly realized by agriculturists. Twelve new banks were registered during the year and there are now banks in all the districts of the Presidency, except Chittoor, South Kanara, Malabar and the Nilgiris. During the year, the banks granted loans to the extent of Rs. 20·57 lakhs as against Rs. 14·73 lakhs in the preceding year. Thirty-eight banks made a profit of Rs. 52,942 and the rest incurred a loss of Rs. 17,067 during the year against a profit of Rs. 12,839 made by some banks and a loss of Rs. 24,089 incurred by others in the year previous. There was an improvement in the collections made by the banks from members, the percentage of arrears under principal and interest at the end of the year being 36·89 and 6·51 respectively against 47·68 and 12·84. The Government note with interest that these banks have already been taking steps to compound informally the debts of their members with their creditors, and that in 143 cases a total original debt standing at Rs. 3,68,889 was scaled down by Rs. 38,191 before the banks discharged it completely.

9. The working of weavers' societies, however, cannot be said to be satisfactory. The profits earned by some of these societies fell from Rs. 5,057 to Rs. 924 and the losses incurred by others increased from Rs. 2,409 to Rs. 4,075. It is reported that these societies are finding it difficult to compete with mill products. The Government trust that the starting of the Provincial Handloom Co-operative Society financed from the grant given by the Government of India for the improvement of the handloom weaving industry will result in an amelioration of the condition of the weavers' societies.

that other towns in the region need to be developed, as part of the grand strategy for relieving the present appalling pressure of industry and population in Birmingham. They emphatically rejected the alternative course of jettisoning the well-protected green belt around the city—although some Birmingham councillors were ready to nibble at it.

Unfortunately, resolutions do not pay for houses. Money does. And Birmingham has made it clear that all it is willing to pay is an annual grant (for ten years) of £8 for each of its families housed elsewhere. It will not build a new town ; and it will not borrow dear and lend cheap (as London is now doing) in order to help small local authorities to undertake expansion. The surrounding county councils, with the notable exception of Staffordshire, are equally unwilling to help the small authorities ; but without more aid from somewhere the little towns, such as Redditch and Banbury, declare, with understandable rustic caution, that they cannot possibly embark on expansion schemes at 6 per cent interest. Thus the local authorities can agree on only one thing: that they must call upon Mr Sandys to resolve all their worries. But this is an invitation which the Minister has already repeatedly rejected.

Some way must be found to break this deadlock. Mr Sandys's wisest course would be to try to break it by offering a deal to the local authorities. If a new town is needed in the West Midlands, then the Government should assume responsibility for building it. The task is quite unsuitable for a local authority operating miles outside its area, and it is unfair to treat Birmingham more shabbily than London. But, in return, the Minister should insist that the local authorities in the region resolve the substantial remainder of the city's "overspill" problem by mutual co-operation and without further aid. They cannot expect to keep their independence if they will do nothing for themselves.

A Message to India

MR KRISHNAMACHARI'S remark that "the differences are not quite as great as they seem to appear in public debate" is perhaps the key to the recent exchange of letters between India's new Finance Minister and the head of the International Bank. If the bank really had tried to dictate economic policy to India, it would deserve sharp criticism. It would also be acting out of character. An institution founded by governments and launched with taxpayers' money could not very easily propagate doctrinaire opposition to all socialist measures ; and the bank, which has lent money to communist Jugoslavia, would look silly if it strained at the gnat of India's mild "socialist pattern" after swallowing Marshal Tito's camel.

Mr Black might, however, have realised that some part of his letter would create a false impression if quoted out of context, as they were almost bound to be. This was particularly true of the passage in which the president of the bank urged India, in its own interest, to give every encouragement to private enterprise. Mr Black was not preaching the superior virtue of private enterprise as such ; he was endorsing the judgment of the bank mission which visited India earlier this year, and which concluded that the financial and technical resources of the state simply could not carry the loads reserved to public enterprise in India's second five-year plan. Nor was his warning that the bank could not specify the amount it would be able to lend India during the period of the plan a veiled threat to withhold aid. The bank would be departing from its usual practice if it committed itself to specific figures for a period of several years, particularly in the case of an outsize request for loans such as India is making.

The studied moderation of Mr Krishnamachari's reply suggests that he quickly, and rightly, interpreted Mr Black's anxiety to save India from getting too far into the red in purely financial, not political, terms. The Indian government may also be alive by now to the fact that Mr Black's ability to raise new capital depends largely on his success in convincing hardheaded businessmen in New York and elsewhere that he is no sucker for "give-away" programmes and that anything his bank touches is as sound as a bell. Paradoxically, it is not impossible that the unintended publication of a letter which reveals Mr Black as a sturdy watchdog of sound finance will actually assist the bank to play (in its president's words) "an important part in providing external financing for your [India's] development efforts."

Italian Doubts About Europe

THE $75 million loan agreed last week marks out Italy as the International Bank's best European client. Hungry for capital with which to attack the traditional poverty of the south, but pursuing policies which have successfully combined general expansion and southern development with price stability, Italy has shown itself increasingly worthy of credit. Last year the bank recognised this, granting Italy a $70 million loan and letting it be known that more would be available. This second grant is a tribute to the speed of Italy's further economic growth as well as to its success in attracting private foreign capital.

As in the case of earlier loans, much of this one will be used on irrigation and power ; $25 million will go to the vast irrigation scheme which is transforming southern Sardinia, and a like sum to power works in Sicily and on the mainland. Among the industrial projects to which the remainder will be devoted is a $4.8 million motor works to be built in Naples. The emphasis on industry is new. Public investment in the south is moving on from its initial preoccupation with roads, irrigation and power, the preconditions of development, to industrial schemes—which, it is hoped, will in turn help to attract badly needed private industrial and commercial capital.

Many Italians have long felt that their southland could best be developed in a European context, and by European effort and capital ; this possibility has made the project for a European common market of special interest to Italy, provided it extends to free movement of capital and labour. Surprisingly, however, the British initiative for a wider European free trade area has had a cool reception in Italy. In part this reflects doubts about Britain's sincerity. But many Italian "Europeans" are suffering from a more general mood of disillusion. Feeling against the coal-steel community has been aroused by dissatisfaction about the high cost of American coal. Many Italians complain that both

Suez and Cyprus have been mishandled and that Britain's Cyprus policy has disrupted Nato in the Mediterranean. More than anything else, perhaps, the Marcinelle mine disaster in Belgium and the subsequent homeward flow of Italian miners have set in motion something like a wave of popular economic nationalism and distrust of the foreigner. If the common market and free trade area come to life, Italy may gain a great deal ; but at present Italian enthusiasm is damped.

Mr Hatoyama in Moscow

AFTER two months of political intrigue and diplomatic trottings to and fro, Mr Hatoyama, the Japanese Prime Minister, has at last got to Moscow. He has gone to try to negotiate a peace treaty between Japan and Russia based on what the Japanese call "the Adenauer formula." This means that the question of the Kurile islands, which have bedevilled all previous attempts to end the state of war, would be shelved for future discussion. In the meantime diplomatic relations will be restored, prisoners of war returned, the current fisheries agreement made permanent, and Russian opposition to Japanese membership of the United Nations withdrawn. Since this satisfies the main Soviet aim, which has always been to establish diplomatic relations with Japan without conceding any territory in return, Mr Hatoyama will probably succeed in negotiating a treaty. It is doubtful whether he will be equally successful in persuading the Diet to ratify it.

At least half the Liberal Democrats are expected to object if the treaty is silent on the question of Habomai and Shikotan, the small islands just off the coast of Japan which the Russians have refused to return until the whole territorial issue has been settled. Mr Hatoyama was only allowed to go to Moscow on condition that he insisted on the return of these islands, which have acquired a symbolic significance ; and if he fails to get them he will have to face a howl of protest when he goes home. Politicians have used the islands to make the Prime Minister's task impossible, as one of his opponents virtually admitted when he said he would do "everything in his power to prevent the Diet from ratifying *any* agreement concluded in Moscow." The Liberal Democrats are bitterly divided by personal jealousies and private feuds as well as by differences over policy. It will be necessary for the party, as one of its leaders has engagingly put it, "to shed its own skin and emerge with a new platform" if it is to remain in existence at all.

The Socialists are rather more sympathetic to Mr Hatoyama's peace proposals. They do not mind the territorial issue being postponed, because they believe that the Russians will never abandon the Southern Kuriles until the Americans abandon their bases in Okinawa and Japan. In consequence the peace talks have increased anti-American feeling ; its latest manifestation has been large-scale passive resistance at the air base at Tachikawa, which is to be enlarged to take jet aircraft. The Japanese fear that the more the Americans dig in, the harder they will be to move and the more dangerous it will be for Japan if another war breaks out. Many Socialists would be glad to give up the American alliance in return for the disputed islands and the doubtful safety of neutralism, and they are likely to support Mr Hatoyama's treaty as a step in this direction. But support from the opposition will not make it any easier for the Prime Minister to reconcile his own party to the terms.

Gad, Tovarish!

COLONEL BLIMP, Mr David Low's creation, knows no frontiers. He has found his way even into the Red Army. His voice could not be heard in Stalin's Russia because he did not need to raise it. The army was beyond reproach and no mere scribbler dared to touch it. But many taboos have gone under in the last few years, and playwrights, satirists and reporters no longer believe in the sacrosanctity of the army. The *Red Star*, the official organ of the armed forces, has now come to the rescue of the army, or rather of its officers' corps, defending the prestige of their uniform in bombastic tones. To judge by the number of indignant letters it quotes, many an officer finds it hard to get used to the new literary criticism. A Major Kulikovsky accuses one playwright of portraying a "negative" military figure without contrasting him with a hero. A Colonel Komlev says bitterly that "a future soldier, even before he enters the military family, is brought up with a critical attitude towards officers." Many more samples of this protesting chorus could be cited. Even a slur on ex-officers is apparently considered harmful. Defence against ridicule is clearly not yet included in the Soviet military curriculum. The striking novelty, however, is that the Russian writers refuse to be silenced by the colonel's indignation. Will Soviet Blimps have to acquire a sense of humour?

First Harvest

Since he first probed the secrets of the atom, man has pursued the vision of using its enormous forces for practical power production. Ideas in the minds of scientist and engineer were the seeds that have now come to fruition with the opening of Calder Hall, the world's first full-scale atomic power station.

The contribution of Babcock & Wilcox Ltd. to this remarkable achievement started eight years ago when, at the request of the Government, they undertook the design study of steam-raising plant for nuclear power stations. They have since manufactured and installed all the special 80-feet-high steam-generating towers for Calder Hall and are extensively engaged in other important developments which offer to the nation a sure promise of greater harvests in the field of nuclear power.

Letters to the Editor

President Tubman's Tour

SIR—I have read with interest your Note of September 22, and I beg to disagree with you that President Tubman was "pointedly avoiding Britain" in his tour of Europe. From what I know, Mr Tubman would like very much to visit England and make contacts, but, as Head of a State, he could not do so unless he is officially invited. I know for a fact that the former British Ambassador to Liberia, Major Charles Capper, did all in his power to get President Tubman invited to England, but the Foreign Office would not budge. Every year the Foreign Office would say the Prime Minister's schedule for the year was too heavy, hence they could not invite President Tubman. This is an open secret in Liberia.

The Liberians have done much to extend the hand of friendship to Britain. The newspaper of which I am editor, for instance, began running BBC schedules every week so that listeners here would pay more attention to what the BBC is saying. A local radio station is now relaying BBC news broadcasts direct. This has never been done with news broadcasts from even our best friends the Americans. But what do we get for such overtures? A cold shoulder.

In the field of commerce, two to three years ago the importation of vehicles from Britain was practically nil. During the International Rubber Study Group Conference in October last year the Liberian government imported a large number of British cars. For the first half of 1955, we imported from Britain 24 motor vehicles, 215 bicycles, 32 buses and trucks and 92 other vehicles. By the end of the year we had ordered vehicles from Britain to a value of $150,000. But did the British follow up? Conspicuous ineptitude was displayed in grasping trade opportunities, and we are now reverting to vehicles from America.

Mr Tubman has done more for Liberia by way of development in ten years than all his predecessors ever achieved. But Britain is still thinking in terms of a Liberia of fifty years ago. From 1949 to now the Americans have invested over three hundred million dollars in Liberia and the rate of investment is increasing. When Mr Tubman took over the reins of government in 1944 the national budget was about one million dollars. This year the revenues are nearing twenty million dollars. It has been estimated that while at present most of the concessions are not paying tax—they have a minimum of five years tax-free period to develop—when some do begin to pay taxes in a year or two, the revenues will double.

As one who was a student in England and enjoyed British hospitality, I would like to see British connections with Liberia strengthened, but certainly this cannot be achieved under present Foreign Office attitudes. I think you will agree with me that for a people to feel that one nation does not like them is dangerous, but I have heard it said quite often by some Liberians "the British just don't like us."—Yours faithfully,

HENRY B. COLE
Editor, *The Liberian Age*
Monrovia

Two Evenings in Kensington

SIR—Your roving correspondent does his best to belittle the People's League for the Defence of Freedom in his report of its Empress Hall meeting; but when the disparaging epithets are cleared away from his account he can be seen to have paid the league an unintended compliment. The British Communist party, small as it is, has been admired by all its opponents for the energy and enthusiasm of its members: the political apathy of the right is acknowledged by both Conservatives and Socialists. If, then, little more than six months after its foundation, the league can run as large and successful a public meeting as the communists, it must have won much public support and have started its career in a way most pressure groups might envy.

Your correspondent was offered a fascist leaflet on the way out. Well, the league, like other organisations, cannot control those who peddle propaganda outside its meetings.

The league earns a black mark from your correspondent for being "extremist" and not "a genuinely liberal pressure group." Your own position was once described as extreme centre. Similarly, if the league is extremist, it is so only in the vehemence with which it attacks certain abuses of power and in its refusal to compromise on important questions of principle. Its appeal to the centre may be gauged by the number of Liberals who have joined it.

Your correspondent is particularly unjust in suggesting that the league ignores criticism. Its weekly paper, the *People's Guardian*, has followed the policy of printing full and word-for-word reports of attacks by opponents, including communists. Few other papers can make this claim.

The real target of his scorn is not the league's programme, but its alleged powerlessness. Policies no better than the league's have often become intellectually respectable when reinforced by the threat of strike action.—Yours faithfully,

J. B. BRACEWELL-MILNES
King's College, Cambridge

Optimism in Canberra

SIR—Your Note on the Australian Budget in the issue of September 8th greatly overstates the extent of the improvement in the Australian balance of payments between 1954-5 and 1955-6 by comparing the figure for the current account deficit for the former year with that for the decline in Australia's reserves—which reflects also the inflow of capital—for 1955-6. The figures given in the budget statement show an improvement from a deficit on current account of £A257 million in 1954-5 to one of £A221 million in the financial year just ended. The fall in international reserves in 1954-5 was £A142 million, compared with £A73 million in 1955-6. There is, as you say, "some way to go" even before the reduction in international reserves can be stopped; it is doubtful whether a country in Australia's present state of development should wish to go much further and actually achieve a balance on current account. It would be unwise, however, for Australia to rely on an annual capital inflow as large as that of 1955-6. Nevertheless, if the recent higher wool

The year's most timely book—just published

NUCLEAR ENERGY IN INDUSTRY

J. G. Crowther

"NUCLEAR ENERGY" the new source of power from the nucleus of the atom, promises a new era of unlimited power. We stand upon the fringe of it, and will be witnesses of the changing character of industry as the fruits of research and development become available. The aim is to give some impression of what is afoot, and this book is written not for the nuclear scientist, but for those who will benefit from his work. It tells the story of development culminating in the building of nuclear power stations. With 100 photographs and diagrams of plant and equipment.

prices are maintained it is reasonable to hope that the fall in the reserves will be halted in the current financial year, and that before the end of it a start may be made in removing import controls.—
Yours faithfully, J. O. N. PERKINS
Australian National University, Canberra

Money in Mortgages

SIR—I have read with interest the article in your issue of September 1st.

In 1951 I accepted the honorary appointment of liaison officer to the North Western Loans Bureau established by the north western branch of the Institute of Municipal Treasurers and Accountants. Since that date I have negotiated temporary loans between members of £18 million.

Your comment "to canalise the flow of citizens' loans between themselves" is not quite correct, as my operations are entirely relating to loans between local authorities.

The success of the scheme is clearly indicated by the following transactions:

Year ended March 31st	Amount £ 000's
1953	2,325
1954	2,665
1955	3,755
1956	7,328

The number of members at March 31, 1956, was 109, and a number of new members have joined since that date. The long term loans negotiated through the bureau are negligible, and therefore the figures quoted relate almost entirely to loans of one month certain and seven days' notice. I have no information as to the actual period of the loans negotiated, but from knowledge of a number of transactions it would appear that a number of loans are retained for periods in excess of one month.

I think it should be made perfectly clear that the liaison officer is only acting as a central focal point for short-term loans between local authorities, and does not deal with other sources. It should also be noted that throughout the country there are other loans bureaux operated by other treasurers, and that there is liaison between each of them.

Briefly, you will see that the function of the bureau is to introduce those local authorities with temporary surplus funds available to those who require short-term funds, thus enabling the lending authority to obtain better terms than bank deposit rates of interest, and the borrowing authority to take up funds without incurring expenses, e.g., commission. There is, therefore, a mutual gain on the part of each local authority.

I would point out that the annual subscription of each authority is 7s. 6d. to cover the cost of postages, telephone calls, etc., incurred by my own local authority.—Yours faithfully,
Nelson, Lancs. W. KNIGHT,
Liaison Officer,
North Western Loans Bureau

Books & Publications

Tao and Chinese Science

SCIENCE AND CIVILISATION IN CHINA: *Volume II, History of Scientific Thought.*
By Joseph Needham. With the research assistance of Wang Ling.
Cambridge University Press. 718 pages. 80s.

THE second volume of Dr Needham's *magnum opus*—five more volumes are to follow—might well stand on its own as a complete outline history of Chinese philosophy. Dr Needham has not, of course, set out primarily to deal with Chinese philosophy. He is concerned with it only in its relation to science and technology; but in considering the attitude of various Chinese schools of thought towards the scientific investigation of nature, he has had to go deeply into the history of general ideas and even of religious beliefs. Nor are such studies uncongenial to him; if his greater enthusiasms are reserved for Chinese alchemy and early watermills, he is very much at home in philosophical controversy of all kinds and has a fine appreciation of the aesthetic side of Chinese religion, as shown in his incidental accounts of visits to temples during his own travels in China.

Dr Needham begins with the Confucians, "giving them pride of place on account of their dominance over all later Chinese thought, although their contribution to science was almost wholly negative." He finds in Confucianism an ambivalent attitude towards science. On the one hand, it was "basically rationalistic and opposed to any superstitious or even supernatural forms of religion"—which should have been favourable to a rational investigation of natural phenomena—but, on the other hand, "its intense concentration of interest upon human social life to the exclusion of non-human phenomena negatived all investigation of Things as opposed to Affairs." It was in Taoism, with its dislike of authority and social conventions, its interest in non-human nature, and its emphasis on relativity and change in the cosmic order, that scientific inquiry found a more suitable intellectual *milieu*. In contrast to the Confucians, the Taoists were always trying to get away from learning and abstract principles to direct experience; Dr Needham quotes one of them as arguing that "the people who manage the dykes of the nine rivers did not learn their business from Yu the Great, but from the waters."

But the quest for mystical illumination would not have combined as much as it did in Taoism with practical material techniques but for the persistent Taoist belief in the possibility of attainment of a physical immortality; the idea that the adept could overcome mortality led the more materially minded followers of the school to strive to prolong earthly life by all kinds of techniques involving medicine, metallurgy and alchemy. The author declares that he knows of "no close parallel to this in any other part of the world." The contributions of this activity, however, were to technology rather than to systematic scientific theory, which for the Taoists smacked too much of the learned abstraction which they despised.

Dr Needham is much less sympathetic to Buddhism than to Taoism as a factor in Chinese thought, and this is not surprising, for if Buddhism is analogous to Taoism in its concern with personal, as distinct from social, regeneration, it is nearer to Confucianism in its indifference to non-human nature and preoccupation with human conduct. The high development of logic and epistemology in Buddhism might, in the author's opinion, have aided scientific thought in China, but seems never to have been brought into relation to it. The trend in Buddhism most favourable to the natural sciences was, he thinks, the Tantric school, which is generally regarded as the most degenerate form of Buddhism as a religion, but "represents one of the fields of research in which interesting discoveries concerning the early history of science in Asia are most likely to be made." Dr Needham emphasises resemblances between Chinese Taoism and Indian Tantrism and suggests at least a partial derivation of the latter from the former; it would perhaps be more satisfactory to seek an explanation of their common elements in a primitive substratum of practice and belief in the whole region from the Ganges to the Yellow River, and in this connection the pre-Buddhist Bon religion of Tibet is well worthy of consideration.

Dr Needham carries his study beyond the limits of philosophical thought into the field of political history, and lays stress on the frequent association of Taoism with the subversive political movements of past times in China. He rightly points out that Taoist thought was hostile to the social and political structure of the Chinese state (which he describes—from the Han dynasty onwards—as "feudal bureaucratism") as endorsed and consolidated by Confucianism, and speculates on the underlying connections between science and

"democracy." But the Taoists were politically anarchists rather than democrats, and the tradition of anti-governmental, popular religious-political organisation in China is quite as much Buddhist as Taoist; the most important of the "chiliastic" sects, the White Lotus, is Buddhist in origin.

Dr Needham justifies the space taken up with doctrines and beliefs inimical to science on the ground that for the history of science adverse conditions are as important as favourable ones, and adds that one of his main objects is to find out "why modern science and technology did not spontaneously develop in East Asia." He is deeply impressed by the technological achievements of the Chinese in ancient and medieval times and considers that these have been much greater than has generally been recognised in the West. He also holds that even in theoretical scientific speculation they were the equals of the Greeks. He admits, however, that these promising beginnings did not mature as they did in Western science, and this leads on to the question why not. He formulates the problem on page 203 of this volume, but then disappoints the reader's whetted appetite by saying that "time has not yet come to speak of this." Indeed, he has made a work of massive learning as exciting as a magazine serial, and should have no difficulty in holding the interest of his readers for the unfolding of his theme through the next five volumes.

The Phase Before Yesterday

STERLING-DOLLAR DIPLOMACY.
By Richard N. Gardner.
Oxford University Press. 445 pages. 42s.

THERE have been three phases of economic diplomacy in the past fifteen years, in the struggle for a freer trading world. The first phase, of wartime and postwar dreams, collapsed with the British economic crisis of 1947. The second was characterised by the failure of the Commonwealth's convertibility plan of 1952. The third phase, which is now upon us and which will move this winter towards its diplomatic crisis, has had its initial motive force in the continental dream of a European common market.

Mr Richard Gardner, an American Rhodes scholar who studied under Mr Roy Harrod at Oxford, has written a diplomatic history of the first stage, down to 1947; his inspiration was the fascinating "inside story" of the wartime and immediately postwar economic negotiations contained in Mr Harrod's "Life of Maynard Keynes." When Mr Gardner is about a quarter of the way through this book, one suddenly realises that he is doing his job very well. Perhaps, from a British point of view, he has laid too little emphasis on the obstacles caused by the illiquidity of the world currency system in his period; currency reserves were far too small for the manœuvres that the idealists demanded, largely because all prices had doubled since before the war save only the price of gold. Certainly, from a realist's point of view, Mr Gardner's closing chapters are a little too gloomy; as he recounts how all the insubstantial wartime visions faded, he seems to forget that they have left much more than a rack behind. This is a freer trading world than most of us expected could be allowed nine years ago. But his judgments are formulated with a sense of mature fairness unusual in a young writer; and the book itself is written in a fluent English style unusual in either a lawyer or an economist. Mr Gardner, *mirabile dictu*, is both.

In the end, therefore, the main complaint to be made about Mr Gardner's book is really a compliment to it. It is a crying pity that he ends his account at 1947; the story of events up to then has been told before, if never so completely. The still more intriguing story of sterling-dollar diplomacy in 1952-55 awaits even preliminary reconnaissance in a book of this sort. The trouble is that such a book, as Mr Gardner's careful scholarship makes clear, would demand two or three years of hard work. Most of the actors in the story are too busy to write it; the task awaits one who was not an actor, but who has Mr Gardner's rare gifts of second-hand narrative and research. Unfortunately by this time Mr Gardner, precisely because of these gifts, will no doubt be too busy too.

Gestating Unions

TRADE UNIONS.
By Eric L. Wigham.
Home University Library. *Oxford University Press.* 284 pages. 7s. 6d.

MUCH of this book is a purely factual study of trade union history. The author, labour correspondent of *The Times*, does his subject full justice, and gives much valuable information. It would perhaps have been helpful if Mr Wigham had described actual cases of union activity; but it is notoriously hard to find "classical" instances of union disputes, because, as he shows, the unions themselves differ so much in their organisation and practice.

At present the great question is the future direction of the unions. The author recognises this to be essential to any discussion of the subject, but it means that he has to abandon his scrupulous avoidance of value-judgments in the historical parts of his book, and rely on his subjective views. There are no rash prophecies: he confines himself mainly to pointing out the faults in the system that seem most in need of quick attention—apathy in the union branches, lack of an adequate central policy, and the dependence of the unions' *status quo* on the continuation of a system which they are politically committed to abolish.

Mr Wigham suggests that it might be to the movement's benefit if the General Council of the TUC could intervene more effectively in inter-union disputes: he tentatively suggests the inclusion on the council of officers with no particular union connection, to relieve the general secretary of some of his immense responsibilities. But elsewhere in the book he makes some very cogent remarks about the separation of the officials from the ordinary members; salaried officers would become just another kind of bureaucrat to the workers, and the danger of strikes directed against the unions themselves, as another kind of boss, would be increased. Their very disinterestedness, which would make it so much easier for them to deal with employers and government departments, would make it only too easy for disruptive elements to represent them as employers' stooges or snoopers.

In emphasising the relative conservatism traditionally shown by the TUC General Council, Mr Wigham says: "It looks as if they will change the Labour Party into a conservative party . . . or they will break with it." This year's conference at Brighton showed that the old leaders are leaders no more: they continually emphasised their purely advisory function, and were downright timid on many issues. They are too conservative to break with the Labour party, and it looks as if they have no power to change anything. The power of the council has changed radically even since Mr Wigham so recently finished his book: but this only confirms his conclusion that the unions are "in one of those periods of gestation. . . ."

Europe's Homeless

THE INTERNATIONAL REFUGEE ORGANISATION.
Prepared by Louise W. Holborn.
Oxford University Press. 819 pages. 45s.

THE problem of "mass communication" is a constant preoccupation of United Nations officials. Faced with a book like "The International Refugee Organisation," one realises why. Miss Holborn has prepared a painstaking history of the IRO; but she has etched in every tree so laboriously that the common reader will be reduced to a babe in her wood, smothered by the little leaves of detail and quite unable to make his way through.

This may not be the author's fault: she was presumably following the instructions of the organisation's Liquidation Board in thus preparing its last testament. But it is an opportunity lost, for this is a remarkable story which should have reached a wider circle than the administrators and statisticians who are likely to be the only beneficiaries.

Between 1947 and 1952 the International Refugee Organisation resettled over a million people, most of whom had been taken as slave labour by the Germans during the war and who refused to return home for fear of persecution by totalitarian regimes. They were found new homes in forty-eight countries—notably the United States, Israel, Canada, Australia, Britain and parts of Latin America—at a cost to

the organisation's eighteen member governments of more than four hundred million dollars.

The operation was probably the most complex ever carried out by international effort. Legal protection and relief, which had normally sufficed in the days of the League of Nations, were no longer enough. These modern refugees had to be groomed by the IRO for emigration; visiting missions picked them over like careful housewives, taking only the best. During months of security screening, the refugees were taught the languages and ways of the countries where they hoped to start new lives; they learned the trades which those countries wanted; and their health was built up to the required one hundred per cent standard —for even the underweight were not acceptable, and pregnant mothers had to wait for clearance until their newly-born babies were seen to be in first-class condition too. People with a shadow on their lungs or defective sight, people with a shrunken arm or a missing finger, anyone over forty-five (thirty-five for professional workers)—none of these stood a chance of emigration in the early years, though latterly receiving countries became a little more humane.

Small wonder that, despite all the IRO's efforts, 350,000 refugees—mainly the old and sick and their families—were still left stranded in Europe when the organisation closed down. One would have gladly exchanged some of the minutiæ of staffing and financial arrangements for more information about the composition of this hard core, most of whom still exist as unwilling charges on grudging countries with problems of their own.

One point of fact is worth correcting. The IRO was not the first agency created by Uno, as Miss Holborn asserts in her opening sentence. Both the Food and Agriculture Organisation and Unesco were earlier offspring.

Arcadian Islands

THE AZORES.
By Claude Dervenne.
Harrap. 165 pages. 30s.

THIS is the first general account of the Azores since the nineteenth century when, in the days of the whaling voyages and the trade in wine and oranges, the readers of some half-a-dozen books knew the islands, not as "where our weather comes from," but as a scatter of the Portuguese Arcadia preserved in mid-Atlantic. Miss Dervenne has now visited all the nine islands and has delighted in her travels. She provides a good deal of information which is largely accurate, although at times one is a little uneasy whether she has seen all she has described. For instance, she says: "there is an acrid smell of sulphur coming from some of the fissures" in the crater of the tall peak of Pico, one of Europe's noblest, sheerest, volcanic cones. This reviewer could smell nothing in 1949; nor in 1839 could the brothers Bullar, whose fond and urbane book, published in 1841, is still the finest account of an archipelago which, although nearly half-way to the western world, endears itself chiefly because it lags behind.

But there is endearment also in a glory of flowers, roses and profuse hydrangeas, lovingly planted along every road and track. Miss Dervenne is at her best when describing these, and manages also to convey the extraordinary effect on land and sea and man and beast of the ever-changing quality of light and atmosphere. Of the island of Flores she says: "To do justice to it, one would have to coin words blue enough, green enough, words drenched in light and mist and fragrant with sweetness, bitterness and solitude." She is not always so well served by her translator and sometimes there is a dogged earnestness about her prose that makes some places, like the modest port of Velas, San Jorge, sound much grander than they really are. She came to love the islanders, and one wishes she had dwelt on them more, for their kindness and grave courtesy are models even for Portugal.

The book has many excellent photographs, but unfortunately includes one or two pretty-pretty studies like that on the jacket, which should not put off the reader from this account of the last in Europe of the Encantadas.

The Development of Economics

THE MEANING AND VALIDITY OF ECONOMIC THEORY.
By Leo Rogin.
USA: *Harper.* London: *Hamish Hamilton.* 697 pages. 52s.
ON THE HISTORY AND METHOD OF ECONOMICS.
By Frank H. Knight.
University of Chicago Press. London: *Cambridge University Press.* 316 pages. 45s.
STUDIES IN THE LABOUR THEORY OF VALUE.
By Ronald L. Meek.
Lawrence and Wishart.
310 pages. 30s.

THE comparative study of economic theory appears to be regaining some of the popularity which it lost in the 1930s. It has obvious disadvantages; notably its lack of immediate relevance to current problems and, especially in teaching, the discouragement which it inflicts on students required to master large bodies of complicated theory known in advance to be obsolete, imperfect, or just plain wrong. But it has merits, too, even apart from those relating to a more general historical understanding. It gives a better understanding of current economic concepts and ways of thought—which inevitably bear the marks of their intellectual lineage; it offers at least the possibility of discovering and reopening some abandoned vein of wisdom; and it imparts a healthy caution in attributing universal validity to descriptions of passing phases of economic development.

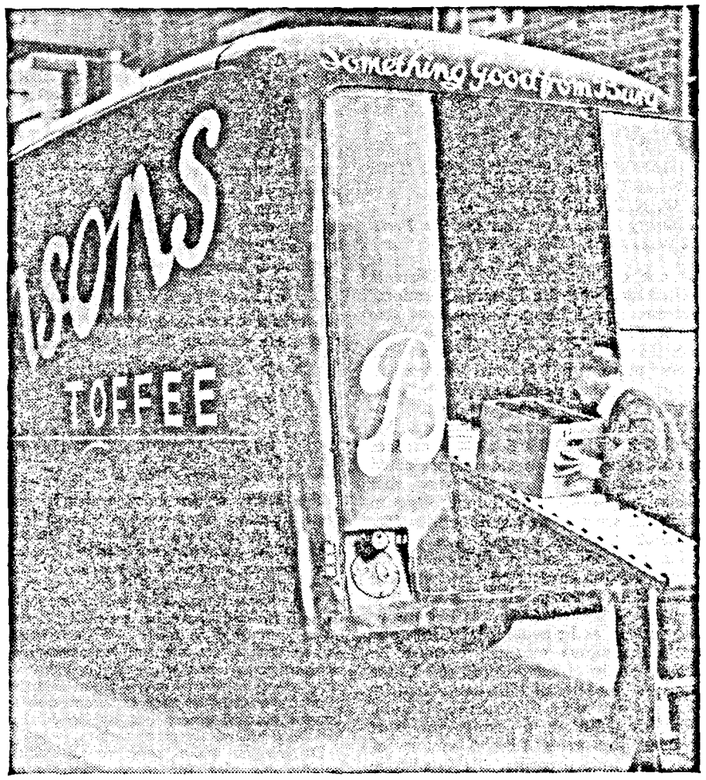
Professor Rogin's massive survey of economic thought from the Physiocrats to Keynes is described as "an exploration of the hypothesis that new systems first emerge in the guise of arguments in the context of social reform." The hypothesis is hardly new; indeed, it is rather surprising that a modern writer should think it in need of statement and justification. Justification here runs mostly on the familiar lines which depict any thinker whose arguments can be invoked, correctly or otherwise, in support of a group interest as a deliberate apologist for that group. Professor Rogin, whom internal evidence suggests to have been a left-wing New Dealer, mercifully avoids the equally familiar imputations of malevolent dishonesty; but his book is better as a straightforward, rather pedestrian narrative or work of reference than as the elucidation of a principle. The only real trouble is that no one but a fairly serious student would, or should, try to read it, and any serious student knows his way to Schumpeter.

Professor Knight's "History and Method" stands on a very different intellectual level. This is a collection of articles, essays and reviews, dating from the 1930s on, whose centre of gravity lies in comparative economics but whose driving force is a concern with the place of economics among the social sciences and of the social sciences in human knowledge and wisdom. Apart from the first paper (the article on "Economics" written for the "Encyclopædia Britannica") it is all extremely stiff going; toughly hammered thought, without a restful platitude in a hundred pages, and made tougher for the reader by an awkward style. The long paper on "The Ricardian Theory of Production and Distribution" is in part a distinctive analysis of the classical system in general, in part a representation of those fundamental concepts of economics for want of which the classics went astray. Similarly the essay on Wicksteed is at once a review and an illuminating exposition of the writer's own conclusions, as modified by a study of "The Commonsense of Political Economy," on the opportunity-cost and labour-cost theories of value and the relation of "pecuniary and non-pecuniary" utilities. This paper, indeed, exemplifies the advantage gained by an economic theorist who does not stick too closely to his last—a habit which leads to forgetfulness of those "non-pecuniary utilities" which can wield so powerful an indirect pecuniary influence, and, still more destructively, to "an irrational passion for dispassionately rational behaviour" and a consequent totally unreal view of social life. There are indeed dangers in the refusal of a specialist's tunnel-vision; notably woolliness and superficiality. Professor Knight is immune to these. He has blind spots (Keynes is one), but he brings to the wider problems of ethics and philosophy the same penetration and power as to the cruxes of economic theory.

Mr Meek hopes, in his "Studies in the Labour Theory of value," to usher

One man helped this confectionery firm to overcome invoicing delays

Bensons' deliveries sometimes had to wait for invoices—but the Burroughs man, Mr. R. Sudall, was able to suggest a quicker system using Burroughs Sensimatic accounting machines.



Bensons Confectionery Ltd., of Bury, have a large home and export trade in toffees and boiled sweets. Last year deliveries were hindered because loaded vans were kept back while invoices were being prepared. More staff were put on the work, but there were still delays during peak periods.

Bensons contacted Burroughs, who sent one of their team of accounting experts—Mr. R. Sudall. Together with Bensons' accountants he made a thorough analysis and suggested a system using two Burroughs Sensimatic accounting machines.

Now, these machines prepare invoices in *one operation* direct from travellers' orders—and accumulate the grand total of all invoices. Each machine prepares 30 to 40 invoices an hour, and loads now go out as fast as they can be packed. Bensons are already coping with a 50% increase in activity, and anticipate further orders through their prompt deliveries.

WHATEVER YOUR BUSINESS

If you have an accounting problem, the Burroughs man can help you. He is an expert on modern accounting systems, and well able to work with your accountants or auditors. Backed by Burroughs' world-wide experience, he will make a full analysis and suggest the most economical, *workable* solution. If he thinks no change advisable, he will say so; if he does recommend a change, he will make a detailed plan and help you get it working smoothly. Call in the Burroughs man — you're committed to nothing. His advice is free.

Burroughs make the world's widest range of business machines. You'll find your local Burroughs office in the telephone book.

FOR SPECIALIST ADVICE ON MODERN ACCOUNTING METHODS

CALL IN THE Burroughs MAN

in "a period of co-existence" between Marxian and non-Marxian economists; he follows an historical analysis, from the classics through Marx, of the rise of that theory, with a study of its critics, and ends with a valiant attempt to apply it to the current economic scene and to indicate lines of further advance. His book rouses much the same sort of admiration as a shot at a speed record on a penny-farthing bicycle; an admiration tempered by the wish that the same skill and energy could be used on a modern drop-handled model.

Bismarck's Bogy

BISMARCK, GLADSTONE AND THE CONCERT OF EUROPE.
By W. N. Medlicott.
University of London, the Athlone Press. 367 pages. 35s.

IN one of his later works, "Disraeli, Gladstone and the Eastern Question," Professor R. W. Seton-Watson was able to conclude that, for all his so-called cant, Mr Gladstone, in terms of the things that came to pass, proved a greater realist than Disraeli in his judgment of the Balkan problem. Professor Medlicott now confronts Mr Gladstone with Bismarck; his researches into many sources previously neglected or unavailable confirm the view that Gladstone, in spite of the verbiage in which he seemed to hostile critics like Bismarck to lose himself, had vision which was not without realism in his conception of concerted international action. Mr Medlicott implies that Bismarck persuaded himself, and as many others as he could, that Gladstone was a dangerous madman because he was genuinely afraid of him; the Three Emperors' League of 1881 was aimed by Bismarck against a Gladstonian Britain.

In his Midlothian campaigns that heralded the great Liberal victory of 1880, and indeed earlier, Mr Gladstone had demanded a reanimated Concert of Europe; he called for the bringing about of "the 'common accord' of Europe, embodying in one organ the voice of civilised mankind in the acting and fostering care of England." Once in office he and Granville induced the powers into a half-hearted co-operation which induced the Sultan to make the territorial cessions to Montenegro and Greece that had been foreshadowed by the Treaty of Berlin. After 1881 Gladstone was blocked by the Three Emperors' League, and weakened by catastrophe in Ireland and Egypt. Yet, as Mr Medlicott writes, "the line of development through British and American idealism to the League of Nations Charter and beyond, the influence of Gladstone on Woodrow Wilson and many American Liberals, and the pacifist movement from the late nineteenth century onwards, all found some inspiration in the Concert of 1880."

Mr Gladstone, moreover, had not been afraid to use force when it became necessary to achieve his aim. Internationally Bismarck was less successful in Professor Medlicott's view, for he merely perpetuated deadlock.

It is interesting to observe the ideological clash between Britain and Germany already in 1880. It would often be slurred over, and often regretted by many of the British and some of the Germans, but it was to help to bring about two fearful wars which would sweep over the world in the twentieth century. Professor Medlicott's researches show more clearly than ever the affinity between the methods and mentality of Bismarck and Hitler. Great though the contrast may be between the Junker and the son of the Austrian customs official, they both loved to create bogies and to sow distrust; hence they disliked all conceptions of concerted action and preferred bilateral action, at most a triple alliance or "tripartite pact."

The book suffers a little from the technical difficulty of making detailed diplomatic history readable. The effect of summarising dispatches is only too often like rather tight knitting. Although his critics occasionally suspect a little artistic licence, it takes Mr A. J. P. Taylor to weave tapestry.

Shorter Notices

A DOCTOR RETURNS.
By Donald McI. Johnson, MP.
Johnson. 256 pages. 16s.

The author of this book, which has no pretensions to literary merit, won the marginal seat of Carlisle for the Conservatives at the last election. Since then, he has been an assiduous questioner in the House of Commons on all matters relating to the reception and care of the mentally ill, and this book can be regarded as part of his campaign to focus public attention on the subject. It is mainly an account of his own experience with the lunacy laws six years ago and of his conviction that the mental symptoms he then experienced were caused not by illness but by drugs that had been unlawfully given to him.

Dr Johnson makes some sound points, notably his plea for more "observation wards" in general hospitals, which would act as a clearing house for all people with mental symptoms who refuse treatment as "voluntary patients." This system acts well in London and elsewhere as a means of avoiding certification in many cases, but it would be unwise to regard it as a complete answer to the problem. It is a pity that in his well-meaning campaign to arouse public interest in mental hospitals and the mentally ill, Dr Johnson argues too much from the particular to the general and in so doing overstates his case. The whole question of certification, and the alternatives to it, is far more complicated than he would appear to think.

★

PLANNING FOR AN EXPANDING ECONOMY.
By C. N. Vakil and P. R. Brahmanand.
Bombay. *Vora and Co.* 434 pages. Rs. 12/8.

In this prolix and repetitive book the authors argue that the Indian planners have based their structure on a misunderstanding of the economic process of development, mainly because they fail to distinguish between the functioning of "advanced" as contrasted with "underdeveloped" economies. The authors believe that the second five year plan's emphasis on investment in fixed capital will necessarily fail to promote employment and generate a cumulative process of development because it provides for no adequate supply of "wages goods" (that is, those goods, including food, upon which Indian workers spend their incomes). This means that the prices of such goods will rise and lead to serious inflation. That failure in the second plan is already foreshadowed is in their opinion shown by the unduly low employment target of the plan itself, and by the already visible tendency for prices to rise after several years of relative price stability. The policy that should be pursued is to invest mainly in consumer goods industries (including food production) at a rate (in relation to national income) greater than the rate of population growth. These industries should be mechanised and not—as projected in the plan—based on cottage and small-scale organisation. The authors repeat this thesis in varied forms throughout many chapters, but the underlying arguments are formulated most completely in Part II, Chapter IX.

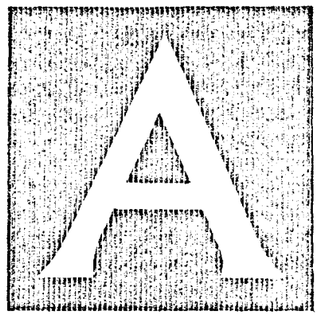
It is commendable that attention should be drawn to the first plan's failure to reduce unemployment and under-employment and to the second plan's disappointing employment target, but the authors seem to underrate the planners' understanding of the problem and to misrepresent their arguments and methods. It is to be hoped that the analysis—although not wholly convincing—may help to suggest ways by which employment as well as output can be accelerated at no distant date.

★

BRITISH FOREIGN POLICY SINCE 1898.
By M. R. D. Foot.
Hutchinsons University Library. 190 pages. 10s. 6d.

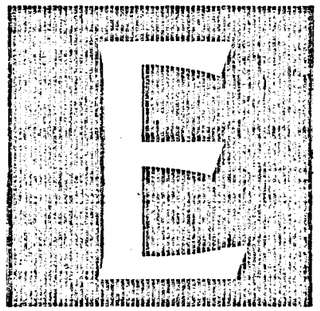
A good short account of British foreign policy, which would explain the full effect of the changes of the last half century, would be a useful thing to have, though difficult to write. Mr Foot has not, in fact, attempted to do this. His purpose has rather been to give a rapid narrative of British diplomatic action with sufficient foreign background to make it intelligible. Since he has also rightly included some account of the two world wars, in the course of which so much policy was made, he has inevitably been very cramped for space and has been forced to sacrifice any attempt at generalisation. Nevertheless, the book will be valuable, if only as clearing away a certain number of popular myths about such turning points as the British entry into the first world war or the "appeasement" era, though Mr Foot gives too little space to non-European questions, above all to changing relations with the United States.

The book is not altogether free from error. It was on the Board of Commissioners for the Egyptian Debt that Germany exercised pressure on Britain after 1885; it had nothing to do with the Suez Canal. Unless one counts the Turks as Europeans, the Japanese victory over Russia was hardly the first Asian triumph over Europeans since the days of Ghengis Khan. The summary of the Zinoviev Letter is misleading; and Mr Foot's judgment on the Balfour Declaration unacceptable as it stands. M. Herriot is not, and was not in 1924, a Socialist. General de Gaulle's provisional government was set up in Algiers and not in London; and the telescoped account of the London and Paris Agreements of 1954 fails to make it clear that Western European Union was an actual expansion of the Brussels Treaty.



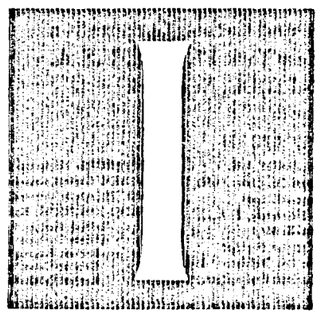
Increased prices of petrol and diesel fuel announced on October 8th and 10th will not affect users of electric vehicles. Every vehicle of this type at the recent Commercial Motor Show used equipment supplied by the British Thomson-Houston Co.—a member of the A.E.I. Group.

ELECTRIC

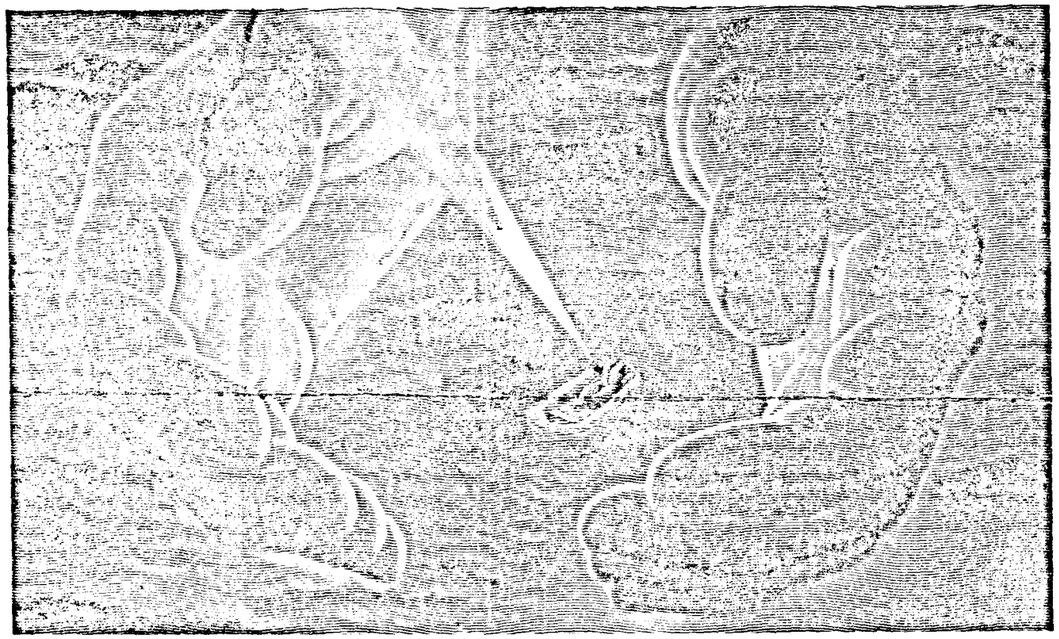


Metropolitan-Vickers—another A.E.I. Company—has supplied trolleybuses to many cities from Copenhagen to Dunedin. A further 62 trolleybuses with M-V electrical equipment recently supplied to Manchester Corporation brings to 269 the total of such vehicles supplied since trolleybuses were first used in Manchester in 1937.

VEHICLES



Batteries for trolleybuses in Finland were supplied by Ediswan—a third member of A.E.I.—whose batteries also provide power for electric delivery vehicles and fork lift trucks.



To save a life

Portable packages of electricity help make our lives safer and more enjoyable

THE BRIGHT BEAM of a flashlight in the hands of an airman down at sea...the untold comfort of an almost invisible hearing aid...the pleasure of listening to your favorite music over a portable radio.

THESE INGENIOUS DEVICES have one thing in common—they all get their electric power from dry-cell batteries. Each day millions of us depend on these portable packages of power for greater safety, comfort, and pleasure.

LARGE BATTERIES furnish power for signalling and communications systems. Hearing aid batteries are now so tiny that they can hide under a dime. Other dry-cells supply power to everything from toys to Geiger counters.

OVER 60 YEARS AGO, the people of Union Carbide produced the first commercial dry-cell. From this beginning, they developed the great variety of EVEREADY batteries that now serve dependably in so many applications.

SCIENTISTS of Union Carbide are constantly working on new, improved methods of producing packaged power. Their goal is to make dry-cell batteries do even more work for all of us.

HAYNES STELLITE Alloys • LINDE Welding and Cutting Equipment • PRESTONE Anti-Freeze • CRAG Agricultural Chemicals

American Survey

AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

Capital Cassandras

Washington, D.C.

THE United States seems to be rapidly acquiring one of the main characteristics of an underdeveloped country—a shortage of capital. Keynes would probably have been startled to be told that the chief economic problem of America in the year 1956—eleven years after the end of the war—was to supply the enormous demands of consumption and of investment without inflation or, conversely, to suppress those demands without causing a severe slump. Yet, as the year draws to a close, these are precisely the problems which the authorities are facing, and their task may be about to become considerably more difficult because of a technical change that has been slowly developing in the structure of the assets of the banking system.

More and more observers in the United States claim to discern two fundamental causes of the present problem, both of which have affected the demand side of the economic equation. The first is an American version of the "revolution of rising expectations," which is said to characterise underdeveloped peoples. A washing-machine, two-car, home-owning civilisation—the kind of civilisation which most Americans now feel is their due—is possible only through consumption on the hire-purchase system, and such consumption must be financed somewhere. The second is a phenomenon described in classic terms as an increase in the marginal propensity to invest.

As a result of the pace of technological research and discovery, business corporations by the hundred are discovering that they have no alternative but to expand and invest. Meanwhile, the growth of population is making more and more urgent the investment of public capital in schools, roads, drains, water supplies, hospitals, and so on. Even if consumption—or more properly the wish to consume—could somehow be kept within bounds, there would apparently be a genuine shortage in the United States of the savings needed to satiate the enormous hunger of the capital market. With the demands of consumers for mortgages and hire-purchase finance added, the shortage becomes acute.

*

The situation has been kept under control up to now in the classic manner, with the fortuitous aid earlier this year of a mild and temporary recession in consumer demand for durable goods, chiefly automobiles. The central banking authorities have simply refused to "print" the new money that would be needed to supply everybody's demands. The practical results of this effort at monetary restraint have been:

1. *A steady rise in interest rates.*—Short-term rates are the highest they have been since the banking crisis of 1933; Treasury bills are yielding over 3 per cent, compared with about 0.6 per cent in the middle of the mild 1954 recession. Long-term yields have risen much less rapidly, but most of them are at postwar highs.

2. *A drastic shift in the assets of the banking system.*—The commercial banks have continued to make a record volume of loans—both ordinary short-term commercial loans to keep business rolling, and some loans in the mortgage and corporate areas that are close to the fringe of capital investment—while selling off huge quantities of the investments, mostly government securities, which they had acquired in the war years. The leading banks in the last year alone have expanded loans by $6.1 billion and reduced their holdings of government securities by $4.3 billion. The boom has been financed up to now, in effect, by assets acquired during the war—for which, fortunately, there have been non-bank purchasers charmed by the rising yields of these assets.

3. *A definite and increasing curb on the availability of credit despite this expansion in loans.*—The central banking authorities insist that more borrowers are being turned away now than ever before in history, even though a record number of borrowers are being accommodated as well. Perhaps the greatest pinch, reflecting the basic shortage of savings, is in mortgage money for housing.

4. *A total money supply kept well under control,* and actually expanding less rapidly than the gross national product. But the speed with which money is turned over has increased sharply.

5. *Some rise in prices in spite of the restraint.*—Retail prices are now about 2 per cent higher than a year ago and wholesale prices about 3 per cent.

6. *A curb on the stock market at long last.*—The present sluggishness of the market in the face of obvious boom conditions may result in part from the election, but it is clearly also due to the monetary situation. Not only are yields on bonds and other fixed-interest securities drawing money away from equities, but the threat to the boom contained in the present monetary restraint is damping the more enthusiastic expectations of future profits.

Why, then, cannot this clearly tolerable situation continue indefinitely? The answer, in many minds, is to be found in the second point—in the change in the character of the bank assets. The banks are less liquid now than they have been for years. Some day they will feel they have to stop selling their investment reserves—or, perhaps just as likely, there will be no buyers for those investments at acceptable

prices. When that day comes—assuming it does come—one of two things has to happen: either business loans must be severely curbed, with an inevitably depressing effect on the economy as a whole; or the central bank, to prevent the slump, is going to have to allow the money supply to expand, through an increase in loans without the offsetting decline in bank investments, much faster than would be consistent with stable prices. In short, as the Cassandras see it, the American economy faces either fairly serious inflation or a fairly serious slump induced by the effort to prevent inflation.

The Cassandras can be wrong, of course. The main hope at the moment appears to be that the rise in interest rates will suck more savings out of the economy, to add to the constant increase in "institutional" savings through such things as pension plans. It is possible that the resultant fall in consumption would not curb the boom too much from the demand side. There is the further point that the non-bank money that has been used to buy government securities from the banks will, if the banks cease to be sellers, have to be invested somewhere.

All of these hopes are just another way of saying that restraints can, at least theoretically, be applied firmly but delicately enough to prevent the two revolutions in demand from outpacing the country's resources. But, in an economy already fully geared to both revolutions, this must remain an open question. If demand—spurred by both social and economic reasons of a fairly fundamental character—is suppressed enough to prevent inflation, can an economy based on that demand continue to prosper?

The central banking authorities have been aware of this problem as a potential cause for worry for several years. In the more immediate sense, they are constantly conscious of the possibility that their policy of restraint might become "too restrictive" in the sense that businessmen and others could not be accommodated in their legitimate need for credit. But, in the future more than in the past, a policy which avoids being indicted as too restrictive for business may well be not restrictive enough when it comes to curbing the money supply. If the revolution in American demand for goods and services proves permanent, the monetary authorities during the next Administration may have to sit on one of the horns of the dilemma.

'Twixt Congress and Belgrade

THE official reaction in Jugoslavia—as publicly announced, at least—to President Eisenhower's decision on the continuation of foreign aid to that country shows little appreciation of the uncomfortable position in which he has been put by this question. This ungraciousness will make it even more difficult for him to go on trying to do his best for the Jugoslavs—should they want him to do so. The President has no wish at this point to discourage Marshal Tito from demonstrating to other satellite countries that it is possible to be friendly with the Russians without being dominated by them; nor does the President want to force the Marshal to become more dependent on the Russians by withdrawing American aid from Jugoslavia. But the Marshal's sudden visit to Russia, and the reticence in Belgrade about its outcome, made it embarrassing for the President to decide definitely at this time that Jugoslavia was still "independent of control by the Soviet Union" and that continued aid to Jugoslavia was necessary to the national security of the United States. Yet by congressional decree such a ruling had to be made at the beginning of this week if American assistance to Jugoslavia was not to be suspended altogether. A bipartisan group in Congress nearly achieved this last summer—as it was, no new money was allowed for weapons for Jugoslavia—and it took all the President's influence to defeat the move even partially.

In the circumstances he could hardly now have ruled that Jugoslavia was unconditionally eligible for aid; apart from anything else this could easily have driven Congress to cut off funds for that country entirely next year. It may hurt the Jugoslavs' pride, and it certainly makes it difficult for them to plan ahead, to be told that the President will supervise them closely and may cut off deliveries at any time; nor are they at present to be trusted with any more tanks or jet aircraft. But they are still to receive what, from a practical point of view, they need most: replacement parts for maintaining the weapons they already have, and the economic assistance which is now available to no other European country except Spain. Perhaps most important, the President's ruling enables Jugoslavia to obtain agricultural supplies, especially wheat, out of the American surplus stocks, to make up for this year's bad harvest.

Presidential Personality

THE Republican personality cult of President Eisenhower reached a new height last week when a "cross section of American citizens" was assembled on television to interview him on the eve of his sixty-sixth birthday. Much work must have gone into collecting these "little people": a Democrat from Virginia, who had wanted Mr Eisenhower to be the Democratic candidate in 1948, still wanted him now; a recently naturalised immigrant, who had won $32,000 on a quiz programme, was curious to know what sort of man Vice President Nixon really was; an automobile worker begged the President "to enlighten my buddies back home" about his "accomplishments for labour"; Mr Lewis Douglas, an Ambassador to London under the Democrats, gave a pæan of praise to Mr Eisenhower's goodness and wisdom; a Negro pastor enlarged on the beauty of the President's home life; and a girl stenographer wanted to know what the President thought about spiritual values in the schools.

Mr Eisenhower seemed less at ease than in his usual press conference, as if vaguely troubled by the Stalinesque ritual thrust upon him. And perhaps he was also conscious that he may have stretched his high sense of responsibility too far by opening the proceedings with a premature announcement of success in the United Nations' negotiations over Suez. Nevertheless, the programme called attention to the President's greatest strength and his rival's greatest weakness. Mr Stevenson has not come through to the ordinary voters either as a figure of heroic stature who can bear on his own shoulders world problems like

West End: 11 WATERLOO PLACE, S.W.1

TODAY the future unfolds at Calder Hall. When the seeds were sown four years ago, C. A. Parsons & Co. Ltd., who had been given the task of building special gas circulating plant necessary to harness atomic power, consulted Shell about lubrication. As a result of experimental work carried out at their Thornton Research Centre, Shell were able to provide a lubricant to satisfy the special conditions involved.
By building their own source of radiation at Thornton, Shell have also been able to develop entirely new lubricants which are resistant to radiation and have many other unusual and complex characteristics. At the threshold of the atomic age Shell once again give leadership in lubrication. You can be sure of Shell.

that of Suez or as a symbol of national morality. Except among the intellectual and professional classes, there are now few people who, in the mocking words of the campaign song, are "madly for Adlai."

A little earlier, however, the President himself had cast some doubt on his own prospective political standing, in connection with the Twenty-second Amendment to the Constitution, which since 1951 has limited any subsequent tenure of the presidential office to two terms. This was put through by a Republican Congress (an attempt, it was said, to stop Franklin Roosevelt from running again). The President described the amendment as "not wholly wise" when asked at a press conference whether he thought it might inhibit his attempt to "revitalise the Republican party"—his main professed reason for seeking a second term. Obviously, if Mr Eisenhower is re-elected and cannot run a third time (as he surely could not, in any case), his authority over recalcitrant and unreconstructed members of his party will be weakened; some of it will inevitably pass to the heir presumptive, Mr Nixon, as the Democrats are pointing out. The President was prepared to concede that his influence might be greatly lessened in some directions, but claimed that the power of the Presidency is such that his influence with his own party would still be very great. His qualification is probably true, although not quite in his terms; it is the power of his immense personal prestige (including the myth that has been created as well as the esteem that is real), rather than of his office, which will make the heir presumptive and his followers uniquely dependent on his blessing.

Negro Protest

REPRESENTATIVE ADAM CLAYTON POWELL, a Democrat from Harlem, was recently reported as saying that a sizable proportion of his fellow Negroes were ready to register a protest vote in favour of the Republicans. And Mr Powell himself is willing and eager as well as ready. Mr Powell has now announced that he is supporting the President because of his respect for Mr Eisenhower's prestige abroad, the President's stand on civil rights, and the series of snubs he himself received from Mr Stevenson's camp during the Democratic candidate's recent tour of Harlem.

Mr Powell's desertion sends shivers down Democratic spines. For while in 1952 only 33 per cent of the adult Negro population voted, they went Democratic by just over four to one; the Negro vote is a key factor in several important northern areas, and in Louisiana and South Carolina in 1952 it exceeded the margin by which those states stayed Democratic. A large part of the prestige of the Democrats in the North depends on their appearing as "the party of the minorities," however much they have to compromise with the South in Congress. The Republicans have recently stepped up their bids for Negro support. But they also cannot go too far in their quest for the northern Negro vote: the Eisenhower Democrats in those southern states that went to the Republicans in 1952 are from the most conservative wing of the Democratic party.

Mr Powell had long been disliked by Democrats and even some Negro leaders for confusing the advance towards Negro equality with his own flamboyant and dedicated self-promotion. In the last Congress he was the author of an amendment to the long-awaited school construction Bill. This rider would have withheld federal money from racially segregated schools; it made the defeat of the Bill a foregone conclusion, uniting the conservatives and splitting the liberals. But, after all, the Democratic platform is weaker than the Republican on civil liberties—by a hair's breadth. And it is a nice question which of the two candidates has hedged the most. "He that would achieve the mastery," Mr Stevenson ventured to quote St Paul to Californians earlier this year, "must be temperate in all things." But what to Mr Stevenson is temperance is to Mr Powell procrastination.

Mr Powell has some personal following in Harlem, but otherwise New York Negroes still seem rootedly Democratic. In Chicago, however, the Republicans are working hard and not without hope for the Negro vote; and in Baltimore the indications are that it may break even for the two parties. As in Florida, many Negro leaders are convinced that no Republican could be a worse enemy of their people than is the Democrat, Senator Eastland of Mississippi, a racial bigot who as chairman of the Senate Judiciary Committee has not merely been able to bottle up all civil rights legislation in the Senate, but also all investigations of why the existing laws are not enforced.

Dividing the Offshore Spoils

DRILLING for oil and gas can now be resumed, after an interval of four months, in the areas off the shores of the Gulf of Mexico which are claimed by the governments of both the United States and the State of Louisiana; but the dispute still remains to be settled by the United States Supreme Court. Congress, in 1953, gave control over these submerged lands to Louisiana on the landward side, and to the federal government on the seaward side, of the state's "historic boundary." But it did not define the precise location of this boundary: the state maintains that it dates back to the Louisiana Purchase and extends for three marine leagues (10½ miles) from the coastline; the federal government contends that it extends for only 3 miles. This controversy in turn hinges on the definition of the starting point: where is the coastline? The state contends that it is marked by a chain of buoys which divide, for navigational purposes, the shallow waters from the deep sea—a line extending, in some places, over 25 miles from the shore. The federal government, not surprisingly, adopts a much more restrictive definition.

For the two governments these are not mere technicalities, but decisions on which depends the division of rich spoils from oil. The federal government has already received $275 million in bonus payments on the small fraction of the area it has leased so far, quite apart from rentals and royalties on production. So successful has been recent exploration in the Gulf of Mexico that estimates of the potentially recoverable offshore reserves of oil are continually being raised, and a figure as high as $10 billion is now being quoted for the revenue that the federal government and the states may eventually share. Moreover many of the most promising discoveries have been made in the areas under dispute.

In May Louisiana obtained an injunction from the State Court to prevent the federal government from selling any more leases in the disputed area. After a prolonged legal wrangle, the US Supreme Court decided that all leasing and drilling in this area must stop until the Supreme Court itself ruled on the boundary, unless the two governments could agree on a formula to permit drilling, and possibly leasing, to continue meanwhile. It is this formula which, after much hard bargaining, has been finally agreed. According to press reports, drilling may be resumed on all existing leases. This is good news for the oil companies who have been forced to shut down about half of the costly offshore drilling rigs they had in operation in the Gulf of Mexico.

Inside a line 3 miles from the shore Louisiana may continue to lease freely; outside a line 30 miles from the shore, which allows for all Louisiana's claims, the federal government may do the same. But in the intervening area there is to be no further leasing for the present although, if the Supreme Court has not drawn a boundary in a year's time, leasing may be resumed in the zone between 10½ and 30 miles from the shore. All money received in future from such leases, and from rentals and royalties from existing leases in the disputed area, is to be put in escrow pending the Court's decision. And the federal government, but not the state, will also impound the revenue it has already received since it began leasing in the disputed area.

Ballistic Calculations

FROM A SPECIAL CORRESPONDENT

THE Secretary of Defence has now admitted publicly that military spending will go up next year by nearly $2 billion and will be about 5 per cent higher than this year. If the Democrats take over the Administration the rise may be more rather than less, as it would certainly be—to a politically impractical extent—if the various services had their way. For the staggering cost of the new weapons is forcing the civilian officials in the Defence Department to insist on the closest weighing of all requests for funds by the officers concerned, to decide whether the desired items are essential today or only desirable sometime in the future.

The extravagant wishes of some of the planners are inspired by the bounds forward now being made in weapons-research. Large advances in both science and technology promise that very efficient new weapons will soon be available, and their advocates yearn to have them in quantity, almost heedless of their costs in dollars. Neither the intercontinental ballistic missile (the Air Force has two projects, "Atlas" and "Titan") nor the intermediate range ballistic missile (notably the Army-Navy "Jupiter") is just around the corner, but they seem nearer than was expected a year ago. Several of the new shorter-range missiles, conspicuously better than the existing pioneers, will certainly be available in the fairly near future.

This prospect of technological advance, combined with a calmer judgment on the state of international affairs for some time to come, has had its effect on planning. Thus, not long ago each design for a new bomber was being rushed in order to get the best equipment into the hands of the forces which would use it as soon as possible. Now there is a tendency to get the design proved and ready for production, but not to plunge into grand-scale output until an acute need for it is manifest. Thus the new B-58, a medium bomber capable of supersonic speeds (the first in that category) is just about ready for production, with perhaps a score already turned out for testing. But so far the Air Force has not shown any anxiety to get it in quantity right away. It has been suggested that, in the present advanced state of missile development, any new manned bomber of long or medium range must be recognised as an interim instrument, soon to be discarded, on which heavy investment is not to be encouraged.

Nor are the ICBM and the IRBM the only deterrents in this case. The new air-to-surface missiles are also a factor. "Rascal," now approaching readiness, for example, is thought to be capable of accurate performance at a range of several hundred miles. It would be launched, obviously, from a bomber while still far from the target and correspondingly far from the enemy's maximum defence of that target. The principal air speed of the launched missile would be that of the missile itself, rather than that of the momentum of the launching-plane. Hence, so far as this aspect of the attack is concerned, the launching-plane's own speed is not nearly so important as it was in the day of the ordinary aerial-bomb. The advantages of a new bomber capable of greater speed, accordingly, are not quite so great as they used to be. And a penny saved by not buying a bomber is a penny added to the fund for developing a missile more valuable than a bomber.

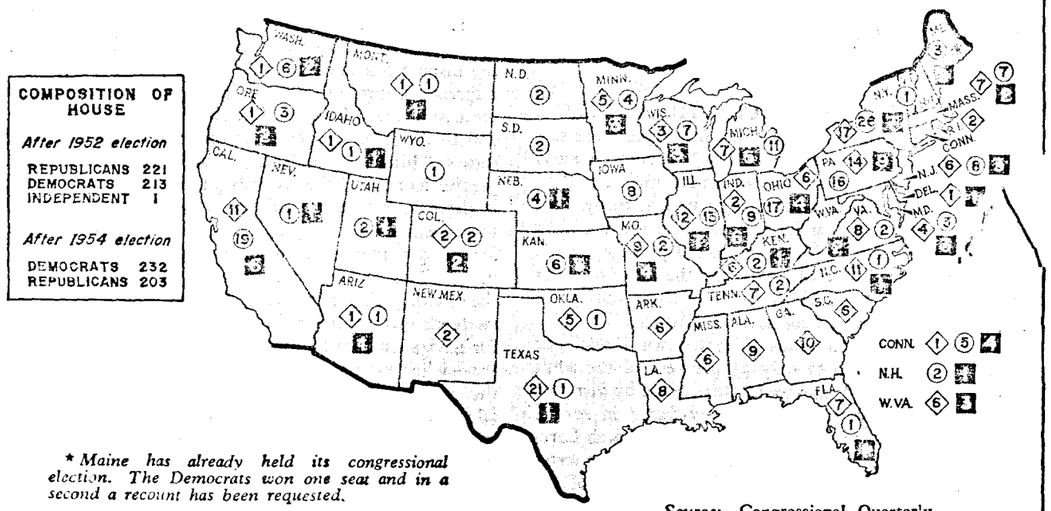
If the cost of the new aircraft were not so forbidding, thrift of this nature would not be so necessary. But the armed services and also the producers of weapons have been compelled to realise that there must be a closer watch on total costs. That the newest weapons must be acquired regardless of expense is not questioned; but concentration will be on these and not on minor improvements in the older weapons. It is clear that the trend is toward "absolute" deterrents to enemy aggression and that, in spite of the vigorous fight which the Army is putting up for the maintenance of a respectable force for conventional warfare, the emphasis is going to be on the unconventional, which happens to be the super-expensive too.

1956 ELECTIONS—HOUSE OF REPRESENTATIVES

◇ Figures indicate number of Democratic Representatives from the state

○ Figures indicate number of Republican Representatives from the state

■ Figures indicate number of marginal seats in each state won by a majority of 55% or less of the vote in 1954



* *Maine has already held its congressional election. The Democrats won one seat and in a second a recount has been requested.*

Source:—Congressional Quarterly.

ALL 435 members of the House must stand for election every two years, most of them in individual districts into which states are divided on the basis of population, but a few of them by statewide vote.

Some of the "marginal" seats are less marginal than the 1954 vote suggests; there were sometimes special circumstances to explain the result, or a good candidate this year may alter the balance. Nevertheless the Democrats hold only 31 of these seats, while there are 63 Republicans who won by only a narrow margin in 1954.

This explains why the Democrats think they have a good chance of keeping control of the House this year, a view which has been strengthened by the outcome of the Maine election last month. On the other hand, the name of a popular presidential candidate on the ballot helps his party's congressional candidates. It would be extraordinary if Mr Eisenhower won the Presidency without also bringing back to Washington a Republican majority in the House of Representatives as he did in 1952—but it may happen this November.

Atoms at Sea

PRESIDENT EISENHOWER'S pet project for a merchant ship powered by atomic energy has at last reached the design stage, and in urging full speed ahead last week the President gave some indication of the characteristics of the proposed vessel. The ship is to carry about 100 passengers and also have a cargo capacity of 12,000 deadweight tons. It will be propelled, at a speed of 21 knots, by a 20,000 hp advanced version of the pressurised water reactor used in the Navy's submarine, the *Nautilus*, and should be at sea in about three years. Of the estimated cost of $40 million, $18 million will be put up by the Maritime Administration, which is to be responsible for the design and construction of the vessel, and $22 million by the Atomic Energy Commission, which will be concerned with the nuclear engine.

The design of the reactor will not be kept secret; indeed, the President's conception of the vessel, as a "floating laboratory, providing indispensable information," and demonstrating "to people everywhere this peacetime use of atomic energy, harnessed for the improvement of human living," is not very far removed from his original vision of a vessel designed as a travelling exhibition of the American initiative in developing atoms for peace. This idealistic project was turned down by Congress in favour of the more realistic development of an atomic merchant ship which would be competitive with vessels powered by conventional engines. The new ship will carry both passengers and cargo, and should have the advantages of high sustained speeds, of a saving in fuel space which will give it greater carrying capacity, and of less need to waste time in port refuelling.

Tepid New England

Boston, Mass.

SUCH political animation as is to be found in the six states of New England relates more to state than to national contests. Despite last month's Democratic successes in Maine hardly anyone expects Mr Stevenson to make much impression on the conservative "upper tier"—Maine, Vermont and New Hampshire—whose combined worth in the electoral college is, in any case, only twelve votes. The remaining interest lies in the outside possibility that Mr Frank Branon, a Democratic farmer who ran the Republican Governor of Vermont very close two years ago, might this time repeat the "Maine miracle" of breaking the Republican monopoly of the state government. The Democratic share in the vote for Governor of Vermont has been rising steadily since the war, from 20 per cent in 1946 to 48 per cent in 1954; in the long run it is such figures that must worry the Republicans, since the Democrats, even when they falter nationally, continue to gather strength in the traditionally one-party Republican states, while, except for isolated forays, the Republicans have failed to do likewise in the one-party Democratic South.

In the lower tier of New England, Rhode Island, the smallest and most densely populated of the forty-eight states, which went Republican last time by less than one per cent of the poll, is expected to transfer its four electoral votes to Mr Stevenson, while Connecticut, with twice the prize, seems safe for Mr Eisenhower. There remains Massachusetts, with sixteen electoral votes, and a population of over four million, divided equally between the metropolitan area of Boston and the rest of the "Commonwealth," and divided equally also between "native" Americans and the "foreign-born" and their children.

Although in state politics the two parties are rather evenly

divided, with the Republicans having a slight advantage in the registration of party members, Massachusetts has gone Democratic in every presidential election from 1928 onwards, except in 1952. In that year the large scale desertion of the Democrats by the Catholic, McCarthy-loving Irish, and the overwrought resentment against Democratic foreign policy among the immigrant groups in general, presented Mr Eisenhower with a 4 per cent lead. The question for this year is whether that lead can be taken away by the damping down of foreign policy as an emotional issue and the phenomenal popularity of Senator John Kennedy, the young Massachusetts Democrat who was elected in the Eisenhower year of 1952 and who nearly won the nomination for Vice President this year.

There is little doubt that if Mr Kennedy were on the Democratic ticket it would win in Massachusetts. A young, handsome, wounded war hero, scion of a wealthy and popular Boston Irish family, Mr Kennedy achieved national stature this year with a best selling book on political courage and a succession of modest, eloquent, engaging appearances before the television screens at the Democratic convention. Since then Mr Kennedy has been putting the party still further in his debt by campaigning up and down the country, wherever there is a Catholic vote, for every bit as if he were on the Democratic ticket himself.

The Senator plans to " saturate " his own state in the last ten days of the campaign ; the local Democrats look forward to his coming like that of a Messiah. Indeed they give the impression of leaving the presidential campaign very largely to him. But enthusiastic as all Massachusetts is about the brilliance of its own son's future prospects, it is questionable whether he can bestow enough of his magic on Mr Stevenson. For the hard truth is that the candidate himself has so far found no way to ignite New Englanders by his personality or his ideas. The chances are that the pull of party regularity and the absence of the crusading spirit that helped Mr Eisenhower in 1952 will restore enough Democrats to Mr Stevenson's column to lower the Republican margin but not to abolish it.

★

Meanwhile, most political talk in Boston concerns not the Presidency but the successor of the popular and highly successful Republican Governor, Mr Christian Herter, who declined to seek a third two-year term. Until six years ago all Massachusetts contests were between Republican Yankees and Democratic Irish, but since then the tickets have become more diversified. In a state where Italian Americans have long been agitating for political recognition, following the lead given by neighbouring Rhode Island, Mr Foster Furcolo is the first candidate with an Italian name to run for Governor. Although he had the wit to be born of an Irish mother there were many Irishmen who were offended when he was nominated with a thumping majority over a rival with a politically potent Irish name. But on his side are the recent Democratic trend of local elections, his own good record as a Congressman, and his assiduous cultivation of all ethnic groups. Against him are Mr Eisenhower's coat tails, Mr Herter's legacy, and the unusual personality of his opponent, Mr Whittier, the Republican Lieutenant-Governor, who is Protestant and Anglo-Saxon without being in any social or temperamental sense " a proper Bostonian."

In Connecticut the Democrats captured the Governorship two years ago. But in spite of the popularity of Mr Ribicoff, New England's first Jewish Governor and the likelihood that he will be re-elected in 1958, most observers agree that Mr Eisenhower will carry the state, but with a substantially smaller margin than the majority of 130,000 which he ran up in 1952. Since Senator Prescott Bush, the Republican who seeks re-election now, was also elected in 1952 to fill four years of an unexpired term but by a majority of only 30,000, it seems clear that, if the President's total falls greatly, the Senator will be in trouble. What is not clear from the rather languid campaign in Connecticut is the political difference between Mr Bush, a New York investment banker, and Mr Dodd, his Democratic opponent for the Senate seat. The contest here is being fought on the middle of the political road where the two parties overlap, at the opposite end of the political (as well as the geographical) map from Oregon, where the issue is squarely joined between incompatible political convictions.

Signing up the Voters

TO the party tacticians, getting people to register so as to be eligible to vote, and then making sure that they do vote, can be more important than trying to persuade them which way to vote. The American Constitution makes clear that the precise terms of the " privilege of voting " are to be defined by state and not federal law, so the qualifications differ greatly. There is a residence requirement in all states, varying from six months in eleven states to two years in three. A majority of the states now keep permanent lists, but in many the individual voter must still re-register every year or sometimes every two years. The deadline for renewal or for registration of new voters has already passed in twenty-four states, but in twelve it does not fall until the last two weeks before the election. Some states make it easy to vote ; others make it hard.

Voters in many states register as nominal supporters of one party or another, and the Democrats appear to be leading the Republicans in the number of voters registering. In Maryland, Arizona and Oregan, all key states, they lead comfortably. The Republicans, however, claim unexpected success in Florida. In California there is a record registration, with the Democrats 928,584 ahead—72,000 more than their lead in 1952. But in that year Mr Eisenhower carried California by 700,000 votes. To register under a party label is not necessarily to vote for that party or, indeed, to vote at all, as the loosely-knit Democrats have often learnt to their cost.

This November it is estimated that 104,850,000 Americans will be of voting age, including two million servicemen, and the " junior voters " in Georgia and Kentucky, where the joy of the franchise begins at eighteen. This is about 4,650,000 more than in 1952, when 63 per cent of eligible voters cast ballots. This percentage may seem low when compared to Britain's 77 per cent in 1955, but the figures would be much closer if southern states, where the result is seldom in doubt and where the Negro, by one means or another, is discouraged from voting, were excluded from the American calculation.

In 1931 the American scientist Jansky reported that radio waves were reaching the earth from outer space ! Yet the science of radio astronomy didn't really get started until after World War II. New radar and radio techniques have discovered *dark stars*—nearly invisible yet radio active, previously hidden from the giant American telescopes on Mount Wilson. In this exciting new science Britain also, despite unfavourable weather, can more than compete with the American astronomers. With their existing radio telescope at Jodrell Bank, Cheshire, Manchester University scientists have made a number of amazing discoveries—adding to our knowledge of the universe.

TUNING IN TO THE STARS

The new, even bigger radio telescope, now being built at Jodrell Bank, to the designs of British Consulting Engineers, Husband & Company, will be the largest in the world. Weighing 2,000 tons, it is completely steerable to consider the faintest radio signals from any part of the sky. To avoid interference from grid and other cables, this plant has its own power house operated by a Mirrlees TL7 engine (250kW) and two other Mirrlees engines provide power at 107 kW each—the Brush Group also supplied the main power switchboard.

POWER PIONEERS

Wherever power is needed for new and unusual projects the Brush Group, through its international sales and service network, offers a comprehensive range of power plant and equipment together with on-the-spot advice and prompt delivery.

The Group produces about a third of the total U.K. output of industrial diesel engines and generating sets—and is the world's largest exporter of this type of equipment.

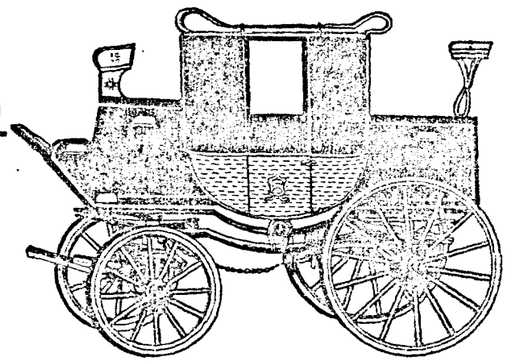
What the Rocket was to the stagecoach



Titanium is to the metals of today

Very occasionally, the slow pace of progress quickens dramatically. Today, titanium — at last harnessed to the needs of engineers — promises to speed the rate of achievement.

No designer in metal can afford to ignore titanium's special properties, particularly its high strength-to-weight ratio and its outstanding resistance to corrosion. Already, aircraft designers are finding in it the answer to some of their most exacting problems. It may provide an answer to yours.

I.C.I. are now producing titanium as a raw metal, and are also making sheet, strip, rod, tube, wire, plate and forging stock from titanium and its alloys. For full technical information about this remarkable new metal, write for the booklet "Wrought Titanium".

The World Overseas

Anglo-Japanese Motes and Beams

FROM OUR CORRESPONDENT IN TOKYO

AFTER a 16-day visit, Lord Selkirk, Chancellor of the Duchy of Lancaster, has left Japan obviously impressed—as who is not ?—by sharply rising productivity in factories and on farms. His goodwill task however was difficult. While the more megaphonic sections of the British press blared at him across 6,000 miles for "hobnobbing with the Japs who are ruining his Duchy," the Japanese were reminding him that in the past year Japan's sterling reserves have fallen by over 50 per cent, a decline which they attribute to unfair restrictions imposed on Japanese goods by "Britain and her colonies."

The truth is that serious misconceptions about each other persist in both Britain and Japan. The British stereotype of Japan is a low-standard country run by unscrupulous monopoly capitalists who ruthlessly exploit their working class and ally themselves with militarists: a Uriah Heep who cunningly but imperfectly conceals his aggressive Napoleonic complex behind a grinning parade of bows and hisses: "So sorry, this my garden now": an unfair competitor who floods the market with his cheap goods, and a bad customer who buys goods only to copy them and then undercut their original manufacturers.

The worst thing about this stereotype is not so much that it is hopelessly out of date as that it is right up *Pravda's* street. For this is just the picture that *Pravda* loves to paint —with the significant difference that, while *Pravda* certainly depicts the Japanese working class as ground down under the heel of monopoly capitalists, allied with militarists, in the Moscow version the militarists are the Americans, and so are the monopoly capitalists. Meanwhile, the facts are that hardly any people in the world are more genuinely pacifist than the Japanese today. Under two per cent of the budget goes on the Japanese defence forces, and the Socialists' popular main plank is to cut even this, while real wages, although admittedly low by European standards, continue to rise (they rose by over eight per cent this year). Also, many of the new Japanese factories offer working conditions that Lancashire might envy.

The Japanese, for their part, have considerable respect for the British way of life and especially for British political institutions ; this persists despite postwar British neglect of Japan, and is likely to survive the present American cultural flood, even the present Japanese craze for baseball. On the other hand, Japan shares the widespread delusion that both the Commonwealth and the sterling area are British equivalents of bowing and hissing, designed to conceal effective British economic control of large parts of the earth. Colonies and Dominions remain indistinguishable still in Japanese eyes, and it is popularly believed that if, say, Australia restricts the entry of Japanese goods, it does so on orders from Whitehall. Lord Selkirk no doubt encountered these misconceptions, and no doubt did his best to dispel them ; but he probably found it rather an uphill job.

Japan and Britain are both islands off mainlands ; and Japan is now under considerable pressure from Communist China to "stand up and declare herself with Asia"—by which Peking means not only recognising Red China, but recognising it as Asia's leading power. The consequences which would flow from such a recognition would almost certainly be more disadvantageous to the western world than the present "flood" of Japanese exports. But Peking is using the bait of trade ; and the Japanese can point out that from the economic angle it is no more unnatural for them to turn again to China than it is for the six Messina countries (who between them absorb 70 per cent of Japan's exports to Western Europe) to contemplate a common market which, the Japanese fear, might well mean sealing off that market to the entry of Japanese goods.

In short, if Japan, the most industrious, the most highly developed, and potentially the friendliest country in Asia as far as the West is concerned, is to be regarded as in any sense a counterweight to Red China's growing influence, something ought to be done to remove misconceptions on both sides. It is not yet too late, but it is getting late: for example, Lord Selkirk could hardly fail to have been struck, as all observers are, by the ready acceptance of Communist propaganda by Japanese students, who are more and more inclined to swallow straight down-the-party-line talk as gospel truth. The British Government is obviously conscious of this need, else it would not have sent Lord Selkirk. British industry can play its part, by carefully reassessing Japan as a market for goods—as the alert West Germans are already doing—instead of constantly grumbling about Japan as an unfair competitor. (The Japanese continue to show great interest in British atomic reactors.)

The British Labour party could certainly help, too, for it is quite on the cards that the Japanese Socialists may quite soon be able to form a government ; they feel (rightly or wrongly) that they are, and are likely to remain, the targets of implacable American suspicion and hostility, and they therefore tend to dismiss out of hand all American warnings against "communism." All the same they are by no means sold on either Russian or Chinese communism ; they like to claim that their model is British democratic socialism.

The claim may not be entirely justified, but it is probably one well worth encouraging, if only because people do tend to behave the way they say they wish to behave, when given half a chance.

The problem of Japanese-British relations has two aspects, one economic and the other political, and it would be idle to pretend that the two are easily reconcilable. But they could probably be brought closer into line than they are now, and it is in everyone's interests that this should be attempted. Lord Selkirk's goodwill visit was a good step in this direction. What Japan is now waiting to see is if there will, in fact, be a real follow through. The ball has been teed, but is the British "driver" still in the bag? And, if it is, will the combined protests of Lancashire and Lord Beaverbrook be allowed to keep it there?

Nationalising Tangier

FROM OUR SPECIAL CORRESPONDENT

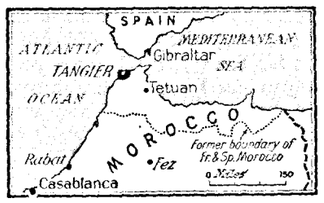
TANGIER is at present the scene of an international conference to tidy up its past and to discuss its future. The conference is being held, it is emphasised in Morocco, on the invitation of the Sultan, and those taking part are the Moroccan Foreign Minister, Mr Ahmed Balafrej, and delegates from the other countries which are represented on the international administration: namely Belgium, Britain, France, Holland, Italy, Sweden, Spain, Portugal and the United States. Russia has never exercised its right, granted in 1945, of taking part in the administration of Tangier, and therefore was not invited to the conference.

The conference began, of course, with expressions of cordiality; an official opening by the Sultan and a splendid *diffa* given by Mr Balafrej and attended by the Sultan's son, Prince Moulay Hassan. The European diplomats, seated on low cushions, ate with their fingers out of courtesy to their hosts, while the Moroccans, out of courtesy to the guests, refrained from using fingers to serve them. The mutual good will was slightly tarnished by the opening speeches of the Sultan and his minister. Mr Balafrej spoke of the conference as a mere exchange of views which would aid the Sultan to come to a decision. But the delegates had been invited to "negotiate," and had expected that any decisions would be taken by agreement.

The surprise was the greater because there was from the start quite a wide measure of potential agreement. The other nations concede that Tangier must be absorbed into Morocco. The French protectorate was ended in March and the Spanish protectorate, in the northern zone, a month later; but in Tangier the transfer of power could only be partial at first, since the issues involved are so complicated. Under a protocol of July the international administrator was replaced by a Governor appointed by the Sultan; and the legislative asembly was dismissed, its powers and those of the committee of control being reduced to those of a municipal council. But most of the omelette still has to be unscrambled. Even now the international courts are not even being discussed, because they cannot be absorbed into the Moroccan system until there is a single system—until, that is, the integration of the former French and Spanish zones has been completed.

For the purpose of unscrambling the rest of the omelette, the present conference has divided itself into three committees. One is considering such questions as the compensation to be paid to officials of the former international administration whose services are no longer required. A second committee is studying the concessions; for example, the telegraph company is Spanish, one cable company British, and there are two American radio stations, a Spanish post office and a British post office. The conferring powers are reported to have agreed on a Moroccan monopoly of posts and telecommunications, and a special agreement is likely to be reached in regard to the Voice of America and the commercial broadcasting station. The third committee has already dealt with the hospitals and schools financed by foreign powers—which presented no difficulty, because Morocco is glad to have them.

The conference is held in private, but rumours about the way things are going have caused alarm and despondency among European residents. It is being said that the delegates do not understand the Arab way of bargaining—that they give things away without first getting something in return: as when the Americans chose, just before the conference, to relinquish the capitulary rights in Morocco which they had kept for three hundred years. As for closing the British post office, some local people will regard that as worse than losing control of the Suez Canal. It is, of course, anomalous that a service started when there was no Sherifian post office should persist, and that it should be possible in a sovereign foreign country to use a stamp with the Queen's head on it. But the speed and reliability of the British post office, and the certainty that letters will not be opened, are appreciated by many people besides the British.



It is amusing to hear people who have come to Tangier to escape paying taxes to the British government getting ready to be angry with that government for not defending their interests. Tangier, they seem to think, should be a little bit British in order to be a home from home for retired people and misfits. But Britain's interest is essentially what it has been ever since Britain was foolish enough, in 1684, to abandon the place that Catherine of Braganza had brought as her dowry to Charles II. That policy was, and is, to prevent Tangier, at the gateway to the Mediterranean, from falling into the hands of a potentially hostile power. That was the policy of the other nations too, and brought it under an international administration: an idea foreshadowed in 1906 in the Act of Algeciras, when various spheres of government passed into European hands; provided for in the Treaty of Fez of 1912, which established the French protectorate; but not finally realised (because of the war) until the Statute of Tangier in 1923. But now that Morocco has recovered full sovereignty, it is in everyone's interest that the country should be prosperous and stable.

This is what now governs the attitude of the conference towards the other half of its work—namely, to discuss the economic future of Tangier, as distinct from liquidating the past. Not all of the powers like the leak in their exchange control which Tangier allows; Spain and France certainly do not. But on balance they are in favour of preserving the peculiarities which have made it a boom town. Tangier has neither income tax nor company tax. Its revenues are drawn from a flat-rate *ad valorem* duty on imports, now 17½ per cent except on some necessities, and from a small tax on land and buildings. There are no exchange restrictions or import controls. These halcyon conditions have led since the war to a great influx of capital. Business houses set up their head offices here to avoid paying tax; capitalists abroad domicile their securities here. The place is a warren of banks, many of them, it is true, just bucket shops that ought to be suppressed (there is no banking law in Tangier). And the visible sign of all this economic activity is the vast amount of building that has gone on since the war.

The boom, however, has tailed off since 1953, and confidence in Tangier as a haven for capital was badly shaken by Morocco's recovery of full sovereignty. How badly is shown by the fact that in December, 1953, there were 53 metric tons of gold in Tangier's banks; by the beginning of 1955 only 40; and by now, none. His Sherifian Majesty has tried to stop the rot by repeated statements that Tangier should have a liberal economic regime, although without specifying how liberal. He is under some pressure from businessmen in the other zones who understandably think it unfair that Tangerines should be free from taxes and restrictions to which they themselves are subject; and also from Si Allal El Fassi, leader of the Istiqlal party, whose rather puzzling view is that Tangier should enjoy freedom from exchange control, but not from import control. There are admittedly some disadvantages for Morocco in a liberal regime for Tangier. It means perpetuating a border around it, which nevertheless will not prevent smuggling into the rest of Morocco, or the leakage of foreign exchange from them. But unless Tangier can either vastly develop its tourist trade (in which case something must be done about the dreadful muddle over visas) or restore business confidence, this busy town may become an empty shell, with its new white buildings peeling, and more than ever of its population scratching a living on the streets as pickpockets, lottery ticket sellers, unwanted guides, shoe-shine boys, or worse.

The business community believes that confidence will not be restored by anything less than an international guarantee of the special regime for Tangier, for a specified number of years. So we come back to the international guarantee which Mr Balafrej once promised, but has now gone back on. Pressed to say just what he meant, Mr Balafrej said that the conference should end in a "declaration" signed by all the participants. But he seems to envisage this as a mere death certificate of the international statute rather than as a comprehensive agreement. It will be a mistake if, to satisfy the extreme nationalists, he tries unilateral action that could only further shake confidence and alienate the friends that Morocco needs.

Frustration at Strasbourg

FROM OUR SPECIAL CORRESPONDENT

"STRASBOURG is a wailing wall without an echo," as an impatient Dutch parliamentarian told his colleagues of Western European Union's Assembly when it held its second, three-day session last week. This frustration ran through all the rather mediocre debates; they were less hopeful than might have been expected since Messrs Adenauer and Mollet last month revived the idea of a "real WEU armaments community" and since the British government has shown signs of willingness to look again at the Union if asked to do so. It was the frustration of parliamentarians who cannot persuade their governments in the Council of the Union to answer questions or even criticisms of their activities. The Council has not, for instance, communicated the full terms of reference to its standing armaments committee to the Assembly's defence committee, whose main job is to follow it. It seems possible that the Assembly's committees may, at least informally, obtain more information in future. Yet the dilemma really goes deeper than that. As Sir James Hutchison, the Conservative rapporteur for the defence committee, noted, the Assembly is hampered because "the Council is interpreting its responsibilities in a narrow way." The governments have confined WEU's role to the standardisation of armaments and to arms control—and seem to have added little to Nato's standardising work. It is not surprising that the parliamentarians tend to emancipate themselves by debating matters well beyond its competence. Some of them even wanted to discuss Suez.

Gaps in Arms Controls

Thus reduced, the Union's most important operation is at present the Agency for the Control of Armaments. This already has a staff of 44 under the Italian Admiral Ferreri. Its inspectors make test checks in depots, camps and arms plants. But with regard to the essential question of controls, they may only check weapons at the assembly stage and cannot inspect earlier processes. It is still not clear whether the agency can persuade the governments to give a wide enough interpretation to "assembly" to make the controls effective.

The full extent of these limitations becomes apparent with the prospect of atomic weapons. The ease with which fissile materials can be turned from pacific to military use at any stage of production necessitates very tight controls at all stages. This only Euratom can provide, though its prospective duties stop short of the control of arms. A WEU-Euratom agreement is therefore the logical conclusion, especially if the system is to function, as its authors hope, as an example for the worldwide control of arms. Politically the most substantial report debated last week was that of Signor Benvenuti which proposed this co-operation. Signor Benvenuti went further. If Britain continues to stand aside from the control system (and by submitting to it only troops stationed in Europe, it is partially standing aside) it becomes a six-power affair with Britain merely associated. To prevent that, Signor Benvenuti appealed to Britain to close the control circuit by joining a "seven-power Euratom."

The only replies to Signor Benvenuti came from the British. As usual the government side was more cautious than the opposition. Lord Stonehaven (Conservative) was negative. Mr John Edwards, speaking for Labour, thought Britain should identify itself with Euratom, but hoped for a halfway house, like the free trade area in relation to the common market. Thorough controls imply that Euratom should have a monopoly of supply of fissile materials, which is at present a major British objection to joining it. Yet the debate has underlined at least two points where the Union falls short: an effective control agency must to some extent have "so-called supranational" powers as Signor Benvenuti called

them; and the practical discrimination between Britain, which is only marginally subject to controls, and the rest of the members of the club weakens their sense of solidarity within it. Some Europeans, like the President of the Belgian Social Christian party, M. Théo Lefèvre, openly denied the Union's proclaimed capacity to replace the defunct European Defence Community.

In fact, the prospects are better than the session made them seem. If the armaments community is really revived by Dr Adenauer and M. Mollet, it can lead far beyond the present fragmentary standardisation of arms to a close co-ordination of Western Union forces. Nato's disarray in Europe under the pressure of the introduction of tactical atomic weapons and of the gaps in French and German contributions to the central front leaves the field more open than usual for the reform, or rather the creation, of the "European nucleus." British interest in the control agency and the change of thinking on European unity in Britain improve the prospects (if Euratom is formed) of an agreement between Euratom and WEU, and between Britain and both, to make control effective. But such changes imply a change in the "political will" of the governments in the Council. Otherwise the Assembly seems doomed to join the other pallid ghosts which line the road to European unity.

Hongkong's Black 46 Hours

FROM OUR CORRESPONDENT

THE Hongkong government authorities fumbled the Kowloon rioting at the outset. The situation got out of hand in the evening and the military were not brought in until the afternoon of the second day. Had the early afternoon warning of the brawl over the removal of Nationalist sticker flags by an over-zealous Chinese official, allegedly unpopular personally in the locality, been properly heeded, the police should have been able to stamp out the semi-organised rioting which flared up in earnest a few hours later. Police reinforcements, who battled against the mobs with restraint and resolution, were being desperately summoned after the rioters had taken control. Then, as violence—and rumours—spread, and tong (secret society) gangsters enthusiastically moved in, military intervention should have been swiftly invoked. The army was ready and willing to take over, but the evidence suggests that there was faulty liaison with the civilian authorities. There might have been a different story had the energetic and experienced Governor, Sir Alexander Grantham, been in the colony instead of returning from his world tour.

As a matter of course, the Communists have been blamed for the development of the second wave of rioting. It is difficult to believe, however, that party strategy could be as devious and subtle as to take the curious form of forcing Chinese to buy and display Nationalist flags and wrecking and setting fire to shops owned by Communist sympathisers. The worst rioting occurred in areas where anti-Communist refugees and strong-arm tongs predominate. The reasonable assumption is that Kuomintang supporters began the rioting over the flags and that the tong hoodlums and other thugs revelled in the opportunity for looting and destruction. Hongkong's most powerful Triad or secret society, the "14 K," has strong criminal sub-branch tongs, notably the "Filial" and "Strong" societies (12,000 and 5,000 members respectively), in the areas affected.

Foreign correspondents were seriously but not unexpectedly hampered in their attempts to cover the rioting. A heavy and frustrating fog of suspicion, timidity and obscurantism overhangs the colonial bureaucracy and officialdom in normal contact with the press; this emergency reduced visibility still further and virtually eliminated all pretence at sensible co-operation, especially when the curfew was applied. The point was well made that Peking, which followed the ugly and dangerous upheaval closely and intelligently, was better informed than the Hongkong press corps. Hence some alarmist canards, like the mythical British army bayonet charge, which gained the worst kind of headlines overseas.

International complications have been raised by the use of Pakistan-born police and Gurkha troops in stemming the riots. It is expected that Pakistan will now ban the recruiting of any more nationals for the Hongkong police force, while Nepal, building up a beautiful new friendship with Peking, has a righteous argument for opposing the use of native sons as mercenaries by a colonial power.

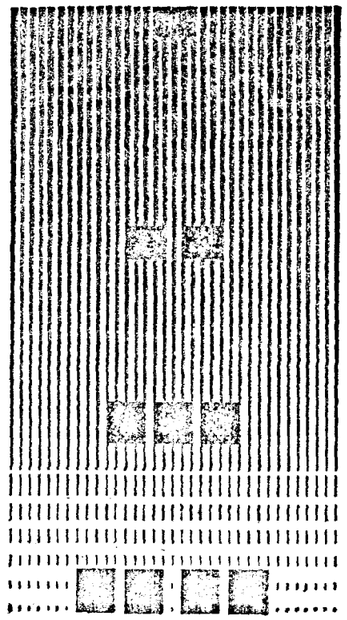
Two grim warnings are implicit in the disorder and bloodshed of Hongkong's black 46 hours. First, there are brutal and reckless forces in seemingly peaceful Hongkong which can be exploded at short notice by any organised influences when disorder is deemed useful or desirable. And, disregarding ideological bitternesses between Communists and the Kuomintang, latent anti-foreigner sentiment is as strong, bristling and instinctive in the colony as elsewhere in Asia: it was impossible not to sense the sympathy of passive Chinese spectators with the rioters as they fought the police and manhandled white men and women.

Finns Face Inflation

BY OUR SPECIAL CORRESPONDENT

EVEN to the casual traveller Finland is a country of contradictions; the former bomb-sites of Helsinki glitter with glass and concrete; a few kilometres away, Tapiola, a new suburb designed to foster social and psychological balance, is rising among the pine woods; in Rovaniemi, the rebuilt capital of Lapland, a superb children's hospital and old people's home are proudly exhibited. But in the forests and along the lakes half the population spend the summer hacking a living out of a few acres of forest soil, too stony and too poor for mechanised farming, and in winter eke out their incomes with timber felling or unemployment relief work.

This contrast between personal poverty and social achievement is equally apparent in the national economy. Finland is in the middle of a serious crisis; inflation, which has been restrained for years, has escaped control; a drop of nearly 25 per cent in the sales of sawn timber, combined with a 10 per cent fall in prices, has lost the country about £1,500,000 worth of foreign exchange; the cost of living index has risen eleven points in the last twelve months and the money market has become so stringent that it is almost impossible to obtain capital. Yet since the war the Finns have managed to make good the loss of Karelia, pay an indemnity of $570 million, rebuild the northern towns



Production grows with good lighting

IN THE MAJORITY of works today the lighting is inadequate or unsuitable, or both. Production is slower than it could be, mistakes are made, health and tempers suffer.

Money spent on a planned lighting system is the best of investments. The foreman can see how things are going; the craftsman at his machine can work more accurately and easily because he can see what he's doing.

Good lighting is only one of the ways in which electricity is playing a vital part in the drive for higher productivity.

Electricity for Productivity

Ask your ELECTRICITY BOARD for advice and information, or get in touch with E.D.A. They can lend you, without charge, films about the uses of electricity in industry. E.D.A. are also publishing a series of books on Electricity and Productivity. Titles now available are: Lighting in Industry, Electric Motors and Controls, Higher Production, Materials Handling, and Resistance Heating. Price 6/6, or 9/- post free.

NEW BRISTOL OLYMPUS GIVES 16,000LB THRUST WITHOUT REHEAT

The latest announced version of the Olympus, the B.OL.6, is officially rated at 16,000 lb thrust without reheat. This makes it the most powerful turbojet for which figures have yet been released.

New versions of the Olympus under development will produce even greater thrust, emphasizing the fact that the Olympus has the greatest development potential of any engine of its class.

Low fuel consumption, high power at high altitudes —these are the basic advantages of the Olympus range, made possible by the twin-spool principle.

Olympus engines now in quantity production, deliver 12,000 lb thrust. Civil versions are available to the world's operators.

burnt by the Germans, and acquire a satisfactory position in world trade. It is not surprising that they find it difficult to know whether they are quite well off or on the point of bankruptcy.

Certainly the Finns never seem to have sat down and tried to be logical about their economy. Inflation seems to them to jump out like a jack-in-the-box whenever they take a hand off the lid. It last escaped when price controls were abolished in the autumn of 1955, and became really serious after the general strike when the government compensated the employers for a 10 per cent wage increase by granting them tax concessions which it could not afford. The Bank of Finland tried to mop up the surplus spending power by a rigorous credit squeeze, but since government spending was not limited this could not be fully effective. The workers, whose wages are tied to the cost of living index, are now entitled to demand a new increase. If they get it, there seems to be no reason why prices and wages should ever stop chasing each other.

Unhappy Coalition

The Finns are aware of the danger and everybody is prepared to try to be reasonable in his demands. But at the moment no one seems to know what a reasonable policy should be. The government has failed to provide any clear indication of what it thinks ought to be done. It is a coalition of Agrarians and Social Democrats, forced into reluctant co-operation by the strength of the Communists, who control nearly a quarter of the Diet and whom the other parties are determined to keep out of office at all costs. The Agrarians represent the smallholders, whose political interests are confined to keeping up food prices and safeguarding the subsidies which now account for nearly a seventh of the country's annual current expenditure. The Social Democrats, on the other hand, having been voted into power by the industrial wage-earners, have to do their utmost to keep prices, and especially food prices, down in relation to wages.

If the problem were merely a straight conflict of economic interests no doubt a compromise could be worked out, but both parties are also divided internally: the Agrarians between the different sorts of farmers, the Social Democrats because many of them double the role of Diet member and trade unionist and are apt to forget which side they are on. Even politicians who have no axe of their own to grind cannot remain indifferent to the economic pressure groups outside the Diet, or to the electorate's demand, not excessive by British standards, for social security. No effective leader has emerged from this untidy welter of personal and group ambitions. Few Finns believe that Mr Fagerholm, the genial Social Democrat prime minister, is capable of imposing an economic policy on the country. He became a popular hero when he saved Finland from its own Communist party in 1948, but since then he has lost much prestige, and he has taken no effective steps to curb inflation since he took office in March.

Lack of capital is the crux of the problem. The present seasonal unemployment, balance-of-payments difficulties, and lag of production behind wages are mainly the result of the rise in production costs at a time when world prices for sawn timber are falling. It has therefore become uneconomic to fell the more remote forests and particularly the slow-growing timber of the far north. With more capital, factories like those at Kuopio could be built for processing the raw wood on the spot into hardboard and cellulose which is easily sold at a profit; more hydro-electric power stations could be built in Lapland to provide industry with cheap fuel and, incidentally, to save the foreign exchange now used for coal; and the mineral wealth of the north, as yet hardly touched, could be exploited. But capital for development the Finns have not got. Even one cellulose factory in Lapland would cost 15 per cent of the country's annual revenue, and at the moment, far from turning taxation into capital investment, the government is using savings to supplement its revenue.

A Confession of Impotence

In order to balance the budget without increasing taxes government bonds have been issued, not only free of tax and bearing a higher interest rate than ordinary deposits, but also tied to the cost of living index. In issuing these the government seems to have confessed that it cannot hope to control inflation. Their immediate effect has been not to increase savings, but to divert them into the government's pocket and to destroy public confidence in any stabilisation programme. Clients' deposits in the ordinary banks have dropped by 7-8,000 million marks while the volume of state bonds has grown by 4,000 million. The government is counting on a further 10,700 million marks from sales of bonds next year. This extra money is needed to pay the bigger pensions which are promised for next January, for unemployment relief work, and for the recent increases in civil servants' salaries.

It is clear that the Finns will have to submit to extremely drastic cuts in their other social services and a freeze in wages and prices if they do not want to price their goods out of world markets. Some experts think that devaluation might help, but it is so unpopular that no Finnish politician dares to advocate it, and it is, in any case, no substitute for reductions in government spending. The trades union council (SAK) has said that although sacrifices must be made they must not fall exclusively on the worker; the Agrarian Union, which has just secured a rise in food prices and is therefore temporarily happy, has called upon the government to "foster the development of normal production" so that the cost of unemployment relief can be reduced, and a national paper has maintained that "the standard of living should not be made lower by decreasing social welfare expenses." Meanwhile, the government has passed the task of working out a stabilisation programme to SAK and the Economic Council, and everybody appears to be hopefully waiting for them to produce a solution which will hurt no one. With the Finnish talent for reconciling contradictions, perhaps they will manage to oblige.

Palestine's Quieter Front

FROM OUR UNITED NATIONS CORRESPONDENT

WHILE the big problems of the Middle East have been occupying the headlines in the world's press, a small United Nations agency has been quietly at work trying to lay the foundations of a real settlement of the Arab-Israel conflict. The UN Conciliation Commission for Palestine was established in 1948 in order to help the parties

to reach an agreement on outstanding questions. Forced by circumstances to leave the larger issues on one side, the commission has directed its efforts to "certain concrete problems on which progress could be made independently of the readiness of the parties to reach overall agreement." It has now issued its report for the period ending September 30, 1956.

Freeing Blocked Funds

The commission has negotiated an agreement with the government of Israel for the complete release of Arab accounts blocked in banks in Israel, subject to one technical reservation which has not proved troublesome. Up to the end of August a total of £2,633,175 was released to Palestine refugees, and this represented about four-fifths of the funds formerly blocked. Considerable progress has also been made with the transfer of securities and other valuables belonging to Palestine refugees which have been held in the safe deposit lockers of banks in Israel. The commission notes that this release scheme,

> which has benefited so many people in so direct and tangible a manner, has clearly demonstrated the way in which international action, coupled with the co-operation and goodwill of the parties directly concerned, can assist in solving some of the many problems which beset the region, thereby gradually reducing the area of disagreement.

Work on the identification of Arab refugee property holdings in Israel has been accelerated. Microfilm copies of the Palestine land registers have been made available to the UN by the British government, and a small staff has been trying to locate all Arab property holdings. Originally it was thought that this operation would not be completed until 1970, but at the present rate of progress it is hoped that the job can be finished by the middle of next year.

The commission has been considering the question of compensation for abandoned Arab lands in Israel, especially in the light of Mr Dulles's suggestion that an international loan might be made to Israel to discharge this undertaking. The Israeli government let it be known about three years ago that it was prepared to accept the principle of compensation under certain conditions. But the commission's efforts to secure unilateral action by Israel have so far been unsuccessful. The present position of the Israeli government is that this question of compensation "cannot be considered in disregard of the general context of Arab-Israel relations" and that no progress is possible until the Arab countries "agree to reverse the present trend of tightening their economic blockade against Israel." The UN commission characterises this position as "unfortunately negative and inconsistent with Israel's previous statements."

Now in its second year

The Paper Bulletin

This is a bulletin service for paper users and makers. It deals with the supply, demand and price trends for paper, paper products and raw materials. The seventh quarterly issue will shortly be available. Full details from:

Hard Decisions for the Dutch

FROM OUR CORRESPONDENT IN HOLLAND

THE long Dutch cabinet crisis has dealt a serious blow to the prestige of parliamentary democracy in Holland, especially as the new government is so like the old one; nine of the thirteen ministers served in Dr Drees's previous cabinet. Originally the delay was due to the protracted argument between the two main parties, the Socialist party, led by Dr Drees, and the Roman Catholic People's party, led by Professor Romme, over whether or not the state should encourage a widespread ownership of property. An agreement to give some tax-exemptions to those who want to save money for immovables such as houses was one outcome of this argument; but the Dutch public remains mystified why agreement on such an apparently simple measure should take so long. The last two months of the crisis, in fact, were largely taken up with a tug-of-war by the parties for as many cabinet seats, and preferably important seats, as possible.

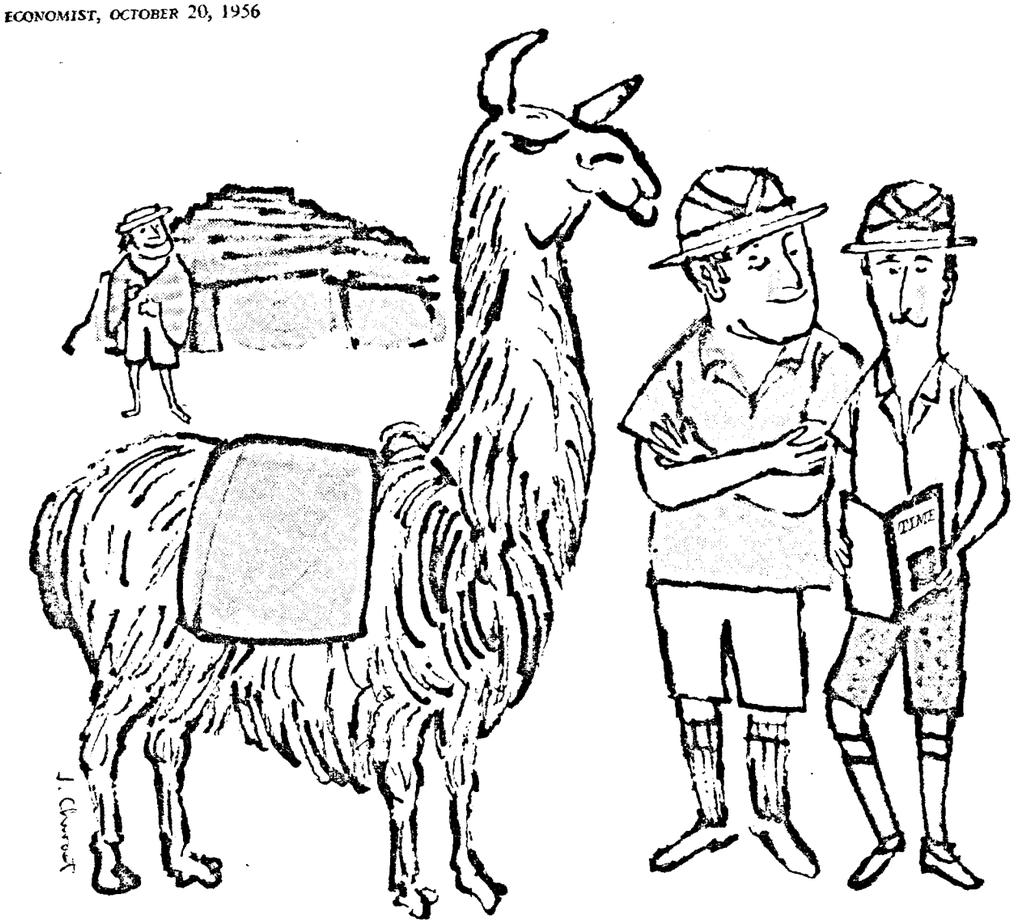
In the end the Socialists emerged much stronger than the Catholics. Their most outstanding politicians are in the cabinet, while the Catholics are represented only by less experienced and important members. Professor Romme himself is not in the government, although he was invited to join. He wants to be as free as possible to withdraw his parliamentary backing from the new coalition whenever seems most useful to him. He wants to choose this moment himself with the object of creating a situation in which only one alternative to a dissolution of parliament and new elections remains—a cabinet without Dr Drees.

Dykes Against Inflation Needed

The new government has some very difficult decisions before it. For the past six months the balance of payments in the European Payments Union has shown a deficit. The dollar deficit is increasing, too. Imports from the dollar area are too high compared with dollar earnings; there used to be a compensating factor in the sale of Dutch shares on the American market, but this has now almost entirely stopped. The public's spending capacity was considerably increased last year by a wage increase of 6 per cent. A further upward jump, in compensation for next year's increase in rents, seems unavoidable. Wage and price levels are, in fact, expected to go up by another six or seven per cent over the next year.

All this means that the exceptionally favourable position enjoyed by Dutch exports over the last six years is now coming to an end. Unless the government takes urgent steps to control wages, prices and investments, inflationary pressures will grow. A political fight over the exact nature of these measures is now going on within the new cabinet and within parliament. The government has, however, already managed to reach agreement on the defence budget for the next two or three years.

Dr Drees seems to be starting his new term of office under much less favourable conditions than his last. But his government has one negative reason for a long lease of life—the political impossibility of forming another one. This means that politicians and parties will think twice before causing a new crisis and that the present cabinet will have to resort constantly to compromise.



You'll meet the most interested people . . . in TIME

One discovery leads to another, TIME after TIME. No sooner do you know that the man who reads the *International Editions* of TIME is a leader in business, government or the professions . . . than you find that 92 out of every 100 of these weekly readers are just like him.

But the most rewarding aspect of TIME's readership lies in the fact that this most interested audience is most remunerative, *twice over*. As individuals, they are decision-makers who buy for their countries and companies. And collectively, they constitute a high-income market for quality *consumer* goods.

You'll further discover that you can match your message to your market. The advertising differs in each of the five world-ranging English-language editions of TIME (though the current news is the same in each). You can choose any or all editions. Naturally, too: you pay only for those you use.

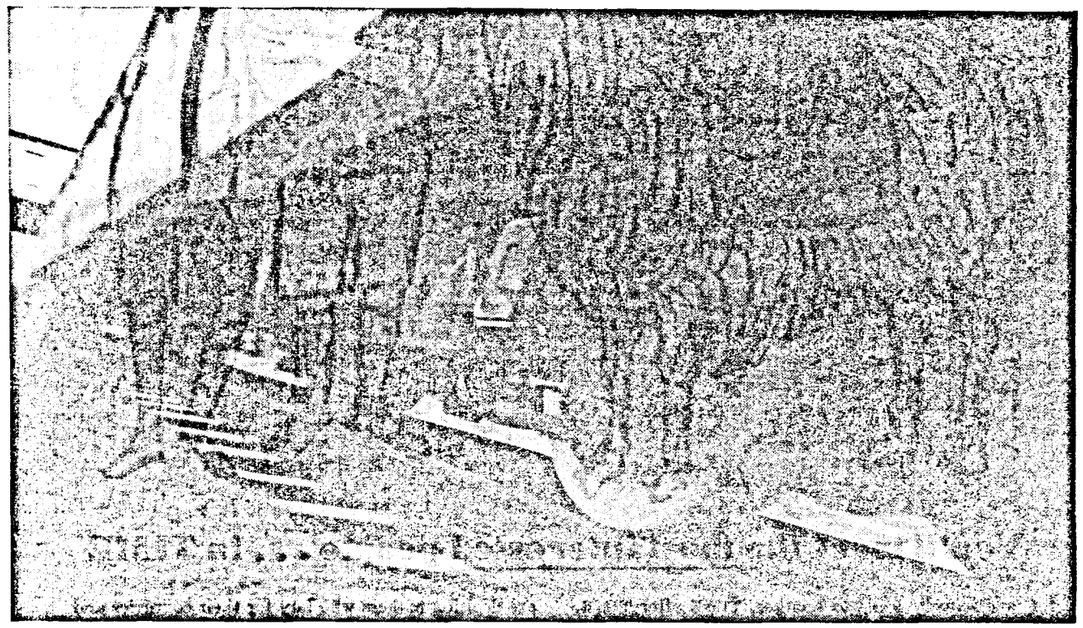
"Boiling" benzene to cool transformers



Electricity is bringing power to our railways. Traction-borne Pyroclor transformers bring safety, economy and flexibility to railway electrification.

YOU MAY THINK IT STRANGE to create heats of over 1000°F. — to keep transformers in trains and buildings at a safe, cool temperature. That, however, is what we do. We find it well worth while. So do the people who buy the transformers.

We use this great heat to condense benzene; react the resultant product with chlorine; and produce a fluid called Pyroclor, which has striking advantages over other transformer coolants.

To begin with, Pyroclor is absolutely *safe:* it's fire resistant and it's chemically inert. This safety brings flexibility and economy to transformer installations: you can put Pyroclor transformers anywhere; no need for expensive long runs of low tension cables; no need for costly fire "protection"— in fact, you will be surprised just how simple a Pyroclor transformer installation can be.

We prefer to leave the more technical advantages of Pyroclor to our — and your — technical experts. We'd just like to make one more point: Pyroclor is the *modern* transformer coolant for the trains, factories, theatres and hospitals of today and tomorrow. It's therefore a typical product of Monsanto . . . bringing a better future closer.

If you (as a manufacturer) are interested in chemicals, it will pay you to get in touch with Monsanto

THE BUSINESS WORLD

Atomic Power Arrives

Nothing, after the Queen opened Calder Hall on Wednesday, will ever be quite the same again—not in atomic energy, not in Britain's economy, not in the world. Eleven years after atom bombs were dropped on Japan, fourteen years after Enrico Fermi proved his theory of controllable chain reaction, and almost a century after the world began to exploit oil as its newest primary fuel, the first full-sized atomic power station has come into operation. The list of currently usable sources of energy is not a long one : timber, coal, petroleum, water, perhaps wind—and now uranium. For the scientists, Wednesday's panoply of flags, flowers and presentations had the nature of a graduation ceremony. The plant itself is the final, crowning experiment of a decade of research, and the technicians are already preoccupied with newer, untried atomic systems evolving in the laboratories where Calder Hall first took shape. For engineers and for industry, Calder Hall is a beginning, the formal inauguration of what will become an atomic power network stretching across Britain and ultimately across the world.

THE relevant fact about Calder Hall today is not its design, nor its military importance, nor its cost, but its size. Atomic power has already been produced in the United States, in Russia and, just recently, in France—but on a small, uneconomic scale. Calder Hall stands as the world's first demonstration that atomic power can be generated, not in miniature, but on the scale on which electricity is normally generated. The four turbo-alternators that fill the long, low turbine house between the two reactors have a total capacity of nearly 100,000 kW, the equivalent of a medium-sized commercial power station.

Calder Hall presents atomic energy as a practical reality—the culmination of bold risks successfully taken. It might have been bigger, more complicated, more advanced in design, using a more effective type of fuel ; it could, in other words, have been based on the reactors now being developed in America and Russia. But it would not then have been generating electricity in October, 1956, at a price not far from parity with existing coal-fired power stations. Britain is the only country that has tried from the start to aim at this parity in costs, and it was a challenging target.

Atomic plant design is a compromise between what is scientifically desirable and what is physically possible using materials and methods immediately to hand. At Calder Hall, speed of construction has been pitted against sophistication of design. This choice has put Britain's atomic development ahead of that of other countries, not by months but by years. In cold economic fact, the loss of a few years may not seem a vital matter in the 20- to 30-year life of a power station. But an atomic plant takes three years to build, and for reasons that will be explained later, at least three years more must elapse before its costs can really be worked out.

★

The scientists have done what was asked of them. It rests with others to decide now how much atomic power the country is to have and how much will be paid for it. An atomic power programme exists, but only in its first stage. More decisive questions about the part that atomic energy will play, in an economy hungry for fuel but fearful about its ability to produce the coal that it needs, still rest in the future.

The Atomic Programme

IT has been plain for some months that the Government's original programme for atomic power, a remarkable and revolutionary document when it was drafted nearly two years ago, under-estimated by half the scale and the pace at which it would be possible to introduce atomic energy into Britain. The power stations outlined in the plan—twelve to be built in the ten years to 1965—were not expected to be more than double the size of Calder Hall. Rough capacities of 150,000 kW to 200,000 kW were mentioned, to give a total of 1,500,000 kW to 2 million kW of atomic generating capacity, or about 5 per cent of the total installed generating plant that the country is expected to require by that date. But with only two of the four Calder Hall turbines turning, industry has submitted tenders for reactors of 300,000 kW, and could today design them for 400,000 kW capacity, nearly double the plan's upper figure and three times its more conservative estimate.

If, then, the number of stations set out in the programme were to be built to plan, but the Central Electricity Authority took advantage of industry's ability to design bigger nuclear installations, the atomic generating capacity functioning in this country by the end of 1956 could easily approach 4 million kW. If, as seems more likely, the number of atomic stations contemplated is actually increased to a total of 15 or more, then roughly 5 million kW, or 12 per cent of the country's generating capacity, might be atom powered and uranium fuelled by 1965.

This is not a big proportion of the total electricity supply of the country, and in terms of coal saved it may not mean much more than 10 to 12 million tons a year, twice the figure mentioned in the original scheme and the equivalent of about three weeks' output from the mines. The real significance of the figures is the implication they carry that within a few years, probably considerably sooner than expected, all the extra generating capacity that has to be provided each year to keep up with the rising electricity demand will come from atomic power stations, and not, as at present, from building new coal-fired stations.

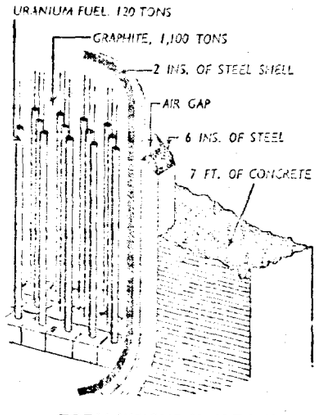
The electricity supply industry of this country will remain firmly based on coal for decades to come. The problem of power from coal is still only a marginal one, centring around the difficulty of increasing the amount of coal raised every year by the tonnage needed to keep pace with the steadily rising demand for energy. Last year, the Central Electricity Authority used nearly 41 million tons of coal and coke, and there would be no difficulty in finding the same tonnage next year and the year after, and so on. But there might be acute difficulty in finding the extra 25 million tons over and above today's 41 million that the expanding power stations are expected to need by 1965, unless other coal consumers were rationed. If some of the extra kilowatts can be provided by burning uranium instead of burning coal, the difficulties involved in expanding coal supplies become so much the less pressing.

How radically the original White Paper plan will be changed depends on the conclusions that the CEA will reach after studying the tenders submitted by the four engineering groups for its first two atom stations. These tenders provide the first detailed estimates that the electricity industry has yet seen of the likely cost of building and running an atomic power station. The evidence should make it easier to decide at what point the present policy of providing a substantial proportion of each year's additional generating capacity from new coal-fired plant could safely be changed in direction towards an investment programme based primarily on atomic power. But no rational decision is possible until more is known about the life of an atomic station and, in particular, the life of its fuel.

Atomic Costs

ATOMIC reactors of the Calder Hall type make joint products: electricity and plutonium. Who is to say what each costs? Plutonium is the principal atomic explosive, and it is also relatively scarce in this country; so it is generally assumed that the CEA will be able to command a substantial rebate for the plutonium produced in its power stations that it will sell back to the Atomic Energy Authority. The first detailed estimates that were made last summer about atomic power costs in Britain by the Atomic Energy Authority's economist, Mr J. A. Jukes, suggested that the gross cost of producing electricity in an atomic power station of the Calder Hall type would be about ¾d. per unit, and that receipts from the sale of plutonium would bring this down to about ½d. net, roughly what it costs to produce electricity from a new coal-fired station.

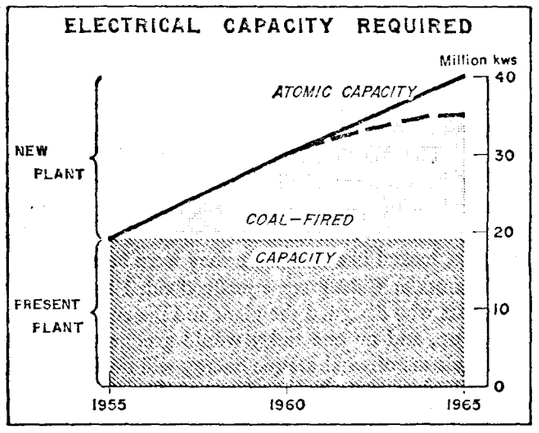
STRUCTURE OF A REACTOR



TOTAL WEIGHT 33,000 TONS

Calder Hall cost between £15 million and £16 million to build, or rather more than £150 per kW of its rated capacity. Since it was begun, marked reductions in the capital cost per unit of output have come in sight—for two virtuously interlocked reasons. The exceptional demands that the building of nuclear reactors has placed upon civil engineering technique—and behind it, on the techniques of the boiler makers, the instrument industry, the steel masters and their many sub-contractors—have brought forth significant advances, particularly in the method of welding on site. At least one of the contractors tendering for the new CEA nuclear stations is prepared to weld 4-inch steel plate on site as against the 2-inch plate used for the pressure shell at Calder Hall. Welding methods have hitherto limited the size and strength of the pressure shell that could be erected, and these are the critical measurements that decide the power output of the reactor.

Improvements in construction technique, design of shell and fuel element, and operating conditions thus interact to hold out to nuclear electricity considerable economies of scale—nuclear power stations of greater capacity for a much less than proportionate increase in construction costs, and hence lower capital costs per kilowatt. The first commercial stations to be built for CEA should not work out at much more than £120 of capital cost per kW of capacity. This is still a good deal higher than the cost of building a coal-fired station, which averages about £75 per kilowatt, and in recent cases on favourable sites has been brought as low as £50 per kW. In the longer run, however, a nuclear station



approaching 400,000 kW in capacity may not cost much more than £20 million, against Calder Hall's £15 million—perhaps £50-£60 per kW.

A cautious minded observer might feel happier that there is good hope of cost reductions in building—in case calculations on the fuel side of the account go awry. The initial fuel charge costs about £30 per kW of capacity, and the present guess is that over the life of the station nuclear fuel will constitute just over half the cost of atomic power. The assumption, in AEA's estimates of cost, that the fuel charge will last three years, is based on a number of hypotheses that may or may not prove valid. The fuel elements are subject to tremendous stresses and pressures set up by the fission process. No direct evidence yet exists whether they can withstand these forces and remain intact until their uranium has been fully consumed. In the big plutonium factories, like Windscale across the Calder river, and also at Calder Hall itself, the fuel is removed fairly rapidly to extract the plutonium content before it has become too contaminated with a second, useless form of non-fissile plutonium (plutonium 240). A commercial power station containing £5 million worth of fuel in its reactor swings the argument the other way towards burning up as much of the uranium as possible. All that can now be said, before practical experience has been gained, is that premature failure of the fuel elements could have unfortunate effects on the ultimate cost of electricity.

Atoms or Coal?

THE immediate impact of atomic electricity is therefor to relieve both the CEA and the Coal Board of their more pressing anxieties about extra coal supplies, without holding out any early prospects of a fall in electricity prices. Even if atomic electricity were to prove dramatically cheap—which is not impossible—the quantities in which it is likely to be produced during the next decade are too small to have any great impact on general selling prices. But the prospect that atomic power does hold out, even on today's conservative cost estimates, is the chance that the price of electricity may continue to fall relatively to the prices of most other fuels and industrial materials, as it has throughout the history of electricity supply. If extra electrical power could be provided only by installing more coal and oil-fired boilers every year, with increasing pressure on coal and oil supplies to provide the extra fuel tonnages needed, then some rise in electricity prices might hardly be avoided: though the efficiency of generation from coal is still rising, the nation would pay dearly for the few million tons of marginal imported fuels that CEA would need each year. Calder Hall may mark the end of this enervating and discouraging process.

By about 1963 CEA will have to decide whether it can cease building any more coal-fired stations—before the atomic stations have been fully proved. The first commercial stations, for which industry submitted tenders at the beginning of this month, will not be commissioned much before 1960. By 1963, the CEA will know whether the guesses about nuclear costs have been correct. The first detailed programme of atomic construction is due to end in 1965, with four stations of more advanced design. Will the knowledge accumulated in the next seven years be enough to warrant a crucial decision whether to cease coal-fired building for ever and base the country's future expansion on the atom? Coal and oil are badly needed for purposes other than the generation of electricity. Pressures on supplies of these conventional fuels by 1965 may be great enough to justify the taking of risks that caution and conservatism might otherwise postpone.

The early start that Calder Hall gives Britain in the atomic field does at least offer the choice of backing an alternative fuel policy so many years the sooner. The economic gain to Britain of these few, possibly critical, years is worth every effort put into Calder Hall, even if British industry were never to export a single atomic power station, even if the primitive satisfaction in beating other countries to a new technical revolution no longer sent a glow through the heart of a nation. For it would be unfair and misleading to underrate the immense effort that has gone to the building of Calder Hall.

The Engineering of Calder Hall

TO build an atomic power station of this so-called simple type taxes the ingenuity of the contractors to the maximum. The natural uranium metal with which Calder Hall is fuelled is the simplest and cheapest form of atomic fuel. It is 99.3 per cent non-fissile ; that is why 120 tons of fuel are needed in each reactor. The structure of a Calder reactor, an 80-foot-high hexagon, is roughly shown in the diagram on page 258. The system of generating electricity from a reactor of this kind depends on blowing carbon dioxide gas over fuel elements hot from fission, and using this heated gas to raise steam in the four boilers that stand at each corner of the building housing the reactor. The process then follows the conventional pattern of electricity generation from steam-driven turbines, except that the temperature is far lower, the steam is wetter and the pressures lower than in conventional power stations.

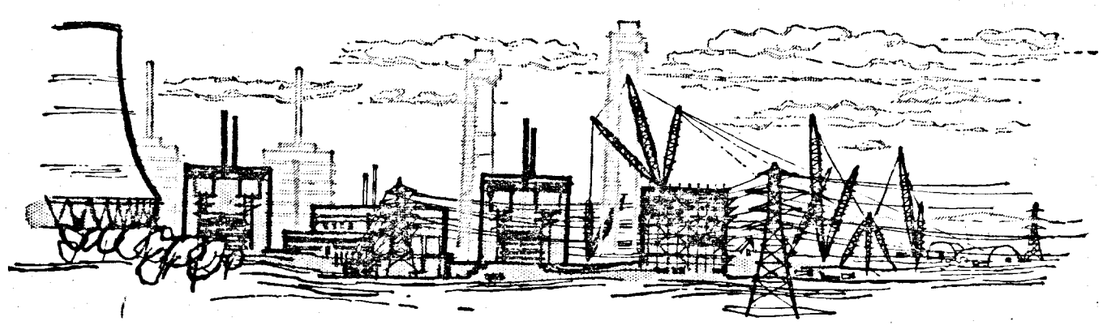
The engineering on the site is more complicated than this description might suggest. The striking feature about a plant like Calder Hall is the huge size of each unit and the extreme precision with which each is assembled. Neither size of structure nor precision of engineering is a formidable problem to modern industry if the two occur separately. But when they are combined, and in a plant that has to be assembled on site and in the open air, engineers are confronted with tasks they have not attempted before. The advances being made now in nuclear power station design are largely developments in on-site engineering methods that make bigger power stations possible, and developments in metallurgy that ease some of the limitations imposed by imperfections in the materials available.

The Calder Hall site presents a remarkable picture of the separate stages of atomic construction. Only the first out of what will ultimately be four reactors is in operation, encased for ever out of sight behind 7-foot walls of concrete. Every vista ends in high, blank walls, and the sense of unreality, heightened by the total absence of any sight, sound or smell or smoke to suggest the violent reactions inside, grows with each frustrated attempt to find some point of contact with, or catch some sign from, the monster inside.

The second Calder reactor is three-quarters finished and due to come into operation at the end of the year. Until recently it was still possible to get near the reactor shell. Welders were joining bundles of half-inch steel pipes, working awkwardly in oddly-shaped apertures in and around the concrete shield ; there are 1,600 of these pipes to each reactor, continuously drawing off gas samples to test them for traces of burst fuel rods. The loading face on the top of the reactor was not quite finished ; the livid pastel paints that give the finished parts of Calder the occasional air of a mental therapy ward had yet to be applied.

Beyond these lie the half-finished structures of the Calder "B" site. The guy ropes that hold the 180-foot cranes stretch a web of steel over Calder "A" and almost as far as Windscale. The concrete shield has been poured for the third reactor and some of the 30-ton sections of the pressure vessel lowered into it stage by stage. The walls and roof of the building itself will go up only when the reactor is finished. Looking downwards 80 feet from the top of the shield towards the steel shell that will ultimately be the reactor core, the ponderous monolithic scale of atomic engineering is conveyed in a way that is missing from the finished plant. It is then possible to realise that 33,000 tons of graphite, steel and concrete are needed to contain safely the force of a splitting atom of obscure, yellow metal. The fourth and final reactor is in process of having its concrete shell constructed, a half-finished catacomb with elegant concrete arches doomed to be shut away for ever from human eyes. The pyramids, perhaps, looked like this while they were being built.

Honours at Calder are equally divided between the scientists who designed the plant and the engineers who put it up, and no one today would grudge them their proud claims of what atomic energy will do for Britain. There is time enough tomorrow to ask questions about design policy for future power stations, about relations with industry (now that industry, too, is turning to atomic design), about exports for atomic plants and, more broadly, about the investment questions that lie ahead to be answered. It will take a long time to assess the debt that the country owes to the energetic, articulate and confident men responsible for Calder Hall. The clear and unromantic vision behind the plan to turn it into the world's first commercial atomic power station is the biggest, and the most successful, venture that postwar Britain has taken.



Business Notes

Wider Interest in Gilt-Edged

CYNICS in the Stock Exchange date the revival of the gilt-edged market from the publication of the Dunlop Rubber Company's half yearly figures a fortnight ago. There is a modicum of truth in that view ; Dunlop did not produce the only disappointing half yearly profit, though it produced the worst of them ; disappointing news from industry was not the only reason why investors turned their attention towards fixed interest securities, but it was one of the reasons and, in retrospect, it is clear that gilt-edged securities quietly took the lead about a fortnight ago. By the middle of this week the revival of buying was marked and it was spreading from the shorter dated stocks to the longer as normally happens when confidence is rising. There has been nothing in industrial shares to match that movement, despite the start of the new account this week, nor in the foreign exchange market where sterling this week has failed to develop any decisive tendency. Over the fortnight that ended on Wednesday the *Financial Times* index of fixed interest stocks has edged up from 92.78 to 93.09, while the industrial index has edged down to stand at 177.9 compared with 179.4.

The gilt-edged revival, small though it is, has opened opportunities for those sponsors of fixed interest securities that have been able to come forward. The London County Council's £15 million 5½ per cent issue which had been regarded as a severe test for a small market was a better success than had been foreseen. Applicants for up to £5,000 received full allotment and the larger ones 78 per cent of their applications. Dealings started on Monday in a favourable market at ⅛ premium and by Wednesday the price had improved by ⅜ premium over the issue price of 99½. Not less fortunate was the General Electric Company with its issue of £6 million unsecured loan stock 1976-81 which was offered to existing shareholders and loan stockholders. Applicants for up to £6,000 received full allotment and larger applicants 50 per cent of their applications. The stock opened at a premium of $\frac{5}{16}$ and by the middle of the week had risen to 1⅜ premium. Institutions now have a little money to invest in suitable fixed interest stocks. But their appetite is not unlimited and present successes are the result of careful thinning down of the queue of would-be borrowers.

Mr Macmillan and the Motor Makers

DINING this week with the industry that his financial policies have hurt more than any other, on the eve of the Motor Show, Mr Macmillan had to expect some criticism of that policy. He got it: Mr F. A. Perkins, president of the Society of Motor Manufacturers and Traders, after describing with some pride the industry's response to earlier Government requests, first to switch to war materials and then to increase exports, commented

> What do we find today? We find the Government are taking every possible step to down-grade the industry. In fact it would almost seem as if they do not welcome its survival.

The Chancellor's answer was as firm as might have been expected. The squeeze was not intended to strangle the economy, he said, but to get it into better shape: there was now a little more flexibility in employment and business generally, and that was all to the good. He was not trying to reduce investment, but to flatten out the curve ; it was inevitable that pressure should fall on the motor industry, but he was confident that it would be able to readjust without "half as much of the trouble and difficulties which gloomy prophets had indicated."

Upon one topic, however, Mr Macmillan received perhaps unexpected support at the SMMT dinner—the question of joining a free trade area with Europe. The motor industry is often considered one of the British industries that might feel the draught if its current 33⅓ per cent tariff, the highest in any major European country, were to be removed. Mr Perkins, however—a maker of diesel engines who can successfully compete today in the German market—found it "refreshing to find that the Government is planning a policy for economic success in Europe coupled with the continued development of the Commonwealth." How far his enthusiasm is shared by car manufacturers remains to be seen.

Esso Comes to Market

UNDERWRITING for the Esso Petroleum Company's issue of £10 million 5½ per cent first debenture stock 1974-78 at £97 is complete, and the lists will open and close on Thursday next week. The prospectus invites careful study from two angles. First, the issue is itself a considerable financial operation and part of a much bigger one ; investors will wish to make their dispositions. Secondly the prospectus reveals rather more of the plans and achievements of the company than has hitherto been known, even though Esso, which is a subsidiary of the Standard Oil Company of New Jersey, has been in the habit of gratuitously making its annual report public.

As an investment the new stock must be considered on its own merits: it is not guaranteed by the American parent, though it is naturally relevant that after the capital changes now proposed the American parent will have £60 million of ordinary capital ranking behind the debenture stock. The new stock must also be considered along with £10 million

of 5 per cent first debenture stock 1963-72 already issued privately, which ranks *pari passu* with the new stock but which is not at present quoted. There is also a further £7 million of debenture stock for which Capital Issues Committee consent has been granted and which will no doubt be issued when the market is propitious. But though the present debenture issue is, so to say, open ended and though it relies wholly on Esso's own assets and earnings, the cover is first rate. On assets the £20 million of debenture stock that will be in existence after the present issue is covered by £75 million of assets. On average profits of the last five years, a gross interest charge of £1,050,000 a year is covered by earnings of £8,232,062.

The auspices also are first rate; with Messrs Morgan Grenfell and Company and three leading firms of stockbrokers as sponsors, and the instalments, with only £25 payable on application, are well spread. The remaining question for investors is whether the price is right. It is certainly high enough for present markets. To redemption at par on the latest date, the gross yield is £5 14s. 10d. per cent and the flat yield £5 13s. 5d. per cent. To redemption at £102 on the earliest date the yield is only slightly higher. Comparison with recent issues in the trustee market—the LCC 5½ per cent loan, for example—is less favourable than appears because the Esso stock will be subject to stamp duty. Investors are moderately on the feed again for longish dated stocks with high coupons and this is probably just long enough and the yield just high enough to tickle their fancy.

Plans Ahead

Esso's achievement has been massive. The profit record calculated before debenture interest and before British tax, and shown on a slightly different basis from the figures in annual reports, reveals only one break in the upward trend of earnings over the postwar decade—a fall in 1954 due mainly to lower selling prices. Over the whole period group profits have risen from £1.5 million in 1946 to £10.2 million in 1955. Net tangible assets at the end of last year (before deducting the first £10 million of debenture stock) were £65.4 million. Group turnover for 1955 is now returned at £215 million, a figure that differs significantly from the £197.3 million previously shown for Esso without its subsidiaries.

The future is not less impressive. In addition to its developments at Fawley, the company has bought 960 acres near Milford Haven, though it has yet to take a final decision about their ultimate use. Esso plans to spend no less than £50 million on fixed assets including tankers in 1956 and 1957, and its requirements for working capital will rise at the same time. Against that programme, the £10 million debenture issue has evidently been tailored to suit the presumed limits that the market can at present take. The company's bank overdrafts and acceptances on December 31, 1955, actually amounted to £13.2 million. In total British investors will be supplying £27 million on the three debenture issues. A further large sum is being provided from retained profits and these retentions are recognised in the £10 million free scrip issue that Standard Oil of New Jersey is to receive. A further £20 million will be put up by the American parent in subscribing for an additional 20 million £1 ordinary shares in cash at par. There may be regrets that the American company is not prepared to let the British investor hold even a slim slice of the equity, instead of doing all its local borrowing on debentures. But the British tax on distributed profits is partly to blame.

Manpower and Steel

SINCE the end of last year, when its opinionated but authoritative *Statistical Bulletin* was emasculated into a mere monthly selection of figures published jointly with the Iron and Steel Board, the British Iron and Steel Federation has expressed its opinions to the public through a quarterly *Steel Review*. This is a much prettier piece of printing; but it has been saved from developing into the glossy exercise in self-congratulation common to its kind by the federation's reiterated emphasis, in each succeeding issue, upon one dominating theme: an examination of the factors that now and in the future must be taken into account in planning the expansion of the British steel industry. These factors, for the most part, are equally relevant to the expansion of the British economy in general. The one upon which the industry concentrates in its latest *Review* certainly is: future supplies of manpower, and the productivity with which steel and other sectors of the economy are likely to be able to equip that manpower.

It begins from the familiar fact that while the population of working age in Britain can be expected to increase between now and 1965 by about 2½ per cent—as against an actual decline in the last ten years—during the next 15 years after that it is likely to fall, and even between now and 1965 the labour force is liable to be docked of one year's young people by the raising of the school-leaving age. About 4 per cent of men between 15 and 64 and about 52 per cent of women between 15 and 59 are not "gainfully employed." As in recent years, more of these may decide to go out to work; but there are limits to such supplementing of the labour force, particularly as further education is likely to hold more young men and women out of "gainful" activity. Continued economic expansion over any long run, therefore, depends upon continuing to increase productivity.

In particular industries, Mr E. F. Schumacher of the National Coal Board argues in the *Review*, the main impetus to higher productivity will continue to be that the cost of labour rises faster than the cost of doing the same man's job by machine (a persuasive argument discussed in these columns a few weeks ago). In the economy as a whole, the federation itself adds, productivity has risen and may continue to rise because the labour force in industries with high output per head, such as the metal-using industries, grows faster than elsewhere. In the upshot, the federation is not pessimistic: "The slower increase in the population of working age need not impair British industrial growth." But it adds two provisos—that Britain will require an educational system adequate to meet the technological challenge, and that "appropriate fiscal and monetary policies needed to foster industrial investment are followed."

The Canal Company Takes Stock

THOUGH the Suez Canal Company's claims for compensation held the foreground of the shareholders' meeting in Paris on Monday the company seems not over keen to stress them now. For that would be to admit that it no longer hopes to bargain its consent to Egypt's breach of contract and the partial withdrawal of its financial claims against a rôle, however modest, in a new international management of the canal. Yet it is clear that the company may have to be satisfied with compensation ; and its claims on behalf of its 100,000 shareholders (half of whom own less than three shares) are well defined.

It rejects, as the chairman, M. François Charles-Roux explained, the Egyptian offer to indemnify shareholders at the bourse value of their shares on the eve of nationalisation ; for the rates were already depressed by fears of nationalisation. Instead it wants, first, compensation for the twelve lost years of its concession—one third of receipts till 1968, that being the ratio of receipts to profits (and profits were nearly eleven million pounds) in 1955. Second, it wants compensation for those of its assets in Egypt to which it was entitled when the concession ended, the value of which is put at about thirty-five million pounds. Last, it wants compensation for payments still due for instance on pensions and debentures. (Only 53,000 debentures remain, worth under three million pounds, to be repaid in instalments by 1962 ; but the freezing of the company's deposits in Egypt where the payments must be made is holding up their redemption.) These claims, together with the £60 million investment portfolio held outside Egypt, greatly exceed the most generous interpretation of the Egyptian offer.

The company's first care is to strengthen its bargaining status, by obtaining an advance on compensation in the form of a portion of the Users' Association's receipts. Its prospects of receiving a sizeable sum are slightly improved by the fact that the association could not legally levy tolls without the company's consent. The Security Council's resolution which sets up an arbitration tribunal to settle the company's dispute with Egypt also strengthens the company's case by implicitly confirming its continued existence and independent status, with its sixty million pounds holdings outside Egypt. (Egypt, disregarding international law, has claimed these as its own.) All this does not mean the company has support in its effort to retain an interest in the canal. It does seem to mean that a just settlement would not be disadvantageous to the shareholders and the movement of Canal shares seems to recognise the fact. The original shares now stand in London at £60 10s. compared with £52 10s. a week ago, the actions de jouissance at £40 10s. compared with £36, and the founders' shares at £39 compared with £32 10s.

What Price Oil?

THIS week's increase of ½d. a gallon in the major oil companies' prices of heavy fuel oil makes more economic sense than last week's ½d. a gallon increase in the price of their petrol. Fuel oil demand is now increasing at the rate of 20 per cent a year, while petrol consumption is rising only by about 3 per cent and sales of the standard grades are actually falling. To meet the new fuel oil demand all of the major oil companies in Britain are making large additions to their refinery capacity. Since there is a limit to the flexibility of any refinery, this means that they are going to produce more petrol as well. Unless they can dispose of all of their additional output of petrol, either at home or abroad, at present prices—an achievement which, to judge by the present trend in demand, will not be easy—then, if refinery profit margins are to be maintained, the prices of fuel oil must go up. Fuel oil prices have indeed risen by over 15 per cent since July, 1955, while the retail price (including tax) of the standard grade of petrol has risen by only about 1 per cent. But fuel oil still fetches only about half the price of petrol. Moreover, coal prices have risen faster than fuel oil prices during the last fifteen months.

Camp Bird Thinks Again

MOVES and counter moves go on in the campaign of Camp Bird, the mining company, to take over the share capital of 18 tin mining companies and redeploy their liquid assets. Boards of some of the companies have announced a vigorous rejection of the plan and a number of companies have proposed to return some of those surplus liquid assets to the shareholders. The reaction of the tin company shareholders is best described in the Camp Bird company's own words. The company does not disclose the number of replies received ; it says that "over 75 per cent of the replies received were in favour of the share exchange proposal, but a large number of shareholders consider the published basis of exchange inadequate." Less audacious bidders might have retired hurt. The Camp Bird directors, among whom Mr John Dalgleish is chairman, have simply improved the offer. How long can this auction through the columns of the press continue ? Has Mr Dalgleish yet reached his limit ?

	Net Assets per Share	Price Now	§ Original Offer	New Exchange Basis	Value of New Offer†
	s. d.	s. d.	s. d.		s. d.
Kinta Tin.....	13 6	21 3	15 2½	4 Camp Bird for 3	18 10

* Allowing for return of capital. † Camp Bird taken at 14s. 1½d.
§ Camp Bird taken at 13s. 10½d.

The table shows the liquid assets of those companies in respect of which Mr Dalgleish has made new and definitive offers. It shows the value of the old offer taking Camp Bird at 13s. 10½d., the previously indicated price ; the value of the new offer taking Camp Bird at last Friday's price of 14s. 4½d. ; the net assets of the companies ; and the present market prices. It certainly shows an improvement in the offer and it equally shows that if Camp Bird succeeded in buying at its new prices it would still be buying

cheaply. One factor that shareholders in the tin companies should not overlook is that the directors of Camp Bird are still offering to pay, not in the coin of the realm, but in their own shares. If the bids, or some of them, were successful, and if a large number of tin shareholders found themselves potential sellers of Camp Bird shares, could those shares hold the current price ?

Landlords and Mr Sandys

PROPERTY shares enjoyed a flicker of activity at the end of last week, after Mr Duncan Sandys had declared his policy of abolishing rent control by stages, but it was only a flicker ; investors soon realised the wisdom—on a subject as complicated as rent control—of waiting for the wording of the bill. Some of them also must have recalled their hopes from the Housing Repairs and Rents Act of 1954, and how slowly they have been fulfilled. On the other hand, the property companies seem well enough pleased with the prospect that Mr Sandys holds out. They are promised a progressive process of abolition of rent control, and they have not asked for more.

What do they hope for from Mr Sandys's plan ? His proposals are three. First he will set free from control owner occupier houses. There are about five million of these and though it is obvious that that number has been swelled by sales to sitting tenants during the period of control, it is not —at least in the property owners' view—likely that a large reverse process of releasing owner occupier houses for letting would begin. Secondly, the Minister foreshadowed a possible decontrol of a slice of the high valued houses. The present guess is that he may do so by reference to rateable value ; if so, decontrol will have to extend rather far down the scale of rateable value to be of much use. As the total of rent-restricted houses (excluding those in owner-occupation) is only 5 million and as most of the lower rated houses are let, release of those with a rateable value of over £25 would not make a significant contribution. It might, in the landlord's view, be necessary to extend decontrol down to an annual value of £18 or even £13. Flats let with services form a small proportion of the total, but the cost of those services is deducted from the rental value before arriving at the rateable value ; many flats have thus been brought under rent control without real justification and it is argued that flats where the cost of service forms a substantial proportion of the rent should be pulled out from control.

What Sort of Ceiling?

THERE remains the third and most important class, those houses that will for the time being remain in control but with new rent ceilings related to current values and maintenance costs. Property owners and the public will have to wait for the bill to see whether Mr Sandys will move far enough to break down the distortions of a rent control system that allows the landlord too little to enable him to maintain such properties in repair. Maintenance costs have multiplied three times between 1939 and 1954 and are now probably three and a half times the 1939 level. The guess is that Mr Sandys, like Mr Macmillan in 1954, will link his increased rent ceiling to rateable value. Under the Macmillan Act, rents were allowed to rise to twice the old gross rateable value to meet increased repair costs. But under the new revaluation for rating, domestic properties have increased in rateable value by only 40 per cent on the national average. Hence the new ceilings would have to be more than 1½ times the new gross value if landlords were to be allowed any higher rents. Such an increase would be quite insufficient to encourage them to go in for new building. The complications and disappointments that have arisen from the Macmillan Act do not encourage any faith in rent ceilings based on rigid mathematical formulae.

One other proposal by Mr Sandys will excite much sharper controversy. It is to free all rent-controlled houses as they become vacant. From the tenant's point of view it can be fairly argued that this will increase the immobility of population, since it will never be possible to move from one rent-controlled house to another. The Minister has clearly felt—and the landlords naturally agree with him—that to have a free market in housing is an overriding advantage.

"Emmies" Further Recovery

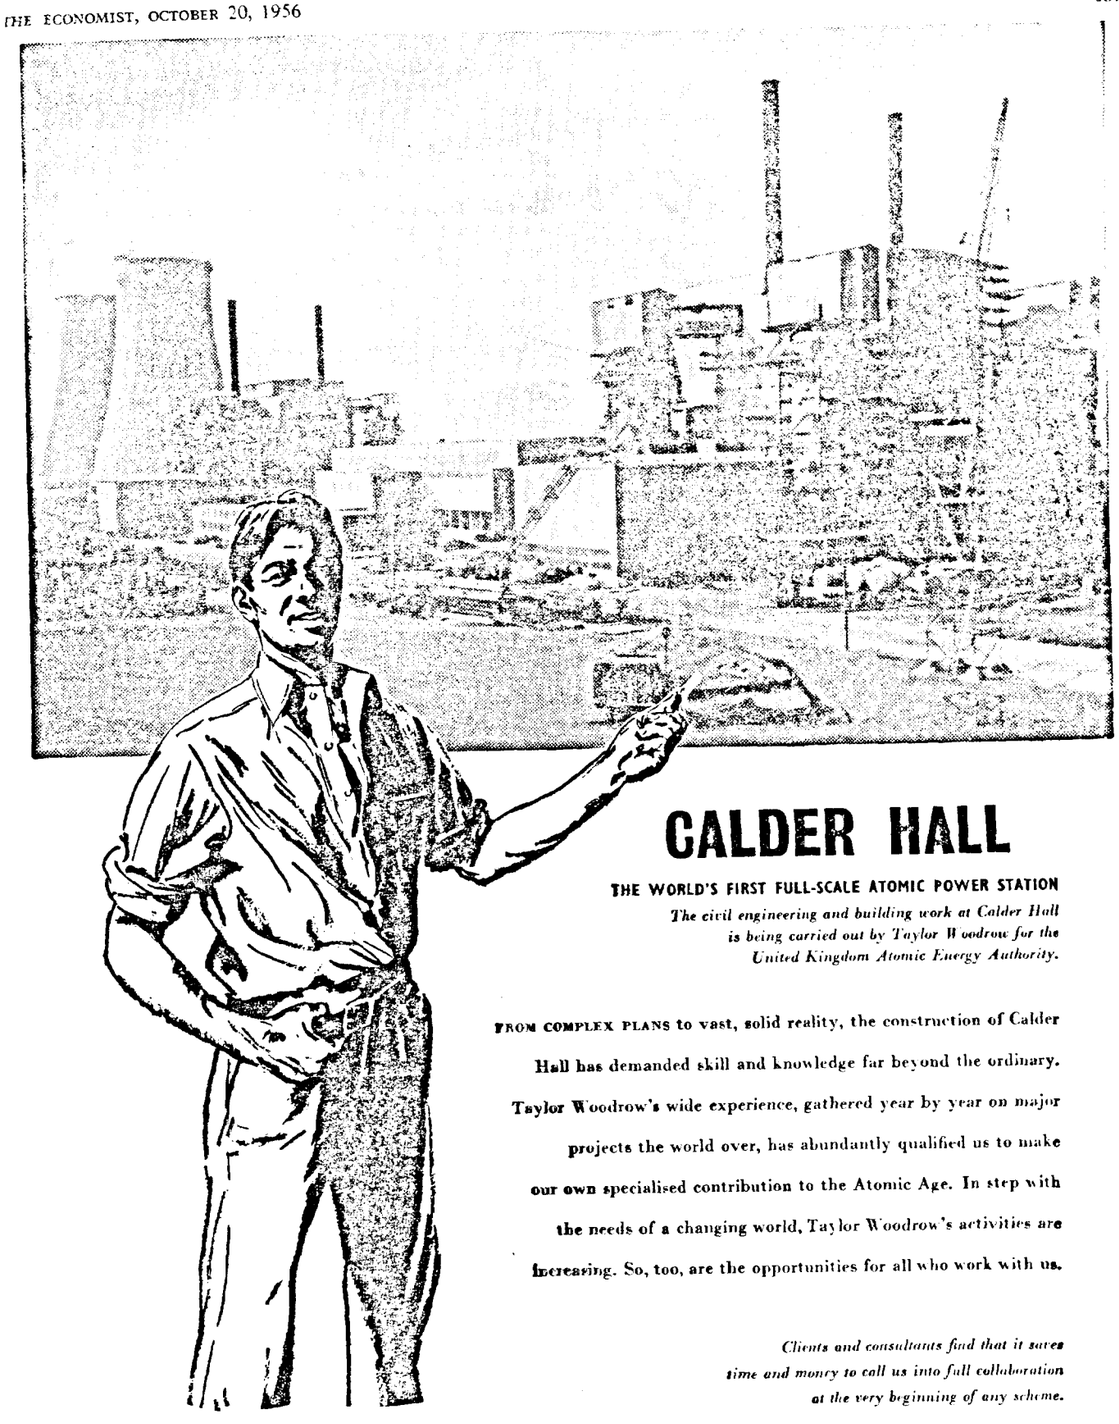
ELECTRIC and Musical Industries has done remarkably well to achieve a rise of £465,000 in profits before tax in the year ended June 30th. It was a year that at the consumer end of the group's wide range of electrical and mechanical products must have been growing increasingly more difficult. And though taxation has absorbed most

£000 (years to June 30th)	1953–4	1954–5	1955–6
Consolidated Results			
Profit before tax	1,076	1,980	2,445
Tax	507	1,105	1,500
Net profit after tax...	546	832	872
Dividend.....	208	326	325
Dividend per cent.....	*10*	*15*	*15*

of the group's increase in profit the process of raising the company from the unhappy situation in which it stood three years ago has continued. Shareholders receive only the same total distribution (a dividend of 12½ per cent and bonus of 2½ per cent) and at the market price of 26s. 9d. at which the 10s. stock units closed on Thursday before the announcement the yield is £5 12s. 2d. per cent.

The Composite Rate

A PROBLEM that has been worrying the building societies all this year has now been settled. The "composite rate" of income tax has been fixed at 5s. 4d. for the current financial year compared with 4s. 10d. in the £ last year. That is the rate that the societies bear on the interest that they pay "income tax borne by the society." It is calculated as an average personal liability of an average building society investor. The rate is re-negotiated each year in the



CALDER HALL

THE WORLD'S FIRST FULL-SCALE ATOMIC POWER STATION

The civil engineering and building work at Calder Hall is being carried out by Taylor Woodrow for the United Kingdom Atomic Energy Authority.

FROM COMPLEX PLANS to vast, solid reality, the construction of Calder Hall has demanded skill and knowledge far beyond the ordinary. Taylor Woodrow's wide experience, gathered year by year on major projects the world over, has abundantly qualified us to make our own specialised contribution to the Atomic Age. In step with the needs of a changing world, Taylor Woodrow's activities are increasing. So, too, are the opportunities for all who work with us.

Clients and consultants find that it saves time and money to call us into full collaboration at the very beginning of any scheme.

from today on....

an entirely new kind of service for British businessmen, scientists and public administrators!

REMINGTON RAND UNIVAC

THE MOST COMPLETE LARGE SCALE GENERAL PURPOSE ELECTRONIC COMPUTING AND DATA-PROCESSING SYSTEM

from today on, the Univac Computing Centre at the Battelle Institute in Frankfurt is open to serve you. It is an exact duplicate of the Centres in New York and Los Angeles, which have been serving business, science and government for over 2 years. Available on a service-fee basis, without capital investment, UNIVAC will help you triumph over rising costs and increasing mountains of paperwork—will permit the growth and control you need.

what the Remington Rand Univac Computing Centre can do for you: This new Centre is prepared to inform you on all matters appertaining to electronic computing, including appreciation courses for evaluation purposes in data-processing... to solve problems hitherto considered insoluble for reasons of complexity or cost... and to handle jobs which are now being processed by less efficient, less economical means.

And, if your needs warrant the purchase of a UNIVAC—in whatever size and price—the Univac Computing Centre will train your own staff to operate it.

REMINGTON RAND UNIVAC—THE WORLD'S FIRST AND ONLY COMPLETE RANGE OF ELECTRONIC DATA-PROCESSING SYSTEMS TO BE MASS-PRODUCED FOR PRACTICAL, EVERYDAY USE.

UNIVAC can do all these jobs for you

light of the standard rate of income tax and the allowances given in the budget. But the sample on which it is based is only drawn at intervals.

This happens to be a year for sampling and societies were expecting an increase because the pay packets of their members must have been better filled and their average tax liability higher. The actual increase of 6d. in the £ was greater than some of them had foreseen. But provision for part at least of the increased cost must have been made when the rates charged and paid were raised this summer. For the time being at least, societies are likely to absorb the increase. But those of them that have not yet announced their decision on mortgage rates to be charged to old borrowers may find it the final straw. As a result of the higher charge for income tax the margin between rates charged to borrowers and rates paid to shareholders must in the long run be held a trifle wider than it otherwise would have been. If, for example, the next move in interest rates were downwards, it would normally have been expected that rates charged to borrowers which are gross could move down rather faster than rates paid to subscribers which are net of tax since there would be less tax to pay. That narrowing of the margin now seems less likely.

For one society, however, there is an interesting new factor in the calculation. The Co-operative Permanent Society in August offered old borrowers whose rates would otherwise have gone to 5¾ per cent or 6 per cent, the option to pay a fixed rate of interest for 7 years of ¼ per cent less. It is now announced that out of about 100,000 borrowers, 20,000 accepted the fixed interest option. If the next move in interest rates is upwards that will be unfortunate for the Co-operative, but if it is downwards there will be a useful cushion of fixed interest mortgages on which no reduction is due.

More Business in Cotton Textiles

TRADE in cotton textiles is picking up. The improvement is modest but more than welcome to Lancashire after heartbreaking slackness. Since the beginning of August order books in spinning and weaving have lengthened by two or three weeks' production. They are still less than comfortable, but merchants and producers seem to think it prudent to build up stocks. Thousands of workers have been lost and it is possible that output may not expand quickly enough and that orders may be lost through extended deliveries. The revival began after yarn prices were brought into line with prices of cheap United States cotton coming from the American government's stock, and the new confidence in raw cotton prices at the lower level has encouraged further business. Producers are now getting back some of the business they lost to imported Indian grey cloth. The subsidy on United States cotton has narrowed the disparity between Indian and British cloth prices, and Lancashire can offer quicker delivery. But it is as well to remember that the improvement in business in the home trade is largely seasonal, and that buying by export houses owes much to replacement orders against sales of cotton textiles under the triangular deals, financed by American raw cotton, with Pakistan and Burma (orders under a similar deal with Indonesia have not yet got under way).

HP Debt Still Falling

THE Treasury, the Board of Trade and the retailers must all, strangely enough, be pleased with the August returns of hire purchase trading. The paradox arises from the fact that contracts now being unwound by regular payment of instalments were made when the initial deposits were lower than they now are on new hire purchase contracts. So the volume of retail sales on hire purchase (the total retail value of the goods) rose while total hire purchase debt continued to fall. Hire purchase debt has fallen every month this year; the index at the end of August stood at 85 compared with 100 last December, so that the actual debt is 15 per cent below the figure of "at least £450 million" with which the index started.

The value of weekly retail sales on hire purchase has risen slightly every month since April when the index stood at 62; at the end of August the index was 67—still much below the starting point of 100 last December. Both the furniture and furnishing shops and the radio and electrical shops not only did an increased hire purchase business in August, but did a slightly higher proportion of their total trade on hire purchase terms—the furniture shops 40 per cent against 37 per cent and the radio shops 25 per cent against 24 per cent. An outstanding feature of the latest returns is the sharp drop in the direct business of the finance houses whose figures are heavily weighted by motor vehicles and caravans. The impact of stiffer controls in the earlier months was less sharp on them than on the retailers, partly because the spring and early summer is the active time in the motor industry. The index of credit extended by finance houses (also based on December, 1955=100) still stood at 100 in July having touched 117 in February. In August it plunged to 81, as the seasonal movement turned against motors and caravans. From the figures of HP Information, which give number of contracts and not values, it is a safe guess that it fell further in September.

Banks and HP Collections

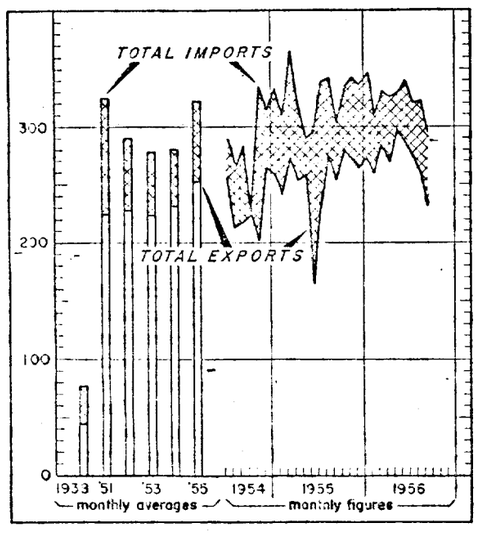
A REGRETTABLE dispute that has lately arisen between hire-purchase finance houses and the clearing banks threatens to involve changes in the channels through which many of the smaller instalments payable for consumer goods are collected. There is usually direct collection of weekly payments, but monthly payments are generally made through the banking system—usually by cheque or standing order if the hire-purchaser has a banking account, and otherwise by cash paid to a bank for credit to the account of the finance company. Inevitably the bulk of these over-the-counter cash payments, made by strangers to the banks, occur at branches (and often at banks) other than those at which the accounts of the finance companies are kept. Some clearing banks in the past have deliberately encouraged these arrangements, in the hope that the non-customers using their facilities might eventually open accounts. Even so, the banks regard themselves as acting for their customers, the finance houses, so that any charge for the work involved is made to the finance house, either

as a specific fee for each collection or as part of the general assessment of charges for working the account as a whole.

In recent years, however, the huge growth of hire-purchase and of this means of payment has created problems for the banks, involving not only a great increase in work at many branches and in transmission of cash, but often severe crowding of offices by non-customers, sometimes at peak periods of normal business for customers. The clearing banks, after joint discussion of the problem, recently decided not to limit these facilities directly, but to apply the same kind of concerted charging procedure that operates for similar collections made on behalf of certain public bodies—such, for example, as the regional electricity boards. They have notified the finance houses that, as from February 1st next, they will charge the finance houses 1s. for each over-the-counter cash collection. This will be a higher charge—in some instances perhaps twice as high—than has been made by individual banks in those cases in which specific charges have been made in the past; but no comparison is possible where, as is possibly the more common arrangement, the finance house pays a general charge (or keeps an agreed minimum balance) to remunerate his bank for the working of the account as a whole. The finance houses most concerned are those with a large consumer business; they do not dispute the principle of making a specific charge, but they regard it as prohibitive if it falls upon them, and have asked the clearing banks to adopt the Scottish system of charging the person who lodges the payment. The banks, however, have insisted upon adhering to the principle of looking to their customers for payment, and will not run the risk of the trouble and embarrassment that might arise if they tried to collect fees from non-customers. Faced with this deadlock, the Financial Houses Association is considering advising its members to instruct their debtors to pay by other means. This presumably implies that the queues at the banks may soon be transferred to the postal-order desks at the Post Offices. Will there be a head-on collision with the queues for Premium bonds?

THE UK TRADE GAP

£ MILLION



The *John Sergeant* and *Auris*

Outside military aviation the gas turbine has as yet had no sudden, spectacular triumphs of application, though its remarkable appetite for the most disparate low calorific fuels from natural gas to peat makes it, in theory, the most versatile prime mover yet. As a static generator—for example, to drive pipeline pumping stations—it has been used for some time; for the propulsion of cars, locomotives and ships, a growing volume of development work and experimentation has been going on for more than a decade, but on the whole the theoretical merits of the gas turbine have yet to be exploited by land and sea transport on a commercial scale. The arrival at Southampton last weekend of the 7,280 ton (gross) cargo liner *John Sergeant* on her maiden voyage from the United States marks a significant stage in this development. For the *John Sergeant* can lay claim to being the first pure gas turbine merchant ship, although it is not entering into business as such (and carries a small "get-you-home" steam turbine should the main plant fail). This is a Liberty ship converted specially by the Federal Maritime Administration at a cost of $3 million, is run by the United States Lines for the Military Transportation Service, and is to be used primarily as a floating test bed.

The United States is a comparatively late comer in the marine gas turbine field (as distinct from its lead in applying nuclear power to marine propulsion). The first vessel to be propelled at sea by a gas turbine was in fact a British naval gunboat as far back as 1947; it was powered by a Metropolitan-Vickers engine and naval research has been progressing steadily since both here and in France. On the commercial side Shell Tankers have been using a turbine to provide part of the power to propel the 12,250 deadweight ton *Auris* since 1951, also as a floating test bed. After more than 20,000 hours at sea, the *Auris* has now gone to Birkenhead to have its 1,200 hp gas turbine and three diesel engines replaced by a 5,500 hp gas turbine unit. When the refit is over in about a year's time this will also qualify as a pure gas turbine vessel (it has already crossed the Atlantic on the gas turbine alone). But the *Auris* will differ from the *John Sergeant* in at least two respects arising from the way each tackles two of the more recent development snags—transmission of the drive astern and the fouling of the turbine blades from the use of low grade residual fuels at high temperatures. The *Auris* will use an ingenious double reduction gearing system recently developed by Pametrada to provide reverse drive, whereas the *John Sergeant* employs a reversible-pitch propeller, which Shell considers too complicated and difficult to maintain to assure reliability. Shell also claims to have overcome the other problem by using Nimonic blades, immune from corrosion, and by injecting powdered additives into the fuel by a microscopic mixing device that it has under development. The *John Sergeant*, on the other hand, appears to have avoided this problem, at least on its first eastbound passage, by using diesel oil.

World-wide technical collaboration in electrical engineering development

THE DRIVER-HARRIS ORGANISATION

Close liaison between the companies of the Driver-Harris world-wide organisation is a very real and active policy. It continues to yield an impressive dividend of technical progress.

The liaison is expressed in regular communication and exchange of visits between technologists, a pooling of knowledge on every fresh aspect of wire-drawing technique, and continuous research along parallel lines between the laboratories and manufacturing plants in the United Kingdom, United States, Eire, France, Italy, Austria and Spain.

The result of that collaboration is a succession of advances in the production of nickel-alloy resistance materials of profound importance to all development in the electrical engineering world.

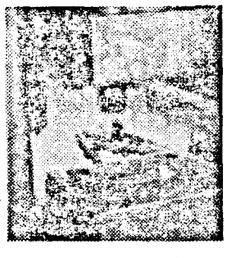
EXTRUSION



FORGING

Lubricating and parting media for ALL engineering processes

Hundreds of processes—intricate and simple—in engineering today have been quickened and improved by the use of 'dag' dispersions of colloidal graphite. Their unique properties provide a low-friction wear-resistant "graphoid surface" which solves lubrication and parting problems involving high temperatures, extreme pressures and excessive friction. Consult us about possible applications for 'dag' dispersions in your manufacturing process.

'Burberry' is the registered trade-mark of Burberrys Limited, makers of the world's finest weatherproofs. From 7 gns. From Burberrys in the Haymarket and appointed retailers throughout the country.

The Steel Industry's Fleet

IT was in August, 1951, that the British steel industry committed itself to a policy of building specialised ships to import its increasing requirements of iron ore: today it has 11 of them in operation and nearly 60 more are on order. The industry's wholly owned importing agency, British Iron and Steel Corporation (Ore) Ltd., is part-owner of nine now in operation and will have an interest in 17 of those still to be built; the other ore carriers have been built by private shipowners who have time charters guaranteed for their ships even before the keels are laid. The industry's shift into specialised shipping continues: orders for five, to cost about £5 million, have been placed with British shipyards during the last fortnight.

The eleven ships that are now operating on BISC (Ore)'s behalf will be able to bring about 1½ million tons of ore a year into Britain; when the whole specialised ore fleet comes into operation by about 1960, its annual importing capacity will be about 9 million tons a year. This will probably cover about 45 per cent of the industry's requirements; its current imports of about 14½ million tons of foreign ore a year may well be of the order of 20 million tons a year by then. The rate of steel expansion in this country, based on pig iron, is likely to be greater than the increase that can be achieved in utilising Britain's own large resources of low-grade ore, so that the dependence upon rich ores from abroad will tend to increase.

Two main considerations have weighed with the industry in this investment in its own specialised shipping. The first is the sharp and unexpected competition it has had to meet on several occasions during the war from the demands for shipping tonnage of the transatlantic coal trade—which now seem likely to continue rather more steadily. The second is the technical advantage to be gained from operating specialised ships designed for the ports between which ore will be carried; this involves a concomitant investment in port handling facilities, in which the industry is also engaged. The iron ore carriers in which the British industry is now investing are mostly of the order of about 12,000-15,000 dw tons. This is considerably larger than the size of ship in which ore tends to be carried now, and will offer operating economies—though none is of the size, some 20,000-25,000 tons, that from a technical point of view might offer the maximum advantages in ore movement.

Free Market in Sugar

THE Sugar Board to be set up under the Sugar Act 1956 was formally established this week with the appointment of the fourth member of the board. Only the chairman, Sir George Dunnett, and the vice-chairman are full-time members; the other two are part-time. The main functions of the board are to buy the Commonwealth raw sugar that the British government contracts to take in at a fixed price; to sell that sugar to private traders at the market price; and to make the payments necessary to the British Sugar Corporation, which buys and refines the domestic beet crop, to enable it to fulfil the guaranteed price for beet. It is frankly and officially a loss-making body. The market price will usually be lower than the fixed price and the loss is to be recouped by a surcharge on all imported sugar. The board will begin to operate, and the surcharge to be levied, on January 1st next year.

Imports of sugar will then be restored to private hands, and the sugar trade will be able to reopen a futures market based on Britain's import and international trade in raw sugar. Talks between the board and representatives of the trade here and in the Commonwealth started some time ago. The contracts by which the board buys in the country of origin and sells fob must be completed soon, for the board will shortly have to begin selling sugar for delivery in the New Year if buyers are to be able to book freight. The arrangements for reopening the London market have yet to be completed, but the trade is still hoping that it will be possible to begin futures trading before the end of the year.

Rhodesian Steel Revives

AFTER fairly lengthy discussions, agreement in principle has now been reached upon the partial de-nationalisation of the small iron and steel works at Que Que and Buluwayo in Southern Rhodesia and their further development by a consortium of British and African steel and mining companies in which the Southern Rhodesian government and the Colonial Development Corporation will be represented. The companies likely to be involved are Lancashire Steel, Stewarts and Lloyds, the Anglo American Corporation, Messina (Transvaal) Development Company, Rhodesian Selection Trust and the British South Africa Company; they will probably take over most of the equity, the Government retaining most of its current investment as debentures in the new company.

It is planned to spend £8 million to build coke ovens, sinter plant, a blast furnace, two extra open-hearth furnaces and to re-model the rolling mills at the works, as well as to develop the ore reserves in the country owned by the Southern Rhodesian Government and the Messina Company. The initial capacity planned is about 150,000 ingot tons of crude steel plus about 250,000-300,000 tons of pig iron for sale; this compares with a present capacity of about 35,000 ingot tons plus a little pig iron for sale. As the steel melting and rolling capacity is brought in, crude steel output would rise to something over 300,000 ingot tons a year and finished steel output to some 250,000 tons. Lancashire Steel will itself erect a wire-drawing mill in the area, importing wire rods from Britain until such time as the finishing capacity of the new Rhodesian Iron and Steel Corporation Limited is eventually enlarged to include a rod mill.

Exchange Control Forms Slashed

AN important simplification of exchange control formalities for small transactions that comes into effect on Monday will reduce the number of forms to be completed and examined by some 1,300,000 a year. The limit of

(1) Relates to wholesale prices in Athens and Piraeus only for Greece. Figures for Ireland are based on January, 1952=100. (2) July-December. (3) Relates to prices in capital cities only for Austria, France, Greece and Turkey. Belgium excludes rent. Denmark includes direct taxes. Figures for Ireland are based on August, 1953=100. (4) Excluding rent. (5) Including direct taxes. (6) Index numbers of unit value which compare the current average value of trade with its value in 1953; they are influenced by changes in the composition of trade as well as price movements. (7) Deposit money and notes and coins held by business, individuals and foreigners. Except for Greece holdings of the issuing authority and other banks are excluded. (8) Holdings of the government and central bank at end of period. Figures for Greece are gold reserves only; foreign exchange figures for Norway exclude government holdings; Norway and Sweden include foreign investments. (9) Beginning May, 1954, a new drachma equal to 1,000 old drachmas introduced. (10) Including some long-term securities. (11) Average for first quarter.

Financial Statistics

EXCHEQUER RETURNS

For the week ended October 13th, 1956, there was an "above-line" deficit (after allowing for Sinking Funds) of £23,814,000 compared with a deficit of £11,096,000 in the previous week and a deficit of £38,248,000 in the corresponding period of last year. Net expenditure "below-line" last week reached £15,057,000, bringing the total deficit to £580,454,000 (£601,716,000 in 1955-56).

THE MONEY MARKET

THE see-saw in the Treasury bill rate continues. At last week's tender the discount market cut its bid by 4d. to £98 14s. 5d. per cent; this followed the increases of 2d. and 5d. per cent at the two preceding tenders. The increase in the discount rate by 1s. 4d. per cent marked by the market's move last week was prompted by the sharp stringency of credit, and by the rise in the Treasury bill rate in New York above 3 per cent; but the outside tenderers reduced their bids by perceptibly less. The upshot was that the average rate of discount on all bills rose by only 1s. per cent, to £5 2s. 2.21d. per cent, and the market's allotment rate fell by one point, to 55 per cent.

Credit conditions turned more comfortable in the middle of this week, thanks mainly to considerable Government disbursements. On Tuesday overnight loans from outside banks were offered at down to 3½ per cent, whilst on Wednesday, the make-up day of the clearing banks, some October maturities were bought at down to 4⅛ per cent.

The price of silver rose sharply in London on Tuesday and again on Wednesday, from 78⅛d. an ounce spot to 80d. The rise was attributed to a lag in supplies from the Far East.

Sterling rose from 2.78⅛ on Thursday last to 2.78⅛ early this week; on Wednesday, however, there was a relapse.

JAMES HOWDEN & COMPANY

(Boiler Auxiliary & General Engineers)

AN ACTIVE YEAR

SALES WELL MAINTAINED

MR CRAWFORD W. HUME ON FORMATION OF CANADIAN SUBSIDIARY

The fiftieth annual general meeting of James Howden & Company Limited was held on October 12th in Glasgow, Mr Crawford W. Hume, MINA (Chairman), presiding.

The following is his circulated statement:

The accounts for the year ended April 30, 1956, are in the usual form.

While the profit of the Group before taxation shows an increase of £47,895 over the previous year, the net profit after taxation is £5[illegible],235, showing a comparable increase of £14,758. The difference in these increases is due to additional income tax of £20,128 and additional profits tax of £13,058, bringing the total taxation provided for to £536,439. This amount covers the usual reserve for income tax due in 1957-58 as well as profits tax for the year ended April 30, 1956, and for Dominions' taxation.

The transfer by the Group to general reserve is £350,168 as against £368,715 last year, but, if the dividend recommended is approved, the unappropriated balance carried forward will be £128,042 compared with £107,950 in the previous year. The general reserve of the Group now stands at £1,289,699.

INCREASED ORDER BOOK

The year under review has been an active one and I feel sure you will agree that the results obtained are satisfactory. The sales have been well maintained and show no reduction on previous years and the order book shows an increase over the previous year.

The progress of scientific and technical development in recent years has been rapid. Our Research Building, completed four years ago, has proved a most valuable asset and the experiments carried out there and the data obtained have ensured that the company maintains its premier position in the development of new and improved designs.

It is interesting to note that the first commercial installation of the electro-precipitator is now being erected. The introduction and final putting into service of heavy capital equipment of a new conception and design such as this take a long time. It is ten years since the first small pilot plant was put into operation and over four years since the designs for this commercial installation were put on paper, and it will be some time yet before this plant is finally in service.

All our factories are in full production, considering the shortage of manpower, and the machines and plant are [illegible] continually under review to maintain efficiency and increase productivity.

OVERSEAS INTERESTS

The companies both in Australia and South Africa have had a successful and profitable year. While these companies, like the parent company, are mainly concerned with the boiler auxiliaries which have always been our main business both on land and sea, the South African companies also hold an outstanding position in ventilating fans for the gold mines.

In Canada, where up to recently the power supply has been mainly provided by hydro-electric stations in which we have little interest, it is now being found necessary and economical to build new thermal stations and we have within the last year or so obtained important orders for our equipment. Till this happened our business in Canada had been almost entirely confined to supplying auxiliary machinery for ships being built there. During the year under review the parent company has, with Treasury consent, formed a wholly owned Canadian subsidiary. It is expected that this new company will in years to come prove to be as successful as those in Australia and South Africa.

The loyal co-operation of the administrative and executive staff and of the workpeople has been evident throughout the year and on your behalf I should like to thank all the employees for their support and service.

The report and accounts were adopted.

TAP & DIE CORPORATION

FURTHER IMPROVEMENT

The Sixth Annual General Meeting of The Tap & Die Corporation Limited was held on October 11th in London.

Mr D. G. N. Lloyd-Lowles, chairman, in the course of his speech, after referring to the death of Mr W. E. Dilke, one of the founders of the British Tap & Die Company Limited, said: The accounts for the year ended May 31, 1956, once again show an improvement on the previous figures, profits having risen from £377,423 to £409,144. Net liquidity of the Corporation has also improved. This year it has risen to £689,480 of which £429,949 is in cash, deposits, Government Securities or bills receivable.

Last year I drew your attention to the progressive increase on dividends. This year we have proposed only a very slight increase, more by way of rounding off an uncomfortable fraction than because we felt a higher distribution was called for. We have, however, consolidated the bonus into the dividend.

The trading profit, after the usual deductions, has risen from £373,397 to £401,365. Taxation, also, has also risen; profits tax from £41,290 to £48,410 and income tax from £154,534 to £172,147. Out of the balance of the year's profits, £17,672 was absorbed in the recapitulisation scheme which reduced our carry forward for the year to £78,755. The total carried forward on profit and loss account is now £365,590.

We have already traded for four and a half months of our present financial year, and the turnover shows a further increase over last year.

Once again our share of the export market has increased and is now over 58 per cent of the cutting tools exported from the United Kingdom. The report was adopted.

SCRIBBANS-KEMP

BATTLE OF RISING OVERHEADS

The twenty-ninth annual general meeting of Scribbans-Kemp Limited was held on October 11th in London, Mr H. Oliver-King (chairman and managing director) presiding.

The following is an extract from his circulated statement:

The profits of this Group are derived from four sources: cakes and biscuits, sugar confectionery, retail stores (sweet shops, grocery and delicatessen branches), and finally from overseas interests represented by flour confectionery manufactured in Montreal, Cape Town and Johannesburg. Shareholders will realise that the risks nowadays are very much more evenly spread over a number of enterprises than was originally the case.

Whilst the Group profit (£936,080 against £1,304,577) is down, the turnover was up in each of the four branches. Factors which have added tremendously to the cost of operating are labour, packing materials, and the ever-swelling cost of transport.

In March, 1957, it is hoped to open the very large extension to our Lincolnshire factory, where the biscuit manufacture will adopt the most modern technique available.

Prices have been held quite firmly and indeed there has been in the case of cakes a range of goods at an even lower price.

The export side of our business has increased considerably. In sterling areas our exports are up by over 10 per cent and in dollar countries by over 50 per cent.

Up to the present moment turnover is being well maintained in every division of our activities, but there is this constant battle of rising overheads against stiff competition, and it may be that, if costs continue to rise, some adjustment in our selling prices may prove inevitable.

The report was adopted.

E. W. TARRY & COMPANY

IMPROVED OVERALL RESULTS

The annual general meeting of E. W. Tarry & Company Limited was held on October 17th in London, Sir Harold F. Flannery, Bart. (the chairman), presiding.

The following is an extract from his circulated statement:

The intense competition noted in my last report continued both in the Union of South Africa and in the Rhodesias, and in certain branches profit margins show some contraction. Other branches, however, have increased their profits with the result that although the turnover shows a small decline, the trading profit, which is returned at £134,045, is an improvement of £23,593 compared with the previous year.

The tendency in Southern Africa is still one of rising costs.

To streamline the organisation, and effect economies, two of our smaller branches have been closed during the year. It is not thought that this action will cause us any serious loss of trade, because it appears that the areas served can be adequately covered by the nearest existing main branches.

The net profit is £32,923 and your Directors recommend payment of an Ordinary Dividend at the same rate as last year of 12½ per cent, requiring £25,156 net. There will remain a sum of £111,362 which is recommended should be carried forward.

With regard to the current year's trading, the turnover up to the present is slightly lower than for the same period of 1955 which was a record, and there is no relaxation in the competition for the available business.

The report was adopted.

LIMIT ENGINEERING

PROSPECTS ~~FORECAST~~ EXCEEDED

The thirty-second annual general meeting of Limit Engineering Group Limited was held on October 16th in London, Mr A. L. Collins (chairman and managing director) presided and in the course of his circulated review said:

These are the first Accounts to be issued since the introduction of the Company's shares on the Stock Exchange in October, 1955, when the Directors forecast a profit of £80,000. I am pleased to report results at £93,190 or £3,549 up on our previous year, due in the main to a considerable increase in turnover and improved manufacturing techniques developed and introduced during the past year.

[illegible] OUTLOOK FOR 1956 [illegible]

Approximately 40 per cent of your Group's products are exported and [illegible] progress is being made with new designs which will widen our field of activities. This expansion is reflected in the Balance Sheet by the increase in the figure of Stock and Work in Progress, but despite this increase our Cash position is satisfactory and has in fact improved in this current year. Turnover for the current five months to the end of August has shown an upward trend over the comparative figures for the same period of last year, and this increased turnover is backed by a very satisfactory Order Book.

The manufacture of small electric motors and ancillary equipment in large quantities involves [illegible] just the electri[illegible] Production enginee[illegible] ed to report that [illegible]ference I am an excellent team wit[illegible]ge[illegible] in both fields.

The report was adopte[illegible]

R. G. SHAW & CO., LTD.

LARGER PROFIT

SIR HARRY TOWNEND'S REVIEW

The fifteenth annual general meeting of R. G. Shaw and Company, Limited, was held on October 11th in London, Sir Harry Townend, chairman, presiding.

The following is an extract from his review of the year ended June 30, 1956:

The Group's profit before taxation amounted to £196,551, an improvement of £42,425. Your Board recommends a dividend of 20 per cent.

The year under review was a prosperous one with satisfactory prices ruling for Quality Teas and Rubber. During 1955, with India and Ceylon harvesting record Tea crops, there has been no shortage in World markets. The price range is wide, with Quality Teas yielding satisfactory returns and medium and common descriptions selling near to or under cost of production.

The year [illegible] was a prosperous one for natural rubber daily price in London [illegible] with an average [illegible] lb as compared with approximately 1s. 4d. for the previous year. Consumption continues to increase. Production of natural rubber in 1955 was the highest ever.

Supply and demand of natural rubber is still more or less evenly balanced. Today's price is 2s. 3½d. and there are no great expectations that the coming months will see a substantial increase unless the International situation deteriorates seriously. However, an efficient estate in Malaya with a large [illegible] even at a price lower than that now ruling, gouge of high-yielding stock can give a year's account of itself. The current financial year has opened satisfactorily.

The report and accounts were adopted.

MALAYALAM PLANTATIONS

MR H. W. HORNER'S STATEMENT

The annual general meeting of Malayalam Plantations, Limited, will be held in London, on November 8th. The following are extracts from the circulated address by the chairman, Mr H. W. Horner.

The crop harvested for 1955-1956 at 15,933,400 lb represented an improvement on that for the previous year, which was 15,832,250 lb, but was disappointing since, if more usual climatic conditions had obtained throughout the year, the crop could easily have been substantially greater.

The average net price realised for the exportable tea was lower by 6½d. a lb than last year's figure, with a somewhat higher cost of production. The weather was favourable for rubber and the year's crop of 6,956,800 lb was well in excess of that estimated and about 750,000 lb more than the total for the previous year.

The net total of proceeds of tea, less cost of production, was about £380,000 less than year. Corresponding figure for the previous of some £70,000 by the end for to the extent from rubber. The profit [illegible] less than that for 1954-1955. The [illegible] recommend a final dividend of 17 per cent, making 25 per cent for the year.

Prospects for the current year, crops were originally estimated at 16,958,000 lb tea and 6,945,000 lb rubber, but the drought in the early part of the year has made doubtful realisation of the full tea crop. The shortage compared with last year was, at the end of September, more than 825,000 lb.

The market for medium and low-grown teas has been lower in recent months, but has improved in the last few weeks.

APPOINTMENTS

UNIVERSITY OF NATAL
SOUTH AFRICA
Applications are invited for the posts of DIRECTOR OF SOCIAL RESEARCH [illegible] The Institute provides facilities for research in social, economic and psychological problems generally as well as in Natal particularly. The Director will be expected to do research himself as well as to plan and promote research by others. The [illegible] will be for five years in the first instance. Imagine a farming world without oil!

As population increases, so must the food supply. Obviously. Yet, without proper implements — tractors, combines — agricultural progress slows. You know it could not have been [illegible] equipment that permits [illegible] productive and [illegible] more intensive, more [illegible] oil that runs [illegible] profitable farming. And it is [illegible] this equipment, helps maintain and protect it. Caltex, in supplying finer fuels and lubricants to the peoples of 67 free nations, is indeed gratified to be part of this immeasurably important cycle.

IE

WHEN WE WERE VERY SMALL in 1895, we were not like other youngsters. Praise embarrassed us.

But at **9** we invented an insulation testing device that we called a 'Megger' Testing Set, and so many people liked it that we began to get used to praise. We made a number of subtle variations on the same idea. They were also well received.

When we were **11** we produced a Chart Recorder and our acceptance of praise became, with so much practice, quite graceful.

At the age of **15** we took to water and developed "Dionic" Water Purity Testing Equipment. The praise was deserved. It could detect even a leakage of 1 pound of seawater into 10,000 lbs. of condensed steam.

At **27** we were producing apparatus for distant indication and control and at thirty-seven it had become such a large part of us that we formed a special division to handle it.

With rather more than half a century behind us the instrumentation schemes we had designed were—and are—to be found in oil refineries, and chemical and petro-chemical plants throughout the world. Not to mention boiler and combustion control equipment.

If you like to look around, you will find our equipment in laboratories, in foundries, in research centres in industry, in ships and so on, AND SO ON.

At the age of **61** we are still growing and our three Divisions—the Instrument Division, the Instrumentation & Controls Division, and the Naval Division—between them serve nearly every branch of industry.

How you can sell to U. S. markets without paying any import duty or income tax at all

Puerto Rico is *inside* the U. S. tariff wall. With 100% tax exemption *for new plants, manufacturers in* Puerto Rico can now compete in U. S. markets at *high profit margins—and with no customs problems* whatsoever.

IN A DRAMATIC bid to develop its industrial economy, the Commonwealth of Puerto Rico is now offering manufacturers such powerful incentives that over 400 new factories have already opened on this sunny island in the Caribbean.

From the European manufacturer's point of view, the advantages of Puerto Rico as a plant site are overwhelming.

Inside the U. S. tariff zone

Because of Puerto Rico's unique relationship with the United States, your company will be operating *inside* the U. S. tariff area.

Result: no import duties are levied on the goods you make in Puerto Rico and sell in U. S. markets.

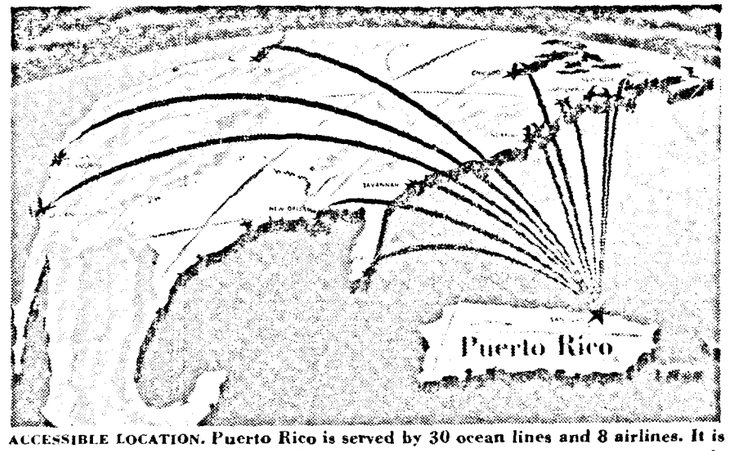
Furthermore, there are no customs delays at ports or airfields. Your goods go straight to your customers in the U. S.

100% tax exemption

Under its Commonwealth status, Puerto Rico has no voting representation in the U. S. Congress—and hence no U. S. Federal income taxes, corporate or personal. Also, as part of its courageous program of industrial development, the Commonwealth Government now grants eligible companies complete exemption from Puerto Rican income taxes for a period of ten years.

What is Puerto Rico's relationship with the U. S. A.?

Puerto Rico is a Commonwealth freely associated with the United States. It is an integral part of the U. S. economic system—and the U. S. dollar is the island's currency. Thus manufacturers in Puerto Rico have none of the problems of operating from a foreign country. Movement of goods, money and people to the U. S. is just as free as it is between the States of the Union. Moreover, your business is not only protected by the Commonwealth Constitution, it is guarded by all the guarantees of the U. S. Constitution, too.



ACCESSIBLE LOCATION. Puerto Rico is served by 30 ocean lines and 8 airlines. It is only 5½ hours by air from New York. Over 80% of the goods that are now made in Puerto Rico's new plants are sold in the United States.

Currency Problems Made Easy

You need the minimum of dollars for your initial investment. For genuinely promising enterprises, the Commonwealth Government is prepared to arrange long-term loans, equity investments, and special low-rental terms for modern factory space.

And there are no currency restrictions whatsoever in Puerto Rico. Any money you accumulate—tax-free profits or original capital—is freely transferable without formality.

Lower Production Costs

Production costs are generally much lower than on the U. S. mainland. An actual cost study made for one U. S. manufacturer showed that his unit profit of $7.30 *before taxes* would rise to $23.36 *tax-free*, if he built a new plant in Puerto Rico. Subject to the eligibility of your own industry, the Commonwealth authorities will make a special cost study for you.

Abundant, Skilful Labour

There are thousands of unemployed and under-employed workers in Puerto Rico today—all eager to play their part in Puerto Rico's industrial renaissance. Their dexterity and their aptitude for new skills are demonstrated by the growth of the electronics industry from zero to 32 plants in six years.

Firms like Union Carbide and Carbon; the Shoe Company of America; Remington Rand; the Carborundum Company; St. Regis Paper; and Beaunit Mills have operations in Puerto Rico today.

Superb climate—friendly people

The climate has been called "as close to Paradise as man will ever see." The Puerto Rican people welcome Europeans as heartily as they will welcome the new opportunities your enterprise will bring them. They know it is *in their own interests* to make every new plant a success. Puerto Rico's excellent labor relations prove this point.

Is your company eligible?

To get all the facts and to find out if your company qualifies for 100% tax exemption and other special operating concessions in Puerto Rico—airmail coupon below.

they saw this man—

found new £140,000 export market

In 1951 a firm of specialized commodity merchants who were doing a small cash-before-shipment trade decided it was high time they exported more. The question was how? They thought of the Export Credits Guarantee Department—and they thought of red tape and form filling. Then the man from E.C.G.D. called, and they soon discovered there was no red tape about him. He told them in plain straightforward language what E.C.G.D. could do for them. He showed them how an E.C.G.D. insurance policy would give them the security they needed to go after business in new markets on credit terms. They took out a policy—and they've never looked back since. In 1952 they exported £6,500 worth of goods to one European country, the next year this business went up to over £43,000, the year after that it increased to £90,000, and in 1955 the turnover was above £140,000! How much did it cost them in premiums to build this credit business? *Less than 55/- a day over the four years.* If you're an exporter, the E.C.G.D. man will be calling on you. Don't you think you'd better see him—and listen to what he's got to say?

With acknowledgement to John Pattle Lennie & Son Limited

This is a true story, but because business between E.C.G.D. and exporters is strictly confidential any details which could identify the exporter have been left out.

E·C·G·D

E.C.G.D. is a Government Department set up to help exporters. Its services are fully explained in the booklet 'Payment Secured'. Write for a free copy.

Signature papers

Do you autograph your goods?
Not literally, perhaps. But a Signature Paper well printed and skilfully designed around your name or trade-mark proudly proclaims that these goods are yours and yours alone. Each package is identified: each package is an advertisement for you from factory through to point of sale. The cost? Apart from a charge for the special rollers on your first order, not much more than for standard box-cover papers. Let us design a Signature Paper for you!

SANDERSON

OF BERNERS STREET

ARTHUR SANDERSON & SONS LTD., DEPT. E, 52 BERNERS ST., LONDON, W.1.

To the Managing Director determined to expand production

A QUICK QUIZ

Can you lay hands on all the capital you need for your expansion ?

Can you find the right factory ?

Do you know just where to get your labour ?

Will the Capital Issues Committee permit you to raise investment capital ?

If you cannot say 'Yes' to all these you must be interested in what Northern Ireland offers you—

Generous Financial Assistance	Capital grants for plant, machinery and new buildings. Grants toward transfer of machinery to Northern Ireland. Grants for training and services. Coal rebate.
Factories—12 planned or building	Government-built factories to meet your needs on rental (from as little as 9d. per sq. ft. per annum). Also factories on repayment.
Plentiful Labour	Plentiful male labour. Possibility of multiple shifts. Little absenteeism: low labour turnover. High output per man.
No C.I.C. Squeeze on factory development in Northern Ireland	The Chancellor of the Exchequer in a letter to the Capital Issues Committee has said of Northern Ireland, "There, in contrast to the rest of the U.K., are unused resources which might be developed for the benefit of our economy as a whole. I am therefore writing to let you know that the Treasury will be ready in principle to consent to proposals to raise money exclusively for investment in Northern Ireland . . . "

Full Information

The Northern Ireland Development Council (Chairman, Lord Chandos) has prepared a practical Memorandum of the facts a businessman wants to know. Write for it in strict confidence to the

This Company is in the OIL BUSINESS

Being in the oil business means producing energy as well as petrol, fuelling power stations as well as motor cars, locomotives as well as buses. And it means men. Skilled men. Men with loyalty and continuity and a wide experience.

This company is an aggregation of such men. Scientists, tanker captains, pipe-fitters, salesmen, drivers, economists . . . 2,500 of them have been with us for a quarter of a century, 218 for over 40 years, 2 are in their fiftieth year of service. Accountants, welders, physicists, engineers, ships' companies, boiler makers . . .

Altogether these men spent 248,000 hours last year on special training, to find ways to do their jobs better.

More than anything, it is the skill and the teamwork of the employees which enable a company to build a tradition of good service as well as long service.

Somebody starts his career with us every day.

Automatic control

Automatic control and adequate instrumentation of industrial processes are essentials for higher productivity. This is particularly important when large quantities of fuel are used and critical time and temperature limits are essential for success. Gas is the only commercial fluid fuel of declared constant calorific value and lends itself ideally to automatic control. The Industrial Gas Engineers at your Area Gas Board have considerable knowledge of this subject, which they will gladly pass on to you.

WHATEVER YOUR BUSINESS— The Gas Industry appreciates the needs of individual consumers for prompt service and for advice which accords with the customer's special circumstances and requirements. Each Area Gas Board offers efficient service to users of gas-fired equipment and can give expert advice based upon the pooled knowledge of all the Boards and of gas users in other countries.

the economic advantages of
LEAD flashings & weatherings

Flashings are strips of Lead Sheet used to exclude rain from the junction between a roof and another part of the structure — for example, where a roof is penetrated by a chimney stack or pipe or where it abuts a wall, and around roof lights and similar projections.

Weatherings are coverings of Lead Sheet to parts of a structure that need protection to prevent the penetration of rain — for example, coverings to cornices, door heads, canopies and similar surfaces.

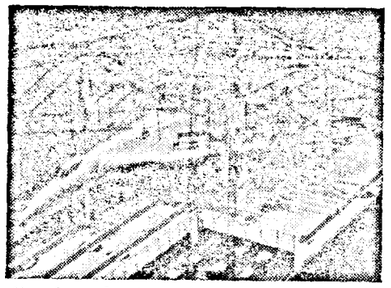
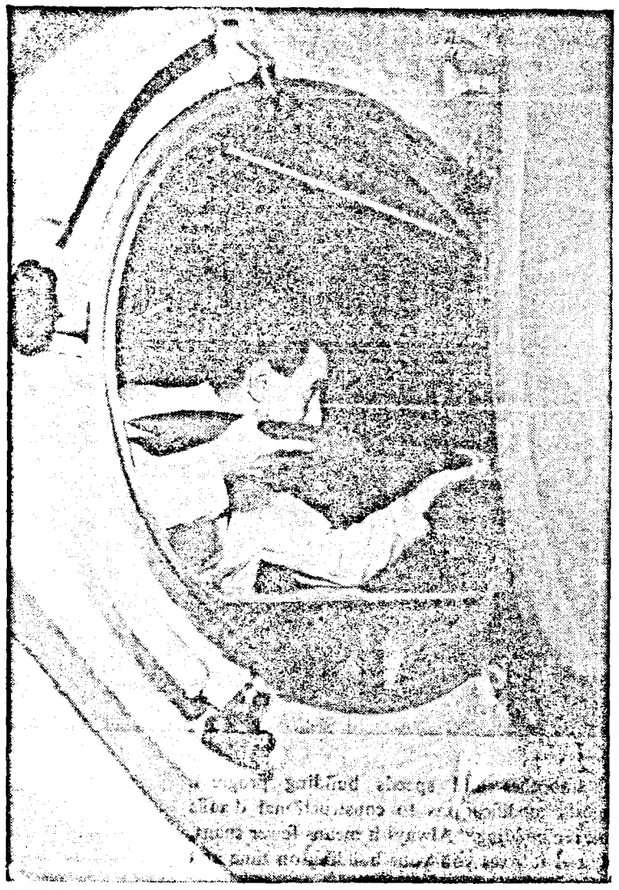
PROBING THE FUTURE OF AVIATION
No. 2 in a series

Tools—for the Unknown

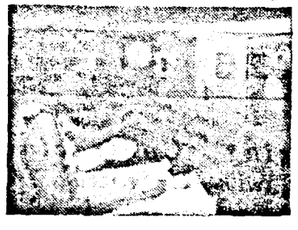


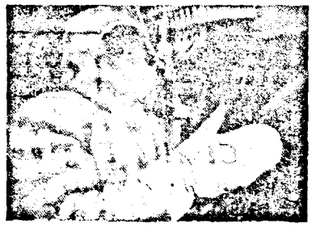
Aircraft tested to destruction on massive test rigs get more punishment than they will ever face in the air.



BELOW: Digital Computer working out the lengthy mathematical problems involved in designing modern aircraft.

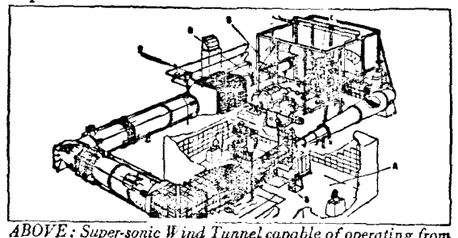
BELOW: High-altitude Test Chamber which reproduces conditions of flight in the upper atmosphere—on the ground.





In less than a generation aircraft design has moved from the workshop into the laboratory. Today, the tools for aeronautical development are complex scientific instruments—wind tunnels through which air races at upwards of 4,000 miles an hour, rooms capable of freezing complete aircraft at around −65°C for days on end. From these and many other complex instruments thousands of test readings have to be reduced into usable engineering data. This is the work of electronic machine calculators, that perform in minutes calculations which would normally take years.

But that is not all: more must be known about how the human body reacts to high-speed high-altitude flight if man's endurance is to keep abreast of his aircraft. It is a quest for knowledge that goes on continuously. Solving such design problems and shaping the planes of the future is the work of the aeronautical engineers of the Hawker Siddeley Group. Men who in the short span of 50 years have progressed from speeds not much greater than that of a fast car to beyond the speed of sound. These efforts are vital —vital if we as a nation are to be equipped and ready to meet any threat to our existence, and if we are to remain leaders in a world at peace.



ABOVE: Super-sonic Wind Tunnel capable of operating from 1¼ to 3½ times the speed of sound, facilitates research into problems of high-speed flight. (A) Control Room. (B) Working Section. (C) Compressors. (D) 10,000 H.P. Motor (E) Gearbox. (F) Cooler.

An Empire Erupts

SINCE Stalin's death it has been clear that the empire which he built up was bound to change; but the pace of change, and its consequences, would vary with the conditions of each subject country. In Russia itself the Soviet society had already had time to consolidate and could bear, so far, the stress of "destalinisation." Elsewhere in eastern Europe currents of "liberalisation," meeting greater or less resistance, took different courses. Hitherto it has not been possible to do much more than watch the gathering momentum of these currents and speculate on how far they might go.

Now a week of cataclysm has revealed something of the unsoundness of Stalin's imperial structure and shown the strength of the pent-up forces which his heirs have released in their gropings after a more stable equilibrium. But it has also given the first indication of the limits beyond which the movement will not be allowed to go—so long, at least, as the Russians have the power to halt it. Last week-end the Poles refused to bow to the will of a Soviet delegation headed by Mr Khrushchev himself. But before Mr Gomulka had completed his demonstration that the communist regimes of eastern Europe need no longer be mere puppets of Moscow, and before he had even embarked on the uphill task of winning national support for a Polish variety of communism, a stern warning came from Budapest. In Hungary, too, there was a nation-wide clamour for a change of leadership and the popular cry was for the return of the disgraced Imre Nagy, as it had been for the disgraced Gomulka in Poland. Mr Nagy was reappointed prime minister but—by a stroke of irony that is bitter for him—his first move had to be to call the Russian troops in to halt the popular wave, lest it might sweep away not only Stalin's faithful servants, but the communist regime itself.

Hungarian bloodshed is the counterpoint to the Warsaw concerto. The events in Poland offer the lesson that, short of a return to Stalinism, the will of Moscow is no longer absolute law within the communist world. But the events in Budapest show that the east European communists, even men like Mr Nagy and Mr Gomulka, who have acquired (if fortuitously) a national stature, will side with the Russians when this is needed to preserve the communist foundations upon which the Stalinist edifice has crumbled.

Escaped like a ghost from the Stalinist limbo, Wladyslaw Gomulka came back last weekend to strike Stalin's already tottering system of satellites a telling blow. Through circumstances he had come to personify a Polish national aspiration. His spectacular return to power was achieved in the teeth of Moscow's vocal opposition. Plainly, had they chosen, the Russians could have imposed their will by force; no Polish bravery could have prevented them. But order would then have reigned in Warsaw only after Soviet tanks had rolled through its streets, destroying on the way such capital of goodwill as has been accumulated over the last three years, and reversing the policy begun after Stalin's death.

The Poles were bold enough to face Mr Khrushchev with this alternative. They thus forced him to put into practice the principles of self-determination (that is, the right of each communist regime to seek its own way) which he himself had proclaimed both at the Moscow congress and on the occasion of Marshal Tito's visit. They took him at his word. Their main argument in the tense hours of bargaining is spelled out in the slogan now plastered on Polish walls: "Long live the friendship with the Soviet Union, based on equality among nations"—with the emphasis on "equality." By the facts, as well as by political logic, Mr Khrushchev was constrained to keep his pledge.

No one knows how long this victory of the weaker partner will last. While it does, it will surely find a louder echo throughout eastern Europe than did the break with Marshal Tito eight years ago. Then it could be argued with some reason that Jugoslavia was the exception confirming the satellite rule. Tito, leader of a popular movement, never owed his position to the help of the Red Army; Jugoslavia was distant enough from the Soviet frontier for Stalin not to risk a world conflict through troop movements; its communist regime was self-made. No other satellite country was in as favourable a position. Poland's example is different and by its nature more contagious. Its stand shows that there are circumstances in which Russia, in dealing with its allies, may be obliged to be content with as much of its aims as can be achieved by persuasion and by pressure short of force. In this new framework its authority must rest on the willing consent of the ruling communist group in each country.

This does not mean that all the east European countries will follow in Poland's footsteps. Czechoslovakia and Rumania, for instance, may take different courses. The Polish recipe is no more of a panacea than was the Jugoslav, but last week's events should encourage other communist countries to think and act at home for themselves, instead of faithfully and mechanically applying formulae imported ready-made from Moscow.

★

The Hungarians, however, have added a tragic rider to the Polish example. Though the anti-Russian tradition there has not such deep roots, in such bitter soil, in Hungary as in Poland, there are similarities in the recent history of the two countries. The people of both these Catholic countries are preponderantly hostile to communism; in both, hard economic pressure has combined with political recalcitrance to produce an explosive mood. There has been no recompense—in food, clothing or domestic comfort—for the denial of freedom and the endless pressure to work harder. But while the Poles—who contrived even in Stalin's lifetime to hold no major state trials—were first on the road towards a relative freedom when the Stalinist fetters began to be removed, the Hungarian rulers, constrained by their own past actions, put up a long and obdurate resistance to the pressures from below. It was only in July that Mr Rakosi, representative of the hated past, relinquished the party leadership to Mr Gero, who in turn was suspected of also trying to apply the brakes; Mr Rajk, executed as a "Titoist" in 1949, was exhumed for his state funeral only this month; Mr Nagy, the former prime minister, disgraced because, like Mr Malenkov, he had paid too much attention to consumer goods, was brought back only when the government was *in extremis*. By then the spark from Warsaw had ignited the explosive mixture; no course of action remained for a communist regime but to call in the Soviet military fire brigade. Not until that had been done was Mr Gerö deprived of the party leadership. Would swifter action have averted the conflagration? The question is one which the Soviet rulers have to answer for themselves; on their answer will depend their future policy in eastern Europe.

★

To change the mechanics of an empire from coercion to co-operation—even if the co-operation is limited to the communist elect in each country—is a revolutionary change. When the Moscow Politbureau precipitately sent four of its leading members to Warsaw on October 19, Mr Molotov may still have been dreaming nostalgically of good old Stalin's days, or repeating, in a new context, Pushkin's words of over a century ago:

> Tell me: how soon will Warsaw
> Proudly lay down the law for us?
> Whither shall we withdraw our fortresses?
> Beyond the Bug, to Vorskla or Odessa? . . .

No doubt the mood of indignation was heightened because these very Poles had been brought to power by the Russians after the war. Mr Gomulka, Mr Khrushchev could swear, owed them his freedom twice: he would have landed in jail if the government in exile had been allowed to return from London; and he would never have left jail alive but for the dramatic reversal of policy after Stalin's death. All this may explain the arrogant way in which, as it appears, the Russians demanded that the Poles should toe the line, arrest the liberalisation movement (likely in the Russian view to get out of hand and bring the regime down), and fall into line with more cautious, more tractable countries. But one fact was plain. On this issue Mr Gomulka and his colleagues had the whole nation, including its working people, behind them.

To break their stand, Mr Khrushchev would not only have had to eat his words; he would have had to put the clock back to where it stood before Stalin's death, or even further. Belatedly, the Soviet leaders grasped the gravity of what was going on. Faced with one of their dead master's victims, they had also inherited the burden of his crimes: the countries which he brought low are the more sensitive to further Soviet interference. They could have taken counsel from Lenin's dictum that

> oppressed people are sensitive to nothing as much as to the feeling of equality and to violations of that equality . . . particularly by their proletarian comrades.

But the blunder had already been committed; and it may well have played its part in precipitating events in Budapest. Back home again, the Soviet leaders had little leisure to digest their Polish lesson; they have yet another crisis to face.

★

Mr Gomulka, his would-be mentors gone, took the rostrum at the party assizes with the confidence of a man taking up the reins of power. Having no reason to spare his predecessors or to make light of his own task, he painted the economic picture of the country in gloomy colours. Even the achievements, such as the rise in coal production, were (he said) the product of a bigger labour force working longer hours, not of higher productivity. In the countryside, money had been thrown away on uneconomic collective farms; henceforth they would have to pay their way, or be disbanded. Poland was threatened with bankruptcy in its foreign accounts. It was by telling them the bitter truth that Mr Gomulka hoped to gain the confidence of the working people. He could not promise wage increases or the prospect in the near future of better food, better houses, or any relief from the prevailing material drabness.

So the miraculous survivor starts his second lease of power with good cards in his hand but with a vastly difficult road ahead. He has behind him the enthusiasm now sweeping Poland. That, while he keeps it on his side, is his chief asset. It is the measure of the extraordinary frustration that the Poles, even Polish communists, have experienced since the war. Last weekend they felt for the first time that they had their destiny in their own hands. At the moment, Mr Gomulka has both the mantle of a national leader and a martyr's halo; and he is the only communist leader not held responsible for the economic muddle and the injustices of the closing stages of the Stalin era. "Not to have done anything," runs a French dictum, "is a tremendous advantage which should not, however, be abused." Mr Gomulka has been condemned to inaction for eight years; he could not do anything. Now, back in power, he faces the practical test.

For all his intention of making concessions to peasant smallholders, his plans for cutting down subsidies, and the rest, Mr Gomulka is still a communist; he proclaims himself one. But most of the Poles now surging enthusiastically and nationalistically behind him are anti-communist. He must know that many may desert him on the morning after the patriotic intoxication. Although he has promised that the *Sejm* (parliament) shall play a bigger part, the new electoral law gives the voter no more than the right to choose among candidates all belonging to a United Front, the communist party and its satellites. Mr Gomulka still holds to the dictatorship of the proletariat. Yet, what if the opponents of the regime, having tasted freedom, demand the right of real opposition? What if the peasants refuse to be coaxed, as they have refused to be coerced? The slogans of demonstrators in Wroclaw—"Down with the Russians" or "We want religious education"—are a warning.

All this inevitably, for all his fine stand, makes Mr Gomulka himself more dependent in the last resort on Soviet support. He depends on Soviet help to overcome his economic ills, Russian guarantees for the ultimate survival of his regime, Soviet protection for the security of Poland's western territories, on which the German Federal Republic has so far maintained the German claim. The fate of Mr Nagy will haunt the communist leaders in Warsaw. It invites an alliance, however reluctant, with Mr Khrushchev after all. The assurances that communist Poland's future is indissolubly linked with Soviet friendship are likely to prove genuine.

Nobody, however, can accuse Mr Gomulka of being a puppet. He has begun in earnest to carry on in Poland the movement started by Stalin's heirs. For a time it looks as if he will have his way and will get a hearing. Will his breathing-space be enough? How far, vested now with a peacetime substitute for Tito's wartime prestige, will he really be able to broaden the popular base of communism and so stand on his own Polish feet? Everything he does will be closely scrutinised. Already the communist world is watching him and the reactions are divided. His victory is hailed, naturally enough, by the Jugoslavs and the Italian *Unità*. The Czechs, and the French *L'Humanité*, acknowledge it reluctantly. The disaffected peoples of eastern Europe will watch to see whether the Polish way pays better than the Hungarian. Above all, the Russians

themselves will draw conclusions from Poland for the policy which will now pay them best.

For the moment, the Soviet rulers can, and no doubt do, draw opposite conclusions from the two sets of events, in Warsaw and in Budapest. The military leaders and their friends, alarmed by threatened communications and crumbling defences, can be presumed to hold that this week marks the policy of relaxation as bankrupt, that all experiments will finally end Hungarian-wise, that it is better to bring out the Stalinist strait-jacket without delay. The opposing group, the politicians who have backed the moves to bring Tito back into the fold and to relax the satellite system, must argue the reverse: that the upheaval shows the unsoundness, not of their system, but of Stalin's; perhaps even that it is necessary to swim even faster with the stream and to give more outlets to the forces of discontent. Their hopes will be pinned on the Gomulka experiment. The view which prevails will determine not only the future shape of eastern Europe, but the face of the Soviet Union as well.

Where extravagant hopes perhaps were raised in the West by the Polish insubordination, the agony of Budapest will have come as a cold shower. It is plain that no communist regime will be allowed to collapse without a struggle: mass desertions from the communist block are not in sight. Not even the Poles, with their appetite for domestic experiment, are likely to demand much freedom in shaping their foreign policy; they are in no position to do so. This is not the end. Events still march, and men may still rise or fall. But the statesmen of the West will have to face the question, when the dust has settled, whether a more genuinely national communist government, even if propped by Soviet power, is not preferable to a mere puppet of Moscow. And if their answer is yes, they may well have to encourage such men as Mr Gomulka —or even Mr Nagy—on their road to a limited independence, by helping them in their economic difficulties. And, looking further ahead, they will have to consider, too, what can be done to give Germany's eastern neighbours some limited freedom of action in foreign policy by reassuring them about the danger of German expansion, a threat which always weighs upon them. (A move towards the settlement of the Polish-German frontier, in particular, would weaken one chain which ties Poland to Russia.) Without these decisions, the West may have to sit supine watching Communism at grips with itself.

Free Trade Without Emotion

The Government's discussions with interested domestic parties about the project for freer trade in Europe are now reaching the final, decisive stage. Mr Macmillan's meeting with Tory backbench MPs on Tuesday is reported to have gone rather well; unless there is a last-minute change of heart (or tactics) there should also be a majority in the Labour party for the initiative. But the expected doubts have now begun to appear in some trade union circles, among rather more industrialists, and on the Bevanite left (following the Beaverbrook right) in politics. This article is an appeal to all these groups to study the issues involved, at some length but without emotion.

ACROSS Whitehall (where Sir Roger Makins is now installed at the Treasury), and wherever politicians and economists gather, the dustsheets are being taken off the principal political and economic debate of the hundred years down to 1932; and some of the dust is being shaken into the public's eyes. After twenty-five years, like a long forgotten Gibson girl returned to the Gaiety to play an *ingénue,* free trade has re-emerged on to the centre of the political stage; and old men's eyes are lighting up with memories of the arguments of long ago. It is all very exciting, and also rather sad. The sadness lies in the fact that the lady now being allowed re-entry, after careful vetting, into the chambers of Whitehall is not at all the girl the old men used to know.

Contrary to the forebodings of Mr Aneurin Bevan on the one hand—and to the fond imaginings of some nostalgic liberals on the other—the present project for freer trade in Europe cannot be discussed in terms of nineteenth century arguments, but only of twentieth century ones. This article will try to set these modern arguments down, with the honest intention of playing fair as between those who instinctively welcome the scheme and those who are instinctively nervous of it—and also with the intention of being as simple as possible.

Forced Suitor

The crucial point to grasp from the beginning is that freer trade in Europe has not been deliberately courted by Whitehall. It has been forced upon it. It is desperately important that all politicians, industrialists and trade union leaders taking part in the present discussions should understand this. If the countries of the continent succeeded in their plans for establishing a common market, and if Britain stayed completely outside these, this would mean that tariffs against German goods in Europe would come down, while tariffs against British goods stayed up. That is something which this country could not afford. The people whom Mr Bevan thinks he sees running after a will-o'-the-wisp are running indeed—but from a spectre, not after it. The spectre is the terrifyingly solid one of an ebullient Germany establishing unchallengeable hegemony over the export markets of the continent.

Can the critics who grasp this essential point find any justification for saying that Britain should still stay outside the scheme? To be fair to the critics, they might find one. The justification—the only tenable justification—that they might put forward for aloofness is that, if Britain does not lend its support, the whole scheme might conceivably fall to the ground: in other words, France might default, as with the European Defence Community, at the eleventh hour. Perhaps France would; possibly, despite our offer of a free trade area, France will still do so. But the powerful argument against basing our policy on this possibility is not only that such a policy would be restrictionist, timorous and un-European—although it would be. The main argument (although here, admittedly, one enters the realm of opinions again) is that the policy probably would not work. Commonsense observation suggests that France could not hold up the European march entirely or for long; the idea of progressive reductions in tariffs has so caught hold on the continent that sooner or later the advance seems bound to go forward, which means that sooner or later we would have to join it. Whitehall now recognises that it had much better be sooner. It is a triumph of good sense there.

The "Disturbance" Argument

It is into this framework that the other main arguments about freer trade in Europe have to be fitted. The first argument—as put forward by enthusiasts—is that freer trade would lead to a wholesale rationalisation of European industry (which would reap for all members the benefits of an American-style mass market); or—as phrased by the critics—that it would cause a lot of disturbance to established industrial concerns. It is not always realised, though it ought to be self-evident, that these two arguments are very largely one and the same thing. The connection between them can be seen from the fact that, if there really were an advance to an American-style single market (which is what the enthusiasts hope), then there would probably be room in it for only one Detroit, or at the most two (which is just what the critics, especially in Coventry, fear).

If that were, in fact, the prospect, *The Economist* would still be heartily—indeed more heartily than ever —on the liberals' side. To be realistic, however, one cannot believe that this is the prospect—yet. The establishment of an American-style single market would depend not only on free movement of goods, but also on unfettered mobility of labour and capital from one area to another; Europe will not get that quickly within the proposed common market, still less within the proposed free trade area. Instead, the pattern that is most likely to emerge for Britain from present plans is that some British industries will get new export opportunities in Europe as European tariffs gradually come down (over a period of twelve to fifteen years), but that others will face (equally gradually) more competition in the domestic market as British tariffs come down, too. On any sensible assessment, the opportunities outweigh the setbacks.

What is quite certain, however, is that, if tariffs in Europe came down against German goods, but not against British goods, then the setbacks—and disturbances—to particular industries in Britain would be very much greater. This is the essential point about "disturbance" for politicians of all parties to grasp now. Wider and more distant visions (or fears) can be left for later debate; neither would be prejudiced by taking the first essential step. They would be prejudiced by not taking it.

The Imperial Argument

The second argument that has to be fitted into this general framework is the imperial one. If, in twelve to fifteen years' time, Britain is playing its full part in the proposed free trade area with Europe, this country will then have three tiers in its schedule of tariff rates: the highest rates, as now, will still be levied on imports from the United States and from other countries outside both Europe and the Commonwealth; the lower or preferential rates, also as now, will be levied on imports from the Commonwealth; while imports of manufactures from Europe will pay no tariff at all, although imports from there of foodstuffs (including wine and tobacco) will apparently still pay the highest (i.e., non-Commonwealth) rate.

Mr Macmillan has used two arguments to try to soften the (frankly not very hard) blow for the Commonwealth of this partial loss of preferential advantages to Europe. One of these arguments is unfortunately bogus, and is only worth examining here because it has been pushed. Mr Macmillan has suggested, and others have echoed, that the creation of a free market in Europe will in some way shake loose more capital for Commonwealth development. Why should this be so? If the free market should lead to a major rationalisation of industry in Europe, then more European capital will need to be used on the continent rather than overseas; if, as is more likely, these visions of European rationalisation and development are a little too grand, then the prospects for expanding Commonwealth investment (out of an expanding national income at home) will remain precisely as they are now. Mr Macmillan may reasonably argue that, thanks to the free trade plan, Britain's national income should expand more quickly, with something more to spare at last on the net balance for overseas development. Certainly he can argue that, if Britain stayed outside a plan on which the Europeans had agreed, our national income (and our at present meagre ability to invest in the Commonwealth) would expand correspondingly more slowly. But to stretch these general truths into a thesis that these European plans are going to be an

important factor in releasing capital specifically for the Commonwealth is special pleading of a sort that is bound to arouse suspicions.

This is a pity, because Mr Macmillan's second argument to the Commonwealth is a much better—indeed a conclusive—one. Nearly 90 per cent of the Commonwealth's exports to Britain are of foodstuffs or of materials ; only the other 10 per cent *could* be affected by a lowering of British tariffs on European manufactures, and only a small proportion of that 10 per cent in practice *would* be affected. The more one subdivides Commonwealth exports of manufactures—including some of those about which fears have been most publicly expressed—into specific categories and sub-heads, the more chimerical becomes the idea that many of them are sold in direct competition with European manufactures.

This is not to deny that there is much truth in the sad argument that imperial preferences are being gradually " whittled away." But the whittling arises not from changes, or prospective changes, in Britain and Europe, but from changes in the Commonwealth countries themselves. Hitherto the countries of the Commonwealth have been willing to grant preferential tariff rates to British machinery and consumer goods. Increasingly, however, countries like Australia and India are reaching a stage of development where they want to buy the best machinery in the cheapest markets (which often means lowering tariffs on American machinery) and to protect their own consumer goods industries (which means raising tariffs on British ones). This trend has nothing to do with any trading arrangements Britain may make with Europe, although—human nature being what it is—it will not be altogether surprising if these arrangements are progressively cited as an excuse. The proper reaction to this, however, is not to say that Britain should therefore do everything possible to deprive these Commonwealth countries of an excuse for doing something which they are probably going to do in any event ; it is to recognise the declining efficiency of imperial preference as a quite separate trend. The belief that there is some clash between the Commonwealth connection and any conceivable arrangements for importing manufactures from Europe is, in fact, largely a myth. It is a myth based on much grander and more respectable emotions than emotional myths usually are ; but there is precious little economic justification behind it.

The D-Mark Problem

There remains the third main argument : that free trade arrangements in Europe might be accompanied by exchange rate problems, which would include cross-strains between sterling and the mark. There is a good deal in this argument. If Germany consistently runs a less inflationary economy than other European countries, or if for some other reason the long-term trend is for Germany's exports to increase more sharply than Britain's, then a D-mark problem, in some ways analogous to the familiar dollar problem, is bound to arise ; and, within a free trade area, it would be impossible to use the tools of restrictionism with which some of the force of the dollar difficulty has sometimes been warded off.

Against this, however, two points need to be firmly borne in mind. First, if Germany outsells Britain, there will be a D-mark problem in any event, within a free trade area or outside it. And, if Britain were outside the area facing a tariff wall, while Germany were inside it, the possibility that Germany might outsell us would become a certainty. Secondly, within the sort of club that will grow up around any European scheme, there should be more hope of consultation about policies whereby excessive creditors might sometimes be persuaded to take steps to avoid making their currencies too scarce—either by lending more money for European development schemes, or by exchange appreciation (Professor James Meade has already suggested that a free trade club could best be organised on a basis of variable exchange rates) or even by occasionally allowing a little more inflation within their domestic systems. Moreover, if weak currencies should be disclosed within Europe as a result of a march towards freer trade, sterling would be neither the weakest nor the first.

★

This, then, is the fairest available summary of the factors that need to be weighed in the present debate about European trade. The crucial point, to repeat, is that if a free market scheme went forward in Europe, and if Britain stayed outside it, the results would be far more disturbance for British industries, more threats of unemployment at home, and (probably) more exchange rate problems for the Treasury than participation in the scheme could ever bring. To recommend participation on these grounds alone must undoubtedly seem a merely negative plea. There is every reason for appealing, too, to the broader liberal and expansionist vision with which this country, and this continent, so badly need—and the need is now practical and urgent—to be inspired. This is something to sound a trumpet for—in *The Economist's* own key. But, for the moment, the argument that may weigh most with the sober doubters is the equally practical, and more immediate, one of what would happen if we stayed outside.

Mr Bevan, the doubters in the TUC, the more fearful industrialists of Lancashire and Coventry—and many others—should be begged to realise that this is not the nineteenth century problem but, in some ways, the precise opposite of it. The nineteenth century problem was whether Britain could afford to remain a free trading nation while all its competitors were protectionist ; the twentieth century problem is whether Britain can afford other countries to stay protectionist against British goods, while they become freer trading nations among themselves.

Algeria: Scoop or Blunder

FRENCH North Africa is a scene of triumph this week for one French cabinet minister, but of despair for another. M. Robert Lacoste, Minister Resident in Algeria, is responsible for the life and limb of its million French residents, and can fairly congratulate himself, and France's secret service, on the coup by which an aeroplane containing the chiefs of staff of the Algerian rebellion was diverted in transit between Morocco and Tunisia ; five wanted men were arrested at Algiers and transferred to France. But M. Alain Savary, Minister for Tunisian and Moroccan Affairs, takes a different view. For the five men in question were on their way from a visit to Morocco, where they had been the Sultan's guests, to a meeting in Tunis, to which they had been invited to discuss, with both the Sultan of Morocco and Tunisia's leader, M. Habib Bourguiba, possible ways of putting an end to the Algerian fighting.

The arrested men were Arab guests. By the act of arrest, all the canons of Arab hospitality have been violated. Flying on a Moroccan commercial air line, they had put their faith in a French pilot. This faith was misplaced and, as a result, a conference out of which a compromise on Algeria might conceivably have emerged has dissolved into a hubbub of Arab indignation. At a Paris cabinet meeting, hastily held in the night of Tuesday to Wednesday, M. Savary is said to have resigned ; though his resignation was refused, he " remains in a state of resignation." In this adventure, the balance of advantage and disadvantage for France cannot be assessed out of hand. For instance, there is some evidence that rebel morale was wearing thin in Algeria. The one indisputable result to emerge at once is that Paris from now on will have to treat with North Africa as a whole, instead of with three separate territories. If this is a blow for France, it is self-inflicted.

★

The chain of events has been dramatic enough to suit the most lurid tastes. In September, Franco-Moroccan relations had seemed to be going fairly well. France was still hoping to secure some kind of local status for the French army and the French investor, but remained deaf to Moroccan and Tunisian demands to dismiss M. Lacoste from his post in Algeria, or to recognise Algeria's " vocation " for independence. On the other hand, the Moroccan and Tunisian leaders, alive to the local need for French investment, were ready to acknowledge " overriding " French interests in their territories. This situation remained unaffected in spite of growing numbers of references to the unity of Arab North Africa, the most pointed of which was made by the Sultan of Morocco in a speech at Oujda in eastern Morocco on September 25th.

The French were therefore ready to bless an attempt by the Sultan and M. Bourguiba to parley with the Algerian leaders. All they asked, when they learned that these men were to go from Cairo to Morocco, was that they should not be received " spectacularly." From October 18th, French opinion hardened a little on account of the capture of the yacht *Athos*, which was carrying arms for the rebels and had evidently been loaded in Egypt—as it seems, under army auspices. M. Lacoste, who gains ground each time opinion hardens, registered a fresh advance on October 20th, when the Sultan, far from receiving the Algerian rebel leaders discreetly, had them flown from northern Morocco to Rabat by his heir apparent. The French Ministry of Foreign Affairs thereupon suspended its negotiations with Morocco.

From then on the French secret service came into play, though how many of the French cabinet knew of its intentions is open to question. It is possible that decisions taken from hour to hour in North Africa were reached as independently of Paris as were those of General Juin in Morocco in 1951, or those of M. de Hautecloque in Tunisia in 1952. On the morning of October 22nd, the Sultan took off from Rabat for a week's visit to Tunisia. Against some expectations, he did not take the Algerian leaders with him, but left them to come on later in a commercial aircraft. The machine refuelled in Majorca, but thereafter landed, not at Tunis, but at Algiers, where the French air hostess is said to have been sufficiently in the know to announce : " This is Tunis." After arrest, the five men were flown to France, where their case, if and when it is heard, will fall on less fanatical ears than it would do in Algiers.

How many Frenchmen think that this coup has made the path to solution in Algeria any easier ? This is the crucial question. M. Lacoste, who must have known of it and is presumed to approve, has the support of most French residents in Algeria ; they have lost blood at rebel hands, and these are men accused of serious offences. M. Lacoste also has the backing of many settlers in Tunisia, and some in Morocco, who begin to see no future for themselves under an Arab government. But what long-term alternative do they see which will be served by this unceremonious seizure of a group of Arab leaders ? May it not be that, whatever the crimes charged to the arrested men, their capture in this fashion will only foster resistance to France in Arab breasts which do not at present harbour it ? By this sort of cold calculation statesmen are tested.

One of France's strong suits in the present North African situation is that both the Tunisian and the Moroccan leaders still see in Paris a valuable counterweight to the spread of Egyptian imperialism, which neither relishes. The Sultan of Morocco views President Nasser as an upsetter of thrones and dangerously

pro-Russian. M. Bourguiba, who would himself wish to be the leader of the democratic movement in North Africa, enjoys a role nicely balanced between dependence on Cairo and dependence on Paris, and is adept in it. To pounce upon the Algerian rebel leaders may have appeared good business in the narrow context of Algerian affairs, but the value of such a trick played on Moroccan guests bound for Tunis is dubious.

An outbreak of fresh attacks on French property followed in Tunisia, and in Morocco at least 30 Frenchmen have been brutally murdered. But the Sultan of Morocco has kept his head sufficiently to send his Prime Minister straight to Paris to remonstrate. It seems, too, that Frenchmen of views more moderate than those of M. Lacoste know that the captured men really represent Algerian Moslem opinion, and that, unless they are treated as the *interlocuteurs valables*—the valid spokesmen—whom the Mollet government says it wants to meet, there is no future for that government in French North Africa. Some men in at least three of the major parties in the French Chamber, while they hold the coup to be defensible as an act of war, think it will be justified politically only if the French Government makes bold use of the captured men to start negotiations.

Neighbours breathing a natural sigh of relief at the capture of Mau Mau "field marshals," and holding Cypriot spokesmen *incommunicado* in the Seychelles, are in no position to preach. But the choice for France would seem almost certainly to lie between treating these prisoners as potential partners in negotiation, and turning all North Africans—as opposed to Algerians only—into people ready to buy guns and turn them on Frenchmen.

Notes of the Week

Poacher into Gamekeeper

MR HEAD'S elevation to the Ministry of Defence has been criticised for most of the wrong reasons. It should be said straightaway that, from all the military circles whose judgment one has come to trust, he has earned the reputation of having by far the firmest grasp of detailed administrative problems of any of Sir Anthony Eden's (or Sir Winston Churchill's) service ministers. On most of the issues for which the press has periodically gunned for him —such as the most recent charge that he has kept reservists unnecessarily idle—closer examination has convinced fair-minded observers that Mr Head has been mainly right and the press mainly wrong. It was a bit absurd that Sir Walter Monckton, and not Mr Head, was made Defence Minister last Christmas. In any normal circumstances, Mr Head's promotion now could be regarded as due reward for services well rendered.

But these are not normal circumstances. To Mr Head will fall the task of planning defence's new look, to replace the now quite apparent mess of the old one. During the summer, senior cabinet ministers were saying freely that this new look envisaged that Britain could do with rather less defence, at much less cost; after Suez, they say that Britain needs more defence, but at no more cost. It is now clear that Sir Walter Monckton tried to carry through the preliminary stages of the first new look by allowing the separate service departments to bargain with each other, Sir Walter himself acting mainly as chairman. The attempt failed, which may be one reason why Sir Walter has bowed out. There is a strong case for arguing that what was needed now was a powerful senior member of the Government (such as Mr Thorneycroft) to come into the Defence Ministry from outside, to decide upon the right policy after reading the relevant papers and studying defence systems in other countries, and then to force his policies through.

Mr Head is going to be very awkwardly placed to do this. This is not because, as the man previously encouraged to bargain for the army vote, he is likely to be too army-minded. It is because, as a service minister previously encouraged to bargain, he must find it more difficult to persuade other service ministers that from now on inter-service bargaining should be counted out. One does not envy Mr Head his task, for example, in trying to dock Lord Hailsham, whose first speech as First Lord of the Admiralty suggests that he is going to be a very eloquent—but not exactly impartial—spokesman for the navy's role. The old adage that a poacher makes a good gamekeeper has always underestimated the embarrassment for the poacher—particularly if there is a need for him to become a sudden martinet, and if the old gamekeeper has been such a very amiable fellow with such very velvet gloves.

Two Tacticians

PARLIAMENT'S reassembly found MPs in a brisk and fairly cheerful mood. The matters for formal debate—hill farming and the Copyright Bill—made heavy and usually non-party going, but there were opportunities for cut and thrust at question time. This showed the Tories to be more angry with Labour than Labour was with the Government—or, rather, very eager to appear so. The Conservatives have now made a deliberate decision that their best electoral tactics are to sound as bitterly contemptuous as possible about Labour's leadership by Mr Gaitskell. The Prime Minister's Llandudno speech set the tone for a new and reassuring Tory myth: that Colonel Nasser would have slumped to his knees long ago if Mr Gaitskell had not encouraged him. No opportunity is to be lost to sneer at what Sir Anthony on Tuesday called "the contradictory convulsions of Her Majesty's Opposition." On the Suez issue, at any rate, Labour does not have to be very worried about this campaign. If the stalemate apparently accepted by Mr Selwyn Lloyd goes on very long, there will be a queue of people in "contradictory convulsions" outside the Government Chief Whip's door—and it will not be composed of Labour members.

But Labour has its problems. The present assumption is that Mr Bevan will not oppose the re-election of either Mr Gaitskell or Mr Griffiths at the beginning of the new session, but that he still wants to be made Labour's shadow Foreign Secretary. A revealing light on battle tactics may have been thrown by Mr Bevan's sudden outburst last weekend against European free trade—not, one suspects, because he feels strongly against it, but because some of Mr Gaitskell's young men have recently spoken strongly in support of it. Mr Bevan's most advantageous personal tactics now may be to be sufficiently conformist for many Labour members to continue to say that Mr Gaitskell really must make him shadow Foreign Secretary, but not so conformist that anybody can assume that Mr Gaitskell is patronising him for good behaviour. He may not want to goad Mr Gaitskell so far that the leader refuses to admit him into Labour's highest counsels, but his interest is probably to brandish the goad just sufficiently to make it clear that, if he is brought into those counsels, Mr Gaitskell will have suffered a defeat. Connoisseurs of Mr Bevan's subtleties in tactical manœuvre are settling back to watch what might well be a superb performance.

Whose Executioner?

THE Government's behaviour over capital punishment at least remains consistent. It is technically correct, but morally deplorable. Details of the proposed "compromise" bill, foreshadowed this week by the Prime Minister, will not be known until the new session opens, but the obvious intention is to keep the gallows in use for certain types of murder. This is the climax of an operation designed to undermine an abolitionist position which the Government knew it could not breach by any straightforward action. Other things being equal, there is now a House of Commons majority in favour of putting the hangman out of business. The Government's policy for months has been to make other factors so unequal that a decisive number of Tory abolitionists would settle for compromise. In this it has now probably succeeded; most pollsters at Westminster agree that just about the requisite dozen have changed sides, and it would be unfair to judge the renegades too harshly. Their consciences have been much bludgeoned, first by their local Tory associations, and ultimately in the unpleasant debate at the Tory party conference. It is easy to see how tempting is the escape ladder of so-called "compromise."

What of Mr Silverman's bill? A great deal of claptrap has been talked about the Parliament Act. All that it in fact lays down is that if a bill is passed by the Commons in two successive sessions, then it automatically becomes law. The Parliament Act lays no duty on a government to provide facilities for the second passage of a bill which it opposes. The decision that any attempt to carry the bill forward must be made through private members' machinery does not therefore raise any genuine constitutional issue. But what it probably will raise is a constitutional row; unfortunately—and unwisely—Labour members are being goaded by the Government's shabby diversion into new bitterness against the House of Lords, a bitterness which may well find its way into their policy at the next election. This is a heavy price to pay for the retention of hanging for another few years (the next Labour government will certainly pass Mr Silverman's bill). Is it too late to suggest that, if the matter does come to another free vote, all Tories who are not completely resolute for the gallows, including the deserting corps of abolitionists, might do well to remember this? Capital punishment, although an affront to many people's sense of public decency, has always been a relatively minor issue. It would seem to be poor conservatism to stir up passions about bicameral government for the sake of this morbid old rope.

Can Jordan Keep its Feet?

HAS Jordan, by its elections of last Sunday, played itself into the expanding grasp of Egyptian imperialism, or can it stay poised (as some weak buffer states contrive to do) between two sets of allies whose motives for helping it conflict?

The election results that are described on page 336 by our special correspondent in Amman show marked bias in favour of Egypt, and away from Iraq and the Anglo-Jordanian treaty; yet they are not wholly clearcut. President Nasser at once seized his advantage and sent his commander-in-chief to Amman on a mission which has resulted in a Jordanian announcement that "in the event of hostilities with Israel" a unified Egyptian-Syrian-Jordanian command under Egyptian leadership would operate at once. There are stories, still unsubstantial, that the visitors also brought offers of a money subsidy equal to that now paid by Britain. But King Hussein's remark, made at a press conference in Amman on Wednesday, that closer Arab unity was not incompatible with the British alliance, suggests that he and some reflective Jordanians would like to see the colour of the Arab money before renouncing the British subsidy.

But there are two parties to the Anglo-Jordanian treaty. If the Jordanians are eyeing it askance, what is its value to Britain? All Jordanians (except when holding office and actually handling the nation's accounts) believe it to be a bargain out of which only Britain derives benefit. In fact, this was never so; and today Jordan is by far the biggest beneficiary. Britain could dispense with the treaty at a loss that would be infinitesimal compared to Jordan's and, by

doing so, would be exonerated from a commitment to join what is now an Egypto-Syro-Jordanian side in the event of attack by Israel. It would be more convenient to Britain, in the context of the American alliance, to be bound to intervene in any Arab-Israel conflict only by the Tripartite Declaration. For Britain to withdraw from the Anglo-Jordanian treaty forthwith would be a mistake, for it would look like pique where no pique is felt. But £12 million a year is a big sum to pay for two small RAF bases on the territory of an ally whose people have shown so clear a distate for British company.

Seismic Shocks in East Berlin

THE upheaval in eastern Europe shakes the ground under the German Democratic Republic and leaves it more precariously isolated than ever. Its newspapers have done their best, or rather more, to minimise events in Poland, offering their readers interpretations from *Pravda* rather than from Warsaw, but through the western radio the east Germans are well aware of what has been going on. Their rulers, remembering the experience of 1953, can hardly feel at ease.

But the opposition to the regime seems powerless. Any rising would be quickly crushed as the rising of 1953 was crushed. There are ample Soviet forces on hand, and the east German regime, wholly loyal to Moscow, would not hesitate to call on them. Russia, too, could have no hesitation about using force, for events in Poland and Hungary have proved more than ever the vital political and military importance of the east German base, interposed between the west and eastern Europe.

Herr Ulbricht continues to serve Russia with his accustomed devotion, with *Neues Deutschland*, the organ of the SED, speaking of western attempts to use "capitulationist, backward and wavering elements, as well as anti-socialist outbursts in Polish newspapers" to bring counter-revolution to Poland. Herr Ulbricht's loyalty has for some time been getting the reward of flattering attention from Moscow. It would not be surprising if he and his circle, whose caution in retreating from Stalinism has long seemed such an anachronism in eastern Europe, now felt themselves able to claim that they had, after all, been right to go slow.

Their policy of very gradual relaxation has not yet, however, been abandoned. The government has been careful to avoid surrendering any solid power, but there is no doubt that the permitted opportunities for criticism have been enlarged. The reports of labour unrest in the zone, for example, seem to have their origin mainly in the stormy factory meetings which have followed the new policy laid down for the trade unions—to give genuine expression to workers' grievances. Smouldering resentments, against bureaucrats and the trade union officials themselves, against bigger stints and the endless pressure for more work, seem to have really come out into the open. Even where resentment broke out in strikes, as in Magdeburg, it seems to have been met so far with discussion rather than arrests. But since it is beyond the power of the east German regime to meet either the political or the economic grievances effectively, the thaw cannot go far.

The "Quiet" Fronts

SOVIET advocates of going slow in eastern Europe may find comfort in the thought that, while Warsaw is astir and Budapest ablaze, all seems apparently quiet on the other fronts, where the dash for freedom was not allowed to move so fast. Mr Gheorghiu-Dej in Rumania has hitherto been able to ride the storm and remain at the helm. In Bulgaria, Mr Chervenkov had to resign the premiership and it was found necessary to rehabilitate posthumously Mr. Kostov, one of the victims of the purge of Titoists, but the situation seems outwardly under control. Czechoslovakia (as an article on page 338 records) looks like a Stalinist island among the surrounding waves. Mr Rajk has had a state funeral in Budapest and Mr Gomulka is back in power, but Prague still sticks to its version of the Slansky trial.

These indications, however, afford no solid basis for policy. Explosions come often as a surprise and there are signs of movement below the surface. In Rumania, in particular, the pent-up forces of discontent, both political and economic, are probably no less powerful than in Hungary. In Bulgaria the risks of revolt may be less because the urban population is small and peasants were, comparatively, least opposed to collectivisation. Czechoslovakia, finally, stands on its own. It was the only country in Eastern Europe before the war with a large industrial population and a strong Communist party. Nor has there been a heavy burden of rapid industrialisation there, as in the more backward countries. But even these advantages can suffice only to gain time.

What makes change more inevitable is that these countries do not stand in splendid isolation. Bulgarians and Rumanians have just been on pilgrimages to Tito's Belgrade, and in Bulgaria the drive for the rehabilitation of Kostov's men is combined with hankerings after the old dream of a Balkan federation. Even the Czechs, between Poland and Hungary, cannot long remain deaf to their stirring messages. Some of the leaders on these "quiet" fronts may now be reflecting that the Polish way is better than the Hungarian.

Dr Adenauer and the Eastern Frontier

EVENTS in eastern Europe have sent a stir through western Germany, for they were bound to suggest once more the hope of German reunification. In Bonn, as elsewhere in the West, it has been hard to see what could be done politically to help the process of change in Eastern Europe. Free Democrat and Social Democrat spokesmen have for once agreed that the liberal spark that had begun to catch in the east would ignite better if the west did not blow it out with premature fanfares. But there is one diplomatic question in which Germany can make a contribution to the opening up of eastern Europe—by allaying Polish fears of German claims on the eastern lands which Poland acquired from her after the war. Dr Adenauer tried on Sunday to do so, denouncing the deliberate fostering by Moscow of Polish fears of an armed German attempt to recover these

lands. He emphasised once more that no German thought of recovering them by any means but negotiation and understanding. He declared German willingness to negotiate with a free Poland—that is a Poland independent of Moscow—and he expressed sympathy for a country which had been thrice partitioned as (he said) Germany was today.

But it is doubtful whether the Chancellor's remarks will impress the Poles favourably, for he went on to emphasise that the refugees' "right to the homeland is a human right which Germany could never give up." In his own mind, the Chancellor no doubt distinguishes between the right of a refugee to go home and the actual return of the territory to German rule. But many Germans do not, and the Polish fears remain. Opposition critics, too, have attacked the Federal government for its failure to take the first elementary step towards sounding out its eastern neighbours—the establishment of diplomatic relations with them.

Germans who argue that the road to reunification lies not through Moscow, but through Warsaw, Prague and Budapest, have gained a powerful further argument from the Russian reply to Bonn's note on reunification. Its final sentence, it is true, does suggest that a better use of the diplomatic relations between Moscow and Bonn could further reunification. But the rest stubbornly repeats all the old arguments and denunciations—that reunification can only come through an understanding between the two German states, that the time is not ripe for free elections, and that west Germany's alliance with the West has damaged the prospects of unity.

Leaving Them Asunder

LORD MANCROFT paraded on Wednesday a familiar governmental formula for dealing with awkward social problems. The Home Office, knowing that there is a division of opinion in the country on whether to widen the grounds for divorce, selects a "balanced" royal commission (which means one composed of members whose views seem likely to be fairly evenly divided). The commission divides evenly. The Government then announces that this even division provides a presumption of a similarly even division in the country, and that it is unreasonable to expect it to legislate in such circumstances. The Government promises, however, to make certain minor—and mainly administrative—changes suggested in the report, including some for the safeguarding of children; it is congratulated on this in a debate in the House of Lords.

In other words, any hope of major reform of the divorce laws is now to be buried for some years. It is doubtful if this is in accord with the majority wishes of the country. The commission's report and the Lords debate have, however, served a useful purpose in showing how extraordinarily muddled are people's views about what sort of a reform they want. There are three points that ought to be disentangled in any debate. First, there is room for argument whether the restless discomforts (for the women, even more than for the children) of a society in which divorce is unusually easy provide a social—as distinct from the purely sacramental—case for making divorces rather unusually difficult; many rationalists who have lived in America, and in other restless societies, will believe that they do. Secondly, however, it is difficult to see how there can be any argument in favour of the present British system of putatively "making divorces difficult," by rendering it virtually obligatory for the male member of a couple which has arranged a "divorce by consent" to go through the nasty hypocrisy of a hotel adultery. Thirdly, therefore, the real attack upon present British divorce laws should be against their rigid foundation on the doctrine of the matrimonial offence.

What sort of divorce law would best accord with these arguments? The logical argument is that the sole decision for a court to make in a divorce action, brought by either party, should be whether there is any real possibility of the separated couple ever resuming co-habitation. To widen the grounds for divorce in this way would not necessarily be to make divorce easier; indeed, such a reform could—probably should—be used to make "fly-by-night" divorces harder, by saying that no petition could be filed (save under very exceptional circumstances) unless the separated couple had already been apart for, say, three years. But only one of the nineteen members of the royal commission, in a terse dissenting note from its report, followed this line of reasoning; and it was not a line given any widespread airing in the Lords on Wednesday.

Housing Policy Now

WHILE Parliament awaits more details of the Government's new policy for privately owned housing, last year's new policy for council housing is rapidly taking effect. Local authorities are increasingly switching their energies from general purpose housing to slum clearance and replacement. Mr Sandys gave the Commons some figures this week which suggest that the rate of slum clearance may rise quite rapidly to 50,000 dwellings a year in England and Wales. If local plans are fulfilled (which is rather doubtful) the eventual rate will exceed 75,000 dwellings, and about half the unfit houses in the country will be cleared during the next seven or eight years.

Instead of getting political kudos for this, however, the Government may be in for a short-term political row. A year ago Mr Sandys estimated that local authorities might continue to build 160,000 houses a year, half for general purposes and half for slum clearance and "overspill." In fact, however, the annual rate of housing starts has already dropped to about 130,000. From now on, the output of houses built for slum clearance will increase rapidly, but this may be more than offset by a further decline in general purpose housebuilding. Many small authorities which have no slum problem are now bowing out of housebuilding altogether, or are building only a trickle. For a Government which once made such a political point of building 300,000 houses a year this could be increasingly awkward. The moral is that the coming reform of the Rent Restriction Acts will need to be drastic enough to secure a proper use of existing housing resources, so that excess housebuilding can be seen to be the wasteful extravagance that it is.

It is in a few big industrial cities that the most serious problem remains. The Liverpool and Manchester conurbations together contain a quarter of England's slums. In these cities slum clearance and the relief of general overcrowding (which is also particularly acute) are dependent upon

"overspill" schemes, which are almost at a full stop—and this dependence is all the greater since the cost of rehousing inside the cities is extremely high. The rising proportion of expensive flats which local authorities must build (it now exceeds a quarter of total new dwellings) much more than offsets the economies which have been made in recent years in housing design and construction. The largest cities—Glasgow and Birmingham no less than Liverpool and Manchester—are going to be the sore spot in housing policy for a long time to come.

Cyprus in Greek Politics

Is something really stirring in the Cyprus affair? Mr Lennox-Boyd's answers to questions in the House of Commons on Wednesday gave the impression that nothing new was afoot. Nor has there been any moderation of the acid tone of Athens broadcasts. But Mr Averoff, the Greek foreign minister, was quoted on Monday as having told visiting journalists that his government recognised that no quick solution was possible. According to the same reports, he proposed that, if no date for Cypriot self-determination could be fixed at present, at least the timing of the machinery for attaining self-determination should be decided and announced. He appears even to have gone so far as to discuss a stage during which Cyprus would enjoy internal self-government while Britain retained an essential minimum of overriding powers.

On the very same day, Mr Averoff officially denied that there could be any thought of "compromise" over Cyprus. "The only settlement that can be considered," he said, "is that laid down by Ethnarch Makarios." His denial, however, contrasts sharply with the charges lately made by Greek opposition leaders and newspapers. They have accused the government not merely of being too conciliatory but of planning to have a compromise agreement in the bag before the United Nations Assembly opens on November 12th. Cyprus is, of course, at present an excellent stick with which any opposition faction can beat the Karamanlis government. Right and Left meet on this enjoyably unhelpful ground; the Eoka leader, Grivas, has demanded the government's resignation and the formation of a new one based on "patriotic unity" in terms which seem to echo the similar demand made by the Greek Communist party a few weeks earlier. Mr Karamanlis, who has been holding a series of ministerial consultations on Cyprus before he personally leads the Greek delegation to the Assembly, must be anxiously calculating whether even the most promising sort of agreement with Britain would strengthen his government's position or destroy it. One thing seems painfully clear: if there is at the moment any possibility of a drawing together of viewpoints, the Greek opposition seems bent on obstructing it.

Capture of a "Field-Marshal"

The capture of Dedan Kimathi, the commander-in-chief of the Mau Mau forces, is spectacular rather than significant. For the last two years the rebellion has been dwindling away until only a few hundred fugitives make up its active part. More a nuisance than a menace, these can safely be left to the security forces. The government's chief pre-occupation must now be the 40,000 members of Mau Mau who are still in detention camps. Those who have been filtered back into society seem to feel no urge to revert to Mau Mau's religious travesties; if this is so, it suggests that the Mau Mau oath was a formula that fascinated rather than convinced its votaries—or else the government's cleansing centre is laudably effective.

★

Although the Mau Mau terrorised and tortured more of their fellow Kikuyu than Europeans, the latter have lived in fear and danger for four years. The responsibility for what has happened is partly theirs by virtue of their governing role, but the aftermath is naturally bitterness, and the settlers are not even united about the best way of securing their own future in the colony.

The victory has been military, but the movement which it has crushed was essentially political. Exploiting genuine economic grievances and evoking atavistic savagery at the same time, politically conscious Africans have been trying to end white rule. This aim persists. While the government tries to remove the grievances (and so far it has concentrated for obvious reasons on the Kikuyu parts of the colony), the extreme African nationalists are likely to cast around for some other area to excite. The pacification of the Kikuyu is not necessarily the end of Kenya's troubles; agitators can shift their ground. While the government as policeman must be on the alert against fresh uprisings, as administrator it must exert itself to win African confidence. This second, and positive, task will be much the more difficult of the two.

Japan Loses the Skin Game

After eleven years Japan and Russia have ended a war which they actively fought for a week. In the intermittent haggling of the last fourteen months the Japanese have swallowed their pride and the Russians have curtailed some of their stiffer demands: that Japan should undertake never to enter an alliance against any of her opponents in the last war; that the warships only of countries bordering on the Sea of Japan should enjoy access to it; that Japan should be allowed to join the United Nations only if China was admitted, too. But the Russians have gained their main point: they have restored diplomatic relations without making any territorial concessions. The problem of the disputed Kurile islands, and with it the formal conclusion of peace, can now be indefinitely shelved, and if the Japanese are unwilling to renounce the islands they will be the only losers. Except for the confirmation of the present fisheries agreement, and the promise not to veto Japan's membership of the United Nations, the agreement is unlikely to give the Japanese much comfort.

Diplomatic relations are to be restored; but the Japanese cabinet's faith in Soviet diplomacy has caused it to strengthen security measures in preparation for expected espionage by the Soviet embassy staff. (The Japanese believe that Mr Tikhvinsky, the head of the Soviet fishery mission in Tokyo, is a senior officer of the secret police.) The clause dealing with Japanese citizens now detained in Russia will not arouse enthusiasm; 1,365 war criminals are to be repatriated, but the Soviet Union promises no more than to "attempt to elucidate" the fate of the 11,177 Japanese who disappeared when Manchuria was overrun. Their relatives will hardly be reassured by this promise. There is also a certain irony in the clause by which the Russians renounce all claim to reparations since they seized $2,000 million worth of equipment after their one-week campaign in Manchuria. Until a commercial treaty can be concluded both countries are to accord each other most-favoured-nation treatment in customs and port facilities, but opinion is sceptical in Japan about the hope of increased trade with the Soviet Union; trade has declined since 1948 because the communists did not offer enough goods. However, the Russians might make an effort to step up trade to the proposed $50 million each way, if by doing so Japan could be involved in close economic relations with the communist block. This prospect will not reassure the Liberal Democrats.

The Japanese diet has to ratify the declaration which ends the state of war before it can come into force. The anti-Hatoyama factions of the Liberal Democrat party will attack it bitterly, but they are unlikely to succeed in blocking its ratification. The Japanese are tired of the peace talks and still more tired of the political intrigues for which the talks have served as a useful peg. Unsatisfactory as the terms are, many Japanese realise that they are the best that can be got.

Financing the Arts

The British Council has said that it needs £55,000 more each year to show the flag of Britain's cultural achievements abroad. It is, of course, on a bad wicket in asking for more at the moment; Sir Philip Hendy's plea that this is "half the price of a misguided missile's tail" is used by everyone who wants money from Mr Macmillan. But the council's plea does raise the whole question of how much educated opinion here considers this kind of propaganda to be worth. One organ of opinion has thundered that the best kinds of British culture to send abroad would be those that are good enough to pay their own way. But the problem is not so simple. The best example of British cultural propaganda at the moment is probably the pavilion at the Venice Biennale. Largely because of it (and it is organised by the council) Henry Moore is a name to conjure with on the continent; and this year the great impression made by Lynn Chadwick's sculptures should not escape notice, although Mr Chadwick's merits did for so long.

The point about the Biennale pavilion is that, although it is a success, no part of the international exhibition in which it is incorporated is intended to pay its way. On its present budget of £59,590 a year the council cannot be expected to extend, or even maintain, this sort of work. Sir Philip suggests that Britain should do more about the biennial exhibition at São Paulo, and send exhibitions around the world. The council also wants to enable orchestras and choirs to tour—profitably if possible—but at the moment it simply has not got enough money to run the necessary risks. The real burden of the council's complaint is that somebody must decide whether it is worth while to give it enough to make a real impression on the foreign public, or whether it should not be killed off now, rather than be allowed to die of malnutrition.

There has been a second cultural candidate in Mr Macmillan's queue this week. The reviewing committee on the export of works of art has criticised the present system of buying works of art of "prime national importance" to prevent them leaving the country. The method is to wait until they are bought by a foreigner, then not to issue an export licence, and have a frantic whip-round to pay the price bid at auction by the foreigner; the state may—and sometimes does—make its contribution through a special supplementary vote in the House of Commons. An inevitable result of this system is that Britain pays the highest possible prices for these works: the committee suggests that a permanent fund should be established to buy them before auction. There seems to be everything to be said for this, particularly as, in theory, it could save, instead of cost, the taxpayers money. The committee's view would presumably be supported by more than one American buyer who has won his prize in open auction, and then had it denied to him while the fund to buy it creeps slowly up.

Irish Eyes Opening?

Our Correspondent in Dublin writes: Mr Costello's government has announced new plans to deal with the economic situation in Ireland. On paper, at least, they look like a potentially valuable re-assessment of priorities. The plans cover a wide range of activities, but they are governed by the proposition that investment in agriculture should be favoured over all other forms of investment. It is also proposed that policies should be framed after discussion with producers' organisations. To this end an Agricultural Production Council, consisting of representatives from the five major voluntary organisations, is to be established to advise on the technical issues involved in expanding production. A roughly similar body is to be set up in industry, where there is also new provision for tax reliefs for exporters. Finally, a further advisory body is to be established to do some exalted brooding on the general direction of investment policy.

It is understandable that Mr de Valera's newspaper should have summed up the plans thus summarised in the headline "Three New Advisory Bodies." Decisions are more urgently needed than analyses, of which there has been no scarcity. Moreover, the results of these plans, even on the most favourable view, must lie in the future. But the direction they indicate is the right one. While other countries have spent so much time and money cosseting high cost agriculture, the Irish Republic, which could have a low cost agriculture, has hitherto done precisely the opposite and has cosseted high cost manufacturing industry instead. Irish farmers and their Department of Agriculture have been at logger-heads for years; the new council may be a useful link (or buffer?) between them. The economic, and political, reactions will be all the greater if there are any signs of faltering policy; and the implications of giving agricul-

ture a clear priority go very deep. But if these promises are carried into effect, and if present policies are adjusted in conformity with them, the Costello government will have done a good day's work for itself as well as for the country.

Old and New Politics in Honduras

DR JULIO LOZANO, for two years Chief of State of Honduras, has out-manœuvred himself. The elections for a Constituent Assembly held earlier this month were too patently doctored: in defiance of democratic practice Dr Lozano's own party, the National Union, won all the seats in the Assembly. The Honduraneans, who have had their fill of dictatorships, rose and the armed services combined to oust Dr Lozano by the only bloodless coup in the country's turbulent history. The leaders of the revolt now govern by military junta. Two of them, Colonel Caraccioli and Major Barnes, are young air force officers who were educated in the United States; the third is the veteran military leader General Rodriguez: all three are supposed to be without political ambition, and are acting merely as armed caretakers. They have announced a programme of respect for human rights and the institutions of the Republic: these high-sounding phrases are believed to be spoken in good faith.

Dr Lozano was constituted Chief of State with absolute powers in 1954 after some looking-glass political juggling. The general elections held that year gave the Liberals under Dr Ramón Villeda a clear lead, but because Dr Villeda himself had polled slightly under half the total votes he could not, under the existing constitutional law, assume the presidency. The Nacionalistas, or conservatives, headed by the patriarchal dictator General Carias, joined with their splinter party the Reformistas to spike the guns of the Liberals by boycotting Congress. In this political deadlock Dr Lozano, the Acting President, was made constitutional dictator, although the Reformistas who supported him were at the bottom of the poll.

The flickers of democratic government died down as Dr Lozano's rule progressed. His pledge to allow political freedom was not fulfilled: the prisons filled up with his opponents, and Dr Villeda was exiled. The Liberals joined with their old enemies the Nacionalistas, but even their united effort was thwarted of a single seat in this month's Constitutent Assembly elections. Only force could end Dr Lozano's old-fashioned Central American political manipulations. The military junta has declared: "On our military honour we promise to return the government to a civilian element that has authentic popular support." If Dr Villeda has not already returned, he will at least be packing his bag.

The Very Average Welshman

CAMBRIAN patriotism should glow at a picture of the economic life of Wales in which transactions across the English border are portrayed as foreign trade. A group of graduate research workers at the University College of Wales have worked out a set of national accounts for their country almost as elaborate as those presented annually in the Blue Book for the United Kingdom.* They estimate that in 1952 the gross national product of Wales (expressed per head of the population) was about nine-tenths of that in the United Kingdom as a whole—£245 compared with £273. This would seem to reflect a good deal of prosperity in a country which depends more on primary production—on agriculture and mining—than England, and where the incidence of unemployment is twice as high. Some tentative and very rough figuring for Scotland suggests that the national income per head there is slightly lower than in Wales, while in Ulster it certainly is—no more there than £186 in 1952. By inference, the figure in England in that year should thus have been about £285.

★

Anything that adds to the sparse knowledge about regional economics is to be encouraged, and a good deal of effort and ingenuity has gone into this particular exercise. Some of these figures, however, seem very precarious; a 5 per cent error is attributed to most of them, but it is hard to feel that it may not be more. Many figures are derived as a proportion of corresponding ones for the United Kingdom, which may account for the fact that no strong national habits emerge from these statistics. After making the usual adjustments between national and personal income and deducting income tax, the Welsh people are said to have had £204 a head at their disposal in 1952—£20 less than those elsewhere in the United Kingdom. According to the accounts which show how they used this, they consistently spent a little less on everything: food, household goods, entertainment—the lot. They did nothing in excess and had no vices. The virtues they can point to are apparently a slightly greater thriftiness and, possibly because of the licensing laws, slightly less thirst—they spent about a fifth less on drink than other Britons. Proportionately there are fewer Welsh people with high incomes but fewer with very small incomes, although the dependence on national assistance is greater. Altogether, the Welshman emerges from this booklet as a rather suspiciously average chap.

* The Social Accounts of the Welsh Economy, 1948 to 1952. University of Wales Press. 3s. 6d.

Pension scheme trusteeship

A SPECIAL SERVICE OF LLOYDS BANK

LLOYDS BANK is particularly well equipped to act as Trustee of new or existing Company Superannuation Schemes.

The Bank's Executor and Trustee Department has wide experience in the investment of Superannuation Funds and an official of the Department would be pleased to explain the service to any interested Company.

Initial enquiries may be made at any branch of the Bank or at the address below:

LLOYDS BANK LIMITED

Executor and Trustee Department

CHIEF OFFICE: 54 THREADNEEDLE STREET, LONDON, E.C.2

New Jerusalem or Old Adam?

THE FUTURE OF SOCIALISM.
By C. A. R. Crosland.
Cape. 540 pages. 42s.

TO anybody who is not in the Labour party today, but who rather feels that he might have been if circumstances or inclination had prompted him into an active political life at any time between 1935 and 1947, Anthony Crosland has always been a very interesting figure: he is the nearest thinker to the centre on the other side of the great divide. He was chairman of the Oxford University Socialist Club just before the war, and President of the Oxford Union just after it; he became a Labour MP in 1950 because he was just old enough to have been deeply stirred by the emotions of the 1930s, while still young enough to realise that some of those emotions are now out of date. For Mr Crosland—almost alone among the young socialist MPs of the last Parliament—has caught the vision of the expanding economy. This book is an attempt to re-think Labour policy, not in order to placate the shade of Keir Hardie, but to accord with a Britain in which—as Mr Crosland rightly believes—national output can double in a generation and be nine times as high as now in a hundred years.

He has three main planks, and in two of them the observer from the other side of the divide will follow him with understanding, and occasional lively enthusiasm. First, very broadly, Mr Crosland believes that a Labour government should give a higher priority than a Tory one to government spending, which means that it would give a lower priority to tax reduction. He insists that an expanding economy could and should redistribute more of its expanding income towards the old, the sick, the larger families and the occasional lame duck; he wants social services for them to be extended, and not at the cost of other people's social services either. He is "savagely" in favour of higher public spending on cultural amenities; to take "one concrete example," he would be prepared to "pay any subsidy necessary to encourage more high building in cities . . . whatever *The Economist* might say about 'distortion' of resources." He also believes that the state should itself step up investment in fields where he considers that private industry has an institutional tendency to invest too little; that is why he considers re-nationalisation of steel to be one of the few remaining essential extensions of public ownership. One certainly does not agree with all these arguments, but one sees Mr Crosland's points. Many people of the centre would like to see a Labour party that concentrated on this sort of policy put into office—not at every election, but perhaps in nearly as many elections as it was successively put out.

Mr Crosland's second requirement for Labour is that it should be the party of reform in the field of non-economic endeavour. Here he has a long, and lively, section on educational policy. But he would also give a high place to reform of "the divorce laws, licensing laws, prehistoric (and flagrantly unfair) abortion laws, obsolete penalties for sexual abnormality, the illiterate censorship of books and plays, and remaining restrictions on the equal rights of women." He admits that the record of his own party on these matters is "by no means immaculate"; but, quite apart from arguments about socialism, "he is also on the left, and a supporter of the Labour party, because as a matter of experience most of those advocating such changes are to be found on the left, and those opposing them on the right." This part of the book is brilliantly written; at some stages of it Mr Crosland has almost made a convert.

But there remains the third plank of his programme; and here, quite suddenly and with a sad and sickening thud, a reader on the other side of the divide must lose all touch and understanding with him. For Mr Crosland's third plank is equality, and an equality that he thinks must go beyond mere equality of opportunity. (His argument here—translate this into sense if you can—is that by pulling down the mighty from their seats a levelling Labour government would in some way mitigate what he agrees to be the abiding British curse of social antagonisms.) Is this policy of equality liable to get in the way of progress towards an expanding standard of life? Well, even if it does, "a Labour government should not . . . when economic efficiency conflicts with social or cultural values, automatically give preference to the former." Will greater equality tend to diminish personal savings? Mr Crosland will "at once concede" that it will, but says that "to maintain large inequalities simply in order to guarantee a certain flow of personal saving seems a rather lop-sided approach." Why? For the sake of greater equality, too, a Labour government must rely on higher taxes rather than on monetary policy to control inflation; it must levy gift taxes and possibly small annual capital taxes; it must have special machinery to hold down dividends; it must . . . . The sausage machine churns on and on. The dynamic of investment in success in the mid-twentieth century has given way to the spluttering engine of bitterness left over from the 1930s. The visionary who was to have lit the way to the new Jerusalem has got lost in the traditional business of giving vent to the older Adam. And by page 529 the reader who would like to vote occasionally Labour will put aside Mr Crosland, even Mr Crosland, still sadly conscious of the great emotional divide. There is no point of contact between the sort of political thinker Mr Crosland would have been if he were passing through university now, and the sort of political prig who can believe that it is worth sacrificing a few pounds of expanding national income for the vicarious enjoyment of redistributing a few pennies of it away from the wicked rich. And that is one of the real political curses of the hideous conditions of the 1930s: they have caused a whole generation of young, naturally generous, forward-looking socialists to grow, on this one issue of levelling, into a set of reactionary old fuddy-duddies before their time.

Himalayan Myth and Fact

WHERE THE GODS ARE MOUNTAINS: *Three Years Among the People of the Himalayas.*
By René von Nebesky-Wojkowitz. Translated from the German by Michael Bullock.
Weidenfeld and Nicolson. 256 pages. 21s.

THE author of this book spent three years on the south side of the Himalayas collecting "Tibetan and Lepcha garments, weapons, implements, ritual objects and books" for the Ethnology Museum of Vienna. Geographically he was hardly an explorer, for he spent most of his time in Darjeeling and Kalimpong, and his excursions into Sikkim do not seem to have taken him further than Gangtok. But his voracious interest in local customs, folklore, myth and magic has provided material for a lively and readable book. Although the high mountains are always in the background of the narrative, the author is concerned with people and their habits rather than with nature, and the famous peaks of the Himalayas figure in his pages as mythical personalities rather than as heights to be climbed by mountaineers. Indeed, he claims that mountaineering literature tends even to reduce knowledge about the human inhabitants of the Himalayas; thus, for example, all native guides are commonly referred to by climbers as Sherpas, whether they are in fact Sherpas or belong to other tribes.

As a record of an Austrian's experience of India since the end of the British Raj, the book gives an interesting picture. Darjeeling, which flourished as a British summer resort, he found full of empty hotels and closed shops, filling up only for the Kali Puja. Otherwise local life seems to have been hardly affected at all by the transfer of power, and the inhabitants still spoke of the British as "sahibs," though one of these, the son of an Englishman and a Lepcha woman, had lost his job in Kalimpong and had had to move out to a poverty-stricken Lepcha village where the author visited him. The most notable change in progress—apart from the Chinese reconquest of Tibet, of which the author heard a great deal, but which he did not directly observe—was the Nepali immigration into Sikkim and its Indian borderland and the gradual disappearance of the primitive Lepchas as a distinct people. The author was specially interested in the Lepchas and anxious to record their legends and traditions before it was too late.

For those who are fascinated by the last mysteries of the high Himalayas, Mr Nebesky-Wojkowitz has some interesting comments on local accounts of the *yeti*, the "abominable snowman" of travellers' tales. He points out that Tibetans, Lepchas and Sherpas all agree in their descriptions of this creature, which, if it exists, is clearly a large ape, somewhat similar to an orang-outang. He also points out that the appellation of "snowman" is something of a misnomer, for the animal is said to inhabit, not the zone of snow, but "the impenetrable thickets of the highest tracts of Himalayan forest," whence it occasionally ventures on to the glaciers in quest of a saline moss found on the moraine rocks. All that remains, it seems, is for a *yeti* to be produced for a zoo or museum; until then everyone is free to indulge in faith or scepticism according to his personal inclination.

Life With Stalin

COMRADE X.
By G. A. Tokaev. Translated by Alec Brown.
Harvill Press. 370 pages. 21s.

EX-COLONEL TOKAEV has written an absorbing second instalment of his memoirs. As a military scientist who headed a rocket research institute in the Soviet Union and was close to Marshal Zhukov, the MVD chief General Serov, and other figures of the early occupation years in Berlin, he is highly enough placed to make his "inside story" of wider interest than a mere personal narrative of a brave non-conformist, who had to seek freedom—and, as he remarks bitterly, find new disappointments—in Britain.

Colonel Tokaev gives a nebulous account of "Comrade X," the military leader of the revolutionary democrats, and of their activities. It is not only his discretion, or Stalin's extermination of conspirators, that does not allow this opposition movement to emerge as a danger to the Soviet state. It is much more the terrible prospect facing patriots in all totalitarian states—if they assassinate the dictator will they open the door to national enemies? This dilemma is most acute when the opposing foreign forces are, in fact, national enemies. But it is less real when they distinguish between the "bosses" and potential allies, and on this point Colonel Tokaev sharply criticises people in the West who lump all "Russians" together as communists (as well as the exiles who claim them all as reactionaries) and he makes a special point of the chances which Hitler lost in the Soviet Union. At the same time, he aims a thrust at Sir Anthony Eden for discouraging the anti-Stalinists by his prewar trip to the Kremlin. It is indeed hard to find the exact line of action which will promote those forces that undoubtedly long for greater liberty in the Soviet Union.

The author bluntly labels Stalin's state "imperialist"—and so it was. Apart from the annexation of the Baltic states, he recalls, with some horrifying details, the mass expulsion and extermination of the Caucasian tribes who fought in part for the Germans. And he seems convinced that Stalin was preparing for aggressive war around 1950, to finish off "capitalist encirclement." In many ways, this book is Khrushchev's denunciation of Stalin written in the first person singular. It lends weight to the theory that two main reasons prompted "the Boss's" former puppets to introduce reforms. One is the obvious fact that they were tired of going in constant fear of their lives; and the other that, given the need of a period of peace in which to catch up with capitalist scientific achievements, it was essential to allow greater freedom to Soviet scientists. But the writer's account of his attempt to run a technical institute with the Party as well as state bureaucrats above him is a valuable reminder that the communist system *per se*, and not merely Byzantine extravagances ("Do you want to have your eyes gouged out, Comrade Tokaev?"), is to blame.

Talking Points

THE ORIGINS AND PREHISTORY OF LANGUAGE.
By G. Révész.
Translated by J. Butler.
Longmans. 248 pages. 30s.

THE origin of language is a subject that lives a somewhat shadowy life on the confines of philology, anthropology, psychology and zoology. Among orthodox philologists it is scarcely respectable, and a minute of the Société de Linguistique de Paris once went so far as to put all discussion of it under a permanent ban. There are good reasons for this attitude; yet it continues to attract writers from the different disciplines and to fascinate the general public.

In a treatise first published in German in 1946 and now translated into English, an academic psychologist, Professor Révész, gives a new analysis of the problem and attempts a theoretical account of how language, considered quite generally as a mode of human behaviour, can have arisen. His idea has been to construct a universal key to the evolution of language by paying attention, in the manner of a biologist, to its functions. From these he excludes as non-linguistic all but those of communication. Communication he sees as arising from the forms of contact among social animals. He lists as the three evolutionary stages of communication—in which he includes, but accords no priority to, non-vocal gestures—the cry, the call, and the word. The first of these he defines as a non-linguistic "message directed to the group"; the second, "directed to definite individuals," is primarily imperative in function; the third, language proper, he again arranges in evolutionary order as the imperative, the indicative, and the interrogative.

The presentation of this theory occupies about half the book. The first half contains an interesting survey of previous literature. One question which has been fatal to many previous theories is that of an original language (*Ursprache*), which has had to be assumed or conjectured by those who have postulated a common origin of all language. This, disposed of by the author in a short chapter, has been more or less by-passed by his own theory. The tidiness of the whole is completed by a full summary at the end and a table setting out in detail the author's hierarchy of forms of contact.

There is no denying, however, that this structure will strike most British readers as excessively rigid and scholastic in character. The field of study is distressingly open. Data over large areas are totally lacking, and it is difficult to imagine any future discovery that could possibly supply them. What can be known is necessarily peripheral and of uncertain relevance. It will therefore be all the more difficult for Professor Révész to convince a scientific reader of the fruitfulness of his own method, which consists in laying down a system of *a priori* generalisations, some of which are in direct conflict with recent findings and experimental results. These conflicts can be noted not only from linguistic research, but also from research into animal behaviour.

Of the main lines of approach to this subject, linguistics, anthropology and archæology, child psychology, and animal behaviour studies, the last is perhaps the most likely to yield positive information. Yet here Professor Révész seems to cut himself off from much useful material by arbitrarily ruling out the concept of "information," which has been found useful by experimental workers in recent interpretations of the vocal behaviour of animals. It is known, for instance, that while some species of birds inherit their song entire, others have to learn it; whole vocabularies of vocal utterances have been established, each with its own appropriate context and a verifiable "meaning" for other birds of the same species. As Dr W. H. Thorpe emphasised this summer in a British Association address, no zoologist will deny the unique pre-eminence of man in the animal kingdom, but equally a great deal of light can be thrown on both human and non-human psychology by exploring those aspects common to both man and other animals.

Shorter Notices

AGRICULTURE AND INDUSTRY—RELATIVE INCOME.
By J. R. Bellerby.
Macmillan. 381 pages. 30s.

In a book Marshallian both in its elegance and its humanitarian sympathy, Mr Bellerby has assembled a striking quantity of statistical material, much of which has not hitherto been analysed, although he does not claim to have found final answers to the problems of why the relative income of agriculture is what it is, or what level of relative income is required to promote the desired transfer of labour, in various circumstances.

Mr Bellerby takes account of currently available information from a number of countries, and makes a thorough study of the information from the United Kingdom, Ireland, United States and Canada. In Canadian experience he found a valuable statistical trial ground for hypotheses, to which agricultural economists might well pay more attention, because of the very varying social conditions in the different provinces. He is not able to settle the interesting controversy whether in the Canadian prairie provinces the supply function is backward-sloping (farmers produce *more* as a consequence of a fall in income); but he has assembled a good deal of useful material on this issue. His review of Irish agricultural history in the nineteenth century is both original and thorough, and he comes to the conclusion that in the long run it was best for all concerned that the income structure of that period should promote emigration.

Probably Mr Bellerby's most important conclusion is that in the long run much of the farmer's trouble can be attributed to excessive mobility into farming in good times. This conclusion deserves further study and, if substantiated, consideration of possible measures, for instance, taxes upon land purchase, or tests (such as the Netherlands imposes) designed to rule out "amateur farmers."

★

MEASURING BUSINESS CHANGES.
By Richard M. Snyder.
New York: *John Wiley.* London: *Chapman and Hall.* 399 pages. 64s.

GOVERNMENT STATISTICS FOR BUSINESS USE: *Second Edition.*
Edited by Philip M. Hansen and William R. Leonard.
New York: *John Wiley.* London: *Chapman and Hall.* 460 pages. 68s.

Both these books are guides to American official statistics—where they are to be found, their nature and their limitations. Mr Snyder describes some 50 economic indicators ranging over national income, population, labour, production, trade, finance and prices. Information is given in detail but in a ready reference form. It is possible, for instance, to look up quickly exactly what goes into the consumer price index or how the index of industrial production is constructed.

The second book had its first edition in 1946; most of it has been revised. Thirteen chapters have been contributed by different authors on the main fields of statistics while an introductory chapter describes the federal statistical system and a closing one the uses of sampling methods. Rather more ground is covered than in the first book, but some of the descriptive material is less detailed with an emphasis on the general applications to business problems.

Letters to the Editor

The Bishops' Bench

SIR—I should be interested to know your authority for the proposition that "the arch, and diocesan bishops are full peers of the realm." I contend that those who sit in the House of Lords are either peers of parliament or lords of parliament. This assertion is based on the House of Lords standing orders. No. 72 states "No Peer or Lord of Parliament hath privilege of Peerage or of Parliament against being compelled by process of the Courts in Westminster Hall to pay obedience to a writ of *habeas corpus* directed to him." Bishops sit as lords of parliament and not as peers. The distinction between a peer and a lord of parliament is fundamental in character, namely, the former have their blood ennobled but lords of parliament remain commoners. According to Pike's constitutional history of the Lords,

> The bishops have no right to be tried in the Court of the Lord High Steward, and therefore surely ought not to be judges there. For the privilege of being thus tried depends upon nobility of blood rather than a seat in the House.

Peers constitute a special blood group; the distinguishing characteristic is its blue colour. It was because of this fact that Archbishop Cranmer in the reign of Mary was indicted before a Court of Oyer and Terminer and a Middlesex jury found him guilty of high treason. If he had been a peer of the realm as you assert that archbishops are, then the indictment could only have been tried by the House of Lords if the House had been sitting; if not by the Court of the Lord High Steward.

Bishops do not change the colour of their blood to blue because they are diocesan ones and revert to red when they cease to hold that office.—Yours faithfully, EDWARD F. IWI
London, N.W.11.

New Blood and Old Guts

SIR—Your special correspondent wrote in his article of October 20th that only some Young Conservatives and Conservative trade unionists were getting reimbursement of their expenses at the annual Conservative conference, and they only if they asked. This is certainly not true of the Hitchin division, which I have the honour to represent. All our representatives automatically receive from the divisional Conservative association their expenses (30s. a day) and a second class return train fare; this has been our practice ever since the war. Many other divisional Conservative associations do the same.—Yours faithfully,
House of Commons MARTIN MADDAN

Jobs for Graduates

SIR—Your recent article speculated on the reason for the fall away in civil service recruitment. As one of the graduates who was covered by the PEP survey may I suggest one very good reason.

When I completed national service in November, 1952, I found the job market in industry very difficult. Hearing from a friend who had been with me in the Royal Air Force that he had joined the administrative class of the civil service and was very pleased with his lot I decided to make inquiries. The leaflets I received, however, indicated that there was no possibility of entry by the interview method until the following June.

While it is true that such a time is convenient to the majority of graduates surely there is a case for recruitment on a more continuous basis?

In addition, the present regulations rigidly restrict the age of entry apart from a concession for national service. Is it not possible that the graduate who has spent some years in industry or commerce, acquiring perhaps in addition a commercial qualification, may have something to offer the civil service?

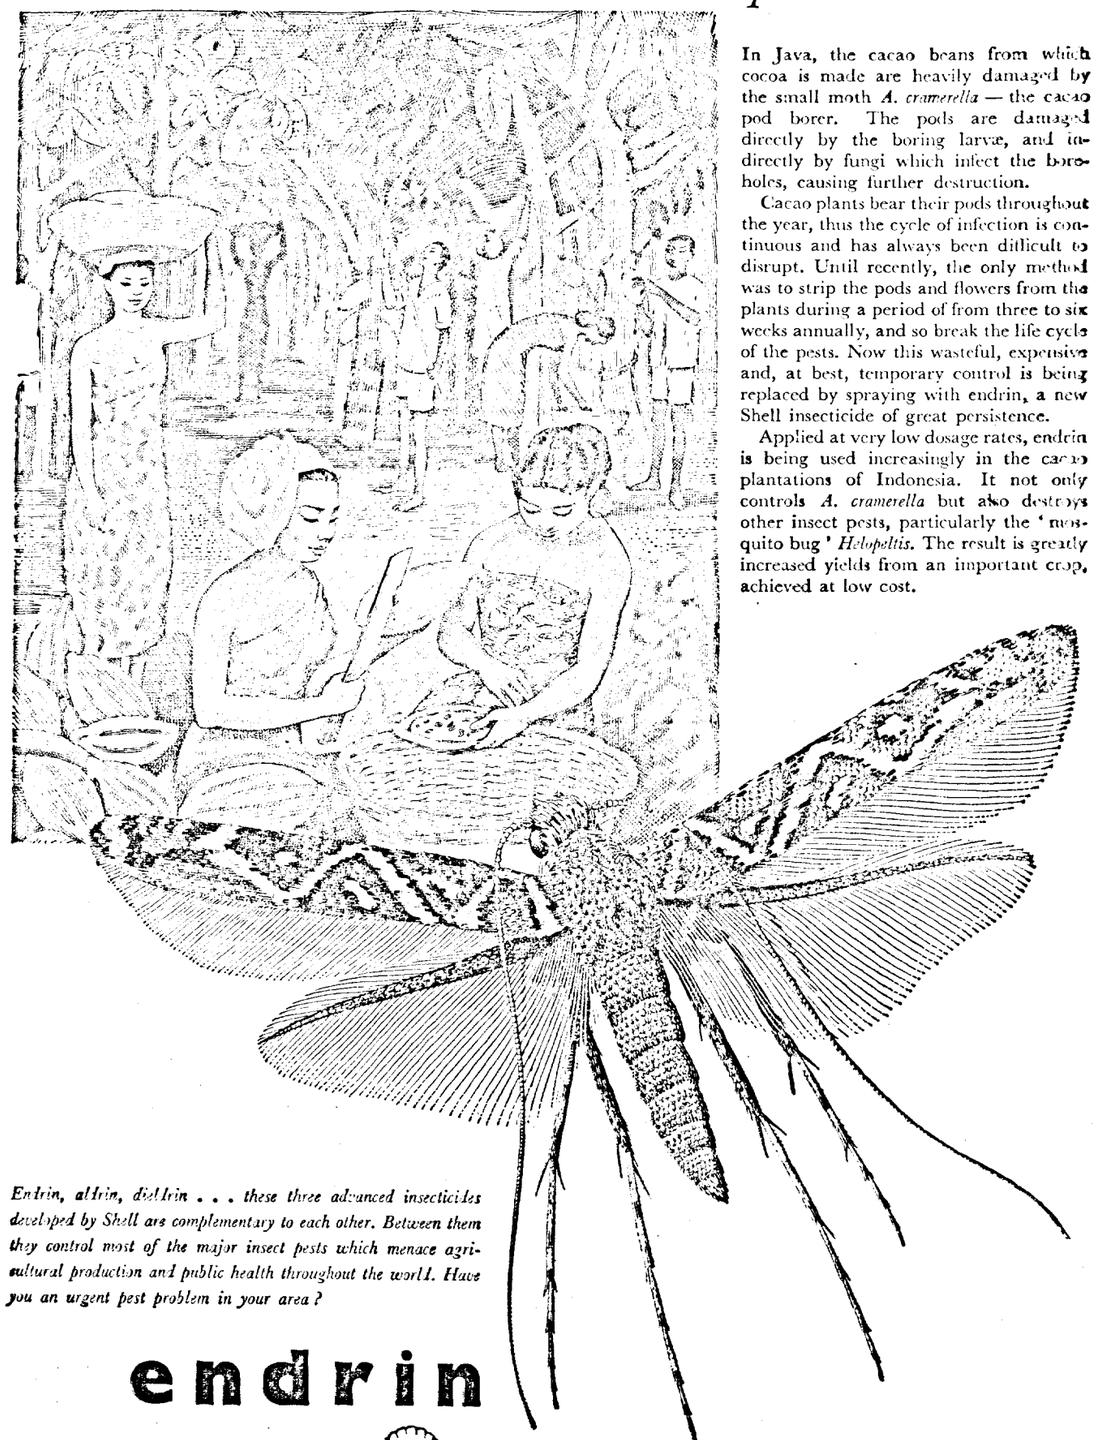
It is, I think, time that the whole system of recruitment was examined and brought more in line with the realities of the times—Yours faithfully,
West Kilbride JOHN L. WHITEHEAD

Suez and Jordan

SIR—Your leader in *The Economist* of October 20th is a masterly exercise in self-deception. The suggestion that Mr Selwyn Lloyd and M. Pineau can in any sense "congratulate themselves on what they achieved in New York" is pure nonsense. The plain facts are that a declared enemy of Britain has, by violent means and in defiance of international obligations, established himself astride (1) the main supply route for our oil, (2) our main sea route to the East. In the absence of military action, he has been left in firm control of the Suez Canal. Yet you congratulate yourself because violence has been avoided.

I—still less the Arab governments—cannot admire the person who, having been robbed by violence, congratulates himself on being deprived of the opportunity to recover his property. Further, if Nasser is not checked now, there will be a larger more dangerous war in the Middle East. This possibility, no doubt, never occurs to you. Try in future to grasp *basic realities*. You will thus avoid the puerility of which I complain.—Yours faithfully, J. L. RUSHBURNE
Ashtead, Surrey

The case of *Acrocercops cramerella*...



In Java, the cacao beans from which cocoa is made are heavily damaged by the small moth *A. cramerella* — the cacao pod borer. The pods are damaged directly by the boring larvæ, and indirectly by fungi which infect the boreholes, causing further destruction.

Cacao plants bear their pods throughout the year, thus the cycle of infection is continuous and has always been difficult to disrupt. Until recently, the only method was to strip the pods and flowers from the plants during a period of from three to six weeks annually, and so break the life cycle of the pests. Now this wasteful, expensive and, at best, temporary control is being replaced by spraying with endrin, a new Shell insecticide of great persistence.

Applied at very low dosage rates, endrin is being used increasingly in the cacao plantations of Indonesia. It not only controls *A. cramerella* but also destroys other insect pests, particularly the 'mosquito bug' *Helopeltis*. The result is greatly increased yields from an important crop, achieved at low cost.

Endrin, aldrin, dieldrin . . . these three advanced insecticides developed by Shell are complementary to each other. Between them they control most of the major insect pests which menace agricultural production and public health throughout the world. Have you an urgent pest problem in your area?

endrin

endrin, aldrin and dieldrin are SHELL insecticides for world-wide use

American Survey

AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

H-Bomb in the Election

Washington, D.C.

THE White House obviously feels that Marshal Bulganin's intervention in the presidential election will help Mr Eisenhower. It replied with unusual promptitude to the Marshal's endorsement last weekend of the views of "certain prominent public figures in the United States" on the subject of "prohibiting atomic weapon tests." The rejoinder was followed on Tuesday by a detailed review, compiled from the official records of the State and Defence Departments and the Atomic Energy Commission, sitting heavily on Mr Stevenson's proposal, which in fact dealt with tests not of all atomic weapons, but only with those of hydrogen bombs. The indications are that in the short run —and the election campaign has only ten more days to go— the President's advisers are right. More Americans will instinctively cheer the President's sharp rebuke to the Russian leader for violating the unwritten law that democracies in a state of election must be handled with delicacy than will feel uneasy that a possibility of agreement on these atomic tests has been rejected on grounds of protocol.

Mr Stevenson spent an unhappy weekend on his farm painfully composing the best answer he could. It agreed that Marshal Bulganin had shown poor taste, but argued that this was no reason for not pressing ahead, in order either to expose the Russians' hypocrisy or to bring them to terms. Other events are also conspiring to obscure Mr Dulles's politically tactless judgment that the question of H-bomb tests is "peripheral." The unrest in Poland and Hungary suggests that approaches to the Russian government in its present difficulties might be as ill-timed as its own approaches to the United States in the middle of an election. The final agreement at the United Nations on the statute of the International Atomic Energy Agency came just at the right moment to call attention to the leadership which President Eisenhower has shown in this field. Both helped the Republicans to make their comparison between the mature President they had to offer and what Mr Nixon calls "the inexperienced second-stringer," Mr Stevenson.

The essence of Mr Stevenson's case is that the testing of H-bombs can and should be treated separately from the general question of disarmament. It can be, because existing monitoring devices could detect any breach without requiring special rights of inspection. It should be, because such testing differs from all other forms of military preparation in that in itself it constitutes a threat to human health. Finally, and in Mr Stevenson's mind most prominently, by such an initiative America could recapture a moral standing in the world which it should never have forfeited. In fact, Mr Stevenson is stretching a point in calling for an American "lead," since the Russians have been talking for a long while about ending tests of bombs. But it would at least mark a new departure if the United States could hit upon a proposal which it had good reason to suppose in advance would probably be acceptable to the Russians. A ban on H-bomb tests, if it could really be entered into safely by the West, might achieve the declared purpose of President Eisenhower's "open skies" proposal: it might establish a climate of confidence in which talks on general disarmament could proceed.

Mr Eisenhower's various replies to Mr Stevenson, which were consolidated in Tuesday's document, amount to saying that the Administration thought of the idea first—in June, 1954, and again in June, 1955—and rejected it because its premises were unsound. The President denies both that the tests endanger health and that a ban could be self-enforcing. He cites a recent report from the National Academy of Science to the effect that, if the tests were continued "at the present rate," they would expose people to far less radiation than they would receive from natural causes and from X-rays. He also tries to blind his opponent with science by arguing that there is "fall out," including the dreaded strontium 90, from the smaller atomic weapons which Mr Stevenson would go on testing as well as from the hydrogen bombs whose tests he would stop. This would seem a little tendentious, since where there is more "fall out" there is presumably more danger. But a more serious objection to Mr Stevenson's idea is the President's argument that it would be difficult to police the boundary lines between permitted and unpermitted experiments. Doctor Ralph Lapp, an atomic physicist who is otherwise enthusiastic about Mr Stevenson's approach, has pointed out that a violator of the agreement could throw up his hands in mock dismay and exclaim that his bang had been bigger than he expected.

★

The principal hazard for the voter in this first nuclear election is that he is really in no position to arbitrate between rival civilians, each buttressed by impressively qualified scientists and each deploying arguments that are obscured partly by their necessary omissions and partly by their inherent difficulty. Of central importance are the related questions whether an inspection can in fact be dispensed with in this instance and how essential further testing is to American military

preparedness. While Mr Stevenson cites the President himself as having said that any large explosion can be detected anywhere, Mr Eisenhower replies that, although the American monitoring system believes itself to be very efficient, it could not guarantee to be foolproof. Further, it might take a matter of months after an explosion to decide whether it had been large enough to break the rules and, in any case, the ability of the United States to interpret other people's tests depended on its keeping up with its own.

To Mr Stevenson's argument that America has had a surfeit of testing and cannot possibly need larger weapons than it already has, the President replies that the purposes of recent experiments are to develop more economical weapons, to learn how to defend American cities better and to discover "clean" bombs that can be directed against military targets without creating lethal "fall out." Finally, Mr Eisenhower contraverts Mr Stevenson's claim that if the Russians cheated, American tests could be resumed within eight weeks. While some Republican orators are making much of the fact that eight weeks is a long time in the schedule of nuclear war, the President confined himself to the observation that tests of a size which require the use of the proving ground in the Pacific take over a year to mount. In the interim, he thinks, the Russians could establish a commanding lead. Inspection, therefore, must come before restriction in bomb-testing as in everything else.

It is not at all clear how far this argument will influence the way people are going to vote. In some parts of the country at least it has had the effect of making Mr Stevenson's personality an issue for the first time in an election that had hitherto seemed to concern "Eisenhower" and "the Democrats." On the west coast and in parts of the middle west the Democratic candidate has been received much more enthusiastically since he tried, in his best television speech to date, to take hold boldly of the issue of "peace" by giving a precisely defined example of how to exercise the "bold leadership" which he believes the President has failed to provide. But many of the voters seem confused about the terms and limitations of an issue raised so late in the campaign. Unless Mr Stevenson can find some new way of formulating his H-bomb proposal before polling day, it will lack the clear-cut, dramatic impact of Mr Eisenhower's telling promise in 1952 that "I will go to Korea." Moreover, whatever Mr Stevenson does now, any chances that his boldness might bring him success may be buried beneath the whispered epithet of "Bulganin's candidate."

Calling-Up The Voters

LAST week Mr Adlai Stevenson devoted a major speech to developing in detail his argument for the abolition of military conscription. He did not dwell this time upon the plausible theme of "let's bring the boys back home"—this he left to the imagination of his audience. He argued rather, more practically, on grounds of military efficiency, citing the doubts of defence planners about the present rapid turnover of skilled men and the wastefulness of the constant repetition of basic training:

> Many military thinkers believe that the armies of the future, a future now upon us, will employ mobile technically trained and highly professional units, equipped with tactical atomic weapons.

The most urgent need, therefore, in Mr Stevenson's view (and also in the opinion of some military—and economic—experts) is to encourage trained men to re-enlist, rather than to go on increasing the supply of partly trained men.

Mr Stevenson argued that a more efficient and sufficiently large army could be gained simply by improvements in pay and service conditions for the existing regular forces. But Mr Charles Wilson, the Secretary of Defence, is probably right to go on being sceptical about this. Rates of pay have been raised considerably, and yet the armed forces still depend on conscription to stimulate regular enlistments. The American forces contain about 2.8 million men and need about 1 million new entrants each year to keep up to strength. In fact, only about 140,000 young men are conscripted annually, usually around the age of 23, not of 18 as in Britain. But to avoid the uncertainty about when, and if, they are to be called up, many men volunteer earlier and in sufficient numbers to fill the gap; they usually sign on for three or four years, instead of two, in order to qualify for better rates of pay, promotion and gratuities. So, while there are comparatively few actual conscripts in the American forces, the necessary rate of recruitment appears to depend upon the competitive existence of conscription.

But there is an ironic and disturbing feature in Mr Stevenson's plea for highly paid, professional armed forces, technicians, presumably, of super-weapons. This might abolish the need for conscription, but it smacks of Admiral Radford's "Fortress America" type of thinking which would concentrate on weapons of retaliation rather than on conventional armies scattered around the world. This is an approach which has been strongly opposed by liberals and some of them must be wondering whether, as the *New York Times* suggests, Mr Stevenson's proposals would not make the distinction between a local incident and a full-scale atomic war even harder to maintain.

Squeeze on Middle Eastern Oil

IN a reappraisal of the effect of imported oil on the security of the United States, the President's advisory committee on energy supplies has modified its original recommendation that the ratio of oil imports to domestic production should remain the same as it was in 1954—16.6 per cent. Now specifically exempted from the formula are all imports of residual fuel oil, which is in chronically short supply in the United States; all imports from Venezuela, which has undertaken to see that its exports of crude oil to the United States (other than to California) do not substantially exceed 405,000 barrels a day; all imports from Canada which, like Venezuela, is regarded as a western hemisphere source which would be secure in wartime; and all imports into the market west of the Rocky Mountains, where the output of Californian crude is insufficient to meet the demand. In effect this new formula puts the whole burden of protecting the domestic industry on the companies which import Middle Eastern crude oil to the east coast; they are responsible for only about 30 per cent of all the crude oil brought into the United States.

The domestic producers feel that the Suez crisis, by emphasising the country's dependence on American crude oil in an emergency, has strengthened their hand. At their request the Office of Defence Mobilisation is holding hearings this week, to determine yet again whether the current level of imports is endangering national security. If the evidence upholds their contention, the domestic producers will demand that the ODM recommend import quotas and that the President impose them. The President's committee has already found that the national security would be impaired if crude oil imports from the Middle East to the east coast of the United States in 1957 were not reduced by about 1 per cent below the rate in the first half of 1956.

But both the President's committee and the ODM are still in favour of "voluntary" restrictions to achieve this reduction—although the ODM has to admit that its repeated requests for lower imports have not been fully observed by the companies concerned. This method, however, completely fails to make allowance for the new importer of Middle Eastern oil, who can be accommodated within the formula only if the established importers "move over and make room" for him by cutting their own imports below the level demanded by a constant ratio of imports to domestic production. And, although the recent rise in tanker freight rates has made Middle Eastern oil dearer, over the long run—even if the oil has to be shipped round the Cape—it is likely to be cheaper for east coast refiners to import from the Middle East than from Texas. This is particularly the case when the oil is bought under long-term contracts with Middle Eastern suppliers. A growing number of companies, for competitive reasons, have been concluding such contracts, while the established importers argue that they cannot be expected to break unilaterally their own long-term contracts with the same suppliers. The task for the ODM, and for the American oil industry, is to find a way of pouring this quart of oil into a pint pot.

Political Flirtation

FROM A FEMALE CORRESPONDENT

THIS election year, as never before, women are indulging in their ancient prerogative of keeping men guessing, and they are doing it *en masse* rather than individually as of old. After 1952, by some statistical wizardry, it was calculated that an unprecedentedly large women's vote (39 per cent stronger than in 1948) had elected "Ike." This assertion was endorsed enthusiastically by the Republican women but has been contested hotly ever since by the Democratic women who, armed with a different statistical interpretation, support the view that men and women swung equally to the Republicans in 1952 and always vote pretty much alike. A final proof of women's affections can be obtained only by such means as giving them differently coloured ballots. The incontestable facts for 1956 are that there are two and a half million more potential female than male voters; more women are voting than ever before and for the first time are in a position to outvote men; and they possess by far the largest number of votes which have so far never been used.

Women are said to vote emotionally and personally, to choose a candidate as they would a husband and to judge him by his wife's recipes or the way he treats his mother. Psychological analysis has characterised Democratic women as "more socially oriented" and benevolent in their attitudes and Republican women as "more personally oriented" with "higher self-esteem." The Democratic women play up "the little guys" as their heroes and wear silver replicas of Mr Stevenson's famous shoe with a hole in the sole. Republican women speak reverently of President Eisenhower as a man "above politics" and wear "Ike" pins studded with rhinestones.

Although women are said to be more "for peace" and "against sin" than men and more concerned with candidates than issues, attempts are being made to discredit the concept that there is a special women's vote or special women's interests. Acting on the (reasonable) theory that "women are not a foreign power" and are interested in the same questions as men, the Democrats have eliminated all special material for them and are incorporating women's political organisations into the regular party hierarchy. Thus they hope to avoid siphoning off feminine energies into less productive social channels. The Republicans agree that women are interested in all the issues but maintain an elaborate programme which relates the knotty aspects of foreign policy or fiscal theory to home and family. Through the National Federation of Republican Women, a partly subsidised but independent organisation with 4,000 clubs, the irresistible forces of feminine chatter are harnessed to pass on scraps of telling political information. Both candidates have made appeals, Mr Stevenson over television to all mothers on the issue of education and the future of American children, and Mr Eisenhower personally to the Republican women, urging them, as guardians of moral and spiritual values, to inform America of the meaning of the Republican programme and to help choose the leaders who will implement it.

★

With rare exceptions, women's prestige as politicians has not kept pace with either their glamour as voters or their reputation as "Moms." Apathy is a perpetual problem. Many women still hesitate to identify themselves completely with one party or the other and have gained the reputation of "shoppers" or "ticket-splitters." Since the vote was won in 1920, the torch has continued to be carried, however, by an ardent and able minority of women in both political parties and in various non-partisan organisations, particularly the League of Women Voters, a direct outgrowth of the Women's Suffrage Association. With 127,000 members in 1,000 local leagues, this unique and indomitable organisation is devoted entirely to problems of government and has an impressive record of accomplishment ranging from local city charters to expert analyses of complex national legislation.

In government, it has been estimated that women hold less than one half of one per cent of elective and administrative positions. In professional party ranks they have had equal representation on the national committees and many state and local committees since the early nineteen-twenties, but their policy-making role has been firmly limited to the fields of health and welfare and their executive role pre-

dominantly to vice-chairmanships. For the first time this year a woman attained a major party position outside women's activities when the Republican National Committee appointed Miss Bertha Adkins to take charge of the highly important special activities for the campaign. The number of women delegates at both national conventions was higher this year, sharply up for the Republicans, but was still a small proportion of the total. Each convention featured a Ladies' Day with speeches by prominent women. Few men strained their ears to hear what may turn out to have been prophetic voices, and one bored columnist suggested that it was too bad women politicians were not more like Mrs Arthur Miller. Probably no one caught the hint from the Democratic Women's Director, Mrs Katie Loucheim, that she thinks "husbands vote as we do."

She could be right. At the vital local level women are taking more and more responsibility for political discussion, raising funds and organising drives to register voters. A candidate's chances for election may depend on the number of distaff "coffee caucuses" he can attend in a day without succumbing to the occupational hazard of "coffee nerves." As volunteers and workers who seldom seek political rewards, women fill some of the gaps created in professional ranks by the diminishing supply of patronage and the drying up of the spoils system.

Women's political maturity varies in different parts of the country depending upon social custom and economic class; their activity is less in the tradition-laden South, greater in traditionless California, less among labour groups, and greater among the economically privileged—a situation which at the moment favours the Republicans. While male politicians cling to their distrust of women in politics as idealistic amateurs who refuse to be bound by party discipline, even the more sophisticated women tend to mistrust politics as an extravagant male "racket" rather than a necessary concomitant of government. Whether women are able to assume other than a minority role in politics, now that they are a majority, may depend on whether the inevitable partisanship of sex remains stronger than that of party. Politically, at least, the United States seems in no immediate danger of becoming a matriarchy.

Unsavoury Attack

Walla Walla, Washington.

PRESIDENT EISENHOWER'S flight to Seattle in the State of Washington may have saved the state's nine electoral votes for him. But it looks as if nothing can now help Governor Arthur Langlie, who was talked by his party into taking his political life in his hands to challenge the sitting Democratic Senator, Mr Warren Magnuson. The high minded Mr Langlie, who had an excellent record in his three four-year terms as Governor, received the maximum support, including the privilege of making the keynote speech at the Republican national convention and a front cover splash in *Time* magazine. But in the primary election, which was a straight popularity contest because neither candidate was opposed in his own party, Mr Langlie fell 150,000 votes behind Senator Magnuson and there is no indication that his subsequent descent to a dirty type of campaigning has narrowed the gap.

Although Senator Magnuson, like his Oregonian neighbour Senator Morse, is a New Deal-type Democrat, with a voting record that is "good" by trade union standards, the resemblance between them then ends abruptly. Whereas Senator Morse antagonises big business concerns by sharpening the issues which divide him from them, Senator Magnuson makes routine speeches against "Wall Street" while working closely with the large private interests in his own state. While Mr Morse is an austere intellectual, Mr Magnuson very evidently enjoys the social advantages of being both a Senator and a personable bachelor. Moreover Mr Magnuson is a superb welfare officer; his real strength lies in the innumerable favours that he has done for his constituents, whatever their party. In particular his chairmanship of the Senate Interstate Commerce Committee places him in a strategic position for helping the shipping and road transport concerns which are powerful in his state. Quietly he points out that, if the Republicans take over the Senate, the new chairman will be Senator Bricker of Ohio, who is intimately involved with the rival railway interests.

Governor Langlie began his campaign by presenting himself as a man with a broader conception of a Senator's opportunities than Mr Magnuson, and with a background of Christian observance and model family living that was meant to cast a shadow by implication on the Senator. But since his shattering setback in the primary election the Governor has been attacking Senator Magnuson's private life directly. Mr Langlie's final campaign folder, headed "The Myth that is Magnuson," opens thus:

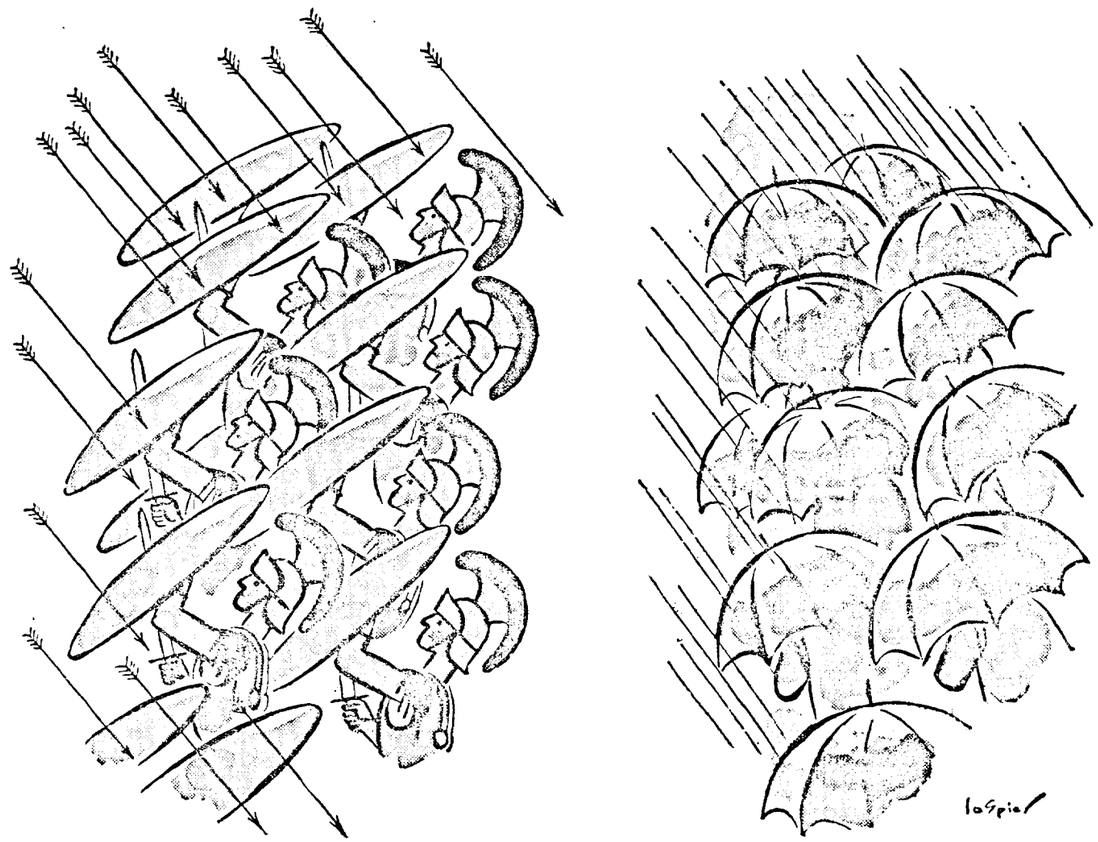
> Once upon a time there was a Senator who loved the purr of a Cadillac, the genial clink of ice cubes late at night, the company of lovely ladies.

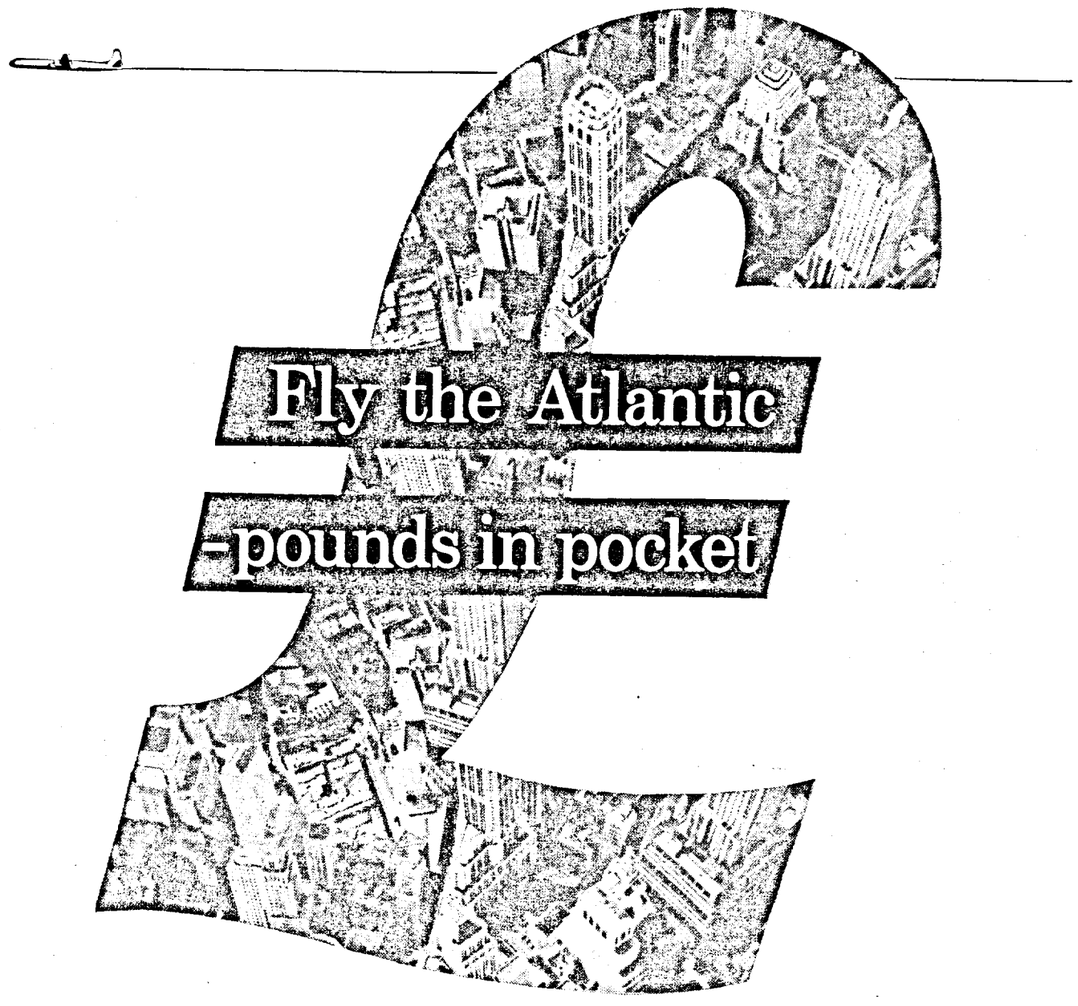
Mr Langlie's desperate—and unsavoury—bid is likely not only to ensure that he is himself defeated but also that the Democrats win the state government.

Small Business in Election Year

A GROUP of "Small Businessmen for Ike" has been encouraged to hear from the President, amid a welter of Democratic accusations that he has neglected them, that he proposes to ask the next Congress to give them about $600 million in tax relief. This sacrifice of revenue to the political holiness of the small businessman will need new legislation (and thus, the President delicately hints, a Republican Congress); but he also drew attention to what he had been able to do already by executive action to carry out the recommendations of his special Cabinet committee on the problems of small business.

In August this committee recommended larger and more flexible funds for the existing Small Business Administration, which was set up in 1953 to reassure the small businessman when the Republicans "took government out of business" by finally abolishing the New Deal's Reconstruction Finance Corporation. It makes loans to established small businesses on adequate security, if they cannot get credit from commercial banks on reasonable terms, and loans for recovery after natural disasters; it also acts as a clearing house for information about defence contracts. Under SBA's generous criteria about 4 million out of a





B.O.A.C.
OFFERS THESE
THREE BIG
FARE CUTS

TOURIST EXCURSION FARES. B.O.A.C. offers year-round, greatly reduced, special 15-day return fares on Tourist Class transatlantic services. You save nearly £35. Spend the full 15 days on the other side of the Atlantic, within an actual 17-day travel period.

FAMILY FARES PLAN. Between Nov. 1st and March 31st, only the head of the family pays the full fare when you fly the Atlantic as a family (First Class or Tourist). For example, with a wife and two children between 12 and 25, a man might save over £300 on a First Class return journey!

SPECIAL EMIGRANT FARES*. Between Nov. 1st and March 31st, B.O.A.C. offers emigrants (with some exceptions) to Canada or the U.S.A. a 40% reduction on the normal Tourist single transatlantic fare! 66 lbs. baggage allowance.

* *Subject to Government approvals.*

Consult your local B.O.A.C. Appointed Agent or B.O.A.C., Airways Terminal, Victoria, S.W.1 (VIC 2323); 75 Regent Street, W.1 (MAY 6611); or offices in Birmingham, Leeds, Manchester, Liverpool and Glasgow (see your Telephone Directory for details).

BRITISH OVERSEAS AIRWAYS CORPORATION

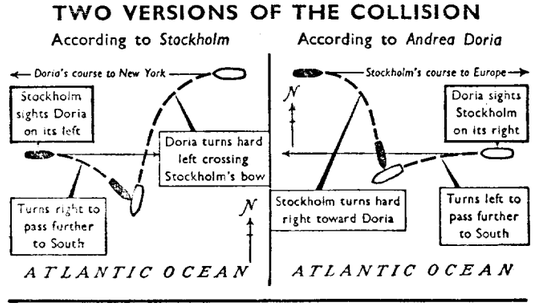
total of 4¼ million businesses are called small. In its entire life until this August it had approved a mere 3,897 loans; but during this year it had already approved more than twice as many loans as for the corresponding period last year—1,717 loans worth $68.9 million against 693 for $32 million. And now the President has authorised the SBA to raise the maximum loan which its fifteen regional directors can make on their own initiative from $50,000 to $100,000. The head of the SBA denies that this flurry has anything to do with the election; he attributed it to a "marked increase in the quality of borrowers."

The Democrats, sensing a genuine feeling among small businessmen that they are not getting a fair share of scarce resources—labour, materials and credit—in this time of prosperity, have long been accusing the Republican Administration of fostering big business at the expense of the little fellow. They have been able to point to a declining share of government defence contracts going to small firms; to the greater relative difficulty which small businessmen have in raising loans for expansion; and to a slight rise in the rate of small business failures. Amid a shower of highly political statistics, it is hard to be clear how genuine the trouble is. But while the average earnings of small businesses have risen steadily in the last few years, their share in the total market has apparently declined. How much hardship the credit squeeze has meant for small businessmen is debatable; but they certainly feel aggrieved at thwarted opportunities.

Port or Starboard?

THE two chief witnesses—the third mate of the *Stockholm* and the captain of the *Andrea Doria*—have now given, and defended under vigorous cross-examination, their conflicting versions of the cause of the collision between their two liners off the coast of New England last July. These officers, and others now following them, are appearing in a public pre-trial investigation in New York to record, for use in future court actions for damages, the evidence

TWO VERSIONS OF THE COLLISION



of witnesses who may not be available later. The Italian Line is suing the Swedish Line for $25 million; the Swedish Line is counter-suing for $2 million; and over 1,000 passengers and shippers of cargo are suing both lines for at least another $10 million.

Of the several contradictory statements, the most crucial concern the relative positions of the two ships before the collision. The third mate of the *Stockholm*, who was in sole charge of the bridge at the time of the collision, maintains that he first sighted the *Andrea Doria* on his port (left) bow. He then altered course slightly to starboard (right) to give the *Doria* more room to pass. Then, without warning, the *Doria* turned hard to port across the *Stockholm's* bow. The captain of the *Andrea Doria*, on the other hand, says that his radar indicated that the *Stockholm* was approaching on his starboard bow. He accordingly veered to port to give the *Stockholm* more room to pass. Then, without warning, the *Stockholm* turned hard to starboard and ran into him.

From the Italian ship the night looked dark and foggy; from the Swedish ship it appeared clear with good visibility. But both ships had radar and picked up the approaching vessel when well over ten miles apart. The *Doria* was travelling at just under 22 knots, the *Stockholm* at 18 or 19 knots; neither reduced speed until the last minute. The Italian Line charges that the east-bound *Stockholm* was some 20 miles north of the customary east-bound shipping lane and was, at the point of collision, actually in the customary sea lane for west-bound ships. The *Stockholm* readily admits that it was steering a course north of the recognised lane, but claims that it was under no legal compulsion to follow any such route exactly. This contention raises a question of wider significance: whether there should be some stricter form of national or international enforcement of the "rule of the road" at sea. The other point of general interest, which has still to be fully examined, is why the *Andrea Doria*, a new ship in the construction of which all the recognised precautions had been observed, sank so quickly.

An Irregular Democrat

Columbus, Ohio

THE senatorial election in Ohio involves one of the few truly original characters on the political stage. Mr Frank Lausche has been elected Governor as a Democrat no fewer than five times, generally in years when the state has favoured Republicans for other offices. He won his first term in 1944 by 100,000 votes when Roosevelt was losing the state by a similar margin, his fourth term in 1952 by 425,000 when Mr Eisenhower was carrying it by half a million, and his fifth in 1954 by 200,000 at the same time as Senator George Bender, the Republican he is now trying to unseat, crawled into the last years of Mr Taft's unexpired term with less than 3,000 votes to spare. With Governor Lausche challenging him for a full six-year term Senator Bender has need to be worried.

Mr Lausche is a great breaker of political rules. Although one of the country's finest orators he makes few set speeches; he pays practically no attention to his own political party, consults no one about his decisions, and wanders about the state campaigning on his own without any of the paraphernalia of modern publicity. He even makes sparing use of television, although he is extremely effective in that medium because he shares to a high degree Mr Eisenhower's capacity of conveying the impression of a father figure, with compassion, understanding and high moral

principle. He is a tall, thick-set man, with fine craggy features and tousled hair, a lilting vibrant voice, a grandiose vocabulary and moist, dreamy eyes. His enemies, who include most of the professional politicians of both parties, think him a humbug; the people of both parties vote for him, so far at least.

For Ohio, which is conservative about its political types as about much else, Mr Lausche was something of an innovation. He was the first Catholic and the first Slav to be elected to office. The son of Slovene immigrants, he retells on all public occasions the classic story of poor boy making good, the route in his case being from gas lamplighter to judge, mayor and governor *via* semi-professional baseball, the inevitable law courses at night school and loyal service as a local Democratic party worker in Cleveland.

As a judge Mr Lausche was a great believer in the padlock, not on jails but on casinos. His unearthing of a forgotten statute which enabled him to instruct the police to lock up gambling houses was the true foundation of his later reputation for fearless independence, while his rulings over labour disputes opened a lifelong feud with the trade unions. He was built up for the mayoralty of Cleveland by a powerful newspaper editor; as soon as he was in he threw over the Democratic boss who had given him his start as a judge and he has been denouncing political machines ever since. After two terms as Mayor Mr Lausche became Governor of Ohio in 1944; he was turned out two years later, but came back in 1948 and has since been electorally untouchable. As each election approached Mr Lausche identified a single public enemy on which to pour his grandiloquent indignation. In turn the scapegoats have been gambling operators, loan sharks, road transport firms who were accused of shirking their fair share of the highway taxes, and owners of open-cast mines who have failed to cover up their ugly traces.

★

To business men in general—and Ohio is an immensely wealthy industrial state—Mr Lausche has been a very satisfactory Governor. He has kept government clean and taxes low. To trade union leaders he seems unspeakable. He refused even to vote for the Democratic senatorial candidate in 1950 because "he would have been the special agent of the special labour bosses" and he denounced as "fantastic" an unemployment insurance programme which the unions put up for referendum.

To both political parties Mr Lausche is a source of great frustration. Republicans in Ohio, who have controlled the State Legislature during four of his five terms as Governor, complain that he is so conservative that he has failed to spend the money for highways and mental hospitals that they have provided. Republicans in the country at large are alarmed at the extent to which Ohio industrialists are backing him for the Senate rather than Senator Bender, a jovial nonentity; and Mr George Humphrey, the Secretary of the Treasury, who is a power industrially and politically in his native Ohio, has been pointing out to his fellow millionaires that an Eisenhower Republican like Mr Bender is worth more to the President than an Eisenhower Democrat like Mr Lausche, since his vote might decide which party would organise the Senate—that is, would provide the committee chairmen.

To this Mr Lausche's almost incredible response was to tell the press covering the Governor's Conference in Atlantic City that he would make up his own mind when he reached Washington on how he would vote about the organisation of the Senate, depending on who was President and how closely the parties were balanced. Lax though American party discipline is, the one occasion on which it almost invariably prevails is when committee chairmen are chosen at the opening of the congressional session. Mr Lausche's advance announcement that he might side with the other party if he held the deciding vote was utterly unprecedented. It was made all the more breathtaking by his reasoning, which was that, as a chief executive who had had to cope with legislatures with hostile majorities, he knew how unsatisfactory such a situation was. In fact, the only legislature with which the Governor had ever had any trouble was one controlled by his own Democratic party.

It was immediately apparent that this time Mr Lausche had overstepped the mark. He had got away in the past with almost any amount of party indiscipline, including his failure to use his office as Governor to give effective support to other Democratic candidates; but now he was repudiated on the floor of the House of Representatives by the senior Democratic Congressman from Ohio, who described his action as "a new low in political opportunism." Senator Bender took immediate advantage, stressing the almost servile adherence to the more progressive aspects of Mr Eisenhower's programme which has now completely replaced his former enthusiasm for Mr Taft. Although a Republican, he has been endorsed by the state branch of the American Federation of Labour and is receiving the open or covert support of many liberals and trade union leaders.

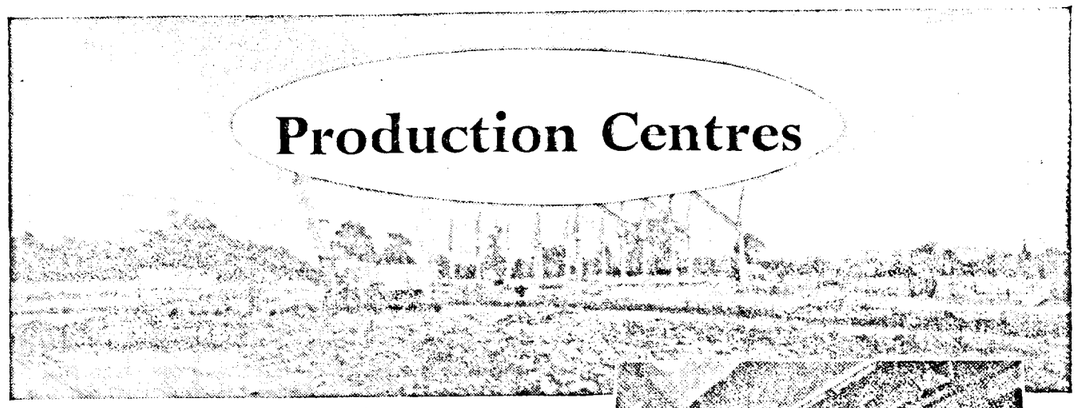
Although Ohio's twenty-five electoral votes are generally considered to be safely in Mr Eisenhower's pocket, Mr Lausche's chances must still be rated better than even. Many strongly partisan Democrats hope he will be beaten, so that, with the removal of his shadow, a real Democratic party can be built up in the state. He has had to explain away rather vaguely his statement at Atlantic City and to come out with a much stronger endorsement than is his wont of Mr Adlai Stevenson, in an attempt to recoup his position with Democratic voters. But Mr Lausche retains a great personal following: election day will show whether he is giant enough to bestride both camps again.

SHORTER NOTES

In appointing Judge William Brennan to fill the coming vacancy on the Supreme Court, the President seems to have been guided only by the desire to pick the best man—and to have succeeded in doing so. A Democrat, a Roman Catholic and a comparatively young man, Mr Brennan came to Washington from the Supreme Court of New Jersey; he has an excellent record on questions of civil liberty.

★

Correction.—In the article on the Stanley Plan, on page 47 of *The Economist* of October 6th, the second sentence of the third paragraph should end with the words, "those who wanted to present a united state-wide front against integration."



First structural members erected on site, May 1955.

From inception to production in 13 months

This large Industrial Unit for the **Pressed Steel Company Ltd.**, at Stratton St. Margaret, near Swindon, illustrates well the comprehensive nature of Cubitts' organisation and the economy and speed resulting from complete teamwork.

Occupation was required in progressive stages, including installation of industrial services. 100,000 sq. ft. were available within eight months of site clearance and a further 100,000 sq. ft. four months later. An additional 160,000 sq. ft. (including a 60,000 sq. ft. basement) were available in twelve months from commencement.

Production of car bodies commenced October 1955.

Consultant Architect: Bertram Carter, Esq., F.R.I.B.A.

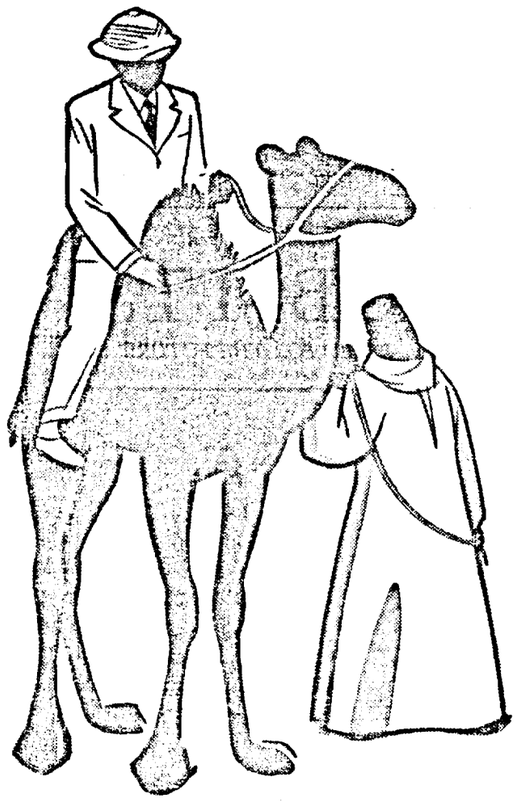
How do you reach your overseas customers?



A FUNDAMENTAL PRINCIPLE of efficient export selling is to tell the best possible message . . . to a great number of prospects . . . at reasonable cost.

In the last analysis there's nothing more effective than a personal sales call. But actually, you could hardly afford to reach your best customers or prospects month after month in this way. That's why so many companies count on advertising abroad just as they do at home. It's the most efficient and economical way to reach the greatest number of prospects.

LIFE INTERNATIONAL and LIFE EN ESPAÑOL are geared to reach your overseas prospects in just that way. Because they are read by people of influence—leaders in business, government and the professions—you know your message is reaching important prospects.

In addition, you can be certain that your message is reaching a great number of prospects in every free country since LIFE INTERNATIONAL reaches the top of the market around the world and LIFE EN ESPAÑOL offers concentrated coverage in Latin America.

Furthermore, because you yourself are in control of your own advertising message, you can see to it that the most important selling points are made in the most effective manner . . . and that your product is shown to its best advantage in the large page sizes of LIFE with its fine colour and printing reproduction.

No wonder leading companies in Britain and on the Continent have more than doubled their investment in LIFE's International Editions in the last four years. They have discovered that these magazines enable them to deliver the best possible message . . . to a great number of prospects . . . at reasonable cost.

LIFE INTERNATIONAL—advertising rates based on average net paid circulation of 260,000 copies printed in English and distributed in 120 countries outside North America.

LIFE EN ESPAÑOL—advertising rates based on average net paid circulation of 300,000 copies printed in Spanish covering all of Latin America.

These are the INTERNATIONAL EDITIONS of LIFE magazine, with a combined current circulation of over 600,000 copies every fortnight.

The World Overseas

Ghosts at Germany's Banquet

FROM OUR SPECIAL CORRESPONDENT

LAST Saturday, the Hamburg shipbuilding yards were strangely quiet; the day shift took the first of the extra twelve paid holidays a year that follow from the reduction of the standard working week from 48 to 45 hours from the beginning of this month. In the Ruhr coal mines, where there is work for 20,000 more face workers if they could only be found, the shorter working week threatens a 4 per cent loss of output (say 3 million tons a year) unless productivity can be further increased. The steel industry now has to add to the heavy list of cost increases that it has had to carry, until this week out of its own margins, a total of six instead of three hours overtime in its 51-hour average week. It pays for these at the modest rates of 25 per cent extra on workdays and 50 per cent extra on Sundays; but what consolation is that if British standards in these matters are just around the corner?

There is no bigger current talking point in German heavy industry than the reduction in working hours and the effect it may have on costs and output. It has been promptly followed by increases in both coal and steel prices, for it was a burden too big to add to the increased costs that these two industries had already been absorbing. Both are governed by "political prices," and Bonn has been no more receptive to the principle of increasing these key prices than Mr Macmillan would have been, though it has given in much more quickly. Coal gets an increase of 2.50 D-marks a ton to meet higher costs, plus a specific increase of 2 marks to finance new housing—4.50 marks in all on an average coal price of about 50 marks a ton. For an industry that has financed well over half its capital expenditure in the last five years out of retained profits, this increase has come as a relief; it is at the limit of its manpower, most of its pits are as fully mechanised as they can be, and it is concentrating with some air of desperation on providing 28,000 new houses a year to attract and keep more labour.

The difficulties of the coal industry are no less palpable in Western Germany than elsewhere. The mines are forced to recognise the realities of full employment by offering the biggest wages and the shortest working time of all German industry; they train five new men for every one they succeed in keeping (and he often goes off road-building in the summer); they expect that union pressure towards a further reduction of hours will be irresistible; and migrants from the east no longer come in a flood. These are the shadows at the feast, and they are promoting doubts about the stability of the boom. Germans have an almost pathological fear of any rise in prices—a built-in freeze in their mental make-up that does not readily distinguish between a rise in prices that follows from monetary depreciation and one caused by rising costs. The lessons of the 1948 currency reform are abidingly vivid in their minds, whereas the demanding posture of the unions is so new that it is not easy for Germans to admit the reasonableness of equating prices as closely as may be to costs.

But reason has prevailed in steel too, after a short tussle between the Ruhr and Bonn. Bessemer steel is being increased by 26.50 D-marks a ton and open hearth steel by 38.50 D-marks—an average increase of something less than 6½ per cent on finished steel. These increases, which have been notified to the European Coal and Steel Community, will still leave German steel with a price advantage over the other five members, for in Bessemer it has been underselling the rest by a margin of 25 to 70 D-marks and in open-hearth by 70 to 110 D-marks. For what the comparison is worth, German steel will now cost appreciably more than British, particularly in the more highly finished products; but British steel also has a "political price," and the question of increasing it is being actively argued by the industry and by the Steel Board.

A Billion Marks Needed

This year, Germany's steel industry expects to produce about 23½ million tons of crude steel, compared with 21.3 million in 1955 and 17.4 million in 1954. It is told that consumers will be wanting 29 million tons by 1960, and its projections towards such an output suggest that an investment of 1 to 1¼ billion marks a year would still be needed. Where can funds of this order of magnitude continue to be found? Over the years 1952 to 1956, the industry's investment has averaged one billion marks, and it has raised a greater proportion of its needs from external sources than any other German industry. Even so, 40 per cent of its investment has been self-financed, and if "investment aid" finishes next year, German steel will have to find at least half its investment funds from its own surpluses—at a time when the tax deferments granted to encourage new investment in recent years will fall due to be paid.

In the past twelve months, the industry has been absorbing cost increases equivalent to more than 500 million marks. It puts the extra cost of American coal, which it has to buy without the benefit of equalised prices as in Britain, at 150 million marks in the year ending next March. It is paying 220 marks a ton for scrap (five times the prewar price) com-

pared with a British controlled price equal to about 130 marks. In some sections profits must recently have been sub-normal, despite increased production and greater efficiency, thus preventing the industry from generating a sufficiently large proportion of the resources that it needs for further expansion. The increase in German steel prices comes none too soon for an industry that only began its real tasks of reconstruction five years ago and has work in hand for several years to come. It never tires of reminding the world that whereas its own production is only 45 per cent higher than before the war, the United States now produces more than twice as much steel and Britain 80 per cent more. It sees its programme not as one of expansion but as a fight to get back to normal.

Two examples might be given to expand this point. At the end of 1949, after dismantling, the August Thyssen-Hütte works at Duisburg were reduced to seven blast furnaces and four open hearth furnaces, without Bessemer or electric smelting furnaces or rolling capacity of any kind. Today, there are six blast furnaces and two building, five Bessemer furnaces, six open hearth furnaces and four more to come in next year, one blooming mill with a second to start next March, ample capacity for rolling heavy products, and a new continuous hot strip mill. Last year, this works produced 1.4 million tons of crude steel; its sights are now set at 2.4 million tons of steel to match its prewar output. And it has built rolling capacity that could handle 3 million tons a year if so much steel is produced. So far all this has been done at a cost equivalent to $100 per ton of annual output, compared with $350 a ton for developing a new greenfield works.

Swift and Cheap Expansion

The same story of rapid recovery and low capital costs per ton of capacity is also true of the Salzgitter works in Lower Saxony, which sits over the biggest iron ore bed in Europe after Lorraine, and was originally conceived as a tremendous iron producer with 32 blast furnaces capable of turning out 5 million tons a year, and steel capacity to match. From its low grade ore, it is now producing 1½ million tons of crude steel, and puts its potential (very modestly, one would think) at 2 million tons. This is a State-owned concern which has 300 million marks of debt on which the average interest charge is between 6 and 7 per cent. It, too, has rolling capacity far in excess of its present steel output, but it is plainly only a matter of time before it is in full use on continuous shifts. Here again one sees a virtually new steelworks rising from the ashes of the old, standing in the books at modest capital cost, and capable of a rapid increase in the output of finished products—with all that these conditions imply for future cost reductions.

It would be wrong, therefore, for anyone in Britain to greet with premature rejoicing the apparent readiness of German trade unions to press their newly found advantages hard. Demands such as those made by engineers and shipbuilders in Schleswig-Holstein this week for fringe benefits to cover sickness and extra holiday money are only one side of the story. Another side is the almost total lack of trouble arising from demarcation in the yards and the admission without question of women welders earning equal pay. True, labour pressures are becoming stronger. Industry's ability to finance for itself a high proportion of its own investment may seem less assured than it was a year or two ago. There is no sign that an active capital market can be developed, and no suggestion of early relief from the high rates, with a general floor of 7 per cent and a ceiling nearer 10 per cent, that industry pays for outside funds. But there is much new capacity, not only in heavy industry, that has been rebuilt out of the ruins much more cheaply than in Britain or the United States, and which still has to show its best paces and its lowest costs. All this promises tough German competition, even if German labour continues to demand a bigger share for itself.

Jordan Leans Towards Egypt

FROM OUR CORRESPONDENT IN AMMAN

SUNDAY'S elections in Jordan provide a good example of Arab nationalism triumphing over self-interest. As far as human eye can detect, the poll was genuinely free: the pro-Egyptian factions gained in strength; the anti-western ones swept the board. Fifteen or sixteen out of forty seats go to so-called independents, about half of whom are anti-western and about half resigned to the British link pending discovery of some equally substantial form of financial aid. The next biggest group, the National Socialists, favour Egypt, though some say that their leader, Suliman Nabulsi, would not be fussy about the source of subsidies were he returned to power (this time he lost his own seat). The main emotion that governed the vote was the new sense of self-importance imparted to the Arab-in-the-street by President Nasser's policy and propaganda. The extreme left did less well than might have been expected in view of the fact that half the constituencies are in embittered Arab Palestine; but the fellow-travelling National Front leader won a seat for Jerusalem, and more of his kind might have been returned but for fear of military weakness in the event of further raids by Israel.

Not a single candidate publicly defended the Anglo-Jordan Treaty; to do so would have been political, perhaps physical, suicide. Candidates made the choice between abrogation of the treaty and its revision. The military consequences of abrogation would be serious for Jordan. Its army is at present no match for the Israelis, and the RAF units at Amman and Mafraq, not to mention the tank squadron at Aqaba, might be invaluable to stem a first Israeli onrush. And, once committed, they would inevitably be reinforced from Cyprus. The significance of the recent training flights of Hunters in the Amman area is unmistakable. British officials in Amman have been at pains to point out that these aircraft are not reinforcement of the RAF units in Jordan, since they are based on Cyprus. That is perfectly true; but it is equally true that if training flights from Cyprus are undertaken on a rotational basis, there will usually be more British aircraft in Jordan than before. It has been argued that, in the military sense, the treaty is superfluous since Jordan is also covered by the Tripartite Declaration. But it is more difficult to get three powers to act than one; and the Americans, and possibly in their present mood the French, would look very carefully at any evidence of Israeli aggression before sending forces to Jordan's aid.

The economic consequences of abrogation would be just as serious for Jordan. The annual British subsidy runs to £12,450,000; the total budget is only £22 million: £9,100,000 of the subsidy goes to the army, £2,250,000 to the Development Board, and £1,100,000 to cover the budget deficit. The subsidy is paid through the liaison officer of the Jordan army in London, and funds are drawn from it when required. At the beginning of each financial year the Jordan army prepares estimates, which are presented to the British government through the British embassy in Amman. At the end of the year the accounts are audited by a Jordan government auditor and presented, again through the embassy. If there is any significant discrepancy between estimates and actual expenditure, Britain is entitled to ask why.

This arrangement is painful to nationalist sentiment. The abrogationists want the subsidy abolished altogether. They rely on the undertaking given by Egypt, Syria and Saudi Arabia to make good the subsidy if the treaty is denounced, and this week's descent on Amman of the Egyptian C-in-C suggests that the sequence of events could be the other way about—that on receipt of firm evidence of substantial Arab aid, the new Jordan government might denounce the treaty. But there are two dangers here. The original Arab offer was given before Colonel Nasser's nationalisation of the Suez Canal; since then Saudi ardour for paying Egypt's bills has cooled, and the money would probably not be supplied so readily now. Secondly, the new paymasters might well weary of subsidising Jordan, and decide to absorb it. Saudi Arabia might revive its claim to Aqaba, and dreams of a Greater Syria have not yet faded in Damascus.

Considerations of this kind decided King Hussein and his advisers to refuse the Arab powers' offer when it was first made. They account for the attitude of the moderates, who want to see the treaty revised, not abrogated. Revision would mean, firstly, removing the slur implied by the word "subsidy." Instead, the British would be asked to pay rent for the military installations in Mafraq, Amman and Aqaba. It would also mean the payment of the rent direct to the Jordan government without any conditions in respect of disbursement, budgets and audits. With a moderate government in control at Amman, there might be something to be said for this arrangement; but if an extremist or corrupt government took over, it would be open to obvious abuse. In the last resort, all that Britain can gain from the subsidy is a strong Jordan army and base facilities. If the strength of the forces is whittled away and the bases endangered by an unfriendly population, the reason for the subsidy disappears.

India's Simpler Map

FROM OUR CORRESPONDENT IN INDIA

INDIA'S new states, their boundaries redrawn mainly according to linguistic divisions, are to be inaugurated on November 1st amidst general satisfaction. After a year of riots and rows bitterness lingers only in Gujerat. This is a triumph both for the Indian love of compromise and for the government's responsiveness to the wishes of its people. The government has not always been clever. It did not realise the impossibility of separating Bombay city from Maharashtra; it put Gujerat into a bilingual Bombay state overnight without any preparation of Gujerati opinion; it did not realise how firm would be Bengali objections to a merger with Bihar. But it has consistently been willing to admit its mistakes and to change its decisions when it was clear that the public did not like them. This willingness is partly the result of Mr Nehru's astonishing elasticity. He has had his unpleasant experiences in Bombay and Ahmedabad, where for the first time in his life the opposition drew larger crowds than he did. But his reaction to these experiences was to come back in line with his public, not to get tough.

Mr Nehru and the Congress party ought to reap a big political reward. There have been moments in the last year when it has seemed certain that there would be trouble

with the Sikhs, that administration of Bombay city from Delhi would cost the Congress the votes of the Mahrattas at the next elections, or that there might be a complete impasse between Bengal and Bihar over their boundaries. None of this has happened. The promise of a Punjabi-speaking region and a Hindi-speaking region within the Punjab has so satisfied the Sikhs that they have decided to confine their communal organisation, the Akali Dal, to cultural activities and are joining the Congress party *en masse*. The Mahratta left-wingers have been completely disorientated by the decision to include Bombay city and Maharashtra in the same bilingual state. The Bihar-Bengal boundary solution has been so quietly accepted that the communists have been unable to make play with it.

The Punjab will have its two regions, one Hindi and one Punjabi. Bombay will include the speakers of both Gujerati and Marathi. The speakers of aboriginal and hill languages will remain in Assam or Bihar or wherever they are at present. There will be some anomalies, like the inclusion of some Marathi-speaking areas in the enlarged Mysore state. But, by and large, all those who speak one language will find themselves in one state, except that the Hindi speakers will be split between five states; and this is less of an exception than it looks, for there is a big difference between the Hindi dialects of, say, Rajasthan and Bihar. Thus, for the first time, the culture, the language and the attitudes of governors and governed will coincide for India

as a whole. There will be a final end to such oddities as the old Hyderabad, with its Urdu education and administration imposed on people who speak other languages.

The new states were made possible only by the integration of the old princely states, which now finally disappear. Before 1947 every linguistic group was split between British India and the India of the maharajas ; and the delicate transition to the new linguistic basis had to be carried out in stages. First, small princely states were amalgamated into bigger units. Now those bigger units themselves are being merged with areas which were once British India. The Rajpramukhs, former princely rulers who in recent years have presided over the groups of amalgamated princely states, now step down. In Mysore alone there has been little change, for the people's loyalty to their state is such that, while absorbing the Kannadigas from neighbouring areas, they have retained the name Mysore and their beloved Maharaja has merely changed his title from Rajpramukh to Governor.

Administratively, the new states represent a considerable tidying up. The little historical special cases disappear. The number of state legislatures goes down almost by half. There will be fewer occasions for dispute over the distribution of river water. There will be no areas, except the few small ones which are to be run by the Centre, with hopelessly inadequate finances and a severe shortage of trained staff.

The last year has imposed a very severe strain. The issues in dispute have been issues about which people feel deeply, and some of the decisions reached have genuinely seemed very unjust to large sections. But, however bitterly people have felt, they have never forgotten that they are Indians first, and Gujeratis, Sikhs or Bengalis only second. The ruffled feelings of Gujerat still need some smoothing. But India has passed through its ordeal and has emerged the stronger for the experience.

Czechoslovakia Revisited—I

Prague Feels its Way

BY A SPECIAL CORRESPONDENT

AN Asiatic fog has descended once again on the Czech scene. While great waves sweep Poland and Hungary, the ripples set up in the Czechoslovak pond by the Soviet Party Congress seem to have completely subsided. Dimly one sees a certain flux—dynamism is the official word. The criminal code is being amended in the direction of "socialist legality." There is a general movement in favour of decentralisation. A new party secretary has been appointed to the central committee (" because of pressure of work," said Mr Bruno Koehler, one of the other two secretaries.) Several new members have been added to the party control commission ("introduction of new blood"—Koehler). Dr Cepicka, the once all-powerful son-in-law of the late President Gottwald, has been thrown out of the government, has made a public confession of the cult of personality and been given a job running the patent office (" very important work "—Koehler). Otherwise all is quiet —at any rate on the surface. In contrast to the political changes which followed the blacklisting of Marshal Tito, when Slansky, the party secretary, Clementis, the foreign minister, and ten others were condemned to death, no widespread changes have accompanied Jugoslavia's rapprochement with Russia.

Many of the Czechs condemned for Titoism who escaped execution have been let out of gaol, but even those who have been quietly rehabilitated are still extremely cautious and difficult to meet, while those who were executed are still referred to publicly and privately as " traitors and criminals." Even demands within the Communist party for a congress at which a new central committee could be elected were refused on the grounds that " such a demand would only be justified if it were necessary to alter the general line of the party." Now as before the apparent stuff of Czech politics is no more than the solution of practical economic problems. And even these discussions take place behind closed doors. One is assured by all leading communists that the discussions are very fierce—but all that the public knows of them is the agreed conclusion. The Assembly passes all laws and resolutions unanimously, the national committees simply announce their decisions, and, behind and above all, the central committee of the party continues to direct.

The Schweik Habit

The official explanation of why the fashionable excitement is so absent is that the Czechoslovak Communist party has been right all the time. Long before the Soviet party congress, it had seen the error of the cult of personality (and it is true that the creator of the appalling Stalin Memorial in Prague, which was completed last year, was ostracised during the last years of its construction and committed suicide before the completion of his work.) According to Czech communists, the Soviet congress, far from reproaching them, went out of its way to commend the Czechoslovak example of one of the roads to socialism—the " peaceful and parliamentary " way.

No doubt it is partly because of this " peaceful " road to socialism that a change in direction (which elsewhere has laid bare the unnecessary slaughter of old comrades) can once again take place quietly. There are so many time-servers within the Czechoslovak party that it does not cost them much to toe a new line ; on the contrary, it is an operation dear to the heart of the " Good Soldier Schweik "—a book which at least one sincere communist has, on his own admission, found invaluable for quotation when dealing with difficult comrades. The present party secretary, Mr Antonin Novotny, is from all accounts a simple working man, one of the old brigade, and without enemies. Both he and President Zapotocky represent what is least hateful in communism—the sincere, self-educated working man who has not lost the common touch.

There is another reason, too, for the apparent differences now between Czechoslovakia and the other satellites. Economically it always was and continues to be far in advance of them. Though it is probably much less prosperous than it would have been had the Czechs been allowed to accept Marshall aid (for which the government voted unanimously), it is far better off than in 1947. The quality of goods is poorer than before the war ; but, although many Czechs may then have been better housed, better clothed and better fed, there was always the fear of unemployment. Now a man may not be able to choose his work, but he is certain to have a job. But hard work is essential. Overwork has in effect taken the place of unemployment. It is the lesser of two evils—and it gives people less time to criticise or think.

SIMON ENGINEERING GROUP

Simon resources and experience are brought to bear on many industrial developments of national and international importance.

SULPHURIC ACID

Many Simon-Carves sulphuric acid plants are used in oil production at great overseas refineries. Others in Britain and abroad help to increase world harvests by supplying acid for fertiliser manufacture : among these are two important new plants in Australia. Also in Australia are plants operating in the vital field of uranium production. At home the output of acid is significantly increased—and payments for imported materials reduced—by two great plants at Billingham and Widnes which make sulphuric acid and cement clinker from British anhydrite.

Give the finest pen in the world

An aristocrat amongst pens, the Sheaffer. Its slim elegance makes it the sort of pen that you're flattered to be seen with. Far too well-bred ever to leak or flood, the Sheaffer owes its supreme position amongst the world's pens to the mechanical perfection of its parts, to the unique filling device,* the exclusive tubular nib, the completely air-tight cap. For the Christmas-conscious the Sheaffer offers an answer that pays tribute to the discernment of all parties concerned.

pneumatic filler
A flick of the finger—and pen flushes and fills in one swift downstroke.

*the world-famous Sheaffer Snorkel Pen filler
Wiping nib, wiping barrel—a thing of the past! Sheaffer filling tube reaches down beyond nib, drinks the ink, retracts!

14-carat gold feather-touch nib
A marvel of delicate precision and strength.

matching sets
'Ensembles'—pen and pencil; 'Threesomes'—pen, pencil and ballpoint. In handsome gift cases.

Skrip
The finest ink for the finest pens.

Sheaffer's
SNORKEL PENS
FROM £3.12.0 TO 9 GUINEAS

Dear money

How much does it cost to collect your money?

Whether you sell goods or services, run a business or control the finances of a local authority, the preparation of invoices, bills, demands (call them what you will) involves costly clerical effort.

Powers-Samas punched card methods make light work of the job. Machines do the arithmetic and produce the finished bills — swiftly, at low cost and with machine accuracy. Then they fill in their time with other accounting, costing and statistical tasks.

What does punched card equipment cost? Powers-Samas have matched their ranges of machines to the needs and budgets of the small, the medium and the large organisation.

POWERS-SAMAS

mechanical, electro-mechanical and electronic accounting machines

Powers-Samas Accounting Machines (Sales) Ltd., Powers-Samas House, Holborn Bars, London, E.C.1.

The workers are passive rather than contented. Even a very time-serving communist writer, Jan Drda, can declare openly that:

> Apart from grumbling and petty bourgeois dissatisfaction, there also exists in our life a very justified dissatisfaction on the part of the working people, based on bitterness about oft-repeated, stereotyped mistakes, on excesses committed by the authorities, on unnecessary losses to our economy, on obvious injustices, on bad operational and managerial methods in our construction, on arbitrary behaviour, haughtiness and other faults.

This, however, is not the stuff of revolution, not what led the Polish workers to Poznan. Moreover, there is the Czechs' attitude towards Russia. They have no tradition of hatred, but a traditional affection which has not been seriously soured by postwar experiences. People are only dimly aware of the extent to which the Soviet Union plundered, and continues to plunder, the economic wealth of the country; the postwar excesses of the Russian soldiery were excused as the naughtiness of children. Political prisoners now returning from the uranium mines at Jachymov tell how the Russians stood up for them against their guards. Writers and artists who have been in trouble with the Czech communists regain favour through Russian support. The Czechs, of course, get sick of hearing how wonderful everything Russian is, but they are fed on little crumbs of complacency; sometimes, they are told, things in Czechoslovakia are even better. The Czechs are the good boys of the socialist camp. It seems improbable that anything exciting will come out of Prague.

Rifles and Roubles for Afghans

"RUSSIAN-AFGHAN friendship has old and glorious traditions," said a leading article in *Pravda* last week. Sceptics may recall the course of Tsarist military expansion in central Asia in the late nineteenth century and raise an eyebrow; but none would deny that the present rulers of Afghanistan have advanced willingly into their mighty neighbour's embrace. The occasion of *Pravda's* remark was the arrival in Moscow of Sardar Mohamed Daud, the Afghan prime minister and cousin of King Zahir Shah, who is now being escorted on a tour of the Soviet Union after receiving a most hospitable welcome from Mr Khrushchev, Marshal Bulganin and all their senior colleagues. A few weeks ago the Afghans began to receive the first consignments of Czech and Soviet arms and war materials under a recently signed agreement; they are apparently to receive on credit no less than $25 million worth of munitions. The copious outpourings of the Moscow press during Prince Daud's visit do not seem to have included any reminder to the Russian taxpayer that his money is being used to modernise the armed forces of a feudal kingdom. All the emphasis has been laid on the benefits which Afghanistan will get from less military forms of Soviet aid.

This economic aid, within the framework of a $100 million credit extending for thirty years, is real enough. Since the famous Khrushchev-Bulganin tour of Asia, the Afghan autocracy has received roubles on a scale out of all proportion to the sums offered to such progressive republics as India and Burma. Soviet experts and whole technical organisations are busy in many parts of the country helping to build factories, dams, and (in *Pravda's* phrase) "lines of communication." This highly selective Soviet generosity calls for some explanation. Moscow need not have paid so high a price if its object had been merely to keep Afghanistan "neutral"; Prince Daud's bitter feud with Pakistan has in itself been quite enough to ensure that his regime would not line up with the Baghdad Pact. Nor can the Russians seriously suppose that their costly investment in Afghanistan will pay off in the conventional sense that the loans will be repaid; any chance of Kabul being able to balance its books for years to come has been lost by its wilful estrangement from Karachi, its natural channel for exports. The obvious conclusion is that Russia is happy to put its money and resources into a border state which it assumes will soon pass completely under its control. So far, Prince Daud has seemed ready to co-operate.

Embattled Schools

FROM OUR CORRESPONDENT IN SINGAPORE

THE Singapore Chinese Middle Schools Students' Union was formed early in 1955, mainly to protest against its members being made liable to national service. Its leaders applied for registration (without which the union would be illegal) and it was registered in December on condition that its activities should be non-political. That proviso was completely ignored from the first. When this became known, certain members were arrested. From documents seized it was manifest that the union was directly controlled by the Malayan Communist Party. The Council of Ministers therefore ordered the dissolution of the union on September 24th, and they have now laid a White Paper before the House in explanation of what they had done.

That this students' union was a communist agency came as a surprise to none. The fact was very generally known. What is disturbing is the scale, as now revealed, of its activities. With a claimed membership of 10,000, it had secured control of half a dozen Chinese middle (i.e. secondary) schools. There was built up in these schools, with the knowledge of trustees, principals and teachers, an elaborate organisation permeating all the pupils' activities. Cells were formed in every class, branches in every school and, when necessary, a "Thoroughly Carrying Out of Resolutions Directory Sub-Committee" to ensure that the union's directives were obeyed. Propaganda methods included study groups, picnics, newspapers, reunion dinners, posters, a printed song-book and continuous use of the school amplifiers.

When further arrests were made and the government instructed the schools to expel some 150 named pupils, the members of the former union occupied two high schools, excluded both teachers and parents, and defied the government to eject them. The Chief Minister, Mr Lim Yew-hock, did not hasten to take up this challenge. What he did was to offer alternative employment to the teachers, 200 of whom promptly accepted it, simultaneously offering places in other schools to all the pupils not actually expelled. Several hundred children soon took this opportunity leaving a strong nucleus still encamped in the school buildings. Next, by withdrawing the licences from the two main offending schools, the Chief Minister reduced the

buildings to the status of privately owned property not to be used for educational purposes. For two weeks he left the matter simply as an issue between the committees of management and trespassers on their property. On Wednesday, however, the union members arrived in lorry-loads at other schools and frightened away many pupils. Mr Lim's response was to announce that the two occupied schools must be cleared by Thursday night.

There are some reassuring aspects to this affair. The work of the Special Branch, the political side of the Singapore CID, has clearly been excellent. Ministers have had full information of all that was happening. Next, the ministers themselves have given way neither to panic nor violence. They have been moderate, unhurried but firm. Finally, their attitude has brought them a wave of public support. Mr Lim commands more confidence each month and is more than ever respected for his quiet resolution. However, it must be recognised that the main problem has not been solved. The expelled "students" are still at large and still taking their instructions from the MCP. Against the internal threat which these youths represent, the only final defence would be a widespread conviction that Singapore is to be effectively defended and will never pass into China's hands. Reassurance on this point is more than overdue.

The Whence and Whither of UN Aid

FROM OUR UNITED NATIONS CORRESPONDENT

SIXTY-FIVE governments pledged a total of $30,295,000 towards the UN technical assistance programme in 1957 at a meeting in New York last week. Slightly over half of this sum was pledged by the United States, while Britain, Canada, France and Russia offered the next largest figures. The total was $2 million greater than last year's. Meanwhile, a report on the programme prepared for the forthcoming Assembly shows that it is not only increasing in extent, but also becoming more multilateral in character. Although nine-tenths of the contributions come from the United States, Europe and the Commonwealth, a number of recipient countries in Asia, Africa and Latin America are making respectable contributions, in manpower as well as in money. In the past year, for example, a Lebanese engineer served in Tanganyika and a Pakistani statistician in Liberia; a Brazilian specialist was assigned to Turkey, and a Turkish one to Afghanistan. The fellowships and training programmes embraced in the programme show a similar trend. Last year about two-thirds of the money spent was used to send technical experts to countries that asked for their services, while rather more than half of the remainder was spent on fellowships.

The largest share of the funds available for this joint programme, in which seven specialised agencies co-operate with the UN itself, went, as usual, to the Food and Agriculture Organisation, which awarded 491 fellowships as against 258 the previous year. It has been particularly concerned to get local agricultural institutions started. Its report, emphasising once again that in many countries lack of trained staff is a greater obstacle to development than lack of capital, brings out the fact that the worst bottleneck is scarcity of trained men at the intermediate level—plant managers, engineering assistants and foremen, and agricultural extension agents. Second among the agencies in the scale of its operations was the World Health Organisation, which has chiefly divided its attention between the administrative job of helping governments to introduce and operate local health services, and the lending of a hand with practical fieldwork, especially in epidemic control. It has helped in mass campaigns to wipe out or bring under control malaria, yaws, trachoma and bilharziasis. Epidemic malaria, the report notes, has now been eliminated in roughly half of the Caribbean islands.

The method of financing this and other special UN activities has recently been discussed by a committee which has now recommended a new procedure. The regular budgets of the United Nations and its agencies are collected roughly on the basis of each member state's ability to pay; Britain's share is now about ten per cent. Some members are seriously in arrears, Uruguay and Nationalist China being conspicuous among the defaulters, but by and large the funds are brought in on a dependable basis. The same cannot be said of certain UN activities that are financed by voluntary contributions from governments, groups or individuals; these include technical assistance, work for refugees, relief work in Korea, and the children's fund. Most members contribute to one or other of these funds: the only states that have not been doing so are Albania, Nepal, Portugal, South Africa and Yemen. Non-member states and territories may and do contribute; in 1955 £167 came from Liechtenstein and £919 from Monaco, while eight British dependencies pledged £14,731 to the children's fund.

The system of voluntary contributions has obvious drawbacks. For example, 95 per cent of the Korean relief funds have come from only four governments. A number of member states would, however, resist any compulsory levy for special activities of this kind, so the voluntary system will necessarily continue. The committee's proposal may at least help to make it a more dependable system. Hitherto, the Assembly has set annual target figures for each special activity, after which the governments are invited to pledge contributions towards the target figures. The pledges have nearly always amounted to less than the target, and actual receipts to less than the pledges. It is now recommended that pledges should be made as soon as is practicable after the Assembly opens, and that the Assembly should then approve more realistic target figures in the light of the amounts pledged. This would certainly seem a practical, as well as an honest, procedure.

Now in its second year

The Paper Bulletin

This is a bulletin service for paper users and makers. It deals with the supply, demand and price trends for paper, paper products and raw materials. The seventh quarterly issue will shortly be available. Full details from:

THE BUSINESS WORLD

Will New Railways Pay?

PERHAPS the six months that the British Transport Commission and the Minister of Transport, Mr Harold Watkinson, have spent on their reappraisal of the future of the railways have been good for both sides. The commission have spelled out, as explicitly as one could expect of major modernisation schemes that will stretch into the seventies, an attractive prospectus of costs and possible returns. The Minister has accepted this with no reservations of substance ; in the words of the White Paper issued on Thursday, " the commission have, in the Government's view, presented a convincing case showing that . . . they should be able to overcome their present financial difficulties, reaching a state of current balance by 1961 or 1962 and eventually a position of considerable strength." With an air of enthusiasm for what is, at this stage, bound to be a problematical and notional exercise, the Government has accepted the plans as " practical and necessary " ; it considers that the commission has now " clearly shown that they can, within a reasonable time, overcome past handicaps and provide the country with a modern and up-to-date transport system which will pay its way."

So the Minister and the commission are at one. Since the scheme was more broadly outlined at the beginning of last year, it has always been possible for the friendly but sceptical outsider to spatter question marks over it. But the biggest question mark of all has always been whether the Government could bring itself to accept its main underlying assumptions (even though several of these implied stinging rebukes for various things that various Ministers had done to the railways in the past) and adopt them as a realistic, commercial and even Conservative policy for the rebirth of the railways. The Government's commitment now could hardly be more complete and that is a great relief ; the country is being asked to put its shirt on a gamble that would have excited George Hudson and which starts at very reasonable odds.

But the assumptions that the Government has, in effect, underwritten, are of the essence of the scheme. They concern matters that, as the commission point out at the outset, are beyond their control. The first assumption is that they will no longer be impeded from covering increases in costs by adjusting their charges. Secondly, they must be able to operate flexible systems of charges and to decide for themselves what services to run. And they insist that there must be " an atmosphere of proper financial discipline throughout their affairs " and that no element of subsidy must intrude. On charges, it is fair to say that the commission have got less than they hoped for from the decision (still only an interim decision) of the Transport Tribunal, which appreciably restricts the commercial freedom to fix freight charges which the 1953 Act appeared to promise. The commission commit themselves to a policy of price restraint (obviously anxious about their current competitive position) but they are sanguine enough to expect that freedom in charges policy might produce £20 million of additional revenue by 1961 or 1962.

★

Modernisation of the railways' equipment and methods must rest on a dependable foundation of commercial freedom. It is expected to cost something, though not a lot, more than the original estimate of £1,200 million, of which £800 million is to be borrowed. The quicker returns are expected from the passenger side: " a total improvement of some £30 million a year may be predicted with confidence as the eventual outcome." On freight the benefits are expected to accrue more slowly, though the commission put the eventual figure " at a minimum " at £55 million a year. Here, stretching out to 1970, is the expectation that modernisation may produce £85 million of additional net revenue, with another £25 million from flexible charges, and £10 million from improved productivity (presumably net, after labour has taken its cut). Allowing for interest on borrowing (say £40 million) and a deficit of annual earnings of £40 million at the start of

the scheme, there should from 1970 onwards be a surplus of £50 million a year over and above the cost of servicing the new capital.

That is the sparkle of the long-run prospectus. The difficulties speak for themselves, and they arise from the considerable threat of a perpetual slide in the value of money. The fact that the commission, for the purpose of their exercise, have subsumed changes in the value of money under the brave assumption that they will be able to match increases in costs by adjusting their charges does not mean that they have suddenly gone in for Pollyanna economics ; this assumption was the only one on which to base rational estimates and it is, moreover, the most formidable of all the challenges that the commission have put to the Government. But compared with these difficulties, the short-term predicament of the commission screams from the housetops. There will be a current deficit of at least £50 million this year, and more next year even if the burden of wages is not increased—which the next two months will reveal. In five years from the end of this year investment expenditures will total £670 million, and in six years £810 million. Not until this money has been spent on freight and passenger yards, stations and vehicles, on diesel and electric traction and on improved track and signals do the commission expect, on their carefully framed assumptions, to get rid of their current deficit after paying interest on the new capital.

Modernisation itself is bound to represent a financial burden in the early years until it fructifies. How is this to be carried in a way that secures the financial discipline on which the commission are rightly so keen and avoids a subsidy ? It is to be done by the well-recognised device for works of a large-scale capital kind by capitalising the interest for the first three years and borrowing it. That is a perfectly respectable procedure. The Government's proposals for dealing with the much bigger problem of the accumulating deficit of the commission until it breaks even in 1961 or 1962 are likely to lead to greater argument. Special advances are to be made out of the Consolidated Fund to cover these deficits up to a maximum "which may be of the order of £250 million" ; they would be repayable by instalments "beginning after a specified period"—presumably after the commission are expected to be earning a surplus ; they will be liable to interest, but "for a certain time" the commission would be "entitled to receive additional special advances to cover payments of that interest." The White Paper hardly makes the Government's intentions on these important points unequivocally clear, and before they are spelled out in the necessary Bill it is to be hoped that the Minister will explain more precisely what is intended.

These financial undertakings by the Government modify, though not in any important way, the hopeful financial guesses that the commission are praying in support for the scheme. But although they are one of its essential components, the success of modernisation could never depend upon them alone. It is sadly true that this country has been guilty of gross under-investment in its railways for two decades ; it is also true that capital investment, though imperative, is only one ingredient in a successful railway policy. New equipment gives a boost to business (the remarkable success of diesel unit trains introduced in the last eighteen months puts to shame the steam-age railwaymen who for a generation regarded them with scorn) and it gives a new interest (coupled with less squalor) for the men who have to work it. It is here that the other ingredients of success must meet together in a combination of fighting commercial enterprise in selling railway service and of the most skilful deployment of labour to get the best return from these expensive new toys. A generation of under-investment has produced deadening effects on management and on men. A campaign for more business and a determined drive for efficiency (from which railway labour will certainly be able to obtain at least its fair share of the gains) must go in step with the progress of modernisation. New capital investment is only the beginning of the process ; its fruition in those luscious surpluses of tens of millions in fifteen years' time depends on a revolution of attitudes on the part of management and men.

★

But there is at least one change in attitude that the Government and the public must make about the railways. More than any other nationalised industry, the railways have for years been the victims of political blow-football. The Government's underwriting of their prospectus towards advancement and self-respect should hold out the promise that, with this new community of financial interest, the Government will not be so ready, as governments have been in the past, to prejudice the commercial opportunities of the railways in order to curry political favour. The simple principle that charges must be adjusted to changes in costs recurs through the commission's report ; it is essential that governments in future should honour it.

So with wisdom and a fair slice of luck this country may in fifteen years be able to look at the Dutch, the German, the Swiss, the French and the Italian railway systems without a shudder of shame. What is proposed in this modernisation scheme is not technically remarkable (save in its very modern standard of mainline electric traction). It is all tried and tested stuff of a minor order of technical complexity compared with the new developments that other industries have successfully tackled since the war. The trouble is that a lot of this new equipment is wanted, in a hurry, and that 800,000 people will have to work it. It ought to be a challenge to them, and if it is skilfully presented it will be. It is people, not shining new gadgets, that will make the plan succeed. But the British public, who will be providing the gadgets, will insist that the railway unions shall co-operate in a task that will make their work more rewarding in both senses.

A New Yardstick for Equities

NO index number is free from faults and each has its virtues. For *The Economist* to add another indicator of ordinary share prices and yields to those already published daily by the *Financial Times* and monthly by the *Investors Chronicle* and the *Faculty and Institute of Actuaries* demands an explanation, for this is a field that has long been tilled by others, and with valuable results for investors. A new indicator, to be justified, must not merely be different ; it must be capable also of making its own contribution to the sum of market knowledge. It is in that belief that the "*The Economist* Ordinary Share Indicator" is now introduced, and will be published each week, together with an average yield on the basis of Wednesday's closing prices. The indicator is calculated by methods similar to those used in the index series published by Merrill Lynch, the well-known American brokers ; its theoretical background owes a debt to the paper on "Investment Policy and Index Numbers" by Messrs. H. W. Haycocks and J. Flymen ; and it would not have been born without the pioneering work on methodology done by Miss Margaret Rix at *The Economist's* request.

The result of this work is unorthodox by British standards, though not unfamiliar to Americans. The indicator is designed for the investor rather than the statistician, though it happens that the production of such an indicator requires marked statistical agility. The aim is to keep it both sensitive and up to date ; this involves some sacrifice of long-term comparability. Above all, the purpose is to embrace currently active ordinary stocks and to exclude inactive ones.

Everything turns then on the choice of stocks. The chart on page 348 shows that the gyrations of the new indicator differ from those of other indices not in direction but in amplitude. This result follows much more from the stocks chosen than from the methods used to weave them into one index number. At the outset 50 ordinary stocks, listed on page 349 were chosen. The number is sufficient to be fully representative of the market leaders but not so big as to include inactive securities. The selection was made in consultation with a number of leading stockbrokers. It differs from others in not using arithmetic tests of eligibility, such as market capitalisation. The test was the partly subjective one of market activity.

No particular industrial balance was aimed at in drawing up the list but, as it turns out, no single trade is over-represented. There is no weighting and no attempt has been made to compile secondary indicators for individual industrial groups. To make up representative industrial groups would have led to the inclusion of inactive stocks and a total index built up from such industrial sub-groups would have lost much of its sensitivity. Speculative interest is not a bar to inclusion where a stock is judged to have more than a transient importance in the market.

To maintain this criterion of market activity, it is intended to revise periodically (usually once a year) the constituent stocks, discarding those that become of less interest, and replacing them with others that become more active. The indicator will not represent a portfolio which is never altered—though it is not likely that the annual revision will result in far-reaching changes in its composition. A stock which loses its status because of amalgamation or because interest on its prior charges is not met will be dropped immediately. But that is not enough in an indicator designed to show movements in the short and medium term. It is equally necessary periodically to replace stocks declining in importance with the rising stars, though there must be an element of subjectivity in this revision as there was in the original selection. Because at its inception the compilers of the indicator were able to "job backwards" no stocks have yet been dropped from it, but two steel stocks, as a result of denationalisation, have been added.

The results of the past calculations are printed on page 348 and in future the current figures will appear with the London Stock Exchange report at the foot of the page corresponding to page 364 of this issue. A weekly indicator may not hit the precise peaks and bottoms that a daily series covers but it should catch the intermediate peaks and troughs which a monthly index tends to miss. The choice of Wednesday's closing prices has the advantage of coinciding with the first day's activities of each new account.

★

Any choice of active, sensitive stocks would be nugatory unless they were plaited into an index number by methods which displayed their activity and sensitivity. *The Economist* indicator breaks new ground by combining them (the jargon is unavoidable) in an unweighted arithmetic average of "price relatives," rebased each year and then linked back to the original base. The gritty technicalities of this method are discussed on page 349. Here it is sufficient to describe the general method of working and the effect it is likely to produce. The original base for each individual stock was an average of its mid-month prices in 1953, a period of relative market stability. The method of "price relatives" equates the price of each stock in the base period to 100 and subsequently an index number for each individual stock on that base is calculated. Then the arithmetic mean of these 50 separate indices is struck to produce the final indicator. At the end of each calendar year the bases of the separate securities are changed to their latest prices and these are used in the ensuing year. Price relatives are calculated on the new base ; they are then arithmetically averaged and that average is then linked back by a conversion

The Mathematics of the Indicator

Method

The indicator is an unweighted arithmetic mean of the price relatives of 50 ordinary stocks. The original base for each stock was an average of its mid-month prices in 1953; at the end of each calendar year the indicator is re-based and then chained back to the original base:

Stock	Original Base	Date 1
A	15s. = 100	20s. = 133·3
B	30s. = 100	35s. = 116·7
C	60s. = 100	90s. = 150·0
All	100	133·3

Stock	New Base (at Date 1)	Date 2
A	20s. = 100	25s. = 125·0
B	35s. = 100	28s. = 80·0
C	90s. = 100	80s. = 88·9
All	100	98·0

To link the unadjusted indicator at Date 2 (that is 98.0) with the original base a conversion factor ($\frac{133.3}{100}$) has to be applied. The final adjusted indicator is $98.0 \times \frac{133.3}{100} = 130.6$.

Re-basing

Re-basing is used because some stock prices move up or down more quickly than others and widen the "spread" between the prices of the various components of the indicator (as if a fan were being gradually opened). Without re-basing, relatively high prices (which are characteristic of growth stocks) would come to have a growing and eventually a dominating influence on the behaviour of the indicator. Re-basing brings each individual price periodically back to 100 and dampens this influence. It is not eliminated because of the use of the linking conversion factor; but this latter uses the average of all the stock prices and thus reduces the effect of "spread" and the exaggerating influence of relatively high prices of the growth stocks. If prices spread out and then later converge after the re-basing, the opposite effect may be produced—an exaggeration of the influence of relatively high prices; in practice, however, this seems a lesser danger than the risk of increasing "spread."

Arithmetic Mean v Geometric Mean

As compared with the geometric mean (GM) the arithmetic mean (AM) tends to maximise the effect of abnormally high numbers and to minimise the effect of abnormally low numbers on the final result. Thus the use of the AM in the indicator will usually increase the influence of growth stocks on the final result. At the base date where all prices are made equal to 100 there is no "spread," but at subsequent dates a certain amount of "spread" is inevitable and consequently the AM of these prices will be higher than the GM.

There is no unvarying relationship between the GM and AM because the influences on them depend not merely on the "spread" between different prices and on the rate at which that "spread" increases or decreases, but also on the fashion in which the scatter of the individual prices changes (as if the fan opened and closed at different speeds and the pattern on it altered too). But market fluctuations would have to be really big to make the choice between GM or AM significant. The performance of the indicator as compared with other indices (and this has been tested empirically by calculations on the past figures) depends almost entirely on the selection of stocks—and hence in the future on the revision of that list—rather than on the choice of the method of averaging.

Yields

A simple arithmetic average of indicated yields has been chosen. Because the selection of stocks favours growth and currently popular equities, the yield on *The Economist* indicator is likely to remain lower than that on the *Financial Times* index.

Ordinary Shares in the Indicator

Associated Electrical Industries, £1

factor to the original base. A shorthand description of this method of calculation is to call it an arithmetic chain index though this is not quite accurate since the linking process takes place only annually. In the normal type of market, where some stock prices move up or down faster than others, this method should increase the influence of growth stocks, and the annual revision of the list aims at the same end. Both are essential ingredients of an active short-term market indicator.

On yields, *The Economist* indicator follows the path of orthodoxy. The yields calculated on each stock are indicated yields, that is the latest interim dividend is added to the latest final (or the other way about); in cases where the total dividend has been forecast that figure is used. The simple arithmetic average of these 50 yields gives the final yield figure. Because of the influence of growth and currently popular stocks on this indicator (and that springs from the selection of stocks) the yields shown by this indicator run below those shown by the *Financial Times* index and the *Actuaries' Investment* index.

The methods chosen to calculate the indicator are useful in establishing a series which is active and sensitive. But the value of the indicator will depend upon the regular and fairly frequent revision of the list of the stocks included in it. Big investors are used to comparing the valuations of their portfolios with index numbers at various dates. The new indicator, because it is arithmetic and because its constituents are reasonably close to the stocks of a forward looking portfolio of equities, should afford realistic comparisons between the two. There is nothing remarkable in the fact that over a recent period the indicator has been riding well above the other indices. But this fact challenges the idea that "beating the averages" is necessarily a matter for congratulation if the portfolio is valued arithmetically and the index is calculated on geometric averages (which always run below arithmetic averages). That is some justification for starting a new series. The differences between the showing of the new indicator and the existing share indices are not spectacular but they seem to warrant the introduction of an indicator, designed to supplement, not to supersede, the others.

Business Notes

The Market Pushes On

ON Wednesday the Government broker raised the price at which he sells Electricity 4½ per cent stock to the market twice in a single day. The two rises of ½ each have brought the price up to 91$\frac{7}{16}$, showing a total rise of half a point in a week. Conversion 4½ per cent stock (1962), which is another of the stocks that the Government broker can supply, has risen $\frac{3}{16}$ to 98¼ in the same period. These movements are not signs that the market is being groomed, but that gilt-edged stocks are in appreciably better demand than they have been in recent months. Some of the smaller banks and many other buyers are now prepared to buy moderately. Where it happens that the Government broker is approaching the end of a line of stock he wished to sell to the market the price movement can be sharp.

Currently, the market seems strong enough to absorb a good volume of new issues. Esso's £10 million of 5½ per cent stock was heavily and quickly over-subscribed on Thursday. The General Electric issue of £6 million 6 per cent loan stock issue was also over-subscribed, and the 4,285,420 £1 ordinary shares offered as rights at £2 per share were highly popular. The market must look for further tests of its appetite in the near future. On the gilt-edged side this week has seen a small issue by West Ham of £1½ million 5¼ per cent stock at £98½, attractive terms for a stock with a single date in 1966 to yield £5 8s. 10d. per cent to redemption. The comparison with the redemption yield of £5 10s. 9d. per cent on the recent London County Council issue is a measure of the market's improvement over the last fortnight. West Ham must be quickly followed by Australia with a funding issue for the maturing 3¼ per cent stock, and the premium savings bonds to come on sale next week will also absorb an unknown proportion of investors' buying power. Big new issues are also planned for the industrial share market. They include, it is believed, about £12 million for British Oxygen.

The Falling Bill Rate

DESPITE the still rising trend of money rates in some overseas centres—the Dutch and Canadian bank rates have both been raised in the past ten days—the London Treasury bill rate last week sustained its sharpest fall for six months. At the Friday tender the discount houses reversed their previous week's tactics and raised their application price by 7d. to £99 15s. per cent, with the result that the average discount rate for the whole allotment dropped by nearly ¼ per cent to a fraction over 5 per cent, the lowest rate since mid-August and fully ¼ per cent below the point reached towards the end of last month. This sharper-than-usual adjustment has been widely regarded as a response to the hopes raised by the recent speech of the Governor of the Bank of England, when he said that "we shall obviously feel more comfortable when circumstances justify a somewhat lower pattern of short-term rates." But the market was swayed also by tactical considerations and, since the authorities have not clearly shown their hand, it is not easy to assess the part played by wider ones. In the week of the Governor's speech, the market was still experiencing difficult credit conditions; the aid afforded by the authorities by open market purchases was not given in such a way as to save the discount houses from an increase in their borrowing costs. Hence they actually cut their tender price for the week's bills—apparently to the surprise of "outside" tenders—and secured only a moderate allotment. Last week the official smoothing technique was better adapted to the market's convenience, and this encouraged the discount houses to make sure of a good allotment.

Both these adjustments—the official one and the market's—could therefore be regarded as mainly tactical. There is no reason yet to suppose that the authorities are deliberately shaping their day-to-day credit policy so as to induce a further decline in rates. Indeed, the lending rate of the Public Works Loan Board was last Friday raised from 5½ to 5¾ per cent for loans of over five years (the short-term rate remaining at 5¼ per cent). It is noteworthy, however, that the better tone of the gilt-edged market since the Suez scare abated has enabled the "departments" to increase their sales. The offtake of stock last week may have been bigger than expected, since the week's bill offering of £280 million was under-allotted by £20 million. Another imminent factor that should slow down the expansion of the bill supply is the premium bonds. Meanwhile, a point of purely technical interest is the resumed offering of 63-day bills, which comprised £60 million of the £260 million of bills offered yesterday. These shorter bills were introduced in early November last year and were offered for seven successive weeks, in order to increase the concentration of bill maturities in the peak tax-gathering season of the new year. They are designed for the same purpose now.

The Mitre and the Top Hat

BUYING through two leading firms of stockbrokers and with direct access to the issuing houses that sponsor major capital issues and with top-ranking financial advice, the Church Estate Commissioners have pursued a resolute and wise investment policy, raising the yield on the portfolio and the stipends of the incumbents of the Church of England. The portfolio is arranged and managed in much the same way as any big investment fund, except that the Church will not invest in the drink or entertainment industries. That touch of the Puritan does not seem inappropriate.

What seems rather stranger is the view that the First Church Estates Commissioner, Sir Malcolm Trustram Eve, takes of a capital profit. Sir Malcolm said the Church was embarrassed by an "unwanted" profit of £160,000 on its holding of Trinidad Oil. The Archbishop of Canterbury, Dr Fisher, added a secular interpretation of the episode:

> The last thing you can call that is a gamble. We were kicked out and given a present, but we did not ask for it.

Should the Church be reluctant (or even feel it sinful) to accept a capital profit? It represents nothing more than the full current worth of a holding previously undervalued, and when it is realised it can be re-invested in other securities so as to preserve (if not to improve) the yield on its portfolio. That is the essence of investment in ordinary shares, which alone offer some chance to a fund of this kind to maintain its real capital, to match an increased income against a reduction in the value of money and consequently to provide better incomes for hard-pressed incumbents who are suffering bitterly from the depreciation of the currency.

If the Church condemns such a policy on moral grounds, it has no business to hold ordinary shares in its investment portfolio. It has a big holding. In the year to March 31st last, its holdings of Stock Exchange securities went down from £145 million to £133 million, but this was largely balanced by the growth of its investment in land and buildings from £14½ million to £22½ million and in mortgages from £15 million to £20 million. The Church's investments in gilt-edged went down from £74.7 million to £46.8 million and its holdings of industrial equities up from £40.6 million to £49.5 million. The yield on its equities went up from £6 8s. 5d. to £6 15s. 6d. per cent and the yield on all its Stock Exchange investments from £4 9s. 6d. to £4 17s. 7d. per cent. These are highly satisfactory yields, though they are based on the original purchase prices of a portfolio acquired over many years. Such perseverance with a policy of investment for better yields has helped to raise stipends from a minimum of £350 in 1948 to an average last year of £679. It is a policy indissolubly linked to chances of capital gains and losses. The profit on Trinidad Oil cannot be divorced from it as something unsavoury; it is of the essence of ordinary share investment, and no churchman need feel ashamed of it.

Boeings for BOAC

THE Minister of Transport has decided boldly and wisely to allow the British Overseas Airways Corporation to order 15 Boeing 707 jet airliners, only two less than BOAC originally requested. Past misfortunes have left BOAC with an inadequate and out-of-date fleet; its future on the North Atlantic depends on flying aircraft at least the equal of those flown by its competitors. The ten Douglas Seven Seas, the first of which will arrive in this country next week, are only stop-gaps that will temporarily redress the balance. Within the next four years, the big American jets are expected to appear on this route, halving the time of the Atlantic crossing and throwing the present competitive pattern into the melting pot. Without jets of this calibre, BOAC would be hopelessly outclassed.

It has not, however, been clear until Mr Watkinson's statement on Wednesday, that BOAC would be allowed to buy enough American jets to put its services on a fully competitive footing. A fleet of 15 is a big one, and the bill will run to £44 million, three-quarters of which will have to be found in dollars. In the case of the Seven Seas, the corporation's bankers arranged a dollar loan, and similar

arrangements have presumably been made for the Boeing 707s. The fifteen aircraft cover not only immediate needs, but also the expected future growth of North Atlantic traffic and the share that BOAC ought to be able to get. The Minister's decision thus enables BOAC to set its sights well above its present disappointing traffic load on the Atlantic route. Because of the earlier curtailment of BOAC's request for 19 Seven Seas to 10, Atlantic operations will continue to be severely curbed until the sixties and the prospect of re-opening the route to South America, now being actively developed by Lufthansa, recedes into the distance.

Advances to State Boards

THE latest of the mid-monthly advances by the Exchequer to the nationalised industries, under the new system of financing their capital requirements, absorbed little more than half the sum involved in the second batch in the series. As the accompanying table shows, the advances made on October 17th totalled only £18 million, thanks to a halving of the demands of the Central Electricity Authority and the absence of any new borrowings by the British Transport Commission. These big changes are not, unfortunately, indicative of any major improving trend, but reflect simply the inevitable and often unpredictable fluctuations of month-to-month payments and receipts. The large borrowings of the CEA in September, for example, enabled the board temporarily to reduce very substantially its overdrafts at the banks, quite apart from the regular reduction that is taking place in its overdraft limit; this unforeseen effect doubtless explains its smaller recourse to the Exchequer in October. On this occasion the Exchequer advances were made on the same day as the banks' monthly make-up; it is not certain, therefore, that the effects will be fully reflected in the clearing banks' statement now due to appear.

EXCHEQUER ADVANCES TO STATE INDUSTRIES*
(£ million)

* Under Finance Act, 1956, and excluding National Coal Board, which draws funds from the Exchequer under separate Acts.

Japan's Shipbuilding Lead

IN no peacetime year since 1920 had any foreign country launched more merchant ships than the United Kingdom. Now a nation defeated in the second world war, Japan, has outstripped this country, with Germany, another defeated nation, jostling with Britain for second place. *Lloyd's Register of Shipping* shows that in the third quarter of this year, tonnage started, launched and completed in Japan far outstripped that in the United Kingdom.

	United Kingdom		Japan	
	No.	Tons gross	No.	Tons gross
Six months ended Sept. 30, 1956 :—				
Work begun	122	566,929	185	943,017
Launched	130	590,045	158	821,179
Completed	143	761,549	150	772,209
Twelve months ended Sept. 30, 1956 :—				
Work begun	260	1,321,609	316	1,787,017
Launched	270	1,349,808	274	1,431,974
Completed	271	1,416,933	238	1,193,262

The increasing tempo of Japanese shipbuilding has been plain for some time. Work in progress increased from 66 ships of 573,871 tons gross a year ago to 144 ships of 1,192,745 tons in September, and meanwhile Japan has delivered 238 ships of 1,193,262 tons. If this pace is maintained, as seems probable, Japan will soon be producing merchant ships at the rate of at least 1,600,000 tons a year. Although Britain's potential capacity is in the region of 1,750,000 tons a year, and the present order book would last three years at such a rate of output, production is being held down to its present level primarily by the shortage of steel and also by continual labour stoppages. If sufficient steel were forthcoming, demarcation disputes and restrictive practices might still restrict output.

Over-dependence on Mixed Orders?

THE world's shipyards do not lack new orders and delivery before 1959 is difficult to obtain anywhere. British shipyards received orders for 149 ships of 950,000 tons gross in the last six months, about one-third for export, In the same period Japanese yards received orders for 58 ships of 1,108,000 tons gross for export alone, domestic orders being on a much smaller scale. Japan's shipbuilding boom is geared almost entirely to orders for large bulk carriers, ore carriers and tankers, mainly for registry in Liberia and Panama, and for Greek and American owners. The British order book is much more balanced between tankers, ore carriers, cargo vessels, passenger and cargo liners and miscellaneous and specialised ships: the overall value per ton gross is higher than in Japan. The larger and simpler type of bulk carrier is cheaper to build per ton deadweight, and simpler to build and therefore more rapidly completed, ton for ton, than passenger and cargo liners.

British yards have good prospects of stable employment, so long as new orders are well spread over different types of ships. But even if the demand for average and more specialised ships remains at its present level, the real expansion over the next few years may lie with the much larger bulk dry-cargo carriers and tankers, of 45,000 tons dw and over, for which only a limited number of British berths are at present suitable. New and extended berths are being contemplated in many foreign countries, including Japan, France, Germany, Sweden, Norway and the Netherlands and lately, too, in a few British yards. So far the orders for extra large bulk carriers have emanated mainly from Greek and other foreign "independent" owners, who have gone to yards that have been able to promise the earliest delivery. Now the major oil companies, such as British Tankers and the Shell group, have made it clear that their future programmes will also include more vessels of 60,000 tons dw and over. Shipbuilders, dry dock owners and port authorities in this country must get used to the idea that this has become a new standard size.

Courtaulds Profit Warning

IN maintaining the interim dividend at 4 per cent the directors of Courtaulds, who do not publish half-yearly profits but occasionally give some indication of the state of trade, offer stockholders a sharp warning. "Current indications are that the consolidated income of the group this year will be appreciably less than for the year to March 31st last." They report that profits both at home and abroad continue to be affected by highly competitive market conditions and by generally rising costs not matched by any general increases in selling prices. On the home front the group has in the first half of its financial year managed to maintain its sales of textile yarns and fibres, but turnover in tyre yarns following the fortunes of the motor trade has been materially lower. Shareholders also get a warning not to jump to conclusions about the final dividend which was 6 per cent last year. The final dividend "will come before the board in June next when the accounts for the full year will be considered in the light of other relevant circumstances." The market was not unprepared for some unpleasant news and Courtaulds £1 ordinary units fell only 3d. to 33s. 6d. on the announcement.

Hobson's Choice for Lancashire

REPRESENTATIVES of the cotton textile industry who gathered at Harrogate for the Cotton Board's annual conference last week-end heard one item of news, and a number of sound and worthy papers that failed to discuss a subject that was in everyone's mind. The news came from Sir Raymond Streat, chairman of the Cotton Board, who announced that a mission from Lancashire would leave for India at the end of November to discuss duty-free imports of cheap Indian cloth with representatives of the Indian industry. This mission, which was suggested by the Prime Minister in the summer, is the outcome of preliminary talks with leaders of the Indian industry who happened to be in London recently. It would be ill-advised, Sir Raymond said, to make the mission's task more difficult by discussing the question now, and the conference accepted his view. But people in Lancashire will be thinking about the implications. India may feel that if its exports to Britain rose much higher, the British Government might be forced to restrict imports of Indian cloth for home consumption. Hence it is not inconceivable that the Indian industry might be persuaded to agree to an unofficial ceiling now. But that would still leave the door open to a possible increase in imports from Hongkong and in time also from Pakistan, which has a young modern industry intent on expansion and with costs perhaps below India's. By advocating unofficial measures of protection the British Government is setting Lancashire to climb a slippery slope.

The implications for Lancashire of British participation in a free trade area in Europe were not discussed in the papers at the Conference. One of the fears expressed at Harrogate was of a "war on two fronts," with Lancashire fighting for a share of the free market while attacked in the rear by duty-free imports from the Commonwealth. Another was that foreign competition in the free market might be assisted by dual prices and subsidies. Mr A. R. W. Low, Minister of State at the Board of Trade, took up these points at the end of the conference. While duty-free entry to cotton textiles from the Commonwealth, he said, would not be altered by British membership of the free market, he reminded his listeners that the value of these imports was only a fraction of Lancashire's sales to preferential markets in the Commonwealth. He expected that the European free market plan would contain provisions against dual pricing and subsidies, and he pointed out that the government was introducing an anti-dumping bill. Though there were certainly risks in joining the free market, the risks of staying outside it were graver still. For Lancashire, indeed, a decision for or against the European free market is simply Hobson's choice.

Premium Bonds for Sale

PREMIUM SAVINGS BONDS will be on sale next Thursday, November 1st, and in anticipation of that day the distribution of the necessary forms (forms which must not be folded if sent through the post) has begun. Applicants will be able to buy through the post offices or through most banks any number of units from one to the maximum holding of 500 on a single signature—up to 10 units across the counter and larger amounts through the post. It will make no difference to the mathematical chance of drawing a prize whether a holding is bought in a single block or in random numbers, but no buyer will be allowed to choose his numbers. That will not stop more superstitious clients from trying to spread the numbering of the premium bonds held. The banks, as agents, are receiving instructions from some customers to buy a quantity of units at a given number a day (sometimes only one) on separate days; these are moves usless to the buyer and troublesome to the Post Office and the banks.

The chance of drawing a prize of £25 or better in the June draw, when all the bonds bought in the month of November rank, is one in 2,100 for a holding of a single £1 bond. For the maximum holding of £500 it is therefore only fractionally worse than one in four. A one in four chance of £25 tax free on £500 for six months will seem an attractive possibility, especially for those in the higher ranges of tax. Whether the clinical purity of "Ernie" with his other-wordly electronic brain will make quite the same appeal to the popular gambler as girls drawing numbers out of drums remains to be seen.

Anything More for Steel Shares?

ACCOUNTANTS in the steel companies are now busy preparing accounts for the financial year which ended on September 30th. Investors can only guess what these accounts will reveal, but some of them have chosen this moment to be buyers of steel equities. The buying phase has been short, but it has been sufficiently strong, as the accompanying table shows, to carry prices up several shillings. The result is that yields on these shares now conform more closely to those offered by comparable equities in other industries. The closing of this yield gap is reasonable.

But is there any chance that the advance will continue? Given present yield comparisons, a further advance in steel shares could be justified only on the assumption that dividends will be fatter. It seems a safe guess that present

£1 Ordinary Stock	Oct. 12th		Oct. 19th		Oct. 24th	
	Price	Yield	Price	Yield	Price	Yield
		%		%		%
Colvilles	30/10½	7·1	34/3	6·4	33/4½	6·6
Dorman Long	24/9	6·5	26/4½	6·1	25/9	6·2
Lancashire Steel	32/1½	6·9	33/9	6·5	33/9	6·5
Stewarts & Lloyds	56/1½	6·3	62/3	5·6	60/6	5·8
John Summers	34/7½	6·9	36/3	6·6	36/–	6·7
United Steel	36/1½	6·9	39/3	6·4	38/7½	6·5
Whitehead Iron	59/–	6·8	60/6	6·6	59/9	6·7
"Financial Times" Index	*172·3*	*6·18*	*176·1*	*6·06*	*179·5*	*5·95*

rates will not be reduced, but it would be hazardous to say they will be increased. Output slackened in the last financial period; prices were held down; and costs have been rising. Net earnings, past and prospective, cannot be expected to take another big leap forward, and a large slice of these earnings will be earmarked for development projects. Not all the major programmes are complete and there are costly developments on the horizon. Moreover, the idea that the cost of future replacement should be provided against in present profits has taken deep root in the steel industry, making another claim on earnings.

Nine Months' Trade

SEPTEMBER is usually a poor month for British exports and this year it contained the minimum 24 working days. As already shown in the preliminary returns exports fell by £31.2 million below the August figure; imports fell by £27.2 million, and as re-exports rose by £1 million the visible trade deficit ran up by £2.9 million to £63.7 million. Expressed on a working day basis—always a somewhat risky exercise—the picture looks grim. Exports were lower than in the previous month or in the corresponding month of last year and the "trade gap"—the excess of exports fob over imports cif was wider.

Some consolation can be drawn from the fact that the terms of trade have not moved adversely. In the Board of Trade Index both import prices and export prices rose a point, the former because of higher freight rates on crude oil and the latter because of higher prices of engineering products and textiles.

Poor though September was in isolation the trade figures

TRADE PER WORKING DAY
(£ million)

	Sept. 1955	Aug. 1956	Sept. 1956
Total exports (including re-exports)	9·77	9·69	9·64
Imports	11·71	11·94	12·30
"Gap"	1·93	2·25	2·65

for the first three quarters of 1956 are not as a whole discouraging. Exports of British products for the nine months have risen by £209 million to £2,332 million, and re-exports by £22 million to £107 million while imports rose by only £30 million to £2,914 million. The "gap" has been reduced from £676 million to £474 million.

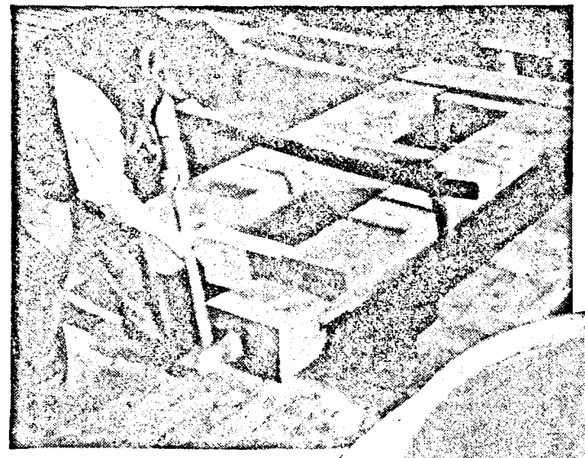
Investing the Rubber Millions

THE Guthrie group of rubber companies has devised a plan for redeploying its great surplus of liquid assets. The group has been forward in its replanting; it has spent large sums on keeping up to date; it has also liberalised the dividend policies of most of the companies in its management. But large liquid funds remain and Sir John Hay, the chairman, thinks that it is not right—at least not yet right—to invest much money on the expansion, as distinct from modernisation, of the plantations in Malaya. He therefore proposes that a big investment trust should be set up to which the rubber companies of the group would entrust their gilt edged securities, which he realises are a poor hedge again inflation, taking ordinary shares of the trust in exchange.

The investment trust is to have an initial issued capital of £1½ million rising later to £2 million, all in £1 ordinary shares. It is to start as a private unquoted company but with the prospect of a quotation later and be managed by

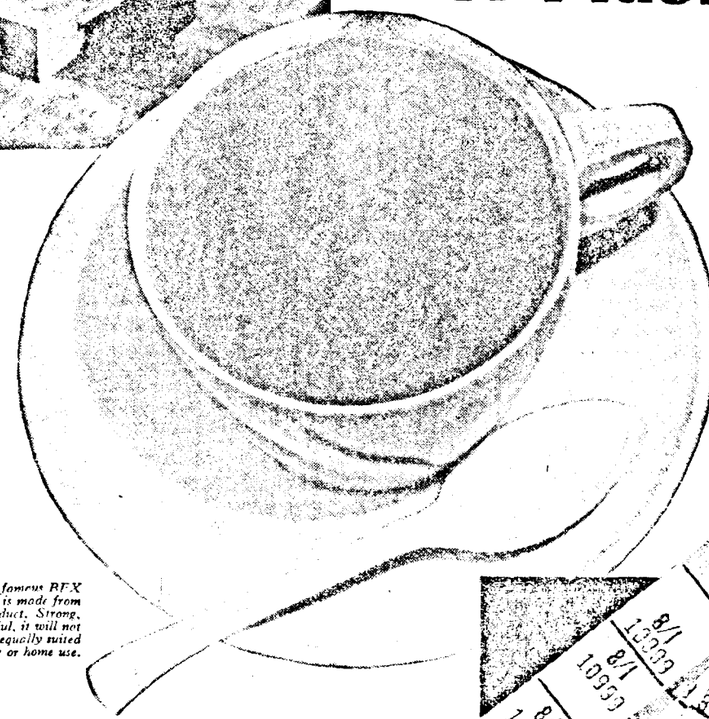
Company	Proposed Shareholding
	£
United Sua Betong	700,000
Labu Cheviot	300,000
Linggi	200,000
Oil Palms of Malaya	100,000
Lambok	90,000
Port Dickson	80,000
Rembau Jelei	70,000

Robert Fleming and Company. Directors of the contributing companies would sit on the board of the trust and would presumably influence its investment policy, though the intention is to broaden the investment portfolio and therefore not to concentrate on rubber. These companies would be the principal shareholders. Some of the smaller companies of the group have not yet decided what shareholding if any they will take.



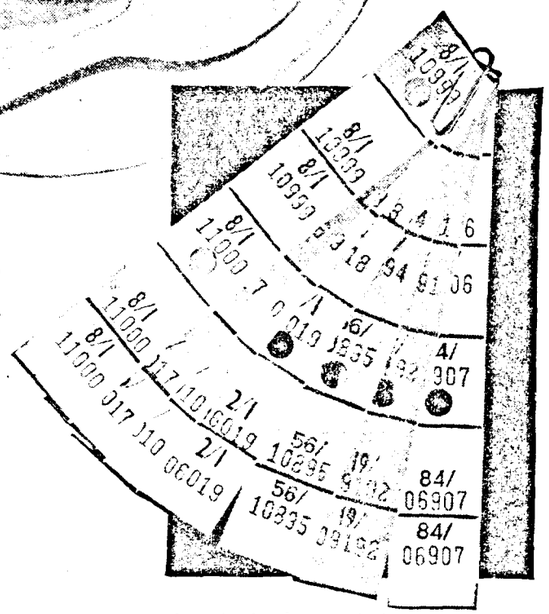
British Waterways workman assembling a lock gate at Tipton, Staffs. The gate is the first of its kind to rely on resin adhesives instead of eighty cold driven rivets, and Beetle Adhesive—a B.I.P. product—is the chosen bonding material.

the Wonder of Plastics



This new cup in the famous REX range of housewares is made from Melmex—a B.I.P. product. Strong, shapely and colourful, it will not easily chip or crack and is equally suited to industrial catering or home use.

In laundries and locks, in tableware and textiles, plastics today play their part. Their role may be contributory, it may be fundamental, but the wonder of plastics is in their versatility, their infinite possibilities. Types and grades are innumerable, each with its own properties—and limitations—presenting a wide field of choice to the intending user. The leading plastics materials manufacturers maintain extensive consultative and development services and none is better qualified to advise and assist than B.I.P.



Laundries, these days, are using laundry tags of paper—wet-strengthened with Beetle Resins—a B.I.P. product. Even wet scrubbing has no effect on these tough tags. (Wet-strengthened paper made by Robert Craig & Sons Ltd., a subsidiary of the Associated Paper Mills Ltd.)

B.I.P. SERVICES

The full resources of the B.I.P. Research, Technical Development and Design services are at the disposal of manufacturers interested in the possibilities of plastics. Advice will gladly be given on any problem concerning plastics applications, irrespective of the type of material involved.

MAXIMUM PRICES Bottles 35/-, ½-Bottles 18/9, ¼-Bottles 9/9, Miniature Bottles 3/9

Shareholders of all the companies will be asked to approve the plan. They may do so with mixed feelings. Certainly Sir John Hay is proposing to put the surplus assets of the companies to work. Any management that does not either employ its capital or return it must reckon that sooner or later someone else will do it for them, and it has not escaped attention that someone else has already asked for a list of shareholders in KMS (Malay States) which although a Guthrie company does not yet appear on the list of proposed shareholders of the Trust. The plan is obviously also intended to hoist a large part of those surplus assets out of reach of a share bidder and therefore beyond the reach of the shareholders. In the hands of a private company wielding the right to refuse a share transfer the transferred assets can in effect only be touched by permission of the majority on the board. Even a successful bidder for the largest shareholder—United Sua Betong with £700,000 invested—would find himself powerless. It is ingenious but *is it right?* Is it right for directors to hang on to surplus assets by such tactics? And is it right to deny shareholders a cash payout when one can obviously be afforded? If the trust were a public company and if the shares were distributed *in specie* to the shareholders of the investing rubber companies, the scheme would be wholly acceptable.

Woolwich Equitable Holds Its Own

THIS year is not one the building societies will look back upon with relish. With dragging feet they have had to dance to the tune of dearer money, raising their payments on shares and deposits and their charges on mortgages. They have had to put a squeeze on their mortgage advances as shareholders withdrew their savings. The smaller societies have been pinched and the larger ones have just managed to hold their own. Woolwich Equitable Building Society, the fourth largest in the movement, is one of the latter.

Years ended Sept. 30th	1955	1956	Variations
	£'000	£'000	£'000
Mortgage balances.....	97,478	105,195	+ 7,718
Investments and cash ...	17,802	19,633	+ 1,831
Total Assets	*116,077*	*125,708*	*+ 9,631*
Liquidity ratio	*15·33%*	*15·62%*	*+ 0·29%*
Shares and deposits	110,486	119,622	+ 9,136
Reserves & carry forward	4,871	5,203	+ 332
Receipts from shareholders	21,265	19,938	− 1,327
Withdrawals by shareholders	8,778	9,758	+ 980
Advances on mortgage	*23,182*	*17,694*	*− 5,488*

Its preliminary accounts for the year to September 30th tell a now familiar story. Withdrawals by shareholders increased and new receipts on shares fell in a period when the society's rate on shares remained at 3 per cent, tax free. Over the year the society received in net new savings on shares about £10,180,000 (compared with £12,487,000) while the balance held in deposits actually declined. It had to clamp down on new mortgages and in the year advances fell by £5,488,000 to £17,694,000; significantly the proportion of advances on newly built houses went up. Thus Woolwich was just able to maintain its liquidity ratio, which rose fractionally from 15.33 to 15.62 per cent. Since the end of its financial year, the society has been paying 3½ per cent, tax free, on shares and has put up its mortgage rates. If the higher rates attract new savings or at least slow down withdrawals, it will be possible to loosen the screws on new mortgages—though only by a turn or two. Hence societies which end their financial years on December 31st may have a more favourable make-up date than the Woolwich, which with the Leeds Permanent is one of the two big societies accounting to September 30th.

Paying for Oil's Expansion

LAST week at Calder Hall Mr Butler suggested that by 1975 atomic energy might be providing the equivalent of at least 50 million tons of coal, and possibly 100 million tons. Mr Jukes, the Atomic Energy Authority's economic adviser, has put the figure more precisely at 60 to 70 million tons. But even on the best assumption of 100 million tons, the expected growth in the British economy depends on using much more oil, as Mr Vignoles, the managing director of Shell-Mex and BP Ltd., pointed out this week. If total energy requirements rise at 3 per cent a year, the power consumed in 1975 will reach the equivalent of some 400 million tons of coal. Of this the coal industry itself, helped by its new investment programme, might produce some 240 million tons (its present target for 1965). Even if the equivalent of 70 million tons of coal were available from nuclear power, a gap of 90 million tons of coal would still remain to be filled by 50 million tons of oil—nearly double the present output of Britain's oil refineries, and calling for a large capital programme.

Where is the money to come from? Mr Vignoles estimates that the world oil industry will have to find no less than £40,000 million over the next ten years—an annual requirement of £4,000 million that equals the capital raised on the open market by all other industries last year in the free world. Funds on this scale for the oil industry alone are clearly beyond the capacity of the market, and Mr Vignoles draws the inevitable conclusion that the industry must still find the greater part of its investment funds out of its own earnings.

To do so, the oil companies must maintain their profit margins, and this involves a crucial point about the character of the increased demand for oil in Britain. It will be concentrated particularly on fuel oil, which is bound to form a steadily rising share of total refinery output. But since fuel oil fetches only about half the price of petrol, average receipts per barrel of oil refined are bound to fall. And although the new refineries, being simpler, should be less costly, the profit margin per barrel of oil refined seems likely to fall, too. Mr Vignoles implicitly supports the view that the price of fuel oil will have to rise. For individual oil companies, however, there are other implications to the pricing of fuel oil. In the oil industry, prices are determined, not by a single body, as are coal prices by the National Coal Board, but by independent companies in competition with each other—and competition for new customers is nowhere more aggressive than in the fuel oil business. If Shell-Mex and BP, for example, were to raise the price of fuel oil in Britain above "Aruba parity"—the cost of importing from the Dutch West Indies fuel oil refined from heavy

Venezuelan crudes—it would have no guarantee that the other marketers of fuel oil would follow its lead. It may not be easy to reconcile competition in any energetic form with the need for large internal surpluses for reinvestment.

New Zealand Wool Sales

THE wool selling season has opened in New Zealand with less display of strength than was seen at the opening of the London sales in September or at the Australian sales at that time. The market was still good and the adjustment was expected. In September there was an element of fear in prices. The labour trouble at Brisbane was not settled, and the Suez crisis with its threat of delays on shipments to Europe was at its height. So London in September was quoting New Zealand crossbred wools at about 10 per cent above the closing prices of the New Zealand selling season that ended in May and almost the same advance above the prices of the London July auctions. Now the new series has started at Dunedin and the market though still strong is about 5 per cent down on London's September prices. Since September some of the cream has come off the market in Australian wools too. In London this week better style Australian merinos have been quoted barely 5 per cent down on the September auction and average style 5 per cent to 7½ per cent down.

As sometimes happens near the beginning of a season the London market this week did not follow the markets in Australia and New Zealand to the full extent of their declines. London prices of Australian merinos are now about 2½ per cent above parity with current Australian prices. London prices of medium crossbred wool is near parity with Dunedin prices, but London prices of fine crossbred wools show a premium of about 5 per cent over the Dunedin market. London is the market where Bradford and the near continent obtain relatively small quantities of wool for quick delivery. The premium may disappear when larger supplies from New Zealand reach Europe.

New Building Society Accounts

IMPORTANT changes in the structure and detail of building society accounts must follow the new form of return tabled by the Registrar of Friendly Societies before Parliament this week. The new form comes into operation 40 days after they were tabled and therefore in good time to catch the annual accounts of those societies whose financial years end on December 31st. Outstanding among the changes proposed are two extensions of the schedule which should help members both to get a clearer view of how far their society has been lending to big borrowers, i.e., property companies, and a clearer view of those loans on which it has encountered difficulties. The new part IV of the schedule must include loans to borrowers with more than one mortgage where the total debt exceeds £25,000, and the new part V must include particulars of properties in which a receiver or manager has been appointed for more than 12 months, but which are not included in part III. The purpose of the new part V of the schedule is clearly to supplement part III which shows properties more than 12 months in arrear but not more than 12 months in possession. In practice some societies have found it convenient to appoint a receiver or manager rather than to take possession.

Another major innovation is the compulsory inclusion as a separate item in the balance sheet of the number and amount of share or deposit holdings exceeding £5,000. The inclusion of this new item should largely meet the criticism, particularly of the President of the Halifax Building Society, that large sums of temporary money were being accepted from limited companies. Such company money would now have to be shown under the new balance sheet heading unless the investment were less than £5,000.

Numerous useful innovations of detail have also been introduced. Holdings of British municipal and county securities will have to be split into quoted and unquoted investments. A new item "other amounts paid by borrowers as consideration for advances" will compel societies to show any premiums that they have charged mortgage borrowers. Under the heading income tax and profits tax, societies are to be required to state the date to which they have made the provisions shown, and a new reserve item is to be set up "mortgage losses reserve account." It seems evident that the Registrar of Friendly Societies has consulted with leaders of the movement in making these changes and that the well managed societies forming the large majority have everything to gain from them. They may, however, be highly revealing about the activities of others.

New Life Office Records

IN every respect 1955 was a bumper year for life offices. Figures just published by the Life Offices' Association and the Associated Scottish Life Offices show record new business in both individual assurances and staff scheme life assurance and pension contracts, accompanied by an increase of £219 million (compared with £202 million) in ordinary life and annuity funds. New sums assured topped the £1,000 million mark for the first time. Some £847 million was assured by individual policies (against £758 million in 1954) and £254 million (against £197 million) by group life and group endowment assurances; the aggregate increase in new sums assured over 1954 was 15 per cent.

These statistics of the life offices' associations, which exclude industrial assurance, cover about 99 per cent of the business of the British offices and of the UK business of the dozen or so Commonwealth offices

Key man, key industry

HERE IS JAMES WOOLLEY, first hand melter in a steelworks in Lincolnshire. His job needs strength, and skill as well. James Woolley has both. He's been making steel for twenty-six years.

Steel from his company goes to all parts of the world. It may leave Britain in any one of a hundred forms: as railway equipment, as ships, as massive structures for engineering projects.

As the world's demand grows, British steelmakers increase their efforts to turn out steel of the quality and quantity needed. Behind these increased efforts are men of the calibre of James Woolley.

British steel leads the world

THE BRITISH IRON AND STEEL FEDERATION

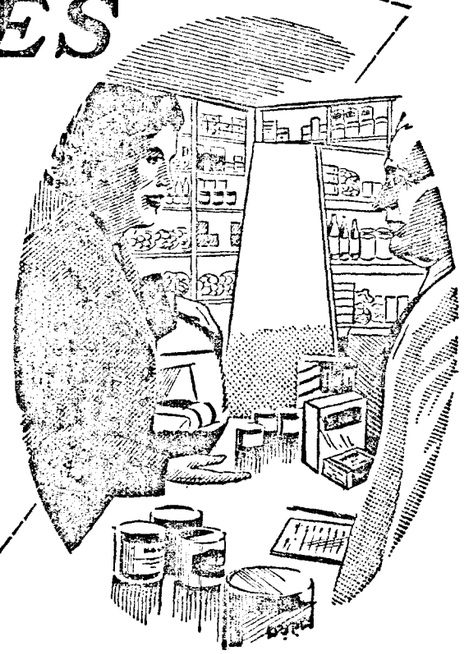
Wherever you may be . . .

HERCULES

is there!

AT THE STORES...

When attractively printed packages catch the housewife's eye it is likely that their appeal owes much to Hercules Resins used in the special printing inks and Hercules Size in the paper or board.



OR IN THE KITCHEN...

The plastic equipment found in every modern kitchen is probably made with Hercules Cellulose derivatives.

BUT THESE ARE ONLY TWO of the countless common tasks in which Hercules chemicals serve the community—invisibly but well.

If you have a problem in industrial chemistry Hercules may have the answer. Address your enquiries to the Technical Service Department.

HERCULES POWDER

that operate in this country. They are the only comprehensive source of information about the rapidly growing staff life assurance and pensions business except that segregated in the annual returns by the offices to the Board of Trade. Expansion in this field was greater in 1955 than in any previous year. The exemption from income tax of the interest build-up of pension funds (as distinct from schemes) assured with a life office that was conceded by this year's Finance Act will, no doubt, give an added fillip to this type of contract.

Public interest is at present centred on the policies that are being offered in considerable variety by the life offices to people eligible for "Millard Tucker" pensions. It remains to be seen how much this new source of business will add to the £327 million of annual premiums that were paid last year for ordinary life assurances and for deferred annuities (£245 for assurances and £82 million for annuities). Some guesses at the size of the increment seem to have ignored the inroads that these policies are bound to make into bread and butter new business in individual endowment assurances.

More Factory Inspectors Needed

FACTORY inspectors have been doubly hit by industrial changes of the past few decades. Their work has grown enormously, more than the total inspectorate itself has increased, with the growing complexity of manufacturing process and with a parallel increase in new legislation, most of it more technical and wider in scope. At the same time, the pay and inducements offered by industries short of trained men has attracted away much of the inspectorate's technically qualified staff.

A detailed survey—the first of this scale since 1928—published by the Ministry of Labour last week-end suggests that the quality of inspectors' work has not as a result fallen off, but the volume is certainly less in some directions than the Ministry would wish. Since 1928 two more Factory Acts have been passed, adding substantially to the safety, health and welfare provisions that inspectors are meant to supervise. Special sets of regulations for particular industries have increased. More complex factories and activities, such as building and ship repairing, have been brought within the scope of the Acts. And industry is showing a greater desire to call in the local inspector for expert advice.

Similarly the decline in the number of technically qualified inspectors may not yet be a cause of serious alarm. The work does not necessarily call for specialist academic training and an engineer, say, is as "handicapped" as an arts graduate in a routine visit to a chemical plant. It is unlikely that the inspectorate could hope to get a great number more of skilled technologists. But the shift in the balance of qualifications has weakened some of its specialist branches. The staff of the chemical and engineering branch is to be trebled, and 26 more inspectors are to be added to help with the serious back-log of building site inspections. This will raise the establishment from 378 to 430. Whether the Ministry can hope to hit even this present target of fifty will depend on what it offers; and inspectors' salaries, low by industrial standards and indeed by civil service standards, are being increased, but only modestly.

Tin Council Meets

THE International Tin Council met in London last week to put the finishing touches to its administrative preparations for bringing the International Tin Agreement into force. While it was doing so the price of tin rose above £800 a ton, at which level the manager of the buffer stock may sell the metal. Tin stands at £809 10s. a ton compared with £797 a ton a fortnight ago, but the passing of the £800 mark is of only theoretical importance. At present the manager holds no tin. The Council fixed September 15th as the due date for contributions under the scheme, and it has already received some contributions; but these have been wholly in cash—as is natural enough, since cash contributions are taken at the rate of £640 a ton. The buffer stock is therefore now able to support the market should it fall below the permissive point of £720 a ton, at which the manager is allowed to buy tin or the compulsory point of £640 at which he must buy tin if he has cash; but it is in no position to curb the market, even if tin were to rise above £880 a ton at which figure the stock must sell if it has tin. According to the Council's own estimates, however, taking the two years 1956 and 1957 together, world supply and demand would be approximately in balance, so that theoretically at least there should be little call for intervention.

Two other events arising from the Council meeting are worth recording. Representation of consuming countries is being broadened; Italy, Turkey and Israel have joined, and the adhesion of Austria as a consuming member was approved. It has also been agreed that the Tin Study Group shall cease publication of the Statistical Bulletin not later than June next year, leaving the Tin Council to start publishing that information in April or May. Thus the Tin Study Group becomes a mere forum for discussion, but available to be called together if, for example, the members wish to consult with the United States, which is not a member of the Council.

Television Advertising Rates

THE Independent Television Authority's programme contractors have been revising their advertising rates and if the changes made by the London weekday contractor, Associated-Rediffusion, reflect the general view, the programme companies have resigned themselves to a seasonal decline in bookings during the summer. The suddenness with which advertising dropped off last summer, six months after the service had opened, alarmed the contractors and they offered lavish inducements in bonus time and generous discounts on big bookings. Most of the bonus offers were timed to end in the autumn, though not those offered by Associated-Rediffusion.

This company now announces that all bonus time will end in February, but discounts for large customers will remain. Next summer, between June and September, all rates will carry a 20 per cent discount. There is an important difference between this discount and the bonus scheme that it replaces, for while the bonus would be fitted in at

GOING TO CANADA?

TWO WAYS TO FLY AND SAVE WITH TCA

15-DAY EXCURSION

SAVE £34

on a normal tourist fare

Now you can fly to Canada on TCA's new 15-Day Tourist Excursion, and save over £34 on a normal tourist fare. Fly the fast, direct TCA Super Constellation route to either Montreal or Toronto.

Ask your Travel Agent for full details of TCA's two wonderful saving offers.

FAMILY FARE PLAN

SAVE £214†

on fares for a family of four

Once again TCA's popular Family Fare Plan will be in operation from November 1, 1956 to March 31, 1957, offering really worthwhile savings for Dad, Mum and the children when they fly together in either Tourist or First Class.

† Based on a family of four flying Tourist return from London to Montreal.

non-peak times the discount applies irrespective of the time booked for the advertisement. The companies have hitherto been at pains to avoid any appearance of such a flat cut in rates although Granada's new rates are generally lower than before.

In other respects, Associated-Rediffusion is coming into line with the other three contractors. It has followed them in offering a wide range of rates running from as high as £950 a minute to as low as £150, having for months remained faithful to its original policy of three basic charges, peak, standard, and off-peak. This sub-division of rates has made the booking of television time bewilderingly complicated, but it helps to match the charges more closely to the size of audiences and indeed, by judicious juggling of rates between different half-hours of the day. It is a neat way of getting the advantages of sponsorship without its draw-backs, but the structure of rates depends to that extent on a rigid pattern of programme series.

SHORTER NOTES

Mappin and Webb, the gold and silver smiths, has purchased for an unspecified price from City Centre Properties its controlling interest in Robinson and Cleaver, the linen drapers. The present board of Robinson and Cleaver, including Mr F. W. Lindgren of City Centre Properties, will be invited to stay in office. At the annual general meeting of Robinson and Cleaver, Mappin and Webb will abstain from voting on the proposal to pay a final dividend of 35 per cent. The directors of Mappin and Webb share Mr Lindgren's doubts on the wisdom of this payment and in particular doubt whether this rate can be sustained in the future.

★

In selling its less remunerative investments, Associated Insulation Products has been considering selling its holding in Minnesota Mining and Manufacturing Company, and not, as stated in *The Economist* of October 6, its holding in British Industrial Plastics.

The Government of Eire has floated a £12 million issue of a 5½ per cent National Loan, 1966, at 98. An intriguing feature of this issue is that the stock will be accepted at its face value, up to a limit of £1,000, as the equivalent of cash in any subscription to any issue of prize bonds made within the next six months.

★

The Rhodesian Selection Trust group of copper mining companies has cut its fixed price for electrolytic copper wire bars by £15 to £265 a ton. This follows a reduction of £20 a ton announced on October 15. Following the latest reduction, the London market price fell £3 10s. on Wednesday, but a sharp rally to £271 a ton followed on Thursday.

★

The directors of British and Commonwealth Shipping have been more generous than their original promise to pay an interim ordinary dividend of 6 per cent, by setting the dividend at 6½ per cent. In making this decision they have had regard to bigger earnings on tramps tonnage, reflecting higher charter and other rates, and "some improvement" in the liner business.

★

A merger is proposed between Lilley and Skinner and Saxone Shoe, which may provide some countervailing power in the boot and shoe trade against the big influence that Sears now has in this market. The scheme is based on an offer to the Lilley and Skinner ordinary shareholders of one 5s. ordinary share in Saxone for every 5s. unit held in Lilley and Skinner plus a cash payment of 1s. 6d. on each ordinary share and 6d. on each "A" ordinary unit.

★

British Petroleum announces an unchanged interim dividend of 1s. per share, tax free.

Company Notes

RHOKANA. High copper prices and the preliminary reports of Rhodesian Selection Trust group of copper companies had prepared investors for much bigger profits and fatter dividends from the rival stable, the Rhodesian Anglo American group, which sells its copper on the basis of market prices and not on a fixed price. Anticipations have not been confounded. The gross profits of Rhokana rose in the year to June 30th last from £13.7 million to nearly £22.1 million and its net profits from £10 million to £15.9 million. From these profits £3 million (against £3½ million) has been earmarked for capital expenditure and another £4,200,000 (against nothing in 1954-55) has been put to general reserve; the latter appropriation includes £1,200,000 representing Rhokana's first contribution to the loan of £20 million to be made by the four copper producers to the Rhodesian government over the next five years.

But the calls of capital development whether for the mines themselves or for Kariba have not stood in the way of higher dividends. Rhokana's full year payment has been raised from 52s. 6d. to 70s. per £1 unit (less Rhodesian taxes). Bigger dividends, too, are being paid by Rhokana's parent company, Rhodesian Anglo American. Its dividend, after Rhodesian taxes, is raised from 7s. 9d. to 9s. per 10s. unit. "Rhoanglo" has a 52.397 per cent interest in Rhokana and a 38.92 per cent interest in Nchanga; the net income attributable to "Rhoanglo" has risen from £7.9 million to £13.9 million.

PRESSED STEEL. For many months Throgmorton Street has been expecting lower, or at the best maintained dividends from the motor industry. The decision by the directors of Pressed Steel to cut the interim ordinary dividend from 7½ to 5 per cent is thus no great surprise; last year the interim payment was followed by a final of 15 per cent, making 22½ per cent in all.

The directors explain why they have come to this decision, though they do not produce figures for the six months' trading to June 30th last. They say that "the fall in the volume of motor car body business, labour disputes in the industry and the continuing tendency for costs to rise have adversely affected profits for the year to date." They describe the group's business in railway wagons as "satisfactory" but sales of refrigerators have been affected by the increase in purchase tax, hire purchase restrictions and the bad summer.

Looking to the future, the directors say that "whilst there are definite signs of improvement in the motor car industry, this is unlikely to result in any appreciable increase in earnings during the balance of the year." What, then, can stockholders expect for the full year's dividend? Twenty per cent? Or will it be less? After the announcement the 5s. stock units were marked down 6d. to 13s. At this price a 20 per cent dividend would give a yield of £7 14s. per cent and 17½ per cent a yield of £6 15s. per cent. These indicated yields suggest that the market is prepared for a cut in the final payment.

★

HAWTHORN, LESLIE. Dynamic is not too strong a word to describe the policy of this Tyneside firm of shipbuilders and marine engineers. An extensive development and modernisation programme has been carried through and ordinary dividends have been progressively increased. This dynamism is recognised in Throgmorton Street where the yield on the company's shares has been much below that offered by other shipbuilders and marine engineers. But even those with faith in the company must have been taken a little by surprise when it announced another increase in the dividend—this time by 3 per cent to 20 per cent for the year to June 30th. Immediately the 10s. shares were marked up by 2s. 6d. to 37s., at which they yield £5 8s. per cent.

The increase in the dividend was justified by the advance in profits. Before tax they have gone up from £901,008 to £1,083,253 and after tax from £422,895 to £508,343. The new dividend is still handsomely covered by earnings, leaving a good balance in hand to finance the development of the business. But in deciding to increase the dividend the directors could not have been governed solely by the past financial year's showing. They must, too, have been well satisfied with the state of the order books. Throughout the shipbuilding industry the third quarter of this year witnessed an increase in new orders, with some delivery dates as much as five years away. Hawthorn, Leslie took, no doubt, its share; its impetus does not seem to be exhausted.

★

J. & F. STONE. The market in the 5s. ordinary shares of J. & F. Stone Lighting and Radio, dealers in radio and television sets and heating and lighting appliances, has been active in recent weeks in expectation either of a free scrip issue or an increase in the dividend. The former has come to pass and not the latter. Subject to the consent of the Capital Issues Committee the directors propose to double the issued capital of £600,000 by a 100 per cent scrip issue. But the ordinary dividend has been left unchanged at 50 per cent (including a 10 per cent bonus) for the year to June 30th last, payable on the old capital.

There is more fat around this dividend as net profits after tax have gone up from £433,118 to £521,783, following an advance in gross income from £980,850 to £1,198,758. This is an excellent result for a year which witnessed the reimposition of hire purchase restrictions and controls on hiring agreements. How has it been achieved? First, in the previous financial year to June 30, 1955, the company's hire purchase debtors rose from £308,615 to £1,404,279 and as these contracts extend for between eighteen months and two years the receipt of payments on them will have helped to swell the latest year's profits. Secondly, in the first few months of the financial year the company was able to use the device of rental agreements. When controls were clamped down on these it turned to hire purchase agreements of nine months or less. It has thus been able to secure some new business, though it has to be assumed that in such a highly competitive market these new orders could not have reached anything like the dimensions of those in 1954-55. Hence as old hire purchase contracts run off there may be the risk of a fall in profits. That possibility is discounted in the yield of 7¾ per cent offered by the 5s. shares at the current price of 31s 9d.

LONDON STOCK EXCHANGE

Next Account begins: October 31st
Next Contango Day: October 31st
Next Settlement Day: November 6th

LONGER dated Government stocks lost ground on balance in the week ended on Wednesday, the *Financial Times* index of Government securities showing a small fall from 84.76 to 84.64. That movement conceals some moderate buying and a good rally on Wednesday. The shorter stocks gained ground on balance; 3 per cent Exchequer 1960 gained ⅛ to 94⅛ and 4 per cent Conversion 1957/58 ⅛ to 98. The new GEC debenture strengthened to 2⅜ premium. Textile shares have been active and have made large gains in the industrial section. *The Economist* indicator rose from 186.8 to 189.3. Foreign bonds revived on the political developments in Eastern Europe.

British Aluminium rose 3s. 6d. to 68s. 6d. on consideration of the recently announced earnings of Aluminium Ltd. GEC recovered 1s. 3d. to 44s. 9d. and other electrical shares improved. Motor shares are firmer, British Motor gaining 6d. to 7s. The rise in textile shares was checked on Wednesday, but on balance large gains predominate; Crosses and Heatons rose 3s. 7½d. to 13s. 9d., Fine Spinners 3s. 4½d. to 16s. 3d., Combined English Mills 2s. 3d. to 10s. and British Celanese 1s. 6d. to 16s. Steel shares continued to rise up to the close of last week, but have since lost part of their gains.

Oil shares improved in places; British Petroleum gained 4s. 3d. to 147s. 6d., but lost a shilling at 146s. 3d. after the interim dividend announcement. Ultramar and Shell Trinidad show large rises, the latter gaining 4s. to 73s. 9d. on balance although declining on Wednesday following the interim dividend announcement. Kaffirs fell on Monday, but subsequently recovered. Coppers have generally receded with the decline in the price of the commodity, although Rhodesia-Katanga rose to a new high point of 54s. Rubber shares advanced on the hope of capital repayments, but suffered a sharp set-back on Wednesday following Guthrie and Company's plan.

THE MONEY MARKET

THE discount market raised its bid by 7d. per cent to £98 15s. per cent at the Treasury bill tender on Friday last. This unusually large adjustment, which marked a fall in the market's discount rate by nearly ⅛ per cent to just under 5 per cent, had not been anticipated by "outside" applicants; so that while the total offer of £280 million was under-allotted by £20 million, the allotted proportion of the market's tender rose from 55 to 66 per cent. The average rate of discount fell by 2s. per cent, to £5 0s. 2.12d. per cent.

The Treasury's offer at yesterday's tender included £60 million of 63-day bills, besides £200 million of the regular 91-day bills. The two months maturities were reintroduced, after a long interval, at this season last year to increase the concentration of maturities in the heavy tax-gathering season of the early New Year.

Credit in the past week has been more comfortable. Before the week-end supplies were still short, and the Bank gave a fair amount of special help; but in the first three days of this week market sources have generally been adequate, though on Tuesday some official purchases were made. Rates on overnight money have not risen above 4½ per cent; dealings in January bills being at 4⅝ per cent and 4⅛ per cent.

Sterling has shown no marked movement against the dollar this week; the rate has hovered around $2.78½.

COMPANY MEETINGS

AMALGAMATED TIN MINES OF NIGERIA

CHAIRMAN'S STATEMENT

The seventeenth Annual General Meeting of Amalgamated Tin Mines of Nigeria Limited will be held on November 16th at The Chartered Insurance Institute, 20 Aldermanbury, London, E.C.

The following is the Statement by Mr J. Ivan Spens, OBE, the Chairman, which has been circulated with the Report and Accounts for the year ended March 31, 1956:

ACCOUNTS

The profit for the year before taxation was £1,235,366 (which includes a dividend (gross) from Kefft Tin Company Limited of £154,122) against £1,484,069 last year.

The net profit before taxation shows a fall over the previous year of £248,703. Taxation takes £695,500 against £768,000 but it must be remembered that last year's charge was after deducting £37,000 adjustments for previous years. I would stress that reduced taxation provides a cushion against a fall in profits, a point that appears to have been overlooked in some press reports on the Company's results. The reduction in the gross proceeds was due to reduced shipments of columbite and to the lower price we received following the withdrawal of the bonus price paid by the Government of the United States. To some extent this fall was offset by the increase in the output of tin concentrates and the higher price obtained. The average price of tin metal realised was £766 against an average price of £721 per ton last year.

The Contingency Reserve has been increased by £20.000 bringing this reserve up to £120.000 The taxation relief for investment allowances on capital expenditure during the year was £9,000 and this amount has, as last year, been transferred from Profit and Loss Account to Capital Reserve. Under the Finance Act 1956 such allowances were suspended as from February 17, 1956.

The three dividends totalling 45 per cent absorbed £504,562 and the balance for the year of £6,304 increases the carry forward to £280,763.

COLUMBITE

The overall sales of columbite were down on the previous year but there were improved sales in the United Kingdom. Though sales are difficult at the present time it is hoped to obtain a market on the Continent and other countries. As a facility to consumers we hold a small stock of columbite in the United Kingdom so that a more prompt delivery can be made against possible inquiries and this has already proved an advantage. Since the end of the financial year, a small stock of columbite has been held in the United States for a similar purpose.

ORE RESERVES

Tin ore reserves at the end of the financial year were estimated at 42,449 tons, a net decrease on the year of 1,602 tons against the 4,435 tons of concentrates won.

SUBSIDIARY COMPANIES

Keffi Tin Company Limited.—This Company continued to operate the pilot plant to which a number of improvements have been made resulting in an improved recovery.

The columbite output at 365 tons of concentrates showed a decrease of 68 tons on the previous year. No output of tin concentrates was won during the year.

Considerable progress has been made towards solving the problems encountered in the recovery of primary columbite and its associated minerals, and an ore-dressing laboratory has been established to investigate the many problems of separation and recovery which have been encountered. Close co-operation with the Geological Survey of Nigeria has been maintained throughout the year.

Plans for building a larger capacity commercial plant and a new mill for dressing the ores are well advanced and much of the machinery and equipment required are on order.

London Nigerian Mines Limited.—This Company continued to work satisfactorily, the output for the year being 280 tons tin concentrates, an increase of 30 tons on last year. Columbite output for the year was 1 ton, against 10 tons as previously.

During the year the Company acquired 13 Mining Leases and two certificates of occupancy over 2,116 and 10 acres respectively.

The pre-acquisition loss of £83,261 has been written off this year in the group accounts against the undistributed profits of the subsidiary companies. I would remind shareholders that this figure was the debit balance on Profit and Loss account when this Company was acquired in 1953 and has been reduced to £793 at March 31, 1956.

LABOUR

For the first five months of the period under review relations with the Company's labour were generally good, but in September, 1955, the Trade Unions declared a trade dispute in support of certain demands and a general strike resulted, commencing on October 17, 1955. After several offers from the employers the strike was called off on November 3rd, and negotiations resumed in the Joint Industrial Council. A settlement was reached and implemented on November 25, 1955.

A system of Trade Testing by Government Testers has been introduced to the Minesfield and so far two examinations have been held.

INTERNATIONAL TIN AGREEMENT

The International Tin Agreement came into force on July 1, 1956, and in due course we shall have to meet our proportion of Nigeria's contribution to the Buffer Stock.

DUKE OF EDINBURGH'S VISIT

During HM the Queen's tour of Nigeria in February, 1956, we were honoured by a visit to the Company's properties of HRH the Duke of Edinburgh. Shareholders will probably have learned some of the details from press sources and I am sure there is no need for me to enlarge upon this.

WELFARE

Matters of welfare continue to receive the attention of the Board and the Management. The Technical Managers' Report records progress during the year.

STAFF

Our thanks are again due to the Management and Staff of A. O. Nigeria Limited, our General Managers in Nigeria, for whose efforts during the year I would again like to express our appreciation.

INDUSTRIAL FINANCE AND INVESTMENT CORPORATION

A REASONABLY SATISFACTORY EXPERIENCE

The thirty-first annual general meeting of The Industrial Finance and Investment Corporation, Limited, will be held on November 16th at 82 King William Street, London, E.C.

The following is the Statement by the Chairman, Mr J. N. Buchanan, DSO, MC, which has been circulated with the report and accounts:

In my remarks last year I commented upon the sharp rise that had taken place in the value of the company's quoted investments; not unnaturally, the aftermath of the 1955 boom has brought with it a reversal of that situation. Bearing in mind, however, that at June 1, 1955 the *Financial Times* Index for Industrial Ordinary shares stood at 214.3, whilst at June 29, 1956 it was 174.4. the company's experience in this respect has been reasonably satisfactory. The year's profits are sufficient to meet the depreciation written off our Investments and leave a comfortable margin to put to Reserve.

PROGRESS OF INVESTMENT INCOME

Once again Investment income has progressed well, but, in view of the prevailing economic conditions and consequent smaller scope for increased dividends, I must repeat the warning I gave last year that a similar rate of increase during the current year cannot be considered likely.

The recovery of continental debts has continued on the reduced scale anticipated and further collections during the current year will probably not exceed one-half the sum received during 1955-56.

A final dividend of 7 per cent is recommended on the Ordinary capital, which, together with the interim dividend of 5 per cent paid on June 23, 1956, repeats 12 per cent for the year. The Investment Fluctuation Reserve is being increased by £25,000 to £400,000 and about £16,000 is added to the balance carried forward on Profit and Loss Account.

The dear money position and the stringent conditions that at present apply to the raising of fresh capital do not permit of any useful forecast of activity in financial transactions; despite this, however, it can be said that there are a number of interesting operations due for completion in the next few months.

THE CALICO PRINTERS' ASSOCIATION, LIMITED

INCREASED GROUP TRADING PROFIT

PROGRESS IN FAR EAST

MR R. M. LEE'S STATEMENT

The fifty-seventh annual general meeting of The Calico Printers' Association, Limited, was held at St James's Buildings, Oxford Street, Manchester, on October 24th, Mr R. M. Lee, chairman, presiding.

The following are extracts from his statement circulated with the report and accounts for the year ended June 30, 1956:

Accounts.—Last year I had to report to you a decline of £198,000 in the Association's Profit on Trading compared with the year 1953-54 and a decline of £269,000 in the Group's Profit on Trading. I am pleased to be able to record that these declines have been more than made good in this year's trading, the Association's Profit on Trading before provision for taxation and other charges having increased by £297,000 and the Group's Profit on Trading by £318,000.

The Consolidated Profit and Loss Account shows a fall of £311.000 in the net profit to £691,000. Last year's result, however, received the benefit of the full amount of tax relief on subvention payments for earlier years which, together with other adjustments of previous years' tax, totalled £666,000, against adjustments this year of £144,000. Excluding these exceptional items, the net profit for the year increased by £211,000.

COMMISSION PRINTING

The volume of commission printing business during the year declined by some 5 per cent. We have suffered a continued heavy reduction of trade in shipping markets as a result of the further inroads Japan is making into markets such as Nigeria, Malaya and Burma. As illustrations, during 1955 imports of cotton prints into Singapore from Japan represented 82 per cent of the total cotton print imports into that market, while an increase of 26 million yards into Nigeria gave Japan 55 per cent of the total Nigerian cotton imports. No evidence is available that Colonial Governments intend to modify their present import licensing regulations and the flood of textiles produced by cheaper labour costs in Japan is therefore likely to continue unchecked. Only in markets such as the Gold Coast and the Belgian Congo which still retain their traditional preference for speciality styles have we been able to hold something like a reasonable share of the business available.

While the heavy decline in the shipping markets was countered to a certain extent by increased business from the group of markets favouring the Home Trade styling of designs, colours and finishes, no foreseeable increase in the Home Trade and kindred markets can compensate in volume for the dwindling trade we are experiencing in our recognised shipping markets. The reason why commission printing has given us a satisfactory return this year is that turnover has been maintained by the addition of special finishes on many of the goods we print for the more fashion-conscious markets. Had it not been for the development of this special finishing, which was largely initiated by the Association, there can be little doubt that printing prices would have had to be increased long before now.

MERCHANTING

The outstanding feature in the Merchant Group's year has been a sharp change in the balance between export and home trade. While turnover expanded and was only a little short of the record achieved two years ago, the export percentage fell substantially.

There are some important markets, on the other hand, where we have made progress during the year and prominent amongst these is the Far East where we largely employ our own selling organisations. These have all improved their figures, and we are particularly proud of the position that has been built up in Malaya. We have reaped some benefit in India from the reductions in duties negotiated last year.

Our business with North America has kept steady and at a satisfactorily high level in the Dominion of Canada.

Search goes on constantly to make the fullest use of the Association's manufacturing and finishing techniques, and to develop new products for new markets and new purposes. Two qualities of this nature were recently introduced and were accorded a splendid reception by the press in this country and overseas, namely the new tropical cotton suiting "Helikon" and the light-weight tropical shirting "Cepea 56" both of which are confidently expected to establish themselves in the coming year as major items in our production plans.

ROYALTIES

For many years past the Association has drawn a considerable Royalty income from patents covering processes originated by our technical staff, the principal source of income having been licences connected with the durable finishes of the type well known under the trade mark "Everglaze." In the past twelve months the income from "Terylene" royalties has overtaken those from other sources and in future years the income from "Terylene" royalties may have a considerable effect on the profits of the Association.

The report and accounts were adopted.

W. & R. WALLACE INDUSTRIES LIMITED

(Manufacturers of Roadstone and Bituminous Products, Electrical Engineers and Forage Contractors)

ALL DEPARTMENTS CONTRIBUTE TO IMPROVED RESULTS

The Tenth Annual General Meeting of W. & R. Wallace Industries Limited was held on October 19th in London.

Mr Walter Wallace (Joint Managing Director) presided, and, in the course of his speech, said:

Your Directors are happy to report that the Company has had another satisfactory year's trading in which every department of the business has made useful contribution.

The consolidated profit for the year amounts to £234,613, as compared with £223,250 the previous year, viz., an increase of £11,363.

These profits are, of course, the balance after payment of all the ordinary outgoings of the business, and to accomplish this result you will readily realise that the Company has had an increased turnover, and this has occurred in all its various departments.

The Debtors have increased considerably, and this is some measure of the increased activities of your Company.

All branches of your business continue to operate and develop normally.

After deduction of the amounts set out in the Accounts for depreciation and amounts written off fixed assets, Debenture Interest, emoluments of Directors and the Auditors' remuneration, there remains a consolidated net profit for the year before taxation of £175,213.

TAXATION'S HEAVY TOLL

We are all aware that taxation takes a very heavy toll on the profits of a business undertaking, and in our case this taxation amounts to £97,058, to which we have added a sum of £16,000 set aside by one subsidiary to establish its tax provision on a current basis in line with the rest of the group.

This shows a total taxation provision of £113,058, and by this means tax is now fully provided up to and including that payable in January, 1958.

After making these payments and provisions there remains a consolidated net profit of £62,155.

Shareholders will be pleased to note that the Directors again recommend a final Dividend of 32½ per cent, less tax, making a total of 42½ per cent, less tax, for the year.

Additions to the Plant and Machinery have been made during the year, and it will be seen that outstanding contracts at June 30, 1956, amounting to £25,000 for Capital expenditure are not provided in the current Balance Sheet.

During the year a sum of £40,512 has been provided for depreciation of fixed assets, which now stand at a figure of £285,843, against an original cost of £547,454.

PLANT WELL MAINTAINED

You will gather from the above that the Plant, Machinery and other assets of your Company are well maintained, and that the Directors are doing all in their power to keep your assets in an efficient condition for carrying on your Company's undertakings.

The financial position of your Company is sound. The total reserves now amount to £177,104, as set forth in the Balance Sheet.

The business of the Company for the current year continues at a satisfactory level in all departments, and, as I have already informed you, the Company is not only fully equipped but has ample reserves to meet further requirements.

The report and accounts were adopted.

The proceedings terminated with a hearty vote of thanks to the directors, staff and workpeople for their efforts in producing such excellent results.

LLOYDS BANK LIMITED

CAPITAL REORGANISATION APPROVED BY MEMBERS

An Extraordinary General Meeting and separate General Meetings of the "A" shareholders and "B" Stockholders were held on October 19th at the Head Office, 71, Lombard Street, London, E.C.

The Right Honourable Sir Oliver Franks, GCMG, KCB, CBE, the Chairman, presided.

Resolutions agreeing to the proposed reorganisation of the share capital of the Bank were duly passed.

The scheme will now be submitted to the High Court for confirmation in so far as reduction of the Bank's capital is concerned.

ANNING CHADWICK & KIVER

CONTINUED STEADY GROWTH

The thirteenth annual general meeting of Anning Chadwick & Kiver Limited was held on October 25th in London. Mr Harold W. Chadwick (Chairman and Joint Managing Director) presiding. The following is an extract from his circulated statement:

The Balance Sheet shows the steady growth which your Company continues to make. After making usual provisions including proposed dividends the nett current assets of the Group have increased from £330,235 (1955) to £377,526.

The Group Trading profit for the year has increased from £104,172 to £129,540. Taxation on profits absorbed £67,127, and it is proposed to pay a final dividend of 12½ per cent, making a total of 22½ per cent for the year.

The past year has not by any means been an easy one as overheads have continued to show slow but steady increases. However, we have been able to meet these by an increased turnover and an ever watchful eye on economies. Our turnover last year exceeded 10 million pounds, the greater part of which was for re-export.

Our subsidiary companies have continued to give a good account of themselves and their progress during the forthcoming years should be steady and satisfactory.

I think it unwise in these very uncertain times to forecast future trading results but I am sure that shareholders will be pleased to know that our new year has opened satisfactorily and apart from an increase in turnover there are signs of a recovery in the prices of certain commodities we handle.

The report was adopted.

OLYMPIC PORTLAND CEMENT COMPANY

CAPITAL DOUBLED

The forty-fifth annual general meeting of this company was held on October 24th in London. The Honourable Gerald H. G. Williamson, chairman, in the course of his speech, said: During the year the plant at Bellingham produced 905,199 barrels of clinker and 889,933 barrels of cement. This was the largest annual production of clinker on record, whilst cement produced and shipped was the third largest on record. Consolidated trading profits, before charging depreciation and depletion, amounted to £273,554 as against £233,139. Net profits after taxation and London expenses were £107,362.

Your Board came to the conclusion, in order not only to meet the rising demand anticipated but also to protect existing markets, that the productive capacity should be increased. Immediate utilisation of the doubled capacity is not envisaged but rather a progressive increase in production.

The installation of the additional kiln and ancillary equipment which our Engineering Consultants and Managers consider necessary will entail an estimated expenditure of about $2,800,000. Some $2 million will be required initially and I have to put before you a resolution to double the authorised capital of the company. In due course it is intended to issue to shareholders 500,000 new £1 shares to be created under the authority of this capital increase, at a price of 30s. per share on the basis of one new share for every old share held. The issue will make available to the company a sum of £750,000 equivalent to about $2,100,000.

The report was adopted and the proposed capital increase approved.

THE CARPET MANUFACTURING COMPANY LIMITED

The sixty-sixth Annual General Meeting of the Carpet Manufacturing Company Limited was held on October 25th at Kidderminster. The Chairman (Mr E. H. O. Carpenter) presided, and in his statement said that everyone was aware of the difficulties through which the carpet industry was passing owing to the economic policies of the day, and he did not propose to add to the comments which had already been made on this subject. The Company's trading year in common with others had been affected. He was glad to say that the Associated Companies in Australia, New Zealand, and South Africa had each enjoyed a successful year.

Capital Payments had been heavy and amounted to over £250,000. This sum had been spent partly towards the cost of new plant and buildings for Woollen Spinning, and partly in enlarging the Spool Axminster Department and bringing it completely up to date. Finally, Advances had been made to Kosset Carpets Limited in the foundation of which the Company was associated, as shareholders knew, with four other leading carpet manufacturers. The products were made on the tufted process. Kosset Carpets Limited had now entered into its first season of active production.

Trading Profits were £114,486 (£197,975); Income from Overseas Companies £51,277 (£79,966); Profit on Sale of Property £6,312 (nil); Net Profits £86,575 (£145,441); to extra Depreciation £40,000; Final Ordinary Dividend 10 per cent less Tax (12½ per cent for year; same); Carry Forward £142,193 (£141,425).

The Accounts and recommendations of the Board were adopted.

ARMSTRONG SHOCK ABSORBERS

EFFECTS OF RECESSION IN MOTOR INDUSTRY

The twenty-first annual general meeting of Armstrong Shock Absorbers Limited was held on October 22nd in London, Mr William Armstrong, BSc, AMIMechE (chairman and managing director), presiding.

The following are extracts from the Chairman's circulated Statement:

This financial year started with the Motor Industry in a very active and optimistic state, but around Christmas a fall off in Exports coupled with the Government's stated and implemented policy of reducing sales on the Home market by the credit squeeze and other means, resulted in a considerable recession. This situation, together with the ever increasing costs of materials and labour, has naturally affected our operations during the year. Nevertheless the financial results are such that your Directors feel justified in recommending a Dividend of 32½ per cent.

The Consolidated Accounts for the year ended June 30, 1956, show a Group Profit of £81,843 compared with £180,267.

Our Heli-Coil Division has made great strides during this year and would appear to have bright prospects for the future. The Heli-Coil is applicable to a very wide range of engineering and industry and is not specifically restricted to the Motor Trade.

In Canada we have continued with a good sales volume and prospects look encouraging. Our Australian Company has had a very disappointing year due to a general recession in the Motor Trade in that territory.

The British Motor Industry is going through a very difficult time and it would be unwise to be unduly optimistic about the future. However, we are steadily increasing our direct exports and this, coupled with the development of the Heli-Coil project, should enable us to approach the future at least with reasonable confidence.

The Report was adopted.

APPOINTMENTS

THE ASSAY OFFICE

NEWHALL STREET, BIRMINGHAM 3

Science Graduate required (M.Sc. Hallmg.—Chemistry) for administrative and technical duties. Salary according to age and qualifications.—Application to be sent to the Assay Master.

ADMINISTRATIVE OFFICER required by The Steel Company of Wales Limited for duties in the Personnel Department.

The successful candidate will be responsible for the co-ordinating of the work of separate sections within the department at levels below principal assistants to the Superintendent and for the control of departmental expenditure.

Candidates should preferably hold a good arts degree, but this is not essential if orderliness of mind and capacity for analytical thought are sufficient.

Salary will be paid according to qualifications.

Those wishing to apply should *write for official Application Form* to:

Superintendent, Personnel Services, The Steel Company of Wales Limited (Steel Division), Abbey Works, Port Talbot, Glam., quoting the reference AO.E.

MARKET RESEARCH. Planning Supervisor required. Good working conditions and prospects offered. Salary *not less* than £600 p.a. Candidates should have experience in the field and be capable of training field staff and planning and developing field studies.—Write, giving full particulars of education and experience, to Market Research Manager, The Hotpoint Electric Appliance Co. Ltd., Crown House, Aldwych, W.C.2.

SENIOR SCIENTIFIC OFFICERS; SCIENTIFIC OFFICERS. The Civil Service Commissioners invite applications for pensionable appointments covering a wide range of scientific research and development in most of the major fields of fundamental and applied science. In biological subjects the number of vacancies is small; individual vacancies exist in the Natural History Museum for candidates who have special knowledge of, or who are interested in, malacology, helminthology, acarology, mammalian taxonomy, taxonomic botany (monocotyledons), Neotropical zoography.

Candidates must have obtained a university degree with first or second class honours in an appropriate scientific subject (including engineering) or in Mathematics, or an equivalent qualification, or possess such professional attainments. Candidates for Senior Scientific Officer posts must in addition have had at least three years' post-graduate or other approved experience.

Interview Boards sit at frequent intervals.

Age limits: Senior Scientific Officers, between 26 and 31, but specially suitable candidates under 26 may be admitted; for Scientific Officers, between 21 and 28 during 1956 (up to 31 for permanent members of the Experimental Officer class). Salary (London) Senior Scientific Officers: (men) £1,135—£1,345; (women) £1,026—£1,220. Scientific Officers: (men) £605—£1,055; (women) £605—£962. Women's scales being improved under equal pay scheme. Somewhat lower rates in the provinces.

Further particulars, for which early application is advised, from Civil Service Commission, Scientific Branch, 30 Old Burlington Street, London, W.1, quoting No. S.53/56 for Senior Scientific Officers and S.52/56 for Scientific Officers.

STATISTICIAN required by the British Market Research Bureau Limited. Good honours degree in statistics or mathematics (or professional qualification of similar level) desirable. Age up to 30. Salary according to age, qualifications and experience.—Applications, marked "Personal," should be addressed to the General Manager at 47 Upper Grosvenor Street, London, W.1.

COST ACCOUNTANT/OFFICE MANAGER wanted for Printing and Wholesale Stationery business in Scottish County town. Knowledge of trade desirable. Pension scheme. Salary commensurate with experience but not less than £750.—Apply, in confidence, stating age and previous experience, Box 546.

ACCOUNTANT required by old-established company in East Africa conducting business of General Merchants, Importers, Exporters, Shipping, Insurance, Warehousing and Forwarding.

The appointment requires an energetic man, preferably a qualified accountant aged between 25 and 35 years, whose experience should include budgetary control, costing systems and mercantile organisation. Passages and housing provided with paid leave to U.K. Good salary commensurate with qualifications and prospect of joining Board of Directors. Interview can be arranged in London.—Replies, in confidence, to Box OC/53, c/o 95 Bishopsgate, E.C.2.

MARKET RESEARCH. Young man with experience of coding and machine tabulating required to work with a small team.—Write, stating age, experience, and qualifications, to the Market Research Manager, W. S. Crawford Ltd., 233, High Holborn, W.C.1.

APPOINTMENTS

THE UNIVERSITY OF MANCHESTER

Applications are invited for two full-time posts of RESEARCH ASSISTANT in the Faculty of Economic and Social Studies. One Assistantship will be available for research in GOVERNMENT, and the other for research in SOCIAL ANTHROPOLOGY or SOCIOLOGY. Applicants should be graduates in any of these subjects or in Modern History or Economic History. There are two grades: Grade II—salary £550 to £650 per annum; Grade III—salary £450 to £500 per annum.—Applications should be sent not later than November 12, 1956, to the Registrar, the University, Manchester 13, from whom further particulars and forms of application may be obtained.

AUSTRALIA—UNIVERSITY OF ADELAIDE

Applications are invited for appointment as LECTURER IN POLITICS in the Department of History and Political Science.

Duties: The Lecturer will be required to conduct courses in modern political institutions with special emphasis on the working of Federalism in Australia, and in International Relations.

The successful candidate will be required to assume duty as early as possible in 1957 and not later than the middle of March.

Salary Scale: £A1,200 x £A80 (£750) to £A1,750, with superannuation provision on the F.S.S.U. basis.

Terms: General terms of appointment, including particulars of the information to be included in applications, may be obtained from the Secretary, Association of Universities of the British Commonwealth, 36 Gordon Square, London, W.C.1, or from the undersigned.*

Applications: Applications should be lodged in duplicate with the undersigned* not later than *NOVEMBER 19, 1956.* Because of the urgency of making an appointment as soon after that date as possible, applicants should request their referees to send their confidential reports direct to the undersigned* so that they will reach him at much the same time as the application.

Further information will gladly be supplied on request to

*V. A. EDGELOE,
Registrar,
University of Adelaide,
Adelaide, South Australia.

UNIVERSITY OF KHARTOUM

Applications are invited for two appointments in ECONOMICS.

Salary Scales:

Assistant Lecturer	— £E1,077 to £E1,152 p.a.
Lecturer	— £E1,152 x £E75 to £E1,677 p.a.
Senior Lecturer	— £E1,752 x £E75 to £E2,277 p.a.

Cost-of-living allowance approximately £E120 p.a. Outfit allowance £E50. Family allowances: wife, £E60 p.a.; first child, £E90 p.a.; second and third child, £E30 p.a. Passages for appointee and family on appointment, termination and annual leave. Appointments on contract for five years with possibility of renewal. Superannuation scheme.

Applications (eight copies) detailing qualifications and experience and naming three referees, as soon as possible to Secretary, Inter-University Council for Higher Education Overseas, 29 Woburn Square, London, W.C.1, from whom further particulars may be obtained.

EUROPEAN SALES

Leading American manufacturer of highly promotional, widely advertised packaged goods has excellent career opportunity in rapidly expanding continental division. Applicant must have pr[illegible] sales ability; know advertising and promotion. E[illegible]d to appoint and work with European distributor [illegible]manage administrative, factory and sales staff. [illegible] two foreign languages including German essent[illegible]idence Europe.

Write in confidence in full detail, giving age, education, complete previous work history including [illegible] etc., Box 547.

GOVERNMENT STATISTICIAN, BARBADOS

Candidates should possess a good Honours Degree in Economics or other appropriate main subject combined with Statistics, and should have had experience in economic analysis and the carrying out of sampling surveys. Duties include the supervision of the work of a Statistical office in preparing the Island's social and economic [illegible]or publication and also research into connected problems.

The [illegible] agreement for three years, salary $6,240 (£1,300) per annum, plus temporary cost of living allowance of $156 (£32 10s.). B.W.I. dollars 4.8=£1 sterling. Income tax at local rates. Baggage and passage expenses for the officer and his family on appointment and completion of agreement allowed up to $1,920 (£400) in either direction.

Application forms and further particulars from Director of Recruitment, Colonial Office, Sanctuary Buildings, Great Smith Street, London, S.W.1, quoting Ref. BCD 59/28/01.

THE LONDON SCHOOL OF ECONOMICS AND POLITICAL SCIENCE
(UNIVERSITY OF LONDON)

Applications are invited for Junior Research Assistantships in the Economics Research Division. The salary scale is £375 x £25—£450 a year. Starting salary according to qualifications and experience. Application forms should be received by the Secretary, Economics Research Division, London School of Economics and Political Science, Houghton Street, W.C.2, not later than November 5th.

B.B.C. requires Assistant in Projects and Developments Section, Audience Research Department. Duties include: assistance in design and preparation of special surveys, analysis and tabulation of results and routine statistical treatment of Department's day to day output. Good general education necessary with qualifications in statistics and preferably experience in their application to market research and opinion surveys. Salary £675 rising by five annual increments to £885 maximum. Requests for application forms (enclosing addressed envelope and quoting reference G.10 Ect.) should reach Appointments Officer, B.B.C., Broadcasting House, London, W.1, within five days.

MARKET RESEARCH MANAGER

There is a vacancy for a Market Research Manager at Mars Ltd., Slough, Bucks, one of the leading confectionery manufacturing companies, owing to the promotion of the present holder of the post.

The post demands wide experience of Market Research in all its aspects and an ability to keep abreast of modern developments in order to ensure that the Company will lead in Market Research techniques. A man is required between 28 and 40 years of age, with first-class contacts with Market Research organisations and sources and the ability to control and develop the Company's Market Research Department. He will be directly responsible to the Director in charge of Research and Development.

The salary range for the post is from £2,500 to £3,500 per annum, commensurate with a key post in a progressive company, which offers real scope for a man able to originate ideas in addition to running an existing Department.

There are generous non-contributory Pension, Life Assurance and Sickness Schemes.

Application forms may be obtained from Personnel Director, Mars Limited, Dundee Road, Slough, Bucks.

ACCOUNTANT

A leading firm of contractors requires a recently qualified man at their London head office to act as assistant to the chief accountant. This is not a vacancy likely to lead to a career with the firm but it would be an exceptional opportunity to gain a couple of years' valuable experience in commercial accountancy for a man who has hitherto been confined to the professional side and who wishes to change over while he is still fit for Final would be considered. Salary up to £750 p.a.—Write to "L. F. C." c/o Dixons, 1-9 Hills Place, London, W.1.

THE CHARTERHOUSE GROUP OF COMPANIES

seeks

GROUP ACCOUNTANT

Applicants, aged 35-45, must be qualified. Experience of modern accounting techniques in commerce and banking essential, and up-to-date general knowledge of company taxation desirable. Task will be to integrate, and subsequently to control, accounting and statistical systems. Promotion to Group Secretary is envisaged. Initial salary £2,000-£2,500 p.a. Generous pension arrangements and conditions of service. Written applications should be sent to The Chairman, Charterhouse Group, 30 St. Swithin's Lane, London, E.C.4.

MANAGEMENT ACCOUNTING

An international organisation in an interesting stage of development requires a qualified accountant to assist at senior level in the Controller's Department in London. The work will be concerned more with the analytical side of accounting matters and problems rather than with routine accounting. Applicants should be within the ages of about 28-32 and should preferably have had some experience with a Management Consultant, or with a department doing similar work in either a Professional Accountants' Office or in a commercial organisation. A practical knowledge of costing and some experience of Group Accounts would also be an advantage. The commencing salary would be in the region of £1,250-£1,500 p.a. but would be arranged according to the experience and potential of the successful applicant. The position is pensionable.—Applications, with short details of age, personal particulars, positions held, and experience of costing, Group Accounts, organisation and methods and allied matters, should be sent to Box W.881, c/o Streets, 110 Old Broad Street, E.C.2.

AN INFORMATION OFFICER

A prominent British industrial company with subsidiaries in the U.S.A., Canada and Australia, wishes to recruit an Information Officer for its Research and Development Department in London. Qualifications required include age between 25 and 28 years, university degree preferably in engineering or science, personal qualities of a high order, some industrial experience where report writing has been practised or alternatively experience of technical journalism. Initial salary will be up to £1,100 and a continuing career with promotion within the company's expanding organisation is envisaged.—Please write, with brief tabulated details of age, education and experience, to Box 545.

SECRETARY/ACCOUNTANT. Brown Knight & Truscott Ltd., printers, require qualified Secretary/Accountant. Age 35-45. Commercial experience preferred. Work initially at Head Office, 11-12 Bury Street, E.C.3, subsequently at Tonbridge, Kent, where Company's main works situated. Senior executive post with prospects. Good salary according to age and experience. Pension scheme.—Apply Chairman.

ASSISTANT (female aged 23-30) required for interesting statistical/personnel vacancy with Oil Company (West End). Advanced level or Higher School Certificate Mathematics essential and previous personnel experience useful. Good salary and prospects; pleasant working conditions; pension scheme; luncheon and welfare facilities. Please reply, with brief details of qualifications, age and previous experience, quoting No. 682, to Box No. 438, c/o Charles Barker and Sons Ltd., Gateway House, London, E.C.4.

WOMAN as Assistant to Company Production Controller to collect and analyse data on prices, discounts, distribution, factory output and load, etc., for plain bearings. Will be expected to carry out research and investigations under supervision in these areas. Age 25 to 45; at least Grammar School education to G.C.E. level, with flair for mathematics. Experience in commerce or economics desirable but not essential as training will be given. Commencing salary £550-£650 p.a.—Details of training and experience to Personnel Manager (Ref. 325), Glacier Metal Co., Ltd., Ealing Rd., Wembley, Middlesex.

PERFUMERY BUYER required by Griffin & Spalding Ltd. Salary about a thousand.—Apply Managing Director, Long Row, Nottingham.

SECRETARY

Applications are invited from members of the Chartered Institute of Secretaries or from qualified accountants for the appointment of Secretary to the British Leather Manufacturers' Research Association. The duties include responsibility for the general finances of the Association; the payment of salaries and wages; the arrangement of Council meetings; the administration and upkeep of the property of the Research Association. Preferred age between 30 and 40. Salary £1,000 to £1,250 depending on qualifications and experience, with pension arrangements under the F.S.S.U. scheme.

Applications, giving the name of two referees, should be addressed to the Director of Research, British Leather Manufacturers' Research Association, Milton Park, Egham, Surrey.

KODAK LIMITED, KINGSWAY, W.C.2

A new post occurs in the Statistics and Economics Department for an Economic Research Assistant. Applications are invited from graduates in Economics, about 25 years of age, who have Economics as their special subject with statistical method as a subsidiary. Some experience of economic analysis as a tool in business forecasting and a knowledge of problems of international trade would be an advantage. The range of products manufactured and markets served are extensive; there are interesting possibilities for the growth of the range of work carried out in the department. Starting salary by arrangement. Letters may be addressed in confidence to the Personnel Manager.

MANAGEMENT CONSULTANCY, as a profession, offers both a challenge and an intriguing scope of fruitful activity to men qualified academically, and by background and experience, to assess modern management problems. A leading firm of management Consultants invites applications to join its staff from those attracted by the challenge and scope and who come with a background of executive authority in commerce or industry.—Letters of application, detailing age, education and career to date, should be addressed to Box 296, R. Anderson & Co., 14 William IV Street, London, W.C.2.

ACTUARIAL STUDENTS—passed at least some part of Part I of Faculty or Institute Examinations—required by Australian Mutual Provident Society (the largest British Mutual Life Office). After short initial probationary period at London office the Society will pay all moving costs to Australia. Salary at age 21 £625 sterling, age 22 £675 sterling, age 23 £725 sterling. Substantial bonuses and increases on passing examinations. Excellent prospects, liberal long service leave, excellent staff pension and life assurance benefits. Apply to Manager for United Kingdom, 73-76 King William Street, London, E.C.4.

TWO GRADUATES IN ECONOMICS required for research work in Department of Economics, International Wool Secretariat. One should have obtained a "first" or good "second" Honours degree and specialised in some branch of economic theory; the other need not have very high academic qualifications, but should have common sense and be prepared to carry out routine enquiries. Starting salaries £500-£600 (according to qualifications) with superannuation benefits. Apply in writing, giving full details of qualifications and experience, to the Secretary, International Wool Secretariat, Dorland House, 18-20 Regent Street, London, S.W.1, marking cover "E.C. Confidential."

YOUNG LADY, Hons. Economics and Statistics graduate, two years' Market Research, competent driver, seeks interesting post in London or Home Counties. Anything considered.—Box 548.

UNIVERSITY COLLEGE LONDON (Gower Street, W.C.1). Professor W. A. Robson (London School of Economics) will give the Hobhouse Memorial Lecture entitled "The Welfare State" on November 6th, at 5.30 p.m. Admission Free, Without Ticket.—E. A. L. Gueterbock, Secretary.

THE Economists' Bookshop has the world's widest range of books on Economics, Politics, History, Anthropology and the Social Sciences. World-wide mailing service. Second-hand books bought.—11-12 Clements Inn Passage, Aldwych, London, W.C.2.

THE ROYAL BANK OF CANADA

DIVIDEND NO. 277

Notice is hereby given that a DIVIDEND of 45 cents per share upon the paid-up capital stock of this Bank has been declared for the current quarter and a Bonus of 25 cents per share for the year ending November 30, 1956, and both will be PAYABLE at the Bank and its branches on and after December 1, 1956 to shareholders of record at the close of business on October 31, 1956.

By Order of the Board
K. M. SLDGEWICK,
General Manager.

October 24, 1956.

"DON'T HEAP COALS OF FIRE." Convert your domestic boiler with the Nu-way "HOME-FIRE" Oil Burner. No dirt, ashes or carrying. Thermostat control. Far cheaper than electricity or gas.—For cost of converting your boiler write Nu-way Heating Plants Ltd. (Box 5971), Droitwich.

CANADIAN PACIFIC RAILWAY COMPANY (Incorporated in Canada with Limited Liability) Canadian Pacific Railway Perpetual 4 Per Cent Consolidated Debenture Stock, New Brunswick Railway 4 Per Cent Debenture Stock, Calgary and Edmonton Railway 4 Per Cent Debenture Stock. In preparation for the payment of the half-yearly interest due January 1, 1957, on the above Stocks, the Transfer books will be closed on November 20, 1956, and will be re-opened on January 2, 1957. R. F. Trenwine, Deputy Secretary, 8 Waterloo Place, Pall Mall, London, S.W.1. October 24, 1956.

YOUNG MAN, realising that he has neither the talent nor the wardrobe to be a musician, will exchange grand piano (or a few crates of Duff Gordon's EL CID Sherry. Candelabra thrown in free!

EXPERT POSTAL TUITION for Examinations—University Law, Accountancy, Costing, Secretarial, Civil Service, Management, Export, Commercial, General Certificate of Education, etc. Also many practical (non-examination) courses in business subjects.—Write today for free prospectus—and/or advice, mentioning examination or subjects in which interested, to the Secretary (G9/2).

ATOMIC POWER FOR PEACEFUL USE

[some more facts of interest]

▶ **IS NUCLEAR FUEL EVERLASTING?** The closed-circuit boiling water type of reactor, which Mitchells believe to be ideally suitable for use in remote areas and for Commonwealth development, consumes very little fuel. A reactor producing 60 megawatts of electric power 'burns up' *230 lb* of fuel per annum out of the charge of 50 tons. The equivalent consumption of coal would be *275,000 tons*. Limited renewal is, therefore, necessary, but this is a routine job presenting no difficulty.

▶ **IS NUCLEAR POWER SAFE?** The boiling water reactor is inherently [illegible]l self-regulating. A nuclear explosion cannot occur in it. Any [illegible] operation which might cause over-rapid heating would also create pockets of steam which would automatically reduce radio-activity and heat production.

▶ **IS NUCLEAR POWER COSTLY?** Nuclear fuel has to be processed and is at present expensive, but such efficiency has already been achieved in converting it into electric power that operating costs are in every way competitive for small-load units and for remote areas. These costs will be lowered progressively as nuclear fuels are themselves developed more cheaply.

MITCHELL DEVELOPMENTS in the field of atomic power are the logical outcome of 35 years' exceptionally wide experience in all branches of engineering and electrical supply. The agreement between Mitchell Engineering Ltd and AMF Atomics Inc of New York, will undoubtedly have far-reaching effect in applying atomic power for the benefit of mankind.

MITCHELL COMPANIES are at present engaged on three important contracts for the United Kingdom Atomic Energy Authority.

Cargoes sweat too

And when they do, rust, staining and other damage may be the result. "Cargo sweat" occurs when ships pass from cold to warm climates. A change from warm to cold can cause condensation on the ship's structure, known as "ship sweat". Shipowners have found the answer to both problems is Thermotank Drihold equipment. This maintains close control of ventilation and drying to ensure that condensation cannot occur. Control of the atmosphere for comfort or industrial processes is the business of Thermotank—on land, sea and in the air. The Company pioneered the first air conditioning of ships more than fifty years ago. Today Thermotank maintain an unequalled service covering every major shipping route throughout the world.

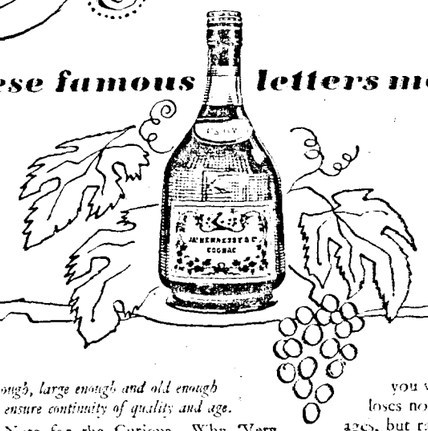
What do these famous letters mean?



No one seems quite to remember. The Hennessy family in Cognac say that when they first used the symbol many decades ago, letters such as V.S.O.P. and X.O., as well as the famous ★ markings, were chalked on the hogsheads of brandy by the blender as his personal guide to the brandy's maturity. V.S.O.P. probably meant 'Very Special Old Pale'.

Nowadays, however, as an indication of age and quality, the letters V.S.O.P. on liqueur brandies have become as equivocal as the brandy trade as the description 'Final Night Extra' on an evening newspaper.

But one thing is certain. *The label 'V.S.O.P.' means nothing unless coupled with the name of a shipper whose stocks are good enough, large enough and old enough to ensure continuity of quality and age.*

Note for the Curious. Why 'Very Special Old PALE'? Because once upon a time there was a fashion for BROWN BRANDY, which was heavily coloured by the addition of burnt sugar.

An Invitation to a Memorable Experience

When you are on holiday in France, visit the Hennessy premises in Cognac. There you will learn with your own eyes and palate what V.S.O.P. was originally meant to stand for.

You will see the vast stocks of matured and maturing brandies. You will be able to taste their quality—choosing at random from this hogshead and that: and you will learn why Hennessy loses none of its brilliance as it ages, but rather gains in character as it mellows in the wood.

You will learn from such a visit why no one in the world can offer you a better choice of genuinely aged Liqueur Cognacs than—

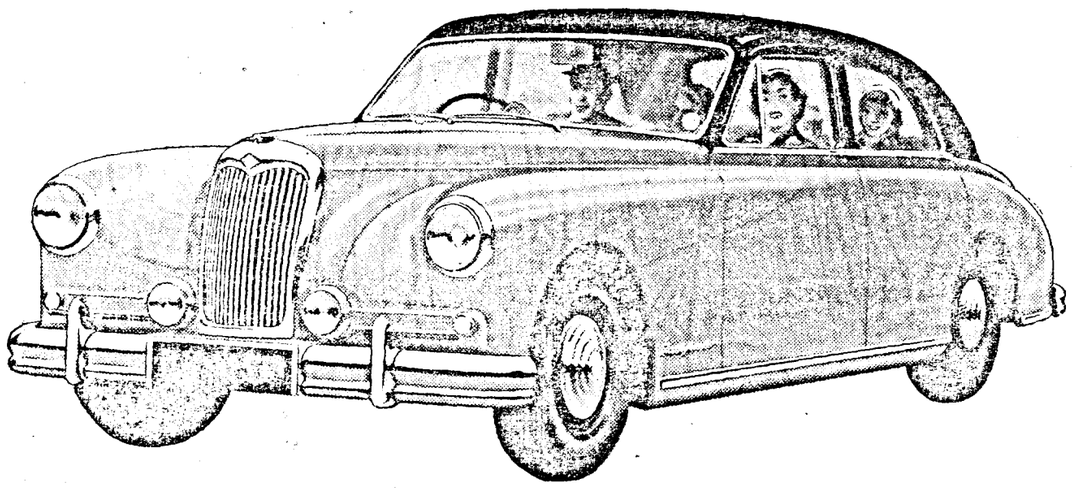
HENNESSY

V.S.O.P — X.O. — EXTRA

P.S.—Hennessy ★★★ is very often served as a liqueur, and why not? It is drawn from the very same stocks as its elder brothers and matured for many years in wood.

In Hennessy, it is Mr. Maurice Hennessy who, in the year 1865, chose the star as a symbol, inspired by the device emblazoned in the window of each of his offices. You can see it for yourself when you visit Cognac.

Go far and fast



Here is the rich, rare comfort you have always desired. In this car you are completely relaxed. And let's admit it, one feels proud of the way the PATHFINDER is singled out and admired. But the worth of this car—the best of all Rileys—goes deeper than the sweeping grace of its brilliant styling. You *must* drive the Pathfinder. It is the only possible way to appreciate its performance. Visit your Riley Dealer and see for yourself what he means when he says "Riley for Magnificent Motoring".

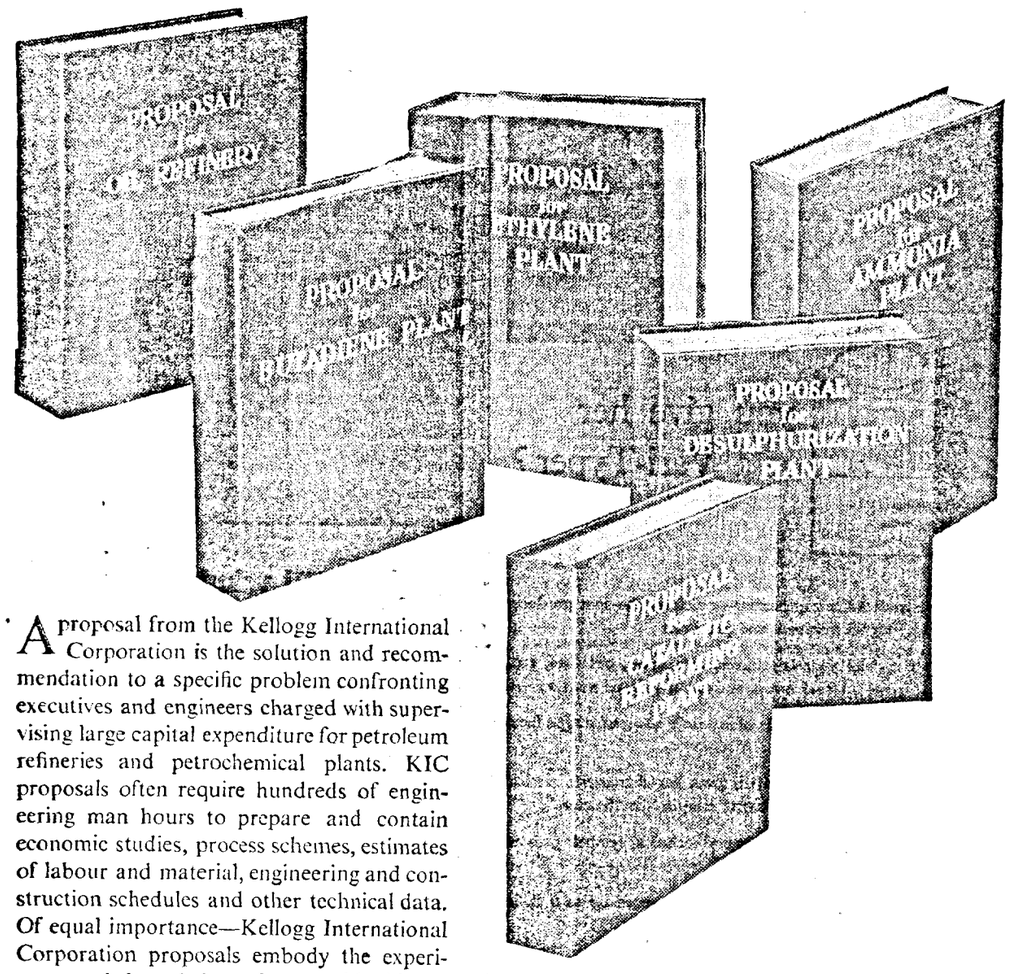
PROPOSALS...



A proposal from the Kellogg International Corporation is the solution and recommendation to a specific problem confronting executives and engineers charged with supervising large capital expenditure for petroleum refineries and petrochemical plants. KIC proposals often require hundreds of engineering man hours to prepare and contain economic studies, process schemes, estimates of labour and material, engineering and construction schedules and other technical data. Of equal importance—Kellogg International Corporation proposals embody the experience and knowledge of a world-wide organization, which has been actively participating in engineering and construction for the petroleum and petrochemical industries since their inception. When planning a capital investment in these fields, a Kellogg International Corporation proposal is usually the most economic approach to solving your problems.

The Chairman speaks . . . on

SHIPOWNERS AND TAXATION

'What the shipping industry has been saying for years is now passing from the theoretical to the practically demonstrable stage, viz., that earnings, less taxes, cannot keep pace with the increased cost of replacing the older units of the fleet . . . One obvious "counter-measure" would be for British shipowners to take advantage of the protection afforded by suitable Colonial flags to build up their fleets by means which are denied to them through excessive taxation in the Mother Country.' *Sir Ernest Murrant, Chairman of Furness, Withy & Co., Ltd., in his annual statement published in The Birmingham Post, Sept. 4th, 1956.*

'Companies with their ships registered under flags of "advantage" or "convenience" continue to thrive in happy and almost total avoidance of taxation, and will be in a very strong competitive position in the future. If Cunard had been able to work under a company registered under a flag of "advantage" instead of in Britain, their profits over the six years 1949 to 1954 would have been increased by over £14m. saved in taxation.' *Col. D. H. Bates, Chairman of Cunard Steam-Ship Co., Ltd., in his annual statement published in the Birmingham Post, April 23rd, 1956.*

Companies wishing their reports and statements to reach a wide and influential market throughout the United Kingdom's most important manufacturing centre, publish them in . . .

All eyes on the girl with the Sensimatic!

Of course they all envy her—they envy her for her ability to do superior work with less effort on her Burroughs Sensimatic. It's the truly modern accounting machine with the *exclusive sensing panel* that automatically follows the correct accounting procedure—makes so many decisions formerly left to the operator. It simplifies the most complex operations. The Sensimatic is her pride and joy—so easy to learn, so fast, so accurate. And so versatile! Each sensing panel permits a choice of four jobs with a turn of the knob. That's why your Burroughs Sensimatic Accounting Machine will stay modern—when you change accounting methods, just change the panel, not the machine. It's a long-term investment in modern accounting. To see how you could speed up *your* work with the Sensimatic, call your nearest Burroughs office. Burroughs Adding Machine Limited, 356-366 Oxford Street, London, W.1.

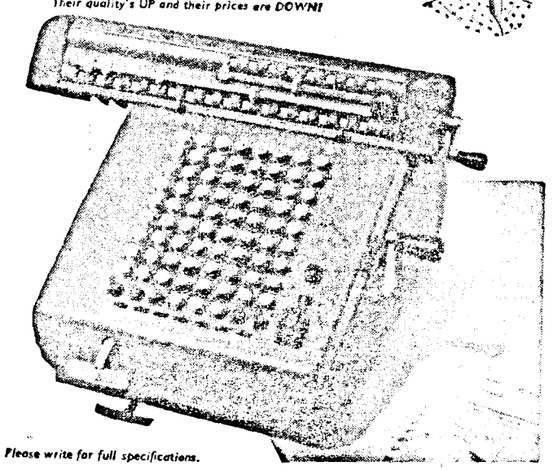
I'm telling you!

There's news . . . excellent news . . . for every one interested in al -purpose adding-calculators. Monroe models in this category, both hand and electrically operated machines, have been restyled and re-designed to give simpler, smoother, faster operation than ever before. These new LN's and LA7's are streets ahead of anything else in their class. But there's more to it than this. Improved production methods, geared to the growing demand for this type of calculator, have actually enabled us to *reduce* prices.

Miss Monroe's excited,
She's highly delighted,
At news that will soon be the talk of the town . . . LN's! LA7's!
They're new and . . . good heavens!
Their quality's UP and their prices are DOWN!

This is the LN-160

. . . an entirely new model incorporating all the latest improvements and precision-built to give an incomparably smooth and satisfying action. Test it for yourself. It may well prove to be perfectly adequate for *all* your requirements though it costs only £85 !



Please write for full specifications.

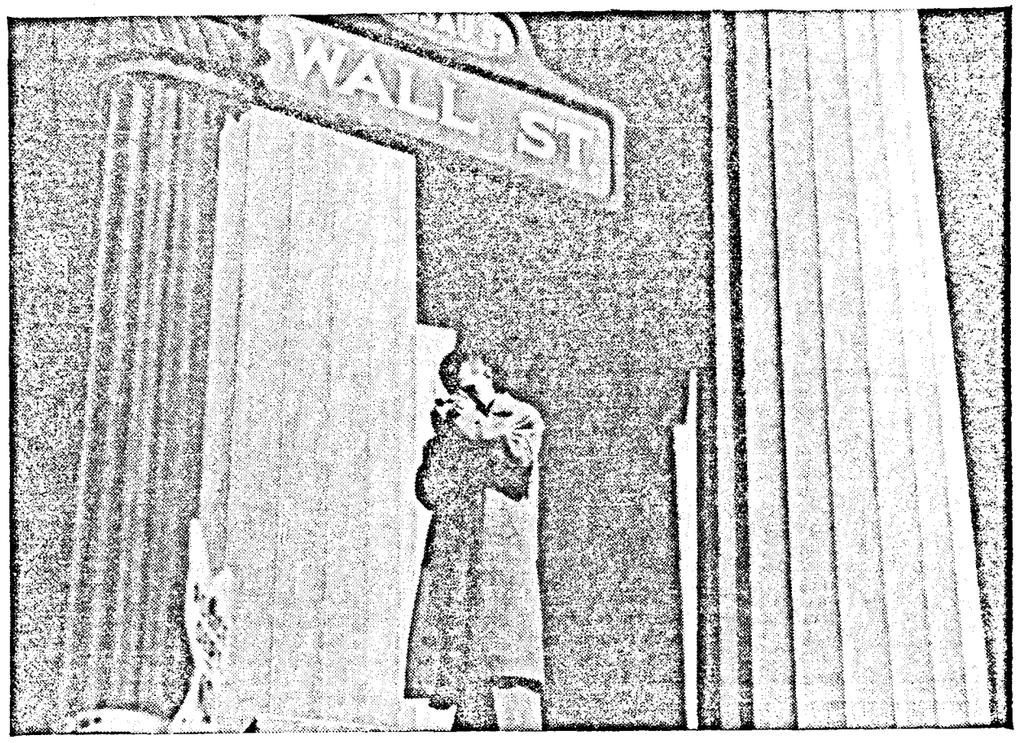
You can start your business trip at Southampton



...you're in America the moment you step on board

*IN THE PERFECT ATMOSPHERE FOR BUSINESS CONTACTS **

ALL THE THINGS that say "America"—the easy courtesy of the Deep South, the streamlined efficiency, the glamour, the glitter, the heart-warming friendliness—all these are yours only two hours away from London!

Over the fifty feet of gangplank onto the famed "United States" or her running-mate the "America" and you're *in* America; the luxury, the hospitality and the gaiety of this friendly country surround you.

And if you're a businessman, remember that here is the perfect atmosphere to lay the foundations of a really successful business trip. In informal, friendly surroundings you meet the men who might make all the difference. But there's fun aboard, too, lots of it. You'll find the few days that separate you from New York pass all too quickly. You travel fast in the utmost comfort when you travel by United States Lines.

***IMPORTANT!** *MEMO TO A BUSINESSMAN*

As a British businessman, you have great advantages to reap if you travel by United States Lines. You have time, first of all, to adjust yourself to the American atmosphere and the American tempo before you arrive in New York.

And, most important, a fresh contact is more easily made under the sociable conditions aboard ship than over an office desk; the people you meet may turn out to be more than just good friends—they may be useful friends.

"We'd had a fire. And as a result production ceased entirely until repairs could be effected. The damage was covered by our fire policy, of course. But we could still have been out of pocket and very worried if it hadn't been for 'The Northern'. They paid us our lost profit and all usual overheads as well as the wages of our workmen during the interruption, amounting in all to £6,050."

This is an ACTUAL CASE taken from our records. Businesses of all kinds and all sizes can protect themselves against such losses through 'The Northern's' Consequential Loss Policy.

Splenetic Isolation

SIR ANTHONY EDEN has isolated Britain, except for the company of France. On Tuesday, having addressed an outmoded and questionable ultimatum to Egypt and Israel, he got a majority in a deeply divided House of Commons, observing: "Honourable Gentlemen may, if they like, impugn our judgment. I hope they will not impugn our motives." But that is precisely what must be done. What was the prime motive? Was it to stop the fighting which Israel had started by moving faster than the Security Council could move? Or was it to carry out a project cherished since July: the seizure of the Suez Canal and the forcible overthrow of Colonel Nasser? The Israeli raid into the Sinai peninsula prompted the British government, not to set about inducing the Israeli forces to go back to their own territory, but to offer Egypt two alternatives: an Anglo-French occupation of the Suez Canal with Egyptian assent, or an Anglo-French occupation of the Suez Canal against Egyptian opposition. As a result, statesmen all over the world are bracketing Britain and France with Israel as aggressors.

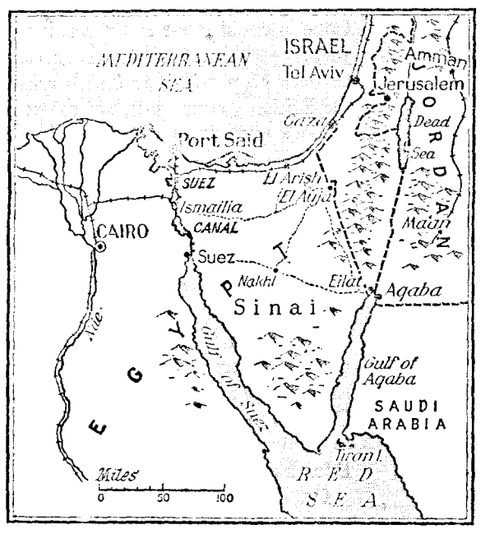
Egypt having chosen the second alternative, Britain and France have attacked a state which, however great its recent misdemeanours, was at the time the victim of an armed assault. This is a gambler's throw; upon it the Prime Minister has hazarded not only his own political future and that of his Government, but, vastly more important, his country's position, interest, and reputation in the world. For an Opposition officially to oppose a war after hostilities have started is, in modern times, unprecedented; but so, too, is what Sir Anthony Eden has done.

On the night before the ultimatum, Israel had invaded Egyptian territory on a scale that the Israelis described as "more than reprisals but less than war." Fighting was in progress as Sir Anthony spoke in the Commons on Tuesday; by accounts then current, it was approaching the Suez Canal. He and the French Prime Minister therefore called on both parties to withdraw ten miles from the Canal banks on either side, and to agree that an Anglo-French force should temporarily—"I repeat temporarily"—step into that coveted area with the double purpose of holding the belligerents apart and of safeguarding free passage for shipping. Failing compliance with this request within twelve hours, "British and French forces will intervene in whatever strength may be necessary to secure compliance." In a passage hard to reconcile with this ultimatum, Sir Anthony added that Britain had sought an immediate meeting of the Security Council.

The intention was that the 12-hour ultimatum should stand whatever the Council decided, for when it met the British representative had instructions that caused a British veto to be used there for the first time. He vetoed first an American resolution calling on both belligerents to withdraw and on other states to refrain from using or threatening force in the area, and then a Russian resolution which left out the second part of the exhortation. On Wednesday

Britain and France voted, again in a minority of two, against calling the special session of the Assembly that is meeting as we go to press.

Whatever the undoubted earlier and continued provocations of Colonel Nasser's policies, to invite Egypt to abandon its only tenable line of defence against attack from the east, and Israel to take up positions more than 100 miles inside the Egyptian border, was the act of a partisan rather than a policeman. If the motive had been simply to stop the fighting and to save British shipping from harm, the first obvious course would have been to order merchantmen to stay away, and the second to aim the intervention at positions not on the canal but nearer the violated armistice line. Inexorably, the evidence suggests that the Anglo-French decision was primarily aimed not at keeping the peace, but at recapturing the ground lost when President Nasser nationalised the Suez Canal in July. This strange cabal, Sir Anthony Eden, M. Mollet, M. Pineau and Mr Lloyd, may have much to answer for. Once their troops have landed on Egyptian soil, they are no longer masters of the word "temporarily." Suppose, as is likely, their action entails a continuing war with Egypt. Where and when will their operation go into reverse let alone stop? And what are its consequences? Many of those already discernible give grounds for the most profound disquiet. First, the attack has rightly incurred the "grave displeasure" of the United States government. Britain and France may have had cause to complain of Mr Dulles's vacillations over the Canal dispute and the Users' Association, but their action now puts his failings in the shade. By it, they are in effect doing their worst to justify the "imperialist" label they so much (and, as it seemed, so rightly) resented when he applied it two months ago. It is they, not he, who have loosened the linchpin of the Atlantic Alliance.



They have so played their hand as to cause Washington soberly to suspect collusion between Britain and France (ready, as it seems there, to stop at nothing to get back on to the canal bank) and Israel (driven desperate by Cairo's repeated boasts that "In two years' time we shall be strong enough to wipe Israel out"). Arab allegations of British collusion with Israel were a foregone conclusion, but it has been maladroit to the point of folly so to frame and execute Anglo-French policy as to give birth to the same belief in the United States.

One major consequence of alienating the American government is described in a note on page 439; if President Nasser had blocked or bungled the Suez Canal traffic, the Americans were ready to carry, and if need be to supply, western Europe's oil; their attitude will not be the same if the flow of traffic is now stopped —as for the present it has already been—by British and French action.

Grievous liabilities in other fields are only too abundant. Britain and France, by acting in direct contradiction to the wishes of the United States, have ensured that the Tripartite Declaration of 1950 (which bound all three to "take action both within and outside the United Nations" if the Palestinian frontiers or armistice lines were violated) is deprived of its one merit—its tripartite character. By vetoing a simple resolution condemning an aggressor, they have subordinated Security Council procedure to self-interest and reduced it to emptiness. Worse, they have invited the use against themselves of the Assembly procedure devised in the black days of Korea to deprive communist aggression of the shield of the Russian veto.

Just as grave is the extent to which Commonwealth opinion has been alienated. The Dominion governments were not consulted; Canada's view agrees with that of the United States; the Australian attitude has been understandably confused; India has been filled with revulsion. In the Middle East itself, the harmful effects of these precipitate actions will be many and widespread; some of them are described by our Cairo correspondent on page 429. The Arab myth, born in 1948, that western intervention has cheated the Arabs of their victory, has received an unnecessary reinforcement. They are doing their best to demolish such inclination to a western alliance as survives amongst their remaining Arab friends, such as Nuri Pasha —who has already declared himself united with Egypt in its struggle. In the larger Asian world, they have supplied Soviet propagandists with enough anti-colonial material for a decade. They may even have transferred to their own account some of the odium which "uncommitted" countries were attaching to the Soviet Union for its action in Hungary.

A week ago Mr Nehru, questioned about eastern Europe, said: "It is not for us to interfere in any way, even by expressing an opinion." In contrast, the Indian government issued on Wednesday a statement which referred bluntly to the Anglo-French intervention as an act of aggression that might lead to large-scale war. Formal protests were also made by Indonesia, and on Thursday violent anti-British demonstrations were reported from Pakistan. The messages sent the same day by Marshal Bulganin and Marshal Voroshilov to Mr Nehru and President Soekarno urging a new conference of the Asian-African "Bandoeng" powers in view of the threat to their interests, show that Moscow did not lose a moment before following through.

★

On the best allowance, there are too few conceivable advantages to measure against this deadweight of clear loss. Even if the Eden-Mollet technique achieves what it is intended to achieve—which is, presumably, a shock sharp enough to bring about the end of fighting, the fall of President Nasser and recovery of some permanent western authority over Suez Canal traffic—the damage still promises to be out of proportion. It may or may not become possible when the fighting is over to devise an international zone between Egypt and Israel which might serve as a secure additional route between the Red Sea and the Mediterranean. But even then, could Britain and France expect to be immune from the disastrous longer-term repercussions of what they are doing—repercussions that include an upsurge of Asian and African mistrust, as well as a loss of American and Commonwealth goodwill?

These thoughts force sober men in Britain to the conclusion that French ministers stung to fury by Egyptian support of the Algerian rebels are not the best counsellors for a British Prime Minister smarting at his betrayal by an Egyptian president whose advocate he once was. To attack Egypt against the reasoned urging of the world, and under cover of a smoke-screen of obfuscatory statements, can arouse no confident support in the country. The manner in which this crisis has been handled suggests a strange union of cynicism and hysteria in its leaders.

Moscow's Hour of Decision

BY swift changes, the consequences of which are still incalculable, the peoples of eastern Europe have ceased to be mere pawns on the political chessboard. After suffering fearful slaughter in its internal struggle, the Hungarian nation has forced its own government to accept its desire to escape from the Soviet government to accept its desire to escape from the Soviet grasp. Mr Nagy, whose position during some phases of the Hungarian revolt had been obscure, on Thursday told the Soviet Ambassador plainly of his country's desire to secede from the Warsaw Pact, adopt a neutral status similar to that of Austria, and say goodbye to the Soviet Army. Protesting against the continuing movement of Soviet forces into Hungary, he said that his government proposed to appeal to the United Nations.

The political climate of eastern Europe has been so much transformed over the last three years, and visibly so much in the past three weeks, indeed in the past three days, that the Soviet leaders are now manifestly forced to ponder whether a victory by arms alone is not, politically, a Pyrrhic victory? It is a dramatic dilemma. What if the threat to the communist system should go so far as to call in question the future of all the dependent communist regimes? Would the Russians make the best even of this, or would they fight? The Hungarians in arms have given the Russian leaders little time for reflection; and Mr Nagy's demands have now posed in its sharpest form the question that they will have to answer.

The conflict between political considerations and military needs was present from the start of the Hungarian revolt. Hungary's communist leaders, bewildered by the magnitude of the upheaval, groped their way clumsily between opposed policies of concession and repression. The mixture of both which they evolved proved self-defeating. Concessions, made grudgingly under pressure—Mr Nagy's appointment, Mr Gero's removal, the inclusion of non-communists in the government—all came too late to satisfy the insurgents, whose resolution grew with success. The backbone of resistance was not broken by bloody repression, which served instead to exasperate national feeling, stiffen the insurgents' will and their demands. And the Hungarian communists could hardly ask the Russians to use their most effective weapons of mass destruction if the purpose of the whole punitive operation was to pave the way for a more popular communist regime; slaughter is not the road to popularity. Now they have themselves bidden the tanks depart.

When they finally realised that the movement was in spate far beyond Budapest, that the insurgents controlled large parts of the country and, above all, that the regime was being deserted by the industrial workers, the Hungarian communist rulers at last saw that their only hope lay in a reconciliation. They set themselves to appear as the leaders, instead of the executioners, of the popular movement. It may be that Mr Nagy, stiffened by those behind him, believes that he can, as Mr Gomulka has done so far, don the mantle of a national leader. Some of his pledges sound like chapters from the Warsaw manifesto. He, too, offers the withdrawal of Soviet troops, and a new relationship with Russia "on a basis of equality." He, too, swears that collectivisation will be halted and more private enterprise allowed, and that the nation will work for tomorrow rather than the distant future.

★

But what would have sounded like a revolutionary conversion before the fighting began is no longer enough. Already Mr Nagy has been compelled to announce the end of single-party rule, to promise free

elections and to begin to steer his country out of the Soviet orbit. The communists may still expect to return to the postwar position when they exercised power under the cloak of a coalition. Then, however, they could rely on the Soviet troops and the security police for ultimate power ; the coalition was Mr Rakosi's salami which he reduced slice by slice. But now, if Mr Nagy keeps his pledge, the transformation will be the other way and may well end in the complete collapse of the communist regime. Certainly it is not likely that Anna Kethly, who has always been uncompromisingly anti-communist, would have agreed to head a newly-constituted Social Democrat party if she had not strong hopes that a real wind of change was blowing.

Once a single country has been allowed to break away from communism, it is hard indeed to see what can prevent a general upheaval of eastern Europe. The Hungarian example need not be contagious if the Hungarians, after all, won no more than the Poles have already got. But if their brave tenacity does win them the right to free elections and the liberty to choose their own regime, other nations of eastern Europe, including Poland, will quickly draw their conclusions. Soldiers and policemen will then decide that it pays to side with the insurgents. It is more than doubtful whether the revolution "from above" imported by the Soviet Army has in ten years struck roots anywhere that can stand the test of a popular verdict. Men like Mr Nagy and Mr Gomulka—and, who knows, even Marshal Tito ?—may be swept away. The events in Poland spelled the end, which Stalin's heirs resigned themselves to accept, of Moscow's spiritual rule as the Rome of the communist world. Now, the Hungarian insurrection could mean the end of its temporal sway over eastern Europe ; that would be another matter—and matter for history.

★

The Soviet leaders are desperately trying to avoid being pegged down to the choice between the naked fist of repression and total withdrawal, lock, stock and barrel. Such is the pace of events that the Russians now pin their hopes on an intermediate solution of the Polish kind—which two weeks ago they accepted from Mr Gomulka only grudgingly and under pressure. This must be the purpose of Tuesday's declaration from Moscow, admitting past mistakes and expressing willingness to discuss with the other signatories of the Warsaw Treaty the withdrawal of Soviet troops from Hungary, Poland and Rumania. A last appeal will probably be made to communist brotherhood and community of interests. East European leaders will be urged to take the Polish way, seeking their own solutions, but remaining within the communist framework and depending ultimately on Soviet support for their survival. But Mr Nagy, pressed ever onwards by the Hungarian patriots, may now have upset the communist apple-cart and left the Russians faced, willy-nilly, with the alternatives of a bloody reconquest and withdrawal from eastern Europe.

Stalin's successors intended that the journey away from Stalinism, undertaken for reasons of their own, should be slow, orderly and controlled from above. They vastly underestimated the explosive nature of the forces of discontent that had been compressed into the Stalinist straitjacket—above all, the force of national feeling. The chain events, leading at a quickening pace from the Moscow congress through the Poznan riots and the act of defiance at Warsaw to the insurrection in Budapest, plainly took them by surprise. After Mr Nagy's challenge can they still believe, that, though the movement of liberalisation has acquired dangerous momentum, there can be no question of changing directions, still less of going into reverse ? The writing is on the wall in Hungary.

★

Some Russians may be ready to draw the conclusion that communism is not a system to be planted with bayonets in foreign soil, but a creed which can only flourish where the ground is fertile. On that argument, if the Gomulka experiment were to fail, it might be better to withdraw than to reconquer ; what was lost in size would be gained in the power to attract. The argument may be sensible ; to act on it would be, none the less, the confession of failure.

And many others, above all the military commanders, may be unready yet to brook such a failure. They will refuse to contemplate such distant perspectives and insist rather on contemplating the risks at hand. There is no guarantee, they will say, that the regimes left behind by the Soviet Army will maintain the existing structure of society or avoid hostility towards their Russian neighbour. Russia may find itself neighboured by a belt of recusant countries leaning towards the West ; the balance of international power will be tilted dangerously against it. This is Russia's eternal fear ; and rather than face it, some of Stalin's heirs, backed by the army, may prefer to stand fast—and to bring down the men at home guilty (as they may think) of squandering the Stalinist empire for the sake of some hypothetical future gains. This new October revolution, 39 years after the first, has rammed momentous decisions upon the Soviet leaders.

In accordance with what those leaders now decide, the western countries will have to shape their strategy for the future. They must be ready. If the Russians are obliged by what is happening to withdraw their troops and let eastern Europe seek its own destiny, the communist challenge will change its character ; new possibilities will be opened up for the settlement of the German question and other problems of the world. But the Soviet leaders will not readily entrust their fate to such a plunge. While they twist and turn the West can only wait—and, in its hour of apparent triumph, events in Egypt will inhibit it from crying triumph and from passing judgments now too confidently.

Parkinson Looks at Cabinet Governments

Just under a year ago the startling discovery of Parkinson's Law was exclusively revealed in the columns of "The Economist." Since then the founder of that law has been engaged in a study of the science of comitology, with particular reference to the structure of cabinet government. We have now acquired the British rights to his research, which (Whitehall will be masochistically glad to hear) does for committees and cabinets what Parkinson's Law did for the civil service.

THE life cycle of the committee is so basic to our knowledge of current affairs that it is surprising that more attention has not been paid to the science of comitology*. The first and most elementary principle of this science is that a committee is organic rather than mechanical in its nature: it is not a structure but a plant. It takes root and grows, it flowers, wilts and dies, scattering the seed from which other committees will bloom in their turn. Only those who bear this principle in mind can make real headway in understanding the structure and history of modern government.

Committees, it is nowadays accepted, fall broadly into two categories, those

(A) from which the individual member has something to gain ; and those

(B) to which the individual member has merely something to contribute.

Examples of the B group, however, are relatively unimportant for our purpose ; indeed some people doubt whether they are committees at all. It is from the more robust A group that we can learn most readily the principles which are common (with modifications) to all. Of the A group the most deeply rooted and luxuriant committees are those which confer the most power and prestige upon their members. In most parts of the world these committees are called "cabinets." This article is based on an extensive study of national cabinets, over space and time.

The Four Stages of Cabinets

WHEN first examined under the microscope, the ideal size of a cabinet council usually appears—to comitologists, historians, and even to the people who appoint cabinets—to be five. With that number the plant is viable, allowing for two members to be absent or sick at any one time. Five members are easy to collect and, when collected, can act with competence, secrecy and speed. Of these original members four may well be versed, respectively, in finance, foreign policy, defence and law. The fifth, who has failed to master any of these subjects, usually becomes the chairman or prime minister.

Whatever the apparent convenience might be of restricting the membership to five, however, we discover by observation that the total number soon rises to seven or nine. The usual excuse given for this increase, which is almost invariable (exceptions being found, however, in Luxemburg and Honduras) is the need for special knowledge on more than four topics. In fact, however, there is another and more potent reason for adding to the team. For in a cabinet of nine it will be found that policy is made by three, information supplied by two and financial warning uttered by one. With the neutral chairman, that accounts for seven, the other two appearing, at first glance, to be merely ornamental. This allocation of duties was first noted in Britain in about 1639, but there can be no doubt that the folly of including more than three able and talkative men in one committee had been discovered long before that. We know little as yet about the function of the two silent members but we have good reason to believe that a cabinet, in this second stage of development, might be unworkable without them.

There are cabinets in the world (those of Costa Rica, Ecuador, Northern Ireland, Liberia, the Philippines, Uruguay and Panama will at once be called to mind) which have remained in this second stage—that is, have restricted their membership to nine. These remain, however, in a small minority. Elsewhere and in larger territories cabinets have generally been subject to a law of growth. Other members come to be admitted, some with a claim to special knowledge but more because of their nuisance value when excluded. Their opposition can be silenced only by implicating them in every decision that is made. As they are brought in (and placated) one after another, the total membership rises from ten towards twenty. In this third stage of cabinets, there are already considerable drawbacks.

The most immediately obvious of these disadvantages is the difficulty of assembling people at the same place, date and time. One member is going away on the 18th, whereas another does not return until the 21st. A third is never free on Tuesdays, and a fourth never available before 5 p.m. But that is only the beginning of the trouble for, once most of them are collected, there is a far greater chance of members proving to be elderly, tiresome, inaudible and deaf. Relatively few were chosen from any idea that they are or could be or have ever been useful. A majority perhaps were brought in merely to conciliate some outside group. Their tendency is therefore to report what happens to the group they represent. All secrecy is lost and, worst of all, members begin to prepare their speeches. They address the meeting and tell their friends afterwards about what they imagine they have said. But the more these merely representative members assert themselves, the more

* Why 'comitology,' instead of 'committology' ? Well, why not ?

loudly do other outside groups clamour for representation. Internal parties form and seek to gain strength by further recruitment. The total of twenty is reached and passed. And thereby, quite suddenly, the cabinet enters the fourth and final stage of its history.

For at this point of cabinet development (between 20 and 22 members) the whole committee suffers an abrupt chemical or organic change. The nature of this change is easy to trace and comprehend. In the first place, the five members who matter will have taken to meeting beforehand. With decisions already reached, little remains for the nominal executive to do. And, as a consequence of this, all resistance to the committee's expansion comes to an end. More members will not waste more time ; for the whole meeting is, in any case, a waste of time. So the pressure of outside groups is temporarily satisfied by the admission of their representatives, and decades may elapse before they realise how illusory their gain has been. With the doors wide open, membership rises from twenty to thirty, from thirty to forty. There may soon be an instance of such a membership reaching the thousand mark. But this does not matter. For the cabinet has already ceased to be a real cabinet, and has been succeeded in its old functions by some body else.

The Law at Work in England

FIVE times in English history the plant has moved through its life cycle. It would admittedly be difficult to prove that the first incarnation of the cabinet —the English Council of the Crown, now called the House of Lords—ever had a membership as small as five. When we first hear of it, indeed, its more intimate character had already been lost, with a hereditary membership varying from 29 to 50. Its subsequent expansion, however, kept pace with its loss of power. In round figures, it had 60 members in 1601, 140 in 1661, 220 in 1760, 400 in 1850, 650 in 1911, and 850 in 1952.

At what point in this progression did the inner committee appear in the womb of the peerage ? It apeared in about 1257, its members being called the Lords of the King's Council and numbering less than ten. They numbered no more than eleven in 1378, and as few still in 1410. Then, from the reign of Henry V, they began to multiply. The 20 of 1433 had become the 41 of 1504, the total reaching 172 before the council finally ceased to meet.

Within the King's Council there developed the cabinet's third incarnation—the Privy Council—with an original membership of nine. It rose to 20 in 1540, to 29 in 1547 and to 44 in 1558. The Privy Council, as it ceased to be effective, increased proportionately in size. It had 47 members in 1679, 67 in 1723, 200 in 1902 and 300 in 1951.

Within the Privy Council there developed the Junto or Cabinet Council which effectively superseded the former in about 1615. Numbering eight when we first hear of it, its members had come to number 12 by about 1700, and 20 by 1725. The cabinet council was then superseded in about 1740 by an inner group since called, simply, the Cabinet. Its development is best studied in tabular form. This is shown in Table I.

TABLE I—GROWTH OF THE ENGLISH CABINET

1740	....	5	1885	....	16	1945	....	16
1784	....	7	1900	....	20	1945	....	20
1801	....	12	1915	....	22	1949	....	17
1841	....	14	1935	....	22	1954	....	18
			1939	....	23			

From 1939, it will be apparent, there has been a struggle to save this institution ; a struggle similar to the attempts made to save the privy council during the reign of Queen Elizabeth I. The cabinet appeared to be in its decline in 1940, with an Inner Cabinet (of 5, 7 or 9 members) ready to take its place. The issue, however, remains in doubt. It is just possible that the British cabinet is still an important body.

The Law in Operation Abroad

COMPARED with the cabinet of Britain, the cabinet of the United States has shown an extraordinary resistance to political inflation. It had the appropriate number of five members in 1789, still only 7 by 1840, 9 by 1901, 10 by 1913, 11 by 1945 and then—against tradition—had come down to 10 again by 1953. Whether this attempt, begun in 1947, to restrict the membership will succeed for long is doubtful. All experience would suggest the inevitability of the previous trend. In the meanwhile, the United States enjoys (with Guatemala and El Salvador) a reputation for cabinet-exclusiveness, having actually fewer cabinet ministers than Nicaragua or Paraguay.

TABLE II—SIZE OF CABINETS

No. of Members		*No. of Members*

How do other countries compare in this respect ? The majority of non-totalitarian countries have cabinets which number between 12 and 20 members. Taking the average of over 60 countries, we find that it comes to over 16 ; the most popular numbers are 15 (seven instances) and 9 (seven again). Easily the queerest cabinet is that of New Zealand, one member of which has to be announced as " Minister of Lands, Minister of Forests, Minister of Maori Affairs, Minister in charge of Maori Trust Office and of Scenery Preservation." The toastmaster at a New Zealand banquet must be equally ready to crave silence for " The Minister of Health, Minister Assistant to the Prime Minister, Minister in charge of State Advances Corporation, Census and Statistics Department, Public Trust Office and Publicity and Information." In other lands this oriental profusion is fortunately rare.

The Coefficient of Inefficiency

A STUDY of the British example would suggest that the point of ineffectiveness in a cabinet is reached when the total membership exceeds 20 or perhaps 21. The Council of the Crown, the King's Council, the Privy Council has each passed the 20 mark when their decline began. The present British cabinet is just short of that number now, having recoiled from the abyss. We might be tempted to conclude from this that cabinets—or other committees—with a membership in excess of 21 are losing the reality of power and that those with a larger membership have already lost it. No such theory can be tenable, however, without statistical proof. Table II on the preceding page attempts to furnish part of it.

Should we be justified in drawing a line in that table under the name of France (21 cabinet members) with an explanatory note to say that the cabinet is not the real power in countries shown below that line ? Some comitologists would accept that conclusion without further research. Others emphasise the need for careful investigation, more especially round the borderline of 21. But that the coefficient of inefficiency must lie between 19 and 22 is now very generally agreed.

What tentative explanation can we offer for this hypothesis ? Here we must distinguish sharply between fact and theory, between the symptom and the disease. About the most obvious symptom there is little disagreement. It is known that, with over twenty members present, a meeting begins to change character. Conversations develop separately at either end of the table. To make himself heard, the member has therefore to rise. Once on his feet he cannot help making a speech, if only from force of habit. " Mr Chairman," he will begin,

> I think I may assert without fear of contradiction—and I am speaking now from twenty-five (I might almost say twenty-seven) years of experience—that we must view this matter in the gravest light. A heavy responsibility rests upon us, sir, and I for one. . . .

Amid all this drivel the useful men present, if there are any, exchange little notes which read, " Lunch with me tomorrow—we'll fix it then."

What else can they do ? The voice drones on interminably. The orator might just as well be talking in his sleep. The committee of which he is the most useless member has ceased to matter. It is finished. It is hopeless, it is dead.

A Mathematical Investigation

So much is certain. But the root cause of the trouble goes deeper and has still, in part, to be explored. Too many vital factors are unknown. What is the shape and size of the table ? What is the average age of those present ? At what hour does the committee meet ? In an article for the non-specialist it would be absurd to repeat the calculations by which the first and tentative coefficient of inefficiency has been reached. It should be enough to state that prolonged research at the Institute of Comitology has given rise to a formula which is now widely (although not universally) accepted by the experts in this field. It should perhaps be explained that the investigators assumed a temperate climate, leather-padded chairs and a high level of sobriety. On this basis the formula is as follows :

$$x = \frac{m^{o}(a - d)}{y + p\sqrt{b}}$$

Where m = the average number of members actually present ; o = the number of members influenced by outside pressure groups ; a = the average age of the members ; d = the distance in centimetres between the two members who are seated furthest from each other ; y = the number of years since the cabinet or committee was first formed ; p = the patience of the chairman, as measured on the Peabody scale ; b = the average blood pressure of the three oldest members, taken shortly before the time of meeting. Then x = the number of members effectively present at the moment when the effcient working of the cabinet or other committee has become manifestly impossible. This is the co-efficient of inefficiency and it is found to lie between 19.9 and 22.4. (The decimals represent partial attendance ; those absent for a part of the meeting.)

It would be unsound to conclude, from a cursory inspection of this equation that the science of comitology is in an advanced state of development. Comitologists and sub-comitologists would make no such claim, if only from fear of unemployment. They emphasise, rather, that their studies have barely begun and that they are on the brink of astounding progress. Making every allowance for self-interest—which means discounting 90 per cent of what they say—we can safely assume that much work remains to do.

We should eventually be able, for example, to learn the formula by which the optimum number of committee members may be determined. Somewhere between the number of 3 (when a quorum is impossible to collect) and approximately 21 (when the whole organism begins to perish), there lies the golden number. The interesting theory has been propounded that this number must be 8. Why ? Because it is the only number which all existing states (See Table II above) have agreed to avoid. Attractive as this theory may seem at first sight, it is open to one serious objection. Eight was the number preferred by King Charles I for his Committee of State. And look what happened to him !

Notes of the Week

Parliament's Reception

STRANGELY, the announcement that split the Commonwealth, the alliance and the country was not a great parliamentary occasion. Sir Anthony Eden arrived at the House from his meeting with the French leaders a bare quarter of an hour before he rose to his feet in the chamber; the text of his statement was handed to Mr Gaitskell with only that quarter of an hour's notice. It is possible that even some Conservative ministers were informed only at that moment how short a time limit was being set on the ultimatum; certainly the impression at Westminster this week has been that the crucial decisions have been taken by Sir Anthony acting unaccustomedly alone. When Sir Anthony announced that the ultimatum had been dispatched, there was only a nervous cheer from the Conservative benches behind him; at this stage the Labour benches were strangely quiet, as they, too, groped for what their reaction should be. Mr Gaitskell was still groping when he stood up to reply; although he asked a pointed question about the legal grounds for the ultimatum, he emphasised that he was eager to avoid immediate debate and argument. It was only on his second appearance at the dispatch box, some twenty minutes later, that he struck firmly upon the formula that the Government should promise not to resort to force until after both the Security Council debate that night and a prepared debate in the House on the Wednesday.

★

The latter part of this formula was not, constitutionally, a very good one. Any call for delay had, of course, the great virtue that delay at this stage would be likely to mean abandonment of the whole operation; Mr Gaitskell can say in retrospect that it usually is more tactful to call for delay, rather than for a complete scrapping of plans, if one is suddenly told that one's daughter is going to run away with the milkman. But it is doubtful if Mr Gaitskell had thought through the real implications of his suggestion at that moment, and the Tories certainly had not; to them—as to the military experts—it appeared that to delay an invasion from (as they assumed) the Wednesday would not be to delay it to the Greek Kalends, but merely to twenty-four hours later, when the Egyptians would be more prepared to meet it. Mr Gaitskell, it seemed to the Tories, was asking that a well-nigh inevitable military operation should be made more bloody and difficult, in order to give himself time to consult about foreign policy with Mr Bevan and to polish his speeches' perorations. This feeling accounted for the Tories' noisy and hostile reception of Mr Gaitskell later that evening. But by this time Tory bitterness and hostility were only a shadow of the bitterness and hostility of the other side. With the swell of public opinion apparently gathering behind it, Labour had taken its entirely proper decision to oppose the Government's action "by all constitutional means"—and also by some less constitutional booing on the floor of the House.

To the Aid of the Party

THE attitude of the Labour party, although not necessarily that of the Tories, therefore seems to be indelibly struck. Labour claims that it is more united than ever before; it has got used to claiming that on every occasion nowadays, but this time the assertion carries some conviction. The only conceivable threat of a split in Labour's ranks would seem to be if the situation developed in some way that divided the party's ardently pro-Israel lobby from their colleagues; but most of the pro-Israel socialists, apart from the two or three who have half-rebelled against the party line already, are adaptable people. One by-product of the crisis is that Mr Gaitskell and Mr Bevan have found themselves genuinely united at a very useful moment for the latter; Mr Bevan was due to speak from Labour's front bench in Thursday's debate, which may or may not be significant for the distribution of party offices to come.

Many Tories, for their part, are desperately unhappy. The party's anti-war group—named, possibly misnamed, the Heald group by some newspapers after a previous Suez debate—is more sizeable than it is at present vocal. Most of the doubters in this group seem likely to stay silent if military operations should go well, and they would certainly rally round Sir Anthony if things should go really bloodily badly; dragging international failure without very much bloodshed would be the development most likely to bring them into the open. For the moment, however, their motto

War in the Middle East

In addition to the leading article on page 391, *and Notes of the Week on this and the following pages, aspects of the Middle Eastern crisis are discussed in dispatches from our Cairo and Paris correspondents on pages* 429 *and* 431, *and in Business Notes from page* 439 *onwards.*

Basic facts about trade, shipping and oil through the Suez Canal were given in "The Economist" on August 4th (pages 419 *to* 423) *and September 22nd (pages* 982 *to* 987.)

seems to be "united and silent we stand, divided and loquacious we fall"; this is even more true of the less belligerent elements among the leadership who, divided, might in fact rise. The future trend within the Tory party is therefore, at present, unpredictable. But perhaps it is not very important to try to predict it. What this crisis may do to the parties is a small affair compared with what it might do to the country.

Is the Bridge Down?

THE extent of the bitterness that the Anglo-French intervention in Egypt has aroused in the United States needs to be explained to the British public with complete frankness. Some British commentators seem to be confidently assuming that all will be well once the State Department's first flush of anger has passed, that "when we've got Nasser on the run" the American attitude will be transformed into one of admiration and gratitude for such a courageous grasping of the Middle Eastern nettle. Certainly, official Washington will not long remain in Wednesday's white hot mood, which was stoked up not only by the belief that Britain and France had conspired with Israel but also by a well founded feeling that the United States ambassadors in London and Paris had been deliberately misled. But even when the coldest of reason has succeeded natural emotion, the bleak fact will remain that Anglo-American relations can hardly be the same again.

Just how wide a crack will gape in the Atlantic bridge will, of course, depend on the British and French governments' future actions as well as on their past ones—but it will be only partially dependent on that. Cruel damage to the fabric is already visible. On the eve of a United Nations Assembly as well as of an election, the Americans feel that they have been bludgeoned into choosing between their main European allies and the forces of spontaneous nationalism which automatically engage their sympathy throughout the world. The shock has been all the greater because American hearts were lifted so high last week by the Hungarians' heroic struggle. When the "spirit of '76" has just been blended with that of 1848, it is a shattering experience to find one's chief allies apparently apeing Metternich and Macchiavelli. It is not surprising that from the most responsible quarters in Washington there is already heard the argument that America need no longer stand so closely by its European allies, now that Soviet power looks like receding and there is promise of the appearance of a buffer zone aligned on Warsaw and Budapest.

True, America will not be converted overnight to the belief that President Nasser is always right, that Israel is always wrong, or that Britain (which is, after all, pressing on with the emancipation of West Africa, Malaya and the West Indies) has simply reverted to the Hessian habits of George III. But in point of fact the figure that Britain and France risk cutting in American eyes is not so much ogre-like as delinquent. The United States is by now sadly familiar with the nuisance-value tactics that can be exploited by such minor potentates as Dr Rhee, Chiang Kai-shek and King Saud. Britain and France seem bent on joining this awkward squad. And not even a super-power can sustain a mighty transoceanic bridge with the aid of such headstrong and teen-aged partners.

Inconsistencies in North Africa

NOW that the hubbub over the trick whereby France captured the Algerian rebel leaders has given place to hubbub over Suez, the men directly concerned with North African affairs—in Paris, Tunis, and Rabat—have a moment in which to pause to think what happens next.

The French are still pursuing two policies that do not dovetail—the one, proceedings against the five captured Algerians; the other, a new offer to Algeria. The five men are to appear before a military court in Paris, charged with sowing demoralisation in the army and amongst the nation to the detriment of national security. This is a capital offence under French law.

Simultaneously, the Algerians were on Monday invited to lay down their arms in return for a new deal which included equal voting rights for Frenchmen and Moslems in a single electoral college, but which is vague about the link between France and the "new Algeria," except for an airy reference to "giving full scope to the Algerian personality." It is doubtful whether such an offer will satisfy people whose leaders have been captured by a subterfuge, and who have been demanding independence; the total unwillingness of all French parties (except the communists) to consider this solution is described by our Paris correspondent on page 431. French optimists keep hope alive by explaining that the evidence captured with the prisoners suggests that the rebellion is doomed, and that its supporters may as well now compromise.

The latest news from Tunisia and Morocco does not provide much support for this view. Undoubtedly, both the Moroccan and the Tunisian leaders want to keep down anti-French outrages; both are co-operating with French army units to this end; neither is dancing to every tune piped by Cairo. They have, for instance, worked to prevent North African participation in the general strike which Cairo radio called last weekend. Both the Sultan and M. Bourguiba seem to want to make the Maghreb a counterweight to Egypt. Heartened by this thought, the French have dispatched a peacemaker to each capital—M. Seydoux (a wise choice) to Tunis and M. Basdevant to Rabat. But Moslem confidence has been breached, and each emissary has a long way to go before he can restore local willingness to preach moderation to Moslem Algeria. The news from Sinai will not ease the task.

The Legislative Queue

SPECULATION about the Government's legislative programme, to be announced in the Queen's speech next Tuesday, has been completely overshadowed by the Suez crisis. But the shape of the programme has been well-advertised in advance; the main question is how many projects Mr Butler will be able to squeeze in. The most controversial of the new measures, the Rents Bill, is likely to be published early in the session; Mr Sandys's announcement on Thursday that general subsidies on council houses are now to cease (except for those on one-bedroomed dwellings) may be a hopeful augury of more courage to come. Among other measures Malta will have to be integrated

in the new session, and the Gold Coast severed. The rest of the Gowers report is to be honoured, giving shop and office workers their new deal. The Government will bring in its modified Death Penalty Bill. The new Local Government Commissions must be set up, and a bill will be needed for the new financial arrangements for the railways. The film levy is to be made compulsory, the Coal Board forced to pay compensation for mining subsidence and pensioners some day are to be allowed to "de-retire." The postponed anti-dumping legislation is expected fairly early in the session. The major reviews of long term guarantees for farmers (on which the Government may already have reached a state of decision) and of defence (on which the Government has not yet reached even a settled state of indecision) could conceivably both call for legislation.

Two other major measures on the *tapis* are reform of the House of Lords and reform of the gambling laws. Both would be time-consuming, and also controversial; there has therefore been some suggestion that they are vying for the last place in the overcrowded queue. The reforms that are needed in the gambling laws are discussed on page 402 of this issue; it is to be hoped that the Government is not going to run away from them. In normal circumstances, and on some issues, the next twelve months should provide the Government with its last chance to take really effective action before the next election; this is worth re-emphasising even in a situation when nobody can know how abnormal—governmentally or even electorally—the next twelve months are going to be.

Repeating the Dose

The most general comments to be passed on Mr Macmillan's second instalment of government economies are again that it is a great pity that he did not take one bold bite at the cherry in June; and that this peculiar system of running round the departments, asking them to cut a neat £100 million slice off estimates that have already been approved, is one that must not be repeated in future years. The Chancellor's definition of the £93 million of economies he has so far announced is still that they all result from deliberate policy decisions to cut government expenditure below the level it would otherwise have attained; all "unplanned" underspendings on the original estimates are supposed to be excluded from the total, as are overspendings (as a result of Suez and other developments) on the other side of the account. The departments that have been asked to make the cuts, however, have been under a great temptation to claim credit for any unplanned underspendings (those arising, for example, from any failures in service recruiting policy) as part of their required contribution. It has become wearying to argue who has won the greater part of this battle of definitions; all that need be said is that the economies so far revealed do not amount to a genuine reduction of a full £93 million in government absorption of resources. And there is a third dreary instalment of £7 million still to be announced.

The two cuts that aroused most controversy last week, however, are genuine enough. They are also cuts that could perfectly well have been decided upon, and should have been announced, last June. The first of them, which will save the Exchequer £750,000 in 1955-56 and £5 million in a full year, is the decision to make the shilling payment for prescriptions under the health service applicable to each item on a prescription form instead of to the whole form. The Labour party's reaction to this decision was depressingly noisy and unconsidering. It was Labour which, quite rightly, first breached the principle of a "free" health service—the prescription charge was first put on the statute book (though not into force) in 1949, while the charge for spectacles and dentures came into force in the spring of 1951—and the party should now be ready to meet changes in the prescription charge with constructive criticism instead of purely emotional explosion.

The justification for the new method of levying the charge (apart from its place in the Chancellor's economies) is that since it was introduced doctors have tended to include more items on a single form so that patients get more for their shilling, though this tendency is not so pronounced as is sometimes made out—1.75 items per form now, compared with 1.6 in 1952. Where these subsidiary items (dressings, for instance) cost less than a shilling, it will now pay the patient to buy them direct from a chemist instead of always bothering the doctor—which is all to the good. It is, however, arguable whether the best method of imposing the charge has yet been found; in particular, whether it should not be proportionate to the cost of the prescription rather than a flat sum. It is also very doubtful whether the Assistance Board is the right channel for reimbursing the charge in cases of hardship. The board's test is necessarily stringent, and, as Conservative backbenchers have urged in the past, there is a case for imposing a more lenient test in the health service. If the Labour party would only give some constructive thought to the administration of the charges, instead of blowing its top at the very mention of them, it would do much more towards making the service as a whole healthier and stronger.

Milk and Money

The second really controversial Government economy announced last week was the reduction in the milk subsidy, which will save the Exchequer £4½ million this financial year. Here again Labour seems to be missing its chance of indulging in constructive, instead of purely emotional, criticism. The economy is an eminently sensible one, but the effect of the manner in which it is being applied is going to be utterly paradoxical. Milk consumers (except welfare consumers) are to be charged an extra ½d. a pint from January 1st.

This increase comes at a time when the country is already swimming in a sea of surplus milk, which is being sold for manufacturing purposes (such as butter and cheese) at a heavy loss. Over the last twelve months milk production has increased by 106 million gallons, but the liquid market (the only profitable part of the milk business) has absorbed less than a tenth of the increase. Clearly, since too much milk is being produced and too little is finding its way to the liquid consumer, the proper course—on purely economic grounds—would be to cut the producers' price while leaving the retail price unchanged. Unfortunately, farm prices cannot be changed immediately; and the effect of the subsidy cut may be felt in the right place only marginally, and as an indirect consequence of the present milk guarantee system. This indirect consequence arises from the fact that the Government's price guarantee to milk producers is limited to a total quantity of 1,651 million gallons, the amount produced in 1952-53; the extra output (which this year has promised to be around 150 million gallons) is automatically depressing the pool prices received by producers. Now that the retail price is going up, less liquid milk is likely to be bought, and the uneconomic milk surplus will presumably become still more unmanageable and unprofitable. The eventual effect may be to force some small producers out of the milk business; but at the moment most producers are responding to the prospect of slightly reduced returns by stepping up their output.

There is need for a careful and considered debate about this. Clearly it would be the utmost folly for the Government to increase the quantities covered by its guarantee, and thus stimulate yet more uneconomic production. On the contrary, effective means must be quickly found for limiting the size of the milk surplus. The Milk Marketing Board is attempting to switch some production back from winter to summer milk—in summer lower production costs help to keep down the losses entailed in disposal for manufacturing. But this policy, though useful, can be only a palliative. Farmers receive the same price for all the milk they offer, irrespective of its destination; and before the war liquid milk prices were kept artificially high in order to subsidise the disposal of the surplus milk to the manufacturers. The danger is that this abuse is about to reappear on a much larger scale as the Government subsidy is withdrawn, and that the consumer—instead of being himself subsidised—will be called on to buttress the overprolific producer.

Signor Togliatti in Hot Water

Communist regimes, with their tight control over press and radio, can make sure that party members get only carefully doctored and distorted versions of such unsettling events as Mr Khrushchev's famous attack on Stalin and Hungary's struggle for freedom. But Communist leaders outside the iron curtain cannot shield their followers from a naked confrontation with the painful truth; and in Italy the largest Communist party in western Europe now finds itself deeply disturbed and divided over the Hungarian revolt.

When Mr Khrushchev's denunciation of Stalin became known last June, Signor Togliatti boldly criticised the Soviet leader's arguments—and was later ticked off by the Soviet central committee for his pains. Now, while regretting the need for Red Army intervention in Hungary, he cautiously approves it—and in consequence has set off an explosion within his own party and got himself into unpleasantly hot water. The Soviet intervention in Hungary and Signor Togliatti's comments on the crisis have been severely criticised by a group of prominent Communist journalists; by 120 distinguished Communist intellectuals (*Unita* refused to publish their manifesto); by Signor Di Vittorio, the head of the Communist-dominated trade union federation, CGIL, which is to commemorate the "heroic stand of the Hungarian workers" in a five minute work stoppage on Saturday; and by thousands of local party officials and individuals whose angry letters have been pouring into the offices of *Unita*.

Some of this outburst is no doubt caused by genuine sympathy for the Hungarians. But the bitterness of the attacks on Signor Togliatti arise out of the openly-expressed fear that by his attitude he has lost the party "hundreds of thousands" of votes in the next elections. This fear must be heightened by the behaviour of the Nenni Socialist party which forms the most congenial bolt-hole for alienated Communist sympathisers. Unlike the Communists, the Nenni Socialists joined in the tributes paid to the Hungarian insurgents by the Italian Chamber last weekend; and their spokesman has uncompromisingly condemned the Soviet intervention in Hungary and expressed his party's "complete and unequivocal solidarity" with the Hungarian workers.

Friendly Warnings from Warsaw

Polish reactions to Hungary's fight for freedom have been in marked contrast to those of other Communist regimes in Eastern Europe. Prague, Bucharest, Sofia and East Berlin have been faithfully following Moscow's line; their attacks on "reactionary and fascist elements" in Hungary and their hysterical warnings against the machinations of western "imperialist circles" strongly recall the outpourings of the communist press in its Stalinist heyday.

The Polish press and radio, on the other hand, are now being surprisingly objective and sympathetic about events in Hungary. They are insisting that the mass of the insurgents are neither "counter-revolutionaries" nor "fascist reactionaries" and that the real cause of the trouble lies in the mistakes and "crimes" of the Stalinist period and the weakness of the "progressive" forces in the Hungarian Communist party since then. Yet the Polish communists are clearly afraid lest the situation in Hungary should get out of hand. They have appealed to the Hungarians to accept the Nagy government and its first comparatively modest reform programme; they have tried to remove from Nagy the slur of calling in Soviet troops by pinning the blame on Gerö; and they continue to utter warnings against the danger of overthrowing the "people's power" in Hungary which would pave the way for a "dictatorship of landowners and capitalists."

Inside Poland itself, Gomulka is evidently trying not to fall into his Hungarian comrades' error of too little and too late. He has given way to the increasingly persistent demands for the release from detention of Cardinal Wyszinski, the Polish Primate. The chairman and the whole presidium of the trades union council have resigned after a stormy meeting at which trade unionists from all over the country put forward what one delegate called "a barrelful of grievances." Local party leaders with Stalinist reputations are being dismissed. Marshal Rokossovsky, who was recently thrown out of the Polish Politburo, has gone away "on leave" and is unlikely to return; the Soviet head of the Polish air force has also been sacked. Gomulka, in short, has been giving the Hungarian communists some practical lessons on how to bow to the storm

before it breaks over one's head. But the government's decision to postpone elections from December to January 20th probably indicates that it does not yet feel very sure of itself.

Industry and Freer Trade

WHEN the President of the Board of Trade asked the Federation of British Industries to report to him on the views of British industry about his proposal to negotiate on the project for freer trade in Europe, he was not presumably giving the industrialists a veto over the economic policy of this country; he was merely trying to find out what the strength of opposition to his intended liberalism is likely to be. The letter the FBI sent to him on Wednesday provides him with his answer; and it is, broadly and perhaps surprisingly, encouraging. To judge from this letter, criticism from industry is going to be muddled, querulous, divided and—in the case of a few special interests—sharp; but it is not going to be united or deep-seated enough to give him any real reason for drawing back. The replies that the FBI has got from its member trade associations, after deducting those who were too divided or dilatory to make up their mind, show a 67 to 27 majority in favour of negotiations, "provided safeguards are worked out"; even among the ranks of the opposition, many members are merely "opposed unless safeguards are assured." Among individual firms that have sent in a reply, 479 (employing 608,440 people) are in favour or "in favour, provided"; only 147 (employing 74,525) are opposed or "opposed unless." Nine of the FBI's ten regional councils are also in favour of going ahead.

The safeguards which the FBI says that its members would like make rambling—and not always easily intelligible—reading. But this is an inevitable consequence of the way in which its letter to the Board of Trade was drawn up. Some of the points it makes—about British taxation, the need to "harmonise" labour costs with the Europeans, strategic industries, the need to avoid currency discrimination abroad, anti-dumping provisions, imperial preference, and other countries' legislation about export agreements—merely represent the general economic theories of particular industrialists who have played a large part in industry's discussions on the scheme. Other remarks about safeguards are logs rolled into the letter by particular protectionist interests. Mr Thorneycroft should examine these on their merits, which are not usually very great. But at all costs—and after reading this letter he should feel reassured that the costs in political upheaval will not really be very great—he should now press on to negotiate with Europe.

A Word Before the Betting Shops

ONE of the most controversial features of the Queen's Speech next week, provided the Government stands firmly by an intention announced last spring, ought to be the announcement of a Bill to legalise "betting shops." Nearly everybody agrees that the present gambling laws of this country are incomprehensible—or, where comprehended, largely unenforceable and unenforced. This is not surprising, since one of the fundamental statutes is still an Act of Henry VIII for Maintaining Artillery—an Act passed because Henry's citizens, instead of practising their archery, were persuaded by "subtill and inventatiue and craftie persons" to waste their time on such games as "slydethrifte otherwise called shovegrote."

The immediate problem before Parliament is not that of shovegrote, but of off-the-course cash betting on horse and dog races. At the moment this is illegal; it is also, however, allowed. The prohibition is made ludicrous by the flourishing of a race of illegal bookmakers' runners, the agents of legitimate and—by the standards of their trade—often quite respectable bookmakers; the runners take cash bets from those who cannot afford to open an account with a credit bookie, or who would find it hard to get credit. Given that the police have failed, despite the most strenuous efforts, to enforce this law (partly because of a lack of public sympathy with it)—and given that this violation is having all sorts of undesirable side-effects—only two possibly sensible courses seem to present themselves:

(1) One would be to implement the daring suggestion made by one of the witnesses before the Royal Commission of 1951, who claimed to have been a runner all his life, and who simply wanted his profession to be legalised. This suggestion, however, has the obvious disadvantages attached to all street trading—although the witness said that the authorities could be sure of getting reputable runners, if they licensed only those who had a certain number of convictions to show that they were well established in the trade.

(2) The second possibility, which was recommended by the Royal Commission in 1951 and now has about an even chance of being implemented by the Government, is to drive cash betting off the streets by allowing it to take place, under orderly conditions, in licensed betting shops. This is the system in operation in the Irish Republic.

The opposition to any such legislation would come mainly from two sources. One of these would be the churches, especially the non-conformist churches, who argue that betting is a deep (perhaps the fundamental) social evil; and that nothing should be done to enable more people to indulge in it more respectably. The other source of opposition would be the bookmakers, who are against reform partly because they know that betting shops would at last bring into the clear—and into the orbit of the tax collectors' scrutiny—the amount of money which passes in cash bets. Up to now only a foolish bookie would declare his profits on his cash business, and thus admit that he was carrying on an illegal trade.

Most people who have studied the subject will feel that the Government should be urged to go forward with legislating for the establishment of betting shops, and to do so during the session that lies immediately ahead. But under what conditions? It is tempting to say that the shops should all be under the control of the Racecourse Betting Control Board, which at present runs the Tote, and the profits from them (although discriminatorily taxed) ploughed back into racing. But fixed odds betting already accounts for so much (too much) of some people's entertainment that it is pretty clear that, under any scheme which is not a deliberate attack upon an established trade, the shops will have to be run by private enterprise turf accountants; indeed, there is evidence that some big bookmakers, while still opposing any Bill through their official Bookmakers' Protection Association, are buying up likely sites already. The usual objections to refusing registration to some firms and licensing others, on the grounds of some bureaucrat's assessment of their apparent respectability, are less strong in this field than in almost any other. But competition of the right sort can be kept going by making those who have got licences very frightened of the possibility of having them taken away again. Here some specific suggestions can be adopted from Irish experience.

The shops should be licensed for short renewable periods, like pubs; this would make the licensees very careful about the hangers-on they collect. Probably the shops should not be allowed to advertise; certainly they should be prevented from displaying reports—or relaying television and broadcast commentaries—from the course, so that people would not be tempted to hang around laying continuous bets. The shops should not be near public houses, and loitering in the neighbourhood should be prevented. It is objected to the Irish shops that they are sordid; while this should console the opponents who visualise respectable non-gamblers being enticed by glittering palaces of vice, it may be remembered that our neighbour with the high emigration rate is not notable for attractive shops of any kind. While the small-town Irish turf accountant may have a shop floored with dirt, his neighbour the butcher may well have the same. This is less likely here.

Relief for Hungary

THE Hungarians are rich in moral support but the International Red Cross has had the singular power of giving body to admiration and sympathy. With almost all practical help for the insurgents passing through the Red Cross, it was important that their channels should be free-flowing. On the whole they were. The Hungarian appeal for emergency medical supplies was received by the League of Red Cross Societies in Geneva last Saturday and immediately transmitted to the national societies, who responded according to their sense of urgency and fitness. Holland and Sweden at once flew blood plasma to the Austrian border; Denmark sent lorries packed with penicillin; Poland succeeded in getting a plane through to Budapest; West Germany began equipping a mobile field hospital; the Americans credited the Geneva League with about £9,000; the British Red Cross sent £1,000. This is not a complete list even of the early relief measures, and after the weekend several other countries, including Britain, joined the air lift carrying massive supplies of drugs and food.

It may be ungracious to cavil when so much assistance was prompt and generous. But a few questions are possibly worth asking. The Hungarian uprising began early on Wednesday: why was almost no assistance sent until the weekend? Reports of the fighting were at first confused, but by Friday it was known that people were dying for lack of medical equipment. The official answer that no supplies could be sent until the Hungarians specified their requirements is hardly valid: wounded men are known to need plasma, antibiotics, morphia and ether. The Austrian Red Cross deserves unstinted praise for its work in getting the supplies into Hungary. But at first the bulk of material went to the border, far from Budapest, where nearly 40,000 casualties have been reported. And what prompted the British Red Cross to send as a first gesture a pitiably small sum of money to Geneva (where there was already an administrative bottleneck) when the urgency was for medical supplies in Hungary? Britain's later contribution of government reserve supplies to the value of £25,000 was more practical but still less than generous. More might have been done in this country to organise private collections: one of the most notable has been the trade unions' gift of £10,000. However, with a few reservations, the Red Cross has shown how incisively a telephone call can cut the red tape of a large organisation. The emergency was well met. But the same kind of situation is likely to happen again and the International Committee of the Red Cross and others might usefully study the experiences of the past week.

Sitting on Singapore

LAST week the riots in Singapore seemed an unfortunate coincidence which gave the Soviet representative at the United Nations meeting on Hungary a chance of a weak but regrettable *tu quoque*; now with the rush of events elsewhere, they may seem to fade into comparative insignificance. Yet they should not be overlooked. They show how very deeply communist organisation has established itself in the colony; and the uprooting was bound to produce violence. But the scream of the mandrake uprooted is less remarkable than the determination of the Singapore government to do a thorough job. It could only be done by Chinese ministers who believe that they know exactly how to deal with their countrymen, and once again Mr Lim Yew Hock has shown his toughness.

He has thus avoided, in the main, racialism as an issue; he has skilfully put himself at the head of a crusade to rid the colony in general and the Chinese community in particular of an ingrowing tyranny. Once again he has made short work of Mr Lee Kuan Yew's protests. He has gone further, and has arrested an extremist member of the Legislative Assembly, Mr Lim Chin Siong, for fomenting strikes and using schoolchildren to work up disorder.

Mr Lim Yew Hock will, of course, have to justify himself; but he is not without evidence, as his white paper on the state of the Chinese middle schools shows. This investigation makes it perfectly clear that communist organisers developed the middle school union as an instrument of power over the schoolchildren, and, indirectly, their parents. It was right to ban the organisation, and virtually inevitable that it should show its power when this happened. The riots are all too clear evidence of the hold which the "middle road" group of Communist trade union leaders, through the union, maintains over the Chinese middle school teenagers. Mr Lim has won the day; but it would be foolish to forecast any peace for the morrow.

The violence of the riots, and the big reinforcements of police and troops which they required from the mainland, again raise acutely the problem of the security of the base. Mr Lim can properly argue that the rioters have made his task in London next December far more difficult. But they are not only likely to stir new doubts in the Colonial Office and the chiefs of staff—they seem to have given the Federation of Malaya a new interest in Singapore. Does the Federation want an independent state with such explosive potentialities on its doorstep, when, demonstrably, only the availability of forces from the mainland may be able to deal with it? This thought may cause Tengku Abdul Rahman to reconsider the possibility of a federal link which would leave him with the power, after independence, to turn the fire-extinguisher on the island.

Sir Roy Welensky's Task

LORD MALVERN'S resignation of the prime ministership of the Federation of Rhodesia and Nyasaland has been awaited for some time; and not without impatience by many wellwishers of the Federal party, which is, for all its faults, the guardian of the liberal idea of partnership between races within the federal union. Lord Malvern's great and unquestioned services to his country were done, and since he was certain to resign soon, it was important that he should do so soon enough to give his successor time to infuse the Federal party with new leadership. Recent by-elections have shown that the party has lost ground badly with the electorate—which is almost wholly white—and it will now be Sir Roy Welensky's task to set to and restore its fortunes.

He is spared one embarrassment at the outset. The Suez crisis has caused Lord Home, the Secretary of State for Commonwealth Affairs, to cancel his visit to Rhodesia. Lord Malvern clearly intended to press Lord Home on the subject of independence, which he supposed was a way of currying favour with the white electorate; Sir Roy will be able to postpone this issue, and think out his own way of getting the federation a "higher status" (his own more guarded and sensible phrase) without inviting a rebuff from Britain. Lord Home would have been bound, at the very least, to ask Sir Roy to state what, in the way of a wider franchise for Africans, he would be prepared to offer as a counterpoise to the transfer of still greater powers over African destinies from Whitehall to Salisbury.

This, as Sir Roy well knows, is not the real issue before the Federation or the Federal party at the moment. The real issue is to make partnership more of a reality to the African population, and out of African co-operation and contentment to recreate the sense of European security. To both races he must talk realism—their need for each other, and their need to make concessions to each other. If he tries to win support by making bargains with particular sections (as he has once or twice done in the past on a lesser scale) he will be lost. He must make a stand on principle, and he must talk the hard facts of Rhodesia's political and economic position; to some extent he has

The Mathematics of Premium Bonds

PREMIUM bonds came on sale on Thursday, and it will be surprising if—for this first month of issue—the sale of them is not very large indeed. For everybody who can understand mathematical intricacies—or who is willing to accept the mathematicians' word about them—should by now have grasped the salient point: if you intend to invest in these bonds and have the money available to do so, then you should certainly buy them in November rather than in December or later. The reason for this lies in the system under which the prize fund is to be distributed. Each bond becomes available for participation in the draw after having been held for six months; in that first month of participation, the "newcomer" bond will carry six months' worth of interest into the prize fund, but will have only the same chance of winning a prize as the "old" bonds already in the pool (which will have contributed, for that month, only one month's worth of interest into the prize fund). Each "newcomer" bond therefore makes a present to "old" bonds in its first month of qualification. But the bonds bought this month will not have any "old" bonds to hand their bonus out to, and will therefore share the bonus among themselves in a bonanza first drawing next June.

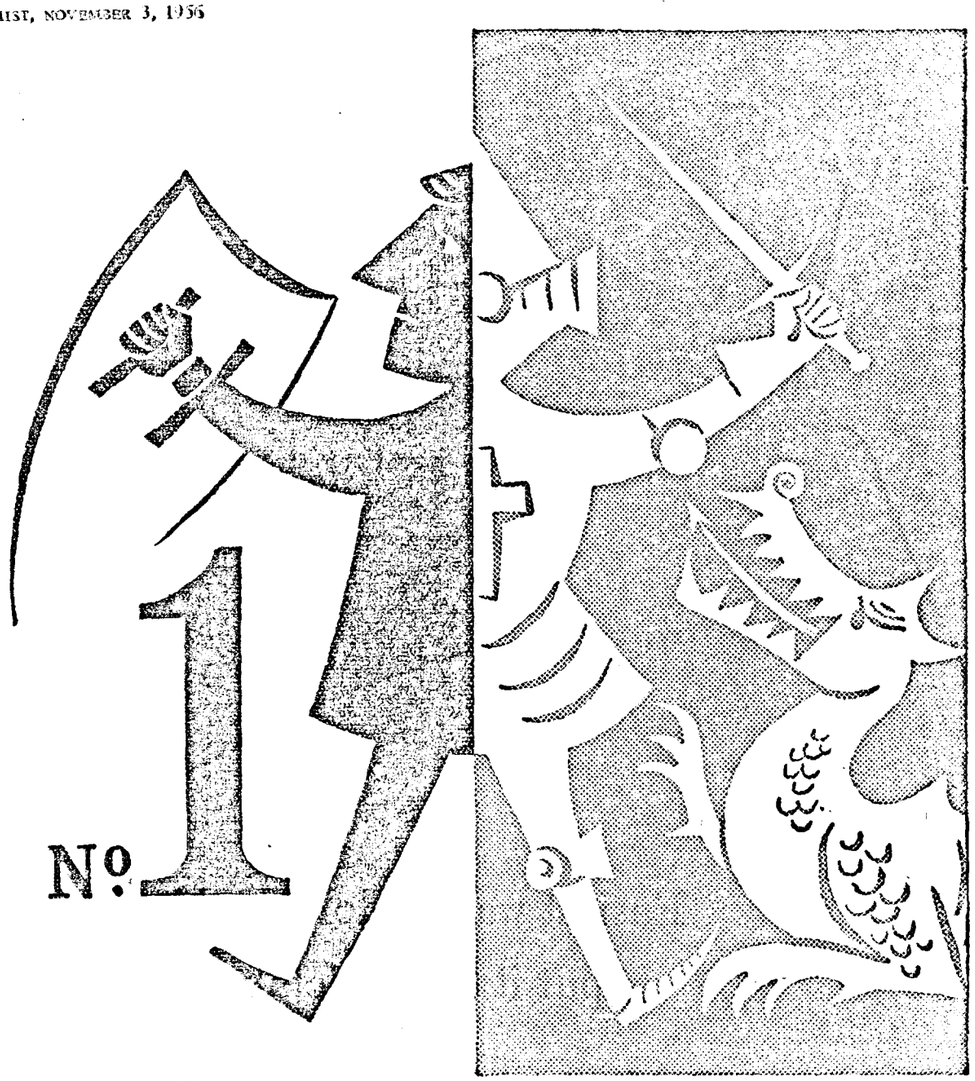
What will be the effects of this statistical oddity upon the odds themselves? It will be easiest to discuss them in terms of the chances of an investor who buys the full permitted complement of £500 worth of bonds this month. The odds against his winning a prize in that first bonanza drawing in June will be only slightly worse than four to one against. There will, however, be five other drawings next year, in July to December. Estimates of our £500 investor's chances of winning a prize in those later drawings can only be worked out after defining which assumption one is making about future purchases of the bonds by other investors:

(1) *The "No Mugs Assumption."* On the least advantageous assumption for him—that after heavy purchases of the bonds in November, nobody or virtually nobody buys them in December or later months—then, at each of the July to December drawings next year, the odds against our £500 investor winning a prize would seem to be about twenty-five to one. With the "slightly worse than four-to-one chance" against a prize for him in June, that would mean that our investor would have a slightly worse than two-to-one chance against winning a prize at any time next year. More than four out of every five prizes won, it should be remembered, will be worth only £25. Still, even a "slightly worse than two-to-one chance" against winning £25 tax free on a £500 investment next year is not a bad speculation for the surtax payer.

(2) *The "Plenty of Mugs Assumption."* If as many people buy bonds in December as do in November, then the odds against our £500 investor winning a prize at next July's drawing would seem to be about seven to one. Even if this rate of new investment was kept up each succeeding month, the odds at subsequent drawings would lengthen because more bonds would now be competing in the pool. But on this pretty unrealistic assumption, our £500 investor this month would be unlucky if he did not win at least one prize some time next year. Clearly, on this assumption, a purchase of the bonds this month would be a very tempting speculation indeed for any surtax payer.

(3) *The "In-Between Assumption."* Most people now seem to be assuming that although purchases in December and subsequent months will be much lower than in November, nevertheless there will be some of them. Suppose, for example, that £50 million was invested by the public this month, but only £10 million in December and in subsequent months. The odds against our £500 investor winning a prize in the July drawing would then seem to be between thirteen and fourteen to one against; the odds would lengthen at subsequent drawings, but our £500 investor would still have only a slightly less than even chance of winning a prize some time next year.

All this is a weird and rather unwonderful form of calculation. It should be emphasised, too, that the word "mug" (to describe anybody who buys a bond after November) has been used here in no pejorative sense. It has been merely a term of exposition, perhaps even (from the intending November purchaser's point of view) of endearment. But the problem remains: if many people do act logically about this, and if there is a large sale of bonds this month but very little sale for the months immediately thereafter, could this raise pressures for some change in the terms of holdings and of drawings? Particularly, perhaps, an increase in the maximum holdings permitted and in maximum prizes? Any such outcome could have political, and not merely complicatedly mathematical, implications.



Self interest or public spirit?

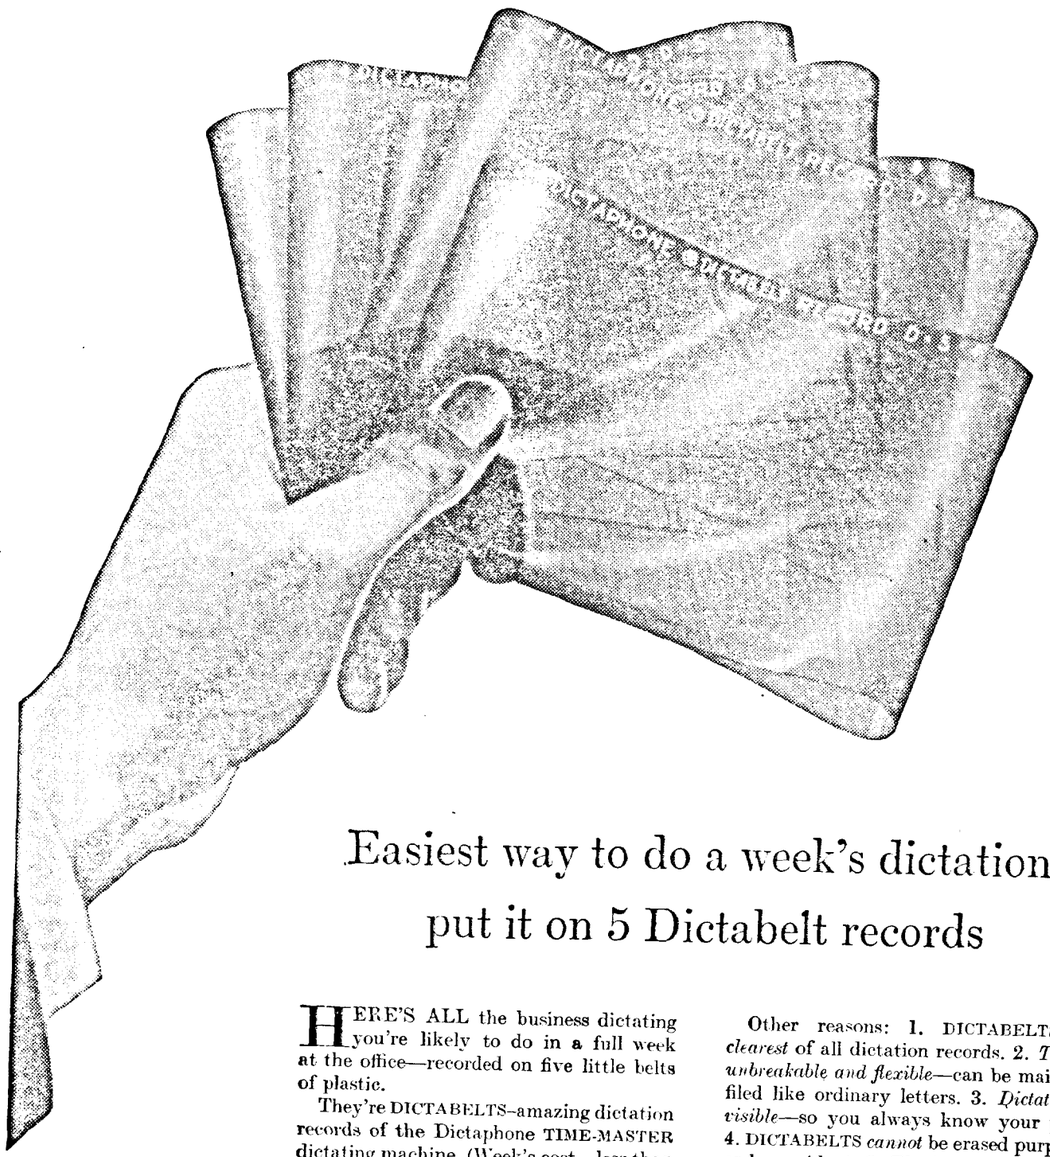
Taking care of number one is nothing more than the instinct of self preservation. It's only human nature after all—but it can be enlisted in the public interest.

Consider the man who assures himself of a comfortable retirement—and looks after his family—through Life Assurance. Money he pays in premiums is invested by his Life Office and helps to provide much-needed capital for British industrial expansion.

In the past four years, the annual amount paid in Life Assurance premiums has increased by over a hundred million pounds. The motive may be self interest, but the effect is to the benefit of all.

Life Assurance *a safeguard of real prosperity*

Issued by the Life Offices' Association, London. Established 1889



Easiest way to do a week's dictation:
put it on 5 Dictabelt records

HERE'S ALL the business dictating you're likely to do in a full week at the office—recorded on five little belts of plastic.

They're DICTABELTS–amazing dictation records of the Dictaphone TIME-MASTER dictating machine. (Week's cost—less than a packet of cigarettes.) DICTABELT economy is only one reason why more people buy TIME-MASTER than all other dictating machines combined.

Other reasons: 1. DICTABELTS *are clearest* of all dictation records. 2. *They're unbreakable and flexible*—can be mailed or filed like ordinary letters. 3. *Dictation is visible*—so you always know your place. 4. DICTABELTS *cannot* be erased purposely or by accident. 5. *They're used just once*—you always dictate on a fresh surface. For more information, write to Dictaphone Company Ltd., 17-19 Stratford Place, London W.1.

an object lesson in the receptivity of the Rhodesians to this treatment in the career of Mr Garfield Todd, the Southern Rhodesian territorial premier, with whom Sir Roy will have to get on rather better than Lord Malvern did. Sir Roy is very conscious that Rhodesia has not much time to achieve by its chosen methods—the opposite of those used in South Africa—racial harmony and nationhood. If he is wise he will make his own deepest convictions his political platform, and leave the rest to the commonsense of his countrymen and the ignorance and parochialism of his opponents.

Berlin as Capital

BERLIN has never ceased to be the German capital in German eyes; the sentiment will find further practical expression if, as now seems possible, Berlin becomes the main home of the next west German parliament. The Christian Democrats are proposing that funds should be voted for a parliamentary building there, in the hope that the new Bundestag may meet there next year. It is not clear whether the Reichstag building itself, so uncomfortably close to the sector boundary, would be chosen. The CDU motion leaves it in doubt how soon and by what stages Parliament and administration would abandon Bonn altogether, but the opposition parties are enthusiastic, and the strange prospect opens up that the centre of gravity of west German government may gradually move towards Berlin.

Governing west Germany from this isolated outpost will present ludicrous practical difficulties. Berlin is not legally part of western Germany, but an occupied city under four-power rule; its communications are always liable to be cut off; such vital ministries as foreign affairs and defence would presumably have to be kept away, and the whole administrative work and cost of governing western Germany would be bound to be increased. Endless opportunities would open up for diplomatic and frontier incidents and for undignified bickering with the east German regime.

But such practical considerations may not prevail against popular feeling and the growing realisation in west Germany that the flux in eastern Europe is opening new opportunities for German initiatives towards reunification. The most remarkable reflection of this feeling has been the positive reaction of the west German government to the latest Russian note on reunification; for the first time it is clearly considering making use of its diplomatic relations with Moscow to talk seriously on the subject. A second and parallel reaction has been the growing interest in negotiations with Czechoslovakia and Poland and the signs of a more flexible German attitude on the Oder-Neisse frontier. The shifting of the west German parliament to Berlin might make a third, if only a psychological contribution to reunification. As the sole all-German city in a divided land, Berlin has long been a symbol of the abiding unity of Germany as a whole, as well as an invaluable window in the iron curtain for the people of eastern Germany. The coming of the west German parliament to Berlin would be a demonstration of western will to unity which would strengthen their morale further and enable them to maintain and increase the pressure of their resistance to the east German government, now so isolated.

Austria's Western Ties

AUSTRIA has long been quietly feeling its way towards a closer relationship with western Europe, within the limits of neutrality prescribed by its peace treaty. Already a member of the Council of Europe and OEEC, it announced last week its intention of joining the Coal and Steel Community, a step which seems vital to a country so dependent on imports of German coal and steel. Austria is already taking an active part in the discussions at OEEC on the possibility of linking the common market with a wider free trade area in which it would be included. And once joined with the six in the coal-steel pool, it may well look further towards full participation in the common market itself and eventually in Euratom.

For Austria, however, a friendly relationship with Germany is a condition of any closer westward ties, and the rapprochement between Bonn and Vienna has been a quiet but important aspect of the foreign policy of both since Herr von Brentano became foreign minister in Bonn. Its success was demonstrated last week when Chancellor Raab

What Divides the Parties?

"Party" is not a thing to be *created*: it is a natural growth—from fitting seed, from favouring climate, from prepared and suitable soil. The strife of parties belongs to a particular and inevitable phase in the life and progress of all free countries—but a phase which essentially belongs to a transitory and imperfect condition of the body politic—a phase which, if permanent, would be indicative of failure and ominous of ruin. The strife of parties—Government by "Party"—belongs to the epoch when Constitutions are in process of formation—when the policy and the destinies of the nation yet tremble in the balance—when vital questions are still undetermined—when fundamental principles are still at stake. *You cannot have great parties unless you have great principles to divide them*—and where have you such principles now? You cannot gather all sections of politicians into *two camps alone*, unless you can find . . . questions which *have only two sides*—and where are such now to be discovered? An abstract doctrine naturally severs men of inherently discrepant characters and mental complexions, and places them on the right hand and on the left—the various degrees and modes and times in which that doctrine is to be carried out in life admit of every difference of opinion, and divide honest and thoughtful men into *many* sections. . . The time may come round when great questions . . . shall again arise to agitate and divide men's minds. When this period recurs, then, we may rest satisfied, we shall see statesmen and their followers separate, as of yore, into two camps, distinct enough and attractive enough to absorb all minor subdivisions and to merge all less important differences. At present we see no subject of domestic policy which promises to swell to this engrossing magnitude. But it is just possible that . . . our international relations may generate some such question . . . which shall involve matters of such high morality and which shall so stir the deeper and stronger feelings of humanity within us, as to range all the timid, the selfish, and the short-sighted on one side, and all the generous, the noble, and the profoundly and prophetically wise upon the other.

The Economist
November 1, 1856

was given a warm welcome by the German government and press. Even the irritant of former German property in Austria, which has been the main source of friction between the two countries since the war, seems to have been assuaged. The German press now generally accepts Austria's inability to break the treaty by a general return of these sequestrated assets, and has recognised Austrian efforts to stretch the terms in favour of the small man.

While developing these western ties of a political and economic nature, Austria has scrupulously observed the military neutrality laid down in the treaty; but there is no doubt where its sympathies lie. The revolt in Hungary has aroused deep sympathy in its neighbour Austria and has called forth untiring efforts at relief. The Austrian government, basing its stand on its neutral status, which, it feels, gives it a special moral right to speak, has appealed diplomatically to Russia to stop bloodshed and allow a return to normal life and "freedom in the sense of human rights." More important, it has without hesitation extended asylum to any rebels who lay down their arms. The political challenge of this to Russia has been lessened by Hungarian offers of amnesty, but if things go badly for the Hungarians now, the trickle over the frontier could turn into a flood of refugees which might be a major economic burden.

A Freedom Denied

THE debate on the adjournment last week brought into the healthy light of day the repressions and complexes in Whitehall which prevent a more liberal approach to the production of official documents in court cases. Even after the modifications in the use of crown privilege in withholding documents which the Lord Chancellor announced last June, it is clear that departmental "convenience" is still an important factor in deciding whether any particular document may be used as evidence. Whitehall's principle —and it is supported by both front benches—was neatly summed up by one MP: "We will hold everything back and let you have bits as we think fit." The civil servants profess to be afraid that if their minutes could at any time be produced in court they might be inhibited from giving frank and honest advice; but it is still far from clear why, in the first place, they should fear that minutes on matters of high policy ever would come into court, and secondly, why, in matters involving the rights of individuals—such as citizens involved in industrial accidents or in the acquisition of their property by the crown—the possibility that their minutes might come before a court of law should prevent them from being honest and frank in their recommendations.

There is no need to be ashamed of being more radical about this even than the majority of protesting MPs. Nobody disagrees that documents invested with "a high degree of confidentiality" must be privileged; but it would be perfectly reasonable to confine this privilege to documents having a bearing on secret weapons, movements of armed forces and public security. Where borderline cases occur, speakers in the debate rightly urged that the use of the closed hearing would meet the problem. This is the method used when aircraft accidents involving secret machines occur; justice is done, even if it is not wholly seen to be done. The real difficulty remains: who is to decide what is and is not privileged? There are objections to all the suggestions put forward in the debate. But it is clear that while the basic attitude of the departments remains what it is, public confidence in the fairness of decisions when to exercise crown privilege will remain dangerously low. The Attorney-General's argument that judicial criticisms of departmental obstruction have been relatively rare is not a sound argument for keeping on the clamps: it is merely a sign of how little greater liberality would cost Whitehall.

End of a Boom Town?

THE international regime in Tangier has formally ended. After three weeks of negotiation, the Moroccan foreign minister, Mr Balafrej, and representatives of the eight members of the former international committee of control, France, Spain, Britain, the United States, Italy, Belgium, Holland and Portugal, have signed a declaration abrogating the international statute and a protocol liquidating the past regime. The central issue of the conference was never in dispute. Although Tangier has been under international control for most of this century it never ceased to be part of the Sherifian empire, and the logic of its return to a sovereign Morocco is unquestionable. The bargaining was over the type of declaration to be signed (Morocco battled unsuccessfully for a unilateral declaration in place of the more legal international instrument) and over the terms under which foreign men and money were to be absorbed into the new regime.

Even here, since Morocco has no intention of driving out either wealth or expertise, the negotiators' interests were seldom far apart. Foreign banking and financial houses are permitted to continue their operations under Moroccan law; postal, telegraphic and radio services have been nationalised but foreign concerns can apply for government concessions; the international civil servants will be compensated if they are not re-employed. The harmony of the conference was disturbed only by the difficulty of reconciling western and Moroccan diplomacy: each side was a learner in the other's methods.

Tangier's economic future is now in Moroccan hands. Over the past ten years, Tangier with its free money market and its free port has become both the centre of a currency black market and a tax-free refuge for foreign capital—roles never suspected when it was internationalised for strategic reasons. Now, the town with its 100,000 inhabitants is entirely dependent on its free exchange market: all employment springs directly or indirectly from currency operations. Without the free market, Tangier would be a dead town. And confidence in the market began to ebb once it became clear that the days of the international regime were numbered. The Moroccan government was too proud to ask for some kind of international guarantee that the old economic methods would continue under the new masters, although it was only in its own interest to do so. It is unlikely that a purely Moroccan declaration will inspire a resurgence of confidence. Business and capital are drifting away; Tangier is not likely to be the same again.

Nuclear power
for the nation's future

AN EXAMPLE of industry pooling its resources to prepare for a mighty project is the linking of the A.E.I.—John Thompson Nuclear Energy Company with two important firms of Civil Engineering Contractors—Balfour, Beatty and Co. Ltd. and John Laing and Son Ltd.

To the strength of the A.E.I.—John Thompson Nuclear Energy Company and its constituents (British Thomson-Houston, Metropolitan-Vickers and John Thompson) is added a fund of knowledge in the civil engineering field.

The Balfour Beatty Group has a world-wide reputation in all forms of engineering and construction work and is at present carrying out major contracts for the Central Electricity Authority. John Laing and Son Ltd. has carried out building and civil engineering work at the first Government Atomic Energy Establishment at Windscale and is at present engaged in the construction of power stations in the United Kingdom, as well as in major development schemes in Canada.

THE DOOR

that safeguards your future

A high proportion of those concerns whose records are destroyed by FIRE are unable to resume business.

It is not, therefore, surprising that Remington Rand have specially created safe equipment capable of giving complete protection to its contents in conditions met with in the most severe fires. The most advanced business record systems in widespread use today were originated by Remington Rand, who can also ensure their safety from destruction by fire.

Monolithically constructed and scientifically insulated, Remington Safe Cabinets are certified to withstand temperatures rising to 2,000°F and Remington Safetifiles to 1,700°F.

Remington Safe Products are among the many modern equipments devised by Remington Rand to streamline the efficiency of business operations. The Man from Remington Rand will gladly call upon you to discuss their application to your own problems — without obligation.

As a fashion buyer. . .

I can usually recognize readers of

Vanity Fair

To begin with they're smart—smart about clothes, about accessories, about cosmetics. From the moment they come into the shop you know there isn't much you can tell them about styles, colours, or even prices. It's not surprising really, when you consider the time they spend going through the pages of the magazine which caters specially for their tastes and interests. It's amazing how often I hear them say: 'I saw it advertised in Vanity Fair.'

It costs only £350 a page to advertise in Britain's largest selling fashion magazine

Vanity Fair is published by

Letters to the Editor

Free Trade Without Emotion

SIR—In a head note to your article you ask various groups of doubters "to study the issues involved, at some length but without emotion." I confess at once to deep feelings of concern about the future of the economy of the United Kingdom and of the Commonwealth as a whole. However, I extend my warmest appreciation of the careful analysis and distinctions made in your article. I am in agreement with almost all it conveyed.

My only doubts concern, first, its effects upon that section of our trade which is neither European nor Commonwealth, and which amounts to about one-quarter of the total. It is here that your accurate distinction between the nineteenth and twentieth century problems does not fully appertain. Secondly, I cannot agree that the "whittling away" of imperial preferences arises solely from "changes in the Commonwealth countries themselves." They have indeed changed, especially in that they have become more and more industrialised in the last half-century. Simultaneously, however, so has the United States, and with that has come the American dedication to the idea of federation and non-discrimination by others.

Canada has been wooed to the idea to a point bordering on the doctrinal. Australia and New Zealand have been partially lured away in the ANZUS pact, and India seems as pathologically obsessed with anti-colonialism as those whose thinking is based on the tradition that the United States is the result of a successful rebellion against the British Empire.

The difference between the United Kingdom in the last century and the United States in this, is that though both in our respective times have been the greatest creditor nation, we allowed tariff-free entry of goods, while the United States expects it of others but retains tariffs to protect itself. True, it has reduced many of them, but so have we. What matters is where we both started from. Recently, the United States has doubled its tariff on wool.

So long as the greatest creditor uses tariff discrimination to protect itself so long must the debtors to protect themselves, and there can be little hope of ever revising the Ottawa Agreements of 1932 to a more realistic level unless we use this method of protection ourselves. Only by the operation of the rule of discriminating reciprocity can the United Kingdom retain its trading position in the Commonwealth, with Europe, or with the rest of the world. Tariffs, variable exchange rates, quotas and managed gold standards are all means of doing so. It is important that we do not rule out elsewhere the use of one method simply because in one section of our trade another may be more suitable. All methods have their parts to play, but my strongest hope is that we shall avoid having to employ those which lead to internal centralised state control. If discrimination be as essential as I believe, tariffs and preferences in the long run are the best way of avoiding that, in a world in which standards and costs of living vary so greatly in the producing and manufacturing nations.—Yours faithfully,

HENRY LEGGE-BOURKE
House of Commons

★

SIR—In the article in your issue of October 27th you summarise the objective of the plan by characterising the 3-tier tariff as follows:

1. Highest rates on imports from the United States and from other countries outside both Europe and the Commonwealth,
2. Preferential rates on imports from the Commonwealth,
3. No tariff at all on imports of manufactures from Europe.

It would seem that avoidable difficulties might be created, if goods under 2 are penalised more heavily than goods under 3. As the plan is a fairly long-range affair and like all such policies susceptible of amendment in the course of development, might it not help to secure acceptance of a project that seems to offer large advantages, if the order of 2 and 3 were reversed, on the basis that, instead of "no tariff at all" on imports from countries in the common market area, what used to be called a revenue tariff not higher than, say, 5 per cent were admissible in the case of such imports, while Commonwealth imports would come in at the most favourable level of "no tariff at all."

This at least offers scope for a modest benefit to such imports and would justify the phrase "Commonwealth preference," which would appear somewhat double-edged, if, as in your classification, an important volume of imports is admitted with an even greater preference.

Incidentally other metropolitan countries besides the United Kingdom have associations with their overseas territories and at present offer them trade privileges. The suggested transposal of the tariff tiers might perhaps also have some attractions for them.—Yours faithfully,

CECIL KISCH
London, S.W.1

South of Khartoum

SIR—Sayed Omer el Zein's letter in your issue of October 13th is rightly appreciative of your article on the Southern Sudan. But he himself "brings into light a few facts" at least three of which are not facts at all, but wishful thinking. May I as an ex-Governor of those three southern provinces for eight years draw your readers' attention to them?

He attributes the "present air of distrust" (i.e. since August, 1955) to the policy of the co-domini of making the South a closed area. The truth is that fifty years of intensive slave raiding from 1850 onwards had established in the South a fear and hatred of the Arab North of which the government from 1900 onwards had to take cognizance. Their policy was to admit only such non-Southerners as were of known good character and were necessary for the gradual and orderly development of the South: permits to enter had to be obtained by all foreigners (British included) and not only by Northern Sudanese. The justification for this policy is to be found in the evidence given by a Northern merchant of Meridi to Judge Cotran's committee of inquiry into the massacres of August, 1955. He said: "I have lived in the South for 41 years, and have never had a harsh word or an insult from a Southerner till the present government came into power [i.e. 1954]."

Secondly Sayed Omer lays the immediate blame for August, 1955, on the late Prime Minister, Sayed Ismail el Azhari, and his party. I do not think this is true. The blame lies on the decision accepted by all parties in the North to abolish rapidly all the safeguards for the South already agreed, and regarded by the Southern representatives as essential. Those who knew the real feeling in the South warned the government in Khartoum again and again of the dangers to which they closed their eyes. August, 1955, showed that the warnings were correct.

Thirdly Sayed Omer writes: "The bulk of the South is for a united Sudan"—adding that only a few educated Southerners wish for federation. He writes rather bitterly about these few. We, who have known the Southerners intimately, are well aware that the most numerous, powerful and warlike tribes of Bahr el Ghazal and Upper Nile Provinces, the Dinka, Nuer, and Shilluk, wish only to be left alone without interference by the North. The educated few realise that financially this is almost impossible: they hope by "federation" to achieve a real measure of political autonomy plus the provision of social services by Northern money. It is a faint hope: if realised it would be a tribute to a farsighted and generous Sudan government. If it is not realised and if the Dinka, Nuer and Shilluk rebel against Arab domination, as Equatoria rebelled in 1955, then the Sudan government will be faced with a far graver emergency.

Wisdom and humility in Khartoum

could cause the "bulk of the South to be for a united Sudan," but it is most certainly not so now.—Yours faithfully,
London, W.14 M. W. PARR

The Very Average Welshman

SIR—Flattered as I am by the fact that you take our estimates seriously enough to comment at some length, and not unkindly, on them, I am a shade uneasy about your implication that the similarities you perceive between Wales and the rest of the United Kingdom result from our use of the technique of applying ratios to UK figures. So far as both production and incomes are concerned, our use of this technique was mercifully limited to very minor items; for the former, the vast majority of our estimates were derived from census of production data and reports of nationalised industries or local authorities, while the income census of 1949-50 provided a reasonably firm and independent basis for the latter. For expenditure estimates, we certainly leaned fairly heavily on the ratio technique. But would this necessarily lead to an elimination of regional differences? After all, the art of the business lies in choosing a suitable indicator, and there is no obvious reason for supposing that the indicators will conceal any differences which exist rather than reveal them. For example, by using new registration figures for private cars as an indicator for personal expenditure on motor-cars one certainly does not produce an average Welshman. Often, of course, the per head estimates for Wales come out at a very similar value as those for the United Kingdom. But is this necessarily "suspicious"? Have you forgotten England's great gifts to Wales—the Sunday Press and commercial TV?—Yours faithfully,

EDWARD NEVIN
University College, Aberystwyth

Suez and Jordan

SIR—I suggest to Mr J. L. Rushburne that it is geography and not his nationalisation of the canal company which has "established Nasser astride the main supply route for our oil and our main sea route to the East." What does Mr Rushburne propose to do about the "basic realities" of geography?

There may be other reasons for "stopping Nasser" but it is high time the illusion is dispelled that ownership of the Canal affects in any way the ability of the man on the spot (provided he accepts the consequences) to stop ships by using the forces which lie to his hand. Permanent guarantees against temporary interference with our shipping (temporary because if there were physical interference we should use troops, United Nations or no United Nations) can be obtained only by indefinite military occupation—which even Mr Rushburne will not suggest.

If we accept this basic reality, then Colonel Nasser by reminding us of the risks of shopping exclusively at his establishment will in the long run have unwittingly done us a service.—Yours faithfully, S. E. GRAHAM
Huby, Nr Leeds

Hongkong Lowers the Boom

SIR—I feel that your correspondent, in your issue of October 6th, in his second paragraph has painted a most onesided picture of the squatter problem and that it would have been fairer if he had given some indication of the results which had been achieved in resettlement of squatters and in rehousing of slum-dwellers.

By "horrible jammed, old Shanghai-like slums," I presume your correspondent refers to old style tenement houses, without modern sanitation. There are, it is admitted, a large number of these buildings, but every effort is being made to replace them with larger modern buildings. However, it has to be borne in mind that reconstruction, on the scale called for, is a problem almost beyond appreciation: first, because of the physical problem of housing tenants while buildings are being demolished and new ones erected; secondly, because of increased rentals necessary to recompense owners for the greatly increased costs of new building, building costs being from six to eight times as much as they were prior to the Pacific war. Thirdly, and associated with the first problem, is the point that in a mountainous country such as Hongkong, where there is just about enough flat land to accommodate the required number of buildings, there is certainly not enough to allow these buildings much in the way of wide open spaces around them. Hongkong's land hunger is such that building sites in the central business area have recently changed hands at values of more than £1¼ million per acre; moderately central residential areas are worth about £200,000; and suburban industrial and residential sites about £70,000 per acre.

As regards the "wretched army of 110,000 squatters," your correspondent makes no mention of the efforts which have been, and are being made, by the Hongkong Government to give these unfortunate people a decent roof over their heads. Some of your readers may be interested to know that on September 30th this year, there were housed in the various resettlement areas and estates more than 198,000 persons, an increase of more than 50,000 over the figures for September 30th last year.

Multi-storey accommodation to house 36,000 persons is now under construction, and it is the policy of the Hongkong Government to continue the fastest possible construction of seven-storey buildings for the resettlement of squatters until the problem is solved.

Finally, it is worthy of note that the cost of this vast programme is being met entirely from local public funds.—Yours faithfully, J. B. KITE,
Secretary,
General Chamber of Commerce
Hongkong

Unforgettable People

SIR—Apropos the article in your issue of September 29th, some of your readers might like to know about a voluntary committee, which for the last three years has been helping one of the largest group of refugees still left in Europe—the 160,000 Spanish Republican emigrés that are still living in the south of France under conditions of extreme poverty. Spanish Refugee Aid—whose honorary chairman is Pablo Casals, the cellist—sends monthly contributions to the Spanish Red Cross dispensaries in Toulouse and Montauban; ships used clothing to Spanish relief groups; and is helping some seven hundred families with money, blankets, work tools, medical supplies, etc. Its help—which, in cash and goods, has come to over £30,000 in the last three years—often means life instead of death for many of the first victims of fascism.

The undersigned, a founder and a director of this committee, will be glad to forward contributions to headquarters in New York City. Cheques should be made out to Spanish Refugee Aid.—Yours faithfully,

DWIGHT MACDONALD

America: Warning and Example

AMERICA AND THE BRITISH LEFT.
By Henry Pelling.
Adam and Charles Black. 184 pages. 18s.

THE United States is the first of the modern ideological nations—nations which are rarely considered in terms of size, resources, natural interests or racial make-up. The physical substratum is quite submerged by a thick overlay of ideas, aspirations and judgments. In a sense, the Founding Fathers invited this development by dedicating their society not to a territory but to a "proposition." And American leaders have often since then felt the compulsion to explain themselves and their policies in terms of mankind's widest aspirations. But most Americans at most times probably do not see themselves in so heroic a light and are puzzled and often irritated by other nations' tendency to see in them a warning or an example or both. Yet the tendency is a fact and occasionally, in international relations, a decisive one.

One aspect of this curious relationship between the United States and other nations has been remarkably well analysed by Mr Henry Pelling in this book. It is short and exceedingly readable, and the author's chosen method—that of picking out five or six crucial Anglo-American occasions in the history of the last century—succeeds admirably in displaying the difficulty of discussing America without pointing the moral and making what are now unattractively termed "value judgments."

Most observers of politics in the post-war decade are familiar with the somewhat bewildering veerings of opinion about the United States among members of the British left. Between 1945 and 1947, America was a country where capitalism was running amok—this was the time when lend-lease ended overnight and the bargaining for a British loan made hard going. Then followed the Marshall Plan period, when Mr Truman's America of Fair Deal, Point Four and unparallelled generosity swept the left into unanimous praise. The mood was dissipated during the phase of rearmament after Korea, and, by 1954, Senator McCarthy's heyday brought warnings of American fascism from the British left.

This speed of change was something of a bewilderment to other groups in Britain. Mr Pelling cites Mr Richard Crossman's confession that it even surprised him. But perhaps the astonishment would have been less if it had been more generally realised that the postwar "rock-'n-roll" in left-wing opinion about America is no more than a projection of a hundred years of similar compass boxing.

Until the 1870s, America was hailed as a land of freedom and opportunity where the worker could make his way unfettered by a class society. Then followed forty years of doubt, during which American industry became dominated by the trusts, and trade union activities were limited and even terrorised by the dominant powers in American society. President Wilson reversed the trend of disapproval and rejection briefly, not so much by his new freedom at home as by his idealism over Allied peace aims. In the twenties, American withdrawal from the international scene was so great that the habit of judgment lapsed a little, although war debts kept alive a picture of Uncle Sam as Uncle Shylock. The collapse of 1929 gave way to Roosevelt and the New Deal, which reversed the condemnation of decadent capitalism and aroused enthusiasm for the possibilities of planning. Such was, broadly, the changing rhythm of blame and praise.

But the picture of left-wing opinion would not be complete without noting, as Mr Pelling clearly demonstrates, the rigidity of purely socialist or Marxist thinking. Here there could be no movement of support or censure, for America as a capitalist power, by definition, did wrong and the better it did, the worse the outcome appeared to dogmatic socialists. If America were to prove that a prosperous, equal society could exist within the framework of private property, then Marxism would be nonsense. From this follows the paradox that the convinced left doctrinaire looks at America with enthusiasm only when things are going badly wrong. The extreme left is thus a point of perpetual criticism towards which the liberally inclined swing back when a Hoover or a McCarthy or a Dulles is particularly disillusioning.

Mr Pelling's precise and lucid pages are not employed in prophecy. But on the basis of his analysis, one may predict that a period of alienation from America lies ahead on the British left. The re-entry of Mr Bevan to the orthodox fold and the emergence of Mr Cousins in trade union politics coincide with a time when in America both liberals and trade unionists are unanimously satisfied with free enterprise. But equally one can surmise that the phase will not last. Mr Pelling has given impressive evidence for the fact that America is always more liberal and the British left less doctrinaire than particular incidents and personalities suggest.

Spreading the Load

TAX PLANNING WITH PRECEDENTS: *second edition.*
By D. C. Potter and H. H. Monroe, assisted by H. G. S. Plunkett.
Sweet and Maxwell. 438 pages. 50s.

SINCE "Tax Planning" was first published two years ago, it has won for itself an important place in the library of professional advisers. Any initial superciliousness has disappeared as its merits have become known and if it is not on the desk when the client is interviewed, it is usually in the top right-hand drawer. In the meantime the Royal Commission on Taxation has added its authority to the existing judicial dicta on the subject of tax avoidance. There is no general principle that a man has a duty not to alter the disposition of his affairs so as to reduce his existing liability to tax. The critics of avoidance ought now to stop their moral vituperation of the individual and concentrate on legislation. They will have to be clear-headed, for avoidance makes some strange bedfellows: getting married on the 5th instead of on the 6th April, surviving a gift by five years, investing in Savings Certificates instead of in War Loan, providing for old age by superannuation schemes instead of by individual savings. There are many very respectable ways of eroding the tax base.

This second edition is much more than a reprint; it is a third longer; the chapters on discretionary trusts, variation of existing settlements, and partnerships have been largely remodelled; there is a new chapter showing the relevance of the old-fashioned marriage settlement in modern planning; and the book now deals with a number of allied topics such as the position of the spouse of the settlor as a beneficiary under a trust, the valuation of gifts and of shares, the family company in relation to estate duty, and pensions for the self-employed. It is a minor criticism that some of these subjects are discussed in chapters of special application (valuation of gifts, for example, comes under infant settlements) instead of being given the general emphasis they deserve.

The authors are not afraid of new ground, and contribute to the current discussion of the form of the trust deed establishing, under this year's Finance Act, a funded pension scheme for persons of a particular occupation. Their deed for the Incorporated Society of Tinkers is admittedly tentative and, giving purely a method of saving against old age without any element of insurance, has the virtue of simplicity; this may be attractive to professional bodies who are faced with the difficulties of a more elaborate scheme.

Tax planning depends on spreading the load, either by dividing legal claims on capital or income over more people, or by spreading the earnings of a working life over the years of retirement. Whatever views are held on particular arrangements, all will agree that the legal possibilities should be widely known. That is the purpose this book achieves.

Infinities

INTRODUCTION TO ASTRONOMY.
By Cecilia Payne-Gaposchkin.
Eyre and Spottiswoode. 518 pages, 50s.

IN time, a troubled people seeks assuagement by going back into its past—on TV, in fiction, in the comic strips or cinema. In space, perhaps, it seeks the same assuagement by "gazing on the infinities" and feeling the inconsequential littleness of everything terrestrial. This may account for the equal spate of books on archæology and astronomy. But of books on the latter, none is better conceived or written than those by the English-born Phillips Astronomer at Harvard. Her earlier "Stars in the Making" has proved a neat foretaste of this big, basic and beautifully produced work.

It is intended for the student beginner, but it should make many a beginner out of those faintly interested. It starts with the history of man's attempts to build the science of astronomy, goes on to his developing knowledge about our own planet, proceeds logically to the development of his tools and methods, and so to the sun, the solar system, and planets, by which time half the book is over. The rest is duly devoted to the stellar universe: the evolution of stars, galaxies, universes perhaps; the physics of the processes and elements involved; conflicting hypotheses about the many remaining unknowns; and a final chapter on the concept of evolution within the setting of the magnitudes of interstellar space and time. There are many useful lists, tables, indices and problems.

Dr Payne-Gaposchkin's style is easy and clear; her British publishers and their London printers have dealt excellently by her, in the production of letterpress, diagrams, tables, and rich and remarkable halftones; and there is little one could wish for that seems to have been left out. The illustrations really adorn the tale—some indeed, like that of the Messier 31 galaxy in Andromeda or of Messier 81 and 83, almost point a moral about universes that never end but just begin all over again. The author by no means grinds axes, and she deftly extricates herself from that overdue preoccupation with our little solar system, which threw so many earlier writers on astronomy out of perspective. Hers is a rich, rewarding introduction to a sane discipline.

Ferment in Asia

OUT OF THE GUN.
By Denis Warner.
Hutchinson. 239 pages. 18s.

MR WARNER is one of the ablest of the many correspondents drawn to Asia by the island-hopping war in the Pacific and kept there by the disturbances of the ensuing decade. Unlike many of his colleagues, he is a gifted writer and has concerned himself with underlying causes as well as with the graphic details of eyewitness reporting. His articles in the London *Daily Telegraph* and in the Melbourne *Herald*, though they have at times landed him in hot water, have been illuminating as well as informative, and the same observations apply to his book. It is on the whole a remarkably successful attempt to combine the incompatibles of "I-was-there" reporting and political analysis. Hair-raising descriptions of battles alternate with disciplined attempts to bring the whole scene into focus, to relate, for instance, the insurrections of Burma, Indonesia and Malaya, and the wars in Korea and Vietnam, to the central designs of Mao Tse-tung in Peking.

If anything, there is perhaps too much of the battle scenes. One discovered the sameness of battle scenes at one's first reading of the *Iliad*, and so it is, on a lesser level, with Mr. Warner's twentieth-century horrors. He is at his best when tracing the course of communist strategy, which he does, not merely accurately (though he modestly disclaims scholarship), but also journalistically—that is, with due regard for the personalities behind the events. His account of the rise of Mao and of the triumph of his revolutionary theories of peasant warfare is of great value; so is his recounting of two fateful but little-publicised conferences—that of the World Federation of Trade Unions in Peking in November 1949, which decided the strategy of the war against the West in "colonial or semi-colonial territories," and that which brought British diplomatic and military chiefs to Malaya a month later.

It was at this latter meeting that Britain's decision to recognise the Communist regime in China and the newly installed Bao Dai regime in Vietnam was taken. The chapter in which Mr Warner discusses the consequences of this double and apparently contradictory decision is the most controversial in the book. It is almost certain that he blames too many of the subsequent western misfortunes on it; just as it can be argued that there are extenuating circumstances in Mr Malcolm Macdonald's Indo-China policy. But Mr Warner might have written a duller book if he had been less controversial. To the layman, "Out of the Gun" will be an eye-opener; even the specialist will gain from reading it.

Shorter Notices

THE STATE OF THE SOCIAL SCIENCES.
Edited by Leonard D. White.
University of Chicago Press. London: *Cambridge University Press.* 518 pages. 45s.

This book contains papers by thirty-two American social scientists which were presented at the twenty-fifth anniversary of the Social Science Building of the University of Chicago. Their subjects cover a wide variety of topics, ranging from "The Ego and Status-Anxiety," to "American Diplomatic Negotiation." An assertion is made in a brief introduction that "optimism" is "the underlying tone of this volume," but as even this tenuous thread cannot be detected as a link connecting the individual papers, they remain an ill-assorted jumble, the perusal of which is conducive to a mood of pessimism and even despair.

Despite the sub-title of the book, "A reappraisal of the problems, methods, and goals of the social science disciplines at mid-century," none of the papers it contains really makes a serious attempt to approach the supremely difficult task of constructive criticism. Glimpses of the truth are, however, seen at times. There appears to have been a naïve expectation in Chicago in the nineteen-thirties that the housing of the exponents of different social science "disciplines" in the same building would stimulate profitable communication between them; such hopes, it is now realised, "were a bit extravagant." It is also recognised that, though the study of small groups and public opinion are said to be "areas of fabulous growth," few new fields of study have been developed. This volume manifests more than ever the familiar tendency for social scientists to devote their lives to speculation about the concepts that might be employed in the understanding of human societies and man's behaviour, to the exclusion of doing anything in particular about understanding them. This, it appears, has been the sad fate of the Chicago School of Urban Sociology, so full of promise in its earlier days.

★

LAND AND PEOPLE IN NIGERIA.
By K. M. Buchanan and J. C. Pugh.
University of London Press. 264 pages. 35s.

A minor, but fortunate, result of the establishment of new universities in the Commonwealth has been an increase in the quality and authority of geographical writing on the territories concerned. From their base at University College, Ibadan, Professor K. M. Buchanan and Dr Pugh have been able to observe Nigeria in all its climates and all its moods. They have been able to add greatly to the specialist literature on West Africa, and here they meet the need for a survey of the resources and human geography of Nigeria.

Although much of the book is naturally taken up with the nature and location of agricultural, mineral and industrial production, this is no mere catalogue of commercial geography. For one thing, the book is written from the inside: the great but unmeasured subsistence production and the flourishing internal trade are given their rightful place alongside cocoa and the other export commodities. These economic activities are also placed fully in their supremely important physical and human setting. After the various abortive agricultural schemes of recent years, nobody can doubt the very real difficulty of evolving methods of land utilisation suited to tropical soils and climates. Disease, too, is an environmental factor in a way quite unknown in temperate latitudes, as is shown by a contribution by Professor A. Brown, of the Ibadan Faculty of Medicine. Finally, the writers show that, even where soil conditions are reasonably favourable, human factors often prevent effective cultivation, whether through the defects of traditional tenurial arrangements, or because ancient wars and slave raids have driven the people away altogether.

This book started life as a projected resource atlas of Nigeria, so that it is not surprising that its maps and diagrams are exceptionally clear and numerous. The oblique aerial photographs give the non-Nigerian reader a series of exciting glimpses of an unknown country. The book undoubtedly sets a new standard in geographical book publication in this country.

Getting specific about gravity!

Falling apples fascinated Sir Isaac Newton. No doubt he enjoyed a few of them while devising his famous gravitational formulas. Newton's concern was with what came down, whereas aviation engineers today are primarily concerned with what goes up. Even so, the gravitational challenge is the same.

A jet plane, intercontinental missile—or anything that moves — usually leaves the design stage too heavy for optimum performance. To be specific — the specific gravity of the material of construction is too high.

Now, with Titanium, the design engineer can capture the strength of alloy steel at barely more than half the weight. What's more, Titanium is unaffected by most corrosives . . . and is impervious to the deadly attack of sea water and marine atmospheres. Its coefficient of expansion is low . . . and it can withstand long-time operating temperatures as high as 1000°F.

All types of Titanium mill products, from foil to seamless tubing, are made by TMCA. With production going up and prices going down, now is a good time to design with Titanium. Technical literature on Titanium is available just by asking.

American Survey

This week the SURVEY is wholly devoted to next Tuesday's elections.

AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

Forecast: No Change

Washington, D.C.

ON Tuesday American voters will have a chance to think better of the choice they made four years ago between the likeable General Eisenhower and the eloquent Governor Stevenson. If they take the chance and elect Mr Stevenson as President, the only sensible course for newspaper editors in future will be to send their political reporters on leave for the duration of the campaign. Every sign that is measurable by experienced interpreters and interviewers points to the re-run in 1956 ending in the same way as the original race in 1952. Mr Stevenson, it seems, will pick up more states than he did last time, though he may lose one, Kentucky, which he then carried; it is also expected that he will come much closer to Mr Eisenhower in some of the key states. But, if the final outcome of the presidential contest is not the same as in 1952—as all the auguries say it will be—it will have to be conceded that no one has yet found any reliable way of divining the voters' intentions before they go to the polls.

It looks as though Mr Eisenhower will just have time to ride home on the slogan of "peace," though war is breaking out in the Middle East, and on the theme of a stable dollar, though the United States is entering a period when inflation will not be wholly controllable by a credit squeeze which becomes progressively more inequitable. But the President has always been a lucky man. He promised to bring back American boys from Korea, and Stalin died. He went to Geneva, after previously discounting the notion of a "summit" meeting, and gained fresh renown from establishing a fact which should never have been in any doubt, that the United States had no intention of going to war.

As a consequence, the President is known around the country as "a diplomat" and "a man who knows how to talk to the Russians"; above all, as a man whose experience is so vast that he can do other people's worrying for them about the complicated affairs of the outside world. When to this is added the President's supreme facility in fulfilling the representative function, that part of his multiple task which is most like the role of a constitutional monarch, the dimensions of Mr Stevenson's disadvantage become apparent. The Citizens for Eisenhower knew what they were doing when they turned the President's sixty-sixth birthday into an orgy of adoration that might have caused national nausea in almost any other country this side of the iron curtain.

It cannot be said that Mr Stevenson has risen very confidently to the challenge. His courage and honesty are undoubted, but his timing in raising the massive issue of the H-bomb towards the end of the campaign seems to have been bad. Put on his mettle by Mr Truman's disparaging criticism at the Democratic convention, Mr Stevenson has tried to behave like a political infighter, suppressing his wit and swinging his blows wide. At the same time his literary taste and harrowing sense of responsibility have spasmodically got the better of him; he struggles against the material he is forcing himself to handle and salves his conscience by issuing lengthy essays, of great persuasive power but little practical influence, about the "New America" he hopes to make.

Four years ago, these same two men were astonishing novelties on the political stage. Since then, Mr Eisenhower, after a painfully slow start, has proved himself to be a natural politician who has happened to spend most of his life in the army. But Mr Stevenson is still a natural scholar who has somehow strayed into politics. While Mr Eisenhower is a President like Franklin Roosevelt, who radiates confidence or, as Mr Stevenson would say, "hands out happiness pills," his opponent appears desperately worried, the kind of man who burdens other people with his troubles. Even his eloquence has become more halting as his prose has become more trenchant. Mr Eisenhower has delivered the speeches written for him with more effect than Mr Stevenson has delivered the speeches he has written for himself. Above all, the Democratic candidate, except when at his too infrequent best, has failed to give his audiences the sense that they are touching the hem of greatness. Nor does anyone draw from his troubled spirit the look of bemused serenity that lingers on the faces of those who have exposed themselves to the presence of the "Ike" they love.

Yet, though all this explains why Mr Stevenson will probably not win, it does not alter the fact that he has come closer to the heart of the country's problems than has his opponent—or, perhaps, more halting though he has been, than he succeeded in doing, more eloquently, four years ago. It is, as Mr Stevenson says, a shaming anomaly that in this richest of all countries there should be a single slum, a single inadequate school, or a danger that illness may bring financial shipwreck to respectable families. It is, as he says, the function of the President to do something about a great moral issue such as that of the ending of racial segregation in the schools. Above all, whatever the precise merits of Mr Stevenson's proposal on H-bomb tests, it can be hoped that his questioning of the President's infallibility in this sphere and the clashing events abroad which even for Washingtonians have eclipsed the last round of the campaign will between them have proved that peace is not passive.

1956 Elections

CANDIDATES

	Republican	Democratic
President:	**D. Eisenhower**	**A. Stevenson**
Vice President:	**R. Nixon**	**E. Kefauver**

Polling Day—Tuesday, November 6th.

Required to win—266 electoral votes.

Results will start coming in about 2 a.m. (British Time) on Wednesday, November 7th, and a decision should be known in London by 7 a.m.

Americans do not vote directly for their President and Vice President but choose electors who are in practice committed to vote for their party's candidates for these offices. There are 531 electors and a candidate must have a clear majority of their votes to win. The number of electoral votes from each state equals the size of its congressional delegation, which consists of two Senators and a number of Representatives which varies according to population. The electors are voted for as a block and therefore the whole electoral vote of each state goes to one party, however small that party's popular majority may be in the state.

If Mr Stevenson this year could win all the states he lost by less than 6 per cent of the popular vote in 1952, and hold all those he won, he would have 343 electoral votes, 77 more than he needs.

HOW DID AMERICANS VOTE FOR PRESIDENT IN 1952?

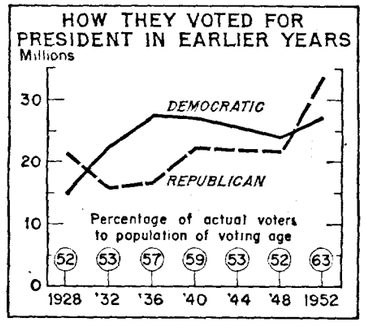
POPULAR VOTES WON BY MR EISENHOWER, BY STATES:—

56% or more | Between 53 and 56% | Between 50 and 53%

	Electoral Votes	Popular Votes
EISENHOWER	442	33,936,252
STEVENSON	89	27,314,992

Figures indicate number of electoral votes in each state

HOW THEY VOTED FOR PRESIDENT IN EARLIER YEARS

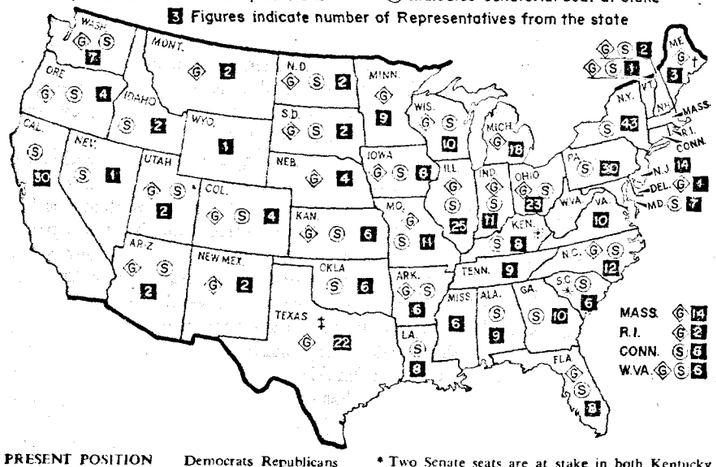


It is estimated that 102,743,000 civilians in the United States will be old enough to vote this year, compared with 98,133,000 in November, 1952. This figure includes everyone over 18 years old in Georgia and Kentucky and over 21 in the rest of the United States. In addition there are about 2,000,000 members of the armed forces of voting age; most states make provision for them to vote by absentee ballot.

WHOM ELSE DO AMERICANS VOTE FOR THIS YEAR?

Ⓖ Indicates Governorship at stake Ⓢ Indicates senatorial seat at stake

3 Figures indicate number of Representatives from the state



MASS. Ⓖ 14
R.I. Ⓖ 2
CONN. Ⓖ Ⓢ 6
W.VA. Ⓖ Ⓢ 6

PRESENT POSITION	Democrats	Republicans
House of Representatives	232	203
Senate	49 (18)	47 (17)
Governorships	27 (14)	21 (16)

Figures in brackets give number of Governorships and Senate seats belonging to each party at stake this year.

* Two Senate seats are at stake in both Kentucky and South Carolina.

† Maine has already elected a Democratic Governor and 1 Democratic and 2 Republican Representatives.

‡ If Senator Price Daniel is, as seems certain, elected Governor of Texas there will be a senatorial vacancy in that state.

All 435 seats in the House of Representatives, 35 of the 96 Senate seats and 30 of the 48 Governorships must be filled this year. Five Democratic candidates for the Senate (all from the South) and 74 Democratic and four Republican candidates for the House have no opposition on November 6th. In the Senate the seats most likely to change hands are in New York, West Virginia and one in Kentucky, all three now held by Democrats, and in Ohio and Pennsylvania, both now held by Republicans. This would give the Republicans a bare majority in the Senate, provided they hold the Vice Presidency. But the Democrats have a good chance of also winning Senate seats in Connecticut, Maryland and Idaho and therefore of keeping control of the Senate.

To win the House of Representatives, the Republicans need a net gain of 16 seats. They are not expected to achieve this unless Mr Eisenhower wins by a landslide, although it is almost unknown for a party to lose the House of Representatives in a year in which it wins the Presidency.

The Democrats Against President Eisenhower

MR STEVENSON this year has been in the unusual position, for a Democratic candidate for the Presidency, of being on the attacking instead of the defending side. But unfortunately for him he has had to attack a national hero, America's "father figure"; the frustrating effects of this have much to do with the indecisive way in which he has fought his campaign—until recently at least. In the last desperate days, however, Mr Stevenson has been hitting out directly and fiercely at Mr Eisenhower. He is using to the full the opportunity offered by the crisis in Egypt and Israel to ridicule the President's claims that he has brought peace to the United States. But an emotional situation of this kind is almost guaranteed to make the average voter cling to the President he knows and trusts, rather than to drive him into the arms of the inexperienced Mr Stevenson. That this will indeed be what happens seems to have been assured by the President's television appearance on Wednesday night, when he gave a brilliant impression of being in authoritative control of the situation.

Thus Mr Stevenson is apparently having even less success with his latest attempt to bring foreign policy into the campaign than he did with his earlier ones—his proposals for abolishing conscription and for ending hydrogen-bomb tests. Both are still essential in Mr Eisenhower's opinion, and these assurances from a general seem to have satisfied the voters. Even if Americans have doubts about the situation abroad, they have none, or almost none, about the boom at home. Few of them show any signs of preferring Mr Stevenson's "New America" to Mr Eisenhower's "Progress and Prosperity." And the Democratic candidate's attempts to scratch at the sore spots on the hide of the national satisfaction have had slight effect, although it is just possible that the cumulation of these irritations could have some unexpected electoral results.

This is particularly likely in the agricultural areas, where the farmers are suffering not only from falling incomes but from drought and are blaming the Republicans for both. But even Mr Stevenson seems to doubt whether their resentment is sharp enough, or their faith in the President shaken enough, to make them turn to the Democrats—and their lavish offers of help—in sufficiently large numbers to give Mr Stevenson a majority in any but a few marginal states—Minnesota and Missouri, for example. Other sources of real discomfort, for which the Democrats blame the President, are the shortage of credit, the rise in the cost of living, the shortage of schools and the expense of medical care.

The most important question in this election—and the most puzzling because it is the least discussed—is that of the President's health. Can a man who has had a serious heart attack and a major operation in the last year carry the burden of the most onerous office in the world? Mr Eisenhower's recent vigorous campaigning, and last weekend's medical report, seem to prove that he can. Hardly any voters will confess to being concerned about this; but many observers believe that this is only because they are ashamed of mentioning such a personal matter, and that it will have a decisive influence on their choice when they go into the polling booths. Even if this is true, no one knows, although many try to guess, in what direction that influence will swing their decision.

Mr Stevenson has wisely refrained from talking about the President's health, but this question underlies his emphasis on Mr Eisenhower's lack of leadership, his allegation that Mr Eisenhower was only a part-time President even before his illness, and his assertion that the conduct of the government at home and the prestige of the United States abroad have suffered as a result. The question of the President's health also underlies the attack on the Republican vice-presidential candidate, Mr Nixon, who would succeed should Mr Eisenhower die in office. The best answer to the Democratic charge that Mr Nixon is unfit to be President has been provided by Mr Nixon himself, for in the past few weeks he has been bearing the main burden of the campaign with an effectiveness, a restraint and a responsibility that have brought him much credit.

According to Dr Gallup

THE almost unanimous view that President Eisenhower cannot fail to defeat Mr Stevenson decisively next week is reminding the public opinion experts ominously of their disaster in 1948. Then they—and everyone else—predicted with equal certainty that Mr Dewey would win, only to see him well beaten by the Democratic candidate, President Truman. Now they are careful to go on conducting surveys until the last possible day and to make perhaps over-adequate allowance for the undecided voter; it was in these two respects that they made their mistakes in 1948. In 1952 they did much better, although they did not predict such a landslide of electoral votes to the Republicans as actually developed. This year the main thing that worries them is the lack of interest in the election. It is all very well for the interviewer to find out how voters intend to mark their ballots; but if they do not bother to vote in large numbers, they can upset the forecast completely and in the present mood of apathy, this might happen.

Dr Gallup's semi-final poll shows a fall of 1 per cent in the popularity of the Eisenhower-Nixon ticket, compared with both two weeks earlier and the two surveys in September; the results were remarkably similar in all these earlier surveys. Now only 51 per cent, instead of 52 per cent, of those interviewed propose to vote for the Republican candidates, and 41 per cent, compared with 40 per cent, are for the Stevenson-Kefauver ticket; even if this indicates the beginning of a trend, Mr Stevenson can hardly make up ten points in a week. The number of undecided voters was 8 per cent; on Dr Gallup's assumption that, if they vote, they will vote in the same way as those who have already made up their minds, President Eisenhower will have a majority of 55 per cent to Mr Stevenson's 45 per cent. When allowance is made for the average error of 3.3 per cent shown by these polls over the past ten elections, this still gives the Republicans a safe margin for victory. In 1952 Mr Eisenhower won 55.4 per cent of the popular votes to Mr Stevenson's 44.6 per cent. It is estimated that to win a Democrat must have at least 52 per cent of the popular votes, because so many Democratic votes are "wasted" in the South under the electoral college system.

the air "fustest with the mostest" accurate information will begin as the polls start closing at 7 p.m. New York time; this is midnight in London.

CBS has announced that Univac's first prediction will be on the air at 8.30 p.m. New York time based on the handful of returns then available. The first prediction will deal only with the presidential race, and will probably say "Univac predicts with . . . votes counted, Eisenhower (Stevenson) will carry . . . states with . . . electoral votes and . . . popular votes." It will also supply the odds on its own accuracy; in 1952 with only 3,398,145 votes available Univac's first prediction was its most accurate. After that, as more returns are reported, predictions will be made about every thirty minutes, and will include forecasts on individual contests, including those for Governorships, as well as the expected composition of the House and Senate.

The returns will arrive over teleprinters from the news services, and will be checked by political editors before being written in computer code language and typed on to magnetic tape. Three operators will produce identical tapes. Univac will examine the three tapes, and accept the version of the majority; it has presumably calculated the risk of two girls simultaneously making exactly the same mistake. Sample results from previous elections, including returns from various key political areas, will have been stored in the machine and, as the current returns are fed in, Univac will check them for reasonableness, compare them with trend and other factors, and type out its forecasts on a high speed printer. The keynote of the CBS-Remington Rand show is prediction, and the excitement will centre on the machine's ability to beat its own odds.

In announcing their programme, IBM and NBC have abjured prediction. They are concentrating on collecting and collating the returns as they are counted and expect to beat their competitors by a handsome margin. Eleven communications centres have been set up across the country, with special links to the standard news gathering devices. Reports coming into any of the centres will be put on to punched cards and fed into IBM "transceivers." Replicas of the cards will emerge within seconds in New York to go directly into the computer. The 705 will have been stocked in advance with the complete election results of 1952 together with blocks of information for comparison and analysis. For example, the farm belt has been somewhat unconventionally (from a political standpoint) broken down into three separate groups of voters—cattle, dairy and grain; 85 marginal districts have been singled out; and arrangements have been made to discover the extent to which the presidential candidates are running ahead of or behind their party by comparing the popular votes for President Eisenhower and Mr Stevenson in any given district with the vote for the local candidate for the House of Representatives. The machine will print a timed record of progress and specific details on demand. As the returns come in, the 705 will accumulate the voting totals for a district, precinct by precinct, compare the 1956 results with the 1952 figures at the same stage and report any variations. A further calculation will give the percentage of the still uncounted votes needed by either side for victory and, within stated "confidence" limits, the likelihood of its being achieved. At this point a man—in this case Mr Joseph Harsch—might prophesy; in any event, he will provide some enlightened comment on the wealth of information available. If all goes according to plan in this battle of the giant brains, the 705 will rely on the speed of confirmed information to beat Univac's rate of calculated forecast.

But the two Goliaths may both be vanquished by a newly emerged David—Underwood Corporation's Elecom 125. This machine, smaller in size and with a more limited capacity than the other two, will make its debut on the election night programme of the American Broadcasting Company—the third national network—which is embarking on electronic prophecy for the first time. Elecom 125 will concern itself only with the presidential contest, and will predict the outcome of each state's electoral votes as well as the final result. Mr Louis Bean, the political analyst who all by himself foretold Mr Truman's victory in 1948, has been assembling more than 100,000 statistics that the machine will need. A "historical norm" has been established from studies of elections for the past four decades, and the forecasts will be based on the percentage shift from this norm in the 1956 figures.

The predictions will start as soon as seven or eight states have reported more than 50 per cent of their returns, and will be produced by the machine in "jumbo" print big enough for the television audience to read them as they emerge untouched by human hand. In tackling the two heavyweights, Elecom 125 is counting on its compact and flexible build, and the fact that it is concentrating all its energies on a single task, to enable it to land the first most telling blow. The news commentators may be bedevilled, but the gamblers should be delighted by the permutations of choice—and of risk—between being first or last, vague or explicit, which the machines will offer next Tuesday night.

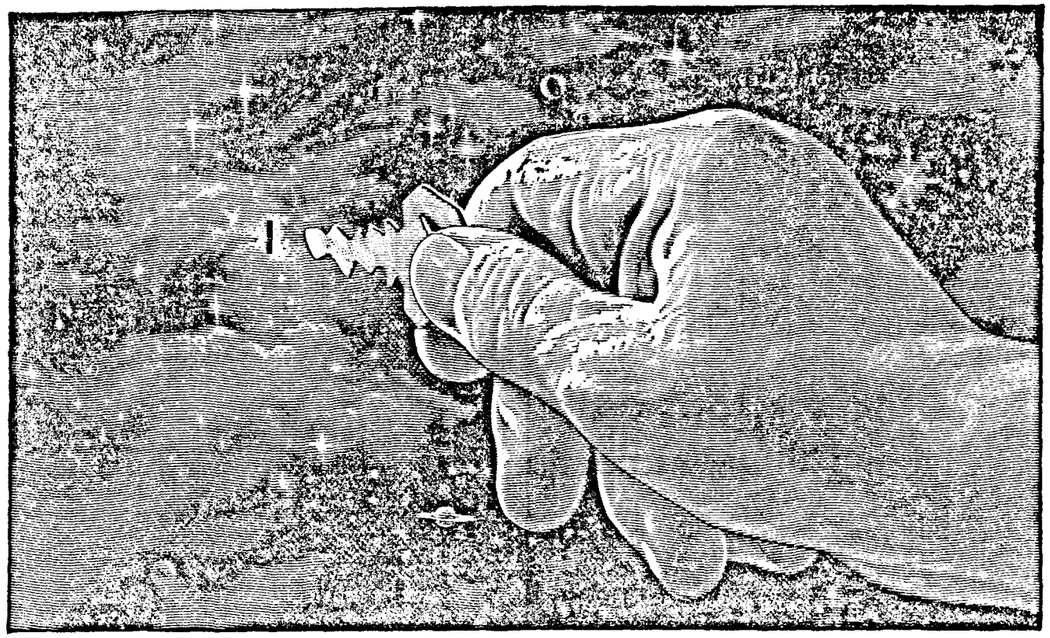
Coat-tail Campaigns

In the presidential fight the Democrats' greatest worry is the large number of voters who say: "Eisenhower is good for peace and the Democrats are good for working conditions. I am going Democratic for everything except President." But in the congressional fights this is a worry for the Republicans. It explains why it is widely believed that the Democrats will perform the extraordinary feat of holding the House of Representatives in a year in which they lose the White House. It also explains why many Republican candidates for Congress are clinging desperately to Mr Eisenhower's coat-tails in the hope of being saved by them.

I—In a Silk Stocking District

New York City

FROM the sumptuous drawing rooms of Upper Manhattan to the bohemian tenements of Greenwich Village stretches a political battleground, much of it spectacularly vertical, which is being fought over with particular tenacity. The outline of New York State's seventeenth congressional district has been lovingly fashioned by a Republican legislature so that the Irish, Italian and Jewish sections, not to mention the intellectuals of the Village, all likely to vote Democratic, must normally expect to be swamped by the favoured denizens of the "silk stocking" blocks of flats bordering on Central Park. The lines of communication in this elongated battleground have such names as Fifth Avenue and Broadway. The contestants are an old fashioned, quirky, international lawyer, Mr Frederic Coudert, and a young, though rather



Unlocking the secrets of the universe

AMAZING TEXTILE FIBERS spun out of natural gas...wonder drugs squeezed from a lump of coal...shining stainless steel forged from drab, brownish earth.

THESE MAN-MADE MARVELS—and nearly everything else that is vital to modern living—were born in the minds and hands of research scientists in their search for a better understanding of our world.

NEVER SATISFIED with things as they are, the research scientist takes apart the raw materials of nature to capture the basic "building blocks" of the universe. Then he rearranges and combines the pieces into new and better things that help improve our lives.

HUNDREDS OF USEFUL PRODUCTS have been created from such basic substances as oil, natural gas, ores, air, and water. And the wonders yet to come, the exciting things of tomorrow, are being sought and found in the research laboratories of today.

RESEARCH IS A LIVING THING to the people of Union Carbide—for it is the foundation upon which their work is built. The elements of the earth are a constant challenge to their insatiable curiosity and technical skills.

PLANT LOCATION FACTS

Where to find the labor skills you need

A suitable labor supply, with appropriate skills, is of prime importance in your plant location decisions.

Supplying all the facts about the labor potential at any site in New York State is our business. The data will be complete, accurate and current.

Our data will include a breakdown of the present industrial labor force by skills, sex and age groups, as well as an informed estimate of the percentage of the total labor force presently available. We also will provide characteristic regional rates for the specific job titles you will be considering or the ranges of rates for more general labor requirements. In addition, we will assemble for you a detailed history of labor-management relationships at any specific New York State locality.

Labor won't be your only consideration in deciding on a new plant location. You will want complete facts on markets, water, available sites or buildings, power, fuel, transportation and raw materials. And you will want information on these as they apply to the successful operation of a specific plant.

A tailor-made report

Any or all of the factors important to your analysis will be covered in a confidential report to you—tailored to your needs. It will be prepared by an experienced professional staff to cover either New York State locations of your choice, or, if you wish, sites which we will select on the basis of your needs.

Our booklet, "Industrial Location Services," explains what we can do for you. To get your free copy, write me at the New York State Department of Commerce, Room 692, 112 State Street, Albany 7, New York.

bald, former naval commander, who rescued General MacArthur from Corregidor, Mr Anthony Akers.

Representative Coudert, the incumbent Republican, has had five terms in office. In 1952 his majority was 24,197; in 1954, when he had Mr Akers against him for the first time, it was 314. Not unnaturally Mr Coudert is now trying to attract some of Mr Eisenhower's popularity to himself by vigorously asserting that he is indispensable to the President's team, while Mr Akers, who probably shares the general view that Mr Stevenson has not got a hope in New York, is steering well clear of presidential politics and is concentrating on his opponent's erratic record. Certainly Mr Coudert's new loyalty to Mr Eisenhower comes rather oddly from a man who at various times has proposed to make income tax unconstitutional, to force the President's resignation after a vote of no confidence by Congress, and to prevent the President from ordering any military action, even in self defence, without reference to Congress. Mr Coudert has also supported the McCarran-Walter immigration law, which is anathema to the various ethnic groups in New York.

Mr Akers rakes over these cinders, charges the Congressman with a record of absenteeism which he indignantly denies, and promises to give both more support to President Eisenhower's foreign policy than Mr Coudert and more assiduous service to his constituents. But Mr Akers' support of the President's foreign policy stops short of the banks of the Suez Canal. Before Jewish audiences in particular he trounces Mr Dulles for having built up the prestige of Colonel Nasser, with a vehemence that would warm many British and French hearts.

A dramatic issue of the campaign revolves around a curious specimen of clumsy over-enthusiasm prepared by one of Mr Coudert's supporters and prematurely exposed by his opponent. This piece of campaign literature resembles an ordinary newspaper but attempts to link Mr Akers with the *Daily Worker* by methods and insinuations which everyone agrees are entirely fraudulent. With Mr Akers now enjoying the role of a traduced war hero, the President's coat-tails may have to be very strong to pull Mr Coudert back to Washington.

II—In Ike's Backyard

Gettysburg, Pennsylvania

Mr Eisenhower, like Mr Truman, now lives in a constituency which is ultrasensitive to the political breeze. The Nineteenth District of Pennsylvania, which contains the President's Gettysburg farm, behaved in the last two elections in the same way as the Fourth District of Missouri, which includes Mr Truman's Independence home: it went Republican in 1952 and Democratic in 1954. In both cases the former Republican Congressman is trying to get back; in Pennsylvania he is Mr Stauffer, an elderly retired business man, described by his opponent, the present Representative, Mr James Quigley, as "a fine, Christian gentleman." The two men have both been fairly orthodox supporters of their parties and there are no personal issues between them, except for Mr Quigley's claim, natural in a much younger man, that he has worked more vigorously for his constituents. The contest is therefore very largely over party policies.

The constituency is in many ways a microcosm of the eastern United States outside the large cities—small, diversified farms alternating with an extraordinary variety of small and medium-sized businesses. Mr Stauffer concentrates on the maintenance of peace, the "restoration of integrity in government," and how the federal government has helped prosperity, while Mr Quigley attacks not the Republican Administration's tax cuts as such but the form they took. Both candidates lament the supposed loss of opportunity for young Americans to build themselves up from scratch in new businesses. Mr Stauffer attributes it to inflation and heavy government spending, both of which he claims are being valiantly brought under control. Mr Quigley puts the blame on the all-engulfing onset of big business in industry and agriculture.

The Democratic Congressman avoids the merest whisper of criticism of President Eisenhower's handling of foreign policy and keeps well clear of such deep waters as Mr Stevenson's proposals on conscription and the testing of H-bombs. His only quarrel with the President is over a matter of local concern: the veto of a Bill which would have stopped the Agriculture Department from forecasting the price of apples.

But Representative Quigley's fate is unlikely to be much influenced by his campaign. He was swept in on the strong Democratic tide of 1954, which installed a "local boy" from York, the largest town in the district, as Governor of Pennsylvania. This year Mr Stauffer may be swept in on the presidential tide of an even more famous constituent. But that depends on whether—and by how much—Mr Eisenhower can hold the state he won in 1952.

Politics on the Assembly Line

The merger of the two great federations of trade unions at the end of last year and the endorsement given by the new organisation to the Stevenson-Kefauver ticket do not mean that all labour leaders have been working wholeheartedly for the Democrats. There are still many trade unionists who are Republican and even more who support Mr Eisenhower. But the importance for the Democrats of labour help is being demonstrated in Michigan, the state where trade unionists, led by Mr Walter Reuther, are more politically conscious than anywhere else in the country.

Detroit, Michigan

BOTH for Governor Mennen Williams and his Republican opponents this year's election in Michigan is of central importance. Mr Williams, who wants the presidential nomination in 1960 if Mr Stevenson is eliminated this year, is the political protege of the automobile workers' union. If the time ever becomes ripe in this political generation for the American equivalent of a "Labour Government," it is likely to be a Williams Administration. The Governor is tempting providence by exposing himself to the whims of the voters for a fifth successive election to the same office. But if he wins he gains the prestige of holding the Governorship of Michigan longer than any other man; if in addition his popularity wins Michigan's twenty electoral votes for Mr Stevenson he will have put the party heavily in his debt. As for the Republicans, who used to run Michigan without much challenge, if they cannot beat Mr Williams for the Governorship in a year in which Presi-

dent Eisenhower's name is on the ballot, then they will have to acknowledge that the state is no longer theirs.

In Michigan, the first home of the assembly line, the two parties are more nakedly identified with the two sides of industry—labour and management—than anywhere else, and both have had their internal troubles. In the Democratic party the craft unions and teamsters had long been accustomed to dabble in the old-fashioned machine politics of Detroit, the only place where the party flourished until recent years. They resented the brash intrusion of the more dynamic automobile workers in 1950, when the latter took over the party rather roughly in order to provide an organisation capable of keeping Mr Williams in office after he had unexpectedly broken the Republican hold on the Governorship two years earlier. Mr Williams's successive re-elections have given the Democrats the time and the incentive to spread through the rural parts of the state, where the party had never before existed. This organisation in turn has now enabled the automobile workers and their allies among the trade unions to withdraw somewhat from their directly political and much criticised activity. As a result, relations have improved, on the surface at least, between them and the craft unions.

★

On the Republican side, the only energetic response to the new Democratic strength in the state came from the "volunteers for Eisenhower," a movement which blossomed under the wing of the Ford Company; the conservative and socially exclusive group which normally ran the party remained associated with the General Motors Corporation. So bitter became this political rivalry (which matched the economic competition between these industrial giants) that, after Mr John Feikens, the youthful captain of the "volunteers," took over the state chairmanship, traditional sources of Republican revenue dried up, and the "Old Guard" sat out the 1954 election. It then tried to use the Republican disaster on that occasion as a pretext for resuming authority. But Mr Feikens clung tenaciously to his job, gained wide attention by his efforts to have trade unions excluded from politics, and brought most unusual harmony to this year's state convention by presenting it with the Republicans' first really powerful standard bearer in years.

This is Mr Albert Cobo. Three times elected to the non-political office of Mayor of Detroit, he is a financial "wizard" who rescued the city from bankruptcy during the depression. His problem is to hold enough of his personal following in normally Democratic Detroit to offset—and more than offset—those Republican voters in rural areas who will not vote for him because he is a "big city man." Although Mr Cobo, facing the full blast of partisan battle for the first time, is putting up a brave fight, he is finding it difficult to keep pace with Mr Williams, who after four terms in office is still only forty-five. The Governor, a dashing young millionaire never seen apart from his perennial campaign symbol, a green, polka-dot bow tie, begins a typical campaign day at six-thirty in the morning at a factory gate and ends it at one-thirty the next morning at a Lithuanian club.

When two men of acknowledged ability and no great divergence over public issues have to campaign against each other there is nothing to do but exchange trivialities. Mr Williams accuses Mr Cobo of investing his money in Arizona instead of in his own state; Mr Cobo replies that Mr Williams has bought expensive shoes in New Jersey. The Governor, who only scraped back by 9,000 votes in 1952 when President Eisenhower was carrying the state with a majority of over 300,000, is considered to be ahead. If he can manage to repeat anything like his 1954 victory, when he was re-elected by 250,000 votes, he might be able to deliver the state to Mr Stevenson.

Forlorn Hope

There are more than two candidates for the Presidency, for "Third Parties" appear on the ballots in many states with candidates for a variety of offices, though few appear in more than one state. Not since 1912, when Theodore Roosevelt's Progressives split the Republican party, has a third party determined the electoral result, although they frequently hope to hold the balance of power in the electoral college.

TWO weeks ago what appears to be the largest American political party, apart from the Democrats and the Republicans, held its presidential nominating convention in Richmond, Virginia. The States' Rights party then nominated Mr T. Coleman Andrews as its candidate; his supporters will be on the ballot in fourteen states. His nomination has made the party into a protest against income tax as well as against federal encroachment on state independence. From 1952 until late last year Mr Andrews was the US Commissioner of Internal Revenue—a strict and efficient one. But now his presidential platform says that income tax is thoroughly "unAmerican. It is right out of the Communist Manifesto." Other planks denounce the Supreme Court's decree against racial segregation in schools as an invasion of the right of states to settle problems in their own way and call for a reversal of "trends towards socialism"; the rejection of "Atlantic Union and World Government"; higher protective tariffs for industry; the curbing of the President's treaty-making power; overwhelming and self-sufficient air supremacy; the suspension of immigration and the ending of foreign aid.

The party has drawn together all manner of malcontents and discontents: old Taftites more Taftite than Taft; mid-western isolationist followers of the late Colonel McCormick's "America First"; many of the southern White Citizens' Councils; friends of Senator McCarthy and many of those embittered optimists who "boomed" General Douglas MacArthur for President in 1948. The number of former high-ranking military men among these right-wing irregulars is remarkable. The common feeling between all Mr Andrew's supporters is one of *nous sommes trahis* or, in the vernacular, "we wuz robbed": a sense that somehow the national interest of the United States has been betrayed, by the influence of "creeping socialism" and internationalism upon the leaders of both the major parties. The movement is strong enough locally in Virginia, where Mr Eisenhower and Mr Stevenson are running neck and neck, and the segregation issue is rife, to cause some real concern that it may take enough votes from the right wing of both parties to affect the presidential result. But Dr George Gallup himself has just announced that it is not clear which of the major parties will be the most hurt by defections to the States' Rights minority.

"GIT THAR FUSTEST WITH THE MOSTEST"

A laconic comment by General Nathan Bedford Forrest during the American Civil War is still the prime rule of logistics

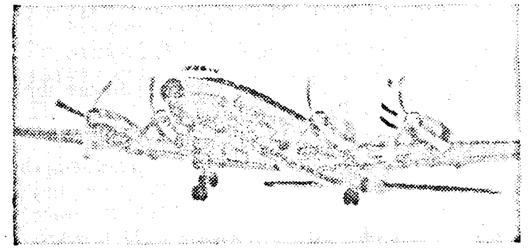
GENERAL FORREST'S SUCCINCT RULE for victory in battle has become a cornerstone of mid-Twentieth Century logistics. There is, perhaps, some irony in the fact that the fiery old General's dictum applies with equal force to military actions specifically designed to prevent or limit warfare.

The capacity of the Bristol Britannia to increase the mobility and striking power of military units has been shown up by its performance on trooping operations during the Suez emergency. Though no details of trooping movements may be given, the Under-Secretary of State for Air recently told the House of Commons that two battalions of troops could be moved from Britain to Cyprus in 40 hours, using only five Britannias.

The Britannia can carry 110 fully armed troops at a speed of 360 mph over a stage distance of 4000 miles without refuelling. It can also take equipment such as jeeps, 25-pounder guns, large jet engines; or alternatively it can carry mixed loads of personnel and military stores. No other military transport can equal this performance.

The Britannia 250 *Maximum payload:* 35,000 lb. *Still air range (with 20,000 lb payload)* 5750 miles. *Maximum cruising speed:* 400 mph. Powered by four Proteus 755 turboprop engines of 4120 ehp. Britannia 250 transports have been ordered by Royal Air Force Transport Command.

BRISTOL AIRCRAFT LIMITED



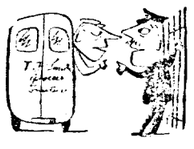
the things they say!

Glad I don't work for a big outfit!

Oh! Why not?

Well, you never see the boss, let alone get the chance of talking to him. Fact is, in a big factory like this you must be just a number without a name.

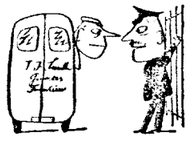
Bit out-of-date aren't you? In these I.C.I. factories there's plenty of chances for a man to make himself heard. He can see his foreman or manager at *any* time, and he can call on his shop steward or his works councillor if he wants help to put his case. Through them he can make his views heard right at the top.



Maybe, but there can't be much of a matey spirit — I.C.I.'s just too big for that.

Don't you believe it! I.C.I. provides playing fields, recreation rooms and clubs where all the chaps can get together. You should get yourself invited to an I.C.I. club some night — you'd see what I mean!

Maybe I will. But don't tell me that when I.C.I. provides all this it isn't guided by self-interest.



Of course it is. The Company wants to see the team spirit in all its works, for it knows that a happy team produces the best results.

Imperial Chemical Industries Limited

The World Overseas

Cairo on the Eve

FROM OUR CAIRO CORRESPONDENT

Early Morning, October 31st

BRITAIN seems tonight to have embarked on a policy which should produce a local victory and ultimate defeat. It has joined the ragged ranks of outmoded militancy, seeking to correct errors of eighteen months of political blindness by using force.

Egypt stands tonight naked before its enemies. Not even ardent Nasserites will claim the power to fight France, Britain and Israel altogether. But in Egypt and—to judge from reports from other parts of the Arab world—in other Arab states as well, Britain, France and Israel are considered leagued together in common aggression with the common aim of bringing Nasser down. Whether or not this aim is justified by Nasser's performance over the past twelve months, it seems in the judgment of any objective observer here that Britain's choice of allies in this punitive operation is calculated to confound its friends and delight its enemies. Not one who professes faith in western policy will dare to raise a voice in defence of France and Israel. Britain alone—perhaps even France—might not have turned the stomach of Iraqi leaders: but Israel is too much. To score a victory on the back of Israeli aggression will reverberate through the Middle East long after victory has sounded its hollow paean in chaotic Arab capitals.

Refusal to Understand

By what miracle of psychiatry will the mind of Arab nationalism be changed overnight? Though the jerrybuilt democracies of Syria and Jordan crumble and give way to seemingly more solid things, there will remain the fundamental force of Arab nationalism, disregard of which has led Britain through successive errors to the final assay of force. This situation derives essentially from refusal to understand or accept the nature of Arab nationalism. In 1954 the chief of the Egyptian criminal investigation department said that whoever helped to destroy communism ensured the stability and progress of a new Egypt. Colonel Nasser said that communists could live only in chaos and were working for the interests of a foreign power. These words were translated, in practice, into the formidable punishments meted out to communists in trials which extended well into 1955. From the defeat of Neguib to the spring of 1954 Nasser worked hard for a western connection; but when he said that the Baghdad pact was incompatible with his policy and with Arab nationalism, he was disregarded or disbelieved. His policy since then has been intolerant and unwise, even from Egypt's point of view. But this does not alter the fact that misjudgment of the forces at work in the Arab world led Britain into complacent assumptions. These remain; they express themselves now in the determination to defeat Nasser on issues on which the Arabs in general—even those Arab leaders who dislike and fear Nasser—cannot but give him their support.

If Nasser Falls

If Nasser should fall as this present extravagant complex of events unfolds there will be many, not least in Egypt, who will herald the event as a merciful release from abuse of power, from a vexatious arbitrariness of action in domestic and external affairs. But, however much this may give the first outcome the colour of success, it has little to do in the long run with the real objects of British policy in the Middle East. Britain's real need is to learn to live again with Arabs. This is not to say that Britain must bow to their impossible demands, for indeed no Arab nationalist in his heart expects that. It is, however, necessary to recognise those forces which, rising from below, have breached for ever the foundations on which the ruling groups rest. Abdulla Rimawy, now Foreign Minister of Jordan, was not long ago treated by General Glubb as a man whose proper place was in a desert gaol, a man living merely in a vacuum of his own conceit. But such men in the Arab world live—in folly or wisdom—by a pattern of common thought. So did Nasser. Fundamentally the issue for Britain is not whether Nasser is good or bad, but whether one can work and live in the Middle East with Nasser's pattern of thought, a pattern which will not be changed by changing Nasser.

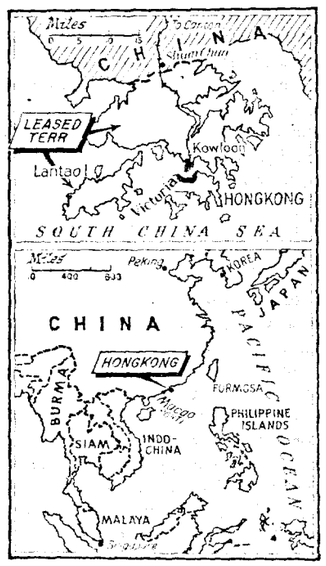
This article is being written in the early hours of Wednesday morning a few hours before British and French troops are expected to land again in Egypt. The British and French communities have been stripped down to their necessities; their embassies are packed with staffs and portmanteaux ready for siege or departure. Nasser has guaranteed civilian life and property. Sirens blow from time to time as reconnaissance planes come over Cairo and the streets have been darkened as for war. During the preceding evening life withered away in the city centre more from weariness of a sustained crisis than fear of its outcome. There is still a sense of unreality, as though war were something disproportionate to any offence within Egypt's range of action.

Hongkong as an Offshore Island

FROM OUR CORRESPONDENT

NOW that Peking has discovered, or has chosen at last to unveil, a design for potential provocation and even aggression against Hongkong, the colony has been abruptly jolted out of a deep and unnatural dream of peace. The awakening was overdue. The shock, on a realistic view, was necessary. The ringing of an alarm clock may be unwelcome, but it should not be unhelpful. The most obtuse resident here, forgetting Shanghai and blathering the old nonsense about "the Chinese needing Hongkong and our help, old boy," can no longer ignore the harsh fact that Peking has at last served warning that affairs and policies in the "unrecovered territory" will now be watched and even supervised with stern vigilance.

Since the riots, Hongkong has in fact become another "offshore island," like Quemoy and Matsu. Mr Chou En-lai sets his own interpretation on China's pious "third principle" of "non-interference in the internal affairs of other countries." Hongkong is packed with anti-communist refugees and riddled with communist sympathisers and agents. The tragic "Double Tenth" riots, obviously unplanned, revealed the explosive tinder beneath the gay lights, bustling industry and surface orderliness. If the communists turn their hand to planned disorders, on Hongkong island as well as in Kowloon and the New Territories, the stage will be set for bloody street-fighting, anarchy and a lightning coup by Big Brother across the border—purely in a protective, policeman-like mood. The cynically distorted reporting of the Kowloon riots by the Peking propaganda machine indicates how swiftly and plausibly the communists could execute and explain a well-planned operation.



Whatever happens next, Hongkong will never be quite the same again. When fires broke out in one squalid refugee encampment a few days after the riots, senior military and police officers and every foreign correspondent in the colony rushed to the scene in anxious expectation of a planned sequel to the Double Tenth disorders. They found the hundreds of homeless assembled in long, uncomplaining queues, patiently awaiting processing, registration, food, medical care and temporary shelter. Special squads of police hovered unnecessarily and awkwardly on the outskirts. Only a few days before, the same area had been a scene of bloodshed, arson and anti-foreigner violence, overhung by clouds of tear-gas and zooming spotter planes.

With the best will in the world, Hongkong's fundamental difficulties must now tend to darken and deepen. It has never been a local weakness to complain or supplicate. The old spirit of self-reliance is still strong here, even if the old horizons of free-booting enterprise are narrowing as Chinese and Japanese exports increase and nationalist tariff barriers rise in shrinking markets. Buoyant foreign entrepot trade may please the *hong* entrepreneurs, but, of course, it threatens the colony's own export manufacturers.

In the face of these facts of life, Hongkong cannot hope to continue unaided to support its sardine-packed population, now 2½ million, and increasing at the rate of 70,000 a year. Rehousing projects may be taking care of 40,000 refugees, but there are an estimated 669,000 refugees in the colony—most of them living in horrible slums and over 100,000 in rooftop shacks. To take care effectively of them and their natural increase, the authorities will need to build a city the size of York each year for an indefinite number of years. (Squatters like the 2,500 who lost their hovels in last week's fire have been officially warned that the rehousing schedule will not and cannot be altered or varied—a necessary step to check the temptation to commit arson among the wretched troglodytes in a desperate bid for priority in winning decent shelter.)

Whether these refugees and their descendants are pro- or anti-communist or merely roofless unemployed is beside the point: they will provide increasingly inflammable material whenever Peking wants to explore the possibilities of properly organised "disorders on China's doorstep." Responsibility for these hordes of refugees cannot be regarded as exclusively a matter for Hongkong. They are as much the wards of the free world as are the refugees in Europe. Of course the problem is an ugly, complex and unpopular one. But if, despite the warning of the Double Tenth rioting, it is ignored and allowed to fester on the limited and explosive confines of Hongkong, the colony's precarious future can be decisively written off.

Atomic Teamwork

FROM A SPECIAL CORRESPONDENT

"HISTORY shows that, with the advent of a new technique, the level of international co-operation rises, and many difficulties that existed before dwindle away as mist under the rays of the sun." These are the words not of Toynbee or Spengler, but of Senhor Muniz of Brazil, in his opening address as president of the United Nations conference in New York on the statute of the International Atomic Energy Agency, which ended last week. Mr Eisenhower, addressing the UN Assembly on December 8, 1953, had called upon the "nuclear powers" to contribute fissionable materials to an international agency in order that "the miraculous inventiveness of man shall not be dedicated to his death but consecrated to his life." The conference just ended, which was a direct result of that moving plea, met at a moment which seemed singularly inauspicious; it was quickly driven off the front pages of even the American press by the Security Council meetings

on Suez, and its concluding acts were eclipsed by the news from Hungary. Nevertheless, it was one of the largest assemblies of nations ever held; 76 UN members and nine other nations were invited and 82 accepted. The vast difference in size and power of the nations represented was not greater than the disparity in their technical achievement; but each of them had only a single vote.

In contrast to the Geneva conference on the peaceful uses of atomic energy in August, 1955, this meeting was dominated by professional diplomats; less than one quarter of the delegates were drawn from the ranks of science. Those scientists who did show up played little part in the deliberations. Among the exceptions was the Cambridge-trained physicist, Dr Homi Bhabha, who headed India's delegation. Dr Bhabha is no newcomer to the field of scientific statesmanship; he had presided over the Geneva conference. It was he who now led the attack on Article 12 of the draft statute, which deals with controls.

The final text of the statute has now been hammered out and is open for ratification; it will become effective when eighteen nations have acceded. There were 63 proposed amendments, nine of them submitted, surprisingly enough, by members of the twelve-nation group which had sponsored the draft. On the whole, however, the sponsors succeeded in holding the line; many of the amendments were withdrawn, and most of the 22 which were finally accepted were clarifications of phrasing.

Governors But No Controls

The statute, as unanimously endorsed on October 23rd, calls for an International Atomic Energy Agency managed by a board of 23 governors. A majority of this board will be self-perpetuating. The five most advanced "nuclear powers"—at present Britain, Canada, France, Russia and the United States—will always be included; and the board will annually co-opt two out of four suppliers of nuclear material—Belgium, Czechoslovakia, Poland and Portugal—and eight other nations to give a fair geographical balance. Ten of the governors, however, will be elected annually (also on a geographical basis) by a general conference of all members of the agency, which will also control the purse strings. No budget has been fixed; there is a provision for fixing a scale of charges for the agency's services, intended to cover some operating costs, but it is not yet clear whether fissionable materials will be leased, loaned or given. In the closing session, the United States promised to make available 5,000 kg of U-235; it will also match other nations' contributions during the next four years. In an earlier exchange of letters the Soviet Union had indicated it would furnish 50 kg. The American contribution is part of 20,000 kg previously set aside for peaceful atomic uses; some of this has already been pledged to other nations under the United States' 37 bilateral agreements, which may now be placed, at least in part, under the jurisdiction of the agency. It is believed in Washington that the security and control provisions in the bilateral agreements would prove extremely embarrassing if enforcement became necessary.

Failure to agree on the question of controls—a question which has also bedevilled the recent negotiations on the "Euratom" plan—at one stage threatened the New York conference with shipwreck. On reaching this sensitive part of the statute, the conference at first drew back; then, returning to the problem, it achieved a compromise which all parties could accept—although some reservations were expressed, India, for example, regarding the degree of supervision proposed as tolerable "for a limited period," while Australia's doubts concerned their adequacy.

In the event, the controls section of the statute was "liberalised" to permit recipient nations to retain atomic fuel not actually in use as long as it was earmarked for an approved programme. This change increases the risk of concentration of sizeable amounts of fissionable material in the hands of "fourth party" nations—that is, countries other than Britain, Russia or the United States, which have not yet an atomic weapon. But the experts regard this as a calculated risk; they point out that there can be no check on the most important danger of diversion—the use of knowledge gained through operation of one of the agency's reactors for the manufacture of weapons. The statute makes no attempt to deal with the problem of existing nuclear armaments, or indeed to prevent a recipient country from employing its own resources to construct a bomb. Whether Pandora's box has been opened for a second time remains to be seen. The agency must report to the UN Assembly annually and to the Security Council when a threat to peace is foreseen. It is expected to begin to function actively next autumn in Vienna, where it will at first be housed in a castle and a stock exchange.

The sanctions to be applied by the agency are mild indeed. A staff of inspectors is to be maintained with access to the territory of users; when violation of the rules is reported the board of governors can curtail or suspend the offender's atomic programme and demand return of materials and equipment. If the violator still refuses to comply, the statute specifies no further corrective action; presumably the assistance of the Security Council would be invoked. The statute makes no provision for action in the event of a beneficiary nation becoming involved in war.

This is not the powerful agency controlling atomic activities in all parts of the world that was envisaged in the Baruch plan. Yet by side-stepping the question of limitation of armaments the participating nations may have made an important first step towards international mastery of a force which can either destroy or save mankind.

Algeria and Suez

FROM OUR PARIS CORRESPONDENT

IN France, there is no official opposition, except from the Communists, and, surprisingly, from M. Poujade (who "will not fight for the Queen of England"), to the use of force against Nasser. But now that the trial of strength is on, there is a greater tendency in Paris to question its consequences (at least on the left) than might be gauged from previous calls for firmness (most from the right), or from M. Mollet's large parliamentary majority. M. Mendès-France, for once, abstained in the vote. The throw at Suez is of the kind that could, whether it succeeds or fails, rapidly shake French parliamentary life, and the North Africa policies that have dominated it, out of their curious lethargy this autumn.

The effects of the Suez intervention on the unstable Maghreb are bound to be considerable. Whatever dislike the Moroccan and Tunisian leaders feel for Nasser, the kidnapping of the Algerian rebel leaders has

made it harder for them to keep contact with France across the popular hostility against the French in their own countries. Nasser in trouble may have more influence on the North African developments than Nasser in his aggressive poses. Many members of the French government, and especially M. Lacoste, have tended to make Nasser's elimination a precondition of ending the Algerian rebellion. But recently the Sultan and M. Bourguiba have been visibly weaning the rebel leaders from Cairo's influence. Now resistance by Nasser for any period of time would almost certainly make him a hero and inspire further fanaticism. The power of the Tunisian and Moroccan leaders to exercise their diplomacy in this situation has already been severely reduced by the capture of the five rebels, for by turning the Sultan and M. Bourguiba from potential, though unacknowledged, mediators, who backed the rebels but publicly acknowledged France's "superior interests," into injured parties themselves, it has made it harder than ever to side-step the main stumbling-block to a settlement: the demand that Algeria's "right to independence" be recognised.

It was precisely this right that no French non-Communist party leader was willing to envisage in last week's Assembly debate. M. Mendès-France specifically rejected negotiations, and asked once again for gestures to reconcile the European and Moslem populations—a programme that seems less adequate than it did five months ago. Basically, this unanimity comes from the general belief that only "indissoluble ties with France" will safeguard the European settlers from repressive laws passed by Moslem majorities. The settlers in Morocco and Tunisia have had their grievances under the new regimes. Rightly or wrongly, their complaints have increased French mistrust, which is reinforced by the latest Meknes massacre and Tunisian disturbances. Such reactions are natural. But these immobile attitudes seem to underline French reliance on Suez to turn the scales. M. Mollet's earlier offer this week of an unconditional cease-fire simply restates, in more solemn form and with an amnesty, the policy of elections, consultations on the Algerian statute and generous economic aid, which he has already proffered several times to no avail.

M. Bourguiba's Vision

This policy is, of course, one of the bases of M. Mollet's support in the Assembly, over which his authority, at least in debate, has been growing steadily greater. Yet the events of the past two weeks have somewhat narrowed this support. For one thing, the debates on Algeria and Suez have widened the breach with the Communists, who have voted for the first time against the government. The right will in future be less cowed by the bogey of Popular Front majorities. For another, the ambiguity which existed this summer about whether M. Mollet stood for negotiation or pacification in Algeria has evaporated. He will find it harder to satisfy the half-avowed opposition in his own party.

If Nasser falls, this weakness on the left will probably matter little and the Algerian policies embodied by M. Lacoste will have enhanced chances of success. Nevertheless, the Algerian rebellion has deep enough local roots for Nasser's fate not necessarily to be decisive to its future. It has seemed at times that M. Bourguiba's officially unpopular vision of a Franco-Maghreb confederation may yet come into its own. For such a confederation, properly understood, provides a hope of resolving the two contradictions at the heart of the Algerian crisis, which now seem unresolvable; first, that between Tunisia and Morocco, which are independent, and an Algeria which would only be a "decentralised" part of France; and secondly, that between a normally functioning nation state and effective safeguards for the European minority, not only in Algeria, but in North Africa as a whole. On the other hand, if Franco-British policy on Suez fails, it is hard to see this moderate policy holding out against the demands for untrammelled Algerian independence.

Mr Suhrawardy's Tasks and Trials

"ALL of us, Muslims and non-Muslims, are Pakistanis first and last. . . . Once Pakistan was created, the two-nation theory lost its force, even for Muslims." With such words Mr Suhrawardy, Pakistan's new Prime Minister, has disowned the doctrine that Hindus and Muslims are separate nations; and an inroad upon it has been made in the Bill passed last month by the National Assembly, which provides for joint (non-communal) electorates in the eastern province. The Bill, however, was also meant to bring about a more stable political situation by reducing tension between the eastern and western provinces—a tension which is unlikely to disappear until the country again has a political party with a nation-wide basis and a nationally acceptable programme.

When Pakistan came into being, the Muslim League was the only national party. Its standing was such that almost every man with political ambition became a member. But the League, unlike India's Congress party, ceased to have a clear programme once its primary aim, the establishment of a separate Muslim state, was achieved. Preoccupied with administration, its hierarchy made little attempt to reorganise the party or keep contact with its rank and file. Today the support it once commanded has been dispersed; in the west it has passed over to the Republican party, the partner in the new coalition of Mr Suhrawardy's own Awami League.

It is not merely fortuitous that the League's collapse has coincided with the repudiation of the two-nation theory. Ever since West Pakistan was reorganised and its provinces and princely states merged into one political unit, Bengali Muslims have complained that they were reduced to a permanent minority in the National Assembly. Since a quarter of East Pakistan's population are Hindus, and the system of separate electorates has strengthened their parliamentary representation, an inordinate value has been placed on the support of Hindu members in the Assembly. The Awami League, now in power in the eastern province, pressed for joint electorates, but was opposed by its Republican partners; their leader, Dr Khan Sahib, failed to convert them; and at the last moment the restraining hand of President Iskander Mirza brought about a compromise which allowed the west to retain separate electorates while abolishing them in the east.

This has not been the only, nor even the first, symptom of strain within the new coalition. Within three weeks of its formation the secretary-general of the Republicans had declared that they would aim at getting a clear majority in the Assembly (they already have 31 out of 80 seats), when they would break with the Awami League and form their own government. Dr Khan Sahib promptly repudiated this startlingly frank expression of opportunism; but Mr Suhrawardy cannot be too optimistic about his chances of survival as Prime Minister.

The economic plight of East Pakistan, which in recent months has undergone flood and near-famine, is an additional burden on him. The development programme in the east has lagged far behind schedule, and also behind that of the west. The planners deemed it wrong to hold up progress in the west to allow the eastern province to catch up. The disparity will continue for some time, and the Bengalis' resentment will not be lessened by the allocation to them of only three billion rupees (about £230 million), while the west gets Rs 500 million more. Mr Suhrawardy has, however, made an effective gesture toward his fellow Bengalis by staging the Assembly's first meeting in Dacca, the capital of the eastern province. He has disarmed Hindu suspicions by his attitude on electorates. And he has the advantage of being one of the very few politicians whose name carries weight in both provinces, and a man of sufficient calibre and political seniority to talk to Mr Nehru on more equal terms than any prime minister of Pakistan since Liaquat Ali Khan.

Unfilled Vacuum

His visit to Peking has been closely followed by the whole country. The new government is understood to favour a move to change Chinese representation in the United Nations—a point which Mr Suhrawardy's hosts in Peking can hardly have failed to raise in view of the imminent UN Assembly meeting. But, although some Awami League members have bitterly attacked Pakistan's present alliances, the Prime Minister has emphasised his respect for existing commitments, and has assured the Chinese that his country is perfectly capable of being their friend while maintaining its defensive associations. But one sector of foreign policy as to which he will have to enlighten Pakistani opinion is the Middle East. Vague talk of Pan-Islamism has often misled the public, which still clamours for a Pan-Islamic policy—while it is to Delhi that Egypt and Saudi Arabia have been making overtures. The new Foreign Minister, Mr Feroz Khan Noon, has named "Pak-Islamism" as a worthier alternative; but the beginnings of a national debate on these issues have now been overtaken and confused by Britain's latest Suez actions, which seem bound to bring about a sharp swing of feeling in Egypt's favour.

Meanwhile, Pakistan's own greatest problem remains political instability—as Mr Suhrawardy emphasised the moment he took office. The vacuum left by the Muslim League has not been filled by any other party with nation-wide appeal. Pakistan has neither a socialist party nor a clear-cut alignment of Right against Left. It is badly in need of parties based on something more than sectional interest and able to expound their distinctive principles in terms that would appeal to both Bengalis and West Pakistanis. The Prime Minister himself has well defined the parties' future task: "to arouse political consciousness in the people, educate them to the problems that concern us, offer to them reasonable, honest and practical solutions, and leave it to them to decide their course of action."

Meet Me at the British Pavilion

BY A CORRESPONDENT LATELY IN SYRIA

HARD words have been said in the past about British official failure to promote Britain's showing at foreign trade fairs, but 1956 is a year in which to take them back. At the recent Damascus international fair, Britain was exhibiting for the first time in a national pavilion. British Overseas Fairs Ltd., a subsidiary of the Federation of British Industries, was responsible for the exhibit, selling space to commercial exhibitors and then leaving them free to arrange their stands. As a result, the British section was larger than any other except Syria's own. The British pavilion housed thirty stands, and nine more were arranged outside it, displaying the products and services of, in all, 104 firms. A wide variety of both capital and consumer goods were on display, and negotiators on the stand did good business on the spot—for instance, a large sale of linotype machines. From the standpoint of popularity the most successful exhibit was, however, a large three-dimensional plastic model of a section of typical Syrian countryside, showing what could be done if British industry were to build roads, railways, oil refineries, power stations, schools, hospitals and factories. The radio stand also attracted large crowds, and for the first time television programmes of interviews, sporting events and films were to be viewed on sets both in Damascus and in the pavilion itself.

Gaggle of Housewives

The fair was held on a fine site on the two banks of the Barada river, within a few minutes stroll of the centre of the city. Its layout was pleasant, the pavilions looked attractive and there was plenty of room to stroll and stare. Most of the pavilions, particularly those of the communist block, were intended for propaganda rather than strictly commercial uses. They were more lavishly built than the British exhibit, which may justly be rated utilitarian. They displayed endless rows of photographs of people enjoying daily chores east of the iron curtain, and they included restaurants serving national specialities. Both the United States and Russia exhibited helicopters, which flew on alternate days, braving the Syrian anti-aircraft fire which at intervals spattered the sky. The American pavilion featured a glass-walled studio where visitors were able to see themselves televised, and a model kitchen, which attracted a gaggle of Arab housewives though much of its equipment was beyond their reach for some years to come. On feast days, visitors from all over the country were well in evidence, producing crowds of impressive size, although few among them were buyers and most of them obviously regarded the display mainly as a fun-fair.

From the business standpoint of many exhibitors as well as of the hosts, however, the fair was marred by the political situation. Talk of the Suez dispute was general; anti-western sentiment was rife and—within the fair-ground itself—loud-speakers were broadcasting news and speeches destined to propagate it. Daily papers, special leaflets and even mullahs were doing the same; it speaks highly for the natural courtesy of the Damascenes that there were not more incidents. The government had forbidden the sale of cotton and grain to France on account of the situation in Algeria, so that, in spite of bumper crops which had been expected

to bring Syrian purchasers to the fair with full pockets, there was no money about. Merchants were disappointed, and were grumbling audibly about local unreadiness to risk money in uncertain times.

Were the British disappointed? Perhaps less so than other exhibitors. In all, they received orders worth about £600,000 during the run of the fair, with promise of more to follow. The radio and television industry, in particular, seemed well satisfied with its first co-operative drive to capture the Middle East market.

Westerners seemed to do better than the communist exhibitors, probably because their goods looked more attractive to Arab eyes, which relish display. The machinery exhibited by the Soviet block lacked the finish and the refinements offered by western manufacturers. Although such machinery, capable of standing rough treatment and comparatively easily repaired locally, can be much more suitable for the Arab countries than the more efficient but also more elaborate western machines, it is unlikely that the Arabs will buy it. For some years they have been accustomed to the newest American models of a wide range of commodities; they therefore look with contempt at a tractor without a self-starter. It is interesting that the communists have shown no understanding of this situation so far.

Czechoslovakia Revisited—II

Overwork and Old Clothes

BY A SPECIAL CORRESPONDENT

ONE'S first sight of Prague after nine years is reassuring. The airport is delightfully free of the milling crowds which throng the bottlenecks of Western Europe. Outside are some smart new cars—just a handful—and a handful of quite nicely dressed people. Their children have pale faces, but look well cared for and well dressed. But one passes very few cars on the way into the city, and even on the Vaclavske Namesti, the Piccadilly of Prague, cars pass at the rate of only two or three a minute, if that.

At three in the afternoon the main streets are crowded with people on their way home. Offices as well as factories start their working day at 6.30 a.m. Most people like this because it makes it possible to have a second job. Very few men earn enough to support a family; almost always the wife must also earn. For a woman not to earn is strongly discouraged, and it is considered that there is no need for a woman to stay with even the youngest children. Creches take babies from the age of six weeks. Few Czech women, incidentally, can feed their babies for much longer than six weeks. The head of a maternity hospital put this down to the strains on their nervous system. It is probably also due to long hours of work and to the housing situation.

In Prague there are only 700,000 habitable rooms for one million people. Rents are very low—3 to 5 per cent of incomes—but flats can be had only with official permission, and are allocated on a points system. There are over 50,000 outstanding applications for flats in Prague. Young couples often live with the parents of both, and when I expressed sympathy with a divorced woman who had to house the parents of her ex-husband, she said she was thankful not have to house him and his new wife as well.

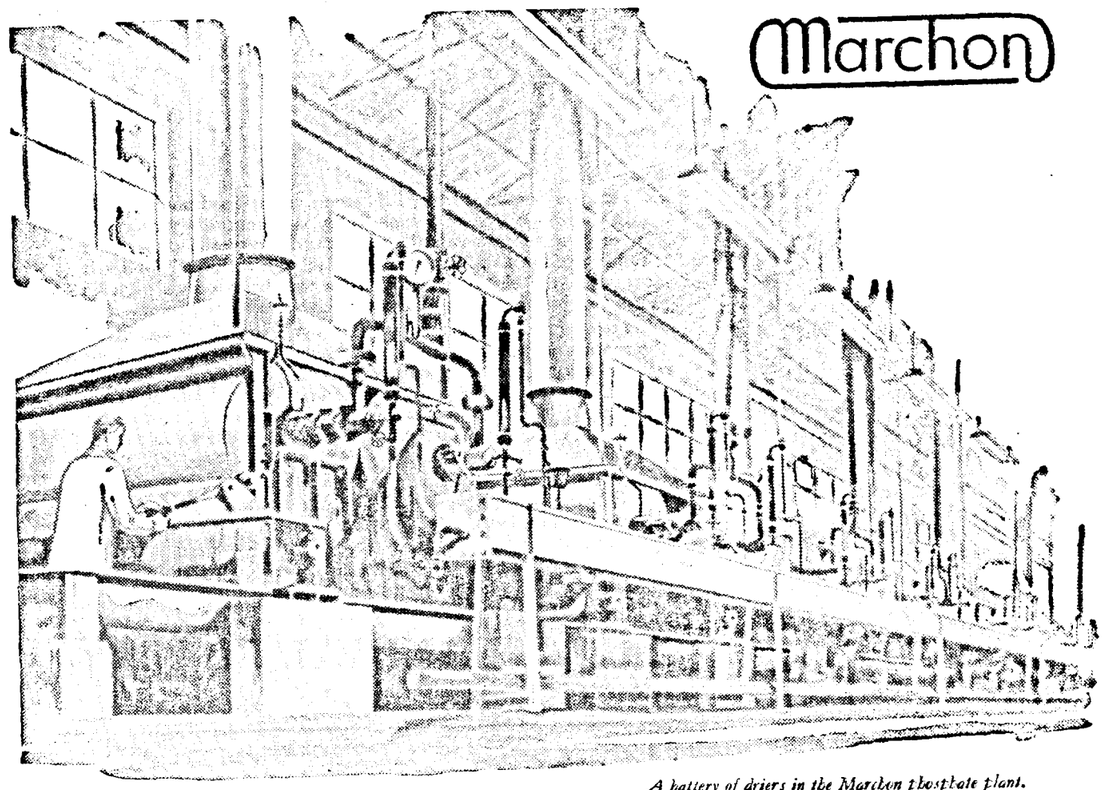
Mechanisation, according to the Minister of Housing, will solve the housing shortage. This is the cry in all fields; and now, for the first time for many years, machines are being bought in the West. Where, a few years ago, British machines could not even be serviced owing to suspicion of all western things, British engineering firms are now being invited to solve some of the Czechs' difficulties. An agreement has just been signed by which 21 British cutting and loading machines will be delivered to the coal mines in Ostrava. A British bridge-building firm has been called in, and British glass-cutting machinery is also being bought.

The Czechs have bought their present relative prosperity (they are popularly considered the America of the communist camp) at a high price in terms of economic dislocation, exploitation by the Soviet Union—every Czech is privately convinced that Russia pays nothing like the market price for Czech machinery and uranium—and sheer physical exertion. The economic and social revolution has been real; while the standards of the pre-war bourgeoisie have fallen catastrophically, the standards of at least some workers may have appreciably risen. One sees no abject poverty in Prague. The poor today are no longer the unemployed—they do not exist—but the unemployables: the old-age pensioners, and the "class enemies," forced to do work for which they have neither aptitude nor strength. The favourites of the regime—the workers in mines, iron foundries, and chemical industries, the soldiers, the policemen, the communist party officials, the "artists"—are comparatively well off. But then many of these privileged people are earning 3-5,000 crowns a month, whereas most people seem to earn something like 1,300 or less.

Cheap Holidays, Dear Food

The official rate of exchange is only just over 20 crowns to the £ (though there is now a tourist rate of 60). At the official rate, the official average wage—and many people earn less—is about £66 a month. But the official rate is false, and prices more than wipe out this apparently royal wage. A roll of bread costs about 5d., a cup of milk 1s., and rather nasty acorn coffee from £7 10s. to £12 a kilogram. Calculated on the lowest possible consumption level—two butterless rolls with water for breakfast and the cheapest possible midday and evening meals—nobody could eat on under 12s. a day, not even a child. It is true that most workers get one daily canteen meal for about 2s. 5d.; but many people find that nearly all their wages go on food alone. One woman I met who earned an average wage herself, and whose husband earned above the national average, was wearing the clothes of her mother, who died seven years ago. They are undoubtedly of better quality than most she would buy now. She had one child. She never went to the theatre or spent money on entertainment, travel, books or anything else. On the other hand, she, like great numbers of workers, could probably have a free holiday in a splendid hotel in the mountains and complete social and medical insurance. On the other hand if her child is ill, for every day she spends at home she must either give up her pay or a day of her holidays.

What is all this for? If, as the communist party proclaims, the standard of living will greatly increase in time, the immense burdens now being shouldered by the Czech masses are perhaps worth it. But will it? And will it do so more quickly and more surely than it would have done under a much freer economy and a different way of life? Whatever the answer, socialism in some form has come to stay in Czechoslovakia.



A battery of driers in the Marchon phosphate plant.

IMPORT to EXPORT at Whitehaven

Whitehaven harbour saw the last armed invasion of the United Kingdom (by Paul Jones in 1778). Today ships arrive peacefully from North Africa bringing phosphate rock for the Marchon plant at Whitehaven. There the rock is treated with sulphuric acid, itself produced from anhydrite mined by Marchon on the spot, to yield phosphoric acid which in turn is transformed into the complex phosphates used in manufacturing detergents. Detergents and detergent intermediates from the Marchon plant are shipped from Whitehaven harbour all over the world. The Marchon plant, in conjunction with the adjacent Solway sulphuric acid plant, forms one of the major industrial units of the United Kingdom.

...who me?

Yes, you on the ladder. Life seems pretty good now, doesn't it? A new job, some responsibility, a decent salary now and perhaps a better one ahead. But, what do you really know about the big problems . . . the problems of your industry? When it comes to the big issues are you the man who knows what he thinks, or just the man who knows what he heard someone else say?

You need THE FINANCIAL TIMES. Read its industrial news. Read the reports of the markets your firm sells in, the techniques your competitors use, the new products that could increase your productivity. Read the articles on economic and financial affairs. They will help you to develop a sounder business judgment . . . broaden your vision . . . prepare you for the new responsibilities you can see ahead of you.

THE FINANCIAL TIMES provides all the facts a business man needs. Try reading it every day for a week. It's the only way to keep up with the man who means business.

Men who mean business read

'Ever in the fire and never consumed'...

THIS IS ONE of those legendary associations that bear no real relation to the truth. Salamanders are amphibians, the black and yellow species 'Fire Salamander' being common still throughout North Africa and Central Europe. Far indeed from being fireproof, he is found only in the dampest places.

There is nothing mythical however about the fire-resistant properties of ASBESTOLUX, one of the most up-to-date manufactured products of The Cape Asbestos Company. Non-combustible and therefore widely used in modern building practice, this asbestos insulation board is mainly composed of Amosite asbestos fibre, from the Company's own South African mines. It is this Amosite, with its high specific volume, i.e. millions of long, thin hair-like fibres per pound, that gives to ASBESTOLUX many of its outstanding qualities—high insulating efficiency, good strength/weight ratio, and extreme durability due to its indifference to temperature, moisture, chemicals, insects and fungi.

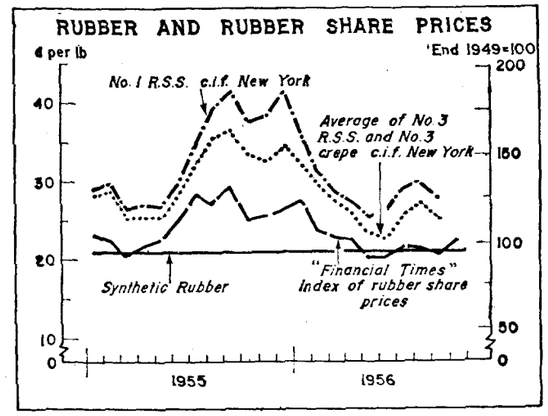
Rubber's Bulging Money Bags

LAST week Sir John Hay presented a modern version of the casket scene from the Merchant of Venice. He put on display the surplus resources of £1½ million that are held by seven companies in the Guthrie group and then made the point that all that glisters is not gilt-edged. Sir John proposes that the seven companies shall pool these holdings and form a new investment trust. The outline of this scheme, which will have to be laid before the shareholders for their consideration, was given on page 354 of last week's issue of *The Economist;* so were a number of critical reservations about it. To redeploy assets that are no longer needed in their existing uses is wholly reasonable; what deserves much closer examination is any proposal to put them beyond the reach of the shareholders of the companies that own them. Sir John argues his case on two grounds—that these resources should be put to work (which is unexceptionable) and that they must be removed from the grasp of the share bidder (which is much less so). Some shareholders have already said that they intend to oppose the scheme.

Why all this spare money in the rubber industry? Something has been done to pass a little of it on to shareholders in higher dividends. There have been some wider ideas of reinvesting it—for example, a joint rubber growing venture in Nigeria is understood to be under contemplation by three of the agencies. But no rubber company board seems to take very kindly to the idea of returning at least part of this hard won surplus to shareholders. For this, there is some excuse. Profits tax might make a distribution expensive, while a reduction of capital might be politically dangerous. Again, rubber growing is a business notoriously exposed to sharp changes; it has seen its liquid assets shrink as well as grow. And many of the smaller companies would be all the stronger for consolidation into larger units with common management and technical services; how can they decide how much of their liquid assets is really "surplus" until they have taken that hurdle?

Yet the fact is unmistakable. Rubber companies are flush with cash. This is not because rubber is outrageously high; the price had come down a long way from over 43d. a lb last year to 26d. before the troubles in Singapore and the Suez crisis pushed it up to 31d. a lb. But in the year to March 31st, during which rubber averaged 34 $\frac{3}{16}$d. a pound, companies made good profits and the companies reporting to June 30th (with only a slightly lower average of 33 $\frac{5}{16}$d) should do well, too. At anything near the present price, efficient producers can make a comfortable profit. They are not being pushed out by synthetic rubber, which is sharing, though not hogging, a growing market for rubber of both kinds. For reasons that are partly political and partly economic, they have no urge to plant more rubber in the east. So the shares of several companies have become a target for share bidders, whose activities have helped to carry the *Financial Times* index of rubber shares up from 90.8 in the middle of this year to the present level of 102.9.



The average price of No. 3 RSS and No. 3 crepe rubber is taken as the nearest equivalent in the United States to general purpose synthetic rubber.

Companies that have recently issued their reports for the year to last March and a few of the bigger ones whose financial years ended earlier have shown high cash assets in relation to the market prices of their shares. A selection of these is shown in table II. A buyer, after deducting the value of the cash, has been able to acquire an interest in good estates at an absurdly

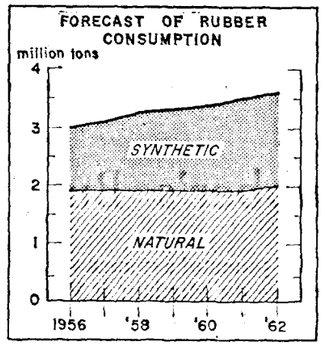
low net price. Small areas of good rubber in Ceylon have been changing hands at £150 an acre ; in Malaya it would cost roughly that amount to nurse an acre of rubber into bearing. But in the share market such land has been changing hands, in effect, at below £60 an acre, and the fact that the companies concerned might be broken up to yield far more than the market price of their shares has naturally attracted the attention of share bidders.

To remove the source of temptation is the obvious counter-move. But the difficulties already mentioned argue themselves. The money is almost a clinging embarrassment. It is impossible for rubber company directors to deny that they are holding handsome surpluses, even though some of them would say that the surpluses may be only temporary. The fact is virtually admitted by the decision of most boards to modernise their estates in Malaya, but not greatly to extend them. Political factors are very much in their minds ; and a number of companies had already done a good deal of replanting when money could not be so easily found as today and before the Malayan Government had begun actively to promote replanting. An increasing proportion of the mature acreage now consists of high-yielding stock. The yield per acre is rising and costs per acre are falling. In the other main producing areas little replanting has been done. In Ceylon, which has a high proportion of old trees, replanting has only recently been stepped up to a respectable rate, and in Indonesia, the largest producer, replanting has virtually marked time. European-owned estates there are still faced with great handicaps over the employment of European staff, remittances homeward are exceedingly difficult, and the estates still do not know the Government's terms for their new leases. No European-owned company would willingly invest in Indonesian rubber under these conditions.

So there can be little increase in world production of natural rubber in the next five years. The accelerated rate of replanting in Malaya will not bear fruit until about 1963, and production in other countries will tend to stagnate. But world consumption of all rubber should continue to grow and the natural rubber industry should be assured of a market. The price to be paid, for delayed replanting, for ineffective government in some Asian countries and for law and order scarcely maintained, is that the growth in world consumption of rubber will have to be met by synthetic. The share of world consumption supplied by natural rubber, which is now about 64 per cent, may shrink further ; conceivably the natural rubber industry may eventually become the residual supplier.



Yet granted the limitations imposed by political instability in the East and by the growth of synthetic rubber production in the West, the outlook for natural rubber seems reasonably favourable. Despite the sharp fall in consumption of natural rubber in the United States and Britain, world consumption has been running slightly above the level of last year. The International Rubber Study Group estimates that consumption in the first eight months of this year amounted to 1,237,000 tons, an increase of about 20,000 tons on the same

period of 1955. Even though estimates of imports into Russia, China and some other Communist countries are subject to a margin of error, the fall in consumption in the United States and Britain must have been more than offset by a sharp increase in imports into communist countries. With world production of natural rubber no higher than in the same period of last year there was an apparent deficit of about 40,000 tons. The real deficit may be smaller than that if production in Indonesia is higher than the official figures show. But given the expected recovery in consumption in the United States in the last quarter of this year the earlier forecasts of a close balance between production and consumption of natural rubber should not be far out. The balance could still be tilted either way according to the demands of Russia and China. If Russia continues to buy at about the same rate as in the past year prices are unlikely to fall far, and may be squeezed higher from time to time.

Shareholders in rubber companies will not despair at that prospect, nor need they worry because share bidders are prodding their directors into putting the surplus capital to work. It may be true that excessive liquidity is a disease of an ageing industry ; young, fast growing industries are seldom too full of cash and are often over supplied with uses for it. If that be so—if rubber growing is suffering from advancing years—then shareholders should be entitled to find more youthful outlets for their money. But the fairer conclusion is that senile decay has not set in ; investors who are prepared to barter a high political and economic risk against a high yield and the chance of some extra cash some day may find the rubber share outlook not wholly uninviting.

Business Notes

Oil Supplies in the Hazard

THE powers taken by the Government on Thursday to regulate the production, distribution and consumption of petroleum products in Britain are unlikely to remain unused. Rationing to conserve supplies of petrol, fuel oil and other products for essential uses, assisted by a resuscitated Petroleum Board or some similar central authority to control the purchase, transport and distribution of oil, is the presumed outcome of this week's action by the Government. The orders already given to shipping to keep clear of the Suez Canal, coming at the seasonal peak of oil movements, will fairly soon bring a reduction in arrivals of Middle East oil in Europe. But meanwhile tankers are arriving brimful, and immediate steps to reduce oil consumption here would mean that they would be delayed in clearance and therefore not used to the best advantage. An effective rationing scheme, if it comes to that, must take some time to put into effect, and it will involve elaborate and co-operative arrangements between the oil companies to rephase their transport, refining and commercial operations.

When there was much talk of boycotting the Suez Canal six weeks ago, *The Economist* showed that, although the costs would dim the attractions of any self-imposed boycott, enough oil for Europe's needs could still be obtained and transported, even if the canal and also the Middle East pipelines were closed. But even the most pessimistic assessment at that time rested on two fundamental, favourable assumptions. The first was that, even if both the canal and the pipelines were closed, Middle East oil would still be available for loading into all the tankers available in the Persian Gulf to transport it. The second was that Britain and other West European countries would have the unqualified support of the American government, shipping industry and oil industry (including both the American major oil companies, with their own vulnerable interests in the Middle East, and domestic producers). Under these conditions and with the co-operation of Scandinavian tankers integration of supplies could be achieved, and enough extra oil could be provided from the United States and Venezuela to make up for such Middle East supplies as could not be lifted for lack of tankers.

Do the Assumptions Hold?

DO these favourable assumptions still apply ? First, can Britain and France still expect to lift crude oil from the Persian Gulf ? That depends on how the Anglo-French military action proceeds, and the reaction of other Arab states to it. Another major question mark concerns the integrity of Tapline. This could certainly be cut by Jordan or Syria, but Saudi-Arabia's need for revenue is such that some part, at least, of any Arabian oil that could not be sent to the Mediterranean by the pipeline might become available for loading in the Persian Gulf. If the pipelines from Iraq to the Mediterranean were cut, and the relatively small portion of Iraq's oil that is at present shipped from the Persian Gulf could no longer be relied upon, another major source would dry up. Iranian supplies should still be available and might be increased at the

expense of their Arab competitors. It should be possible to safeguard Kuwait supplies. The total prospect would be grim but not hopeless—provided that tankers were available to transport this oil round the Cape.

That was the second favourable assumption made in September. Is it realistic now to expect the assistance of the American government in escaping the consequences of actions taken in direct opposition to the views of President Eisenhower and the Secretary of State? The American Administration, unwilling at any time to impose rationing on American oil consumers, will be doubly unwilling to ration home supplies for the benefit of Britain and France now. Only other European countries, which have taken no part in the Middle East campaign, could reasonably expect American assistance in obtaining oil. Where in that event do we stand? In broad terms, Europe imports about 125 million tons of oil a year, of which about 60 million tons come through Suez, 35 million tons from the Eastern Mediterranean pipeline terminals, and 30 million tons from the Western Hemisphere. Assuming that Persian Gulf supplies remain available, the oil that formerly came through Suez to Europe would have to travel roughly twice as far round the Cape, and the oil formerly delivered from the Eastern Mediterranean terminals more than twice as far (to some countries, such as Italy, many times as far). Only the supplies from the Western Hemisphere would still require the same number of tankers. To meet European requirements without changing the source of supplies would therefore require between 75 per cent and 100 per cent more tanker tonnage. This is clearly impossible, and the problem could only be solved by stepping up the supplies drawn from the United States and Venezuela, and altering the pattern of Europe's imports to perhaps 90 to 100 million tons from the Western Hemisphere, leaving only about 30 million tons to be drawn from the Middle East. But without the unqualified support of the American oil industry this operation, too, would be out of the question. And to avoid a desperate oil shortage Britain would be left with the unpleasant necessity of diverting to exclusively British—and perhaps French—use British controlled tankers, which would still be urgently required to maintain supplies to other European countries and to consumers in Asia, Africa and Australia.

Gilt-Edged under the Shock

WAR is the ugliest word, and the Stock Exchange has to weigh its financial consequences. So far the market has done little more than to take the precaution of marking down and widening quotations. The reaction in prices has been comparatively modest and the minimum of business has been transacted. Investors have not yet faced the longer-run implications for the British economy of this week's events. Rather than contemplate anything so dire, they have waited on events, keeping the possibility of a quick military success in mind, and following a course of temperate moderation rather than hurry and panic.

Yet the reaction in the gilt-edged market has been severe. Until the end of last week gilt-edged prices were riding easily, buoyed up by hopes that sooner or later some easing of interest rates was a reasonable expectation. On this hopeful tide, new debenture issues were carried to what then seemed the comfortable haven of bulging subscription lists. But the storm in Egypt wrecked the hopes and destroyed the safe refuges. In two days' trading, War Loan dropped from 70$\frac{5}{16}$ to 68$\frac{1}{4}$, the lowest point ever touched in its history. Yet at the close on Wednesday it was called at 69$\frac{7}{8}$, unchanged on the day and it was only one-eighth lower at Thursday's close. The similar story of precautionary marking down on Tuesday followed by a pause on Wednesday and Thursday was repeated throughout the list.

Among the first casualties in the stock market were the new issues. Before the week-end Esso's £10 million issue of 5½ per cent debenture stock at 97 attracted £42 million

and allotments above £100 had to be scaled down drastically. Dealings on Monday took the premium to ¾; on Tuesday, such was the sudden change in fortune, it was at a discount, on Wednesday it closed at ⅝ discount, having at one time slumped to 1¼ discount; and it closed at ⅝ discount on Thursday. The West Ham issue of £1½ million of 5½ per cent stock, 1966, at 98½ attracted £6 million in applications, but it opened at a discount of 2 points and was still 1½ discount on Thursday. The same fate must be expected for the Australian cash-cum-conversion offer of 5½ per cent stock, 1970-72, at 97½d. Much of the £6,950,700 of maturing 3¾ per cent stock was held in the discount market, and the success of the issue (which a week ago seemed likely) turned on the cash offer. Events in Egypt have upset its prospects, as they have upset so much else.

Reaction in Equities

WHILE a week ago gilt-edged prices were moving up, equity prices were edging uneasily down, as each day added its contribution to the story of smaller profit margins and the institutions, with a fair volume of accumulated funds, were beginning to find attractions in the high running yields on fixed interest stocks. The Middle Eastern crisis accentuated the fall in industrial equity prices, but it did not precipitate a sudden collapse. In the week to Wednesday's close *The Economist* ordinary share indicator (in which growth stocks such as those in the oil industry have a strong influence) fell from 189.3 to 183.8, compared with its recent peak at the end of August of 193.1.

Leading industrial shares were marked down moderately but the full weight of the crisis fell inevitably on the Middle

Eastern oil shares. In dealings on Thursday British Petroleum were down to 135s. 1½d. (against 146s. a week earlier), Shell to 144s. 6d. (against 152s.) and Burmah to 85s. 6d. (against 90s. 6d.). Trading was not heavy but the jobbers had no other recourse. Metal and commodity shares did not go soaring off on the rise in commodity prices though

one of the few shares to record a gain was International Nickel. The equity market, like gilt-edged, could take precautions, but once these were taken it could only wait and see.

Sterling Takes the Strain

THE conflagration in the Middle East inevitably brought additional pressure on sterling. By normal standards the world is short of sterling and the technical position is correspondingly strong; but pressed by uncertainties as grave as those thrown up this week operators can usually contrive to push the "leads and lags" a little further against sterling. That has been the case during the past week. The weakness of sterling has been apparent not only against dollars but also in terms of most Continental currencies; against the D-mark sterling has fallen to its support point. The dollar rate fell on Tuesday from $2.78⅞ to $2.78½; and it was subsequently supported at this level by the Exchange Equalisation Account, with a slight improvement to $2.78⅞ on Thursday.

So far, the extent of the support in the exchange market appears to have been moderate. This may in part be due to the fact that the authorities have chosen this week to take part of the strain on sterling by allowing more gold to be sold to non-official quarters in the bullion market. The rise in the price of gold to 252s. an ounce has outstripped the fall of sterling in terms of dollars, and in consequence intervention through the gold market has been slightly cheaper than through the exchange market. The weakness of sterling has also been apparent in the transferable market, where the rate has fallen from $2.76 to $2.75. The losses of gold and dollars by the Exchange Account in the final two days of October will be reflected in the gold figures for the month that were due to be published on Friday.

Shipping Diversions and Freights

THE first reaction in the shipping markets to the latest turn of events in the Middle East was the natural one of virtually suspending business in Far Eastern fixtures. Neither owners nor charterers were prepared to make new contracts without knowing whether the Suez Canal area would become part of the fighting zone—whoever might be doing the actual fighting—and charterers were busily enough engaged rearranging itineraries for vessels already in or bound for the Mediterranean. The official warning to keep clear of Israeli and Egyptian waters was probably unnecessary, for several ships were halted when the news of the Israeli raid broke out and most of the rest as soon as the Anglo-French ultimatum—with its implications—was announced. The P & O and *Orient* lines, for example, had already told three liners heading for the canal to turn back, two to Malta and the third to Aden. Ironically the two P & O liners were making for the canal for the first time since they were first diverted three months ago, and, in fact, much of the shipping tonnage previously re-routed round the Cape had already gone back to using the canal. At the beginning of this week the daily convoys through the canal were rather big, a total of 56 ships passing through on Monday and 46 on Tuesday; but the number dropped to 20 on Wednesday and by Thursday traffic appeared to have come to a standstill. This is the time of the year when the canal traffic normally becomes heavy.

The full cost to shippers of the latest Anglo-French move, in terms of extra freight and insurance costs and from longer transit times round the Cape, will appear only slowly. What the closing of the canal will mean in longer voyages to destinations normally reached through Suez was described in the issues of *The Economist* published on August 4th and September 22nd. As for freight costs, both the dry-cargo tramp and the spot tanker markets were already under some pressure. About an eighth of the total foreign-going tramp tonnage sailing under the British flag is still requisitioned, and the spot tanker market hit a new post-Korean War peak last week when the oil companies began to book extra tankers for their winter programme. The longer passages that now seem inevitable will undoubtedly put a further serious strain on available tonnage and send freight rates higher still.

Jump in Commodities

COMMODITY prices rose more sharply, and on a broader front, than when Egypt seized the Suez Canal last July. But though some consumers here and on the Continent thought it prudent to purchase extra supplies, there has been no general rush to buy, and by Thursday several commodities were slightly below their peaks. The response of some commodities has been tempered by the fact that production is high, while consumption in many British industries is running below the peak levels of last year. In the rubber industry, for one, there has been some involuntary building up of stocks; moreover, manufacturers can if they choose buy more synthetic rubber at prices cheaper than those of natural rubber. It is also conceivable

that some consumers hope that any serious interruption of supplies would be relieved by releases from strategic stocks, though whether the British government would share that view is another question.

The shortage of supplies—or lack of it—is broadly illustrated by the spread between the prompt and forward quotations. Copper was weak before the crisis, and cash metal was at a discount of about £1 a ton. That discount

THE WEEK'S ADVANCES

	Oct. 25	Oct. 31	Nov. 1
Tin, cash £ per ton	810	877½	882½
Copper, cash £ per ton	269	292½	295
Lead, prompt, £ per ton	115	117½	119
Zinc, prompt, £ per ton	96	100	100
Rubber, spot, d. per lb	27	30½	31½
Cocoa, Oct., Dec., £ per ton .	196	215½	210

has since narrowed, but it has not disappeared. The opposite is true of tin. Thanks partly to sales to the United States, stocks in Metal Exchange warehouses dropped last week to as little as 550 tons; hence it was not surprising that the premium for cash metal increased still further this week, to close on Thursday at £46 a ton. The premium for prompt lead, on the other hand, is still only about £1 a ton, but in zinc, which was firm before the crisis, the premium has risen to nearly £3 a ton. In the rubber market the war in Egypt accentuated a rally set off by the riots in Singapore, but rubber prices, too, are slightly below the peak and prompt supplies command only a small premium.

The Cushion of Stocks

In none of the major commodities liable to be affected by the diversion of shipping from the Suez Canal are Britain's stocks near the danger point. Stocks of tin, lead, rubber and tea are all equivalent to at least one and a half month's supply, enough to tide consumers over the delays of two weeks or so that may result from the re-routing of ships round the Cape. Figures of stocks, however, are one of the least satisfactory chapters of Britain's economic Bradshaw, primarily because they are mostly two months or more out of date. In the table total stocks are shown at

	Total Stocks	Months' Supply
Tin (tons)	3,630	1·5
Lead (tons)	35,790	1·6
Rubber (tons)	54,130	1·7
Raw Wool (mn lb)	171	3·7
Tea (mn lb)	109	2·5

the end of August (except that tea stocks refer to October 19th). These stocks are then expressed as equivalent to so many months' supply, reckoned at the average rate of total consumption (including exports) this year. In fact, the level of stock carried by manufacturers is based mainly on their estimate of future requirements and the availability of forward supplies. The total figures of stocks, especially of metals and rubber, also exaggerate the supply available to British industry. They include stocks held by dealers and merchants for sale to foreign as well as to domestic consumers. If these stocks are excluded from the total, stocks of tin and lead are equal to just under one month's home consumption.

Coal in Hand

The coal industry—and perhaps soon the Government also—may be grateful for the large cushion of supplies built up from last year's huge import programme. This year, with a tiny gain in output (barely half a million tons on a total output so far of 177¼ million tons and most of it from open cast workings) the industry has been able to feed its British customers with an extra 2¾ million tons, increase its net export surplus (including bunkers) by 1¼ million tons, put 4 million tons less into stock, and still manages to enter the coal winter this week with a bumper 20 million tons of distributed stocks and a further 2¾-3 million tons still at the collieries. This is 1½ million tons

COAL SUPPLIES
(Million tons)

	1956 (42 weeks)	1955 (42 weeks)	Change
Output :—			
Deep-mined	167·68	167·57	+0·11
Opencast	9·60	9·25	+0·35
	177·28	176·82	+0·46
Imports	4·65	9·55	−4·90
Total supplies	181·93	186·37	−4·44
Exports and bunkers	8·05	11·19	−3·14
	173·88	175·18	−1·30
Inland consumption	172·82	170·07	+2·75
Taken into stock	1·06	5·11	−4·05

more than on November 1st last year and the best winter stock position since the war. Merchants' stocks, at 2 million tons on October 20th, against less than 1¾ million tons last year, are indeed almost embarrassingly large—for the merchants. Householders again have not noticeably built up their own stocks while summer prices lasted. Most of the increase in home consumption this year has come from power stations and coke ovens; direct industrial use and the collieries' own consumption have fallen, and domestic purchases have risen only fractionally.

Both import and export programmes have been progressively revised during the course of the year: the latest estimates are 6½ million tons for both exports (excluding bunkers) and imports, and most of the ships are already booked for the remaining 1¾ million tons of imports still to come in the next two months. If the Government were to decide to import more, as an insurance against any interruption in oil supplies, the operation would now be both difficult and costly.

ICFC

Finance for Industry and Commerce

ICFC provides finance in the form of long-term loans on fixed terms, or share capital, to industrial or commercial enterprises established in Great Britain. Amounts range normally between £5,000 and £200,000.

During the present period of credit restrictions, the Corporation will only consider applications for capital from firms concerned in work of national importance. Consideration may also be given to new ventures which are soundly conceived and adequately sponsored.

Please write for our booklet—"Capital for Business and Where to Find It" to Dept. I, at any of the addresses below.

THE SILENT REVOLUTION

No merciless clacking of knitting-needles. Instead, a peaceful revolution—the painless rising of the working classes, which has changed the nation's economic structure.

Between 1949 and 1954 the number of people in the middle income group, between £500 and £1,000 after payment of tax, *more than trebled*. It is into this category that the averagely successful working man can now expect to graduate.

Industrial and factory workers have benefited most. They, and their tastes, have been 'Americanised' into what used to be considered the middle-class standard of living. This in turn is why the Empire News & Sunday Chronicle—read by one fifth of the country's adult population—has greatly strengthened its already strong position, and why it can help others to do likewise.

For the Empire News & Sunday Chronicle is indispensable to any advertiser aiming to cover the vital Midlands and North, the great industrial regions. The IPA Survey showed that 64% of Empire News & Sunday Chronicle readers were concentrated in the North—32% more than any other national Sunday newspaper.

Here too are concentrated the greatest number of multi-income households. Families with four-figure earnings and low overheads can well afford what were recently middle-class 'luxuries'. The Empire News & Sunday Chronicle's unequalled penetration into these homes confirms the paper's dominant advertising significance.

'The most interesting phenomenon of recent years' is how The Economist describes this revolution. As a phenomenon it is not only to be marvelled at. It alters the work of the statistician, the social worker, the politician. It also strengthens the living bond between the advertiser and the Empire News & Sunday Chronicle.

MOTORISTS! cast your vote for freedom

1 In the past, the great majority of garages offered a choice of makes of petrol. Recently a system has been introduced into this country whereby most garages sell only the product of one petrol company (i.e. Garage 'A' sells only 'X' make of petrol and Garage 'B' sells only 'Y' make of petrol).

2 This system has the effect of limiting the motorist's choice of petrol at a particular service station, but in certain cases it also seeks to limit his choice of motor oil to that of the petrol company's own make.

Which do you prefer?

(a) Garages which offer a choice of makes of lubricating oil? ☐

(b) Garages which sell only the lubricating oil made by a particular petrol company? ☐

Please register your vote by putting an 'X' in the appropriate square and signing below:

ADDRESS_____

POST TODAY TO:—THE SECRETARY, M.A.M.A., 67 GROSVENOR STREET, LONDON, W.1.

This information is confidential. No use will be made of your name and address. Please cut out this coupon and post in unsealed envelope (2d. stamp) to the Secretary, Motor Accessories Manufacturers Association Ltd., 67 Grosvenor Street, London, W.1. The object of the Association is, "To promote by exchange of information and by concerted action, the unrestricted sale and display of accessories, tyres, batteries, oils and other products distributed by Members of the Association to the motor and allied trades."

Capital for Tankers

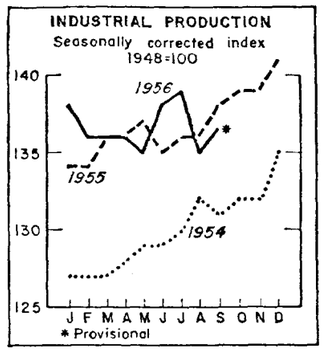
THE total tonnage of oil tankers on order from the world's shipyards at the end of June this year has been estimated at not far short of the enormous figure of 20 million tons deadweight. Most of this tonnage is due to be delivered by 1960-61: it is equivalent to just under 45 per cent of the tanker tonnage at present afloat and, allowing for the higher speeds and larger capacities of these new ships, rather more—perhaps 56 per cent—of existing transportation capacity. The London brokers that compiled these estimates, John I. Jacobs and Company, reckon that over 7 million tons dw of this total has been booked by oil companies and the remainder by tramp companies.

This building programme will make a heavy call on the capital resources of both, and Mr F. J. Stephens, managing director of the Shell Petroleum Company, calculated this week that the tanker tonnage ordered outside North America for delivery during the next four or five years will call for about £300 million a year. Presumably, as he says, "it can be assumed that, as these ships have already been ordered, the money has been found or earmarked for them." But Mr Stephens is more concerned, as most other tanker operators are, with the financing of future tanker building programmes, in particular the tankers that will have to be ordered for delivery after 1960-61 when the large hump of middle-aged tankers built during the war will begin to need replacement. Oil companies already have their hands full with the colossal capital needs of their other activities. According to Mr Stephens the oil industry outside the United States will be spending £3,500 million in the next five years on production, refining and distribution. Most of this will have to come from the industry's own earnings, and the rate of spending will inevitably increase; so the oil companies are unlikely to wish to increase their share of the world fleet much beyond the present 40 per cent for financial as well as operational reasons. Thus the tramp operators must be given some assistance to provide their own share of the growing oil tanker tonnage, and Mr Stephens asks, quite justifiably, why institutional investors here do not do anything like as much towards investing in tankers—and the oil industry's future—as their counterparts in the United States and on the Continent. Long-term investment in oil tankers nowadays is surely as safe as houses.

Output Still Level

THE official production indices for September will be put under close scrutiny for any signs whether output is at last starting to rise again. For most of this year the "all industries" index number has clung stubbornly to last year's level and the first estimate of 139-140 (1948 = 100) for September seems to be following the same course; it is just perceptibly lower than the final figure for September last year. After making adjustments for seasonal factors the average figure for the first nine months of 1956 is now precisely half of one per cent above that for the same period of 1955. Although this first forecast for September will probably be revised (and all previous first estimates since February have in the end been revised upwards, the June and July figures by as much as two to three points) it is clear that industry is not yet showing any signs of that marked spurt in output it will need if it is to keep abreast of its performance towards the end of 1955 and so stay ahead of last year as a whole.

The simple reason why output has levelled off this year is that production for export and investment has not risen sufficiently to compensate for the falling off in defence spending and the flattening of consumer demand (in cars and other hardware; consumption of food, drink, tobacco, and clothing has risen). The economy is moving in the direction the Chancellor intended, but slowly and at the immediate cost of total national product. Labour too is still gradually filtering towards the right industries. But an intriguing question remains. What has happened to the first instalment of industry's two-year investment boom? Factory completions are now noticeably higher and the rise in the deliveries of machinery and plant indicates that these empty shells are being equipped. But these evident additions to manufacturing capacity are not yet being reflected in higher production. Those industries where the gap between rising capacity and stable or falling output is yawning widest must by now be contending with some significant additions to fixed costs.



Credit Expansion Again

THE tendency towards a revival of credit expansion that first showed itself in the late spring has become much more pronounced in the past two months. The latest return from the clearing banks, which relates to the four weeks to October 17th, shows that net deposits rose by £73 million, to £6,115 million. This contrasts with an increase of only £17 million in the corresponding month last year, when the banking system was still feeling the force of the contractionary influences set in motion early in 1955. Since mid-July net deposits have risen by £127 million, whereas in the corresponding period last year they dropped by £34 million. Hence the seasonally-corrected index compiled by Lloyds Bank, which declined from 112.0 (1948 = 100) in February, 1955, to 104.6 by last spring, has since risen to 105.6, the latest month's rise being 0.3.

Over the three months, the dominant influence has been the growth of the banks' liquid assets, which mainly reflect governmental borrowings from the banking system. Principally in consequence of the redemption of the unconverted portion of the 1954-56 War Bonds at mid-August and the launching of the new system of direct financing of the nationalised industries by the Exchequer, liquid assets have risen since July by £219 million. Over the same period, as the detailed table given here last week showed, the Exchequer advances totalled £81 million, but at the date

of the latest banking figures the October batch of advances (£18 million) had not exerted its full effect. In particular, the portion employed by the state boards in reducing their bank overdrafts did not appear to have then reached the banks; the mid-October total of these overdrafts at the clearing banks was £82.2 million compared with £82.0 million at mid-September (overdrafts with the Scottish banks were likewise virtually unchanged, at £8.2 million).

LONDON CLEARING BANKS

	October 17, 1956		Change on Month	Change on Year
	£ mn.		£ mn.	£ mn.
Deposits	6,376·2		+105·9	+ 0·4
Net deposits*	6,115·1		+ 73·4	− 10·3
	£ mn.	% †		
Liquid Assets	*2,265·1*	*37·1*	*+ 50·7*	*+208·3*
Cash	510·3	*8·0*	+ 5·1	− 9·8
Call money	409·0	*6·4*	− 4·8	+ 0·6
Treasury Bills	1,346·1	*21·1*	+ 54·0	+233·2

All other	*1,780·2*	...	*+ 2·6*	...

* After deducting items in course of collection.
† Ratio of assets to published deposits.

Despite this lag in the impact on the banking figures, liquid assets rose during the period by £51 million, and the rise would have been larger still if several banks had not added moderately to their investment portfolios. Hence the average liquidity ratio rose by a further 0.2 to 37.1 per cent; this contrasts with 33.8 per cent at the corresponding date last year and 34.3 per cent in 1954. To correct this excess of liquidity, the authorities are evidently counting upon a good flow of funds into premium bonds. Bank advances during the month showed no decided trend; those to the private sector rose slightly—but, after the previous month's exceptional decline (by £41 million), a further fall was hardly to be expected.

Monopolies Under Restriction

NOVEMBER 1, 1956, will probably feature in the calendars of several groups of people—jay walkers and "reckless" cyclists for one, and premium bondholders for another. No doubt it will not be missing from future Middle Eastern history books. But that date was also of some significance for British industry. For the first instalment of this year's Restrictive Trade Practices Act came into force on that day. Collective enforcement of resale prices was banned outright by the Act, but trade associations were given three months' grace to November 1st before the ban started to operate. The Tobacco Trade Association was the first to bow before the official storm, and a third tobacco company—J. Wix and Sons, which makes Kensitas cigarettes and is a subsidiary of the American Tobacco Company—has now brought out gift coupons. The overwhelming success of the Imperial Tobacco Company and Gallaher in the cigarette trade in the last year or two, to the painful cost of most of the other manufacturers, does not make these new competitive moves at all surprising. The fight for larger shares of the market will undoubtedly be fierce in this industry, but the new freedom for competition between manufacturers and between distributors applies to a long list of other trades, too, though elsewhere it may not have such immediately noticeable effects.

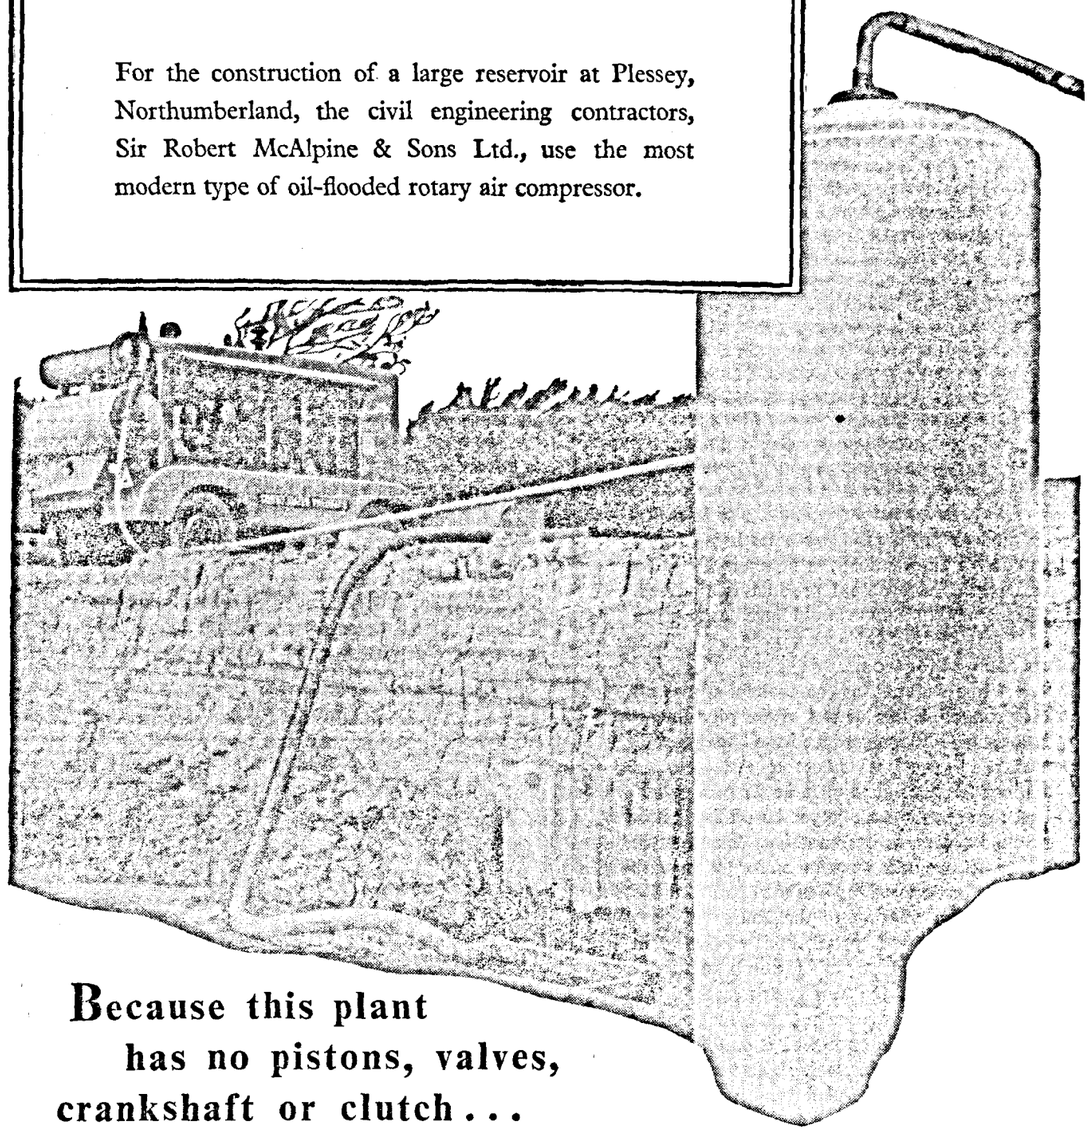
Meanwhile the Board of Trade and the Registrar of Restrictive Trading Agreements have been making progress towards implementing Part I of the Act which deals with the practices that have to be registered and which may eventually lead to proceedings in the new Court. The first order under the Act listing the agreements to be "called up" between November 30th and February 28th next year was made in August. These were, broadly, arrangements that include restrictions as to prices or other terms or conditions or which involve collective discrimination, and they form the most important and numerous group. To assist industries that will have to furnish particulars of these agreements in the next four months, the Registrar has published this week a booklet specifying the details and documents he will need.

Second Thoughts on Steel

THE steel industry can be well pleased with the compliments it has been given by the British Productivity Council. Between 1946 and 1955 British steel output increased by 60 per cent, with the addition of only 13½ per cent to the labour force—an increase over the decade of 41 per cent in output per man. Credit for this performance is given in the council's report mainly to the £470 million of new capital spent since 1946 to modernise and expand its capacity. As output has gone up the fuel used per ton of pig iron and per ton of steel has been reduced. Equally encouraging—although the maintenance men's ban on overtime shows that there are exceptions—is the council's contention that the trade unions in the British steel industry have "for many years fully grasped the close connection between high productivity and high earnings which underlie the policies of the American trade unions."

Good output and lower real costs cannot be decried. But when the council discusses British steel prices it comes perilously close to that complacency against which it sensibly warns the industry. British steel is sold to the home market at lower prices than those quoted by German, French, Belgian and American producers, giving British steel consumers a cost advantage over their competitors abroad. But can this price advantage be maintained indefinitely? To some extent it is artificial. When German steelmakers import coal, they pay the full marginal price—and it is heavy, for there is no averaging of home and import coals as in the British coal industry. The export of steel scrap from Britain is controlled, thus depressing the price of scrap in Britain by several pounds a ton below the free market price. Exports of semi-finished steel are broadly marshalled in order to preserve supplies for the home market. The price of finished steel, which is controlled by the Iron and Steel Board, makes a generous allowance for depreciation at replacement cost, but the higher costs of coal, iron ore

For the construction of a large reservoir at Plessey, Northumberland, the civil engineering contractors, Sir Robert McAlpine & Sons Ltd., use the most modern type of oil-flooded rotary air compressor.



Because this plant has no pistons, valves, crankshaft or clutch...

it gives the kind of really long-term trouble-free service that puts it far ahead of the conventional type of compressor. Those moving parts which normally require frequent servicing are replaced by a simple two-stage vane type rotary compressor. The entire unit runs in oil and is oil-cooled. And new design features such as fully automatic control, centralised instrument panel, and non-detachable radiator doors are incorporated to make the CP Power-Vane the most important advance in design since the portable compressor came into general use. Certainly, this is something every Plant Engineer should know about...

How Automatic Can You Get?

In modern production processes it is normal to control automatically a number of related variables. The eventual product is analysed. If it is found that there could have been a more effective setting of the process controllers, they are changed for the next day's run.

But imagine that, as the product comes off the production line or out of the pipe line, it is immediately analysed and the process controllers *automatically* re-set to the optimum settings to produce an even better product.

Although this cannot yet be realised, it is no pipe dream. It is something which Sunvic Controls have been working on for many years —and is just one example of the extra facilities they will be offering in the course of time towards increased production efficiency in industry. This kind of research naturally attracts some of the best brains in industry, and there is always room at Sunvic for younger men with scientific or technical qualifications who are interested in joining a fast-expanding Company engaged in absorbing and important work.

Today Sunvic takes control

and scrap, wages and transport were not fully covered by the price increases allowed earlier this year, and were partly offset from the accumulated surplus on the central purchasing and distribution of imported iron ore and other raw materials. This surplus has now been exhausted.

The ability of British steel to finance out of its own earnings an adequate share of the necessary future expansion in its capacity is currently imperilled. If supplies of British steel are to keep up with demand, finance must be found; and unless the rate of technical improvement can be speeded up still more, British steel prices will have to rise more closely to those in Europe and America. The council might have asked whether price controls impede the adoption of new techniques or the financing of future growth.

BOAC's North Atlantic Fleet

With the arrival of the first of the ten Douglas Seven Seas it has ordered, the British Overseas Airways Corporation's new North Atlantic fleet can begin to take shape. The unique asset of the Seven Seas is its ability to fly the Atlantic non-stop in both directions. When it goes into operation with BOAC in January, the corporation will for the first time in years be abreast of the competition and have a chance to reverse the depressing fall in its share of North Atlantic traffic.

Between now and 1960, these services will be expanded first by non-stop turbo-prop flights with the more advanced Britannias and ultimately by pure jet services with the Boeing 707. These may be supplemented by the use of Comets. The new de Havilland jet airliner that was announced in the House of Commons last week will be the fifth of the Comet series. It is in an early stage of development and not intended for delivery before 1962. It is not conceived as the British answer to the big American jets. De Havilland have always been reluctant to increase the size of the Comet beyond that suggested by the estimated traffic and the available airport facilities on BOAC's less glamorous Commonwealth routes. The new airliner is obliged to have a North Atlantic range, but its payload on that route is unlikely to exceed two-thirds of that of the bigger American airliners.

The Minister of Supply, who gives some sign of feeling that the aircraft industry's critics are beginning to lay about them too wildly, though he himself is no apologist for the industry, told questioners that exports during the year should reach 727 aircraft valued at £105 million, two-thirds more than in 1955. These are admittedly the product of only a handful of companies, but even in the United States there are never more than a handful of saleable aircraft and engines in production at any one time.

Two Shifts in Cotton Spinning

Representatives of employers and unions in the main section of the cotton spinning industry have now approved in principle an agreement which opens the way to the wider adoption of shift-working, a more rational wage structure and improved working conditions. Though a detailed agreement has still to be drafted and signed its broad outlines are already clear. The unions have accepted the principle of two shifts based on a 38½-hour working week (as in cotton weaving), for the same wage as for the present 45-hour week. Two shifts have been worked for some time under local agreements in about twenty mills, but the shift has been one of 37 hours—and in these cases will remain so—for a 45-hour wage. Most employers have argued that this premium was too high to make shift working economic, and the longer shift of 38½ hours should prove more attractive. The unions have also agreed to an alternative wage structure based on the principles of work study applied in redeployed or re-equipped mills; this, again, is an advance on previous policy. Finally, the employers' federation has accepted a minimum standard of working conditions covering mechanical handling, dust extraction, lighting, spacing of machinery and the like. In the main this standard is already in operation in roughly one-third of the mills. Though the federation cannot compel its members to conform to the new conditions, the unions will be able to ensure acceptance by any mill wishing to introduce two shifts. The immediate importance of the new agreement should not be exaggerated. The leaders of the two sides of the industry have cleared the way; it is now up to management and labour in the individual mills to go forward.

Voteless Equities

Articles appearing in *The Stock Exchange Journal* do not necessarily represent the views of the Stock Exchange Council and a discussion appearing in the latest issue which comes to the defence of the non-voting equity share is not therefore to be taken as a statement *ex cathedra*. Its argument is put on grounds of expediency rather than principle. Indeed it suggests that "much of the outcry against non-voting shares is based on academic objections" and it points out, with good reason, that shareholders without a voice have not been treated any more shabbily, for that reason, than those that have one.

This can be true. So can the writer's argument (which has been conceded in these columns) that there may be a particular justification for limiting the votes of outside shareholders in certain family businesses. But non-voting equities are being increasingly exploited. Since 1938 such shares in the commercial and industrial list have increased tenfold in nominal terms from £7.9 million to £75.4 million. It has been argued here and elsewhere that this growth was undesirable and should be checked. It is not a matter on which the Stock Exchange Council seems disposed—or, indeed, may even be able—to take effective action; and proposals to alter the law to ban the non-voting share are undoubtedly drastic. At this stage, there is still a good deal of argument in favour of leaving the exploitation of the non-voting share to the good sense of companies and their financial advisers; there is, moreover, the impressive influence of the issuing houses and the institutional investors towards the principle that voteless shares should be the exceptional and not the normal, to be adopted only in special circumstances. Investors remain disappointed that the council has not insisted that a non-voting share should

be clearly labelled as such in the Official List. The mere inclusion of "non-voting" in the title of the security when it is issued is not enough.

Smaller Profits from Rootes Motors

If it is said that Rootes Motors has just scraped through a difficult year, that is no mean achievement. In the preliminary statement for the year to July 31st the directors say that the group's turnover was maintained. But gross profits, which have tumbled from £3,557,325 to £2,031,129, have been affected "by rising costs throughout the year which have not been passed on to the public at home or overseas and by certain supply difficulties which resulted in considerable loss of turnover." This implies that competition between the motor manufacturers in a shrunken market has been intense and that the difficulty of securing shipping space has led to a loss of potential (as opposed to actual) sales in export markets.

Profits have not been affected by the loss of £613,601 incurred by Singer Motors as this was taken into account when Rootes acquired the equity of that company. Rootes has paid Singer's preference dividend under the guarantee arrangements made at the time of the merger. The directors of Rootes have left the ordinary dividend unchanged at 8 per cent but the cover on this dividend has fallen sharply following the drop in net earnings after tax from £1,689,449 to £870,610. On the maintained dividend the company's 4s. stock units now standing at 5s. 4½d. yield 5.9 per cent—a smaller yield than is offered by either British Motor or Standard. But on these two dividends the market sets a bigger question mark than it did upon the Rootes dividend.

High Fashion in Hawick

Fashion is fickle: to some industries it brings decline, to others a fresh lease of life. To the Hawick knitwear industry it has brought both. Twenty years ago the sweater and twin-set made in this small Border town was a practical, work-a-day affair, hardly to be worn on special occasions. Then, inspired by the Continent, manufacturers began to put fashion to work. Since the war they have succeeded so well that they have created a year-round demand. Knitwear is now made for the spring, autumn and winter, for daytime and evening wear. Styling has become more elaborate, progressing from the deceptively simple classic—still a best-seller—to the "neo-classic" and finally to the "dress-maker" style. But one thing has not changed: cashmere remains the principal, supreme, raw material. The beauty and fine workmanship of these garments have made Hawick and firms such as Pringle and Lyle & Scott renowned.
